Introduction

MindFusion.Diagramming for Java Swing (JDiagram for short) is a Java class library that that lets you create and display various types of diagrams and charts. The library includes model classes that describe the structure and appearance of a flow diagram, and view classes that can be integrated into any application that targets the Java Swing framework. By providing your software with ready to use capabilities for visualizing and editing relational data, JDiagram saves you from hundreds of hours of coding and debugging efforts.

JDiagram can give graphical representation to:

- Workflow processes
- Class relationships
- Graphs and networks
- Entity-relationship / database diagrams
- IVR systems
- Industrial automation processes
- Genealogy trees
- Algorithms and flowcharts
- Mind maps
- Organizational charts
- XML documents
- Classification hierarchies
- Data mappings

JDiagram provides intuitive user-interaction model for creating or editing diagrams. In addition, its programmatic interface places at your disposal many useful functions, ranging from printing, XML serialization, exporting to PDF and SVG to path-finding and automatic layout algorithms.

The control has been tested with the most popular Java development environments, and is used by companies from all around the world to create applications in Java.

General Information

The JDiagram Library

- Redistribution is royalty free
- Can be purchased with source code
- Is written in Java
- Implements the Document/View architecture
- Includes applet class for use in Web pages

User Interaction

- Several user interaction modes
- Free-form drawing
- Scrolling and zooming
- Copy and paste to/from the system clipboard
- Panning
- Automatic scrolling while dragging items with the mouse
- Alignment to grid
- Node alignment guides
- Multiple selection
- Tool-tips
- Docking points can be defined for nodes
- Magnifier tool
- Undo / redo support

- Rotate and flip shapes

Programming

- Programmatic access to the diagram elements
- Builder classes for fluent API
- Numerous properties for customizing appearance and behavior
- Numerous utility methods
- Path finding and cycle detection
- Rich event set
- The applet fires events that can be handled using JavaScript

Store and Retrieve Diagrams into/from

- Files on disk
- Java streams
- ASCII strings
- XML documents
- JSON strings

Output

- To display through Java Swing
- Printing and print preview
- To a browser using HTML image maps

Export and Import

- Export Portable Document Format (PDF) files
- Export Scalable Vector Graphics (SVG) files
- Export images in jpeg, gif, tiff, and png formats
- Export Visio 2013 drawing (.vsdx) documents
- Export Excel Open XML Format (XLSX) files
- Import OpenOffice Draw documents
- Import Visio 2013 drawing (.vsdx) documents

Diagram Elements

- More than 100 predefined node shapes
- Each diagram item can display multiple labels and icons
- Display SVG drawings in nodes
- Ability to define custom shapes and shape libraries
- Rotation of shapes at arbitrary angles
- Use any Java Swing component as a diagram node
- Container nodes
- Display hierarchical data in TreeView nodes
- Support for custom node and link types
- Assign diagram items to layers
- Tables with unlimited number of rows and columns
- Table cells can span several columns and rows
- Sections of table rows can be expanded or collapsed
- Links can comprise multiple segments
- Link segments can be straight lines or curves

Automatic Layout

- Spring-Embedder graph layout
- Directional tree layout
- Radial tree layout
- Fractal tree layout
- Layered graph layout

- Grid layout
- Simulated Annealing graph layout
- One-way graph layout
- Orthogonal graph layout
- Circular graph layout
- Orthogonal link router
- Source code flowchart layout
- Decision flowchart layout
- Triangular graph layout
- Hierarchical graph layout
- Cascading graph layout
- Tree map layout
- Process diagrams layout
- Automatic link routing

Appearance

- Styles and themes
- Nodes can display images and text
- Multiple text labels per item
- Various text alignment styles
- Text can be laid out in polygonal areas
- Glass visual effects
- Styled HTML-like text formatting
- Customizable fonts and colors
- Custom painting of nodes
- Shadows
- User-assigned mouse cursors
- Z-order
- Rich choice of pen and brush styles
- Transparent nodes
- Invisible nodes
- A background swimlane grid

Behavior

- Lock diagram elements
- Read-only mode supported
- Tables can be scrolled
- Collapse and expand hierarchy branches
- In-place text editing
- Dynamic positioning of links relative to connected nodes

Link Diagram Items

- Nodes to nodes
- Table rows to table rows
- Nodes to table rows
- Unconnected links

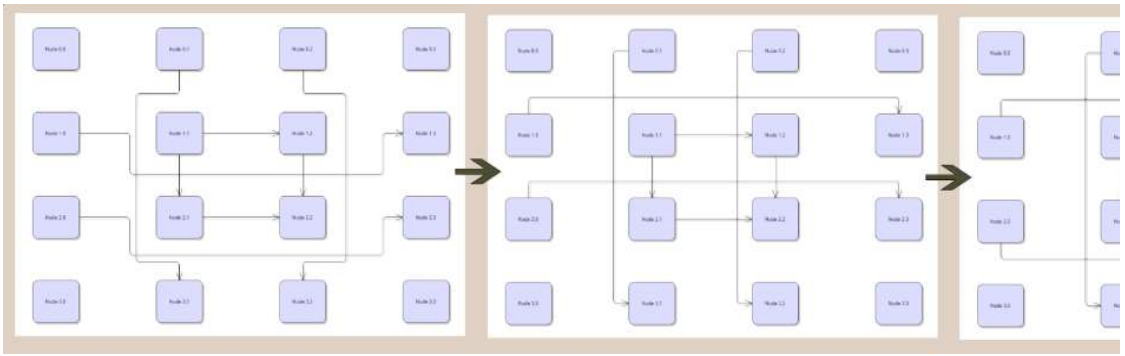
Hierarchical Grouping

- Attaching nodes to other nodes
- Attaching nodes to link control points
- Attaching nodes to link segments

Auxiliary Controls

- Overview control
- Ruler control
- Shapes listbox

- Node list control
- Layer list control
- Zoom control
- Item list control
- Palette control



What's New in this Release

The list below describes recent changes and additions to JDiagram:

New in version 4.9.2

Auto-routing improvements

- Set the WhileModifying flag in TriggerRerouting to reroute links while users drag their end points.
- Enable the MinimizeCrossings property of PatternRouter to make it select routes with fewer crossings. Note that this adds an additional loop to the algorithm, which may affect performance for large diagrams.
- New EvaluateFarPoints property of RoutingOptions, considered by **PatternRouter** and GridRouter, selects the best route from the possible start/end point combinations of the link's incident nodes. Note that this adds an additional loop to the algorithms, which may affect performance for large diagrams.
- Set the MinLinkSpacing property of CompositeRouter to specify the padding between nearby links.
- This screenshot demonstrates the effects of **EvaluateFarPoints** and **MinimizeCrossings** properties:

Custom lasso tools

If you set the Behavior property of DiagramView to DrawLasso, the control lets users draw selection lasso without changing actual Selection. You could use that in conjunction with initializeLasso and lassoDrawn events to implement custom tools or selection logic, such as:

- Opening a custom context menu or UI panel styled for bulk operations.
- Creating a visual screenshot / export of only the selected region.
- Implementing custom selection logic or filters (e.g. select nodes of a specific type, or select only links).
- Bookmarking the selected area (adding it to Bookmarks).

Miscellaneous

- NodeElement property of LinkValidationEvent returns the TreeViewItem or TableNode cell related to the event.
- Fixed bitmap deserialization exception when loading pre-v4.1.4 XML files.

API changes

- **ZoomBehavior** class renamed to LassoBehavior (it now implements both DrawLasso and **Zoom** behaviors).

New in version 4.9.1

Serialization improvements

- **Json** element added to SaveToStringFormat enumeration, and can be used with saveToString and loadFromString methods.
- For naming consistency with XML serialization methods, JSON methods (**saveToJsonFile**, **saveToJsonObject**, etc) have been renamed to saveToJson and loadFromJson.
- JSON serialization methods extended to provide full set of **OutputStream** / **InputStream** overloads.
- XML serialization methods extended to provide full set of **OutputStream** / **InputStream** overloads (previously missing from DiagramDocument).
- AutoDeleteItems now saved in JSON format.
- Custom dash styles of DiagramItem's Pen property are now saved in JSON format.
- LaneGrid cell border styling now saved in JSON format.
- **LaneGrid** header fonts now saved in JSON format.
- The order of OutgoingLinks and IncomingLinks is now preserved in JSON format.

Miscellaneous

- nodeModified event is now also raised when users adjust the shape of a FreeFormNode by moving a FreeFormHandle. The AdjustmentHandle property of NodeEvent now reports the AdjustmentHandle instance used to modify a node. Previous move/resize/rotate enumeration value is now returned by getNodeHandleType method.

API changes

- Attention: loadFromJson(string) parameter now specifies file name. Call loadFromString to load from JSON data string instead. Replace saveToJson -> String calls with saveToString(SaveToStringFormat.Json);
- **saveToJsonFile** and **saveToJsonObject** replaced by saveToJson overloads.
- **loadFromJsonFile** and **loadFromJsonObject** replaced by loadFromJson overloads.
- The type of AdjustmentHandle property of NodeEvent changed from NodeHandleType enum to AdjustmentHandle reference. Previous move/resize/rotate enumeration value is now returned by getNodeHandleType method.

New in version 4.9

ItemListView control

ItemListView supersedes NodeListView and lets you show both nodes and links in the list. Items can be added by calling addItem method, and removed by calling removeItemAt. DefaultNodeSize property from **NodeListView** is called NewInstanceSize in the new class. The AutoConnectLinks and AutoConnectDistance properties control whether links created via drag-and-drop should connect to nearby nodes in the target diagram. For compatibility with legacy code, **NodeListView** won't be removed from the library, but it won't be getting any new improvements.

Palette control

The Palette control represents a tool palette that displays DiagramItem objects grouped into categories. It implements Accordion user interface that displays ItemListView components as its child panels, and category icon, title and collapse/expand button in pane headers. Each child **ItemListView** displays the items added to its corresponding category. Call the addCategory method to define a category and create its respective accordion pane. Call addItem to add an item to specified category. The control can also be configured by setting its Model to an object implementing PaletteModel interface. **Palette** provides same behavior and appearance properties as the **ItemListView** class.

Miscellaneous

- The jsonSerializeTag event now lets you set a new Representation (previous version allowed only modifying the provided JSON object).
- Fixed JSON serialization of Tag values of char type.

API changes

- **DiagramNodeEventArgs** used by NodeListView events has been renamed to NodeListEvent.
- A few ***EventArgs** classes renamed to ***Event** to follow Java conventions.

New in version 4.8.1

- Improved padding in BPMN shapes' geometries.
- VisioExporter improvements.
- Fix for items remaining in spatial index if calling some APIs from deleted events.
- getDiagramListeners method.
- Fix for GridRouter not updating spatial index.

New in version 4.8

ItemLabel image

New Image property added to ItemLabel lets you display icons along a link's geometry, or add more images to a ShapeNode. If a label contains both Text and Image, their relative position is specified by ImageAlign property (by default the image is placed on left side of text), and distance by ContentPadding. The image is rendered using intrinsic size reported by **java.awt.Image**, unless you override it by setting ImageSize property. You can treat label images as clickable icons by handling linkClicked or nodeClicked events and checking Label argument passed to their handlers.

Customize node action icons

The Renderers class lets you customize the appearance of nodes' fold, scroll and collapse icons, by providing **Graphics2D** drawing callbacks, bitmap images or SVG drawings:

- Set ExpandIconRenderer to override the appearance of collapse / expand buttons displayed by Expandable nodes.
- Set ScrollIconRenderer to override the appearance of scroll arrows displayed by Scrollable tables.
- Set FoldIconRenderer to override the appearance of fold / unfold buttons displayed by Foldable containers.

Miscellaneous

- Label argument now provided with click and double click events.
- Locked property added to ItemLabel. It lets you prevent users from editing label's text, and moving it when Behavior is set to MoveLabels.
- SVG rendering improvements.
- JSON serialization fixes and improvements.

API changes

- XmlException moved to **com.mindfusion.common** package.

New in version 4.7.3

- Improved render quality of bitmaps assigned to node's Image property.
- Improved render quality of Overview control.
- The Brush property of pens is now serialized in binary and XML formats.

New in version 4.7.2

Support for custom in-place edit controls

Handle the createEditControl event to display a custom Java Swing component for users to edit item's content. This event is raised when entering in-place editing mode, either interactively by users or by calling the beginEdit method. You could handle the event to return a composite control for editing many of the item's properties, and not only text. When leaving in-place editing mode, the Diagram raises destroyEditControl to let you copy to the item any values entered by the user and close the custom editor.

Miscellaneous

- Set the AutoDeleteLinks property to **false** to prevent deleting links along with a node they connect, and disconnect the links instead.
- FreeFormNode objects now support rotation.
- DividerPen property added to ContainerNode, TableNode and TreeViewNode classes. It lets you customize the appearance of the divider line drawn between a node's caption bar and content area.
- nodeHovered and linkHovered events raised when the mouse pointer rests over items for HoverDelay milliseconds.
- Improved in-place editing of ItemLabels.

New in version 4.7.1

Drag-and-drop improvements

- The control now displays a ghost image of nodes dragged from NodeListView. Set the DragIndicatorOpacity property to set the image opacity.
- Set HorizontalDropAlignment and VerticalDropAlignment to specify placement of dropped node relative to mouse pointer

Miscellaneous

- The Opacity property lets you create translucent DiagramItem by applying it to the alpha channel of all colors in the item.
- TableNode copy constructor fixes.
- Improved in-place editing of ItemLabels.

New in version 4.7

Spatial index

Set the EnableSpatialIndex property of Diagram to create an index of item positions for faster hit-testing and viewport clipping queries. This should greatly improve user interaction and rendering speed for diagrams containing tens of thousands or more items.

Java

```
// it will take some time to populate the diagram with a million nodes,
// but subsequent redraws and hit-tests should be very fast
Diagram diagram = new Diagram();
diagram.setAutoResize(AutoResize.None);
diagram.setDefaultShape(Shape.fromId("Rectangle"));
diagram.setValidityChecks(false);
diagram.setSelectAfterCreate(false);

for (int c = 0; c < 1000; c++)
{
    for (int r = 0; r < 1000; r++)
    {
        ShapeNode node = diagram.getFactory().createShapeNode(
            20 + c * 40, 20 + r * 40, 25, 25);
        node.setText(
            Integer.toString(
                diagram.getNodes().size()));
    }
}
diagram.resizeToFitItems(20);
diagram.setEnableSpatialIndex(true);

diagramView.setDiagram(diagram);
```

Note that rendering speed improves only when showing a smaller part of the diagram inside DiagramView's viewport. Rendering a lot of items at small zoom levels or in overview's fit-all mode will still need a lot of processing, so you might want to apply constraints on minimal zoom level of diagram view and overview controls for large diagrams.

Pattern router

New PatternRouter class routes links by applying patterns of segment and turn sequences and accepting them when resulting paths do not cross nodes. A path is accepted if its final segment ends in target point and is orthogonal to respective side of target node. If there are several possible paths, the router selects the shortest one. The MinimumDistance property specifies minimum allowed distance of link segments from nodes. The PreferredDistance property specifies distance of first or last link bend from associated node. **PatternRouter** includes several predefined patterns designed to create consistent-looking paths, and allows creation of custom patterns. Custom patterns can be defined as sequence of RouteStep objects specifying whether the path advances by relative or absolute distance, or changes direction:

Java

```
RoutePattern rightZigzag = new RoutePattern();
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.AdvanceRelative, 0.5f));
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.TurnRight));
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.AdvanceRelative, 1));
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.TurnLeft));
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.AdvanceRelative, 0.5f));
router.getPatterns().add(rightZigzag);

// this can be defined in shorter form using a pattern string
// RoutePattern rightZigzag2 = new RoutePattern(
//     "ADR0.5 TRR ADR1 TRL ADR0.5");
```

Composite router

The CompositeRouter class lets you chain link routers (objects implementing LinkRouter interface) so that a link passes through the sequence until it gets routed successfully. Diagram's default router is now set to a **CompositeRouter** instance containing a PatternRouter and GridRouter sequence. This applies the several standard pattern paths when possible, and otherwise routes links using the cost minimizing heuristics-based grid router.

Miscellaneous

- Disabling AvoidOverlaps property of RoutingOptions lets you create routes with overlapping segments.
- Improved keyboard focus handling for CompositeNode components.
- Fixed exception in EditComponent drawing code.

API changes

- **suspend** and **resume** methods removed from LinkRouter interface. Call Diagram's suspendLinkRouter and resumeLinkRouter methods instead.
- Default LinkRouter changed from QuickRouter to CompositeRouter instance.
- boolean **SmartPolylineEnds** property of RoutingOptions replaced by PolylineRouting enum property, which also provides an option to prevent inclined link segments for Polyline routes.

Version History

The list below describes past changes and additions to JDiagram:

New in version 4.6.2

Multiple labels per node

The NodeLabel class allows multiple captions to be displayed for a single DiagramNode of any type. Node labels provide a set of properties allowing full customization of their display and positioning. Label position is defined by specifying a pin point and offset from it, set through setCornerPosition, setEdgePosition, setCenterPosition methods. In addition, the HorizontalAlign and VerticalAlign properties of **NodeLabel** specify on which side of pin point to draw the label's caption.

For example, following code adds extra labels to top-left and bottom-right corners of a ShapeNode:

Java

```
ShapeNode node = diagram.getFactory().createShapeNode(10, 50, 40, 30);
node.setText("text"); // centered main text

NodeLabel lb1 = node.addLabel("label 1");
lb1.setCornerPosition(0, 0, 0);
lb1.setHorizontalAlign(Align.Near);
lb1.setVerticalAlign(Align.Near);
lb1.setBrush(new SolidBrush(Color.red));
lb1.setTextColor(Color.white);

NodeLabel lb2 = node.addLabel("label 2");
lb2.setCornerPosition(2, 0, 0);
lb2.setHorizontalAlign(Align.Far);
lb2.setVerticalAlign(Align.Far);
lb2.setBrush(new SolidBrush(Color.yellow));
lb2.setTextColor(Color.red);
```

Miscellaneous

- Improved text rendering quality on high-resolution displays.
- Fixed automatic scrolling and ZoomControl panning on high-resolution displays.
- Improved **ZoomControl** rendering quality.
- More precise vertical centering of text in table captions and cells.
- The MoveLabels behavior lets user move link and node labels interactively.
- ExcelExporter exports pen width of links.
- **ExcelExporter** sets more precise positions of link end points.
- HorizontalOffset and VerticalOffset now work for link labels positioned using setLinkLengthPosition method.
- DashStyle.DashDotDot serialization fix.

New in version 4.6.1

TableNode improvements

- The CaptionBackBrush property lets you customize the fill of table's caption bar.
- Tables can be custom-drawn by setting their CustomDraw property and handling the drawNode event.
- Table cells can be custom-drawn by setting the CellCustomDraw property and handling the drawCell event.
- Fixed thick appearance of caption divider line when using CellFrameStyle.Simple.

TreeViewNode improvements

- The Brush property of TreeViewItem allows assigning different backgrounds to individual items.
- The ShowLines property lets you toggle visibility of items' connecting lines.

Miscellaneous

Fixed exception when serializing LinkLabel in JSON format.

New in version 4.6

Scrollable containers

Set the Scrollable property of ContainerNode to let users scroll the container's contents. The node then displays scrollbars at right and bottom edges that can be used to scroll interactively. The ScrollX and ScrollY properties let you determine current scroll position or change it programmatically. Note that in order to let container's content overflow and become scrollable, you must either disable AutoGrow, or allow users reduce container size by changing HandlesStyle and EnabledHandles properties from their default MoveOnly / Move values.

Container improvements

- ContainerNode containment is no longer implemented via a Group object. Child nodes are now stored in a dedicated Children list, and a node's container is returned by the Container property.
- Enable the AutoDeleteChildren property to automatically delete child nodes when a container is deleted.
- Drag-and-drop operations from NodeListView and ShapeListBox automatically add the newly created node to a container if one is found at the drop position.
- Call the resizeToFitChildren method to resize a container, making it big enough to contain its child nodes.
- The KeepInsideParent constraint of child nodes now also prevents them from overlapping the container's caption bar.
- The AutoGrow property lets you prevent **ContainerNode** from growing when adding child nodes to it.

Text rendering improvements

- If WrapAtCharacter is disabled, long words that do not fit on a single line are now rendered clipped by default instead of stopping rendering at their position.
- WrapOverflowingSingleWordLines property of TextFormat enables wrapping of long words that would not fit on a single line, while other text lines keep wrapping only at word boundaries.

Lasso zoom tool

The control now supports several ways to zoom using lasso tool:

- Set the Behavior property to Zoom to always draw zoom lasso.
- Set the Zoom flag for one of the keys in ModifierKeyActions to let users draw zoom-lasso with respective modifier key pressed and the left mouse button.
- Assign Zoom value to RightButtonActions or MiddleButtonActions property to zoom using respective mouse button.

Modifier keys

The ModifierKeyActions property of DiagramView lets you bind modifier keys to diagram actions defined in ModifierKeyAction enum to execute when dragging with left mouse button with respective key pressed:

- **None**: disables the modifier.
- **Pan**: pans the view.
- **Select**: draws selection lasso.
- **OverrideBehavior**: draws a new item instead of grabbing adjustment handle.
- **Magnify**: shows magnifier.
- **ExtendSelection**: adds to selection without deselecting items outside of lasso.
- **Zoom**: draws zoom lasso.

Button bindings

RightButtonActions and MiddleButtonActions properties of DiagramView let you map mouse buttons to members of the MouseButtonAction enum (Pan, Cancel, Select, Draw, Magnify, Zoom) specifying how mouse click or drag operations affect the diagram.

Miscellaneous

- The initializeLasso event lets you customize appearance of selection lasso before it shows on screen.
- New bringIntoView overload lets you scroll to specified rectangular area.

- New zoomToRect overload lets you zoom to a rectangular area while keeping it centered in the viewport.
- ImageAlign supports new **FitLeft**, **FitTop**, **FitRight** and **FitBottom** alignment styles, which resize Image to fit node's boundaries and align it to respective border.
- Layout classes now process DiagramLinks connected to TreeViewItems.
- Fixed background drawing glitch when the diagram is smaller than current viewport and grows due to AutoResize.

API changes

- Container's child nodes are no longer accessible via SubordinateGroup; use the container's Children list instead.
- A node's container is no longer accessible via MasterGroup; use the Container property instead.
- Java Applet classes removed.

New in version 4.5.1

- The MoveNodes behavior allows grabbing nodes to drag them without using adjustment handles.
- Fixed tooltips when Windows 10 display scaling is enabled.
- Fixed inplace-edit when Windows 10 display scaling is enabled.
- FillMode enum moved from **com.mindfusion.diagramming** to **com.mindfusion.drawing** package.

New in version 4.5

SVG nodes

The SvgNode class represents nodes that can display SVG drawings in addition to the rendering provided by its base ShapeNode class. SVG elements are rendered after the associated bitmap Image and just before the drawNode event is raised for Additional custom drawing. SVG elements are parsed and associated with the node through a com.mindfusion.svg.SvgContent object, which should be initialized and then assigned to the Content property. The Factory class contains createSvgNode overloaded methods for creating nodes from SVG files or from already loaded **SvgContent** instances.

JSON serialization improvements

- HatchBrush objects are now serialized in JSON files.
- saveToJson now encodes the JSON content in UTF8 format.
- Fixed JSON serializaton of pens with null DashStyle.

Miscellaneous

- ImagePadding property of ShapeNode, TableNode and Cell lets you set padding space between element's borders and the contained Image.
- FoldIconSize property added to ContainerNode.
- Tag property added to the **Cell** class lets you associate custom data with cells.
- Fixed drawing glitches when Windows 10 display scaling is enabled.

New in version 4.4.1

JSON Serialization

Diagrams can now be serialized in JSON format. This can be used for interoperability with MindFusion JavaScript diagramming library, or for general storage in JSON files or databases. To serialize a Diagram to a JSON string, call its saveToJsonString method. To deserialize a diagram back from its JSON representation, call the loadFromJsonString method. Custom item classes can implement JSON serialization for their additional properties by overriding the saveToJson and loadFromJson methods of DiagramItem. Such classes must be registered for serialization by calling the registerItemClass method and providing a string identifier for the *clientClass* parameter.

Miscellaneous

- New createDiagramLink overload of the Factory class makes it easier to create links between TreeViewNode items.
- Fixed misplaced tracker rectangle in Overview control when Windows resolution scaling is enabled.

New in version 4.4

New CompositeNode components

Component classes that support user interaction can now be used as part of CompositeNode templates:

- ButtonComponent implements clickable buttons inside nodes.
- CheckBoxComponent represents a check-box that lets users select true / false values.
- EditComponent implements editable text area.
- NumericEditComponent implements number-entry area.
- SliderComponent allows selecting a value from numerical range by dragging a slider.
- SpinnerComponent represents a spin-edit component.

Improved FlowchartLayout

FlowchartLayout can now arrange more types of graphs, no longer requiring them to represent strictly-nested source code structures.

New in version 4.3.3

Text improvements

- Caption text of TableNode and ContainerNode objects can wrap to multiple lines in plain-text mode.
- Table cell text can wrap to multiple lines in plain-text mode too (i.e. when EnableStyledText is disabled).
- TextPadding now works for **ContainerNode** captions.

Bug fixes

- Automatic layouts should now preserve shape of multi-segment links in containers.
- Fixed exceptions in CascadeLayout and LayeredLayout with LinkType set to Cascading.
- Fixed LinkLabel loading code from old XML diagram formats.

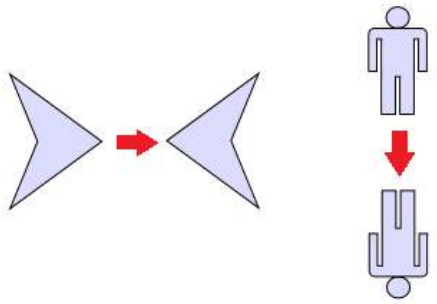
New in version 4.3.2

Export Excel files

The ExcelExporter class from com.mindfusion.diagramming.export package exports diagrams to Excel Open XML format (XSLX). Diagrams are exported as Excel AutoShapes drawings. The export overload that takes a DiagramDocument parameter creates a sheet for each DiagramPage in the document. The export(Diagram) overload creates a single Excel sheet.

Java

```
ExcelExporter ex = new ExcelExporter();
ex.setTemplatePath(
    templatesFolder + "/ExcelTemplate.xlt");
ex.export(diagram, fileChooser.getSelectedFile().getAbsolutePath());
```



Miscellaneous

Improved back-buffer allocation code. The memory footprint of the diagram should now be much lower and drawing should be slightly faster.

New in version 4.3.1

Flip shapes

The shape of a ShapeNode can be flipped horizontally or vertically. Enable the AllowFlip property and the shape flips when an edge is dragged over its opposite edge. You can get or set current flip state using FlipX and FlipY properties.

DiagramLink improvements

- AllowSplitLinks now works for Bezier links too. Users can insert a new Bezier segment by dragging any point (other than a control point) of a selected link. Adjacent segments can be merged back into a single one by dragging a tangent control point (square adjustment handle) onto a pass-through control point (round adjustment handle).
- IntermediateShape shapes are now rendered at correct position for **Spline** links.

Miscellaneous

- The PanAndModify behavior lets you select and modify when the mouse pointer is over an item, or pan the view otherwise.
- The updateRuntimeIndices method of Diagram assigns unique integer identifiers to items, accessible via getRuntimeIndex. Identifiers are transient and valid only for the current state of diagram immediately after the updateRuntimeIndices() call.

API changes

- Brush, Pen and DashStyle classes have been moved to com.mindfusion.drawing package.
- Support for Java 7 dropped, JDiagram.jar is now compiled using Java 8 compiler.

New in version 4.3

Fluent API

Builder classes in **com.mindfusion.diagramming.builders** package add support for fluent programming style. Static with and instance init methods in DiagramItem, DiagramItemStyle and Layout -derived classes return a builder instance that can be used to set up respective new or existing objects:

Java

```
diagram.getNodes().add(
    ShapeNode.with()
        .brush(Color.LIGHT_GRAY)
        .font("Arial", 4)
        .enableStyledText(true)
        .text("Task <i>1</i>")
        .toolTip("This is the task")
        .create());

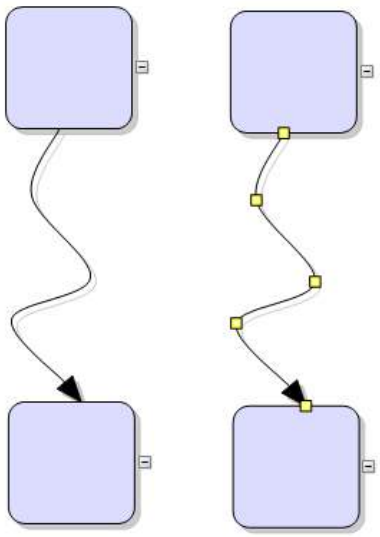


diagram.getFactory()
    .createShapeNode(20, 20, 20, 20).init()
        .brush(Color.LIGHT_GRAY)
        .font("Arial", 4)
        .enableStyledText(true)
        .text("Task <i>2</i>")
        .toolTip("This is the second task");

TreeLayout.with()
```

```
    .levelDistance(20)
    .nodeDistance(20)
    .linkStyle(TreeLayoutLinkType.Cascading3)
    .create()
    .arrange(diagram);
```

DiagramLink improvements

- The component no longer keeps a separate segmentCount field, removing a common source of errors. The SegmentCount property now calculates its value from ControlPoints elements. The updateFromPoints(updateGroups, updateSegments) overload has been removed too.
- SegmentCount setter no longer refuses changing number of segments if auto-routing is enabled or the link is a self-loop.
- The new **Spline** element of LinkShape enumeration draws links as interpolating splines that pass through all of their control points:

Enum types

Old-style enumeration classes with static finals have been replaced by enum types, improving type checking and auto-completion support. This change will not affect your code if only passing enum members to methods from the API. If storing them in fields on the other hand, you must change the field type from int to respective enum type.

The types changed to enum are - Action, Align, Anchoring, AttachToLink, AttachToNode, AutoResize, Behavior, CellFrameStyle, ColumnStyle, CustomDraw, DelKeyAction, DirectionConstraint, EffectPhase, ExpandButtonAction, ExpandButtonPosition, GlassEffectType, Granularity, GraphicsUnit, GridStyle, GroupRotation, HandlesStyle, HatchStyle, HitTestPriority, HyperLinkStyle, ImageAlign, LayeredLayoutLinkType, LinkCrossings, LinkShape, LinkTextStyle, MarkStyle, ModificationStart, MouseInputMode, MultipleGraphsPlacement, NodeHandleType, Orientation, Relationship, RelativeToLink, RerouteLinks, RestrictToBounds, SaveToStringFormat, SelectionStyle, ShadowsStyle, ShowAnchors, SimpleShape, SnapToAnchor, TableConnectionStyle, TickPosition, TreeLayoutBalance, TreeLayoutDirection, TreeLayoutLinkType, TreeLayoutType, TreeViewConnectionStyle.

Type of EnabledHandles and TriggerRerouting properties has been changed to EnumSet.

Fixes

- Fixed a problem where setLicenseKey did not work on non-Oracle implementations of the Java runtime.
- Fixed SvgExporter bug where incorrect offset would be applied to nodes' Image bitmaps.

New in version 4.2

Free-form nodes

A FreeFormNode collects all points from users' mouse or touch input and displays them as node's outline. To let users draw free-form nodes interactively, set Behavior to DrawFreeForms or LinkFreeForms. Use the Points property of **FreeFormNode** to get or set outline points programmatically. If the Closed property is set, the node is drawn as a closed shape and its interior filled, or otherwise the node is drawn as a poly-line. If the distance between first and last points drawn by user is shorter than AutoCloseDistance, the node's **Closed** property is automatically set to **true**. AutoCloseDistance default value is Float.MAX_VALUE, so free-form nodes are always closed.

Convert free-form drawings to ShapeNodes

Additional drawing modes, convenient for touch input, convert FreeFormNode objects drawn by user to ShapeNode objects with matching shapes. To enable them, set Behavior to DrawFreeShapes or LinkFreeShapes. The shapes against which the user's input is matched are set via diagram's FreeFormTargets property. By default it contains Rectangle, Decision and Ellipse shapes.

Fixed bugs

- Text outside of node boundaries was not repainted correctly after loading custom shape library from XML.
- TreeViewNode scrollbar arrow buttons did not scroll correctly in some situations.
- HandlesStyle is now serialized by the base DiagramNode class. This automatically saves the value for custom node types and fixes lost non-default values for CompositeNode and **TreeViewNode** after serialization.

API changes

Adjustment handles are no longer identified by integer values but by instances of AdjustmentHandle and derived classes. This changes the signatures of DiagramItem.hitTestHandle methods and the InteractionState constructor. Standard handle classes included are NodeAdjustmentHandle for changing a node's position and size, LinkAdjustmentHandle for changing link control point positions, and FreeFormHandle for changing the position of a FreeFormNode outline point.

New in version 4.1.4

Resize table columns and rows

Columns and rows of a TableNode can now be resized interactively if its AllowResizeColumns or AllowResizeRows properties are enabled. In order to resize, move the mouse pointer to the border line on column's right side or row's bottom side until it shows resize cursor and start dragging. The control raises tableColumnResizing and tableRowResizing events to let you validate new size or prevent resizing some elements. The tableColumnResized and tableRowResized events are raised after the operation completes.

License keys

There is no separate trial build of the control's JAR archive provided anymore. Instead, call the setLicenseKey method of DiagramView to disable the component's evaluation mode and stop displaying trial messages. **setLicenseKey** is static and you can call it just once before creating any views. License key strings are now listed on the Keys & Downloads page at MindFusion's customer portal.

Miscellaneous

- Undo/redo records for in-place edit operations are now created automatically.
- KeepInsideDiagram constraint prevents a node from leaving diagram boundaries during user interaction (the older RestrictItemsToBounds property does not stop nodes from leaving diagram area but returns them to original position if dropped outside).
- Dashed selection frames are now drawn in two colors and should be visible on both the default white background and custom darker backgrounds. You can change the second dash color via DashBackground property of HandlesVisualStyle.
- Improved mouse capture for composite controls hosted inside ControlNodes.

- StartPoint and EndPoint properties provide a shortcut to setting the first and last control points of a DiagramLink.

Fixed bugs

- Fixed text clipping problem when magnifier is over TreeViewNode.
- Links to contained nodes were left visibly disconnected from them after deleting a folded ContainerNode.
- Lasso selection could not select strictly horizontal or vertical straight-line links when IncludeItemsIfIntersect is disabled.

New in version 4.1.3

- Type of LayoutTraits keys, such as TreeLayoutTraits and SpringLayoutTraits, has been changed from custom objects to Java enumerations.
- **LayoutTraits** values are now saved also by binary serialization methods, while older versions saved them only in XML format.
- The changeUnit method now also scales pen widths.
- A new setBounds overloaded method lets you move a node without updating positions of its links or attached nodes.
- Fixed a bug where setMeasureUnit would not switch away from Centimeter unit.
- Fixed a bug where folding a ContainerNode would not hide its child nodes after loading from XML until Z order cache is invalidated.
- Fixed all compiler warnings from component's source code and sample projects.
- Fixed obfuscation problem where nested XDimension2D.Double type wasn't accessible.

New in version 4.1.2

AnchorPatern improvements

- The XUnit and YUnit properties allow specifying the coordinates of an AnchorPoint as a fixed offset from the node's top-left corner rather than in percentage, so that the point position does not change when the node is resized.
- The AnchorPattern property of Shape class lets you associate anchor points with shape definitions. If a ShapeNode instance does not contain its own AnchorPattern, it will derive the one defined by the node's Shape.

Miscellaneous

- Type of Margin property of LinkLabel has been changed from **float** to Thickness.
- The changeUnit method sets a new MeasureUnit and scales the coordinates of diagram items to keep them the same size.
- Fixed node spacing in bottom-to-top TreeLayout.
- TabbedScrollPane allows reordering tabs when AllowTabReorder property is enabled.
- Improved quality of print preview page images.
- DisableTextClipping property added to PdfExporter.

New in version 4.1.1

Improved arrowhead rendering

- Arrowheads are rendered as a single path when possible and several arrowhead Shape definitions have been changed to implement mitered joints when HeadPen is set to a thick pen.
- The point where end segments connect to arrowheads can be specified via the LinkSegmentInset property of shapes. Shape definitions from the ArrowHeads class set it to suitable default value. This allows using transparent or semi-transparent brushes without seeing the link line drawn behind arrowheads.
- Arrowhead shadows are no longer filled if the link's EffectiveBrush is **null** or fully transparent.
- IntermediateShape is now also rendered for Bezier links.

Miscellaneous

- Set the Brush property of LinkLabel to fill the background of link labels.
- Multiple-resize of rotated nodes fixed to apply same offsets in nodes' local coordinate system.
- Fixed a bug where setting the CaptionBackBrush property of containers would hide the caption-bar borders.

New in version 4.1

Tree map layout

Tree maps represent hierarchies by nesting child nodes within their parents, where the areas of leaf nodes are proportional to their Weight values. Unlike other layout algorithms, TreeMapLayout expects hierarchies to be defined via grouping or containment (see attachTo method and ContainerNode class), and will ignore any links in the diagram. The diagram area covered by the topmost nodes in a hierarchy is specified via the LayoutArea property. By default, the layout tries to keep the ratio of node sides as close as possible to one. However this could make it hard to distinguish separate levels of the hierarchy. To alleviate that, set Squarify to **false**, and child nodes will be arranged either as a row or a column inside their parent node, alternating directions for each level. The drawback is that when **Weight** ratios differ greatly or nodes contain many children, some nodes could end up with very narrow rectangles.

Decision flowchart layout

DecisionLayout arranges simple flowcharts consisting of decision boxes with up to three outgoing links per node and activity boxes with a single outgoing link per node. The nodes are arranged in columns and rows, whose distance depends on the HorizontalPadding and VerticalPadding property values. When links share the same row or column, they are placed at a distance specified via LinkPadding. The layout arranges nodes recursively starting from StartNode. If **StartNode** is not specified, the algorithm selects the root of the deepest branch of the graph's spanning tree as start node.

Composite nodes

The CompositeNode class implements nodes whose appearance can be defined via composition of components and layout containers. The content of a composite node can be loaded from XML files similar to .NET Xaml templates and Android XML layouts. This initial release includes layout containers such as StackPanel and GridPanel, and read-only components like ImageComponent, TextComponent, ShapeComponent, BorderComponent. Future versions will add interactive components like buttons and text editors.

Export Visio 2013 files

The VisioExporter class can export the content of Diagram and DiagramDocument objects to Visio 2013 VSDX files. In order to use it, import the **com.mindfusion.diagramming.export** namespace. **VisioExporter** relies on a template file, called *Visio2013.vxt*, containing some boilerplate Visio XML code. The template must be either located in same folder as the application, or its path must be specified via the TemplatePath property. At this time the exporter supports shapes from Visio basic stencil. Support for more shapes will be added upon request.

Miscellaneous

- Layout algorithms now automatically resize diagram's Bounds if it's not large enough to fit the arranged content. To revert to old behavior and keep fixed **Bounds** size, set GrowToFit to **false**.
- Improved PdfExporter performance.
- VisioImporter now supports Visio group shapes. Child shapes in groups are no longer lost when importing, and their corresponding diagram nodes are attached to the corresponding group node.

New in version 4.0.5

Resize multiple nodes

Now it is possible to resize multiple selected nodes simultaneously. To enable that, set the AllowMultipleResize property to **true**. When enabled, dragging a corner or side adjustment handle of any node resizes all nodes in the selection. The operation will be cancelled for all nodes if any of them does not accept its new size, e.g. if it's smaller than minimum allowed node size.

VisioImporter improvements

- The Item argument of VisioImportListener.importItem event handlers is now pre-set to a DiagramItem instance created for the imported Visio shape, letting you avoid parsing some standard data such as Bounds or Text. You can either modify this item's properties, or replace it with a new instance of a different type.
- ImportItemEvent now provides properties for accessing the XML content of Visio shape masters.
- NURBS lines are now imported as Bezier links.
- Fixed a crash when a shape master does not have a name attribute (this happens with custom stencils).
- Fixed a bug where one-segment connectors were imported at wrong positions.
- Fixed a crash when theme1.xml is missing from the imported vsdx archive (this happens with files converted from old Visio versions to 2013 format)

ZoomControl improvements

- Changing DiagramView's ZoomFactor now updates zoom control slider automatically.
- The pan widget now fills the ZoomControl width or height instead of having fixed size.
- Setting **ZoomControl**'s width larger than its height makes the zoom slider horizontal.

Miscellaneus

- Fixed a bug where Ruler alignment guides were not positioned correctly for diagrams starting at negative coordinates.

API changes

- The **selectionMoved** event has been renamed to selectionModified, and is also raised if nodes are resized when AllowMultipleResize is enabled. Event handlers now receive SelectionEvent parameter instead of **EventObject**.
- The **selectionMoving** event has been renamed to selectionModifying, and is also raised if nodes are resized when **AllowMultipleResize** is enabled. Event handlers now receive SelectionValidationEvent parameter instead of **ValidationEvent**.

New in version 4.0.4

Import Visio 2013 files

The VisioImporter class can import .vsdx files created by Visio 2013. In order to use it, you must import the com.mindfusion.diagramming.importers namespace. Various overloads of the import method can be used to import the file into a DiagramDocument whose pages correspond to the Visio drawing pages, or into a single Diagram whose content is merged from all imported pages. At this time **VisioImporter** supports the basic flowchart and data flow Visio stencils. For each node shape from the .vsdx file, the importer creates a ShapeNode object whose Shape, Text, Brush and Pen properties are set to values corresponding to the imported Visio shape. For each connector shape, the importer creates a DiagramLink object whose Origin and Destination are set to the corresponding imported nodes, and whose ControlPoints reflect the geometry of the connector.

Import OpenOffice Draw files

The DrawImporter class can import .odg files, created by the OpenOffice Draw vector graphics editor. In order to use it, you must import the com.mindfusion.diagramming.importers namespace. **DrawImporter** supports shapes from the General and Flowchart shape palettes in Draw. Various overloads of the import method can be used to import the OpenOffice drawing into a DiagramDocument whose pages correspond to the Draw pages, or into a single Diagram whose content is merged from all imported pages. For each node shape from the .odg file, the importer creates a ShapeNode object whose Shape, Text, Brush and Pen properties are set to values corresponding to the imported OpenOffice shape. For each connector shape,

the importer creates a DiagramLink object whose Origin and Destination are set to the corresponding imported nodes, and whose ControlPoints reflect the geometry of the connector.

Zoom control

The ZoomControl class lets users change interactively the current zoom level and scroll position of a DiagramView. To set it up, add a **ZoomControl** to the frame, place it anywhere over a **DiagramView**, and set the control's View property to that view. Set the ZoomStep and ScrollStep properties to specify the amount added to view's zoom level or scroll position by **ZoomControl**'s buttons. You can customize the control's appearance by setting properties such as Fill, BorderColor, CornerRadius and TickPosition.

Miscellaneous

- Links can now snap to nodes from a distance when their AutoSnapToNode property is enabled. The maximum snap distance is specified via the AutoSnapDistance property. AutoSnapToNode supersedes the old **SnapToNodeBorder** property, which worked only for nodes under mouse pointer.
- Set the RoundedLinks and RoundedLinksRadius property to draw arcs at the joints of Cascading and Polyline links' segments.
- Selection.IncludeItemsIfIntersect property specifies if lasso-selection should select items that intersect the selection rectangle, or otherwise are entirely inside it.
- Several new shapes added for better compatibility with Visio 2013 basic stencil: RightTriangle, Decagon, Trapezoid, Star4Pointed, Star5Pointed, Star6Pointed, Star7Pointed, Star16Pointed, Star24Pointed, Star32Pointed, Donut, Plaque.
- **Permissions** attribute added to JAR manifest file to allow loading DiagramApplet under Java 7 update 51.

New in version 4.0.3

Pattern brushes

The HatchBrush class allows filling shapes with a pattern. Supported patterns are exposed as members of the HatchStyle class. Points or lines from the patterns are painted using the brush' ForegroundColor property, while the space between points or lines is filled using BackgroundColor.

Adjustment handles improvements

- MoveOnly and HatchHandles3 handle styles now have the same default appearance as in .NET versions of the control, based on a HatchBrush with Percent50 pattern. The brush can be changed using the PatternBrush property of HandlesVisualStyle.
- Two new HandlesStyle members added, RoundAndSquare and RoundAndSquare2, that draw corner resize handles as circles and remaining handles as squares.
- RotationHandleBrush property added to **HandlesVisualStyle**.

Miscellaneous

- Scrollable property added to TreeViewNode.
- Decoration elements in Shape definitions can now be accessed using the getDecorations method.
- You can change the text region of existing shapes using the setTextArea method.
- The colors of multiple-selection frame can now be customized using the Pen and Brush properties.
- The MeasureUnit property now supports Centimeter and WpfPoint values. The latter allows loading diagram files saved by WPF and Silverlight versions of the control with their default units.

API changes

For source code compatibility with Android version of the control, and eventual multi-touch support in future Java Swing versions, these members has been renamed to follow the W3C pointer events specification:

- **getMousePosition** method in NodeEvent, LinkEvent and DiagramEvent has been renamed to getPointerPosition.

- **mousePressed**, **mouseMoved**, **mouseDragged** and **mouseReleased** members of BehaviorBase have been renamed to pointerDown, pointerOver, pointerMove and pointerUp respectively.
- **nodeMouseEnter**, **nodeMouseLeave**, **linkMouseEnter**, **linkMouseLeave** events in DiagramListener have been renamed to nodePointerEnter, nodePointerLeave, linkPointerEnter, linkPointerLeave.

New in version 4.0.2

ContainerNode improvements

- child nodes are now drawn by their containers; when containers overlap, the children of a lower container cannot appear in front of the upper container anymore;
- the ClipChildren property specifies whether to clip child items to container's boundaries;
- the ZIndex property no longer changes automatically when dropping nodes into a container;
- the Visible property of child items no longer changes when folding or unfolding containers; this lets you keep invisible items inside containers;
- when selection including a container and its child node is dropped into another container, the child node now remains in its original container;

Miscellaneous

- The ScrollZoneSize property of DiagramView can be used to specify the size of the area near the control edges that starts auto-scrolling.
- Improved placement of link labels along shorter link segments.
- The arrangeLinkLabels method rearranges link labels whose AutoArrange flag is set.
- DiagramLink.intersects checks whether two links intersect.
- The hitTest method determines whether a diagram item or any of its child items contain the specified point.
- Overriding hitTestHandle in a derived item type lets you implement custom adjustment handle testing for the type.
- The getFlatItemList returns a list of all TreeViewNode items.
- The GridOffsetX and GridOffsetY properties let you change the origin of the alignment grid.

New in version 4.0.1

Preserve order in tree layout

The Balance property of TreeLayout can be set to Preserve to keep the original geometric order of child nodes when arranging them under their parent. This can be used to arrange tree branches in a specific order by first placing them in increasing horizontal or vertical positions. Another possibility is to apply **TreeLayout** from nodeModified handler to let users rearrange the tree branches by dragging and dropping a node.

Undirected path finding

PathFinder now supports undirected mode. Its methods have been changed from static to instance, and its constructor takes an ignoreDirection parameter. If ignoreDirection is enabled, the underlying graph is treated as undirected and link direction is not considered when looking for paths.

Selection improvements

- DiagramView.Behavior can be set to SelectOnly to let users select existing items, but not modify them or draw new ones.
- The SetsDirtyFlag property of the Selection class specifies whether the Dirty flag should be set when selection changes.

Miscellaneous

- Style classes now contain a FontUnit property specifying the unit of measure of FontSize. Important: the default FontUnit value is Point, while font sizes were always measured in diagram's MeasureUnit in previous versions. If using styles instead of setting items' Font property, when upgrading to version

4.0.1 you must either adjust **FontSize** for the **Point** units, or change FontUnit to **World**, which makes it compatible with previous versions.
- the last row in a TableNode will now be rendered clipped if it fits only partially inside the node, whereas in previous versions the row would not be rendered at all.
- the HandlesStyle of a link can now be set to Invisible to stop rendering its selection handles, but still allow dragging control points.
- the AllowAddChildren and AllowRemoveChildren properties of ContainerNode specify whether users are allowed to add or remove child nodes to / from the container.
- the getNearestBorderPoint method of DiagramNode can be used to find a point from the node's border closest to a specified point.
- the Ruler control now raises nodeModified events when nodes are moved using alignment guides.
- styled text can contain <br> tags to force line breaks.
- HeadBrush, BaseBrush and IntermediateBrush properties allow setting distinct brushes for respective arrowhead shapes.
- the Cell.TextPadding property allows customizing text margins of table cells.

Fixed bugs

- fixed crash in LayerListView control.
- TableNode.resizeToFitText did not work correctly with styled text.
- fixed bug when cloning DashStyle objects.
- zTop and zBottom methods did not work correctly with layers.

New in version 4

Styles and themes

The appearance of the items in a diagram can now be modified using styles. The style represents a set of properties, which can be applied to an individual diagram item (by assigning it to the DiagramItem.Style property) or to all items of a specific type (by using a Theme). The styles can be easily expanded to include the properties in derived item classes.

The theme represents a collection of styles. Each style in the theme is associated with the diagram items of a specific type and affects all items of this type. Themes can be loaded from XML files. New themes can be created using the Theme Editor tool. Several pre-defined theme files are installed under the Themes subfolder of the control's root installation folder.

For more information about this new feature, check Styles and Themes.

Node effects

Two visual effects, represented by GlassEffect and AeroEffect classes, can be applied to nodes. To apply an effect, create an instance of the respective class, set up its properties, then add the instance to the Effects collection of a node (or to Diagram.NodeEffects collection to apply it to all nodes). Effects can be added, removed or modified at any time and this will immediately reflect on the diagram. Effects of different types can be applied simultaneously. It is also possible to apply more than one effect of the same type.

Diagram documents and tabbed views

The DiagramDocument class represents a collection of diagram pages or sheets, represented by DiagramPage objects. DiagramPage is derived from Diagram and only adds a Title property, so any current code that processes **Diagram** objects will work with **DiagramPage** objects too. New pages can be added to the document and existing pages can be removed and reordered via the Pages collection. The diagram document provides higher level of events for the pages contained inside it. The document supports the notion of an active page.

A DocumentView object placed inside a TabbedScrollPane can be used to display **DiagramDocument** objects. The view displays tabs for the individual pages in the document. The active page can be changed interactively by activating its associated tab. New pages can be added and removed to/from the document through buttons in the tab tray and the pages can be rearranged by dragging their associated tabs with the mouse.

One-way graph Layout

The OneWayLayout class ensures that links enter into nodes from the same general direction and exit them from the opposite side. If the graph contains cycles, some links bend around the nodes to keep the enter/exit direction consistent. The algorithm aims to minimize the number of such links.

Rotation improvements

- All built-in node types can now be rotated by setting their RotationAngle property, or interactively through the rotation handle. To enable interactive rotation, you must set the respective bit in DiagramNode.EnabledHandles;
- Attached nodes can rotate together with their master node if the group's FollowMasterRotation property is set to RotateChildren;

Node list control

The NodeListView is a **JList** control that can host any type of DiagramNode objects. Nodes from to the **NodeListView** control can be drag-and-dropped onto a Diagram, which creates a clone of the dragged node at the drop position.

Layers

Items can now be assigned to layers, and layers can be hidden, locked or moved up/down in the Z order as a group. Call the setLayerIndex method of items to associate them with layers in the Diagram.Layers collection. The Layer objects provide Visible, Locked and ZIndex properties, which will affect all items in the respective layer. Layers also expose a Title property shown in the LayerListView control. Newly drawn items are added to the layer specified via Diagram.setActiveLayer.

For additional information about layers, refer to Layers.

Layer list control

The LayerListView control provides user interface for working with Layer objects. The control displays a list of all layers in a specified Diagram with a title and an overview area, and also allows editing of layer's Title, Visible and Locked properties and choosing the **Diagram**'s currently active layer. New layers can be added to the **Diagram** by clicking the '+' button. The selected layer can be deleted by clicking the '-' button.

Magnifier

The new magnifier tool allows users to interactively zoom in (or out) portions of the diagram by holding down a modifier key or pressing a mouse button. The magnifier's zoom factor and appearance can be customized. Additional information can be found in the corresponding section of Scrolling and Zooming.

Ruler improvements

The ruler units can now be specified more precisely through instances of the new MeasureUnit class. The **MeasureUnit** class provides several built-in units as well as the opportunity to create custom units of measure. As a result, the **RulerUnit** enumeration has been removed and the type of the Unit property has been changed. The **InchDivisions** property of the Ruler class has been removed as well - the division information is now built into the **MeasureUnit** type and no longer needs to be specified explicitly. Custom divisions can still be specified for any unit by creating a custom **MeasureUnit** instance and providing the appropriate value in the standardDivisons constructor parameter.

Miscellaneous

- The value of DiagramItem.ZIndex property is no longer required to be unique and smaller than the number of items;
- The **Shape** property in ContainerNode and TreeViewNode can be set to Rectangle or RoundedRectangle;
- Link labels are arranged automatically by the control when their AutoArrange property is enabled. Auto-arranged labels will avoid overlapping nodes or other labels.
- HeaderFont property added to PrintOptions, specifies the font used to draw the page header.

- The new TextPadding property specify the distance between node's text and the node borders

API changes

- RotationAngle property moved from ShapeNode to base DiagramNode;
- Inherited node classes should now override the drawLocal method instead of draw to get built-in support for node rotation. Overriding **draw** still works, but any custom drawing code would have to take care of rotation;
- Type of Group.FollowMasterRotation changed from **boolean** to enum GroupRotation;
- **LinkStyle** enum renamed to LinkShape;
- **DiagramLink.Style** property renamed to Shape;
- **TableStyle** enum renamed to SimpleShape;
- **TableNode.Style** property renamed to Shape;
- The type of **TextColor** and **CaptionColor** properties have been changed to Brush; the properties have been renamed to TextBrush and CaptionBrush;
- The default value of **Pen**, **Brush** and **Font** properties of items is now **null** to allow for inheritance from DiagramItem.Style or Diagram.Theme. Custom drawing code in inherited classes should use the values returned by getEffectivePen, getEffectiveBrush or getEffectiveFont to get the actual object that should be used when drawing;
- zLevelUp, zLevelDown, zTop and zBottom methods now require a boolean argument specifying whether items are allowed to change layers;
- ZIndex no longer corresponds to the position of items within Diagram.Items collection. Items however still contains the items sorted by Z order, as defined by item's **ZIndex** and LayerIndex;

New in Version 3.5

Use Java Swing components as nodes

ControlNode is an adapter class that allows using any **java.awt.Component** -derived object as a diagram node. Such nodes can be used to implement advanced entity viewers or editors using the Java Swing framework. A Component instance can be assigned to the Control property of the host node. It could be a standard Java Swing component such as a JTable or your own custom control. If the Behavior property of DiagramView is set to DrawControls or LinkControls, then users are allowed to draw control host nodes interactively. Such host nodes will have their Control initialized to an instance of the type specified via DefaultControlType.

Loading UI controls in the same applet instance

Recent Java and browser versions do not work very well when more than one applets are loaded on the page (e.g. IE crashes when reloading such pages, in some browsers Java objects cannot be passed between two applets). Hence the DiagramApplet, used to host a DiagramView control, has been modified to also show the miscellaneous UI controls such as Overview, ShapeListBox and Ruler. The applet parameters used to create and customize these controls are listed in the Diagram Applet topic.

Miscellaneous

- Improved path-finding for long links in QuickRouter.
- The print header string now can contain a %T format specifier that will display the total number of pages.
- SwimlaneLayout improvements.

New in Version 3.4

Automatic node alignment

If AutoAlignNodes is enabled, the node currently being drawn or resized is aligned to another node so that a pair of their vertical or horizontal sides become collinear. To specify the maximal distance at which nodes are aligned, set the AutoAlignDistance property. The pair of aligned nodes is indicated visually by drawing an alignment guide using the pen assigned to AlignmentGuidePen.

Fractal tree layout

FractalLayout is a tree layout algorithm that places child nodes symmetrically around their parent node. Nodes at the lowest level are arranged directly in a circle around their parent. At the upper level, the already arranged nodes form branches that are arranged in a circle around the new parent node. The algorithm is recursively repeated till the highest level is reached. If nodes in the tree have uniform number of children, the end result has fractal-like appearance (subsets of the graph look like scaled-down copies of the whole graph). You can choose which node should be displayed at the center of the topmost circle by setting the Root property. If it is not specified, the algorithm automatically selects a root that leads to more balanced distribution of nodes.

New node constraints

- If KeepInsideParent is enabled, a node cannot be moved outside the boundaries of its ContainerNode or group's master node.
- If KeepRatio is enabled, a node's width-to-height ratio is preserved when the user resizes the node.
- The user cannot move a node's side past its opposite side if the DisableMirroring constraint is set.

Miscellaneous

- getAllIncomingLinks, getAllOutgoingLinks, getAllLinks methods return all links connected to a node and its elements (TableNode rows or TreeViewNode items).
- Rotated nodes are now aligned to the grid when moved.
- PdfExporter could not be used from Java 7 because of a removed deprecated method (FontManager.getFont). This is now fixed by using equivalent API members.
- Fixed a bug where a link would align to incorrect anchor point when the target node is rotated.

New in Version 3.3

Layout class enhancements

- OrthogonalLayout now produces more compact layouts with less link bends if MinimizeLinkBends is enabled.
- If there is only one used execution path after a branching and up to two empty ones, FlowchartLayout will now center the used path under the branching start node.
- Specify start and end nodes in LayeredLayout via the setStartNode and setEndNode methods.

Relationship queries

The query method of DiagramItem can be used to find items that can be reached from the current one by following a path described in the query expression specified as argument. The expression includes selectors separated by a / character, where each selector returns the items from the result set of the previous step. The expressions can also include boolean predicates that filter the results using boolean and arithmetic expressions.

Miscellaneous

- createFlowchartLayout method added to ScriptHelper.
- Find out a link's length via the getLength method of DiagramLink.
- Display multiple link labels via the addLabel method.

New in Version 3.2

Swimlanes

The swimlane grid lets you emphasize the relationship between a group of diagram items by displaying them in a distinct lane or cell within the grid. To display the lane grid, set the EnableLanes property of the Diagram class to **true**. In order to customize the grid, set the various attributes exposed by the LaneGrid property, which lets you specify the number of rows and columns, add headers, customize the cell appearance, etc. The new *Lanes* sample project uses the lane grid to let users draw Gantt charts.

SwimlaneLayout algorithm

SwimlaneLayout can be used to arrange process diagrams in which nodes representing activities are placed in swimlanes representing resources. The index of the resource allocated to an activity should be assigned to the corresponding node's LayoutTraits via the SwimlaneLayoutTraits.Lane key.
By default, the algorithm works with the diagram's LaneGrid, but its SwimlaneGrid property can be set to any class that implements the SwimlaneGrid interface. This allows applying the layout to a custom-drawn grid rendered through the drawBackground event, or one composed of locked background nodes.

CascadeLayout algorithm

CascadeLayout places nodes on a virtual grid and arranges links orthogonally, such that if the source graph is planar all links are guaranteed to have no more than two bends and will not intersect. By default the layout method arranges nodes in rows and link segments in columns; this can be changed by setting the Orientation property.

TriangularLayout algorithm

TriangularLayout places nodes on a virtual grid, such that if the source graph is planar, all links are guaranteed to have a single segment and not intersect. If the graph is not planar, its intersecting links can be optionally segmented and bended in order to improve readability. The layout method places the nodes from the external face on a triangle and recursively adds the rest of the nodes as vertices of internal triangles. As a result, it is very effective for near maximal-planar (a.k.a. triangular) graphs.

HierarchicalLayout algorithm

HierarchicalLayout places nodes on user-defined levels, such that if the source graph is level-planar, all links are guaranteed to have a single segment and will not intersect. A graph is considered level-planar if it is possible to draw it without link intersections when its nodes are positioned on predefined levels. The layout method requires that for each node LayoutTraits contains a HierarchicalLayoutTraits.Level entry specifying the level, and no two connected nodes must be on the same level.

Miscellaneous

- selectionChanged event raised when items are selected or deselected.
- drawStyledText draws a formatted text string similarly to shape nodes whose EnableStyledText property is enabled.
- UBendMaxLen property added to QuickRouter.
- The FoldedSize property of ContainerNode specifies the container's size when it is folded.
- The Id property added to DiagramItem allows assigning custom identifiers to items. It can also be used to just store additional custom data similarly to Tag.

New in Version 3.1

Support for custom arrowheads

The type of the HeadShape, BaseShape and IntermediateShape properties of DiagramLink has been changed from enum **ArrowHead** to class Shape, which is also used to define ShapeNode shapes. The ArrowHeads class now exposes **Shape** definitions that correspond to the **ArrowHead** enumeration members from previous versions. It is also possible to set any other predefined or custom shape accessible through the fromId method as an arrowhead. When used for arrowheads, position (50, 0) in the shape definition corresponds to the arrowhead's tip point.

Topological graph layout

If the underlying graph if acyclic, TopologicalLayout arranges the nodes linearly in such a way that each node comes before all destination nodes of its outgoing links. The links are drawn as curves above the chain of nodes, with their height proportional to the distance between the nodes. If the graph is not acyclic, the layout algorithm finds an ordering with a minimal number of back links, and draws the back links below the chain of nodes.

Miscellaneous

- Shadows can be painted using any brush type and not only in solid color. The **ShadowColor** property has been replaced by ShadowBrush.
- Granularity property added to QuickRouter.
- ShowToolTips property added to DiagramView

New in Version 3

TreeView nodes

The TreeViewNode class represents nodes that can display hierarchical data. The root items displayed in the node can be accessed through the getRootItems method. New items can be added to and removed from the returned collection. The root items can have child items on their own and so on. For more information, refer to the TreeViewItem class.

Ruler control

The Ruler control provides horizontal and vertical scales that helps users measure and align diagram items. In order to set the **Ruler** as a parent of a DiagramView, call its setDiagramView method. The control also implements support for scrolling and can be used instead of a **JScrollPane**.

Export to SVG

The SvgExporter class creates a Scalable Vector Graphics (SVG) drawing from the content of a Diagram. Custom-drawn elements are exported too through an SVG implementation of the **Graphics2D** interface provided by *JDiagram*.

Link routing enhancements

A much faster link routing algorithm has been implemented. It can arrange a thousand links for just a few seconds, while older versions would require several minutes. Now it is also possible to create custom routing classes to be used when a link must be routed by implementing the LinkRouter interface. An instance of such class can be set through the LinkRouter property of the Diagram class. *JDiagram* provides two classes that implement **LinkRouter** - GridRouter and QuickRouter. By default **LinkRouter** is set to a **QuickRouter** instance.

Flowchart graph layout

FlowchartLayout recognizes program code-like patterns in the graph, such as loops, sequences and if/switch branchings, and arranges them recursively. **FlowchartLayout** could be used to arrange other types of graphs as well, though with some restrictions. For example it treats all back links as loops in the code, and expects that they are nested - loop links starting closer to the stop node should end closer to the start node. Another similar restriction is that there shouldn't be any cross-links that connect different branches of a decision sub-graph.

Layout enhancements

- If StraightenLongLinks is enabled, LayeredLayout straightens links that cross multiple layers of the graph.
- Add SpringLayoutTraits.Frozen to a node's LayoutTraits to make SpringLayout ignore forces acting on a node but still consider the node's repulsion force on other nodes.
- The EnableAssistants property of TreeLayout allows creating organizational charts as in MS Office.
- The speed of GridLayout and OrthogonalLayout has been improved.

Adjustment handles styling

The ActiveItemHandlesColor, SelectedItemHandlesColor and DisabledHandlesColor properties have been replaced by ActiveItemHandlesStyle, SelectedItemHandlesStyle and DisabledHandlesStyle. The HandlesVisualStyle objects returned by them provide sub-properties for greater control over the

appearance of selection handles. The adjustment handles can now be painted not only in solid color but with arbitrary brushes, such as GradientBrush and TextureBrush objects.

New ScriptHelper methods

- The createColor method creates a **Color** instance.
- Use createPaper and createPageFormat to create objects required for print job setup.
- createSize and createSizeF create **Dimension** and **Dimension2D** instances.

Miscellaneous

- DiagramApplet provides local clipboard support through the copyToClipboard and pasteFromClipboard methods, which avoids the security checks done by the corresponding DiagramView methods.
- Elements of Shape definitions can be assigned distinct color and pen style attributes.
- The ShowLabels property of ShapeListBox specifies whether the control should display item labels.
- Links can be custom draw by setting their CustomDraw property and handling the drawLink event.
- PdfExporter creates hyperlinks for nodes whose HyperLink property is set.
- The drawForeground event lets render custom graphics in the diagram foreground.

API changes

serializeTag and deserializeTag handlers should call the setHandled method in order for the control to use the custom tag xml.

New in Version 2.2

Export to PDF

The PdfExporter class lets you exports diagrams to Adobe Portable Document Format (PDF) files. In order to do that, create a **PdfExporter** instance and call its export method. If you need to set the page size and orientation, call the setPageSize, and setPageOrientation methods.

New in Version 2.1

OrthogonalLayout

The OrthogonalLayout class implements an orthogonal graph layout algorithm. Each link is drawn as a chain of alternating horizontal and vertical segments. Nodes are placed in a way that facilitates few links bends and crossings. This algorithm was designed for planar graphs where the nodes have at most four incident links, and produces best results with such graphs as input. It can arrange any arbitrary graph as well, by adding some dummy nodes and links to planarize the graph and reduce its vertex degree, and removing them after the layout.

CircularLayout

CircularLayout distributes nodes evenly on the circumference of a circle at positions that result in as few link crossing as possible. Set its Radius attribute to specify the size of the layout circle. Call setSiftingRounds to specify the number of fine-tuning crossing-reduction iterations.

Miscellaneous

- The mergeUndoRecords method lets you merge several undo records into a single composite record.
- A custom position for the collapse/expand button displayed for expandable nodes can be specified through the setExpandButtonPosition method.
- The draw method of Diagram is now public, and can be used to draw the diagram content on a custom **Graphics2D** object.
- Link labels can be edited in place. linkTextEdited and linkTextEditing events have been added.

API changes

The **OrthogonalLayout** class from previous JDiagram versions has been renamed to OrthogonalRouter.

New in Version 2

Document/View Architecture

JDiagram implements the Model-View-Controller (MVC) architectural pattern in its new version 2. The MVC design pattern as applied to JDiagram separates the diagram data (model) from its representation to the user (view) and controlling it by the user (controller). According to the MVC design pattern, JDiagram Version 2 provides two new classes instead of the **FlowChart** class, namely Diagram and DiagramView.

Support for Custom Diagram Item Types

The JDiagram API has been redesigned to allow for seamless integration of custom node and link types. You can define a custom item type by deriving from DiagramLink or DiagramNode. You can also derive from more specific node types such as ShapeNode or ContainerNode. New items can be added to a diagram by instantiating them and adding them to the Nodes or Links collections. To improve support for custom types, many type-specific methods have been replaced with more generic versions, for example, findNode instead of **findBox** and **findTable**. For more information on the API changes, take a look at the Moving to JDiagram 2 section of the help file.

Containers

The ContainerNode class implements diagram nodes that can function as containers for other nodes. Containers can be folded to hide their content, and unfolded to show it again. Containers can be nested one within another, without limitation on the depth of nesting. The containerChildAdded and containerChildRemoved methods are called when nodes are added to or removed from containers.

OrthogonalRouter

OrthogonalRouter is a secondary layout algorithm that can be used to arrange links after an initial node arrangement has already been applied. The orthogonal layout is useful when there are much more links than nodes in a graph. The algorithm strives to achieve the following criteria, while preserving as much of the initial node configuration as possible: links must not overlap; only vertical and horizontal routing lines are used; graph routing is performed with respect to the specified main layout direction; links crossings are minimized; bends are minimized.

Layout Algorithm Improvements

Now, it is possible to place the unconnected subgraphs in such a way that the diagram covers a minimal area. To enable that, choose MinimalArea for the MultipleGraphsPlacement object.

Clipboard Operations

A single diagram item or a selection of items can be copied or cut to the system clipboard. This is done programmatically using the copyToClipboard and cutToClipboard methods. To paste the clipboard contents into the current diagram call pasteFromClipboard.

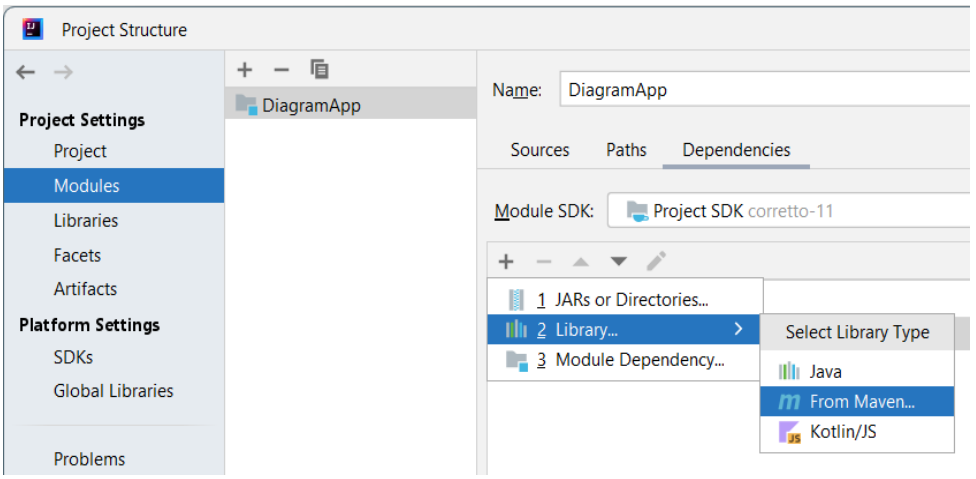
API Changes

For more information on the API changes, take a look at the Moving to JDiagram 2 section of the help file.

Getting Started

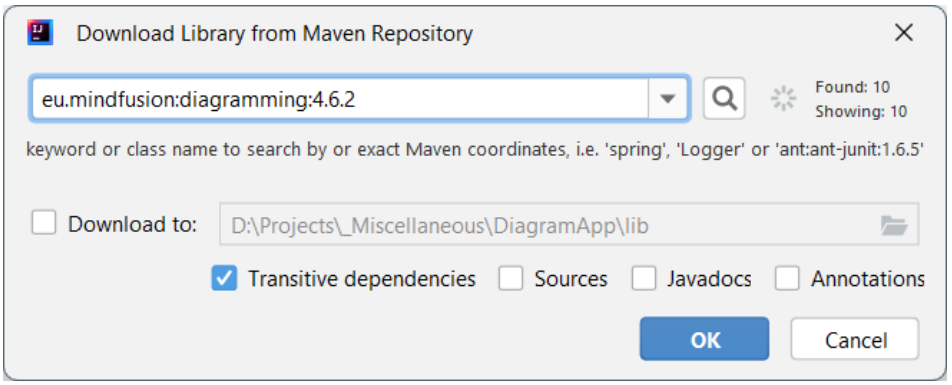
The following topics describe how to integrate the Diagramming for Java Swing API into your project, and create an instance of the DiagramView control.

Add Diagramming Library



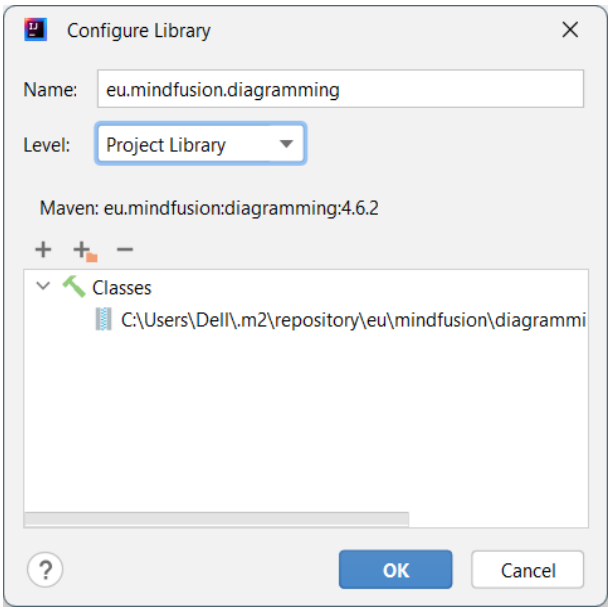
You can add diagram library's JAR file to your project either from the Maven Central repository, or from locally installed distribution.

Add From Maven Central



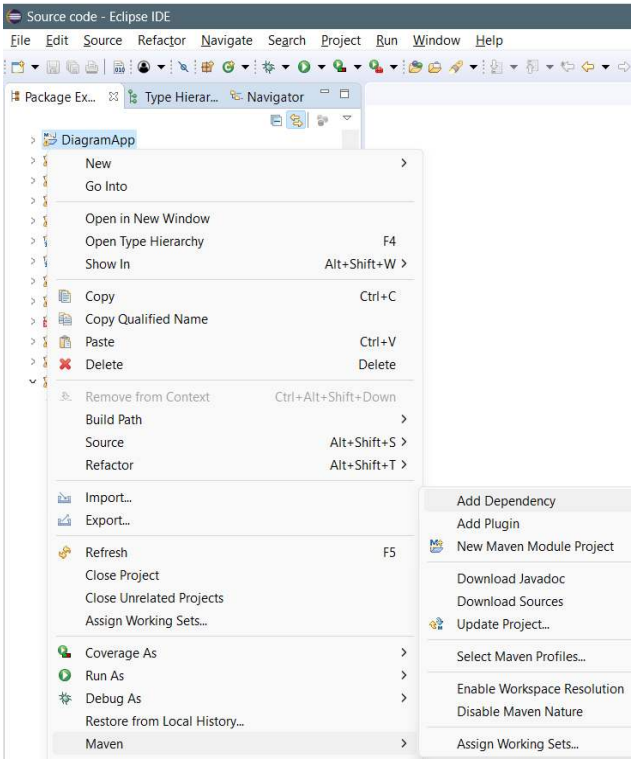
You can install the MindFusion.Diagramming library from Maven Central. After integrating it by following any of the following steps, you should be able to import com.mindfusion.diagramming classes and add controls from the library to your UI (DiagramView, NodeListView, Overview, etc).

IntelliJ IDE

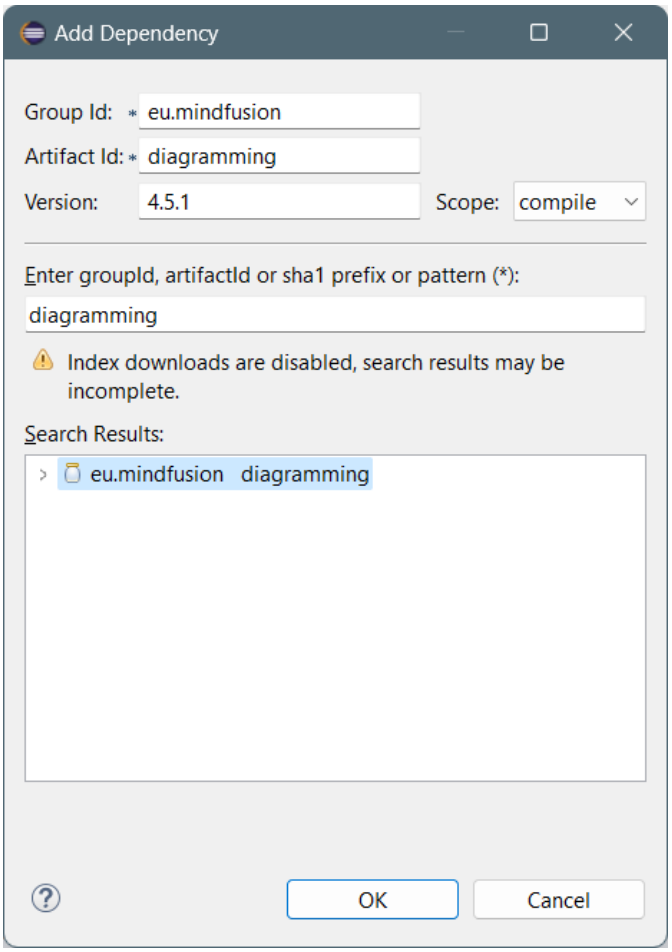


In order to integrate Diagramming for Java Swing into your IntelliJ project, select the Project Structure command from File menu, open Modules -> Dependencies page, click the + button and select Library -> From Maven command:

On the *Download Library from Maven* screen, search for "mindfusion:diagramming", select latest version of the package and click OK:



On *Configure Library* screen, select the library level and click OK:



Eclipse IDE

From Maven-based project's context menu, select Maven -> Add Dependency command:

On *Add Dependency* screen, search for "diagramming", select the latest version and click OK:

Maven Projects

In any Maven-based project, you can list eu.mindfusion.diagramming package as dependency in pom.xml and let the build system take care of downloading and integrating the jar file:

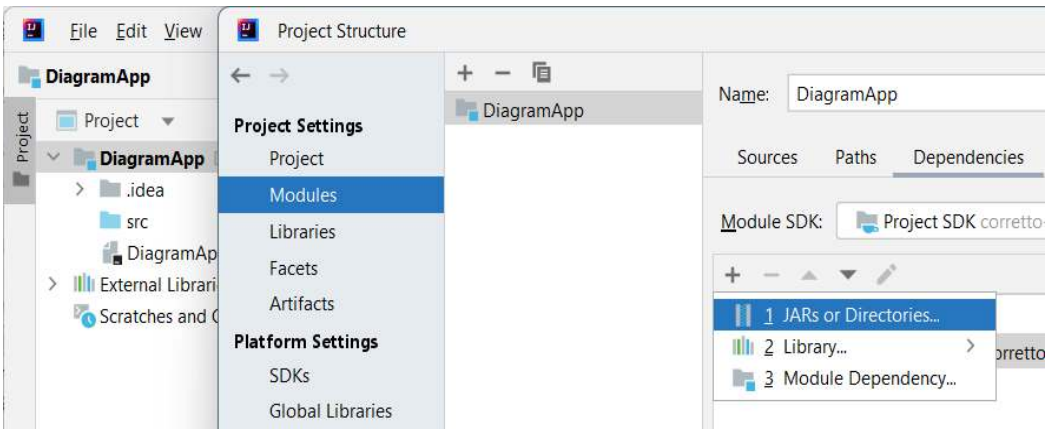
pom.xml

```
<dependency>
    <groupId>eu.mindfusion</groupId>
    <artifactId>diagramming</artifactId>
    <version>4.5.1</version>
</dependency>
```

Gradle Projects

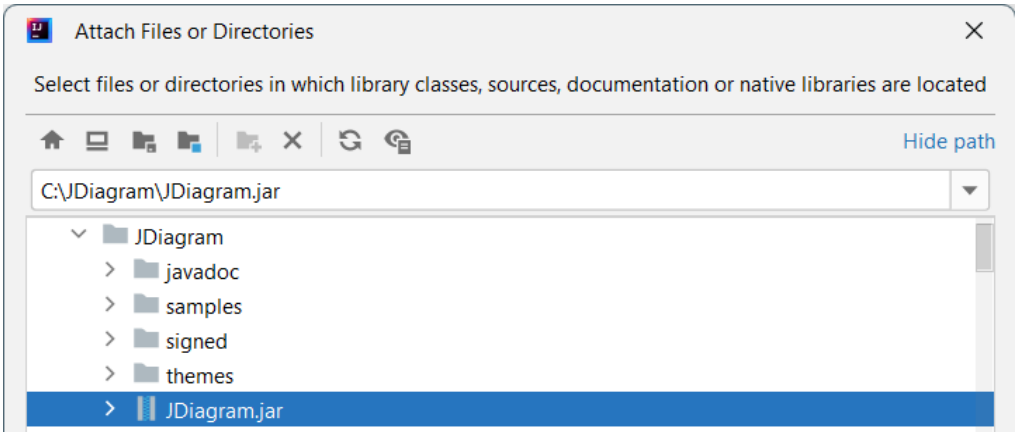
In any Gradle-based project, you can list eu.mindfusion.diagramming package as dependency in build.gradle and let the build system take care of downloading and integrating the jar file:

build.gradle



```
dependencies {
    implementation 'eu.mindfusion:diagramming:4.5.1'
}
```

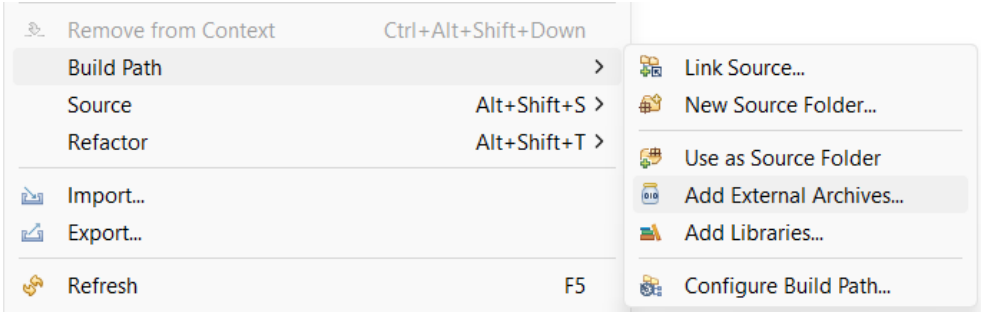
Add Local JAR



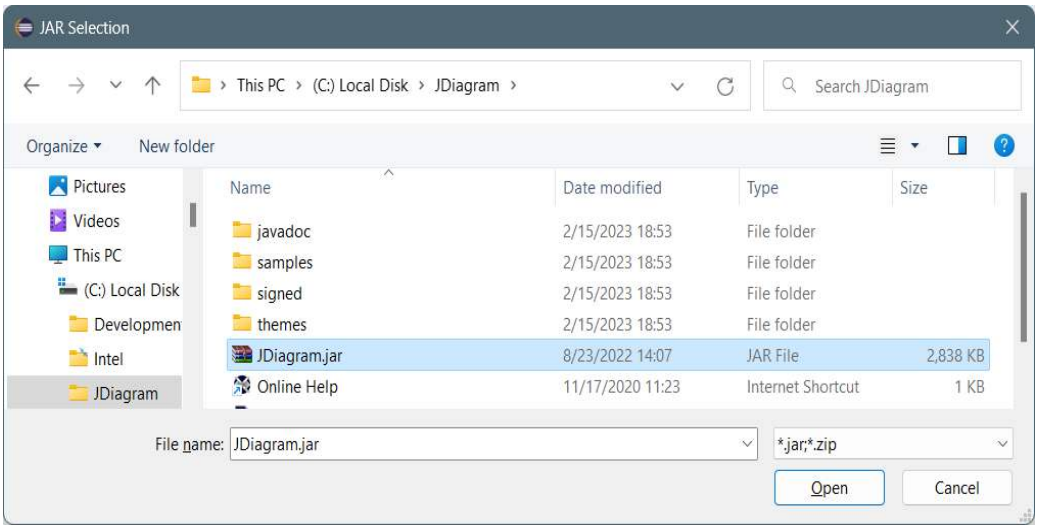
You can use the diagram library archive (JDiagram.jar) from locally installed distribution. After adding it to your project's dependencies, you should be able to import com.mindfusion.diagramming classes and add controls from the library to your UI (DiagramView, NodeListView, Overview, etc).

IntelliJ IDE

In order to integrate Diagramming for Java Swing into your IntelliJ project, select the Project Structure command from File menu, open Modules -> Dependencies page, click the + button and select the JARs or Directories command:



On the *Attach Files* screen, browse to the location where you have unarchived JDiagram.zip and select JDiagram.jar.



Press OK to confirm all dialogs.

Eclipse IDE

In order to integrate Diagramming for Java Swing into your Eclipse project, select the Build Path -> Add External Archives command from project's context menu:

On *JAR Selection* screen, browse to the location where you have unarchived JDiagram.zip and select JDiagram.jar.

Create DiagramView Instance

Once you have added a JDiagram reference to your project, you can access the public classes defined in JDiagram packages. The most important classes are Diagram, which represents the diagram data, and DiagramView, which is a Swing component that displays the diagram. You usually create and initialize a new instances of the **Diagram** and **DiagramView** classes in the same place where you create and initialize the rest of the user interface of your application. Associate the diagram to be displayed by this view by calling the setDiagram method. To let users scroll the diagram, add the **DiagramView** object to a JScrollPane container. Thus, a minimal application containing a scrollable diagram that can be used to draw flowcharts looks like this:

Java

```
package flowcharter;

import java.awt.Dimension;
import java.awt.Toolkit;

import javax.swing.JFrame;
import javax.swing.JScrollPane;

import com.mindfusion.diagramming.*;

public class MainWindow
    extends JFrame
{
    public MainWindow()
    {
        diagram = new Diagram();
        diagramView = new DiagramView();
        diagramView.setDiagram(diagram);

        JScrollPane scrollPane = new JScrollPane(diagramView);
        getContentPane().add(scrollPane);

        Dimension size = Toolkit.getDefaultToolkit().getScreenSize();
        setSize(size);
    }

    public static void main(String[] args)
    {
        MainWindow window = new MainWindow();
        window.setVisible(true);
    }

    private DiagramView diagramView;
```

```
    private Diagram diagram;
}
```

The initialization of the JDiagram control can be very different depending on what you will use it for, but there are certain properties you will most likely need to adjust in all cases. Here they are:

- Choose a Behavior for the control, which defines how JDiagram must interpret actions done with the mouse by users of your application. The default value, **LinkShapes** specifies that users can draw diagram nodes and connect them with diagram links. Another value, **LinkTables** allows drawing tables and relationships between them. The **Pan** behavior allows panning the view by dragging the mouse. Modify bans users from drawing new items, but allows them to modify existing ones. Call the setBehavior method of the **DiagramView** class to adjust the control's behavior.
- There are other methods of the **DiagramView** class for customizing the behavior of the diagram and its items - take a look at getCustomBehavior and setCustomBehavior, getCustomLinkType and setCustomLinkType, getCustomNodeType and setCustomNodeType.
- There are various methods that let you customize the general appearance of your diagram, such as setBackBrush, setBackgroundImage, setBoundsPen, setGridColor and so on.
- There is a set of methods that let you specify default attributes for diagram items. The names of these methods usually correspond to the name of the attribute they provide a default value for, prefixed by the name of the appropriate item class. For example, the method that lets you specify the text of the link's label is called DiagramLink.setText, while the default value for new links can be set through Diagram.setLinkText.

Once you have initialized JDiagram, you usually use the DiagramListener interface to handle various events, such as linkCreated and linkModified. These events let you take specific actions when diagram items are created or modified, such as updating the internal state of your application.

Browse the other sections of this help file to learn more about the functionality provided by the MindFusion.Diagramming classes, methods and properties. Follow the tutorials to learn how to populate the diagram model programmatically or create custom item types.

User Interaction

Most likely an application would use JDiagram to enable users to interactively create diagrams, flowcharts and other kinds of presentation documents. A user composes or edits a diagram by drawing its elements on the JDiagram canvas area. With the help of a mouse or another pointing device users draw shapes, tables and links, possibly connecting them in complex hierarchies, graphs, trees or other structures they might need.

Creating New Items

New items can be created by drawing them with the mouse. While a user drags the mouse, the view of the control is updated to show what the new item would look like at the pointer location. If the operation cannot be completed at the current mouse position, the cursor changes to a crossed out circle. When the user releases the button, the item is created. The control does not let users create very tiny nodes which would be hard to select and modify. By default, links can be drawn only between nodes, unless the AllowUnconnectedLinks attribute is enabled. Users can cancel item creation by pressing the right mouse button while drawing.

Modifying Items

A user modifies an item by dragging its adjustment handles. The setModificationStart method specifies when these handles appear. The first option, AutoHandles, makes the handles appear when the mouse hovers over an item; modification of the item can start immediately by pointing it and dragging a handle. The second option is **SelectedOnly**: in order to be modified, an item should first be selected. Adjustment handles appear around the item to indicate that now it can be moved or resized. The number and functionality of the handles depend on the item type and the value specified through the setHandlesStyle method.

Modifying a Node

Usually nodes have nine adjustment handles. The one at the center can be used to move the node. When dragged, each corner handle resizes the node by moving the two edges adjacent to the corresponding corner. The edge handles placed at the center of each side can be used to resize a node either horizontally or vertically. Shape nodes can be rotated using an additional round handle drawn above them. Each handle can be enabled or disabled by setting or clearing the respective bit through the setEnabledHandles method.

Modifying a Link

Variety and behavior of link adjustment handles depend on the link's Style and SegmentCount. Control-points stay at both ends of each segment that constitutes a link. JDiagram offers three link styles. The following sections discuss how to modify links of each style.

- The first style called Polyline defines links, which consist of a series of straight segments, drawn between control-points. There are no restrictions as to the number of segments. Dragging a control-point modifies each segment adjacent to the point. If the setAllowSplitLinks method is called, users are allowed to insert new control points or to remove existing ones. Inserting a control point is done by pressing the left mouse button over a segment and dragging. The new point appears at the mouse location and splits the pointed segment in two.
- If link's style is set to Bezier, each segment has 4 manipulation handles that define a curve. Each curve goes through the end-points, which are shaped as circles. Bend of the curve is defined by the middle two points shaped as rectangles. If a user drags an end-point modification handle, the adjacent control points will be moved with same translation vector as that of the end-point. If a bend control point is dragged, the symmetric control point of the neighboring curve is also moved to ensure the two stay on the same line with the end-point and on the same distance from it.
- Cascading links consist of straight horizontal and vertical segments, each one orthogonal to its neighbors. If a control-point is dragged, the segments adjacent to it are moved and resized preserving their orthogonal orientation to each other. If the **setAllowSplitLinks** method is called, users are allowed to insert new control points to Cascading links or remove existing ones. The orientation of the link segments can be changed if LinkCascadeOrientation is set to Auto.

Modifying a Table

By default, table modification handles are drawn as dotted lines over its borders. To move a table, drag its caption bar. To resize a table, drag any of its borders or corners.

Selecting Items

Multiple items are selected by dragging while CTRL key is down. Selection can also be toggled with CTRL + clicking an item. A rectangle appears around selected items, allowing a user to move all of them at once.

Scrolling and Panning

The DiagramView can be scrolled if its placed inside a **JScrollPane**. Users scroll the view by dragging the scrollpane's scrollbars, which appear when the diagram area is larger than the view. The user could also pan the diagram view by pressing the left mouse button and dragging while the ALT key is down.

Interpreting Users Actions

Mouse operations can be interpreted in different ways depending on the value of the Behavior property. It defines whether for example dragging the mouse creates a node or selects existing items. Check the property description for more information on the built-in input modes.

You can also create a custom mouse input controller by deriving from the BehaviorBase class and calling the setCustomBehavior method of DiagramView. A custom controller could implement only the higher-level startDraw method to specify what kind of operation should start when the user begins to drag the mouse, or the createNode method to create an instance of a custom node class. Alternatively, override the lower-level pointerDown, pointerMove and pointerUp methods to completely overhaul user interaction. A custom **BehaviorBase**-derived class is demonstrated in the *Fishbone* sample project.

Programming Interface Overview

The next few chapters give you an overview of all JDiagram features, grouped by functionality. Hyperlinks refer to the detailed description of methods and classes.

Document-View Architecture

JDiagram implements the Model-View-Controller (MVC) architectural pattern. The MVC design pattern as applied to JDiagram separates the diagram data (model) from its representation to the user (view) and controlling it by the user (controller).

Single Diagram Canvas

The Diagram class represents the diagram data model and provides operations to process the data. It exposes properties and methods for adding new diagram elements, finding and accessing existing elements, or removing them.

The DiagramView class presents the relevant data from the **Diagram** class by drawing on the screen using the Java Graphics2D API. When the diagram is changed, the view automatically redraws the affected part of the image to reflect the changes. Multiple views can display the same diagram. Perform the setDiagram method of the **DiagramView** class to specify the diagram displayed by the view. Each view can have a different zoom level and scroll position.

Controllers responding to user interactions are represented by Behavior objects. The Behavior property of **DiagramView** and respective enumeration let you switch between different controllers, specifying how GUI actions should be interpreted to manipulate the diagram elements, or scroll / zoom the view itself.

Multiple Diagram Pages

The DiagramDocument class represents a collection of diagram pages or sheets, represented by DiagramPage objects. Document's pages are stored in its Pages collection. The **saveTo*** methods of **DiagramDocument** save all pages in a single file, and respectively the **loadFrom*** methods load all pages from the file.

DiagramPage is derived from Diagram and only adds a few properties, so any code that processes **Diagram** objects will work with **DiagramPage** objects too. A diagram document forwards each event raised by its pages, giving you a chance to use the same listener for events raised by different pages. If a page should implement distinct user interaction or validation logic, it is also possible to attach handlers to the **Diagram** events inherited by **DiagramPage**.

A single **DiagramPage** could be assigned to the Diagram property of DiagramView, and that lets you create your own user interface for presenting a list of pages to the user and selecting a current page.

The library includes the TabbedScrollPane and DocumentView classes, which work together to present all pages of a document in a tabbed user interface, with each tab corresponding to a page. The page displayed in the active tab is exposed through the CurrentPage property of **DocumentView**. Users can switch between pages by activating the corresponding tab. New pages can be added to and existing pages removed from the document using buttons in the tab strip, and pages can be rearranged by dragging their corresponding tabs with the mouse.

User Interface Components

DiagramView

DiagramView renders the contents of a Diagram and allows users to create new items or modify existing ones using a mouse or other pointing devices. The Behavior property defines how the control interprets user actions. Additional properties control scrolling and zooming of the view.

Palette

The Palette control represents a tool palette that displays DiagramItem objects grouped into categories. It implements Accordion user interface that displays ItemListView components as its child panels, and category icon, title and collapse/expand button in pane headers. Each child **ItemListView** displays the items added to its corresponding category. Call the addCategory method to define a category and create its respective accordion pane. Call addItem to add an item to specified category. The control can also be configured by setting its Model to an object implementing PaletteModel interface. **Palette** provides same behavior and appearance properties as the **ItemListView** class.

ItemListView

ItemListView represents a tool palette that contains uncategorized list of diagram items. Items can be added by calling addItem method, and removed by calling removeItemAt. Drag-and-drop operations from **ItemListView** to DiagramView create a copy of the dragged item, and set its size to NewInstanceSize.

Overview

Overview provides a scaled-down view of a target DiagramView, helping users work with larger diagrams. A tracker rectangle shows current viewport of the main **DiagramView**, and by dragging it users can change the scroll position. It can also be resized to zoom the target view.

ZoomControl

ZoomControl lets users change the zoom level of a target DiagramView by dragging a slider. It also includes arrow buttons for scrolling the view.

Ruler

The Ruler control displays horizontal and vertical scales that let users measure and align diagram nodes.

Diagram Structure

Standard Item Types

Diagram elements in JDiagram are represented by ShapeNode, TableNode, ContainerNode and DiagramLink instances. Combined and linked together, they can form complex data structures such as process or entity-relationship diagrams, class hierarchies, networks and graphs. Each of their rich features can be customized through numerous methods and properties. JDiagram also offers intuitive user interface for drawing and editing diagram items interactively.

Shape Nodes

Shape nodes can represent geometric shapes, flowchart elements, icons in network diagrams, and so on. They can hold both graphics and text in different fonts, sizes and colors. There are more than 100 predefined shapes and apart from them, JDiagram offers an easy way to define custom shapes. Shape nodes can be rotated, either interactively using the round selection handle drawn above them, or programmatically using the setRotationAngle method. The ShapeNode appearance can be customized further using several types of custom painting. The first type gives you full control over the painting. With the second one your painting code is performed additionally to the basic painting. The third one performs standard drawing of shape nodes and custom drawing of their shadows. Shape nodes can display background images and graphics. The file formats supported are GIF, JPEG and PNG.

SVG Nodes

The SvgNode class represents nodes that can display SVG drawings in addition to the rendering provided by its base ShapeNode class. SVG elements are rendered after the associated bitmap Image and just before the drawNode event is raised for Additional custom drawing. SVG elements are parsed and associated with the node through a com.mindfusion.svg.SvgContent object, which should be initialized and then assigned to the Content property.

Table Nodes

Table nodes can be used to represent table schemas in database diagrams or classes in class-hierarchies. A table contains cells arranged in a grid, and every cell can display text and/or image. Cells can span several rows and columns as set through the setRowSpan and setColumnSpan methods. Cells, columns and rows can be customized in various ways - there are appropriate methods available for setting their extents (setCaptionHeight, setRowHeight, setColumnWidth), frame style (setCellFrameStyle), image (setImageAlign, Cell.setImageAlign) and text format and alignment(Cell.setTextFormat, setCaptionFormat, setEnableStyledText). Tables' dimensions can be programmatically changed. Inserting (insertRow, insertColumn), appending (addRow, addColumn) or deleting rows and columns (deleteColumn, deleteRow) can be done in a very comprehensive, intuitive way whenever you might need it. Tables can also display background images and graphics. The file formats supported are GIF, JPEG and PNG.

Free-form Nodes

A FreeFormNode collects all points from users' mouse or touch input and displays them as node's outline. To let users draw free-form nodes interactively, set Behavior to DrawFreeForms. Use the Points property of **FreeFormNode** to get or set outline points programmatically. If the Closed property is set, the node is drawn as a closed shape and its interior filled, or otherwise the node is drawn as a poly-line. If the distance between first and last points drawn by user is shorter than AutoCloseDistance, the node gets closed automatically.

Control Hosts

A ControlNode can host any Java Swing control - instance of a **java.awt.Component** -derived class. The hosted control might be any of the standard component types such as JTable or JButton; custom controls are also supported. A **ControlNode** can be connected with links to any other nodes - control hosts, shapes or tables.

Container Nodes

A ContainerNode can contain other diagram nodes. When a container is moved, its child nodes move too. Containers can be folded to hide the contained nodes, and unfolded back to show them again. Nodes inside a container can be linked to nodes both inside and outside of it. When a container is folded, the links connected to contained nodes point to the container outlines. Containers can be nested within each other to unlimited depth.

TreeView Nodes

The TreeViewNode class represents nodes that can display hierarchical data. The root items displayed in the node can be accessed through the getRootItems method. New items can be added to and removed from the returned collection. The root items can have child items on their own and so on. For more information, refer to the TreeViewItem class.

Links

DiagramLinks represent various types of connections and relations in diagrams. JDiagram offers three basic link types:

- polyline links composed of straight-line segments (choose Polyline link style)
- curved links composed of Bezier-spline segments
- links composed of horizontal and vertical segments, alternating their orientation so that every segment is orthogonal to its neighbor

A link can be connected to a node at each of the link's ends. It is also possible to have unconnected links - having one or both of their ends not connected to nodes. Some customizable link's attributes are: arrowheads (setHeadShape, setHeadShapeSize, setHeadPen), shape (setShape, setCascadeOrientation),

color (setTextBrush), text (setText, setTextStyle), pen width and style, modification behavior (setAllowMoveStart, setAutoRoute, setAllowMoveEnd, setDynamic) and number of segments (setSegmentCount).

Custom Item Types

Custom Item Types

You can create your own item types by deriving the DiagramNode and DiagramLink classes or their successors such as TableNode, ContainerNode and so on. Thus, you can add custom data fields to the diagram items, and implement custom visualization and interaction functionality.

Serialization

If you add custom fields to your item class, you will probably want their values saved when saving diagram files, and restored when loading files. To enable this, override the writeExternal and readExternal methods of the DiagramItem class, which let you use **ObjectOutputStream** and **ObjectInputStream** objects to implement binary serialization. To implement XML serialization, you must override the saveToXml and loadFromXml methods, and use the registerItemClass method to associate an element name with your class.

Clipboard operations

You must implement the clone method in order to enable copyToClipboard and pasteFromClipboard to work with your custom item type. If **clone** is not implemented, you will get an instance of the base class created for the pasted item, and this could lead to an exception when the base class deserialization code tries to load the item state from a data stream created by the derived class. If your class has any custom fields, it must also implement the writeExternal and readExternal methods for proper serialization.

Rendering

If you need to provide custom rendering for your items, override the drawLocal and drawShadowLocal methods. They receive as an argument a **Graphics2D** object, which provides methods for drawing vector graphics, text and images. The specified **Graphics2D** in drawLocal has a rotation transform applied to it to match the node's RotationAngle, and a translation transform to match the node's position, so that the coordinate system origin (0,0) is at the node's top-left corner. Alternatively, override the draw method to receive a **Graphics2D** without any local transformations applied to it.

Apart from drawing on screen via Java's **Graphics2D** objects, JDiagram provides PdfGraphics2D and SvgGraphics2D implementations of that interface, which are used when exporting to PDF and to SVG. That lets you use the same code regardless of where the item should draw itself.

User interaction

To allow the user to draw items from a custom class, set the Behavior of the diagram view to Custom, and call the setCustomNodeType and/or setCustomLinkType method with the Class object that corresponds to your type. If you need to change how items handle user interaction while they are being initially created, implement the startCreate, updateCreate and completeCreate methods. In order to change how items respond to user interaction while they are being modified, implement the startModify, updateModify and completeModify methods.

Creating and Deleting Items

Creating Items Programmatically

In order to add a new node or link to a diagram, create an instance of the item class by calling the **new** operator and add it to the diagram's Nodes or Links collection. This works the same way for adding both items from your custom class or ones from the predefined JDiagram types.

There are several shortcut methods provided for creating instances of the predefined node and link types. The methods are members of the diagram's Factory object:

- The createShapeNode method creates a ShapeNode at the specified position with the specified dimensions and shape.
- The createTableNode method creates a TableNode at a specified position. Tables have a method that connects them with other tables called addRelation.
- The createContainerNode method creates a ContainerNode at the specified position.
- There are several overloads of the createDiagramLink method that allow connecting two nodes of the same type or of different types.

Drawing New Items

Users can draw diagram elements with the mouse. Call setBehavior to specify what type of elements should be created when a user starts drawing. While items are being drawn, the control raises the validation events nodeCreating and linkCreating to let you validate the operation and prevent creating items at a specific location. When the user releases the mouse button, the item is added to the collection that contains items from the same type (for example, the collections returned by the getNodes).

Deleting Items

Call the **remove** method of the collection returned by the getItems method to delete an object from the diagram. The clearAll method clears diagram contents by deleting all objects.

By default, deleting a node also removes its links. Set the AutoDeleteLinks property to **false** to prevent that, and disconnect the links instead.

Accessing Items

One of the most common tasks when using the component is iterating over all items in the document or navigating through the connections between items - from a node to the incoming or outgoing links, or from a link to its origin and destination nodes. To enumerate items of a diagram, use the collections returned by the following methods: getItems, getLinks, and getNodes. The nodes connected through a link are returned by the link's getDestination and getOrigin methods. To access the links connected to a node, use its getIncomingLinks and getOutgoingLinks methods. The first collection contains references to all links pointing to the node, the second - to the links that start from it. Links can connect to rows of a table; to find such links, use the table's getRows method and the getIncomingLinks and getOutgoingLinks methods.

Selected Items

If only one chart object is selected, it is considered the active object and can be accessed with the getActiveItem method. Multiple objects can be selected when clicking or dragging with the Ctrl key pressed at the same time. Multiple- selection can be accessed through the getSelection method of the Diagram class. The Selection object provides methods to access the selected items: getItems, getLinks, getNodes.

Finding Items

You can search for chart objects by their tag using the findLink, findNode, findGroup methods. Tag objects are compared by calling the equals method of the **java.lang.Object** class. If there are more objects with the same tag, the first one will be returned. If no object with the specified tag exists, null object reference will be returned. Groups can also be searched by tag using **findGroup**.

Relationship Queries

The query method traverses the graph by following node/link connections and group's parent/child relationships to find items in specific relation to the current one. The method receives a string argument consisting of selectors and optional predicates. The query is executed in several steps. In each step the result set is constructed from the previous result set by following the relationship specified by the current selector. If a predicate is specified after the selector identifier, the result set is filtered to include only items for which the predicate evaluates to **true**.

Attaching and Grouping Items

JDiagram allows attaching a node to another diagram element, establishing a subordinate - master relationship between the two items. The easiest way to attach nodes is to call the attachTo method. When a master element is moved or resized, any subordinated node follows it, so that the initial distance between the two items stays constant. This happens both when a user moves the master item around, and when the item position is changed using a method.

> **Note**
>
> Recent versions of the API include NodeLabel and LinkLabel classes, which address several of the scenarios described below. We recommend using these classes when appropriate, as they offer a more lightweight and easily configurable alternative to attached nodes.

Possible Uses

- Attach a transparent shape node to another item and set its text by calling the setText method, so that the shape node acts as an additional label assigned to the main item (to make a shape node transparent, call its setTransparent method).
- Attach a shape node to another item and set the node's image by calling its setImage method, so that it acts as an additional icon displayed inside or near the main item.
- Attach a shape node or a table to another item and handle the nodeClicked or cellClicked event to perform some action on the main item. This makes the subordinated node act as a button or another type of UI element attached to the main item.
- In all previous cases, the attached nodes can be locked by a call to their setLocked method in order to use them only as a decorations embellishing the main item. That prevents users from selecting, modifying or drawing links to the subordinates.
- Attach child elements in a tree branch to the branch root, so that when a user moves a tree node, the node's children moves simultaneously with it. Modifying an item in such hierarchical group makes the modification propagate through all dependant subordinated items.

Hierarchical Grouping

An unit of attached items is represented by an instance of the Group class. To create a group, call the createGroup method passing the master object as argument, and use the Group methods to attach items. The attachTo method of nodes is a shortcut to creating a group and attaching an item to it. Every member of a group can be the master object of another group, that is, an item can be subordinate in one group and meanwhile be another group's master. JDiagram doesn't impose any limits to the depth and width of group hierarchies built that way. However, it is not possible to put an item as a subordinate in more than one groups because the hierarchy relations would become ambiguous.

Unions

It is possible to create such groups, where modifying any item in the hierarchy causes updating of all other items. This can be done by putting the items in circular chain of dependencies - that is, item1 is attached to item2, item2 to item3 ... itemN to item1. If any of these items is modified, the change will propagate through the chain until it reaches its originator.

Attaching Items to a Group

Links cannot be attached to groups but can be master items of groups. If a group's master item is a link, nodes can be attached to the control points or segments of the link. See the attachToLinkPoint and

attachToLinkSegment methods for details. If the master item is a node, other nodes can be attached to any of its corners, or to an area specified as percent of master-node's bounding rectangle. Check attachToCorner and attachProportional for details. A shortcut to creating Group instance and calling the appropriate attachTo method of the DiagramNode class.

Accessing Group Items

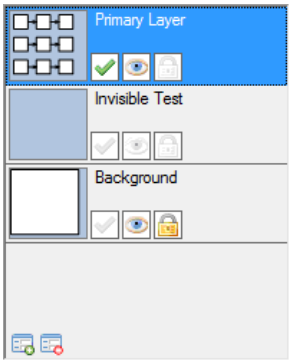
The master item of a group can be accessed through its getMainItem method and the subordinate items are returned by the getAttachedNodes method. To get the groups in which an item participates, use its getMasterGroup and getSubordinateGroup methods.

Destroying Groups

If a user deletes the master item of a group, the group is destroyed automatically. If getAutoDeleteItems returns true, subordinated items in the group are deleted too. If **getAutoDeleteItems** returns false, subordinated items are just detached from their master and remain intact. Groups can be destroyed programmatically using the destroyGroup method.

Layers

Layers



Items can be assigned to layers, and layers can be hidden, locked or moved up/down in the Z order as a group. Layer objects provide Visible, Locked and ZIndex properties, which will affect all items in the respective layer. Layers also expose a Title property shown in the LayerListView control. Newly drawn items are added to the layer specified via Diagram.setActiveLayer.

Call the setLayerIndex method of items to associate them with layers in the Diagram.Layers collection. If LayerIndex has the default value of -1, the item is not associated with any layer and its visibility depends only on the item's own Visible property.

Layer list control

The LayerListView control provides user interface for working with Layer objects. The control presents a list of the specified Diagram's layers, showing their title and an overview image of the objects in each layer, and also allows editing of layer's Visible and Locked properties and choosing the Diagram's currently active layer. New layers can be added to the Diagram by clicking the + button and removed by clicking the - button.

The image below illustrates a **LayerListView** with several layers.

Collapsing and Expanding Tree Branches

If your chart represents a tree structure, you might want to collapse a sub-tree starting from a node or expand a sub-tree that was previously collapsed. Use the setExpanded method of a node to do this

programmatically. You can also invoke the setExpandable method to show a +/- button beside the node; using this button the user will be able to collapse and expand the sub-tree, which has the specified node as root. To check if a sub-tree is expanded or collapsed call the getExpanded method.

Displaying Expand/Collapse Button

If the Expandable attribute of a node is set to **true**, there is a [±] button displayed beside the node to allow users to collapse or expand the tree branch starting there. The button location can be customized through the diagram's setExpandButtonPosition method. The appearance of the collapse / expand icon can be customized by setting Renderers.ExpandIconRenderer. By default, pressing that button automatically collapses or expands the tree branch and raises the treeExpanded or treeCollapsed events.

Defining Tree Direction

A node can be connected to other nodes through outgoing and incoming links. You can call the setExpandOnIncoming method to specify which items connected to a node will be regarded as its descendants. If you pass false (default value) then each node will be regarded as a parent of its outgoing links and the items attached to them. If you pass true, the node' incoming links will define its children. Thus this property specifies the parent-children relationship between chart items and respectively the overall direction in which collapsing / expanding is done.

Expanding a Branch Recursively

Use the setRecursiveExpand method to specify whether the whole sub-tree starting from a node will be shown when expanding, or only the first level of descendants.

Custom Expand/Collapse Functionality

The setExpandButtonAction method lets you override the standard functionality of the [±] button. Set this property to RaiseEvents and handle the expandButtonClicked event if you need to implement your own expand/collapse logic.

Multiple Diagram Pages

The DiagramDocument class represents a collection of diagram pages or sheets, represented by DiagramPage objects. New pages can be added to the document and existing pages can be removed and reordered via the Pages collection. The saveToXml and saveTo methods of **DiagramDocument** save all pages in a single file, and respectively the loadFromXml and loadFrom methods load all pages from the file. **DiagramDocument** can also load files created by the serialization methods of Diagram, and will show them in a single page. Note that the opposite is not true: **Diagram** cannot load directly a **DiagramDocument** file.

DiagramPage is derived from **Diagram** and only adds a Title property, so any code that processes **Diagram** objects will work with **DiagramPage** objects too. A diagram document forwards each event raised by its pages, giving you a chance to use the same handler for events raised by different pages. If a page should implement distinct user interaction or validation logic, it is also possible to attach handlers to the Diagram events inherited by **DiagramPage**.

A **DiagramDocument** can be exported to PDF using the new overloads available in the PdfExporter. Other export classes do not support multi-page export at this time, but still can be used to export individual pages via their Export(Diagram) method.

A single **DiagramPage** could be assigned to the Diagram property of DiagramView, and that lets you create your own user interface for presenting a list of pages to the user and selecting a current page. The package also includes a DocumentView and TabbedScrollPane classes that presents all pages of a document in a tabbed user interface where each tab corresponds to a page. The page displayed in the active tab is exposed by the CurrentPage property of **DocumentView**. The active page can be changed interactively by activating its associated tab. New pages can be added and removed to/from the document through buttons in the tab tray and the pages can be rearranged by dragging their associated tabs.

Components

The following topics are discussed in more details:

Using Components
General information on components and how to use them in diagram nodes.

Standard Component Types
A complete list and information about the standard JDiagram components, such as ButtonComponent, TextComponent and ShapeComponent.

Components and XML
How to define components hierarchies in XML and how to load those hierarchies.

Creating Custom Components
Information on how to implement and use custom components.

Using Components

The components in JDiagram are used through an instance of the CompositeNode class or a class deriving from **CompositeNode**. Simply create concrete component instances and add them to the Components collection of the **CompositeNode**.

Arranging Components

By default the composite node arranges its child components on top of each other, in the order they were added to the Components collection. To apply custom arrangement, the children should be organized in a component hierarchy using the appropriate panel components. For example, to arrange children horizontally, in a row, you can use the StackPanel with Orientation set to Horizontal. Here is an example on how to do this in code:

Java

```
StackPanel panel = new StackPanel();
panel.setOrientation(
    com.mindfusion.common.Orientation.Horizontal);
panel.setSpacing(1);

TextComponent text = new TextComponent();
text.setText("Hello world!");
panel.getComponents().add(text);

ButtonComponent button = new ButtonComponent();
TextComponent buttonContent = new TextComponent();
buttonContent.setText("Click me!");
button.setContent(buttonContent);
panel.getComponents().add(button);

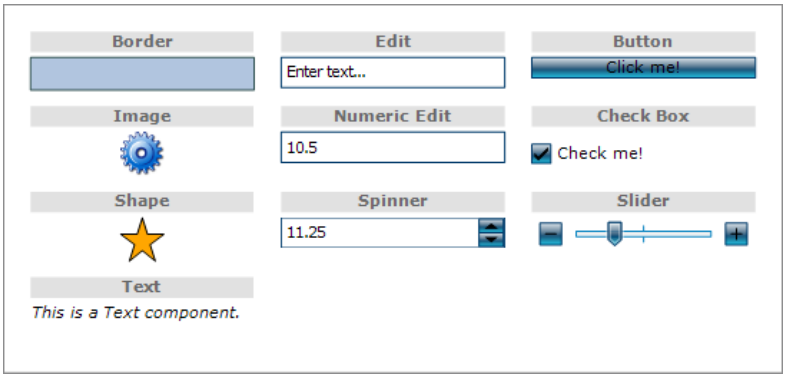
node.getComponents().add(panel);
```

It is possible to create custom panel classes by deriving from ContentComponent and overriding the arrangeComponents method. For an example on how to implement custom panel classes, check the Creating Custom Components topic.

Another way to arrange child components is by deriving from CompositeNode and overriding the arrangeComponents method. Then, you can manually assign the position of individual nodes through their Bounds property.

Finding Components

The findComponent method of the CompositeNode class can be used to search for components by their Name. This method performs a recursive search of all components in the Components collection and returns a reference to the first component with the specified name. This is particularly useful when the component hierarchy is defined through XML and you need to obtain a reference to a specific component



in the hierarchy for additional processing. For more information on how to define components in XML check Components and XML.

Hit-testing Components

To retrieve the topmost component at a specific location, use the getComponentAt method of the CompositeNode class. This method ignores components with any of the following properties set to **false**: IsEnabled, IsHitTestVisible.

Standard Component Types

The following image illustrates the standard components using the default appearance settings. Additional information about the individual components can be found below.

Border Components

The border components can adorn a single component with a border and a background. To nest a more complicated structure within a border, use one of the panel components as a parent. The border component exposes few properties. The Background and Pen can be used to define the border appearance. The derived Padding property can be used to specify the distance between the border sides and the child component. The border child can be assigned through the Content property.

Button Components

The button components represent a clickable button. The button components, similar to the border components, can host a single child component - usually a TextComponent. The default button appearance is controlled through a set of brush and pen properties - Brush, BrushHovered, BrushPressed, Pen, PenHovered and PenPressed. These properties define the appearance of the button in its different states. An alternative way to define the button appearance is through images by using the ImageList property. In addition the buttons can be custom drawn by handling the customDraw event. When a button component is clicked, the mouseClicked event is raised.

CheckBox Components

The check box components represent specialized buttons with an additional state - checked. The appearance of the check box in its checked state can be customized through the CheckedImageList. The state can be programmatically get or set through the isChecked property.

Text Components

Text components can display static text. Text components expose an array of properties for customizing the appearance of the displayed text, including Font, TextColor, TextFormat and Background. The text of the text components can be specified through the Text property.

Edit Components

The edit components display editable text content and are analogous to the WinForms text boxes. The following properties define the appearance of the text within the component - Font, TextColor, TextWrapping. In order to edit the text in an edit component, the component has to have keyboard input. This is achieved by setting IsFocused to **true**. The user can focus an edit component by clicking on it with the left mouse button. To enable single line edit mode set AcceptsReturn to **false**.

The edit components expose several events, most notably - textChanging and textChanged.

Selection

The current selection of the edit component is defined through the SelectionStart and SelectionLength properties. The appearance of the selection is defined through the SelectionColor, InactiveSelectionColor and HideSelection properties.

Undo/Redo

The edit components implement undo and redo internally. To undo the most recent changes press CTRL+Z while the edit component has the input focus. To redo the changes, press CTRL+Y.

Clipboard

All standard Clipboard operations are supported and can be accessed through the usual keyboard shortcuts: Copy - CTRL+C, Cut - CTRL+X, Paste - CTRL+V.

NumericEdit Components

The numeric edit components are similar to the generic edit components. The main difference is that the numeric edits (as the name suggests) allow only numeric input. In addition to the standard edit events, the numeric edits also expose the more specialized validateValue and valueChanged events. The numeric components support undo, redo and clipboard as well.

Image Components

The image components display an image in different alignment modes. The image and alignment can be specified through the Image and ImageAlign properties respectively.

Shape Components

The shape components can display arbitrary geometrical shapes. Any shape defined through a Shape object can be used, including all predefined shapes. The shape components can also be initialized using the specialized geometry syntax when defined in XML. For more information regarding this, check Components and XML. The appearance of the displayed shape is specified through the Brush and Pen properties and the shape itself is assigned through the Shape property.

Slider Components

The slider components provide a way to interactively select a single numeric value or a range of numeric values from within a fixed interval, by dragging one or more thumbs along a horizontal rail. In addition the slider component provides two buttons which can be used to adjust the value more precisely. The type of the slider component can be specified through the Type property. The interval of available values can be set through the Minimum and Maximum properties. The selected values can be get or set through the Value, StartValue and EndValue properties respectively depending on the type of the slider. The components expose a set of events, which are raised when the slider values are changed interactively. These events are batchValueChanged, endValueChanged, startValueChanged, and valueChanged.

Spinner Components

The spinner components represent a composition of a numeric edit box and two buttons. In addition to the core functionality provided by the numeric edit, the value can also be adjusted through the buttons or by pressing the Up, Down, PageUp and PageDown keys while the edit has the input focus. The interval in which the value can vary is specified through the Minimum and Maximum properties. The current value can

be accessed through the Value property. The events that are raised when the value is changed are valueChanged and batchValueChanged.

Simple Panels

The most basic of all three built-in panels. Simple panels arrange their child components on top of each other, in the order they were added in the Components collection. The children are positioned within the available space according to their HorizontalAlignment, VerticalAlignment, Width and Height.

Stack Panels

Stack panels arrange their children in a vertical or horizontal row, according to the value of the Orientation property.

Grid Panels

Grid panels arrange their children in a table. The rows and columns of this table are defined through GridRow and GridColumn objects which are added to the Rows and Columns collection of the GridPanel respectively. Each grid panel needs to define at least one column and row in order to be effective. The destination row and column of individual child components depends on the value of their GridRow and GridColumn properties.

Components and XML

As described in the Using Components topic, to use components in JDiagram you need to instantiate them and add them to the Components collection of a CompositeNode. JDiagram provides a more convenient method for defining component hierarchies - through XML.

Definition

Each node in the source XML represents a component or an object. The child nodes in the XML represent child components. The XML attributes represent either property assignments or event handler attachments. A simple component hierarchy defined in XML is illustrated below:

XML

```
<SimplePanel>

  <Shape Name="Shape" Shape="Rectangle" />

  <Border Padding="2">
    <GridPanel>
      <GridPanel.Columns>
        <GridColumn Width="30" />
        <GridColumn />
      </GridPanel.Columns>
      <GridPanel.Rows>
        <GridRow />
      </GridPanel.Rows>

      <Image Name="Image" ImageAlign="Fit" />

      <StackPanel Orientation="Vertical" GridColumn="1">
        <Text Name="Title" Font="Arial, 12pt, style=Bold" TextAlignment="Near" />
        <Text Name="FullName" TextColor="Blue" TextAlignment="Near" />
        <Text Name="Text" Font="Arial, 8pt" TextAlignment="Near" />
      </StackPanel>
    </GridPanel>
  </Border>

</SimplePanel>
```

Because the XML documents have a single root, the component hierarchies defined through XML can have a single root too. In the case when a hierarchy needs to have more than one root each root can be defined in its own XML or all the root components can be grouped under a single component container.

As is observed in the sample above the components can be specified through shortcut names. The following table lists all available shortcuts:

Component	Shortcut Name
BorderComponent	Border
ButtonComponent	Button
CheckBoxComponent	CheckBox
EditComponent	Edit
ImageComponent	Image
ShapeComponent	Shape
TextComponent	Text
NumericEditComponent	NumericEdit
SliderComponent	Slider
SpinnerComponent	Spinner

The components can also be defined using their full names.

Composite Properties

Some properties have too complex values and cannot be represented with attributes. Consider for example the collection properties, such as the Columns and Rows properties of the GridPanel. These properties can be defined as child nodes using the specialized syntax illustrated below:

XML

```
<ComponentName>
  <ComponentName.PropertyName>
    <PropertyValue />
  </ComponentName.PropertyName>
</Component>
```

For example, to define Content of a ButtonComponent, you can use the following syntax:

XML

```
<Button>
  <Button.Content>
    <Text Text="Hello world!" />
  </Button.Content>
</Button>
```

Images

Images can be defined in XML using **Bitmap** objects and string paths. Here is an example:

XML

```
<Image>
  <Image.Image>
    <Bitmap>Images/MyImage.png</Bitmap>
  </Image.Image>
</Image>
```

In the example above "Images/MyImage.png" will be interpreted as an image path and the loader will attempt to create a new **java.awt.Image** instance by passing the file path to the **Toolkit.getImage** method.

Shapes

The Shape of shape components can be defined in XML by either specifying the name of a predefined shape or by using the specialized syntax for graphical paths. The example below defines two ShapeComponent instances in a StackPanel. The first shape component uses the predefined Ellipse shape and the second uses a custom arrow shape:

XML

```
<StackPanel Spacing="1">
  <Shape Shape="Ellipse" Width="6" Height="6" Pen="Red" Brush="Yellow" />
  <Shape Shape="M0,30 L50,30 L50,0 L100,50 L50,100 L50,70 L0,70 z" Width="6" Height="6"
Pen="Green" Brush="LimeGreen" />
</StackPanel>
```

The specialized graphical path syntax supports the following subset of operations:

Command	Description
MX,Y	Moves to point (X, Y).
LX,Y	Draws a line from the current point to point (X, Y).
CX1,Y1 X2,Y2 X3,Y3	Draws a curve from the current point to (X3, Y3) using points (X1, Y1) and (X2, Y2) as control points.
AW,H R A D X,Y	Draws an arc with size (W, H) using rotation R and an end point (X, Y). A specifies whether to draw the large arc (1 - large arc, 0 - small arc) and D specifies direction - (1 - positive angle, 0 - negative).
z	Closes the figure.

Loading XML

Component hierarchies defined in XML can be loaded using the XmlLoader class. The class provides several static load method overloads for loading XML from different sources - a content string, **Stream** or XML **Document**. Each of the Load methods returns a ComponentBase representing the root of the loaded hierarchy. This component can then be added to a CompositeNode or as a child of another component. The following example illustrates how to use the **XmlLoader**:

C#

```
CompositeNode node = new CompositeNode();
node.getComponents().add(XmlLoader.load("<Edit Text=\"Some text\" />"));
```

Handling Events

Unlike MindFusion.Diagramming libraries for other platforms, Java version cannot attach handlers to events by names specified in XML. Instead, you will have to add an event listener explicitly after loading a template:

XML

```
<StackPanel Orientation="Vertical" GridColumn="1">
    <Button Name="Button" Width="10" Height="10"/>
    <Edit Name="Edit" Width="50" Height="30"/>
</StackPanel>
```

Java

```
ButtonComponent button = (ButtonComponent)node.findComponent("Button");
button.addComponentMouseEventListener(
    new ComponentMouseEventAdapter()
    {
        @Override
        public void mouseClicked(Object sender, ComponentMouseEvent e)
        {
            EditComponent edit = (EditComponent)node.findComponent("Edit");
            edit.setText("click");
        }
    });
```

Resolving Types

The XmlLoader is capable of resolving external (non-component) types found in the source XML by calling Class.forName. However, this can be slow in certain scenarios. In addition certain types might not resolve properly because the loader always uses the first type that matches the specified name regardless of namespace. For these reasons, the **XmlLoader** provides means to manually resolve external types. In order to take advantage of this, you have to implement the TypeResolver interface and pass an instance of your class to the corresponding load overload. For any external type found, the loader will invoke the resolveType method. If the method returns **null** the loader will attempt to resolve the type using its default logic.

Error Handling

It is not unusual for the XmlLoader to throw an exception when loading components from XML. There are many reasons for this to happen, including ill-formatted XML. Therefore it is recommended to always try and catch exceptions when loading components from XML.

Creating Custom Components

Custom Component

In order to create a custom component, simply derive from any of the built-in component classes, ultimately from the ComponentBase class. Usually you will want to override the draw method to render the component and eventually the getDesiredSize method. A simple custom component is illustrated below:

Java

```
import java.awt.Color;
import java.awt.Graphics2D;

import com.mindfusion.diagramming.RenderOptions;
import com.mindfusion.diagramming.components.ComponentBase;

public class RectangleComponent extends ComponentBase
{
    @Override
    public void draw(Graphics2D g2d, RenderOptions options)
    {
        g2d.setPaint(Color.RED);
        g2d.draw(getBounds());
    }
}
```

The above component only renders a red rectangle.

To provide custom component behavior based on the user input, override the onMouseDown, onMouseUp, onMouseMove, onKeyDown, onKeyUp and onKeyPress methods.

Custom Panel

To create a custom container component, you need to derive from the ContainerComponent class and override the arrangeComponents method and possibly the getDesiredSize method. From within the **arrangeComponents** method you position the individual child components by assigning values to their Bounds property according to their desired size and the arrangement logic of the panel. Below you can find the implementation of a very simple custom panel class, which arranges its children with a constant offset relative to each other.

Java

```
import java.awt.Graphics2D;
import java.awt.geom.Rectangle2D;
import java.awt.geom.Rectangle2D.Float;

import com.mindfusion.diagramming.XDimension2D.Double;
import com.mindfusion.diagramming.components.ComponentBase;
import com.mindfusion.diagramming.components.ContainerComponent;

public class OffsetPanel extends ContainerComponent
{
    @Override
    public void arrangeComponents(Float availableSpace, Graphics2D g2d)
    {
        float y = 0;
        for (ComponentBase component : getComponents())
        {
            // calculate the desired size of the component
            Double availableSize = new Double(availableSpace.getWidth(),
availableSpace.getHeight());
            Double desiredSize = component.getDesiredSize(availableSize, g2d);
            component.setBounds(
                new Rectangle2D.Float(
                    y, y, (float)desiredSize.getWidth(), (float)desiredSize.getHeight()));
            component.arrangeComponents(component.getBounds(), g2d);

            y += 2;
        }
    }

    @Override
    public Double getDesiredSize(Double availableSize, Graphics2D g2d)
    {
        double width = 0;
        double height = 0;

        double y = 0;
        for (int i = 0; i < getComponents().size(); i++)
        {
            ComponentBase component = getComponents().get(i);

            Double desiredSize = component.getDesiredSize(availableSize, g2d);

            width = Math.max(width, desiredSize.getWidth() + y);
            height = Math.max(height, desiredSize.getHeight() + y);

            y += 2;
        }

        return new Double(width, height);
    }
}
```

Using Custom Components in XML

If you want to use custom components in XML you may need to supply a custom TypeResolver object to the loader. This is especially true if you want to use shortcut names for your components. Consider the above RectangleComponent in the following example:

XML

```
<Rectangle />
```

Loading this XML will fail unless you supply an **TypeResolver**, which can resolve "Rectangle" to **RectangleComponent**.

User Interaction

Controlling User Interaction

There are several ways to control user actions on the document as a whole or on the separate items.

Specify How User Actions are Interpreted

The Behavior property provides several predefined sets of rules specifying how user input with the mouse/keyboard is interpreted . If set to LinkShapes, drawing over an empty document area is processed as a ShapeNode creation request and drawing over a node creates a link. Note that such behavior leads to some extra work when creating overlaying nodes - users need to draw the second node on an empty area and move it over the first one afterwards. If you want to avoid that you should use the **DrawShapes** behavior. If **LinkTables** is set, drawing over an empty area creates a table, and dragging over a table creates an link. Behavior options also include **DrawLinks**, **DrawTables** and **Modify**.

Setting Diagram Bounds

Document size can be get or set with the getBounds and setBounds methods respectively. By default, users are able to move items outside document bounds. To prevent this use setRestrictItemsToBounds method. It provides three RestrictToBounds options to restrict item positions. They might not be restricted at all. The most restrictive option is to keep items entirely inside the document area. Another option allows items to be partially outside the document area but having at least a small visible part inside.

Item Constraints

Constraints upon how users are allowed to modify a node are set through the setConstraints and setEnabledHandles methods. The former can be used to constrain the move direction, node size and aspect ratio. The latter enables or disables specific manipulation handles of a node. That allows making the node non-moveable, non-resizable, or resizable only horizontally/vertically.

Items can be locked by the setLocked method. Locked items are excluded from selection and users cannot select, move or modify them.

Control How Links Connect to Nodes

You can specify whether a DiagramNode accepts incoming and outgoing links by using the setAllowIncomingLinks and setAllowOutgoingLinks methods respectively.

Anchor points define where link's ends should be placed when a user attaches a link to a node. A pattern of anchor points can be assigned to a node by calling the node's setAnchorPattern method. To specify whether link ends are aligned to anchor points when creating or modifying links use the setSnapToAnchor method.

You can forbid users to move links' end points by calling setLinkEndsMovable passing **false**. This can also be controlled on a per-link basis through setAllowMoveEnd and setAllowMoveStart methods.

The setAllowSelfLoops method enables or disables drawing of reflexive links. They are allowed by default, but can be disabled if you consider them meaningless for your application. The setAllowLinksRepeat method can be used to control if two nodes can be linked more than once in the same direction.

In-place Text Editing

The text of nodes and tables can be edited in-place by double-clicking the respective items. To enable the feature invoke the setAllowInplaceEdit method passing true as its argument. For tables, both captions and cells can be edited in this way. Call the cellTextEditing method to enable/disable in-place editing per cell. Depending on the type of item being edited, one of these events can be fired when editing completes: nodeTextEdited, cellTextEdited.
In-place editing mode is exited when users click outside the text entry control or by pressing the ENTER or ESC keys if respectively setInplaceEditAcceptOnEnter and setInplaceEditCancelOnEsc are called.

Validation Events

When users try to create, delete or select an item one of the following events is fired. To ban the action, set corresponding event boolean argument to false:

Event	Description
nodeCreating	Raised while a user draws a new node.
linkCreating	Raised while a user draws a new link.
nodeSelecting	Raised when the user is trying to select a node.
linkSelecting	Raised when the user is trying to select a link.
nodeDeleting	Raised when the user is trying to delete a node.
linkDeleting	Raised when the user is trying to delete a link.
nodeModifying	Raised while a user modifies an existing node.
linkModifying	Raised while a user modifies an existing link.
nodeTextEditing	Raised while a user makes changes to the text of a node.
linkTextEditing	Raised while a user makes changes to the text of a link.

For more events that can be fired by user actions, please, visit the DiagramListener section of the documentation.

Miscellaneous

- To enable items to be automatically selected when they are created, call setSelectAfterCreate passing **true**.
- The ModifierKeyActions property allows assigning different functions to the CTRL, ALT and SHIFT keys.
- The RightButtonActions and MiddleButtonActions properties let you change the function of respective mouse buttons.

Single and Multiple Selection

Selecting and Modifying Items

In order to move or modify a diagram element, users manipulate its modification handles. Modification handles appear around an item when it is selected. Each handle can be dragged to perform specific transformation on the item. The appearance and behavior of modification handles can be altered by calling the setHandlesStyle method. You can also invoke the setModificationStart method to make those handles appear automatically for non-selected items when the mouse pointer hovers over them.

Active Item

If only one diagram item is selected, it is considered the 'active' item. One of the items in a multiple-selection is also regarded as active; it is usually the one selected last. The active item has white modification handles drawn around it, while other items in multiple-selection have gray handles. The active item is probably the one, users are most interested in while editing a diagram, and your program can update its state and user-interface according to that. Access to the active item is provided through the getActiveItem method of the Diagram class.

Multiple Selection

Selection of diagram objects in JDiagram is represented by an instance of the Selection class. This class provides methods to programmatically select or deselect items, as well as methods that modify how the selection looks and behaves. The selected items within the current document can be obtained through the getSelection method of the Diagram class. Multiple items can be selected, thus moved at the same time. To programmatically add or remove items to the multiple-selection invoke one of the addItem, toggle and removeItem methods. The clear method deselects all items and the change method selects a single item deselecting all other. To disable multiple selection, pass false to setAllowMultiple.

Drawing a Selection Rectangle

To select multiple items, users must draw a selection rectangle with the left mouse button while holding down the CTRL key. The MiddleButtonActions and RightButtonActions properties let you enable drawing the selection rectangle using the middle or right mouse button.

Custom Lasso Tools

If you set the Behavior property of DiagramView to DrawLasso, the control lets users draw selection lasso without changing actual Selection. You could use that in conjunction with initializeLasso and lassoDrawn events to implement custom tools or selection logic, such as:

- Opening a custom context menu or UI panel styled for bulk operations.
- Creating a visual screenshot / export of only the selected region.
- Implementing custom selection logic or filters (e.g. select nodes of a specific type, or select only links).
- Bookmarking the selected area (adding it to Bookmarks).

Appearance

The visual style of multiple-selection can be modified by the setStyle method of the Selection class. For example selection might be painted as a dashed rectangle or a semi-transparent filled rectangle. Another method related to selection visualization is the Diagram's setSelectionOnTop, which can be used to specify whether selected items should be painted according to their Z-order position or they should be painted on top of the non-selected items.

Enumerating Items

The Selection class exposes the selected items as lists of items. The selected items from a particular class can be accessed through the corresponding method. To get the list of all selected nodes and links, use the getNodes and getLinks methods. You can obtain a list with all selected items, disregarding class, by invoking the getItems method. Alternatively you might enumerate all items in the diagram and call their getSelected method.

Automatic Selection

To enable automatic selection of newly created objects, call setSelectAfterCreate passing **true**.

Automatic Alignment

The following features help the user align items interactively.

Alignment Grid

Items are aligned to a grid when AlignToGrid is enabled. More information is available in the Alignment Grid topic.

Align nodes to nodes

If AutoAlignNodes is enabled, the node currently being drawn or resized is aligned to another node so that a pair of their vertical or horizontal sides become collinear. To specify the maximal distance at which nodes are aligned, set the AutoAlignDistance property. The pair of aligned nodes is indicated visually by drawing an alignment guide using the pen assigned to AlignmentGuidePen.

Snap links to nearby nodes

The currently drawn or modified link can automatically snap to the nearest border point of the nearest node when AutoSnapLinks is set. The maximal distance at which links will connect to a nearby node is set via AutoSnapDistance.

Clipboard Operations

A single diagram item or a selection of items can be copied or cut to the system clipboard. This is done programmatically using the copyToClipboard and cutToClipboard methods. To paste the clipboard contents into the current diagram call pasteFromClipboard.

If you create a custom item type, its instances can be copied to the clipboard only if they are registered for serialization using registerItemClass and provide a copy constructor. If the class defines additional fields, they must be serialized by the respective save / load method overrides to allow copying their values to the clipboard.

JDiagram does not provide keyboard interface to clipboard operations. You might assign the standard CTRL+C, CTRL+X and CTRL+V shortcuts to menu items and handle them by calling the respective methods.

Scrolling and Zooming

Enable Scrolling

To enable scrolling, add the DiagramView instance to a **JScrollPane** container or to a Ruler.

Diagram Size

The diagram size is specified through the Bounds property. Its value is a **Rectangle2D** instance that specifies the origin of the diagram coordinate system and the diagram size. The scrollbar ranges also depend on the current ZoomFactor.

Automatic Scrolling

The setAutoScroll method enables or disables automatic scrolling. When a user drags a modification handle outside JDiagram visual area while manipulating an item, if automatic scrolling is enabled, the control will scroll its view towards the pointer position. The ScrollZoneSize property defines the size of the area near the view borders that triggers automatic scrolling.

Programmatic Scrolling

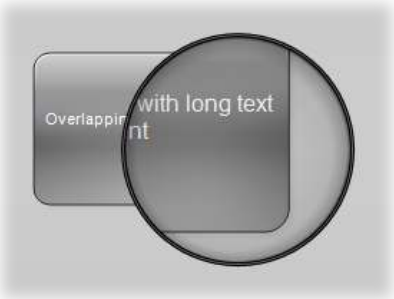
To scroll the document contents programmatically, you can use one of the scrollTo, setScrollX or setScrollY methods. To get the current scroll position, call getScrollX and getScrollY. The bringIntoView method scrolls the viewport to ensure that a specific diagram item can be seen in the view.

Scrolling Nodes

The contents of nodes such as ContainerNode, TableNode and TreeViewNode can be scrolled too. Set a container's Scrollable property to allow scrolling, with AutoGrow disabled to let the container's contents overflow. If a table's Scrollable property is set to **true**, there are up/down scroll buttons displayed in the table's caption bar. By clicking these buttons users can scroll the rows of the table. Scrolling can also be done programmatically using the CurrentRow property.

Zooming

Zooming is controlled by the setZoomFactor method. The zoom factor is expressed as a percentage, 100% meaning no zoom. Higher than 100% makes the diagram items look closer and bigger on the screen - zooming in. Less than 100% makes items look further and smaller on screen - zooming out. To zoom and scroll the view to fit the diagram contents to the control's client area, call zoomToFit. To zoom and scroll the view so it fits a specified rectangular document area to the control's client area, call zoomToFit(Rectangle2D**)**.



Lasso Zoom Tool

The control supports several ways to zoom using lasso tool:

- Set the Behavior property to Zoom to always draw zoom lasso.
- Set the Zoom flag for one of the keys in ModifierKeyActions to let users draw zoom-lasso with respective modifier key pressed and the left mouse button.
- Assign Zoom value to RightButtonActions or MiddleButtonActions property to zoom using respective mouse button.

Magnifying

The DiagramView provides an option for zooming in (or out) portions of the diagram through the Magnifier tool. The magnifier tool can be permanently activated by calling setMagnifierEnabled. Alternatively, on-demand magnification through a Magnify value to the view's Behavior property.

The magnification factor can be specified by calling the setMagnifierFactor method. The size of the tool and its border thickness can be set through the MagnifierWidth, MagnifierHeight and MagnifierFrameThickness properties.

Panning

The diagram view can be panned by holding ALT while dragging the mouse with the left button down. To let users pan the view with the left mouse button without using a modifier key, set the Behavior property of DiagramView to Pan. JDiagram displays the PanCursor while panning.

Tool-Tips

Tool-tips are short text messages displayed when the mouse pointer hovers over a diagram item for a while.

Tool-tips can be defined for each diagram element and for the whole document. If the mouse pointer stands still and it points to an item, then the tool-tip of the item is displayed. The tool-tip of the diagram appears if there is no item under the cursor or if there is an item but there isn't any tool-tip text defined for it. To associate a tool-tip with the diagram, use the setToolTip method. To associate tool-tips with individual items, use DiagramItem.setToolTip.

The tooltips can display HTML content, including links, images and formatted text. To enable this, enclose the tooltips' text between <html> and </html> tags, and then use HTML formatting tags as you would do in a web page.

Tool-tip's text is also used as a value of the ALT attribute of image map areas corresponding to items; see HtmlBuilder for more information.

In-place Editing the Contents of Items

Standard in-place editing

To activate the standard in-place editing of the text of JDiagram objects, call the setAllowInplaceEdit method passing **true**. The **setAllowInplaceEdit** method allows in-place editing the content of a diagram element by double-clicking it. In-place editing mode can be accepted and exited by clicking anywhere outside the text-field.

If you want to change the way of accepting / rejecting changes, the following DiagramView methods allow using the ENTER and ESC keys to perform that: setInplaceEditAcceptOnEnter and setInplaceEditCancelOnEsc. When **setInplaceEditAcceptOnEnter** indicates a **true** value, pressing the ENTER key causes accepting changes and exiting in-place editing mode. If **setInplaceEditAcceptOnEnter** indicates **false**, pressing ENTER inserts a new line in the text while in in-place editing mode. If **setInplaceEditCancelOnEsc** passes **true**, pressing the ESC key performs rejecting changes and exiting in-place editing mode.

In-place editing can be applied to the attributes enabled by the following methods: ShapeNode.setText, DiagramLink.setText, Cell.setText, TableNode.setCaption and ContainerNode.setCaption. For tables, both captions and cells can be edited in this way.

If you want to enable/disable in-place editing of a specific table's cell, handle the cellTextEditing event. To enable/disable in-place editing of nodes, handle the nodeTextEditing event. For a DiagramLink object, the linkTextEditing event is raised while in-place editing. These validation events let you prevent users from editing the text in the particular object if it is necessary.

When in-place editing of a node is completed, the nodeTextEdited event is raised. For a table's cell, handle the cellTextEdited event. The linkTextEdited event is raised when in-place editing of a **DiagramLink** object completes.

By default, JDiagram creates **JTextArea** control instance to let users edit item's text. The enterInplaceEditMode event allows customizing the properties of that control, or attaching event handlers to it. **enterInplaceEditMode** specifies the font of the in-place edited text box. The setInplaceEditFont method sets the font used to display text in the in-place editing text control.

When leaving in-place editing mode, the leaveInplaceEditMode event is raised. This event is raised in all cases of closing the in-place editing control, for example, when the user accepts or cancels the changes made to an item's text, or when the EndEdit method is called.

To enter in-place editing mode programmatically and let users edit an item's text inline, call the beginEdit method of DiagramView. The **endEdit** method exits in-place editing mode.

In-place editing of custom items

The InplaceEditable interface allows implementing the standard in-place editing for custom defined items. By means of the methods of this interface, you can specify the position of the in-place editing JTextArea control and copy the entered text to a property of the edited item.

The getEditRect method returns the destination rectangle of the in-place editing box. getTextToEdit represents the initial contents of the in-place editing box. setEditedText sets the edited text to the object after completing the in-place editing.

Using custom editor controls

Handle the createEditControl event to create a custom in-place editor control. This event is raised if AllowInplaceEdit is enabled and the user double-clicks an item, or when the application invokes the

beginEdit method of DiagramView. When the event is raised, set its EditControl argument to an instance of your custom editor class. You can use any Java Swing component as editor instead of the default **JTextArea**. It is your responsibility to set the editor control size and position. For an example, take a look at the *InteractiveTable* sample project.
When the user exits in-place editing mode by clicking outside the editor, MindFusion.Diagramming raises the destroyEditControl event. Handle it to transfer the values entered into the editor to the respective properties of the edited item, and finally destroy or hide the editor control.

Placement and Layout

Items Placement

Measure Unit

The setMeasureUnit method lets you specify the unit of measure for all location and size -related values assigned to JDiagram object attributes by passing as arguments to their methods.

Location and Size of Nodes

Use the setBounds or getBounds methods to change or get the location and size of a node. To move a node without changing its size, call the move method. To change only the size of a node, invoke the resize method. The ShapeNode's resizeToFitImage and TableNode's resizeToFitImage methods set nodes' sizes to fit that of their pictures.

Links Control Points

Links have two or more control points, depending on their style and segment count. You can get access to the control points by using the DiagramLink.getControlPoints method. You must call updateFromPoints after moving control points of a link in order to repaint the link and update its internal state variables. The smallest rectangle that bounds all link points can be obtained by calling the DiagramLink.getBounds method.

Link Dynamics

Use the Dynamic property of a link to enable it to automatically recalculate its end point positions if the nodes connected to the link are moved or resized; the end points are moved in such a way that the link points to the centers of the linked nodes. A related property is AutoSnapToNode, which can be enabled to make the link end points align to the border of their origin or destination nodes while a user move the link ends.

The setRetainForm and getRetainForm methods are useful for links that have more than two control points. If the nodes connected by a link are moved around, usually only the segments at the ends of that link are updated, so that they stay linked to their respective nodes. In that case all intermediate control points stay where they are. However, if **setRetainForm** is enabled, all control points will move simultaneously in a way they preserve their relative position to each other, and thus preserving the overall form of the link.

To enable or disable automatic routing of a link, use the setAutoRoute and getAutoRoute methods. Routed links avoid nodes by finding the shortest path between their origin and destination that does not cross any other nodes. The link routing algorithm can be tuned through the attributes accessed by getRoutingOptions. The getRouteLinks method gets whether newly created links will automatically find their way between nodes. To set links to find their route automatically, call setRouteLinks.

Interactive Moving or Resizing

End-users of your application can move around or resize diagram objects. They do this by selecting an item and dragging any of its adjustment handles, a point inside its interior, any of it sides or a selection frame.

The way diagram nodes can be interacted with can be controlled by using the setHandlesStyle and getHandlesStyle methods. The handle style also defines the visual representation of selected items on screen. setEnabledHandles and getEnabledHandles allow disabling specific manipulations to perform on a node, for example resizing the item horizontally or moving it. If a node is modified interactively, the nodeModified event is fired. When the user moves any control point of a link, the linkModified event is raised.

Controlling the Z-order

The Z-order defines how items are ordered on the Z-axis so that one looks above or below another. Members of the DiagramItem class give you full control over the Z-order. To move an item one level up or down, invoke the zLevelUp or zLevelDown methods. To move an item to the bottom of the Z-order, call its zBottom method. To move the item in front of all others, call its zTop method. You can use the setZIndex or getZIndex method to get or set the index of an item in the Z-order array.

Alignment Grid

JDiagram provides an alignment grid to help users place diagram items more precisely. To activate the grid, use the setAlignToGrid method. If the grid is active while an item is being created or modified, the item's control-points are aligned to the nearest grid points. The distance between adjacent grid points is set by calling the setGridSizeX and setGridSizeY methods. The GridOffsetX and GridOffsetY properties allow specifying the horizontal and vertical offset of the first point in the alignment grid.

Items created or modified by a user are automatically aligned to the grid. However, if items are placed in the diagram programmatically, their coordinates are set to the specified positions without aligning. In such cases use alignPointToGrid if items must be placed exactly at grid points.

The method setShowGrid can be used to turn the grid visible or invisible. The color and style of a visible grid can be adjusted through the setGridColor and setGridStyle methods respectively.

Lanes Grid

The classes from the com.mindfusion.diagramming.lanes namespace let you develop process maps and swimlane diagrams, useful in business process planning and reporting. Processes consist of consecutive operations accomplished by people involved, technical installations, means of contact, and flow of information. The swimlane grid features allow indicating and arranging related diagram items in complicated processes and systems, that is, Swim lane diagrams (known as Rummler-Brache diagram), Gantt Charts (planning and scheduling of projects). A lane in the grid can visually contain nodes, links, shapes or images, that represent tasks fulfilled in specified periods of time by people, companies or departments.

The **com.mindfusion.diagramming.lanes** namespace provides the Grid, Header, HeaderList and Style classes, the ICell interface and the ResizeType enumeration. These types expose additional properties and methods that let you define your own grids as required by your application logic. Grids can include varying number of lanes, divided into child rows and columns whose intersections form cells. The cells color and style can be customized too.

Use the EnableLanes property of the Diagram class to display lanes in your application. The LaneGrid lets you setup the rows and columns in the grid by defining horizontal and vertical lanes, where each lane can be titled by its own header and/or subheadings. The grid can be resized by setting the ColumnCount and RowCount properties or by adding headers to the ColumnHeaders and RowHeaders collections. A column or row can be divided into child elements by adding to the SubHeaders collection of a **Header**, which lets you form a complex hierarchy of unlimited depth. The intersection of rows and columns can be either a simple cell for bottommost elements in the hierarchy, or a group of cells for parent rows and columns. Cells or cell groups can be accessed via the grid class get method, that lets you index cells either by their integer positions, or by their **Header** objects.

If the AllowResizeHeaders property of the **Grid** class is enabled, users can resize the grid columns and rows as desired. LaneColumnResizeCursor and LaneRowResizeCursor properties get or set the mouse cursor

shown when resizing the lane column header or the lane row header. CellBoundsChanged event is raised when a cell is resized. An application can handle this event in order to rearrange or resize nodes so that they stay within a specific column or row of the grid.

The position of the grid and grid headers within the diagram is defined via TopMargin and LeftMargin, which specify the grid offset relative to Bounds. HookHeaders enables lane headers to be anchored to the left or right side of the control's visible area. The sizes of headers at different levels in the lane hierarchy can be set in a single operation by the RowHeadersWidths and ColumnHeadersHeights properties.

The appearance of the lanes grid can be customized further via the AlignCells property, which specifies whether cells are aligned to each other, the HeadersOnTop poperty, which specifies whether headers should appear on top of the Z-order, and the TopLeftAreaStyle specifying the appearance of the grid's top-left corner.

The **Grid** class provides many miscellaneous methods that can be used to find grid elements, for determining their bounds and for hit-testing: findColumn, findRow, getCellBounds, getCellColumn, getCellFromPoint, getCellRow, getColumn, getRow, getRowIndex, getColumnHeaderBounds, getColumnIndex, getHeaderBounds, getRowHeaderBounds, getHeaderFromPoint.

Laying out Diagrams Automatically

Applications that process hierarchical or more complex entity-relationship data might need to present that data to end-users in an aesthetical and visually appealing manner. Such applications would store their data as graph of connected nodes possibly having additional information attached to them. However, position and size coordinates of nodes might be unnecessary and/or unavailable. JDiagram provides a way to automatically arrange the nodes of a diagram, applying attractive layouts on the overall structure of the diagram. To utilize that functionality, an application can create a diagram by assigning generic coordinates to its nodes, instantiating a layout object and invoking the layout's arrange method. The **arrange** methods can be prevented from changing positions of individual items by setting the IgnoreLayout property of those items to **true**.

The classes that implement automatic layout algorithms are located in the com.mindfusion.diagramming namespace. The following sections list the available algorithms categorized by their general implementation strategy: force-directed algorithms, graph topology based algorithms and semantics based algorithms.

Force-directed layout algorithms

Force-directed algorithms simulate forces acting between objects in the graph and iteratively run a physical simulation that pulls the objects closer or pushes them apart. At each iteration the energy associated with the simulated system decreases, and the node positions calculated by this process usually lead to evenly distributed nodes and uniform link lengths.

Spring-Embedder Graph Layout

Spring-Embedder is force-directed layout algorithm. It simulates a physical system in which nodes repulse each other, and the links between them act as confining springs. Graphs processed by Spring-Embedder have their nodes distributed uniformly across the diagram area. The algorithm can be applied on a graph by creating a SpringLayout object and calling its arrange method. Members of SpringLayout allow you to set the desired distance between graph nodes and the number of iteration steps to use while calculating node positions. You can also specify that JDiagram should try to minimize link crossings. If you select that option, the algorithm would produce better result with more iteration steps. However, it needs more time to complete if more steps are specified. Spring-Embedder layout might be applied like this:

Java

```
import com.mindfusion.diagramming.*;

...
void someMethod()
```

```
{
    SpringLayout layout = new SpringLayout();

    layout.setIterations(500);
    layout.setNodeDistance(30);

    layout.arrange(diagram);
}
```

Grid Graph Layout

The GridLayout algorithm arranges diagram nodes in a grid, keeping connected nodes close together. The algorithm strives to achieve a small number of link crossings. It is based on an iterative process whose initial steps shuffle the grid nodes randomly. That can lead to very different results each time the algorithm is run. To apply the layout to a diagram, create a **GridLayout** instance, set its members and invoke the arrange method. The grid layout might be applied like this:

Java

```
import com.mindfusion.diagramming.*;

...
void someMethod()
{
    com.mindfusion.diagramming.GridLayout layout =
        new com.mindfusion.diagramming.GridLayout();

    layout.setGridSize(75);

    layout.arrange(diagram);
}
```

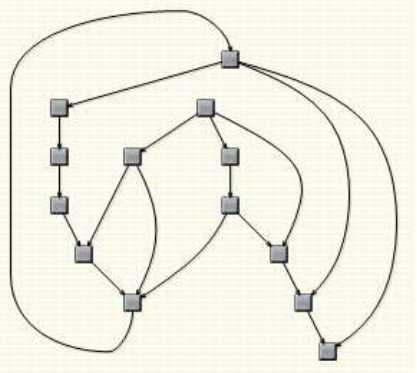
Simulated Annealing Graph Layout

The AnnealLayout class implements the Simulated Annealing graph layout algorithm. Simulated Annealing is a general-purpose optimization method used to solve large-scale combinatorial problems by simulating the process of heating and cooling of metal to achieve freedom from defects. Finding a nice arrangement of a graph is a combinatorial problem that can be reduced to assigning costs to graph configurations and finding the minimum cost configuration. **AnnealLayout** assigns costs to graph configurations by evaluating different aesthetic criteria such as distance between nodes, length of links and the number of link crossings. Thus the best configuration found will have good aesthetic properties.

Circular Graph Layout

CircularLayout distributes nodes evenly on the circumference of a circle at positions that result in as few link crossing as possible. Set its Radius attribute to specify the size of the layout circle. Set SiftingRounds to set the umber of fine-tuning crossing-reduction iterations.

Topology based layout algorithms



The following algorithms are based on the topological features of the graph being arranged, such as the size and adjacency of faces (a face is a region bounded by links) and the overall direction of links. The algorithms differ in the shape they apply to graph faces and the manner in which faces are embedded in the plane.

One-way Graph Layout

The OneWayLayout class ensures that links enter into nodes from the same general direction and exit them from the opposite side. If the graph contains cycles, some links bend around the nodes to keep the enter/exit direction consistent. The algorithm aims to minimize the number of such links.

Orthogonal Graph Layout

The OrthogonalLayout class implements an orthogonal graph layout algorithm. Each link is drawn as a chain of alternating horizontal and vertical segments. Nodes are placed in a way that facilitates few links bends and crossings. This algorithm was designed for planar graphs where the nodes have at most four incident links, and produces best results with such graphs as input. It can arrange any arbitrary graph as well, by adding some dummy nodes and links to planarize the graph and reduce its vertex degree, and removing them after the layout. However this might lead to using larger area than necessary, due to the space occupied by dummy elements.

Orthogonal Router

OrthogonalRouter is a secondary layout algorithm that can be used to arrange links after an initial node arrangement has already been applied. The orthogonal layout is useful when there are much more links than nodes in a graph. The algorithm strives to achieve the following criteria, while preserving as much of the initial node configuration as possible.

- links must not overlap;
- only vertical and horizontal routing lines are used;
- graph routing is performed with respect to the specified main layout direction;
- links crossings are minimized;
- bends are minimized;

Topological Layout

If the underlying graph if acyclic, TopologicalLayout arranges the nodes linearly in such a way that each node comes before all destination nodes of its outgoing links. The links are drawn as arcs above the chain of nodes, with their height proportional to the distance between the nodes. If the graph is not acyclic, the layout algorithm finds an ordering with a minimal number of back links, and draws the back links below the chain of nodes.

Cascading Graph Layout

CascadeLayout places nodes on a virtual grid and arranges links orthogonally, such that if the source graph is planar all links are guaranteed to have no more than two bends and will not intersect. By default the layout method arranges nodes in rows and link segments in columns; this can be changed by setting the Orientation property.

Triangular Graph Layout

TriangularLayout places nodes on a virtual grid, such that if the source graph is planar, all links are guaranteed to have a single segment and not intersect. If the graph is not planar, its intersecting links can be optionally segmented and bended in order to improve readability. The layout method places the nodes from the external face on a triangle and recursively adds the rest of the nodes as vertices of internal triangles. As a result, it is very effective for near maximal-planar (a.k.a. triangular) graphs.

Semantics based layout algorithms

The following algorithms arrange the diagram in a way that shows the semantics of individual items or the overall graph structure, such as hierarchical relations between objects, loops and decisions in flowcharts, assignments of nodes to layers or swimlanes.

Tree Layout

If application's data is structured hierarchically, it is appropriate to apply tree layout on it. To do this, create a TreeLayout object and call its arrange method. Members of TreeLayout control many aspects of the layout process. The type of layout can be directional or radial. You can choose how much space to leave between tree levels and between nodes on the same level. For directional layouts the style of links in the arranged

tree can be set to straight, orthogonal or curved. Global tree direction and alignment can be customized too. The tree layout might be applied as shown below:

Java

```
import com.mindfusion.diagramming.*;
import com.mindfusion.diagramming.jlayout.*;

...
void someMethod()
{
    TreeLayout layout = new TreeLayout();

    layout.setType(TreeLayoutType.Cascading);
    layout.setDirection(TreeLayoutDirection.LeftToRight);
    layout.setLinkStyle(TreeLayoutLinkType.Cascading2);
    layout.setLevelDistance(10);

    layout.arrange(diagram);
}
```

Fractal Tree Layout

FractalLayout is a tree layout algorithm that places child nodes symmetrically around their parent node. Nodes at the lowest level are arranged directly in a circle around their parent. At the upper level, the already arranged nodes form branches that are arranged in a circle around the new parent node. The algorithm is recursively repeated till the highest level is reached. If nodes in the tree have uniform number of children, the end result has fractal-like appearance (subsets of the graph look like scaled-down copies of the whole graph).

You can choose which node should be displayed at the center of the topmost circle by setting the Root property. If it is not specified, the algorithm automatically selects a root that leads to more balanced distribution of nodes.

Layered Graph Layout

The LayeredLayout algorithm arranges diagram nodes in layers according to several criteria, most important of which are: connected nodes must be placed close together; links must flow in one direction if possible; links must cross as few layers as possible; links must not cross other links. To apply the layout to a diagram, create a LayeredLayout instance, set its members and invoke the arrange method. The layered layout can be applied like this:

Java

```
import com.mindfusion.diagramming.*;

...
void someMethod()
{
    LayeredLayout layout = new LayeredLayout();

    layout.setOrientation(com.mindfusion.diagramming.jlayout.Orientation.Horizontal);
    layout.setSplitLayers(true);
    layout.setLayerDistance(35);

    layout.arrange(diagram);
}
```

Tree map layout

Tree maps represent hierarchies by nesting child nodes within their parents, where the areas of leaf nodes are proportional to their Weight values. Unlike other layout algorithms, TreeMapLayout expects hierarchies to be defined via grouping or containment (see attachTo method and ContainerNode class), and will ignore any links in the diagram. The diagram area covered by the topmost nodes in a hierarchy is specified via the LayoutArea property. By default, the layout tries to keep the ratio of node sides as close as possible to one. However this could make it hard to distinguish separate levels of the hierarchy. To alleviate that, set Squarify to **false**, and child nodes will be arranged either as a row or a column inside their parent node,

alternating directions for each level. The drawback is that when **Weight** ratios differ greatly or nodes contain many children, some nodes could end up with very narrow rectangles.

Decision flowchart layout

DecisionLayout arranges simple flowcharts consisting of decision boxes with up to three outgoing links per node and activity boxes with a single outgoing link per node. The nodes are arranged in columns and rows, whose distance depends on the HorizontalPadding and VerticalPadding property values. When links share the same row or column, they are placed at a distance specified via LinkPadding. The layout arranges nodes recursively starting from StartNode. If **StartNode** is not specified, the algorithm selects the root of the deepest branch of the graph's spanning tree as start node.

Flowchart Graph Layout

FlowchartLayout recognizes program code -like patterns in the graph, such as loops, sequences and if/switch branchings, and arranges them recursively. **FlowchartLayout** could be used to arrange other types of graphs as well, though with some restrictions. For example it treats all back links as loops in the code, and expects that they are nested - loop links starting closer to the stop node should end closer to the start node. Another similar restriction is that there shouldn't be any cross-links that connect different branches of a decision sub-graph.

Swimlane Layout

SwimlaneLayout can be used to arrange process diagrams in which nodes representing activities are placed in swimlanes representing resources. The index of the resource allocated to an activity should be assigned to the corresponding node's LayoutTraits via the SwimlaneLayoutTraits.Lane key.
By default, the algorithm works with the diagram's LaneGrid, but its SwimlaneGrid property can be set to any class that implements ISwimlaneGrid. This allows applying the layout to a custom-drawn grid rendered through the drawBackground event, or one composed of locked background nodes.

Hierarchical Graph Layout

HierarchicalLayout places nodes on user-defined levels, such that if the source graph is level-planar, all links are guaranteed to have a single segment and not intersect. The layout method requires that for each node LayoutTraits contains a HierarchicalLayoutTraits.Level entry specifying the level, and no two connected nodes must be on the same level.

Link Routing

Routed links avoid nodes marked as obstacles (call the getObstacle and setObstacle methods) by finding the shortest path between their origin and destination that does not cross any other nodes.

Setting Up a Link Router

The control finds paths for links affected by modifications of nearby nodes by calling methods of an object that implements the LinkRouter interface. This object can be get or set through the LinkRouter property of the Diagram class. JDiagram provides a few classes that implement **LinkRouter** - PatternRouter, GridRouter, QuickRouter and CompositeRouter. By default LinkRouter is set to a **CompositeRouter** instance.

Automatic or Explicit Routing

The routeAllLinks method can be invoked to explicitly rearrange links in a way they do not cross nodes. In addition, links have an AutoRoute property that enables or disables automatic routing of a link; that property is initialized from the diagram's RouteLinks value. The TriggerRerouting property of RoutingOptions class specifies when links should be rerouted automatically.

Tuning the Routing Algorithm

When a GridRouter is used, the RoutingOptions class allows customizing various aspects of the routing algorithm. That algorithm evaluates possible paths aiming to find one that has a minimal cost. The values

set through the setLengthCost, setTurnCost, setCrossingCost and setNodeVicinityCost methods are added to the total cost of a route and have a great influence over the shape of the chosen path. The orientation of the first and the last segment of the routed links can be specified by calling the setStartOrientation and setEndOrientation methods respectively.

Anchor Points and Patterns

Anchor Points

For each node you can define one or more points to which links should dock when connecting to that node. Such points are represented by instances of the AnchorPoint class. The position of an anchor point relative to node's bounding rectangle is specified by calling the setX and setY methods. Their values are expressed as percent of the node's width and height to accommodate for moving and resizing. The final location of an anchor point is determined by this simple calculation:

Java

```
return new Point2D.Float(
    nodeRect.x + nodeRect.width * x / 100,
    nodeRect.y + nodeRect.height * y / 100);
```

A point's position can also be defined as a fixed offset from the node's top-left corner, letting you define anchor positions that do not depend on the node's width or height. This is controlled independently for X and Y coordinates, by means of the XUnit and YUnit properties.

To control whether an anchor point accepts incoming or outgoing links or both, call the setAllowIncoming and setAllowOutgoing methods. When a link is drawn, its ends are aligned to the nearest anchors allowing docking of the respective end type. Another way to control whether links can be connected to an anchor point is to handle the validateAnchorPoint event.

Anchor Patterns

An AnchorPattern instance defines a set of anchor points to be used together. When creating an anchor pattern, pass to its constructor an array of AnchorPoint objects. The **AnchorPattern** class exposes several predefined patterns that can be accessed through the static fromId method. An existing pattern can be accessed and assigned as a single entity trough the getAnchorPattern and setAnchorPattern methods of nodes. The following example creates a pattern of four anchor points:

Java

```
pattern = new AnchorPattern(new AnchorPoint[] {
    new AnchorPoint((short)50, (short)0, true, true),
    new AnchorPoint((short)100, (short)50, true, true),
    new AnchorPoint((short)50, (short)100, true, true),
    new AnchorPoint((short)0, (short)50, true, true) }, "Decision");
```

The points are located at the middles of bounding rectangle sides of nodes to which the pattern is assigned. All four points accept both incoming and outgoing links.

Displaying Anchor Points

Anchor points can be hidden, always visible on the screen, or displayed automatically. This can be specified through the getShowAnchors and setShowAnchors method. The appearance of anchor point marks can be customized by calling their setMarkStyle and setColor methods.

Anchor Patterns and Tables

A distinct anchor pattern can be assigned to every row of a table. When a link is connected to a row, the respective end of the link is aligned to the nearest AnchorPoint assigned to that row. If a row does not have associated anchor points of the appropriate type (incoming/outgoing), the link will be connected to the

nearest row that has such anchors defined. If none of the rows of a table has an associated anchor pattern, links are connected to the middle of the left or right side of the pointed row.

Undo and Redo

Overview

Interactive actions, carried out by users, and programmatic commands that change the structure of a diagram are recorded in a history queue. While action records are still in that queue, the actions can be undone or redone. The queue has a fixed length - if it gets full, recording a new action makes the oldest one drop from the queue.

Undo is disabled by default. To enable it, call the setUndoEnabled method. To undo or redo an action, call the undo or redo methods of UndoManager. JDiagram does not provide keyboard shortcuts for undo/redo. Your application must have its own menu items and/or keyboard accelerators to provide the necessary user interface, and invoke the respective methods in response to UI events.

JDiagram automatically saves the following types of actions for later undo/redo:

- adding an item to the diagram
- removing an item from the diagram
- moving or resizing items
- creating a group
- destroying a group
- expanding or collapsing trees
- scrolling table rows
- adding or removing tables' rows

Changes of item values are not saved automatically in the history. If your application must be able to undo/redo changes, use the ChangeItemCmd command. **ChangeItemCmd** allows recording several changes as an atomic undoable action.

In some cases, you might need to create your own types of actions or commands. For example, suppose you need undo/redo for changes made to items' tag objects. However, JDiagram is not able to detect such changes, so it cannot undo them. To enable undo/redo, create a subclass of Command and implement the **execute**, undo and redo methods.

Actions and Commands

Undoable interactive actions and programmatic commands that can be carried out by JDiagram are represented by Command subclasses. The **Command** class provides the necessary interface to **execute**, undo or redo actions. In some cases, you will have to implement these methods in derived classes, but you should not call them directly. Use the undo or redo methods of the UndoManager to undo or redo a command. The UndoManager methods call the respective Command methods and in addition update the state of the command history and the Diagram.

The following JDiagram classes are derived from **Command**:

Command	Description
AddGroupCmd RemoveGroupCmd	Creates a new hierarchical group. Destroys a group.
AddItemCmd RemoveItemCmd ChangeItemCmd	Adds a new item to the diagram. Removes an item from the diagram. Handles undo/redo of item changes.

CompositeCmd	Allows several actions to be undo and redone at the same time.
AddToContainerCmd	Adds an item to a container.
FoldContainerCmd	Folds a container node.
GroupAttachCmd	Attaches an item to a group.
GroupDetachCmd	Detaches an item from a group.
ModifyItemCmd	Moves or resizes an item.
RedimTableCmd	Change number of table's columns or rows.
ExpandItemCmd	Expands or collapses a tree of items.
ScrollTableCmd	Scrolls table's rows.
ExpandHeaderRowCmd	Expands or collapses tables sections.
RemoveFromContainerCmd	Removes an item from the container node.

Instances of most of these classes are created implicitly by JDiagram in response to users' actions or method calls. You might need to explicitly instantiate only **ChangeItemCmd** - to undo or redo property changes - and **CompositeCmd** - to present several actions as single undoable operation.

The data of your application might be tightly integrated in JDiagram diagrams, for example through tag objects. In these cases, JDiagram cannot detect undo or redo changes to your data. To enable undo of such changes, you must inherit the **Command** class and implement your versions of the **execute**, **undo** and **redo** methods. To record your own action in the undo/redo history, call the executeCommand method of **Diagram**.

Undo Manager

The undo manager acts as a mediator between commands, the diagram and the command history. It is represented by the UndoManager class, whose only instance can be accessed by calling the Diagram's getUndoManager method.

By default, undo functionality is disabled - commands are executed, but are not recorded in history for later undo or redo. To enable undo, invoke setUndoEnabled and pass **true** as argument. You might need to disable undo before executing actions not intended to be undone by the end-users, for example creating special start/end nodes. Another situation in which you might want to disable undoing is when creating programmatically a lot of new diagram items - say hundreds or thousands. JDiagram creates an undo record for each item creation; if the capacity of the command history (getCapacity, setCapacity) is smaller than the number of items created, most of the records will drop from the history queue while adding new ones. That would waste processing power and memory for creating undo records that won't be used.

As an alternative, you can create a composite record by calling startComposite. All subsequent create-item actions are saved in the composite. The composite is saved in the undo history as a single record that allows undo or redo of all constituent actions as a single operation. **startComposite** creates and returns a CompositeCmd instance, which is marked as active composite in the undo manager. While there is an active composite, all actions that are carried out are added to it. Call the execute method of the active composite to stop recording sub-commands in it and save it in the history as atomic undoable operation.

Use the undo and redo methods of the undo manager to undo or redo actions. Do not call the respective methods of the Command class - they are called internally by the undo manager, and in addition the current command history position is updated and the diagram view is repainted.

Command History

The undo/redo history is represented by a CommandHistory instance. That instance is created by the UndoManager and can be accessed from its getHistory method.

The undo manager adds commands to the history after executing them. If the history queue is full, the oldest command records are removed when new ones are added. Use the setCapacity method of **CommandHistory** to specify how many action records to keep in the queue.

The history has a current-command pointer indicating which are the next commands to undo or redo. If a command is undone, the current pointer in the history queue is moved back and allows undoing even older actions. If the current pointer is not at the last record, any newer commands can be redone again.

To query which are the next commands to be undone or redone, use the getNextUndo and getNextRedo methods. They return the Command instances contained in the queue, which are referred by the current position pointer. If no further undo or redo is possible, these methods return **null**. You might use them to indicate to end-users, which are the next commands to undo/redo, for example

Java

```
if (diagram.getUndoManager().getHistory().getNextUndo() == null)
{
    // everything has been undone
    miUndo.setEnabled(false);
    miUndo.setLabel("Undo");
}
else
{
    if (diagram.getUndoManager().getHistory().getNextUndo() instanceof AddItemCmd)
    {
        // the next action to undo is item-creation
        miUndo.setEnabled(true);
        miUndo.setLabel("Undo Create");
    }
}
```

To ban end-users from undoing last commands, clear the command history by invoking the clear method.

Undo or Redo Item State Changes

Changes to the state of diagram items caused by invoking item methods that change the item's state are not recorded automatically for later undo. To enable undo of these changes, you must explicitly create a ChangeItemCmd instance and add it to the history queue.

The ChangeItemCmd constructor requires a reference to an item as argument and saves the item's initial state to be restored by later undo. Call the ChangeItemCmd.execute method after one or more item's method calls. **execute** records the final state of the item to be restored by later redo. This allows changes to several properties of an item to be saved within a single record, which can be undone or redone as a single operation:

Java

```
ShapeNode node = (ShapeNode)diagram.getNodes().get(0);

// save item state
ChangeItemCmd propChange = new ChangeItemCmd(diagram.getNodes().get(0), "Change");

// change properties
node.setText("new text");
node.setBrush(new SolidBrush(Color.blue));
node.setShape(Shape.fromId("Ellipse"));

// add to history
propChange.execute();
```

You might need to treat changes to several items as an atomic operation. To do so, create a CompositeCmd instance and add the **ChangeItemCmd** commands to the composite by calling the addSubCmd method:

Java

```
if (diagram.getSelection().getNodes().size() == 0) return;

// make all changes seem like a single operation by
// putting them in composite Command
CompositeCmd composite = new CompositeCmd(
    diagram, "Change selection");

for (DiagramNode node : diagram.getSelection().getNodes())
{
    ShapeNode shapeNode = (ShapeNode)node;

    // save item state
    ChangeItemCmd propChange = new ChangeItemCmd(shapeNode, "Change");

    // change properties
    shapeNode.setText("new text");
    shapeNode.setBrush(new SolidBrush(Color.blue));

    // add to the composite
    composite.addSubCmd(propChange);
}

// store final state of all contained commands
composite.execute();
```

Composite Commands

Sometimes you might prefer having a set of actions undo and redo as a single atomic operation. JDiagram provides the CompositeCmd class to help you with that. **CompositeCmd** objects act as containers of other Command-derived objects. When undo or redo are invoked on a composite command, all its subcommands are respectively undone or redone.

To add a command to the composite, call the addSubCmd method. Call execute to execute all subcommands contained in the composite. Subcommands are executed or redone in the same order in which they were added to the container, and are undone in the opposite order.

Often JDiagram implicitly generates **Command** objects in response to users actions or method calls, and automatically records them in the history queue. You do not have direct access to those commands and cannot add them to a composite by using **addSubCmd**. To enable creating composites in such cases, the undo manager provides the notion of active composite. Active composite is created by calling the startComposite method of UndoManager. Each action executed after that is made part of the composite, instead of adding it directly to the command history. Invoking the **execute** method of the current composite completes it and saves it in the history queue.

Subclassing the Command Class

JDiagram's diagrams can be just a part of the data model of your application, which might already have undo/redo functions implemented for its native data. To integrate JDiagram undo functionality into the application's undo mechanism you have to subclass Command and create classes responsible for changes in your application's data. When a change occurs outside the diagram, it can still be recorded by calling the Diagram's executeCommand method and integrated into JDiagram's command history.

A simpler scenario when you might have to subclass **Command** is using complex objects as tags. Actions that change these objects cannot be detected and handled automatically by JDiagram. To integrate such an action into the diagram's undo history, you must create a **Command** instance that knows how to carry out, undo or redo the action.

Command subclasses must implement execute, undo and redo methods. Actions represented by your subclass must be carried out by the **executeCommand** method of Diagram that invokes executing of the

command passed as argument, and then is added to the history queue whose **undo** and **redo** methods can be called multiple times later by the UndoManager. Usually you can implement **redo** as a call to **execute**, but if the latter is time consuming, its result state can be saved in an instance member and restored by redo.

Do not call the **undo** and **redo** methods of your class directly, just implement them and they will be invoked by **UndoManager**'s undo or redo methods when necessary.

The example below shows a simple implementation of Command methods:

Java

```
class PersonTag
{
    public String Name;
    public String Address;
    // and so on
}

class AddressChangeCmd extends Command
{
    public AddressChangeCmd(PersonTag p, String address)
    {
        super("Address change");

        this.p = p;
        this.oldAddress = p.Address;
        this.newAddress = address;
    }

    @Override
    public void execute(boolean undoEnabled)
    {
        p.Address = newAddress;
    }

    @Override
    public void undo()
    {
        p.Address = oldAddress;
    }

    @Override
    public void redo()
    {
        // undo manager is enabled if Redo is called
        // so pass true for the undoEnabled argument
        execute(true);
    }

    private PersonTag p;
    private String oldAddress;
    private String newAddress;
}

// somewhere in later code
PersonTag tag = (PersonTag)diagram.getActiveItem().getTag();
AddressChangeCmd command = new AddressChangeCmd(tag, "far far away");
diagram.executeCommand(command);
```

Diagram Serialization and Output

Serializing Diagrams

XML Serialization

A diagram can be saved as an XML document. To do that, call the saveToXml method of the Diagram class. To deserialize a digram back from its XML representation, call the loadFromXml method.

Custom item classes can implement XML serialization for their additional properties by overriding the saveToXml and loadFromXml methods. In addition, such classes must specify a string to use as their identifier in the XML document by calling registerItemClass.

The control raises serializeTag and deserializeTag to enable serialization of complex Id and Tag objects without overriding the item classes. The PropertyName event argument specifies which property is being serialized.

JSON Serialization

To serialize a diagram as a JSON string, call its saveToJsonString method. To deserialize a diagram back from its JSON representation, call the loadFromJsonString method. The saveToJson and loadFromJson methods serialize the JSON strings to / from files.

Custom item classes can implement JSON serialization for their additional properties by overriding the saveToJson and loadFromJson methods. Such classes must be registered for serialization by calling the registerItemClass method and providing a string identifier for the *clientClass* parameter.

The control raises jsonSerializeTag and jsonDeserializeTag to enable serialization of complex Id and Tag objects without overriding the item classes. The PropertyName event argument specifies which property is being serialized.

Binary Serialization

Diagrams can be serialized in byte sequences wrapped by Java streams. Such streams may represent files, memory buffers, communication pipes, TCP sockets and so on. In serialized form a diagram might be saved in a database record too. To save the current diagram into a stream call the saveTo method, and respectively to load a diagram from a stream call loadFrom. Three shortcut methods are provided for work with files. saveTo creates a disk file and a stream that wraps it and invokes saveTo. loadFrom opens a read-stream on a disk file and invokes loadFrom.

All objects referenced by the diagram, such as images and fonts, are serialized together with the diagram elements. The tag objects that are associated with diagram elements are also saved if they implement the **Serializable** interface. If a tag is not serializable it won't be saved by the save- methods.

Exporting the Diagram

Exporting Images

You can create a static image representing the current diagram using the createImage method. The method returns a **java.awt.image.BufferedImage** object. The BufferedImage can be further serialized as a Jpeg, Gif or Png file, as shown in the following example:

Java

```
try
{
    java.awt.image.BufferedImage image = diagram.createImage();
    javax.imageio.ImageIO.write(image, "png", new File("d:\\export.png"));
}
catch (IOException ex)
{
}
```

Exporting PDF files

In order to export to PDF, import the com.mindfusion.diagramming.export and com.mindfusion.pdf packages. Create a PdfExporter instance and call its export method. The margins setter methods lets you specify the page margins for all pages in the document. If you need to set the page size and

orientation, call the setPageSize, and setPageOrientation methods. The setAutoScale method allows scaling the diagram to fit in one or more PDF pages. The following example shows how to export a diagram to a Pdf file in response to pressing a button event and using the JFileChooser control where the location is selected and the name of the Pdf file is entered:

Java

```
btnExportPdf.addActionListener(new ActionListener(){
    public void actionPerformed(ActionEvent arg0) {
        JFileChooser saveFileDialog = new JFileChooser();
        saveFileDialog.setCurrentDirectory (new File ("."));
        saveFileDialog.setFileFilter(
            new javax.swing.filechooser.FileFilter()
            {
                public boolean accept(File f)
                {
                    return f.getName().toLowerCase().endsWith(".pdf")
                        || f.isDirectory();
                }

                public String getDescription()
                {
                    return "PDF files|*.pdf";
                }
            });

        if (saveFileDialog.showSaveDialog(MainFrame.this) == JFileChooser.APPROVE_OPTION)
        {
            PdfExporter pdfExp = new PdfExporter();
            pdfExp.export(diagramView.getDiagram(),
saveFileDialog.getSelectedFile().getAbsolutePath());
        }
    }
});
```

Exporting SVG files

Create an SvgExporter instance and call its export method, passing a Diagram object and the full path to the .svg file as parameters.

Export Excel files

The ExcelExporter class from com.mindfusion.diagramming.export package exports diagrams to Excel Open XML format (XSLX). Diagrams are exported as Excel AutoShapes drawings. The export overload that takes a DiagramDocument parameter creates a sheet for each DiagramPage in the document. The export(Diagram) overload creates a single Excel sheet.

Printing and Print Preview

Print or Preview a Diagram

Call the print method to print the current DiagramView. The printPreview method opens a preview window that shows how the diagram would look when printed on paper.

Settings for Printing

The PrintOptions class exposes the available settings for printing. An instance of this class is accessible by calling the DiagramView's getPrintOptions method. Apart from properties inherited from RenderOptions, the print options object exposes members for customizing the header of printed pages, such as DocumentName, HeaderFormat and HeaderFont.

Size of a Printed Diagram

If the background image is set and the printing of the background image is enabled by performing the RenderOptions.setEnableBackgroundImage method, the size of the printed diagram is defined solely by the document bounds (obtained through the getBounds method). If the actual diagram items occupy only a small portion of the document, there might be some pages printed that do not display any items but just a part of the background image. To avoid that, call resizeToFitItems before printing.

If no background image is used, JDiagram prints only the part of the document containing all items that are both visible (getVisible, setVisible) and printable (getPrintable, setPrintable). That avoids printing blank pages.

Print Scaling

Use the setScale method to print a diagram in larger or smaller proportions than the actual ones.

Appearance

Styles and Themes

The style and theme system provides a consistent way to customize the appearance of a Diagram and its items. By using styles and themes, it is easier to achieve coherent look and feel across the entire diagram. In addition, changing the look and feel can be achieved by simply replacing the current theme. New themes can be designed in the visual environment of the Theme Editor tool and subsequently used and distributed as XML files. Several pre-defined theme files are installed under the Themes subfolder of the control's root installation folder.

Styles

The style is a set of properties. Styles can be applied to diagrams and individual diagram items and this can potentially affect the values of some properties of the target object. More specifically, if the value of a style-affected property in the target object is **null**, then the value is obtained from the associated style. The style does not necessarily need to provide values for all of its properties. If a styled property is **null** and it is not defined in the associated style, the style system searches for a value in the current theme. A complete value precedence list can be found later in this topic.

The styles are represented by the Style class and its various subclasses. Styles can be applied to diagram objects through the Style property of the Diagram class and to diagram items through the Style property of the DiagramItem class. Styles can also participate in themes, in which case they affect all objects of specific type.

Themes

The theme is a set of styles, each associated with specific diagram or item type. When the theme is applied to a diagram, the styles registered in the theme affect all objects of their associated type.

Themes are represented by the Theme class and can be assigned to Diagram objects through the setTheme method. Styles are associated with types within the theme through the registerStyle method. The following code creates a new theme, with a single style for ShapeNode items and applies this theme to an existing diagram.

Java

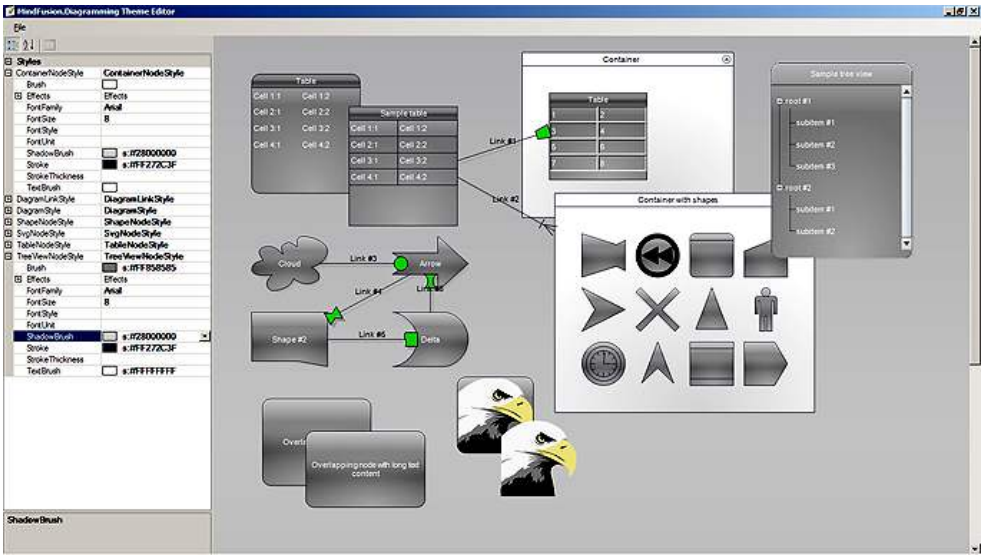
```
Theme theme = new Theme();
ShapeNodeStyle style = new ShapeNodeStyle();
style.setFontFamily("Courier New");
theme.registerStyle(ShapeNode.class, style);
diagram.setTheme(theme);
```

Alternatively, themes can be loaded from XML files by calling the loadFromXml method. Such XML files can be produced by the Theme Editor tool, or by calling the saveToXml method of an existing theme.

Value Precedence

The style and theme system is hierarchical. This means that, when a value of a styled property is requested, the system starts searching for this value along a chain of defined styles. The system returns the first valid value encountered. If no valid value is encountered along the chain, the system returns a globally defined default value for the property. The following list explains the search order in more details:

1. If the local value of the object is not **null**, the local value is returned.
2. If the object has a style and the property in this style has value, this value is returned.
3. If the object is an item, which is part of a diagram, the local style of the diagram is searched.
4. If the object is an item, which is part of a diagram and the diagram has associated theme, the theme is searched for styles registered for the item's type or its base types. If a style with a defined property value is found, this value is returned.
5. Similar search as the previous one is performed for a theme-registered style for the Diagram class.
6. If the above steps do not produce value; the system returns a globally define default for the property.



For example, if the effective value of the text brush property of a ShapeNode is requested (through the getEffectiveTextBrush method), the style system performs the following search, according to the above rules:

1. If the node's TextBrush property is not **null**, its value is returned.
2. If the node's Style is set and the DiagramItemStyle.TextBrush property in this style has value, this value is returned.
3. If the node is part of a diagram, the Diagram.Style is set, and the DiagramStyle.TextBrush property of this style has value, this value is returned.
4. If the node is part of a diagram and the Diagram.Theme is set, the theme is searched for a style registered for the **ShapeNode** type. If there is such style and its **DiagramItemStyle.TextBrush** property has value, this value is returned.
5. Similar search as the previous one is performed for a theme-registered style for the **Diagram** type.
6. Finally, the system returns a globally-defined default value for the **TextBrush** property (which is a solid Black brush).

Theme Editor

The Theme Editor provides simple visual environment for theme creation and modification. The editor displays a sample diagram with items of various types and exposes a list of all possible built-in diagram and item styles through a property grid to the left. Any modification of the style properties in the grid is immediately reflected on the diagram to give a preview on what effect the change would have if the theme is applied to a diagram. The theme can be saved at any time through the Save menu. Existing themes can be opened and modified.

The following image illustrates the Theme Editor in action:

Custom Styles

The following section describes how to enable styling for properties of custom item classes. To enable styling, create a custom style class by deriving from the closest existing type. For example, for a custom ShapeNode (say, MyNode), the custom style needs to inherit from ShapeNodeStyle:

Java

```
public class MyNodeStyle extends ShapeNodeStyle
{
}
```

For each property in MyNode that needs to be styled, define a property with the same name and type in the MyNodeStyle class by following the pattern below. For example, if MyNode contains a property MyBrush of type Brush, the following code defines its corresponding style property:

Java

```
class MyNodeStyle extends ShapeNodeStyle
{
    public MyNodeStyle()
    {
        myBrushProperty = registerProperty("MyBrush");
    }

    public Brush getMyBrush()
    {
        return (Brush)getValue(myBrushProperty);
    }

    public void setMyBrush(Brush value)
    {
        setValue(myBrushProperty, value);
    }

    private Object myBrushProperty;
}
```

Now, in the custom MyNode class, define a new method, getEffectiveMyBrush, which will return the actual value of MyBrush:

Java

```
public Brush getEffectiveMyBrush()
{
    // Checking for local value
    Brush localValue = getBrush();
    if (localValue != null)
        return localValue;
    // Querying the property value through the style system
    return (Brush)getValue("MyBrush");
}
```

Remember to register the style class for serialization, along with the custom node class:

Java

```
Diagram.registerClass(MyNode.class, "MyNode", 1);
Diagram.registerClass(MyNodeStyle.class, "MyNodeStyle", 1);
```

Now you can style and theme your custom nodes. Here is a theme, which affects the MyBrush property of all MyNode items in a diagram:

Java

```
Theme theme = new Theme();
MyNodeStyle myNodeStyle = new MyNodeStyle();
myNodeStyle.setMyBrush(new SolidBrush(Color.lightGray));
theme.registerStyle(MyNode.class, myNodeStyle);
diagram.setTheme(theme);
```

It is important to remember that there are no global default values for custom properties. Therefore you should be prepare to handle **null** values from getValue or ensure that at least one of the five steps in the precedence list above produces a value.

Brush and Pen Classes

Brush Classes

JDiagram defines classes that encapsulate the **Paint** and **Stroke** classes of Java. There are four brush classes that inherit the abstract Brush class, namely HatchBrush, GradientBrush, SolidBrush and TextureBrush.

HatchBrush allows filling the interiors of objects with a hatch pattern. Supported patterns are exposed as members of the HatchStyle class.

The GradientBrush class provides a gradient brush which paints the interior of objects starting with one color and gradually changing to another color by interpolating the RGB values of the two colors. His getColor1 method gets the first gradient color, and getColor2 gets second gradient color. The getAngle method gets the gradient orientation angle.

The SolidBrush class represents a brush for painting the interior of objects with a single color. His getColor method gets the color that fills the interior of objects.

The TextureBrush class defines a brush that fills the interior of objects with a texture pattern. The getTexture and setTexture methods allow specifying a texture pattern.

A brush is assigned to an item by calling the setBrush method. To set the diagram's background brush, perform the setBackBrush method. The setLinkBrush method assigns a default brush to new links.

The Pen Class

The Pen class allows specifying the pen for items, shapes, table nodes, links, and container frame lines. To get and/or set the pen color, use the getColor and/or setColor methods. The getWidth and setWidth methods enable indicating the width of the lines drawn with the pen.

To assign a pen to an item, call the setPen method. The setLinkPen method allows assigning the default pen to new links.

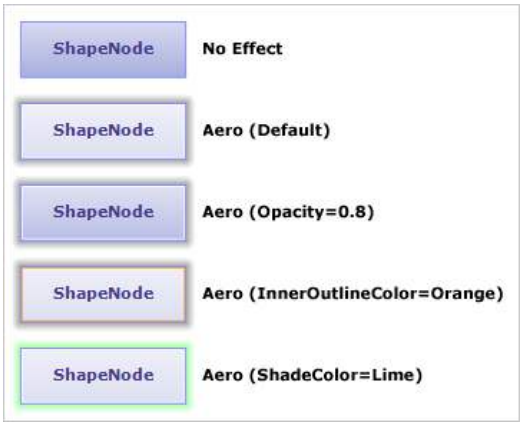
To set the default pen that should be assigned to new nodes, call the setShapePen method.

The setTablePen method allows specifying the pen for TableNode objects.

Use the setBoundsPen method to assign the pen for drawing the diagram bounds.

The Diagram.setContainerHighlightPen and ContainerNode.setHighlightPen methods set the Pen for drawing the container frame lines when an item is dragged over the container.

Node Effects



To apply an effect to the nodes in a diagram, create an instance of one of the effect classes and add this instance to the Diagram.NodeEffects collection. To apply the effect to individual nodes, add the instance to the node's Effects collection. To discard the diagram effects for a particular node, add a **null** reference at position 0 in the node's **Effects** collection. Effects can also be applied through styles by adding them to the DiagramStyle.NodeEffects and DiagramNodeStyle.Effects collections respectively.

It is possible to combine different effects by adding instances of their appropriate types to the effect collections. If is also admissible to apply more than one effect of the same type.

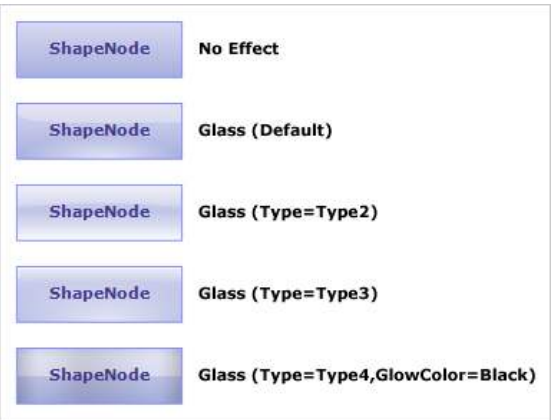
The currently supplied effect types are Aero and Glass. They are examined in more details in the sections below.

Aero Effect

The Aero effect is represented by the AeroEffect class. The effect is designed to roughly resemble the Aero theme of Windows. More specifically, the effect adds semi transparency to the nodes, a smooth shade at the outside and a thin inset stroke. The semi transparency is specified through the setOpacity method. Opacity varies from 0 to 1 inclusive, where 0 indicates full transparency and 1 indicates the original node color. The semi transparency is applied only on the node brush. The colors of the shade and the inner stroke are specified through the setShadeColor and setInnerOutlineColor methods respectively. The following image illustrates how these properties affect the output:

The following example applies the Aero effect on the nodes of an existing diagram:

Java



```
AeroEffect effect = new AeroEffect();
effect.setOpacity(0.5f);
effect.setInnerOutlineColor(new Color(255, 255, 255, 100));
diagram.getNodeEffects().add(effect);
```

Tips

- The Aero effect works very well in scenarios with overlapping nodes or in cases where the background is more complex than solid color, due to the effect of semi transparency.
- Aero combines well with the Glass effect. There are some examples at the end of this topic.
- The ShadeColor is usually black or another dark color. However, some nice glow effects can be achieved by setting bright **ShadeColor** on a diagram with dark background.
- The Aero effect can impact performance if there are many nodes visible in the diagram.

Glass Effect

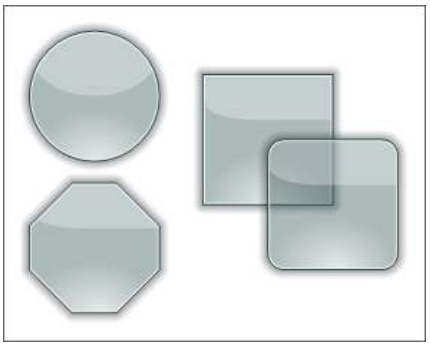
The Glass effect is represented by the GlassEffect class. The Glass effect adds visuals on top of the nodes in order to give the impression of a reflective surface. There are several variations of this effect, which can be selected through the setType method. The color of the reflection and the ambient color can be specified through the setReflectionColor and setGlowColor methods respectively. When UsePenAsGlow is set to **true** the color of the node's pen is used as the ambient color. The following image illustrates the differences between the distinct effect types:

The following example applies a Glass effect with the default settings to the nodes of a diagram:

Java

```
diagram.getNodeEffects().add(new GlassEffect());
```

Tips



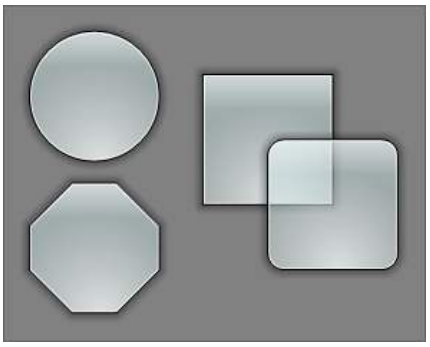
- The GlowColor is usually white. However, for Type4 glass effects it is often more suitable to use black glow.
- The Glass effect combines well with the Aero effect. There are some examples at the end of this topic.
- Several glass effects of different types can be applied simultaneously for emphasized effect.

Examples

The values of the effect properties are usually selected in accordance with the color scheme of the target diagram and the desired end result. In addition different types of effects can be applied simultaneously to achieve more interesting results. The examples below demonstrate possible effect combinations in various color contexts.

Aero & Glass (Dark on Light)

In this example the Aero and Glass effects are combined. The Aero effect is useful in scenarios when dark nodes are placed on light background or vice versa, in order to emphasize the contrast.



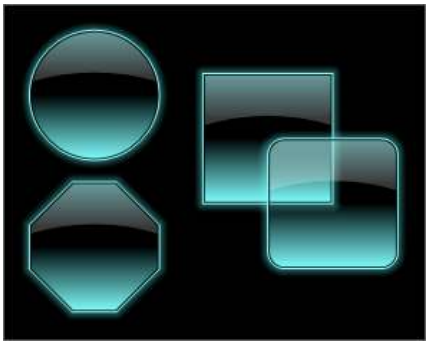
Here is the code that applies the above effects:

Java

```
diagram.getNodeEffects().add(new GlassEffect());
diagram.getNodeEffects().add(new AeroEffect());
```

Aero & Glass (Light on Dark)

This example is similar to the first one, only this time the nodes are painted in light colors and the background is dark.



Here is the code that applies the above effect:

Java

```
GlassEffect glassEffect = new GlassEffect();
glassEffect.setType(GlassEffectType.Type3);
diagram.getNodeEffects().add(glassEffect);
diagram.getNodeEffects().add(new AeroEffect());
```

Glow Effect

This example uses bright colors on black background to create a glow effect. The example utilizes an Aero effect with ShadeColor set to the color of the nodes' pens.

Here is the code that applies the above effects:

Java

```
GlassEffect glassEffect = new GlassEffect();
glassEffect.setType(GlassEffectType.Type2);
glassEffect.setUsePenAsGlow(true);
diagram.getNodeEffects().add(glassEffect);
AeroEffect aeroEffect = new AeroEffect();
aeroEffect.setOpacity(0);
aeroEffect.setInnerOutlineColor(Color.black);
aeroEffect.setShadeColor(new Color(128, 255, 255));
diagram.getNodeEffects().add(aeroEffect);
```

For the rest of the settings for the above effect images, refer to the **Effects** sample project.

Customizing the Appearance of Items

Different visual styles and properties can be set individually for every JDiagram object as described in the following paragraphs.

Line Width and Style

The borders of nodes and the lines of links are drawn using a pen whose width and style can be customized. Using the Pen objects, provided by JDiagram, you can specify dash pattern, color and thickness for items' contours. To assign a pen to an item, use the setPen method of the Item class. Links use the

getHeadPen method to draw their heads. To change it, use the setHeadPen method of the DiagramLink class. When customizing items through styles and themes, the appearance of their border lines can be set via the setStroke and setStrokeThickness properties of DiagramItemStyle.

Color of Diagram Elements

JDiagram provides Brush objects for filling the interior of items. Brush is an abstract class. Depending to the type of interior filling you desire, you instantiate a brush object from one of the derived classes (GradientBrush, HatchBrush, SolidBrush or TextureBrush) and associate that object with the appropriate item, using its setBrush method. The Cell class provides a setBrush method, which enables setting separate brushes to individual cells.

Text

Diagram items can have attached text, displayed inside / over them.

Text of shape nodes is set using the setText method and the text alignment is specified using the setTextFormat method. The text can contain formatting specifiers, such as bold, italic and so on, which can be enabled by calling of setEnableStyledText. To make a shape node big enough to display its text without clipping, call resizeToFitText. You can add more text labels to a node by creating NodeLabel objects.

Links have their text drawn horizontally above their middle segment or rotated as specified through the setTextStyle method; the string to display can be set using the setText method. Links can display additional labels added via the addLabel method. Each label can be rendered using distinct font, color and alignment attributes as set via the LinkLabel methods.

Tables have caption text and alignment is specified by setCaption and setCaptionFormat; table cells expose setText and setTextFormat methods.

All chart items expose setFont method, specifying the name, style and size of the font of item's text.

The color of item's text is set through the corresponding setTextColor method: ShapeNode.setTextColor, DiagramLink.setTextColor, TableNode.setTextColor and Cell.setTextColor. Additionally, tables expose the setCaptionColor method for setting the color of their captions.

Images

ShapeNode can render a **java.awt.Image** bitmap assigned to its Image property. Call the resizeToFitImage method to set the node's dimensions to the intrinsic size of the bitmap. You can add more images to a node by creating NodeLabel objects, and treat them as clickable icons by handling nodeClicked event and checking its Label argument.

TableNode exposes Image property used to draw table's background. Each cell in the table can render its own Image as well. For example that might be used to display an icon for the key field of a database table.

Images can be positioned in different ways: they can be tiled, stretched or aligned to the containing objects' centers or sides. Use ShapeNode.setImageAlign and TableNode.setImageAlign to specify how images are placed within the corresponding nodes. An image shown inside a node is clipped in accordance with the shape of that node. The ImagePadding property specifies how much space to leave between image and node's borders.

Shadows

The shadow of each diagram item can be painted with a distinct brush, as specified by the item's setShadowBrush method. The brush can be set to null to hide an item's shadow. Shadow offsets from their items can be set individually by the setShadowOffsetX and setShadowOffsetY methods.

DiagramLink-specific Properties

The shape and orientation of link segments is specified by the setStyle method; the number of segments is specified by the setSegmentCount method. The form and size of the arrowhead shape is set using the setHeadShape and setHeadShapeSize methods. Shapes displayed at the beginning of links can be set via setBaseShape and setBaseShapeSize. Shapes can be displayed at middles of segments, helping to follow long links . They are defined by the setIntermediateShape and setIntermediateShapeSize methods. The lines of arrowhead shapes are painted using the Pen specified by the setHeadPen method.

Link crossings

Intersection points where links cross their paths can be rendered as arcs or breaks, as specified by setLinkCrossings. It depends on the z-order, which links jump over the others, or which links appear cut by the others. If LinkCrossings is set to Arcs, links with higher Z-index jump over those with lower Z-index. If set to Cut, links at lower Z position are cut by links at higher Z. Radius of arcs and breaks can be set through the setCrossingRadius method.

ShapeNode-specific properties

The shape of a node is defined using the setShape method. Shape templates can be applied to a shape node with an orientation of 0/90/180/270 degrees as specified through the setShapeOrientation method. The shape rotation can be modified through the setRotationAngle method. Your own drawing code may be invoked for a node, depending on the value specified in setCustomDraw. Shape nodes can be marked as transparent in the setTransparent method, having only their text or images rendered.

TableNode-specific properties

The outline of a table can be either a rectangle or rounded rectangle, as specified by the Shape property. Set CellFrameStyle to customize the borders of table cells. The table caption bar is painted according to CaptionFormat, CaptionBrush and CaptionBackBrush properties. You can run custom-drawing code for the whole table or its cells by setting CustomDraw or CellCustomDraw properties and handling drawNode or drawCell events.

User Defined Node Shapes and Custom Drawing

The appearance of JDiagram items can be customized in several additional ways, as described below.

Shape Templates

The Shape class provides the means for defining complex node shapes, made of straight lines, arcs and Bezier curves. A shape must always contain an outline to be used for hit testing, clipping and finding intersections with other objects. Optionally shapes can contain decoration elements and text region definitions. Decorations are visual elements that do not take part in hit testing and clipping. Text regions are the parts of shapes in which node's text is laid-out and rendered. JDiagram provides a set of over 100 predefined shape templates, which can be accessed by calling the getShapes method of the **Shape** class. Each predefined shape has a string identifier assigned to it. Use the fromId method to find a shape with the specified id. A shape template can be assigned to the Shape member of shape nodes through the setShape method.

Shape Libraries

The ShapeDesigner tool that comes with the JDiagram suite lets you draw custom shapes and store them in shape libraries. Note that the tool is not available yet as a Java application, and the JDiagram shape designer runs only under Microsoft Windows. A library file can be loaded into your application using the ShapeLibrary class. The definitions loaded from a shape library are automatically added to the shared shapes collection and can be accessed through the getShapes and fromId methods of the Shape class, just as the predefined shapes.

Custom Painting

Another way to customize a item's appearance is implemented by firing events each time an item is painted, giving you the option to attach your own drawing code to the JDiagram's rendering engine. Use the setCustomDraw method to enable that feature in your application. JDiagram gives you five options for custom drawing. If you choose Additional drawing style, your drawing code will be executed after the standard item drawing code is executed and the image is rendered, but before the text is rendered. Furthermore, the **Graphics** object you receive to draw on has a clipping region applied that corresponds to the node's shape. If using **Full** drawing mode, none of the standard JDiagram drawing code is executed - just yours. The **ShadowOnly** mode performs standard painting of items, but leaves the drawing of shadows

to your code. Place your own drawing code in a handler of the drawNode, drawLink and drawCell events. This events are fired for each item with custom-draw style that needs repainting.

Combining Custom Shapes with Custom Drawing

Finally, you could combine user-defined shapes with the Additional custom-painting style. Thus, you can get custom shapes enabled for a node and your custom painting code executing with the node shape used as clipping region. You might clear the clipping region, but be careful - if you draw outside node's bounding rectangle, the view may not update correctly.

Text Formatting

Text in Shape Nodes

A ShapeNode can display text within its outlines. Text layout and alignment depend on the value specified through setTextFormat. The text is painted with the color set in setTextBrush. Even more useful formatting attributes can be enabled by setEnableStyledText.

Layout Text in Arbitrary Shapes

ShapeNode instances can have various shapes, as specified through setShape and setShapeOrientation methods. JDiagram uses a formatting algorithm that fits exactly each line of the node's text within the width of a line inside a polygonal shape. If a shape node has curved outlines, the formatting algorithm approximates them the polylines.

Supplementary Node Labels

Apart from main text content, the NodeLabel class lets you display additional labels and pin them to node's edges or corners. Call the addLabel method to create such supplementary labels, and use **NodeLabel** (and base ItemLabel) properties and methods to customize their appearance and position.

Text in Tables

A TableNode can display text in its caption bar and inside each cell. The caption text is specified by setCaption and its color and alignment are specified through setCaptionBrush and setCaptionFormat. The text in individual cells is specified by a call to the setText method and its color and format are set through setTextColor and setTextFormat respectively. Calling the setEnableStyledText method can enable the use of formatting tags in the text.

Styled Text

The ShapeNode.setEnableStyledText method for shape nodes and TableNode.setEnableStyledText method of tables respectively enable or disable styled text rendering. Styled text can have various attributes applied to the characters it contains. The attributes are specified using HTML-like formatting tags embedded in the raw text.

The following table lists the currently supported style tags:

Tag	Description
<**i**> text </**i**>	Italic text
<**b**> text </**b**>	Bold text
<**u**> text </**u**>	Underlined text
<**sub**> text </**sub**>	Subscript
<**sup**> text </**sup**>	Superscript

<**color**=#**RRGGBB**> text </**color**>	Changes the color of the text. The red, green and blue color channels are specified as hexadecimal numbers.

Link Labels

The text of a DiagramLink is specified by setText. The setTextColor and setTextStyle methods can be used to specify the color and position of the text.

Apart from main text content, the LinkLabel class lets you display additional labels and pin them to link's points or segments. Call the addLabel method to create such supplementary labels, and use **LinkLabel** (and base ItemLabel) properties and methods to customize their appearance and position. Labels can automatically avoid overlapping nodes or other labels when their AutoArrange property is set.

Fonts

All items provide a setFont method that allows getting or setting the font used for rendering their text.

Modifying the Diagram Appearance

You can customize most of JDiagram visualization effects.

Background

JDiagram background area is filled using the brush specified by the setBackBrush method. Background theme can also be an image set by the setBackgroundImage method. The image can be any of the supported by Java file formats - JPG, PNG or GIF. Background image can be centered, aligned to a corner of the control or document, tiled or stretched to cover the drawing area - as specified by the setBackgroundImageAlign method.

Shadows

By default all diagram objects have shadows drawn under them. If the shadow style is set to OneLevel, the object shadows are drawn at the lowest Z-level under all objects, which makes them look as on single Z-level. If it is set to ZOrder, each shadow is drawn immediately under its corresponding object, possibly covering parts of other objects, which gives more 3D-like look to the diagram. If the style is set to None, no shadows are drawn. The shadows style can be set through the setShadowsStyle method. Shadows' offset from items is specified by the setShadowOffset, setShadowOffsetX and setShadowOffsetY methods. Shadows are painted using the brush specified via setShadowBrush.

Selection

Selection handles drawn around the active item can be customized through the style object returned by getActiveItemHandlesStyle. Items in multiple selection have their handles drawn using the style returned by getSelectedItemHandlesStyle. Disabled manipulation handles are painted using the style returned by getDisabledHandlesStyle when disabled handles are displayed (see setShowDisabledHandles). You can control the way multiple selection is displayed through the setHandlesStyle method of the Selection class.

Mouse Cursors

Different mouse cursor icons can be set to give context-sensitive feedback to users, prompting them if creation/modification of an object is possible. The following methods can be used to specify the cursor's appearance in different situations: setPointerCursor, setMoveCursor, setDisallowCursor, setDrawLinkCursor, setAllowLinkCursor, setDisallowLinkCursor, setHorizontalResizeCursor, setVerticalResizeCursor, setDiagonalResizeCursor, setCounterDiagonalResizeCursor.

Grid Settings

You can turn on/off the alignment grid by calling the setShowGrid method. The setGridColor method can be used to specify the color of grid points and lines.

Miscellaneous

Associate Custom Data with Items

You can associate custom values from any data type with diagram elements by setting their Tag and Id properties. If the associated data is of a value type or of type that is serializable, then it is saved and loaded together with the diagram items when diagrams are saved or loaded. The findNode, findLink, findNodeById and findLinkById methods let you find diagram elements associated with a specific value.

Inspecting Items Geometry

- The intersects method of DiagramLink lets you test if links intersect other links or nodes.The getLength method of the **DiagramLink** class returns the total length of a link.
- The hitTest and containsPoint methods let you check if an item contains specified point.

Fluent API

Builder classes in **com.mindfusion.diagramming.builders** package add support for fluent programming style. Static with and instance init methods in DiagramItem, DiagramItemStyle and Layout -derived classes return a builder instance that can be used to set-up respective new or existing objects:

Java

```
diagram.getNodes().add(
    ShapeNode.with()
        .brush(Color.LIGHT_GRAY)
        .font("Arial", 4)
        .enableStyledText(true)
        .text("Task <i>1</i>")
        .toolTip("This is the task")
        .create());

diagram.getFactory()
    .createShapeNode(20, 20, 20, 20).init()
        .brush(Color.LIGHT_GRAY)
        .font("Arial", 4)
        .enableStyledText(true)
        .text("Task <i>2</i>")
        .toolTip("This is the second task");

TreeLayout.with()
    .levelDistance(20)
    .nodeDistance(20)
    .linkStyle(TreeLayoutLinkType.Cascading3)
    .create()
    .arrange(diagram);
```

Tutorials

The tutorials in this section assume you have already added a Diagram object to your Java application as shown in the Getting Started topics.
Eclipse projects that contain the full source code from the tutorials are available in the Samples folder under the JDiagram installation folder.

Tutorial 1: Loading Graph Data

This tutorial shows how to load graph data from XML and create diagram objects corresponding to the graph nodes and edges.

1. Right-click the project in Package Explorer and choose New -> Other from the context menu. Create a new XML file called SampleGraph.xml and add to it content in the following form:

XML

```
<?xml version="1.0" encoding="utf-8" ?>
<Graph>
    <Nodes>
        <Node id="0" name="start" />
        <Node id="1" name="activity 1" />
        <Node id="2" name="task 1" />
        <Node id="3" name="task 2" />
        <Node id="4" name="activity 2" />
        <Node id="5" name="task 3" />
        <Node id="6" name="task 4" />
        <Node id="7" name="activity 3" />
        <Node id="8" name="task 5" />
        <Node id="9" name="task 6" />
        <Node id="10" name="end" />
    </Nodes>
    <Links>
        <Link origin="0" target="1" />
        <Link origin="1" target="2" />
        <Link origin="1" target="3" />
        <Link origin="2" target="4" />
        <Link origin="3" target="4" />
        <Link origin="4" target="5" />
        <Link origin="4" target="6" />
        <Link origin="5" target="10" />
        <Link origin="6" target="10" />
        <Link origin="0" target="7" />
        <Link origin="7" target="8" />
        <Link origin="8" target="9" />
        <Link origin="1" target="9" />
        <Link origin="9" target="10" />
    </Links>
</Graph>
```

2. Add a windowOpened event handler to the JFrame:

Java

```
this.addWindowListener(new WindowAdapter()
{
    @Override
    public void windowOpened(WindowEvent e)
    {
        loadGraph(diagram, "SampleGraph.xml");
    }
});
```

3. Create the loadGraph method and declare the following variables. "nodeMap" maps diagram nodes to their identifiers, and "bounds" contains the default node size.

Java

```
void loadGraph(Diagram diagram, String filepath)
{
  HashMap<String, DiagramNode> nodeMap = new HashMap<String, DiagramNode>();
  Rectangle2D.Float bounds = new Rectangle2D.Float(0, 0, 15, 8);
}
```

4. Load the XML document and its root element using the XML DOM API:

Java

```
// load the graph XML
Document document = loadXmlFile(filepath);
Element root = document.getDocumentElement();
```

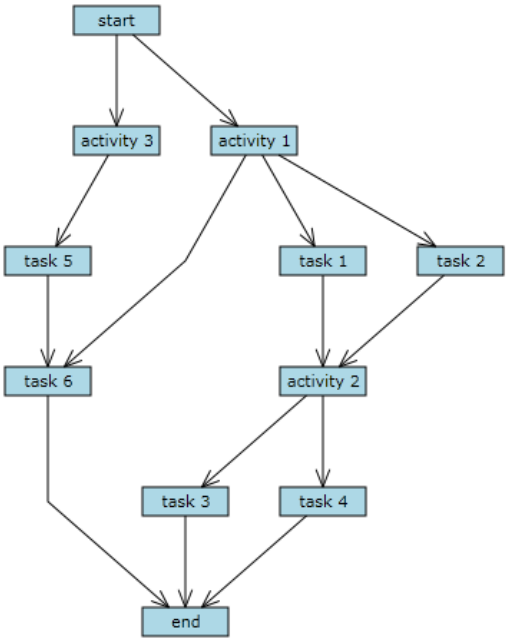
5. Load the graph node elements and create their corresponding ShapeNode objects by calling the createShapeNode method of the Factory class. **createShapeNode** is just a shortcut to creating a **ShapeNode** instance using the "new" operator and adding it to the Nodes collection of the diagram. Additionally, this code maps the new node to the "id" attribute of the XML element, and sets the node's Text to the value of the "name" attribute.

Java

```
// load node data
NodeList nodes = root.getElementsByTagName("Node");
for (int i = 0; i < nodes.getLength(); ++i)
{
    Element node = (Element)nodes.item(i);
    ShapeNode diagramNode = diagram.getFactory().createShapeNode(bounds);
    nodeMap.put(node.getAttribute("id"), diagramNode);
    diagramNode.setText(node.getAttribute("name"));
}
```

6. Load the graph links and create corresponding DiagramLink objects. The Origin and Destination of the links are accessed by their ids through the "nodeMap" dictionary.

Java



```
// load link data
NodeList links = root.getElementsByTagName("Link");
for (int i = 0; i < links.getLength(); ++i)
{
    Element link = (Element)links.item(i);
    DiagramNode origin = nodeMap.get(link.getAttribute("origin"));
    DiagramNode target = nodeMap.get(link.getAttribute("target"));
    diagram.getFactory().createDiagramLink(origin, target);
}
```

7. Arrange the diagram using the LayeredLayout class.

Java

```
// arrange the graph
LayeredLayout layout = new LayeredLayout();
layout.setLayerDistance(12);
layout.arrange(diagram);
```

8. Build and run the project. If everything is fine, you should see this representation of the graph:

Tutorial 2: Loading Hierarchical Data

This tutorial shows how to load hierarchical data recursively from XML and create diagram items corresponding to the hierarchy.

1. Right-click the project in Package Explorer and choose New -> Other from the context menu. Create a new XML file called SampleTree.xml and add to it content in the following form:

XML

```
<?xml version="1.0" encoding="utf-8" ?>
<Project>
    <Activity Name="Activity 1">
        <Activity  Name="sub-activity 1">
            <Activity  Name="sub-activity 1-1" />
            <Activity  Name="sub-activity 1-2" />
        </Activity>
        <Activity  Name="sub-activity 2">
            <Activity  Name="sub-activity 2-1" />
            <Activity  Name="sub-activity 2-2" />
            <Activity  Name="sub-activity 2-3" />
        </Activity>
        <Activity  Name="sub-activity 3">
            <Activity  Name="sub-activity 3-1" />
            <Activity  Name="sub-activity 3-2" />
        </Activity>
    </Activity>
    <Activity Name="Activity 2">
        <Activity  Name="sub-activity 1">
            <Activity  Name="sub-activity 1-1" />
            <Activity  Name="sub-activity 1-2" />
            <Activity  Name="sub-activity 1-3" />
        </Activity>
        <Activity  Name="sub-activity 2">
            <Activity  Name="sub-activity 2-1" />
            <Activity  Name="sub-activity 2-2" />
        </Activity>
    </Activity>
    <Activity Name="Activity 3">
        <Activity  Name="sub-activity 1">
            <Activity  Name="sub-activity 1-1" />
            <Activity  Name="sub-activity 1-2" />
```

```
            <Activity  Name="sub-activity 1-3" />
            <Activity  Name="sub-activity 1-4" />
        </Activity>
        <Activity  Name="sub-activity 2" />
        <Activity  Name="sub-activity 3">
            <Activity  Name="sub-activity 3-1" />
            <Activity  Name="sub-activity 3-2" />
        </Activity>
    </Activity>
</Project>
```

2. Add a windowOpened event handler to the JFrame:

Java

```
this.addWindowListener(new WindowAdapter()
{
    @Override
    public void windowOpened(WindowEvent e)
    {
        loadTree(diagram, "SampleTree.xml");
    }
});
```

3. Add the following member to the frame class to hold the default node size.

Java

```
final Rectangle2D.Float bounds = new Rectangle2D.Float(0,0,30,8);
```

4. In loadTree, create the tree root node, and call the createChildren method, which builds the tree recursively.

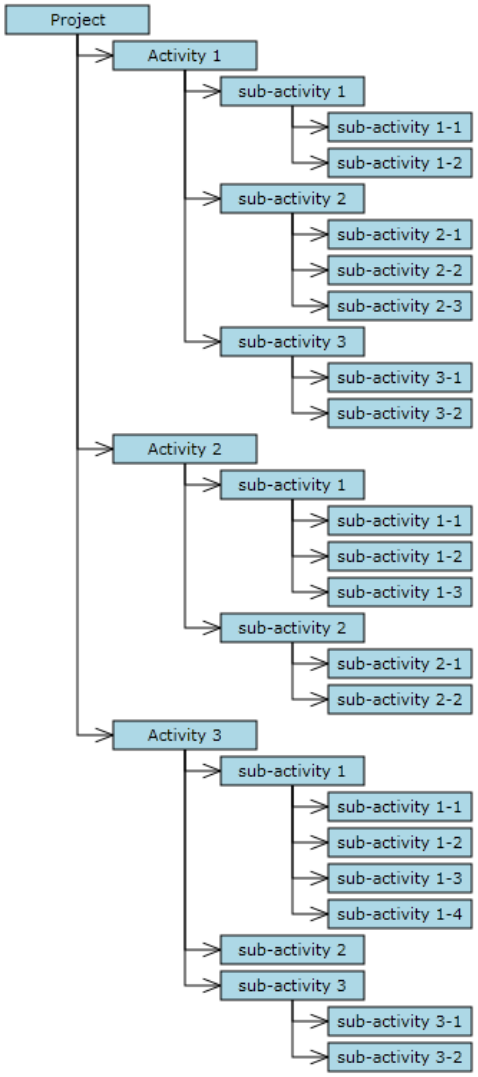
Java

```
void loadTree(Diagram diagram, String filepath)
{
    // load the tree XML
    Document document = loadXmlFile(filepath);
    Element rootElement = document.getDocumentElement();

    // create diagram elements recursively
    ShapeNode root = diagram.getFactory().createShapeNode(bounds);
    root.setText("Project");
    createChildren(diagram, root, rootElement);
}
```

5. Define createChildren as follows. It takes as parameters the parent DiagramNode and parent XML element, iterates the child XML elements to build the next level of the hierarchy, and creates corresponding diagram items by calling createShapeNode and createDiagramLink.

Java



```
void createChildren(Diagram diagram, DiagramNode parentNode, Node parentElement)
{
    NodeList elements = parentElement.getChildNodes();
    for (int i = 0; i < elements.getLength(); i++)
    {
        Node element = elements.item(i);
        if (element.getNodeName().equals("Activity"))
        {
            ShapeNode node = diagram.getFactory().createShapeNode(bounds);
            node.setText(((Element)element).getAttribute("Name"));
            diagram.getFactory().createDiagramLink(parentNode, node);
            createChildren(diagram, node, element);
        }
    }
}
```

6. Use TreeLayout to arrange the diagram. Add the following code to the end of the loadTree method.

Java

```
// arrange using TreeLayout
TreeLayout layout = new TreeLayout();
layout.setType(TreeLayoutType.Cascading);
layout.setDirection(TreeLayoutDirection.LeftToRight);
layout.setLinkStyle(TreeLayoutLinkType.Cascading2);
layout.setNodeDistance(3);
layout.setLevelDistance(-8); // let horizontal positions overlap
layout.arrange(diagram);
```

7. Build and run the project. If everything is fine, you should see this representation of the hierarchy:

Tutorial 3: Create a Custom Node Type

This tutorial shows how to define a custom node class that inherits CompositeNode and adds several new properties. Its appearance is defined using an XML template.

1. Right-click the project in Package Explorer and choose New -> Other from the context menu. Create a new XML file called OrgChartNode.xml and add the following template code to it.

Xml

```
<SimplePanel>
    <Shape Name="Shape" Shape="Rectangle" />
```

```
    <Border Padding="2">
        <GridPanel>
            <GridPanel.Columns>
                <GridColumn Width="30" />
                <GridColumn />
            </GridPanel.Columns>
            <GridPanel.Rows>
                <GridRow />
            </GridPanel.Rows>

            <Image Name="Image" />

            <StackPanel Orientation="Vertical" GridColumn="1">
                <Text Name="Title" Font="Arial-6" TextAlignment="Near" />
                <Text Name="FullName" Font="Arial-4" TextColor="Blue" TextAlignment="Near" />
                <Text Name="Details" Font="Arial-4" TextAlignment="Near" />
            </StackPanel>
        </GridPanel>
    </Border>

</SimplePanel>
```

2. Add to the project a new class called OrgChartNode. Make it derive from **CompositeNode**.

Java

```
import java.awt.*;
import java.io.*;
import javax.xml.parsers.DocumentBuilder;
import javax.xml.parsers.DocumentBuilderFactory;
import org.w3c.dom.Document;
import com.mindfusion.diagramming.*;
import com.mindfusion.diagramming.components.*;
import com.mindfusion.diagramming.components.TextComponent;

public class OrgChartNode extends CompositeNode
{
    static Document xmlTemplate = loadXmlFile("OrgChartNode.xml");

    public OrgChartNode(Diagram diagram)
    {
        super(diagram);
    }

    private ShapeComponent shapeComponent;
    private ImageComponent imageComponent;
    private TextComponent titleComponent;
    private TextComponent fullNameComponent;
    private TextComponent detailsComponent;
}
```

3. In the constructor, load from the XML template using XmlLoader, and assign references to individual components using findComponent:

Java

```
// create components from XML template
getComponents().add(XmlLoader.load(xmlTemplate, null, null));

// find components by name
shapeComponent = (ShapeComponent) findComponent("Shape");
imageComponent = (ImageComponent) findComponent("Image");
titleComponent = (TextComponent) findComponent("Title");
fullNameComponent = (TextComponent) findComponent("FullName");
detailsComponent = (TextComponent) findComponent("Details");

// customize appearance
titleComponent.getTextFormat().setHorizontalAlign(Align.Near);
fullNameComponent.getTextFormat().setHorizontalAlign(Align.Near);
detailsComponent.getTextFormat().setHorizontalAlign(Align.Near);
shapeComponent.setIsOutline(true);
```

```
setFill(new SolidBrush(Color.WHITE));
setStroke(new Pen(Color.BLACK, 0.5));
```

4. Define custom properties that delegate their implementation to the components loaded from the template.

Java

```
public Pen getStroke()
{
    return shapeComponent.getPen();
}

public void setStroke(Pen value)
{
    shapeComponent.setPen(value);
    this.repaint();
}

public Brush getFill()
{
    return shapeComponent.getBrush();
}

public void setFill(Brush value)
{
    shapeComponent.setBrush(value);
    this.repaint();
}

public Image getImage()
{
    return imageComponent.getImage();
}

public void setImage(Image value)
{
    imageComponent.setImage(value);
    this.repaint();
}

public String getTitle()
{
    return titleComponent.getText();
}

public void setTitle(String value)
{
    titleComponent.setText(value);
    this.repaint();
}

public String getFullName()
{
    return fullNameComponent.getName();
}

public void setFullName(String value)
{
    fullNameComponent.setText(value);
    this.repaint();
}

public String getDetails()
{
    return detailsComponent.getText();
}

public void setDetails(String value)
{
    detailsComponent.setText(value);
```

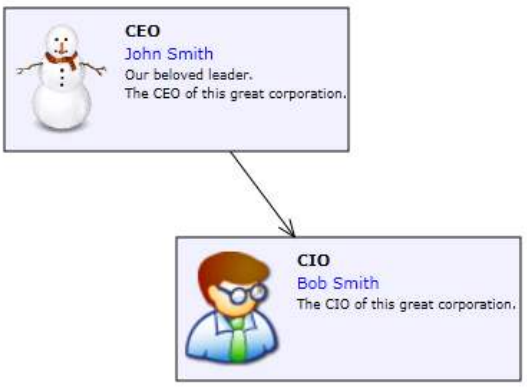
```
    this.repaint();
}
```

5. Add a Diagram and DiagramView to the JFrame constructor.

Java

```
Diagram diag = new Diagram();
DiagramView view = new DiagramView();
view.setDiagram(diag);
JScrollPane scrollPane = new JScrollPane(view);
scrollPane.setVisible(true);
getContentPane().add(scrollPane);
```

6. Add a few instances of the OrgChartNode class.



Java

```
// create first OrgChartNode
OrgChartNode node1 = new OrgChartNode(diag);
node1.setStroke(new Pen(0.5f, Color.RED));
node1.setBounds(20, 10, 80, 40);
node1.setTitle("CEO");
node1.setFullName("John Smith");
node1.setDetails("Our beloved leader.\n" +
    "The CEO of this great corporation.");
node1.setImage(loadImage("image1.png"));
diag.add(node1);

// create second OrgChartNode
OrgChartNode node2 = new OrgChartNode(diag);
node2.setBounds(60, 60, 80, 40);
node2.setTitle("CIO");
node2.setFullName("Bob Smith");
node2.setDetails("The CIO of this great corporation.");
node2.setImage(loadImage("image2.png"));
diag.add(node2);

// create connector
diag.getFactory().createDiagramLink(node1, node2);
```

7. Build and run the project. You should see the custom nodes rendered like this:

Tutorial 4: Custom Nodes Integration

This tutorial builds upon the OrgChartNode type from Tutorial 3. It shows how to fully integrate the custom type with other JDiagram features, such as serialization, undo support, creating nodes by drag-and-drop or drawing with the mouse on the canvas.

1. Add a NodeListView to the frame and add a few OrgChartNode objects as its children:

Java

```
// create a NodeListView
NodeListView nodeList = new NodeListView();
nodeList.setSize(110, 800);
nodeList.setDefaultNodeSize(new Dimension(80,40));
nodeList.setIconSize(new Dimension(60, 30));
nodeList.setIconMargin(new Dimension(5, 5));
getContentPane().add(nodeList, BorderLayout.WEST);

// add nodes to list view
OrgChartNode orgNode = new OrgChartNode(diagram);
orgNode.setTitle("CEO");
orgNode.setFullName("Type here");
orgNode.setDetails("Chief executive officer");
orgNode.setImage(loadImage("image1.png"));
nodeList.addNode(orgNode);

orgNode = new OrgChartNode(diagram);
orgNode.setTitle("CIO");
orgNode.setFullName("Type here");
orgNode.setDetails("Chief information officer");
orgNode.setImage(loadImage("image2.png"));
nodeList.addNode(orgNode);
```

2. Add a copy constructor to the OrgChartNode class. The control throws an exception if you try to create via drag-and-drop an instance of a class without copy constructor:

Java

```
public OrgChartNode(OrgChartNode prototype)
{
    super(prototype);
    findComponents();
}

void findComponents()
{
    // find components by name
    shapeComponent = (ShapeComponent) findComponent("Shape");
    imageComponent = (ImageComponent) findComponent("Image");
    titleComponent = (TextComponent) findComponent("Title");
    fullNameComponent = (TextComponent) findComponent("FullName");
    detailsComponent = (TextComponent) findComponent("Details");
}
```

3. In order to enable drawing OrgChartNodes with the mouse, inherit the LinkNodesBehavior and override its createNode method. You could also inherit BehaviorBase or any of its derived classes, and override either **createNode** or startDraw:

Java

```
public class OrgChartBehavior
    extends LinkNodesBehavior
{
    protected OrgChartBehavior(DiagramView diagramView)
    {
        super(diagramView);
    }

    @Override
    protected DiagramNode createNode()
    {
        return new OrgChartNode(getDiagram());
    }
}
```

4. Assign an instance of the behavior class to the CustomBehavior property of the DiagramView class:

Java

```
// enable drawing OrgChartNodes with the mouse
view.setCustomBehavior(new OrgChartBehavior(view));
```

5. To implement serialization support, add an empty constructor to the node class. Since all custom properties simply delegate to the components hosted in base CompositeNode class, you don't have to override serialization methods such as saveToXml and loadFromXml methods in this instance. However you will have to recreate the references to components loaded by the base class by overriding onLoad:

Java

```
// empty constructor required for deserialization
public OrgChartNode()
{
}

@Override
protected void onLoad(Diagram diagram)
{
    super.onLoad(diagram);
    findComponents();
}
```

6. Call the static registerItemClass method to assign an XML element name to the custom item type:

Java

```
Diagram.registerClass(OrgChartNode.class, "my:OrgChartNode", 1);
```

7. In order to enable undo / redo of changes done on OrgChartNode, create a DiagramItemProperties - derived class that contains member corresponding to the additional properties defined by OrgChartNode:

Java

```
public class OrgChartNodeProperties
    extends DiagramNodeProperties
{
    String Title;
    String FullName;
    String Details;
    Pen Stroke;
    Brush Fill;
    Image Image;
}
```

8. Override the createProperties, saveProperties and restoreProperties methods:

Java

```
@Override
protected DiagramItemProperties createProperties()
{
    return new OrgChartNodeProperties();
}

@Override
protected void saveProperties(DiagramItemProperties props)
{
    super.saveProperties(props);

    OrgChartNodeProperties state = (OrgChartNodeProperties)props;
    state.Title = getTitle();
    state.FullName = getFullName();
    state.Details = getDetails();
    state.Stroke = getStroke();
    state.Fill = getFill();
    state.Image = getImage();
}
```

```
@Override
protected void restoreProperties(DiagramItemProperties props)
{
    super.restoreProperties(props);

    OrgChartNodeProperties state = (OrgChartNodeProperties)props;
    setTitle(state.Title);
    setFullName(state.FullName);
    setDetails(state.Details);
    setStroke(state.Stroke);
    setFill(state.Fill);
    setImage(state.Image);
}
```

9. The full source code for this tutorial is available in the Samples/Tutorial4 subfolder under the JDiagram installation folder.

Reference

com.mindfusion.common Namespace

Accordion Class

A container control that displays a stack of collapsible panes.

Syntax

Java

```
public class Accordion extends JPanel
```

Remarks

The **Accordion** control organizes its child panels vertically and provides a flexible space-distribution model tailored for sidebars, toolbox panels, and palettes.

Pane Management

Panes can be added using the addPane method, which automatically instantiates and adds a new AccordionPane with a specified title, icon, and content component. Individual panes can be removed from the container by passing the pane instance to the remove method, and the entire stack can be cleared at once using removeAll.

Layout

Only expanded panes are allowed to stretch and share any extra vertical space provided by the parent container. Collapsed panes restrict their maximum height to display only their header buttons. All panes are aligned to the top of the container. If all panes are collapsed, they will stack tightly at the top of the viewport, leaving any remaining empty space at the bottom rather than stretching the collapsed headers to fill the area.

Expansion Management

The control can be configured to either allow multiple panes to be expanded concurrently (the default behavior) or to enforce a single-expand mode where opening one pane automatically collapses all

others. This is controlled via the AllowMultipleExpands property. The expansion state of an individual pane can be programmatically queried or updated using the isExpanded and setExpanded methods on the AccordionPane, which fires property change events to allow listeners to react to visibility changes.

Accordion Members

A container control that displays a stack of collapsible panes.

The following tables list the members exposed by the Accordion type.

Public Constructors

	Name	Description
	Accordion	Initializes a new instance of the Accordion class.

Public Methods

	Name	Description
	addPane	Adds a new collapsible pane to the accordion.
	getAllowMultipleExpands	Gets a value indicating whether more than one pane can be expanded at the same time.
	remove	
	removeAll	Removes all panes from the accordion.
	setAllowMultipleExpands	Sets a value indicating whether more than one pane can be expanded at the same time.

Accordion Methods

Accordion.addPane Method

Adds a new collapsible pane to the accordion.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public Accordion.AccordionPane addPane (
    String title,
    Icon icon,
    JComponent content
)
```

Parameters

title
The title to display in the pane's header.

icon
The icon to display in the pane's header.

content
The component to display as the pane's content.

Return Value

The newly created AccordionPane.

AccordionPane Class

Represents a single collapsible pane within an Accordion control.

Syntax

Java

```
public class AccordionPane extends JPanel
```

Remarks

The **AccordionPane** represents a single collapsible section within an Accordion control. It consists of a clickable header button (which displays a title, an optional icon, and an expansion arrow) and a content area that can be shown or hidden.

Setting Content

The content of a pane can be any standard UI component (including containers such as a **JPanel** and **JScrollPane**). It is initially defined when the pane is created via the Accordion's addPane method. If the UI needs to be updated dynamically, the content can be replaced at runtime using the setContent method, and the current content component can be retrieved using getContent.

Properties

- Appearance: The visual identity of the pane's header is controlled via the Title and Icon properties.

- Expansion State: The Expanded property controls whether the content area is visible. Modifying the expansion state automatically updates the arrow indicator in the header and triggers a layout recalculation in the parent Accordion. When expanded, the pane is allowed to stretch vertically to consume available space; when collapsed, its height is strictly limited to the height of its header.

BitMask Methods

BitMask.get<T> Method

Method returns a EnumSet from given BitMask value.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
<T> EnumSet<T> get (
    int id,
    Class<T> instance
)
```

Parameters

id
represents bit value

instance
a Class to detect concrete type of Enum.

Return Value

EnumSet of Enum or Empty set if BitMask value & Power of 2 equals Zero.

See Also

BitMask Members
BitMask Interface
com.mindfusion.common Namespace

BitMask.set<T> Method

Method returns int representing the BitMask value from given EnumSet

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
<T> int set (
    EnumSet<T> values,
    Class<T> instance
)
```

Parameters

values
A EnumSet that is converted to BitMask value

instance
a Class to detect concrete type of Enum.

Return Value

BitMask value.

CanConvert Members

The following tables list the members exposed by the CanConvert type.

Public Methods

	Name	Description
	canConvert	

See Also

CanConvert Interface
com.mindfusion.common Namespace

CanConvert Methods

CanConvert.canConvert Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
boolean canConvert (
    String value
)
```

Parameters

value

Return Value

See Also

CanConvert Members
CanConvert Interface
com.mindfusion.common Namespace

Category Interface

Specifies the name of a category in which to group annotated property when displayed in a property grid.

Syntax

Java

```
public interface Category extends Annotation
```

See Also

Category Members
com.mindfusion.common Namespace

Category Members

Specifies the name of a category in which to group annotated property when displayed in a property grid.

The following tables list the members exposed by the Category type.

See Also

Category Interface
com.mindfusion.common Namespace

ChangeListener Interface

Defines the events raised when an object is changed.

Syntax

Java
`public interface ChangeListener extends EventListener`

See Also

ChangeListener Members
com.mindfusion.common Namespace

ChangeListener Members

Defines the events raised when an object is changed.

The following tables list the members exposed by the ChangeListener type.

Public Methods

	Name	Description
	changed	Invoked when the object is changed.

See Also

ChangeListener Interface
com.mindfusion.common Namespace

ChangeListener Methods

ChangeListener.changed Method

Invoked when the object is changed.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
void changed (
    EventObject e
)
```

Parameters

e
An EventObject object.

See Also

ChangeListener Members
ChangeListener Interface
com.mindfusion.common Namespace

Collections Class

Provides utility methods for processing collections.

Syntax

```
Java
public class Collections
```

Inheritance Hierarchy

java.lang.Object
com.mindfusion.common.Collections

Collections Constructor

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public Collections ()
```

See Also

Collections Class
com.mindfusion.common Namespace

Collections Methods

Collections.reverse<E> Method

Reverses the specified ArrayList.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static <E> void reverse (
    ArrayList<E> c,
    int index,
    int count
)
```

Parameters

c

index

count

See Also

ColorConverter Class

Syntax

Java
`public class ColorConverter implements CanConvert`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.common.ColorConverter

See Also

ColorConverter Members

com.mindfusion.common Namespace

CommonUtils Members

The following tables list the members exposed by the CommonUtils type.

Public Constructors

	Name	Description
	CommonUtils	

Public Methods

	Name	Description
	add	Overloaded.
	addAll	
	addDirectoryToZip	
	areClose	
	arrayMultiplication	
	as	Down-casts the object to specified type.
	cartesianToPolar	
	checkIntersect	Checks if the specified rectangle and circle intersect.

	clone	Overloaded.
	colorFromHtml	
	concat	Joins array elements using the specified delimiter.
	convertRect	
	deviceToDoc	
	distance	
	distToLineSegment	Calculates distance from the specified point to the specified line segment.
	distToRectPoint	Returns the nearest to pt point that lies on the outline of rectangle.
	docToDevice	
	filter	Overloaded.
	findValidateRoot	Returns the ancestor component that acts as validate root
	fromLTRB	Overloaded.
	getInvariantLocale	
	getIterableSize	
	getLength	Overloaded.
	getLocation	
	getMidColor	
	getScreenResolution	Returns the screen resolution in dots-per-inch. Checks up the availability of the Headless mode.
	getSize	
	imageFromFile	Loads an image from the specified file.
	imageFromStream	Loads an image from the specified stream.
	indexOf	Overloaded.
	isFalse	
	isTrue	
	lineIntersect	Calculates the intersection point of endless lines (pA, pB) and (pC, pD)
	lineIntersectHorizontal	Finds the x coordinate of the intersection point of the horizontal line at y and the line defined by points pA and pB. If the lines do not intersect, result is undefined.
	lineIntersectVertical	Finds the y coordinate of the intersection point of the vertical line at x and the line defined by points pA and pB. If the lines do not intersect, result is undefined.
	minDistToRect	Calculates the minimum distance between a given point and a given rectangle.

	nc	Performs a null-coalescing of the specified arguments.
	newPoint2D	Overloaded.
	newPointDouble	Overloaded.
	newPointFloat	Overloaded.
	newRectangle2D	
	newRectangleDouble	Overloaded.
	newRectangleFloat	Overloaded.
	normalizeRect	
	parse	Parses space separated numbers into Point2D
	polarToCartesian	
	rad	
	readFileAsString	
	resize	
	revalidateSynced	Performs synchronized revalidation to ensure that layout is up to date after this method returns.
	set	Overloaded.
	setHeight	
	setLocation	
	setWidth	
	setX	Overloaded.
	setY	Overloaded.
	subtract	Subtract the coordinates of one point from the coordinates of another
	toTitleCase	
	translate	
	translateX	Overloaded.
	translateY	Overloaded.
	unzip	
	withOpacity	
	writeStringToFile	
	zipDirectory

CommonUtils Methods

CommonUtils.add Method

Overload List

Name	Description
CommonUtils.add (T, double, double)	
CommonUtils.add (T, Point2D)	Add (translate) the coordinates of one point with the coordinates of another

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.add<T> Method (T, double, double)

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

`public static <T> T add (`
`  T changed,`
`  double addX,`
`  double addY`
`)`

Parameters

changed

addX

addY

Return Value

See Also

add Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.add<T> Method (T, Point2D)

Add (translate) the coordinates of one point with the coordinates of another

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <T> T add (
    T changed,
    Point2D changeVector
)
```

Parameters

changed

changeVector

Return Value

the first parameter which holds the result

See Also

add Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.addAll<T> Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <T> void addAll (
    Collection<T> target,
    Iterable<T> items
)
```

Parameters

target

items

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.addDirectoryToZip Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static void addDirectoryToZip (
    String source,
    ZipOutputStream out,
    String parent
)
```

Parameters

source

out

parent

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.areClose Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean areClose (
    float a,
```

```
    float b
)
```

Parameters

a

b

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.arrayMultiplication Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static float[] arrayMultiplication (
    float[] array,
    float value
)
```

Parameters

array

value

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.as<T> Method

Down-casts the object to specified type.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <T> T as (
    Class<T> type,
```

```
    Object object
)
```

Parameters

type
A Class instance specifying the target type.

object
The object to down-cast.

Return Value

The object cast to specified type, or null if it's of a different type.

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.cartesianToPolar Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static void cartesianToPolar (
    Point2D coordCenter,
    Point2D point,
    Point2D result
)
```

Parameters

coordCenter

point

result

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.checkIntersect Method

Checks if the specified rectangle and circle intersect.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

`public static boolean checkIntersect (`
`  Point2D pt,`
`  Rectangle2D rc,`
`  float rad`
`)`

Parameters

pt

rc

rad

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.clone Method

Overload List

Name	Description
CommonUtils.clone (T)	
CommonUtils.clone (T)	

See Also

CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.clone<T> Method (T)

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

`public static <T> T clone (`
`  T point`
`)`

Parameters

point

Return Value

See Also

clone Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.clone<T> Method (T)

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static <T> T clone (
    T point
)
```

Parameters

point

Return Value

See Also

clone Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.colorFromHtml Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static Color colorFromHtml (
    String htmlColor
)
```

Parameters

htmlColor

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.concat Method

Joins array elements using the specified delimiter.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String concat (
    String delimiter,
    Object[] objs
)
```

Parameters

delimiter
A character inserted between the array elements.

objs
The objects to be joined.

Return Value

A string containing the concatenated string representations of the objects.

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.convertRect<T> Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <T> T convertRect (
    Rectangle2D rc,
    T dest
)
```

Parameters

rc

dest

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.deviceToDoc Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Rectangle2D deviceToDoc (
    Graphics2D g,
    Rectangle r
)
```

Parameters

g

r

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.distance Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static double distance (
    Point2D pt1,
    Point2D pt2
)
```

Parameters

pt1

pt2

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.distToLineSegment Method

Calculates distance from the specified point to the specified line segment.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static float distToLineSegment (
    Point2D pt,
    Point2D p1,
    Point2D p2
)
```

Parameters

pt

p1

p2

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.distToRectPoint Method

Returns the nearest to pt point that lies on the outline of rectangle.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Point2D distToRectPoint (
    Point2D pt,
    Rectangle2D r
)
```

Parameters

pt

r

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.docToDevice Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Rectangle docToDevice (
    Graphics2D g,
    Rectangle2D r
)
```

Parameters

g

r

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.filter Method

Overload List

Name	Description
CommonUtils.filter (Iterable, Class)	Creates Iterable that iterates only over the subset of the given Iterable that consist of elements of desired type.
CommonUtils.filter (Iterator, Class)	Creates Iterator that iterates only over the subset of the given Iterator that consist of elements of desired type.

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.filter<T, D> Method (Iterable<T>, Class<D>)

Creates Iterable that iterates only over the subset of the given Iterable that consist of elements of desired type.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <T, D> Iterable<D> filter (
    Iterable<T> unfiltered,
    Class<D> desiredType
)
```

Parameters

unfiltered
the collection of items that can be of different type.

desiredType
the class of the items in the collection to be returned.

Return Value

An iterator over the collection items of the desired type.

See Also

filter Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.filter<T, D> Method (Iterator<T>, Class<D>)

Creates Iterator that iterates only over the subset of the given Iterator that consist of elements of desired type.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <T, D> Iterator<D> filter (
    Iterator<T> unfiltered,
    Class<D> desiredType
)
```

Parameters

unfiltered
the collection of items that can be of different type.

desiredType
the class of the items in the collection to be returned.

Return Value

An iterator over the collection items of the desired type.

See Also

filter Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.findValidateRoot Method

Returns the ancestor component that acts as validate root

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Component findValidateRoot (
    JComponent c
)
```

Parameters

c
A JComponent whose validation root should be returned.

Return Value

A Component that is the validation root of c.

See Also

CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.fromLTRB Method

Overload List

Name	Description
CommonUtils.fromLTRB (double, double, double, double)	
CommonUtils.fromLTRB (int, int, int, int)	

See Also

CommonUtils Members
CommonUtils Class

CommonUtils.fromLTRB Method (double, double, double, double)

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Rectangle2D fromLTRB (
    double l,
    double t,
    double r,
    double b
)
```

Parameters

l

t

r

b

Return Value

See Also

fromLTRB Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.fromLTRB Method (int, int, int, int)

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Rectangle fromLTRB (
    int l,
    int t,
    int r,
    int b
)
```

Parameters

l

t

r

b

Return Value

See Also

fromLTRB Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.getInvariantLocale Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Locale getInvariantLocale ()
```

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.getIterableSize Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static int getIterableSize (
    Iterable<?> item
)
```

Parameters

item

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.getLength Method

Overload List

Name	Description
CommonUtils.getLength (double[][], int)	Returns the specified dimension of the specified two-dimensional array.
CommonUtils.getLength (short[][], int)	Returns the specified dimension of the specified two-dimensional array.
CommonUtils.getLength (int[][], int)	Returns the specified dimension of the specified two-dimensional array.
CommonUtils.getLength (float[][], int)	Returns the specified dimension of the specified two-dimensional array.
CommonUtils.getLength (T[][], int)	

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.getLength Method (double[][], int)

Returns the specified dimension of the specified two-dimensional array.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static int getLength (
    double[][] array,
    int dimension
)
```

Parameters

array

dimension

Return Value

See Also

getLength Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.getLength Method (short[][], int)

Returns the specified dimension of the specified two-dimensional array.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static int getLength (
    short[][] array,
    int dimension
)
```

Parameters

array

dimension

Return Value

See Also

getLength Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.getLength Method (int[][], int)

Returns the specified dimension of the specified two-dimensional array.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static int getLength (
    int[][] array,
    int dimension
)
```

Parameters

array

dimension

Return Value

See Also

getLength Method Overload List
CommonUtils Members

CommonUtils.getLength Method (float[][], int)

Returns the specified dimension of the specified two-dimensional array.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static int getLength (
    float[][] array,
    int dimension
)
```

Parameters

array

dimension

Return Value

See Also

getLength Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.getLength<T> Method (T[][], int)

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <T> int getLength (
    T[][] array,
    int dimension
)
```

Parameters

array

dimension

Return Value

See Also

getLength Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.getLocation Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Point2D getLocation (
    Rectangle2D rect
)
```

Parameters

rect

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.getMidColor Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Color getMidColor (
    Color[] colors
)
```

Parameters

colors

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.getScreenResolution Method

Returns the screen resolution in dots-per-inch. Checks up the availability of the Headless mode.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static int getScreenResolution ()
```

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.getSize Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Dimension2D getSize (
    Rectangle2D rect
)
```

Parameters

rect

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.imageFromFile Method

Loads an image from the specified file.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Image imageFromFile (
    String filePath
)
```

Parameters

filePath
A string containing file path.

Return Value

A **java.awt.Image** instance representing the loaded bitmap, or **null** if I/O error occurred.

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.imageFromStream Method

Loads an image from the specified stream.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Image imageFromStream (
    InputStream stream
)
```

Parameters

stream
A **java.io.InputStream** instance.

Return Value

A **java.awt.Image** instance representing the loaded bitmap, or **null** if I/O error occurred.

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.indexOf Method

Overload List

Name	Description

CommonUtils.indexOf (String, String, Locale, boolean)	
CommonUtils.indexOf (T[], T)	

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.indexOf Method (String, String, Locale, boolean)

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static int indexOf (
    String source,
    String value,
    Locale locale,
    boolean ignoreCase
)
```

Parameters

source

value

locale

ignoreCase

Return Value

See Also

indexOf Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.indexOf<T> Method (T[], T)

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <T> int indexOf (
    T[] array,
```

```
    T element
)
```

Parameters

array

element

Return Value

See Also

indexOf Method Overload List
CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.isFalse Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean isFalse (
    Boolean value
)
```

Parameters

value

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.isTrue Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean isTrue (
    Boolean value
)
```

Parameters

value

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.lineIntersect<T> Method

Calculates the intersection point of endless lines (pA, pB) and (pC, pD)

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <T> boolean lineIntersect (
    Point2D pA,
    Point2D pB,
    Point2D pC,
    Point2D pD,
    Point2D result
)
```

Parameters

pA

pB

pC

pD

result
the point that will receive the result if the lines intersect

Return Value

true if the lines intersect

See Also

CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.lineIntersectHorizontal Method

Finds the x coordinate of the intersection point of the horizontal line at y and the line defined by points pA and pB. If the lines do not intersect, result is undefined.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static double lineIntersectHorizontal (
    double y,
    Point2D pA,
    Point2D pB
)
```

Parameters

y

pA

pB

Return Value

The intersection point x coordinate.

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.lineIntersectVertical Method

Finds the y coordinate of the intersection point of the vertical line at x and the line defined by points pA and pB. If the lines do not intersect, result is undefined.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static double lineIntersectVertical (
    double x,
    Point2D pA,
    Point2D pB
)
```

Parameters

x

pA

pB

Return Value

The intersection point y coordinate.

CommonUtils Class

CommonUtils.minDistToRect Method

Calculates the minimum distance between a given point and a given rectangle.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static double minDistToRect (
    Point2D pt,
    Rectangle2D rc
)
```

Parameters

pt

rc

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.nc<T, S1, S2> Method

Performs a null-coalescing of the specified arguments.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <T, S1, S2> T nc (
    S1 s1,
    S2 s2
)
```

Parameters

s1

s2

Return Value

See Also

CommonUtils.normalizeRect Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Rectangle2D normalizeRect (
    Rectangle2D rc
)
```

Parameters

rc

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.parse Method

Parses space separated numbers into Point2D

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean parse (
    String pair,
    Point2D dest
)
```

Parameters

pair
A string representation of the point coordinates.

dest
A Point2D object to which the parsed values are assigned.

Return Value

true if the string has been parsed successfully, otherwise false.

CommonUtils.resize<T> Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <T> T resize (
    T changed,
    double width,
    double height
)
```

Parameters

changed

width

height

Return Value

See Also

CommonUtils Members
CommonUtils Class
com.mindfusion.common Namespace

CommonUtils.revalidateSynced Method

Performs synchronized revalidation to ensure that layout is up to date after this method returns.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static void revalidateSynced (
    JComponent comp
)
```

Parameters

comp

See Also

Convert Members
com.mindfusion.common Namespace

Convert Members

Converts various types to and from string in a locale-independent way.

The following tables list the members exposed by the Convert type.

Public Methods

	Name	Description
	fromBase64String	Converts the specified encoded string to plain text
	fromBoolean	Converts the specified bool value to string.
	fromColor	Overloaded.
	fromDouble	Converts the specified double to string.
	fromImage	Converts the specified image to string.

	fromInt16	Converts the specified short to string.
	fromInt32	Converts the specified int to string.
	fromInt64	Converts the specified long to string.
	fromPointString	Converts the specified comma separated string to a list of PointF objects.
	fromSingle	Converts the specified float to string.
	toBase64String	Converts the specified plainText string to Base64String
	toBoolean	Converts the specified string value to bool.
	toColor	Converts the specified string to Color. The string should be in the format #AARRGGBB.
	toColor1	Converts the specified string to Color. The string should be in the format #AARRGGBB or rgba(0,0,0,0) default value Black
	toDouble	Converts the specified string to double.
	toImage	Converts the specified string value to image.
	toInt16	Converts the specified string to short.
	toInt32	Converts the specified string to int.
	toInt64	Converts the specified string to long.
	toPointString	Converts the list of PointF objects to a comma separated string.
	toSingle	Converts the specified string to float.

Convert Methods

Convert.fromBase64String Method

Converts the specified encoded string to plain text

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromBase64String (
    String base64EncodedData
)
```

Parameters

base64EncodedData
encoded string

Return Value

decoded string

See Also

Convert Members
Convert Class
com.mindfusion.common Namespace

Convert.fromBoolean Method

Converts the specified bool value to string.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromBoolean (
    boolean val
)
```

Parameters

val
The value to convert.

Return Value

A string representing the specified value.

See Also

Convert Members
Convert Class
com.mindfusion.common Namespace

Convert.fromColor Method

Overload List

Name	Description
Convert.fromColor (Color)	Converts the specified Color to string. The resulting string is in the format #AARRGGBB.
Convert.fromColor (Color, boolean)	Converts the specified Color to string. boolean hex param is a param to indicate whether color has to be converted to Hex value. The Default resulting string is in the format rgba(0,0,0,0).

See Also

Convert Members
Convert Class
com.mindfusion.common Namespace

Convert.fromColor Method (Color)

Converts the specified Color to string. The resulting string is in the format #AARRGGBB.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromColor (
    Color val
)
```

Parameters

val

Return Value

See Also

fromColor Method Overload List
Convert Members
Convert Class
com.mindfusion.common Namespace

Convert.fromColor Method (Color, boolean)

Converts the specified Color to string. boolean hex param is a param to indicate whether color has to be converted to Hex value. The Default resulting string is in the format rgba(0,0,0,0).

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromColor (
    Color val,
    boolean hex
)
```

Parameters

val

hex

Return Value

Convert Members
Convert Class
com.mindfusion.common Namespace

Convert.fromImage Method

Converts the specified image to string.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromImage (
    Image val
)
```

Parameters

val
The image object to convert.

Return Value

A string representing the specified value.

See Also

Convert Members
Convert Class
com.mindfusion.common Namespace

Convert.fromInt16 Method

Converts the specified short to string.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromInt16 (
    short val
)
```

Parameters

val

Return Value

See Also

Convert Members
Convert Class
com.mindfusion.common Namespace

Convert.fromInt32 Method

Converts the specified int to string.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromInt32 (
    int val
)
```

Parameters

val

Return Value

See Also

Convert Members
Convert Class

Convert.toBase64String Method

Converts the specified plainText string to Base64String

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String toBase64String (
    String plainText
)
```

Parameters

plainText
string

Return Value

string

See Also

Convert Members
Convert Class
com.mindfusion.common Namespace

Convert.toBoolean Method

Converts the specified string value to bool.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean toBoolean (
    String s
)
```

Parameters

s
The string value to convert from.

Return Value

A boolean value that is deserialized from the specified string.

Convert.toColor Method

Converts the specified string to Color. The string should be in the format #AARRGGBB.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Color toColor (
    String s
)
```

Parameters

s

Return Value

See Also

Convert Members
Convert Class
com.mindfusion.common Namespace

Convert.toColor1 Method

Converts the specified string to Color. The string should be in the format #AARRGGBB or rgba(0,0,0,0) default value Black

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Color toColor1 (
    String s
)
```

Parameters

s

Return Value

See Also

Convert.toPointString Method

Converts the list of PointF objects to a comma separated string.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static String toPointString (
    List<Point2D.Float> points
)
```

Parameters

points
The list of PointF objects to convert.

Return Value

A comma separated string.

See Also

Convertible Members

The following tables list the members exposed by the Convertible type.

Public Methods

	Name	Description
	toBoolean	Converts the value of this instance to an equivalent boolean value using the specified culture-specific formatting information.
	toByte	Converts the value of this instance to an equivalent byte value using the specified culture-specific formatting information.
	toChar	Converts the value of this instance to an equivalent char value using the specified culture-specific formatting information.
	toDateTime	Converts the value of this instance to an equivalent DateTime value using the specified culture-specific formatting information.
	toDecimal	Converts the value of this instance to an equivalent big integer value using the specified culture-specific formatting information.
	toDouble	Converts the value of this instance to an equivalent double value using the specified culture-specific formatting information.
	toInt	Converts the value of this instance to an equivalent integer value using the specified culture-specific formatting information.
	toLong	Converts the value of this instance to an equivalent long value using the specified culture-specific formatting information.
	toShort	Converts the value of this instance to an equivalent short value using the specified culture-specific formatting information.
	toSingle	Converts the value of this instance to an equivalent float value using the specified culture-specific formatting information.

	toString	Converts the value of this instance to an equivalent string value using the specified culture-specific formatting information.
	toType	Converts the value of this instance to an equivalent value of the specified type using the specified culture-specific formatting information.

Convertible Methods

Convertible.toBoolean Method

Converts the value of this instance to an equivalent boolean value using the specified culture-specific formatting information.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
boolean toBoolean (
    Locale locale
)
```

Parameters

locale
An object that supplies culture-specific formatting information.

Return Value

A boolean value equivalent to the value of this instance.

See Also

Convertible.toByte Method

Converts the value of this instance to an equivalent byte value using the specified culture-specific formatting information.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
byte toByte (
    Locale locale
)
```

Parameters

locale
An object that supplies culture-specific formatting information.

Return Value

A byte value equivalent to the value of this instance.

Convertible.toChar Method

Converts the value of this instance to an equivalent char value using the specified culture-specific formatting information.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
Character toChar (
    Locale locale
)
```

Parameters

locale
An object that supplies culture-specific formatting information.

Return Value

A char value equivalent to the value of this instance.

See Also

Convertible Interface
com.mindfusion.common Namespace

Convertible.toDateTime Method

Converts the value of this instance to an equivalent DateTime value using the specified culture-specific formatting information.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
DateTime toDateTime (
    Locale locale
)
```

Parameters

locale
An object that supplies culture-specific formatting information.

Return Value

A DateTime value equivalent to the value of this instance.

See Also

Convertible Members
Convertible Interface
com.mindfusion.common Namespace

Convertible.toDecimal Method

Converts the value of this instance to an equivalent big integer value using the specified culture-specific formatting information.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
BigDecimal toDecimal (
    Locale locale
)
```

Parameters

locale
An object that supplies culture-specific formatting information.

Return Value

A big integer value equivalent to the value of this instance.

See Also

Convertible Members
Convertible Interface
com.mindfusion.common Namespace

Convertible.toDouble Method

Converts the value of this instance to an equivalent double value using the specified culture-specific formatting information.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
double toDouble (
    Locale locale
)
```

Parameters

locale
An object that supplies culture-specific formatting information.

Return Value

A double value equivalent to the value of this instance.

See Also

Convertible Members
Convertible Interface
com.mindfusion.common Namespace

Convertible.toInt Method

Converts the value of this instance to an equivalent integer value using the specified culture-specific formatting information.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
int toInt (
    Locale locale
)
```

Parameters

locale
An object that supplies culture-specific formatting information.

Return Value

An integer value equivalent to the value of this instance.

See Also

Convertible Members
Convertible Interface
com.mindfusion.common Namespace

Convertible.toLong Method

Converts the value of this instance to an equivalent long value using the specified culture-specific formatting information.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
long toLong (
    Locale locale
)
```

Parameters

locale
An object that supplies culture-specific formatting information.

Return Value

A long value equivalent to the value of this instance.

See Also

Convertible Members
Convertible Interface
com.mindfusion.common Namespace

Convertible.toShort Method

Converts the value of this instance to an equivalent short value using the specified culture-specific formatting information.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
short toShort (
    Locale locale
)
```

Parameters

locale
An object that supplies culture-specific formatting information.

Return Value

A short value equivalent to the value of this instance.

Convertible Interface
com.mindfusion.common Namespace

Convertible.toSingle Method

Converts the value of this instance to an equivalent float value using the specified culture-specific formatting information.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
float toSingle (
    Locale locale
)
```

Parameters

locale
An object that supplies culture-specific formatting information.

Return Value

A float value equivalent to the value of this instance.

Convertible.toString Method

Converts the value of this instance to an equivalent string value using the specified culture-specific formatting information.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
String toString (
    Locale locale
)
```

Parameters

locale

An object that supplies culture-specific formatting information.

Return Value

A string value equivalent to the value of this instance.

See Also

Convertible Members

com.mindfusion.common Namespace

Convertible.toType<T> Method

Converts the value of this instance to an equivalent value of the specified type using the specified culture-specific formatting information.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
<T> Object toType (
    Class<T> conversionType,
    Locale locale
)
```

Parameters

conversionType

locale
An object that supplies culture-specific formatting information.

Return Value

A string value equivalent to the value of this instance.

DateTime Members

Immutable representation of date and time.

The following tables list the members exposed by the DateTime type.

Public Constructors

	Name	Description
	DateTime	Overloaded.

Public Fields

	Name	Description
	MaxValue	Represents the largest possible value of **DateTime**.
	MinValue	Represents the smallest possible value of **DateTime**.

Public Methods

	Name	Description
	add	Returns a new **DateTime** that adds the value of the specified Duration to the value of this instance.
	addDays	Overloaded. Returns a new **DateTime** that adds the specified number of days to this instance.
	addHours	Overloaded. Returns a new **DateTime** that adds the specified number of hours to this instance.
	addMilliseconds	Overloaded. Returns a new **DateTime** that adds the specified number of milliseconds to this instance.
	addMinutes	Overloaded. Returns a new **DateTime** that adds the specified number of minutes to this instance.
	addMonths	Overloaded. Returns a new **DateTime** that adds the specified number of months to this instance.
	addSeconds	Overloaded. Returns a new **DateTime** that adds the specified number of seconds to this instance.
	addTicks	Returns a new **DateTime** that adds the specified number of ticks to this instance.
	addYears	Returns a new **DateTime** that adds the specified number of years to this instance.

	clone	Cloneable.clone implementation.
	compareTo	Comparable.compareTo implementation.
S	daysInMonth	Returns the number of days in the specified month and year.
	equals	Object.equals override.
	getDate	Gets the date component of this instance.
	getDay	Gets the day of month component of the date (1-31).
	getDayOfWeek	Gets the day of the week represented by this instance.
	getDayOfYear	Gets the day of the year represented by this instance.
	getHour	Gets the hour component of the date (0-23).
	getMillisecond	Gets the millisecond component of the date (0-999).
	getMinute	Gets the minute component of the date (0-59).
	getMonth	Gets the month component of the date (1-12).
	getSecond	Gets the second component of the date (0-59).
	getTicks	Gets the total number of ticks in this instance.
	getTimeOfDay	Gets the time of the day of this instance.
	getWeekOfYear	Gets the week of the year for the current date.
	getYear	Gets the year component of the date.
	hashCode	Object.hashCode override.
S	isLeapYear	Returns a value indicating whether the specified year is a leap year.
	isLessThan	Determines whether the current **DateTime** is less than the specified **DateTime**.
	isLessThanOrEqual	Determines whether the current **DateTime** is less than or equal to the specified **DateTime**.
	isLocalTime	Gets a value indicating whether the time represented by this instance is a local time.
	isUtcTime	Gets a value indicating whether the time represented by this instance is a UTC time.
	isWeekend	
S	now	Gets a **DateTime** object that is set to the current date and time in the default time zone and locale.
S	op_Addition	Adds a specified time interval to a specified date and time, yielding a new date and time.
S	op_Equality	Determines whether two specified instances of **DateTime** are equal.
S	op_GreaterThan	Determines whether one specified **DateTime** is greater than another specified **DateTime**.

	op_GreaterThanOrEqual	Determines whether one specified **DateTime** is greater than or equal to another specified **DateTime**.
	op_Inequality	Determines whether two specified instances of **DateTime** are not equal.
	op_LessThan	Determines whether one specified **DateTime** is less than another specified **DateTime**.
	op_LessThanOrEqual	Determines whether one specified **DateTime** is less than or equal to another specified **DateTime**.
	op_Subtraction	Overloaded.
	subtract	Overloaded.
	today	Gets a **DateTime** object that represents the current date in the default time one and locale.
	toJavaCalendar	Converts the stored date and time to a **Calendar** object.
	toJavaDateTime	Returns the stored **LocalDateTime** value.
	toLocalTime	Converts the value of the current **DateTime** object to local time.
	toLongDateString	Overloaded.
	toLongTimeString	Overloaded.
	toShortDateString	Overloaded.
	toShortTimeString	Overloaded.
	toString	Overloaded. Converts the value of the current **DateTime** object to its equivalent string representation.
	toUniversalTime	Converts the value of the current **DateTime** object to Coordinated Universal Time (UTC).
	utcNow	Gets a **DateTime** object that is set to the current date and time on this computer, expressed as the Coordinated Universal Time (UTC).

DateTime Class
com.mindfusion.common Namespace

DateTime Constructor (Date)

Initializes a new instance of the DateTime class, representing specified **Date**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime (
    Date date
)
```

Parameters

date
A **java.util.Date** instance.

See Also

DateTime Constructor Overload List
DateTime Class
com.mindfusion.common Namespace

DateTime Constructor (int, int, int)

Initializes a new instance of the DateTime class with the specified values.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime (
    int year,
    int month,
    int day
)
```

Parameters

year
The year component of the new date.

month
The month component of the new date.

day
The day component of the new date.

See Also

DateTime Constructor Overload List
DateTime Class
com.mindfusion.common Namespace

DateTime Constructor (int, int, int, int, int, int)

Initializes a new instance of the DateTime class with the specified values.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime (
    int year,
    int month,
    int day,
    int hour,
    int minute,
    int second
)
```

Parameters

year
The year component of the new date.

month
The month component of the new date.

day
The day component of the new date.

hour
The hour component of the new date.

minute
The minute component of the new date.

second
The second component of the new date.

See Also

com.mindfusion.common Namespace

DateTime Constructor (int, int, int, int, int, int, int)

Initializes a new instance of the DateTime class with the specified values.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime (
    int year,
    int month,
    int day,
    int hour,
    int minute,
    int second,
    int millisecond
)
```

Parameters

year
The year component of the new date.

month
The month component of the new date.

day
The day component of the new date.

hour
The hour component of the new date.

minute
The minute component of the new date.

second
The second component of the new date.

millisecond
The millisecond component of the new date.

DateTime Constructor (long)

Initializes a new instance of the DateTime class with the specified number of ticks.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime (
    long ticks
)
```

Parameters

ticks
A date and time expressed in number of 100-nanosecond intervals.

See Also

DateTime Constructor Overload List
DateTime Class
com.mindfusion.common Namespace

DateTime Constructor (LocalDateTime)

Initializes a new instance of the DateTime class, storing specified **LocalDateTime**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime (
    LocalDateTime dateTime
)
```

Parameters

dateTime
A **java.time.LocalDateTime** instance specifying date and time.

See Also

DateTime Constructor Overload List
DateTime Class
com.mindfusion.common Namespace

DateTime Methods

DateTime.add Method

Returns a new DateTime that adds the value of the specified Duration to the value of this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime add (
    Duration value
)
```

Parameters

value
A Duration object that represents a positive or negative time interval.

Return Value

Returns a new DateTime that adds the value of the **Duration** to the value of this instance.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.addDays Method

Returns a new DateTime that adds the specified number of days to this instance.

Overload List

Name	Description
DateTime.addDays (double)	Returns a new **DateTime** that adds the specified number of days to this instance.
DateTime.addDays (long)	Returns a new **DateTime** that adds the specified number of days to this instance.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.addDays Method (double)

Returns a new DateTime that adds the specified number of days to this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime addDays (
    double value
)
```

Parameters

value
A number of days. The value parameter can be negative or positive.

Return Value

A DateTime whose value is the sum of the date and time represented by this instance and the number of days represented by value.

See Also

addDays Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.addDays Method (long)

Returns a new DateTime that adds the specified number of days to this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime addDays (
    long value
)
```

Parameters

value
The number of days to add. The value parameter can be negative or positive.

Return Value

A DateTime whose value is the sum of the date and time represented by this instance and the number of days represented by value.

See Also

addDays Method Overload List

DateTime.addHours Method (double)

Returns a new DateTime that adds the specified number of hours to this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public DateTime addHours (
    double value
)
```

Parameters

value
A number of whole and fractional hours. The value parameter can be negative or positive.

Return Value

A DateTime whose value is the sum of the date and time represented by this instance and the number of hours represented by value.

See Also

addHours Method Overload List

DateTime Class
com.mindfusion.common Namespace

DateTime.addHours Method (long)

Returns a new DateTime that adds the specified number of hours to this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public DateTime addHours (
    long value
)
```

Parameters

value
The number of hours to add. The value parameter can be negative or positive.

Return Value

A DateTime whose value is the sum of the date and time represented by this instance and the number of hours represented by value.

See Also

addHours Method Overload List
DateTime Members

DateTime.addMilliseconds Method

Returns a new DateTime that adds the specified number of milliseconds to this instance.

Overload List

Name	Description
DateTime.addMilliseconds (double)	Returns a new **DateTime** that adds the specified number of milliseconds to this instance.
DateTime.addMilliseconds (long)	Returns a new **DateTime** that adds the specified number of milliseconds to this instance.

See Also

com.mindfusion.common Namespace

DateTime.addMilliseconds Method (double)

Returns a new DateTime that adds the specified number of milliseconds to this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime addMilliseconds (
    double value
)
```

Parameters

value
A number of whole and fractional milliseconds. The value parameter can be negative or positive. Note that this value is rounded to the nearest integer.

Return Value

A DateTime whose value is the sum of the date and time represented by this instance and the number of milliseconds represented by value.

See Also

addMilliseconds Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.addMilliseconds Method (long)

Returns a new DateTime that adds the specified number of milliseconds to this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime addMilliseconds (
    long value
)
```

Parameters

value
The number of milliseconds to add. The value parameter can be negative or positive.

Return Value

A DateTime whose value is the sum of the date and time represented by this instance and the number of milliseconds represented by value.

See Also

DateTime.addSeconds Method (double)

Returns a new DateTime that adds the specified number of seconds to this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public DateTime addSeconds (
    double value
)
```

Parameters

value
A number of whole and fractional seconds. The value parameter can be negative or positive.

Return Value

A DateTime whose value is the sum of the date and time represented by this instance and the number of seconds represented by value.

See Also

addSeconds Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.addSeconds Method (long)

Returns a new DateTime that adds the specified number of seconds to this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public DateTime addSeconds (
    long value
)
```

Parameters

value
The number of seconds to add. The value parameter can be negative or positive.

Return Value

A DateTime whose value is the sum of the date and time represented by this instance and the number of seconds represented by value.

See Also

addSeconds Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.addTicks Method

Returns a new DateTime that adds the specified number of ticks to this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime addTicks (
    long value
)
```

Parameters

value
A number ticks. The value parameter can be positive or negative.

Return Value

A DateTime whose value is the sum of the date and time represented by this instance and the time represented by value.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.addYears Method

Returns a new DateTime that adds the specified number of years to this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime addYears (
    int value
)
```

Parameters

value
A number of years. The value parameter can be negative or positive.

Return Value

A DateTime whose value is the sum of the date and time represented by this instance and the number of years represented by value.

DateTime Class
com.mindfusion.common Namespace

DateTime.clone Method

Cloneable.clone implementation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime clone ()
```

Return Value

A DateTime object.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.compareTo Method

Comparable.compareTo implementation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int compareTo (
    DateTime o
)
```

Parameters

o
The DateTime object to compare to.

Return Value

A negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.daysInMonth Method

Returns the number of days in the specified month and year.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static int daysInMonth (
    int year,
    int month
)
```

Parameters

year
The year.

month
The month (a number ranging from 1 to 12).

Return Value

The number of days in month for the specified year. For example, if month equals 2 for February, the return value is 28 or 29 depending upon whether year is a leap year.

DateTime Class
com.mindfusion.common Namespace

DateTime.equals Method

Object.equals override.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public boolean equals (
    Object value
)
```

Parameters

value
The object to compare to this instance.

Return Value

true if the value parameter equals the value of this instance; otherwise, false.

DateTime Class
com.mindfusion.common Namespace

DateTime.getDate Method

Gets the date component of this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime getDate ()
```

Return Value

A new DateTime with the same date as this instance, and the time value set to 12:00:00 midnight (00:00:00).

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.getDay Method

Gets the day of month component of the date (1-31).

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int getDay ()
```

Return Value

The day component, expressed as a value between 1 and 31.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.getDayOfWeek Method

Gets the day of the week represented by this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DayOfWeek getDayOfWeek ()
```

Return Value

One of the DayOfWeek constants.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.getDayOfYear Method

Gets the day of the year represented by this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int getDayOfYear ()
```

Return Value

The day of the year, expressed as a value between 1 and 366.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.getHour Method

Gets the hour component of the date (0-23).

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int getHour ()
```

Return Value

The hour component, expressed as a value between 0 and 23.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.getMillisecond Method

Gets the millisecond component of the date (0-999).

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int getMillisecond ()
```

Return Value

The millisecond component, expressed as a value between 0 and 59.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.getMinute Method

Gets the minute component of the date (0-59).

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int getMinute ()
```

Return Value

The minute component, expressed as a value between 0 and 59.

See Also

DateTime Members
DateTime Class

DateTime.getMonth Method

Gets the month component of the date (1-12).

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public int getMonth ()
```

Return Value

The month component, expressed as a value between 1 and 12.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.getSecond Method

Gets the second component of the date (0-59).

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public int getSecond ()
```

Return Value

The second component, expressed as a value between 0 and 59.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.getTicks Method

Gets the total number of ticks in this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public long getTicks ()
```

Return Value

The number of ticks that represent the date and time of this instance. The value is between MinValue and MaxValue.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.getTimeOfDay Method

Gets the time of the day of this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Duration getTimeOfDay ()
```

Return Value

A Duration that represents the fraction of the day that has elapsed since midnight.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.getWeekOfYear Method

Gets the week of the year for the current date.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int getWeekOfYear ()
```

Return Value

The week number of the specified date.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.getYear Method

Gets the year component of the date.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public int getYear ()
```

Return Value

The year, between 1 and 9999.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.hashCode Method

Object.hashCode override.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public int hashCode ()
```

Return Value

A 32-bit signed integer hash code.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.isLeapYear Method

Returns a value indicating whether the specified year is a leap year.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean isLeapYear (
    int year
)
```

Parameters

year
A 4-digit year.

Return Value

true if *year* is a leap year; otherwise, false.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.isLessThan Method

Determines whether the current DateTime is less than the specified **DateTime**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public boolean isLessThan (
    DateTime d
)
```

Parameters

d
A DateTime.

Return Value

true if the current date is less than *d*; otherwise, false.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.isLessThanOrEqual Method

Determines whether the current DateTime is less than or equal to the specified **DateTime**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public boolean isLessThanOrEqual (
    DateTime d
)
```

Parameters

d
A DateTime.

Return Value

true if the current date is less than or equal to *d*; otherwise, false.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.isLocalTime Method

Gets a value indicating whether the time represented by this instance is a local time.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public boolean isLocalTime ()
```

Return Value

true if the current time represents a local time; otherwise, false.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.isUtcTime Method

Gets a value indicating whether the time represented by this instance is a UTC time.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public boolean isUtcTime ()
```

Return Value

true if the current time represents a UTC time; otherwise, false.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.isWeekend Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public boolean isWeekend ()
```

Return Value

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.now Method

Gets a DateTime object that is set to the current date and time in the default time zone and locale.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static DateTime now ()
```

Return Value

A DateTime whose value is the current local date and time.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.op_Addition Method

Adds a specified time interval to a specified date and time, yielding a new date and time.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static DateTime op_Addition (
    DateTime d,
    Duration t
)
```

Parameters

d
A DateTime.

t
A Duration.

Return Value

A **DateTime** that is the sum of the values of *d* and *t*.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.op_Equality Method

Determines whether two specified instances of DateTime are equal.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean op_Equality (
    DateTime d1,
    DateTime d2
)
```

Parameters

d1
A DateTime.

d2
A **DateTime**.

Return Value

true if *d1* and *d2* represent the same date and time or are both null; otherwise, false.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.op_GreaterThan Method

Determines whether one specified DateTime is greater than another specified **DateTime**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean op_GreaterThan (
    DateTime d1,
    DateTime d2
)
```

Parameters

d1
A DateTime.

d2
A **DateTime**.

Return Value

true if *d1* is greater than *d2*; otherwise, false.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.op_GreaterThanOrEqual Method

Determines whether one specified DateTime is greater than or equal to another specified **DateTime**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean op_GreaterThanOrEqual (
    DateTime d1,
    DateTime d2
)
```

Parameters

d1
A DateTime.

d2
A **DateTime**.

Return Value

true if *d1* is greater than or equal to *d2*; otherwise, false.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.op_Inequality Method

Determines whether two specified instances of DateTime are not equal.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean op_Inequality (
    DateTime d1,
    DateTime d2
)
```

Parameters

d1
A DateTime.

d2
A **DateTime**.

Return Value

true if *d1* and *d2* do not represent the same date and time or are both null; otherwise, false.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.op_LessThan Method

Determines whether one specified DateTime is less than another specified **DateTime**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean op_LessThan (
    DateTime d1,
    DateTime d2
)
```

Parameters

d1
A DateTime.

d2
A **DateTime**.

Return Value

true if *d1* is less than *d2*; otherwise, false.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.op_LessThanOrEqual Method

Determines whether one specified DateTime is less than or equal to another specified **DateTime**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean op_LessThanOrEqual (
    DateTime d1,
    DateTime d2
)
```

Parameters

d1
A DateTime.

d2
A **DateTime**.

Return Value

true if *d1* is less than or equal to *d2*; otherwise, false.

DateTime.op_Subtraction Method

Overload List

Name	Description
DateTime.op_Subtraction (DateTime, DateTime)	Subtracts a specified date and time from another specified date and time and returns a time interval.
DateTime.op_Subtraction (DateTime, Duration)	Subtracts a specified time interval from a specified date and time and returns a new date and time.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.op_Subtraction Method (DateTime, DateTime)

Subtracts a specified date and time from another specified date and time and returns a time interval.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration op_Subtraction (
    DateTime d1,
    DateTime d2
)
```

Parameters

d1
A DateTime (the minuend).

d2
A **DateTime** (the subtrahend).

Return Value

A Duration that is the time interval between *d1* and *d2*; that is, *d1* minus *d2*.

See Also

op_Subtraction Method Overload List
DateTime Members

DateTime.op_Subtraction Method (DateTime, Duration)

Subtracts a specified time interval from a specified date and time and returns a new date and time.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static DateTime op_Subtraction (
    DateTime d,
    Duration t
)
```

Parameters

d
A DateTime.

t
A Duration.

Return Value

A **DateTime** whose value is the value of *d* minus the value of *t*.

See Also

op_Subtraction Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.subtract Method

Overload List

Name	Description
DateTime.subtract (DateTime)	Subtracts the specified date and time from this instance.
DateTime.subtract (Duration)	Subtracts the specified duration from this instance.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.subtract Method (DateTime)

Subtracts the specified date and time from this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Duration subtract (
    DateTime date
)
```

Parameters

date
A DateTime instance.

Return Value

A Duration interval equal to the date and time represented by this instance minus the date and time represented by value.

See Also

subtract Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.subtract Method (Duration)

Subtracts the specified duration from this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime subtract (
    Duration duration
)
```

Parameters

duration
A Duration instance.

Return Value

A DateTime equal to the date and time represented by this instance minus the time interval represented by value.

See Also

subtract Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.today Method

Gets a DateTime object that represents the current date in the default time one and locale.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static DateTime today ()
```

Return Value

A DateTime set to today's date, with the time component set to 00:00:00.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toJavaCalendar Method

Converts the stored date and time to a **Calendar** object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public Calendar toJavaCalendar ()
```

Return Value

A **java.util.Calendar** instance.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toJavaDateTime Method

Returns the stored **LocalDateTime** value.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public LocalDateTime toJavaDateTime ()`

Return Value

A **java.time.LocalDateTime** instance.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toLocalTime Method

Converts the value of the current DateTime object to local time.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public DateTime toLocalTime ()`

Return Value

A DateTime object representing the local time equivalent of the current date and time.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toLongDateString Method

Overload List

Name	Description
DateTime.toLongDateString ()	Converts the value of the current DateTime object to its equivalent long date string representation.
DateTime.toLongDateString (Locale)	Converts the value of the current **DateTime** object to its equivalent long date string representation.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toLongDateString Method ()

Converts the value of the current DateTime object to its equivalent long date string representation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toLongDateString ()
```

Return Value

A string that contains the long date string representation of the current DateTime object.

See Also

toLongDateString Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toLongDateString Method (Locale)

Converts the value of the current DateTime object to its equivalent long date string representation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toLongDateString (
    Locale locale
)
```

Parameters

locale
The locale that supplies culture-specific formatting information.

Return Value

A string that contains the long date string representation of the current DateTime object.

See Also

toLongDateString Method Overload List
DateTime Members

DateTime.toLongTimeString Method

Overload List

Name	Description
DateTime.toLongTimeString ()	Converts the value of the current DateTime object to its equivalent long time string representation.
DateTime.toLongTimeString (Locale)	Converts the value of the current **DateTime** object to its equivalent long time string representation.

See Also

com.mindfusion.common Namespace

DateTime.toLongTimeString Method ()

Converts the value of the current DateTime object to its equivalent long time string representation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public String toLongTimeString ()`

Return Value

A string that contains the long time string representation of the current DateTime object.

See Also

toLongTimeString Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toLongTimeString Method (Locale)

Converts the value of the current DateTime object to its equivalent long time string representation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toLongTimeString (
    Locale locale
)
```

Parameters

locale
The locale that supplies culture-specific formatting information.

Return Value

A string that contains the long time string representation of the current DateTime object.

See Also

toLongTimeString Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toShortDateString Method

Overload List

Name	Description
DateTime.toShortDateString ()	Converts the value of the current DateTime object to its equivalent short date string representation.
DateTime.toShortDateString (Locale)	Converts the value of the current **DateTime** object to its equivalent short date string representation.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toShortDateString Method ()

Converts the value of the current DateTime object to its equivalent short date string representation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toShortDateString ()
```

Return Value

A string that contains the short date string representation of the current DateTime object.

See Also

toShortDateString Method Overload List
DateTime Members

com.mindfusion.common Namespace

DateTime.toShortDateString Method (Locale)

Converts the value of the current DateTime object to its equivalent short date string representation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toShortDateString (
    Locale locale
)
```

Parameters

locale
The locale that supplies culture-specific formatting information.

Return Value

A string that contains the short date string representation of the current DateTime object.

See Also

toShortDateString Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toShortTimeString Method

Overload List

Name	Description
DateTime.toShortTimeString ()	Converts the value of the current DateTime object to its equivalent short time string representation.
DateTime.toShortTimeString (Locale)	Converts the value of the current **DateTime** object to its equivalent short time string representation.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toShortTimeString Method ()

Converts the value of the current DateTime object to its equivalent short time string representation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toShortTimeString ()
```

Return Value

A string that contains the short time string representation of the current DateTime object.

See Also

toShortTimeString Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toShortTimeString Method (Locale)

Converts the value of the current DateTime object to its equivalent short time string representation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toShortTimeString (
    Locale locale
)
```

Parameters

locale
The locale that supplies culture-specific formatting information.

Return Value

A string that contains the short time string representation of the current DateTime object.

See Also

toShortTimeString Method Overload List
DateTime Members

DateTime.toString Method

Converts the value of the current DateTime object to its equivalent string representation.

Overload List

Name	Description
DateTime.toString ()	Converts the value of the current **DateTime** object to its equivalent string representation.
DateTime.toString (String)	Converts the value of the current **DateTime** object to its equivalent string representation using the specified format.
DateTime.toString (String, Locale)	Converts the value of the current **DateTime** object to its equivalent string representation using the specified format and locale.
DateTime.toString (String, Locale, boolean)	Converts the value of the current **DateTime** object to its equivalent string representation using the specified format and locale.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toString Method ()

Converts the value of the current DateTime object to its equivalent string representation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toString ()
```

Return Value

A string representation of the value of the current DateTime object.

See Also

toString Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toString Method (String)

Converts the value of the current DateTime object to its equivalent string representation using the specified format.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toString (
    String format
)
```

Parameters

format
A standard or custom date and time format string.

Return Value

A string representation of value of the current DateTime object as specified by *format*.

See Also

toString Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toString Method (String, Locale)

Converts the value of the current DateTime object to its equivalent string representation using the specified format and locale.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toString (
    String format,
    Locale locale
)
```

Parameters

format
A standard or custom date and time format string.

locale
The locale that supplies culture-specific formatting information.

Return Value

A string representation of value of the current DateTime object as specified by *format*.

See Also

toString Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toString Method (String, Locale, boolean)

Converts the value of the current DateTime object to its equivalent string representation using the specified format and locale.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toString (
    String format,
    Locale locale,
    boolean excelFormat
)
```

Parameters

format
A standard or custom date and time format string.

locale
The locale that supplies culture-specific formatting information.

excelFormat
true to accept Excel-compatible format strings, or **false** otherwise.

Return Value

A string representation of value of the current DateTime object as specified by *format*.

See Also

toString Method Overload List
DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.toUniversalTime Method

Converts the value of the current DateTime object to Coordinated Universal Time (UTC).

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public DateTime toUniversalTime ()
```

Return Value

A DateTime object representing the UTC equivalent of the current date and time.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DateTime.utcNow Method

Gets a DateTime object that is set to the current date and time on this computer, expressed as the Coordinated Universal Time (UTC).

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public static DateTime utcNow ()`

Return Value

A DateTime whose value is the current UTC date and time.

See Also

DateTime Members
DateTime Class
com.mindfusion.common Namespace

DayOfWeek Enumeration

Specifies the day of the week.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public enum DayOfWeek`

Members

	Member name	Description
	Friday	Indicates Friday.

	Monday	Indicates Monday.
	Saturday	Indicates Saturday.
	Sunday	Indicates Sunday.
	Thursday	Indicates Thursday.
	Tuesday	Indicates Tuesday.
	Wednesday	Indicates Wednesday.

Duration Class

Represents an immutable time interval.

Syntax

Java
`public class Duration implements Comparable<T>, Cloneable`

Inheritance Hierarchy

java.lang.Object
com.mindfusion.common.Duration

See Also

Duration Members
com.mindfusion.common Namespace

Duration Members

Represents an immutable time interval.

The following tables list the members exposed by the Duration type.

Public Constructors

	Name	Description
	Duration	Overloaded.

Public Fields

	Name	Description
	MaxValue	Represents the largest possible value of **Duration**.
	MinValue	Represents the smallest possible value of **Duration**.
	TicksPerDay	Represents the number of ticks in 1 day.
	TicksPerHour	Represents the number of ticks in 1 hour.
	TicksPerMillisecond	Represents the number of ticks in 1 millisecond.

	TicksPerMinute	Represents the number of ticks in 1 minute.
	TicksPerSecond	Represents the number of ticks in 1 second.
	Zero	Represents zero duration.

Public Methods

	Name	Description
	add	Returns a new **Duration** object whose value is the sum of the specified **Duration** object and this instance.
	clone	Cloneable.clone implementation.
	compareTo	Comparable.compareTo implementation.
	equals	Object.equals override.
	fromDays	Overloaded.
	fromHours	Overloaded.
	fromMilliseconds	Overloaded.
	fromMinutes	Overloaded.
	fromSeconds	Overloaded.
	fromTicks	Returns a **Duration** that represents a specified time, where the specification is in units of ticks.
	getDays	Gets the days component of the time interval represented by the current **Duration** object.
	getHours	Gets the hours component of the time interval represented by the current **Duration** object.
	getMilliseconds	Gets the milliseconds component of the time interval represented by the current **Duration** object.
	getMinutes	Gets the minutes component of the time interval represented by the current **Duration** object.
	getSeconds	Gets the seconds component of the time interval represented by the current **Duration** object.
	getTicks	Gets the number of ticks that represent the value of the current **Duration** object.
	getTotalDays	Gets the value of the current **Duration** object expressed in whole days.
	getTotalHours	Gets the value of the current **Duration** expressed in whole and fractional hours.
	getTotalMilliseconds	Gets the total number of milliseconds in this instance.
	getTotalMinutes	Gets the value of the current **Duration** expressed in whole and fractional minutes.
	getTotalSeconds	Gets the value of the current **Duration** object expressed in whole and fractional seconds.

	hashCode	Object.hashCode override.
	negate	Returns a **Duration** whose value is the negated value of the specified instance.
S	op_Addition	Adds two specified **Duration** instances.
S	op_Equality	Indicates whether two **Duration** instances are equal.
S	op_GreaterThan	Indicates whether a specified **Duration** is greater than another specified **Duration**.
S	op_GreaterThanOrEqual	Indicates whether a specified **Duration** is greater than or equal to another specified **Duration**.
S	op_Inequality	Indicates whether two **Duration** instances are not equal.
S	op_LessThan	Indicates whether a specified **Duration** is less than another specified **Duration**.
S	op_LessThanOrEqual	Indicates whether a specified **Duration** is less than or equal to another specified **Duration**.
S	op_Subtraction	Subtracts a specified **Duration** from another specified **Duration**.
S	op_UnaryNegation	Returns a **Duration** whose value is the negated value of the specified instance.
	subtract	Returns a new **Duration** object whose value is the difference between the specified **Duration** object and this instance.
	toJavaDuration	Returns the stored **java.time.Duration**.
	toString	Returns the string representation of the value of this instance.

Duration Constructor

Overload List

Name	Description
Duration ()	Initializes a new instance of the Duration class with zero length.
Duration (Duration)	Initializes a new instance of the **Duration** class, storing specified **java.time.Duration**.
Duration (int, int, int)	Initializes a new instance of the **Duration** class with the specified duration.
Duration (int, int, int, int)	Initializes a new instance of the **Duration** class with the specified values.
Duration (int, int, int, int, int)	Initializes a new instance of the **Duration** class with the specified value.
Duration (long)	Initializes a new instance of the **Duration** class with the specified length.

See Also

Duration Constructor ()

Initializes a new instance of the Duration class with zero length.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public Duration ()
```

See Also

Duration Constructor Overload List
Duration Class
com.mindfusion.common Namespace

Duration Constructor (Duration)

Initializes a new instance of the Duration class, storing specified **java.time.Duration**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public Duration (
    Duration duration
)
```

Parameters

duration
A **java.time.Duration** instance specifying duration.

See Also

Duration Constructor Overload List
Duration Class
com.mindfusion.common Namespace

Duration Constructor (int, int, int)

Initializes a new instance of the Duration class with the specified duration.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Duration (
    int hours,
    int minutes,
    int seconds
)
```

Parameters

hours
The hours component of the new duration.

minutes
The minutes component of the new duration.

seconds
The seconds component of the new duration.

See Also

Duration Constructor Overload List
Duration Class
com.mindfusion.common Namespace

Duration Constructor (int, int, int, int)

Initializes a new instance of the Duration class with the specified values.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Duration (
    int days,
    int hours,
    int minutes,
    int seconds
)
```

Parameters

days
The hours component of the new duration.

hours
The hours component of the new duration.

minutes
The minutes component of the new duration.

seconds
The seconds component of the new duration.

See Also

Duration Constructor Overload List
Duration Class
com.mindfusion.common Namespace

Duration Constructor (int, int, int, int, int)

Initializes a new instance of the Duration class with the specified value.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Duration (
    int days,
    int hours,
    int minutes,
    int seconds,
    int milliseconds
)
```

Parameters

days
The hours component of the new duration.

hours
The hours component of the new duration.

minutes
The minutes component of the new duration.

seconds
The seconds component of the new duration.

milliseconds
The milliseconds component of the new duration.

See Also

Duration Constructor Overload List
Duration Class
com.mindfusion.common Namespace

Duration Constructor (long)

Initializes a new instance of the Duration class with the specified length.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Duration (
    long ticks
)
```

Parameters

ticks
A duration expressed in number of 100-nanosecond intervals.

See Also

Duration Constructor Overload List
Duration Class
com.mindfusion.common Namespace

Duration Methods

Duration.add Method

Returns a new Duration object whose value is the sum of the specified **Duration** object and this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Duration add (
    Duration duration
)
```

Parameters

duration
A Duration.

Return Value

A new object that represents the value of this instance plus the value of *duration*.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.clone Method

Cloneable.clone implementation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Duration clone ()
```

Return Value

A Duration object.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.compareTo Method

Comparable.compareTo implementation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int compareTo (
    Duration o
)
```

Parameters

o
The Duration object to compare to.

Return Value

A negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.equals Method

Object.equals override.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public boolean equals (
    Object value
)
```

Parameters

value
The object to compare to this instance.

Return Value

true if the value parameter equals the value of this instance; otherwise, false.

Duration.fromDays Method

Overload List

Name	Description
Duration.fromDays (double)	Returns a Duration that represents a specified number of days, where the specification is accurate to the nearest millisecond.
Duration.fromDays (long)	Returns a **Duration** that represents a specified number of days, where the specification is accurate to the nearest millisecond.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.fromDays Method (double)

Returns a Duration that represents a specified number of days, where the specification is accurate to the nearest millisecond.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration fromDays (
    double value
)
```

Parameters

value
A number of days, accurate to the nearest millisecond.

Return Value

A Duration that represents *value*.

See Also

fromDays Method Overload List
Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.fromDays Method (long)

Returns a Duration that represents a specified number of days, where the specification is accurate to the nearest millisecond.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration fromDays (
    long value
)
```

Parameters

value
A number of days, accurate to the nearest millisecond.

Return Value

A Duration that represents *value*.

Duration.fromHours Method

Overload List

Name	Description
Duration.fromHours (double)	Returns a Duration that represents a specified number of hours, where the specification is accurate to the nearest millisecond.
Duration.fromHours (long)	Returns a **Duration** that represents a specified number of hours, where the specification is accurate to the nearest millisecond.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.fromHours Method (double)

Returns a Duration that represents a specified number of hours, where the specification is accurate to the nearest millisecond.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static Duration fromHours (
    double value
)
```

Parameters

value
A number of hours accurate to the nearest millisecond.

Return Value

A Duration that represents *value*.

See Also

fromHours Method Overload List
Duration Members

Duration.fromMilliseconds Method (double)

Returns a Duration that represents a specified number of milliseconds.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration fromMilliseconds (
    double value
)
```

Parameters

value
A number of milliseconds.

Return Value

A Duration that represents *value*.

See Also

fromMilliseconds Method Overload List
Duration Members

Duration.fromMilliseconds Method (long)

Returns a Duration that represents a specified number of milliseconds.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration fromMilliseconds (
    long value
)
```

Parameters

value
A number of milliseconds.

Return Value

A Duration that represents *value*.

See Also

fromMilliseconds Method Overload List

Duration.fromMinutes Method (double)

Returns a Duration that represents a specified number of minutes, where the specification is accurate to the nearest millisecond.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration fromMinutes (
    double value
)
```

Parameters

value
A number of minutes, accurate to the nearest millisecond.

Return Value

A Duration that represents *value*.

See Also

fromMinutes Method Overload List
Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.fromMinutes Method (long)

Returns a Duration that represents a specified number of minutes, where the specification is accurate to the nearest millisecond.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration fromMinutes (
    long value
)
```

Parameters

value
A number of minutes, accurate to the nearest millisecond.

Return Value

A Duration that represents *value*.

Duration.fromSeconds Method

Overload List

Name	Description
Duration.fromSeconds (double)	Returns a Duration that represents a specified number of seconds, where the specification is accurate to the nearest millisecond.
Duration.fromSeconds (long)	Returns a **Duration** that represents a specified number of seconds, where the specification is accurate to the nearest millisecond.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.fromSeconds Method (double)

Returns a Duration that represents a specified number of seconds, where the specification is accurate to the nearest millisecond.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration fromSeconds (
    double value
)
```

Parameters

value
A number of seconds, accurate to the nearest millisecond.

Return Value

A Duration that represents *value*.

See Also

fromSeconds Method Overload List
Duration Members

Duration.fromSeconds Method (long)

Returns a Duration that represents a specified number of seconds, where the specification is accurate to the nearest millisecond.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration fromSeconds (
    long value
)
```

Parameters

value
A number of seconds, accurate to the nearest millisecond.

Return Value

A Duration that represents *value*.

See Also

fromSeconds Method Overload List
Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.fromTicks Method

Returns a Duration that represents a specified time, where the specification is in units of ticks.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration fromTicks (
    long value
)
```

Parameters

value
A number of ticks that represent a time.

Return Value

A Duration with a value of *value*.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.getDays Method

Gets the days component of the time interval represented by the current Duration object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public int getDays ()
```

Return Value

The day component of this instance. The return value can be positive or negative.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.getHours Method

Gets the hours component of the time interval represented by the current Duration object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public int getHours ()
```

Return Value

The hour component of the current Duration object. The return value ranges from -23 through 23.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.getMilliseconds Method

Gets the milliseconds component of the time interval represented by the current Duration object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public int getMilliseconds ()
```

Return Value

The millisecond component of the current Duration object. The return value ranges from -999 through 999.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.getMinutes Method

Gets the minutes component of the time interval represented by the current Duration object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public int getMinutes ()
```

Return Value

The minute component of the current Duration object. The return value ranges from -59 through 59.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.getSeconds Method

Gets the seconds component of the time interval represented by the current Duration object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public int getSeconds ()
```

Return Value

The second component of the current Duration object. The return value ranges from -59 through 59.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.getTicks Method

Gets the number of ticks that represent the value of the current Duration object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public long getTicks ()
```

Return Value

The number of ticks contained in this instance.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.getTotalDays Method

Gets the value of the current Duration object expressed in whole days.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public double getTotalDays ()
```

Return Value

The total number of days represented by this instance.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.getTotalHours Method

Gets the value of the current Duration expressed in whole and fractional hours.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public double getTotalHours ()
```

Return Value

The total number of hours represented by this instance.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.getTotalMilliseconds Method

Gets the total number of milliseconds in this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public long getTotalMilliseconds ()
```

Return Value

The total number of milliseconds.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.getTotalMinutes Method

Gets the value of the current Duration expressed in whole and fractional minutes.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public double getTotalMinutes ()
```

Return Value

The total number of minutes represented by this instance.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.getTotalSeconds Method

Gets the value of the current Duration object expressed in whole and fractional seconds.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public double getTotalSeconds ()
```

Return Value

The total number of seconds represented by this instance.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.hashCode Method

Object.hashCode override.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int hashCode ()
```

Return Value

A 32-bit signed integer hash code.

See Also

Duration Members
Duration Class

Duration.negate Method

Returns a Duration whose value is the negated value of the specified instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Duration negate ()
```

Return Value

A Duration with the same numeric value as this instance, but the opposite sign.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.op_Addition Method

Adds two specified Duration instances.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration op_Addition (
    Duration d1,
    Duration d2
)
```

Parameters

d1
A Duration.

d2
A **Duration**.

Return Value

A **Duration** whose value is the sum of the values of *d1* and *d2*.

See Also

Duration.op_Equality Method

Indicates whether two Duration instances are equal.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean op_Equality (
    Duration d1,
    Duration d2
)
```

Parameters

d1
A Duration.

d2
A **Duration**.

Return Value

true if the values of *d1* and *d2* are equal or both are null; otherwise, false.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.op_GreaterThan Method

Indicates whether a specified Duration is greater than another specified **Duration**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean op_GreaterThan (
    Duration d1,
    Duration d2
)
```

Parameters

d1
A Duration.

d2
A **Duration**.

Return Value

true if the value of *d1* is greater than the value of *d2*; otherwise, false.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.op_GreaterThanOrEqual Method

Indicates whether a specified Duration is greater than or equal to another specified **Duration**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean op_GreaterThanOrEqual (
    Duration d1,
    Duration d2
)
```

Parameters

d1
A Duration.

d2
A **Duration**.

Return Value

true if the value of *d1* is greater than or equal to the value of *d2*; otherwise, false.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.op_Inequality Method

Indicates whether two Duration instances are not equal.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean op_Inequality (
    Duration d1,
    Duration d2
)
```

Parameters

d1

A Duration.

d2

A **Duration**.

Return Value

true if the values of *d1* and *d2* are not equal; otherwise, false.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.op_LessThan Method

Indicates whether a specified Duration is less than another specified **Duration**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean op_LessThan (
    Duration d1,
    Duration d2
)
```

Parameters

d1

A Duration.

d2

A **Duration**.

Return Value

true if the value of *d1* is less than the value of *d2*; otherwise, false.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.op_LessThanOrEqual Method

Indicates whether a specified Duration is less than or equal to another specified **Duration**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static boolean op_LessThanOrEqual (
    Duration d1,
    Duration d2
)
```

Parameters

d1
A Duration.

d2
A **Duration**.

Return Value

true if the value of *d1* is less than or equal to the value of *d2*; otherwise, false.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.op_Subtraction Method

Subtracts a specified Duration from another specified **Duration**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration op_Subtraction (
    Duration d1,
    Duration d2
)
```

Parameters

d1
A Duration.

d2
A **Duration**.

Return Value

A **Duration** whose value is the result of the value of *d1* minus the value of *d2*.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.op_UnaryNegation Method

Returns a Duration whose value is the negated value of the specified instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Duration op_UnaryNegation (
    Duration d1
)
```

Parameters

d1
A Duration.

Return Value

A **Duration** with the same numeric value as this instance, but the opposite sign.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.subtract Method

Returns a new Duration object whose value is the difference between the specified **Duration** object and this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Duration subtract (
    Duration duration
)
```

Parameters

duration
A Duration.

Return Value

A new time interval whose value is the result of the value of this instance minus the value of *duration*.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.toJavaDuration Method

Returns the stored **java.time.Duration**.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Duration toJavaDuration ()
```

Return Value

A **java.time.Duration** instance.

See Also

Duration Members
Duration Class
com.mindfusion.common Namespace

Duration.toString Method

Returns the string representation of the value of this instance.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toString ()
```

Return Value

A string representation of the value of the current Duration object.

EqualityComparer<T> Interface

Syntax

Java
`public interface EqualityComparer<T>`

See Also

EqualityComparer(T) Members
com.mindfusion.common Namespace

EqualityComparer(T) Members

The following tables list the members exposed by the EqualityComparer(T) type.

Public Methods

	Name	Description
	equals	Determines whether the specified objects are equal.
	hashCode	Returns a hash code for the specified object.

See Also

EqualityComparer<T> Interface
com.mindfusion.common Namespace

EqualityComparer(T) Methods

EqualityComparer(T).equals Method

Determines whether the specified objects are equal.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
boolean equals (
    T x,
    T y
)
```

Parameters

x
The first object of type T to compare.

y

The second object of type T to compare.

Return Value

true if the specified objects are equal; otherwise, false.

See Also

EqualityComparer(T) Members
EqualityComparer<T> Interface
com.mindfusion.common Namespace

EqualityComparer(T).hashCode Method

Returns a hash code for the specified object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
int hashCode (
    T obj
)
```

Parameters

obj
The **Object** for which a hash code is to be returned.

Return Value

A hash code for the specified object.

com.mindfusion.common Namespace

Helper Class

Provides utility methods when translating from C# to Java.

Syntax

Java
`public class Helper`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.common.Helper

See Also

Helper Members
com.mindfusion.common Namespace

Helper Members

Provides utility methods when translating from C# to Java.

The following tables list the members exposed by the Helper type.

Public Constructors

	Name	Description
	Helper	

Public Methods

	Name	Description

	as	Performs a try cast of o to class c.
	getLength	Overloaded.
	nc	Performs a null-coalescing of the specified arguments.

See Also

Helper Class
com.mindfusion.common Namespace

Helper Constructor

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Helper ()
```

See Also

Helper Class
com.mindfusion.common Namespace

Helper Methods

Helper.as<_T, _S> Method

Performs a try cast of o to class c.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <_T, _S> _T as (
    _S o,
    Class<?> c
)
```

Parameters

o

c

Return Value

See Also

Helper.getLength Method

Overload List

Name	Description
Helper.getLength (double[][], int)	Returns the specified dimension of the specified two-dimensional array.
Helper.getLength (short[][], int)	Returns the specified dimension of the specified two-dimensional array.
Helper.getLength (int[][], int)	Returns the specified dimension of the specified two-dimensional array.
Helper.getLength (float[][], int)	Returns the specified dimension of the specified two-dimensional array.
Helper.getLength<_T> (_T[][], int)	

See Also

Helper Members
Helper Class
com.mindfusion.common Namespace

Helper.getLength Method (double[][], int)

Returns the specified dimension of the specified two-dimensional array.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static int getLength (
    double[][] array,
    int dimension
)
```

Parameters

array

dimension

Return Value

See Also

getLength Method Overload List
Helper Members

Helper.nc<_T, _S1, _S2> Method

Performs a null-coalescing of the specified arguments.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static <_T, _S1, _S2> _T nc (
    _S1 s1,
    _S2 s2
)
```

Parameters

s1

s2

Return Value

See Also

Helper Members
Helper Class
com.mindfusion.common Namespace

HorizontalAlignment Class

Specifies how an object or text is horizontally aligned relative to an element.

Syntax

Java

```
public class HorizontalAlignment
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.common.HorizontalAlignment

See Also

HorizontalAlignment Members

Specifies how an object or text is horizontally aligned relative to an element.

The following tables list the members exposed by the HorizontalAlignment type.

Public Fields

	Name	Description
	Center	The object or text is aligned in the center of the control element.
	Left	The object or text is aligned on the left of the control element.
	Right	The object or text is aligned on the right of the control element.

See Also

HorizontalAlignment Class
com.mindfusion.common Namespace

HorizontalAlignment Fields

HorizontalAlignment.Center Field

The object or text is aligned in the center of the control element.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public static final int Center`

See Also

HorizontalAlignment Members
HorizontalAlignment Class
com.mindfusion.common Namespace

HorizontalAlignment.Left Field

The object or text is aligned on the left of the control element.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public static final int Left`

See Also

HorizontalAlignment Members
HorizontalAlignment Class
com.mindfusion.common Namespace

HorizontalAlignment.Right Field

The object or text is aligned on the right of the control element.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public static final int Right`

See Also

HorizontalAlignment Members
HorizontalAlignment Class
com.mindfusion.common Namespace

HorizontalAlignment Enumeration

Specifies how an object or text is horizontally aligned relative to an element.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public enum HorizontalAlignment`

Members

	Member name	Description
	Center	The object or text is aligned in the center of the control element.
	Left	The object or text is aligned on the left of the control element.

	Right	The object or text is aligned on the right of the control element.

Public Constructors

	Name	Description
	InvalidFormatException	Overloaded.

See Also

InvalidFormatException Class
com.mindfusion.common Namespace

InvalidFormatException Constructor

Overload List

Name	Description
InvalidFormatException ()	Initializes a new instance of the InvalidFormatException class.
InvalidFormatException (String)	Initializes a new instance of the **InvalidFormatException** class.

See Also

InvalidFormatException Class
com.mindfusion.common Namespace

InvalidFormatException Constructor ()

Initializes a new instance of the InvalidFormatException class.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public InvalidFormatException ()
```

See Also

InvalidFormatException Constructor Overload List
InvalidFormatException Class
com.mindfusion.common Namespace

InvalidFormatException Constructor (String)

Initializes a new instance of the InvalidFormatException class.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public InvalidFormatException (
    String message
)
```

Parameters

message

See Also

InvalidFormatException Constructor Overload List
InvalidFormatException Class
com.mindfusion.common Namespace

InvalidOperationException Class

Thrown when performing an operation that is considered illegal in the current context.

Syntax

```
Java
public class InvalidOperationException extends RuntimeException
```

Inheritance Hierarchy

java.lang.Object
  java.lang.Throwable
    java.lang.Exception
      java.lang.RuntimeException
        com.mindfusion.common.InvalidOperationException

See Also

JsonContext Class

Syntax

Java
`public class JsonContext`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.common.JsonContext
    com.mindfusion.diagramming.JsonPersistContext

See Also

JsonContext Members
com.mindfusion.common Namespace

JsonContext Members

The following tables list the members exposed by the JsonContext type.

Public Constructors

	Name	Description
	JsonContext	

Protected Fields

	Name	Description
	brushes	
	inplaceImages	
	inplaceResources	

Public Methods

	Name	Description
	parse	Deserializes the specified JSON formatted string to a JsonObject.
	readBrush	Overloaded.
	readBrushColor	Reads a Brush object with the specified color.
	readBrushes	Reads all brushes.
	readColor	Overloaded.
	readEnum	Reads an enum value.
S	readFile	Reads json file
	readFont	Overloaded.
	readImage	Reads an Image object.
	readImages	Reads all images.
	readObject	

	readPen	Overloaded.
	readPointF	Reads a **Point2D.Float** object.
	readPointString	Reads a list of points.
	readRectangleF	Reads a Rectangle2D.Float object.
	readSizeF	read the SizeF object
	readStringFormat	Reads a StringFormat object.
	serialize	Serializes the specified JsonObject to a JSON formatted string.
	writeBrush	Writes a MindFusion.Drawing.Brush object.
	writeBrushColor	Writes the color of the specified brush.
	writeBrushes	Writes all currently accumulated brushes.
	writeColor	Writes a Color object.
	writeEnum	Writes an enum value.
S	writeFile	Writes serialized json to file.
	writeFont	Writes a Font object.
	writeImage	Writes an Image object.
	writeImages	Writes all currently accumulated images.
	writeObject	
	writePen	Writes a MindFusion.Drawing.Pen object.
	writePointF	Writes a PointF object.
	writePointString	Writes a Point string.
	writeRectangleF	Writes a RectangleF object.
	writeSizeF	Writes a sizeF object
	writeStringFormat	Writes a StringFormat object.

Protected Methods

	Name	Description
S	Base64Decode	
S	base64Encode	
S	toCamelCase	
S	toPascalCase

JsonContext.Base64Decode Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
protected static String Base64Decode (
    String base64EncodedData
)
```

Parameters

base64EncodedData

Return Value

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.base64Encode Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
protected static String base64Encode (
    String plainText
)
```

Parameters

plainText

Return Value

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.parse Method

Deserializes the specified JSON formatted string to a JsonObject.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public JsonObject parse (
    String json
)
```

Parameters

json
The JSON string.

Return Value

The deserialized JsonObject.

JsonContext.readBrush Method

Overload List

Name	Description

JsonContext.readBrush (JsonValue)	Reads a MindFusion.Drawing.Brush object.
JsonContext.readBrush (JsonValue, Brush)	Reads a MindFusion.Drawing.Brush object.

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readBrush Method (JsonValue)

Reads a MindFusion.Drawing.Brush object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Brush readBrush (
    JsonValue value
)
```

Parameters

value
A JsonValue

Return Value

Brush Object

See Also

readBrush Method Overload List
JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readBrush Method (JsonValue, Brush)

Reads a MindFusion.Drawing.Brush object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Brush readBrush (
    JsonValue value,
    Brush defaultValue
)
```

Parameters

value
A JsonValue

defaultValue
A Brush to return in case JsonValue == null

Return Value

A Brush Object

See Also

readBrush Method Overload List
JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readBrushColor Method

Reads a Brush object with the specified color.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Brush readBrushColor (
    JsonValue value
)
```

Parameters

value
A JsonValue

Return Value

A Brush Object

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readBrushes Method

Reads all brushes.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

`public void readBrushes (`
`  JsonValue value`
`)`

Parameters

value
List of Brushes

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readColor Method

Overload List

Name	Description
JsonContext.readColor (JsonValue)	
JsonContext.readColor (JsonValue, Color)	Reads a color.

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readColor Method (JsonValue)

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

`public Color readColor (`
`  JsonValue value`
`)`

Parameters

value
A JsonValue

Return Value

A Color

See Also

readColor Method Overload List
JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readColor Method (JsonValue, Color)

Reads a color.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Color readColor (
    JsonValue value,
    Color defaultValue
)
```

Parameters

value
A JsonValue

defaultValue
A default Color to return in case value or value.getValue() == null

Return Value

A **Color** Object

See Also

readColor Method Overload List
JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readEnum Method

Reads an enum value.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int readEnum (
    JsonValue value
)
```

Parameters

value
A JsonValue

Return Value

-1 if value is null or int value of given Enum.

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readFile Method

Reads json file

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String readFile (
    String fileName
)
```

Parameters

fileName
a Name from where Json is read

Return Value

a String.

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readFont Method

Overload List

Name	Description
JsonContext.readFont (JsonObject)	Reads a Font object.
JsonContext.readFont (JsonObject, Font)	Reads a Font object.

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readFont Method (JsonObject)

Reads a Font object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Font readFont (
    JsonObject obj
)
```

Parameters

obj
A JsonObject containing Font Details

Return Value

A Font Object

See Also

readFont Method Overload List
JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readFont Method (JsonObject, Font)

Reads a Font object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Font readFont (
    JsonObject obj,
    Font defaultFont
)
```

Parameters

obj
A JsonObject containing Font Details

defaultFont
A default Font Object to return in case JsonObject == null

Return Value

A Font Object

See Also

readFont Method Overload List
JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readImage Method

Reads an Image object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Image readImage (
    JsonValue value
)
```

Parameters

value
A JsonValue containing image index

Return Value

A Image Object

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readImages Method

Reads all images.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public void readImages (
    JsonValue value
)
```

Parameters

value
A JsonValue containing ArrayList

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readObject Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Object readObject (
    JsonValue value
)
```

Parameters

value
A JsonValue Object

Return Value

A value wrapped in JsonVaue Object or null

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readPen Method

Overload List

Name	Description
JsonContext.readPen (JsonValue)	Reads a MindFusion.Drawing.Pen object.
JsonContext.readPen (JsonValue, Pen)	Reads a MindFusion.Drawing.Pen object.

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readPen Method (JsonValue)

Reads a MindFusion.Drawing.Pen object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Pen readPen (
    JsonValue value
)
```

Parameters

value
A JsonValue

Return Value

Pen Object

See Also

readPen Method Overload List
JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readPen Method (JsonValue, Pen)

Reads a MindFusion.Drawing.Pen object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Pen readPen (
    JsonValue value,
    Pen defaultPen
)
```

Parameters

value
A JsonValue

defaultPen
A Default Pen Object to return in case if value or value.getValue() == null

Return Value

Pen Object

See Also

readPen Method Overload List
JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readPointF Method

Reads a **Point2D.Float** object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Point2D.Float readPointF (
    JsonValue value
)
```

Parameters

value
JsonValue

Return Value

Point2D.Float

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readPointString Method

Reads a list of points.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public List<Point2D.Float> readPointString (
    JsonValue value
)
```

Parameters

value
JsonValue

Return Value

List<Point2D.Float>

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readRectangleF Method

Reads a Rectangle2D.Float object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Rectangle2D.Float readRectangleF (
    JsonValue value
)
```

Parameters

value
A JsonValue object

Return Value

Rectangle2D.Float wrapped in JsonValue Object

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readSizeF Method

read the SizeF object

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public XDimension2D.Double readSizeF (
    JsonValue value
)
```

Parameters

value
JsonValue

Return Value

Dimension

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.readStringFormat Method

Reads a StringFormat object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public TextFormat readStringFormat (
    JsonValue value
)
```

Parameters

value
JsonValue

Return Value

TextLayoutOptions

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.serialize Method

Serializes the specified JsonObject to a JSON formatted string.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String serialize (
    JsonObject obj
)
```

Parameters

obj
The JsonObject to serialize.

Return Value

The serialized string.

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.toCamelCase Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
protected static String toCamelCase (
    String text
)
```

Parameters

text

Return Value

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.toPascalCase Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
protected static String toPascalCase (
    String text
)
```

Parameters

text

Return Value

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeBrush Method

Writes a MindFusion.Drawing.Brush object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public JsonValue writeBrush (
    Brush brush
)
```

Parameters

brush
a Brush that has to be written

Return Value

JsonValue

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeBrushColor Method

Writes the color of the specified brush.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public JsonValue writeBrushColor (
    Brush brush
)
```

Parameters

brush

Return Value

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeBrushes Method

Writes all currently accumulated brushes.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonValue writeBrushes ()
```

Return Value

JsonValue

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeColor Method

Writes a Color object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonValue writeColor (
    Color color
)
```

Parameters

color
a **Color** to be written

Return Value

JsonValue

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeEnum Method

Writes an enum value.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonValue writeEnum (
    Object enumValue
)
```

Parameters

enumValue
a value to be written

Return Value

JsonValue

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeFile Method

Writes serialized json to file.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static void writeFile (
    String fileName,
    String fileContent
)
```

Parameters

fileName
A file path.

fileContent
serialized JSON content.

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeFont Method

Writes a Font object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonObject writeFont (
    Font font
)
```

Parameters

font

Return Value

JsonValue

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeImage Method

Writes an Image object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonValue writeImage (
    Image image
)
```

Parameters

image
a **Image** to be written

Return Value

JsonValue

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeImages Method

Writes all currently accumulated images.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonValue writeImages ()
```

Return Value

JsonValue

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeObject Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonValue writeObject (
    Object o
)
```

Parameters

o
A Object to wrap in JsonValue

Return Value

A JsonValue Object

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writePen Method

Writes a MindFusion.Drawing.Pen object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonValue writePen (
    Pen pen
)
```

Parameters

pen
a Pen to be written

Return Value

JsonValue

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writePointF Method

Writes a PointF object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonObject writePointF (
    Point2D.Float point
)
```

Parameters

point
Point2D.Float

Return Value

JsonObject

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writePointString Method

Writes a Point string.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public JsonValue writePointString (
    List<Point2D.Float> points
)
```

Parameters

points
List<Point2D.Float>

Return Value

JsonValue

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeRectangleF Method

Writes a RectangleF object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public JsonObject writeRectangleF (
    Rectangle2D rectangle
)
```

Parameters

rectangle
Rectangle2D.Float

Return Value

JsonObject

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeSizeF Method

Writes a sizeF object

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonObject writeSizeF (
    Dimension2D size
)
```

Parameters

size
Dimension

Return Value

JsonObject

See Also

JsonContext Members
JsonContext Class
com.mindfusion.common Namespace

JsonContext.writeStringFormat Method

Writes a StringFormat object.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonValue writeStringFormat (
    TextFormat stringFormat
)
```

Parameters

stringFormat
The StringFormat to write.

Return Value

JsonValue

See Also

JsonConverter Class

Syntax

Java
`public class JsonConverter`

Inheritance Hierarchy

java.lang.Object
com.mindfusion.common.JsonConverter

See Also

JsonConverter Members
com.mindfusion.common Namespace

JsonConverter Members

The following tables list the members exposed by the JsonConverter type.

Public Methods

	Name	Description
	fromBase64String	Converts the specified encoded string to plain text
	fromBoolean	
	fromColor	Converts the specified Color to string. boolean hex param is a param to indicate whether color has to be converted to Hex value. The Default resulting string is in the format rgba(0,0,0,0).
	fromDouble	
	fromImage	Converts the specified image to string.
	fromInt16	
	fromInt32	
	fromInt64	
	fromPointString	Converts the specified comma separated string to a list of PointF objects.
	fromSingle	
	toBase64String	Converts the specified plainText string to Base64String

	toBoolean	
	toColor	
	toDouble	
	toImage	Converts the specified string value to image.
	toInt16	
	toInt32	
	toInt64	
	toPointString	Converts the list of PointF objects to a comma separated string.
	toSingle

JsonConverter Methods

JsonConverter.fromBase64String Method

Converts the specified encoded string to plain text

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromBase64String (
    String base64EncodedData
)
```

Parameters

base64EncodedData
encoded string

Return Value

decoded string

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.fromBoolean Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromBoolean (
    boolean val
)
```

Parameters

val

Return Value

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.fromColor Method

Converts the specified Color to string. boolean hex param is a param to indicate whether color has to be converted to Hex value. The Default resulting string is in the format rgba(0,0,0,0).

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromColor (
    Color val,
    boolean hex
)
```

Parameters

val

hex

Return Value

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.fromDouble Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromDouble (
    double val
)
```

Parameters

val

Return Value

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.fromImage Method

Converts the specified image to string.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromImage (
    Image val
)
```

Parameters

val
The image object to convert.

Return Value

A string representing the specified value.

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.fromInt16 Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static String fromInt16 (
    short val
)
```

Parameters

val

Return Value

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.fromInt32 Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static String fromInt32 (
    int val
)
```

Parameters

val

Return Value

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.fromInt64 Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromInt64 (
    long val
)
```

Parameters

val

Return Value

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.fromPointString Method

Converts the specified comma separated string to a list of PointF objects.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static List<Point2D.Float> fromPointString (
    String s
)
```

Parameters

s
The comma separated string.

Return Value

A list of PointF objects.

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.fromSingle Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String fromSingle (
    float val
)
```

Parameters

val

Return Value

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.toBase64String Method

Converts the specified plainText string to Base64String

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String toBase64String (
    String plainText
)
```

Parameters

plainText
string

Return Value

string

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.toBoolean Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

JsonConverter.toDouble Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static double toDouble (
    String s
)
```

Parameters

s

Return Value

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.toImage Method

Converts the specified string value to image.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Image toImage (
    String s
)
```

Parameters

s

Return Value

See Also

JsonConverter Members
JsonConverter Class

com.mindfusion.common Namespace

JsonConverter.toInt64 Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static long toInt64 (
    String s
)
```

Parameters

s

Return Value

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.toPointString Method

Converts the list of PointF objects to a comma separated string.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String toPointString (
    List<Point2D.Float> points
)
```

Parameters

points
The list of PointF objects to convert.

Return Value

A comma separated string.

See Also

JsonConverter Members
JsonConverter Class
com.mindfusion.common Namespace

JsonConverter.toSingle Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static float toSingle (
    String s
)
```

Parameters

s

Return Value

JsonObject Class
com.mindfusion.common Namespace

JsonObject Constructor

Initializes a new instance of the JsonObject class.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public JsonObject ()
```

See Also

JsonObject Class
com.mindfusion.common Namespace

JsonObject Methods

JsonObject.fromDictionary Method

Converts a generic dictionary to a JsonObject.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static JsonObject fromDictionary (
    Map<?, ?> map
)
```

Parameters

map
Object that has to be converted to JsonObject

Return Value

A JsonObject

See Also

JsonObject Members
JsonObject Class
com.mindfusion.common Namespace

JsonObject.getValue Method

Overload List

Name	Description
JsonObject.getValue (String)	return the value associated with key or default value
JsonObject.getValue (String, JsonValue)	return the value associated with key or default value

See Also

JsonObject Members
JsonObject Class
com.mindfusion.common Namespace

JsonObject.getValue Method (String)

return the value associated with key or default value

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonValue getValue (
    String key
)
```

Parameters

key
String

Return Value

JsonValue

See Also

getValue Method Overload List
JsonObject Members
JsonObject Class
com.mindfusion.common Namespace

JsonObject.getValue Method (String, JsonValue)

return the value associated with key or default value

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonValue getValue (
    String key,
    JsonValue defaultValue
)
```

Parameters

key
string

defaultValue
JsonValue

Return Value

JsonValue object

See Also

getValue Method Overload List
JsonObject Members
JsonObject Class
com.mindfusion.common Namespace

JsonValue Class

Syntax

Java
`public class JsonValue`

Inheritance Hierarchy

java.lang.Object
com.mindfusion.common.JsonValue

See Also

JsonValue Members
com.mindfusion.common Namespace

JsonValue Members

The following tables list the members exposed by the JsonValue type.

Public Constructors

	Name	Description
	JsonValue	Initializes a new instance of the JsonValue class.

Public Methods

	Name	Description
	equals	
S	fromBoolean	Converts a boolean to JsonValue.
S	fromDateTime	Converts a DateTime to JsonValue.
S	fromDouble	Converts a double to JsonValue.
S	fromFloat	Converts a float to JsonValue.

	fromInt	Converts an int to JsonValue.
	fromJsonObject	Converts a JsonObject to JsonValue.
	fromLong	Converts a long to JsonValue.
	getValue	
	hashCode	
	toArrayList	Converts the value to ArrayList.
	toBoolean	Converts the value to boolean value
	toDateTime	Converts the value to DateTime.
	toDouble	Converts the value to double.
	toFloat	Converts the value to float.
	toInt	Converts the value to int.
	toJsonObject	Converts the value to JsonObject.
	toJsonValue	Converts a string to JsonValue.
	toLong	Converts the value to long.
	toString	Overloaded.

See Also

JsonValue Class
com.mindfusion.common Namespace

JsonValue Constructor

Initializes a new instance of the JsonValue class.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonValue (
    Object value
)
```

Parameters

value
a json value

See Also

JsonValue Class
com.mindfusion.common Namespace

JsonValue Methods

JsonValue.equals Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public boolean equals (
    Object o
)
```

Parameters

o

Return Value

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.fromBoolean Method

Converts a boolean to JsonValue.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static JsonValue fromBoolean (
    boolean value
)
```

Parameters

value
Boolean

Return Value

Json representation of Boolean value.

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.fromDateTime Method

Converts a DateTime to JsonValue.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static JsonValue fromDateTime (
    DateTime value
)
```

Parameters

value
A DateTime

Return Value

A JsonValue

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.fromDouble Method

Converts a double to JsonValue.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static JsonValue fromDouble (
    double value
)
```

Parameters

value
A double value

Return Value

A JsonValue

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.fromFloat Method

Converts a float to JsonValue.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static JsonValue fromFloat (
    float value
)
```

Parameters

value
A Float

Return Value

A JsonValue

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.fromInt Method

Converts an int to JsonValue.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static JsonValue fromInt (
    int value
)
```

Parameters

value
int valie

Return Value

A JsonValue

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.fromJsonObject Method

Converts a JsonObject to JsonValue.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static JsonValue fromJsonObject (
    JsonObject value
)
```

Parameters

value
A JsonObject

Return Value

A JsonValue

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.fromLong Method

Converts a long to JsonValue.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static JsonValue fromLong (
    long value
)
```

Parameters

value
Long value

Return Value

JsonValue

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.getValue Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Object getValue ()
```

Return Value

this.value

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.hashCode Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int hashCode ()
```

Return Value

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.toArrayList Method

Converts the value to ArrayList.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public ArrayList toArrayList ()
```

Return Value

A **ArrayList**

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.toBoolean Method

Converts the value to boolean value

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static boolean toBoolean (
    JsonValue value
)
```

Parameters

value
A JsonValue Object

Return Value

Boolean representation of JSON value

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.toDateTime Method

Converts the value to DateTime.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
```

```
public static DateTime toDateTime (
    JsonValue value
)
```

Parameters

value
A JsonValue

Return Value

A DateTime

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.toDouble Method

Converts the value to double.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static double toDouble (
    JsonValue value
)
```

Parameters

value
A JsonValue

Return Value

A Double value

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.toFloat Method

Converts the value to float.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static float toFloat (
    JsonValue value
)
```

Parameters

value
JsonValue Object

Return Value

A Float valie

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.toInt Method

Converts the value to int.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static int toInt (
    JsonValue value
)
```

Parameters

value
A JsonValue

Return Value

int value

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.toJsonObject Method

Converts the value to JsonObject.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static JsonObject toJsonObject (
    JsonValue value
)
```

Parameters

value
A JsonValue

Return Value

A JsonObject

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.toJsonValue Method

Converts a string to JsonValue.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static JsonValue toJsonValue (
    String value
)
```

Parameters

value
A String

Return Value

JsonValue object

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.toLong Method

Converts the value to long.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

`public static long toLong (`
`  JsonValue value`
`)`

Parameters

value
A JsonValue

Return Value

Long value

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.toString Method

Overload List

Name	Description
JsonValue.toString ()	
JsonValue.toString (JsonValue)	Converts the value to string.

See Also

JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.toString Method ()

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public String toString ()`

Return Value

See Also

toString Method Overload List
JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

JsonValue.toString Method (JsonValue)

Converts the value to string.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static String toString (
    JsonValue value
)
```

Parameters

value
A JsonValie

Return Value

A String value

See Also

toString Method Overload List
JsonValue Members
JsonValue Class
com.mindfusion.common Namespace

KeyValuePair<K, V> Class

Syntax

Java

```
public class KeyValuePair<K, V> implements Map.Entry<K, V>, Cloneable
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.common.KeyValuePair(K, V)

See Also

KeyValuePair(K, V) Members

The following tables list the members exposed by the KeyValuePair(K, V) type.

Public Constructors

	Name	Description
	KeyValuePair	

Public Methods

	Name	Description
	clone	
	getKey	
	getValue	
	setValue	

See Also

KeyValuePair<K, V> Class
com.mindfusion.common Namespace

KeyValuePair(K, V) Constructor

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public KeyValuePair (
    K key,
    V value
)
```

Parameters

key

value

See Also

KeyValuePair<K, V> Class
com.mindfusion.common Namespace

KeyValuePair(K, V) Methods

KeyValuePair(K, V).clone Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public Object clone ()`

Return Value

See Also

KeyValuePair(K, V) Members
KeyValuePair<K, V> Class
com.mindfusion.common Namespace

KeyValuePair(K, V).getKey Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public K getKey ()`

Return Value

See Also

KeyValuePair(K, V) Members
KeyValuePair<K, V> Class
com.mindfusion.common Namespace

KeyValuePair(K, V).getValue Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public V getValue ()`

Return Value

See Also

KeyValuePair(K, V) Members
KeyValuePair<K, V> Class
com.mindfusion.common Namespace

KeyValuePair(K, V).setValue Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public V setValue (
    V value
)
```

Parameters

value

Return Value

See Also

KeyValuePair(K, V) Members
KeyValuePair<K, V> Class
com.mindfusion.common Namespace

License Class

Syntax

Java

```
public class License
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.common.License

See Also

License Members
com.mindfusion.common Namespace

License Members

The following tables list the members exposed by the License type.

Public Methods

	Name	Description
	getExpiration	
	getNumberOfUsers	
	getProduct	
S	licenseFromKey	
S	licenseFromKeyFallback	

See Also

License Class
com.mindfusion.common Namespace

License Methods

License.getExpiration Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public Calendar getExpiration ()`

Return Value

See Also

License Members
License Class
com.mindfusion.common Namespace

License.getNumberOfUsers Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public int getNumberOfUsers ()`

Return Value

See Also

License Members
License Class
com.mindfusion.common Namespace

License.getProduct Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String getProduct ()
```

Return Value

See Also

License Members
License Class
com.mindfusion.common Namespace

License.licenseFromKey Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static License licenseFromKey (
    String key
)
```

Parameters

key

Return Value

See Also

License Members
License Class
com.mindfusion.common Namespace

License.licenseFromKeyFallback Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static License licenseFromKeyFallback (
    String key
)
```

Parameters

key

Return Value

See Also

License Members
License Class
com.mindfusion.common Namespace

LicenseManager Class

Syntax

```
Java
public class LicenseManager
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.common.LicenseManager

See Also

LicenseManager Members
com.mindfusion.common Namespace

LicenseManager Members

The following tables list the members exposed by the LicenseManager type.

Public Constructors

	Name	Description
	LicenseManager	

Public Methods

	Name	Description
	addLicense	
	checkLicense	

See Also

LicenseManager Class
com.mindfusion.common Namespace

LicenseManager Constructor

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public LicenseManager ()
```

See Also

LicenseManager Class
com.mindfusion.common Namespace

LicenseManager Methods

LicenseManager.addLicense Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static void addLicense (
    String licenseKey
)
```

Parameters

licenseKey

See Also

LicenseManager Members
LicenseManager Class
com.mindfusion.common Namespace

LicenseManager.checkLicense Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static int checkLicense (
    String packageName,
    String[] productNames
)
```

Parameters

packageName

productNames

Return Value

See Also

LicenseManager Members
LicenseManager Class
com.mindfusion.common Namespace

ListChangedAction Class

Describes the action that caused a BaseListListener.listChanged event.

Syntax

Java

```
public class ListChangedAction
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.common.ListChangedAction

See Also

ListChangedAction Members
com.mindfusion.common Namespace

ListChangedAction Members

Describes the action that caused a BaseListListener.listChanged event.

The following tables list the members exposed by the ListChangedAction type.

Public Fields

	Name	Description
	Add	One or more items were added to the list.
	Remove	One or more items were removed from the list.
	Replace	One or more items were replaced in the list.
	Reset	The content of the list changed dramatically.

See Also

ListChangedAction Class
com.mindfusion.common Namespace

ListChangedAction Fields

ListChangedAction.Add Field

One or more items were added to the list.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public static final int Add`

See Also

ListChangedAction Members
ListChangedAction Class
com.mindfusion.common Namespace

ListChangedAction.Remove Field

One or more items were removed from the list.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public static final int Remove`

See Also

ListChangedAction Members
ListChangedAction Class
com.mindfusion.common Namespace

ListChangedAction.Replace Field

One or more items were replaced in the list.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static final int Replace
```

See Also

ListChangedAction Members
ListChangedAction Class
com.mindfusion.common Namespace

ListChangedAction.Reset Field

The content of the list changed dramatically.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static final int Reset
```

See Also

ListChangedAction Members
ListChangedAction Class
com.mindfusion.common Namespace

ListChangedEvent<E> Class

Provides data for the BaseListListener.listChanged event.

Syntax

Java

```
public class ListChangedEvent<E> extends EventObject
```

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.common.ListChangedEvent(E)

See Also

ListChangedEvent(E) Members

Provides data for the BaseListListener.listChanged event.

The following tables list the members exposed by the ListChangedEvent(E) type.

Public Methods

	Name	Description
	getAction	Gets the action that caused the event.
	getNewItems	Gets the list of new items involved in the change.
	getOldItems	Gets the list of items affected by a Replace, Remove, or Reset action.

See Also

ListChangedEvent<E> Class
com.mindfusion.common Namespace

ListChangedEvent(E) Methods

ListChangedEvent(E).getAction Method

Gets the action that caused the event.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public int getAction ()`

Return Value

One of the ListChangedAction constants.

See Also

ListChangedEvent(E) Members
ListChangedEvent<E> Class
com.mindfusion.common Namespace

ListChangedEvent(E).getNewItems Method

Gets the list of new items involved in the change.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public List<E> getNewItems ()
```

Return Value

A list with the new items.

See Also

ListChangedEvent(E) Members
ListChangedEvent<E> Class
com.mindfusion.common Namespace

ListChangedEvent(E).getOldItems Method

Gets the list of items affected by a Replace, Remove, or Reset action.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public List<E> getOldItems ()
```

Return Value

A list with the removed items.

See Also

ListChangedEvent(E) Members
ListChangedEvent<E> Class
com.mindfusion.common Namespace

ListItemEvent<E> Class

Provides data for the BaseListListener.itemAdded event.

Syntax

```
Java
public class ListItemEvent<E> extends EventObject
```

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.common.ListItemEvent(E)

See Also

ListItemEvent(E) Members
com.mindfusion.common Namespace

ListItemEvent(E) Members

Provides data for the BaseListListener.itemAdded event.

The following tables list the members exposed by the ListItemEvent(E) type.

Public Methods

	Name	Description
	getItem	Gets the item related to the event.

See Also

ListItemEvent<E> Class
com.mindfusion.common Namespace

ListItemEvent(E) Methods

ListItemEvent(E).getItem Method

Gets the item related to the event.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public E getItem ()`

Return Value

The item related to the event.

See Also

ListItemEvent(E) Members
ListItemEvent<E> Class
com.mindfusion.common Namespace

MyCheckBoxIcon Class

Syntax

Java
`public class MyCheckBoxIcon implements Icon, UIResource, Serializable`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.common.TriStateCheckBox.MyCheckBoxIcon

See Also

MyCheckBoxIcon Members
com.mindfusion.common Namespace

MyCheckBoxIcon Members

The following tables list the members exposed by the MyCheckBoxIcon type.

Public Constructors

	Name	Description
	MyCheckBoxIcon	

Public Methods

	Name	Description
	getIconHeight	
	getIconWidth	
	paintIcon	

Protected Methods

	Name	Description
	getControlSize	

See Also

MyCheckBoxIcon Class
com.mindfusion.common Namespace

MyCheckBoxIcon Methods

MyCheckBoxIcon.getControlSize Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
protected int getControlSize ()
```

Return Value

See Also

MyCheckBoxIcon Members
MyCheckBoxIcon Class
com.mindfusion.common Namespace

MyCheckBoxIcon.getIconHeight Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int getIconHeight ()
```

Return Value

See Also

MyCheckBoxIcon Members
MyCheckBoxIcon Class
com.mindfusion.common Namespace

MyCheckBoxIcon.getIconWidth Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public int getIconWidth ()
```

Return Value

See Also

MyCheckBoxIcon Members
MyCheckBoxIcon Class
com.mindfusion.common Namespace

MyCheckBoxIcon.paintIcon Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public void paintIcon (
    Component c,
    Graphics g,
    int x,
    int y
)
```

Parameters

c

g

x

y

See Also

ObservableList<E> Class

Syntax

```
Java
```

```
public class ObservableList<E>
    extends AbstractList<E>
    implements Externalizable
```

Inheritance Hierarchy

java.lang.Object
  java.util.AbstractCollection(E)
    java.util.AbstractList(E)
      com.mindfusion.common.ObservableList(E)

See Also

ObservableList(E) Members
com.mindfusion.common Namespace

ObservableList(E) Members

The following tables list the members exposed by the ObservableList(E) type.

Public Constructors

	Name	Description
	ObservableList	Overloaded.

Protected Fields

	Name	Description
	list	

Public Methods

	Name	Description
	add	
	addListListener	
	contains	
	get	
	readExternal	
	remove	Overloaded.
	removeListListener	
	set	
	size	
	writeExternal	

Protected Methods

	Name	Description
	fireAdded	
	fireRemoved	
	fireReplaced

ObservableList(E) Members
ObservableList<E> Class
com.mindfusion.common Namespace

ObservableList(E).set Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public E set (
    int index,
    E element
)
```

Parameters

index

element

Return Value

See Also

ObservableList(E) Members
ObservableList<E> Class
com.mindfusion.common Namespace

ObservableList(E).size Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public int size ()`

Return Value

See Also

ObservableList(E) Members
ObservableList<E> Class
com.mindfusion.common Namespace

ObservableList(E).writeExternal Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

`public void writeExternal (`
`  ObjectOutput out`
`)`

Parameters

out

See Also

ObservableList(E) Members

ObservableListListener(E) Methods

ObservableListListener(E).elementAdded Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
void elementAdded (
    E newElement
)
```

Parameters

newElement

See Also

ObservableListListener(E) Members
ObservableListListener<E> Interface
com.mindfusion.common Namespace

ObservableListListener(E).elementRemoved Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
void elementRemoved (
    E oldElement
)
```

Parameters

oldElement

See Also

ObservableListListener(E) Members
ObservableListListener<E> Interface
com.mindfusion.common Namespace

Orientation Enumeration

Specifies orientation.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public enum Orientation`

Members

	Member name	Description
	Horizontal	Horizontal orientation.
	Vertical	Vertical orientation.

See Also

com.mindfusion.common Namespace

OrientationConverter Class

Syntax

Java
`public class OrientationConverter implements CanConvert`

Inheritance Hierarchy

java.lang.Object
com.mindfusion.common.OrientationConverter

See Also

OrientationConverter Members
com.mindfusion.common Namespace

OrientationConverter Members

The following tables list the members exposed by the OrientationConverter type.

Public Constructors

	Name	Description
	OrientationConverter	

Public Methods

	Name	Description
	canConvert	
	convert	

See Also

OrientationConverter Class
com.mindfusion.common Namespace

OrientationConverter Constructor

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public OrientationConverter ()`

See Also

OrientationConverter Class
com.mindfusion.common Namespace

OrientationConverter Methods

OrientationConverter.canConvert Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public boolean canConvert (
    String value
)
```

Parameters

value

Return Value

See Also

OrientationConverter Members
OrientationConverter Class
com.mindfusion.common Namespace

OrientationConverter.convert Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Orientation convert (
    String orientation
)
```

Parameters

orientation

Return Value

See Also

OrientationConverter Members
OrientationConverter Class
com.mindfusion.common Namespace

OverflowException Class

Thrown when an operation results in an overflow.

Syntax

Java

```
public class OverflowException extends RuntimeException
```

Inheritance Hierarchy

java.lang.Object
  java.lang.Throwable

java.lang.Exception
java.lang.RuntimeException
com.mindfusion.common.OverflowException

See Also

OverflowException Members
com.mindfusion.common Namespace

OverflowException Members

Thrown when an operation results in an overflow.

The following tables list the members exposed by the OverflowException type.

See Also

OverflowException Class
com.mindfusion.common Namespace

Pair<TFirst, TSecond> Class

Defines a class used to store two related objects.

Syntax

Java
`public class Pair<TFirst, TSecond>`

Inheritance Hierarchy

java.lang.Object
com.mindfusion.common.Pair(TFirst, TSecond)

See Also

Pair(TFirst, TSecond) Members
com.mindfusion.common Namespace

Pair(TFirst, TSecond) Members

Defines a class used to store two related objects.

The following tables list the members exposed by the Pair(TFirst, TSecond) type.

Public Constructors

	Name	Description
	Pair	Overloaded.

Public Methods

	Name	Description
	equals	
	getFirst	Gets the first object in the pair.
	getSecond	Gets the second object in the pair.
	hashCode	
	setFirst	Gets the first object in the pair.
	setSecond	Sets the second object in the pair.
	toString	

See Also

Pair<TFirst, TSecond> Class
com.mindfusion.common Namespace

Pair(TFirst, TSecond) Constructor

Overload List

Name	Description
Pair(TFirst, TSecond) ()	Initializes a new instance of the Pair class.
Pair(TFirst, TSecond) (TFirst, TSecond)	Initializes a new instance of the **Pair** class.

See Also

Pair<TFirst, TSecond> Class
com.mindfusion.common Namespace

Pair(TFirst, TSecond) Constructor ()

Initializes a new instance of the Pair class.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public Pair ()`

See Also

Pair(TFirst, TSecond) Constructor Overload List
Pair<TFirst, TSecond> Class
com.mindfusion.common Namespace

Pair(TFirst, TSecond) Constructor (TFirst, TSecond)

Initializes a new instance of the Pair class.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Pair (
    TFirst x,
    TSecond y
)
```

Parameters

x
The first value.

y
The second value.

See Also

Pair(TFirst, TSecond) Constructor Overload List
Pair<TFirst, TSecond> Class
com.mindfusion.common Namespace

Pair(TFirst, TSecond) Methods

Pair(TFirst, TSecond).equals Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public boolean equals (
    Object obj
)
```

Parameters

obj

Return Value

See Also

Pair(TFirst, TSecond) Members
Pair<TFirst, TSecond> Class
com.mindfusion.common Namespace

Pair(TFirst, TSecond).getFirst Method

Gets the first object in the pair.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public TFirst getFirst ()
```

Return Value

See Also

Pair(TFirst, TSecond) Members
Pair<TFirst, TSecond> Class
com.mindfusion.common Namespace

Pair(TFirst, TSecond).getSecond Method

Gets the second object in the pair.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public TSecond getSecond ()
```

Return Value

See Also

Pair(TFirst, TSecond) Members
Pair<TFirst, TSecond> Class
com.mindfusion.common Namespace

Pair(TFirst, TSecond).hashCode Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int hashCode ()
```

Return Value

See Also

Pair(TFirst, TSecond) Members
Pair<TFirst, TSecond> Class
com.mindfusion.common Namespace

Pair(TFirst, TSecond).setFirst Method

Gets the first object in the pair.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public void setFirst (
    TFirst value
)
```

Parameters

value

See Also

Pair(TFirst, TSecond) Members
Pair<TFirst, TSecond> Class
com.mindfusion.common Namespace

Pair(TFirst, TSecond).setSecond Method

Sets the second object in the pair.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public void setSecond (
    TSecond value
)
```

Parameters

value

See Also

Pair(TFirst, TSecond) Members
Pair<TFirst, TSecond> Class
com.mindfusion.common Namespace

Pair(TFirst, TSecond).toString Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public String toString ()`

Return Value

See Also

Pair(TFirst, TSecond) Members
Pair<TFirst, TSecond> Class
com.mindfusion.common Namespace

Parser Class

Syntax

Java
`public class Parser`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.common.Parser

See Also

Parser Members
com.mindfusion.common Namespace

Parser Members

The following tables list the members exposed by the Parser type.

Public Constructors

	Name	Description
	Parser	

Public Methods

	Name	Description

	readJsonObject	Deserializes a JsonObject from the specified JSON-formatted string.

See Also

Parser Class
com.mindfusion.common Namespace

Parser Constructor

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public Parser ()
```

See Also

Parser Class
com.mindfusion.common Namespace

Parser Methods

Parser.readJsonObject Method

Deserializes a JsonObject from the specified JSON-formatted string.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public JsonObject readJsonObject (
    String json,
    JsonContext context
)
```

Parameters

json
The JSON-formatted string.

context
An JsonContext object providing contextual information about the serialization process and some helper serialization methods.

Return Value

JsonObject

See Also

Parser Members
Parser Class
com.mindfusion.common Namespace

Queryable<T> Class

Extends **Iterable** objects with additional functionality.

Syntax

Java
`public class Queryable<T> implements Iterable<T>`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.common.Queryable(T)

See Also

Queryable(T) Members
com.mindfusion.common Namespace

Queryable(T) Members

Extends **Iterable** objects with additional functionality.

The following tables list the members exposed by the Queryable(T) type.

Public Constructors

	Name	Description
	Queryable	Overloaded.

Public Methods

	Name	Description
	aggregate	
	concat	
	contains	Overloaded.
	count	Overloaded.
	defaultIfEmpty	
	distinct	
	elementAt	

	first	
	firstOrDefault	
	intersect	
	iterator	
	last	
	lastOrDefault	
	max	Overloaded.
	min	Overloaded.
	ofType	
	orderBy	
	orderByDescending	
	reverse	
	select	
	selectMany	
	single	
	singleOrDefault	
	sum	
	toArray	
	toIterable	
	toList	
	union	
	where

public Queryable (
    Object[][] source
)
```

Parameters

source

See Also

Queryable(T) Constructor Overload List
Queryable<T> Class
com.mindfusion.common Namespace

Queryable(T) Methods

Queryable(T).aggregate Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public T aggregate (
    BiFunction<T, T, T> func
)
```

Parameters

func

Return Value

See Also

Queryable(T) Members
Queryable<T> Class
com.mindfusion.common Namespace

Queryable(T).concat Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

`public Queryable<T> concat (`
`  Iterable<T> source`
`)`

Parameters

source

Return Value

See Also

Queryable(T) Members
Queryable<T> Class

ScrollEvent Class

Provides data for the scroll events.

Syntax

Java
`public class ScrollEvent extends EventObject`

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.common.ScrollEvent

See Also

ScrollEvent Members
com.mindfusion.common Namespace

ScrollEvent Members

Provides data for the scroll events.

The following tables list the members exposed by the ScrollEvent type.

Public Methods

	Name	Description
	getNewValue	Gets the new value of the scroll bar.
	getOldValue	Gets the old value of the scroll bar.
	getType	Gets the type of scroll event that occurred.

See Also

ScrollEvent Class
com.mindfusion.common Namespace

ScrollEvent Methods

ScrollEvent.getNewValue Method

Gets the new value of the scroll bar.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java
`public int getNewValue ()`

Return Value

An integer value.

See Also

ScrollEvent Members
ScrollEvent Class
com.mindfusion.common Namespace

ScrollEvent.getOldValue Method

Gets the old value of the scroll bar.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int getOldValue ()
```

Return Value

An integer value.

See Also

ScrollEvent Members
ScrollEvent Class
com.mindfusion.common Namespace

ScrollEvent.getType Method

Gets the type of scroll event that occurred.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public int getType ()
```

Return Value

One of the ScrollEventType constants.

See Also

com.mindfusion.common Namespace

ScrollEventType Class

Specifies the type of action used to raise a scroll event.

Syntax

Java
`public class ScrollEventType`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.common.ScrollEventType

See Also

ScrollEventType Members
com.mindfusion.common Namespace

ScrollEventType Members

Specifies the type of action used to raise a scroll event.

The following tables list the members exposed by the ScrollEventType type.

Public Fields

	Name	Description
	EndScroll	The scroll box has stopped moving.
	First	The scroll box was moved to the minimum position.
	LargeDecrement	The scroll box moved a large distance. The user clicked the scroll bar to the left(horizontal) or above(vertical) the scroll box, or pressed the PAGE UP key.
	LargeIncrement	The scroll box moved a large distance. The user clicked the scroll bar to the right(horizontal) or below(vertical) the scroll box, or pressed the PAGE DOWN key.
	Last	The scroll box was moved to the maximum position.
	SmallDecrement	The scroll box was moved a small distance.
	SmallIncrement	The scroll box was moved a small distance.
	ThumbPosition	The scroll box was moved.
	ThumbTrack	The scroll box is currently being moved.

SwingFuture(T) Methods

SwingFuture(T).cancel Method

Cancels the wrapped java.util.concurrent.Future.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public void cancel ()
```

See Also

SwingFuture(T) Members
SwingFuture<T> Class
com.mindfusion.common Namespace

SwingFuture(T).fulfilled Method

Report success.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public void fulfilled (
    T result
)
```

Parameters

result
The result value.

See Also

SwingFuture(T) Members
SwingFuture<T> Class
com.mindfusion.common Namespace

SwingFuture(T).rejected Method

Report error.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public void rejected (
    Exception error
)
```

Parameters

error

See Also

SwingFuture(T) Members
SwingFuture<T> Class
com.mindfusion.common Namespace

SwingFuture(T).setWrapped Method

Sets wrapped java.util.concurrent.Future.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public void setWrapped (
    Future<T> wrapped
)
```

Parameters

wrapped
The wrapped java Future.

Vector.multiply Method (Vector, Vector)

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java
public static float multiply (
    Vector vector1,
    Vector vector2
)
```

Parameters

vector1

vector2

Return Value

See Also

multiply Method Overload List
Vector Members
Vector Class
com.mindfusion.common Namespace

Vector.negate Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java

public static Vector negate (
    Vector vector
)
```

Parameters

vector

Return Value

See Also

Vector Members
Vector Class
com.mindfusion.common Namespace

Vector.normalize Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

```
Java

public static Vector normalize (
    Vector vector
)
```

Parameters

vector

Return Value

See Also

Vector Members
Vector Class
com.mindfusion.common Namespace

Vector.right Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Vector right (
    Vector v
)
```

Parameters

v

Return Value

See Also

Vector Members
Vector Class
com.mindfusion.common Namespace

Vector.setX Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public void setX (
    float value
)
```

Parameters

value

See Also

Vector Members
Vector Class
com.mindfusion.common Namespace

Vector.setY Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public void setY (
    float value
)
```

Parameters

value

See Also

Vector Members
Vector Class

Vector.subtract Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Vector subtract (
    Vector vector1,
    Vector vector2
)
```

Parameters

vector1

vector2

Return Value

See Also

Vector Members
Vector Class
com.mindfusion.common Namespace

Vector.toPointF Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Point2D.Float toPointF (
    Vector vector
)
```

Parameters

vector

Return Value

See Also

Vector Members
Vector Class
com.mindfusion.common Namespace

Vector.toSizeF Method

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public static Dimension toSizeF (
    Vector vector
)
```

Parameters

vector

Return Value

See Also

Vector Members
Vector Class
com.mindfusion.common Namespace

Vector.toString Method

Overload List

Name	Description
Vector.toString ()	
Vector.toString (Locale)	

See Also

Vector Members
Vector Class
com.mindfusion.common Namespace

Vector.toString Method ()

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toString ()
```

Return Value

See Also

toString Method Overload List
Vector Members
Vector Class
com.mindfusion.common Namespace

Vector.toString Method (Locale)

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public String toString (
    Locale provider
)
```

Parameters

provider

Return Value

See Also

toString Method Overload List
Vector Members
Vector Class
com.mindfusion.common Namespace

VerticalAlignment Enumeration

Specifies how an object or text is vertically aligned relative to an element.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public enum VerticalAlignment
```

Members

	Member name	Description

	Bottom	The object or text is aligned to the bottom of the control element.
	Center	The object or text is aligned to the center of the control element.
	Top	The object or text is aligned to the top of the control element.

Name	Description
XmlException (String)	Initializes a new instance of the XmlException class.
XmlException (Throwable)	Initializes a new instance of the XmlException class.

See Also

XmlException Class
com.mindfusion.common Namespace

XmlException Constructor (String)

Initializes a new instance of the XmlException class.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public XmlException (
    String message
)
```

Parameters

message

See Also

XmlException Constructor Overload List
XmlException Class
com.mindfusion.common Namespace

XmlException Constructor (Throwable)

Initializes a new instance of the XmlException class.

Namespace: com.mindfusion.common
Package: com.mindfusion.common

Syntax

Java

```
public XmlException (
    Throwable cause
)
```

Parameters

cause

com.mindfusion.diagramming.TriangularLayout

See Also

AbstractLayout Members
com.mindfusion.diagramming Namespace

AbstractLayout Members

The base class for all layout classes.

The following tables list the members exposed by the AbstractLayout type.

Protected Constructors

	Name	Description
	AbstractLayout	Initialzes a new instance of the **AbstractLayout** class.

Public Methods

	Name	Description
	arrange	Overloaded.
	getAnchoring	Gets how to align links to the anchor points of nodes.
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content.
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph.
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout.
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout.
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds.
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.
	getProgress	Gets the progress callback delegate.
S	removeMidleSegmentPoint	
	setAnchoring	Sets how to align links to the anchor points of nodes.
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content.
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph.
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout.
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout.
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds.
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.
	setProgress	Sets the progress callback delegate.

AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout Constructor

Initialzes a new instance of the AbstractLayout class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`protected AbstractLayout ()`

See Also

AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout Methods

AbstractLayout.arrange Method

Overload List

Name	Description
AbstractLayout.arrange (Diagram)	Applies the layout to the specified Diagram instance.
AbstractLayout.arrange (Diagram, DiagramItemList)	Applies the layout on the specified subset of items from the specified **Diagram** instance.

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.arrange Method (Diagram)

Applies the layout to the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

`public boolean arrange (`
`  Diagram diagram`
`)`

Parameters

diagram
The Diagram that is arranged.

Return Value

true if the diagram has been arranged successfully; otherwise, **false**.

See Also

arrange Method Overload List
AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.arrange Method (Diagram, DiagramItemList)

Applies the layout on the specified subset of items from the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public abstract boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram
The Diagram that is arranged.

items
A collection of nodes and links from diagram that define the subgraph to arrange.

Return Value

true if the diagram has been arranged successfully; otherwise, **false**.

See Also

arrange Method Overload List
AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.getAnchoring Method

Gets how to align links to the anchor points of nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Anchoring getAnchoring ()
```

Return Value

A member of the Anchoring enumeration.

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.getGrowToFit Method

Gets a value indicating whether the diagram boundaries should grow to fit the arranged content.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getGrowToFit ()
```

Return Value

true to grow diagram's Bounds if the arranged items would not fit, or **false** otherwise. The default value is **true**.

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.getKeepGroupLayout Method

Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getKeepGroupLayout ()
```

Return Value

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.getLayoutLink Method

Gets an object, which is notified when the position of a link is changed by the layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public LayoutLink getLayoutLink ()
```

Return Value

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.getLayoutNode Method

Gets an object, which is notified when the position of a node is changed by the layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public LayoutNode getLayoutNode ()
```

Return Value

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.getMargins Method

Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public XDimension2D.Double getMargins ()
```

Return Value

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.getMultipleGraphsPlacement Method

Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public MultipleGraphsPlacement getMultipleGraphsPlacement ()
```

Return Value

A member of the MultipleGraphsPlacement enumeration.

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.getProgress Method

Gets the progress callback delegate.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LayoutProgress getProgress ()
```

Return Value

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.removeMidleSegmentPoint Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public static void removeMidleSegmentPoint (
    Link link,
    boolean uniq
)
```

Parameters

link

uniq

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.setAnchoring Method

Sets how to align links to the anchor points of nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setAnchoring (
    Anchoring value
)
```

Parameters

value
A member of the Anchoring enumeration. The default value is **Ignore**.

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.setGrowToFit Method

Sets a value indicating whether the diagram boundaries should grow to fit the arranged content.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setGrowToFit (
    boolean value
)
```

Parameters

value

true to grow diagram's Bounds if the arranged items would not fit, or **false** otherwise.

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.setKeepGroupLayout Method

Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setKeepGroupLayout (
    boolean value
)
```

Parameters

value

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.setLayoutLink Method

Sets an object, which is notified when the position of a link is changed by the layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLayoutLink (
    LayoutLink value
)
```

Parameters

value

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.setLayoutNode Method

Sets an object, which is notified when the position of a node is changed by the layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLayoutNode (
    LayoutNode value
)
```

Parameters

value

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.setMargins Method

Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMargins (
    XDimension2D.Double value
)
```

Parameters

value

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.setMultipleGraphsPlacement Method

Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMultipleGraphsPlacement (
    MultipleGraphsPlacement value
)
```

Parameters

value
A member of the MultipleGraphsPlacement enumeration. The default value is **Horizontal**.

Remarks

If the diagram contains several unconnected subgraphs, each of them is processed by the algorithm independently from the others. This property specifies how such subgraphs should be placed one relatively to another. The possible options are to arrange them in a row, in a column, or in such a way that the diagram covers a minimal area.

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

AbstractLayout.setProgress Method

Sets the progress callback delegate.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setProgress (
    LayoutProgress value
)
```

Parameters

value

See Also

AbstractLayout Members
AbstractLayout Class
com.mindfusion.diagramming Namespace

Action Enumeration

The members of this enumeration identify the current operation carried out interactively on an item. Usually you would pass one of these constants to the constructor of an InteractionState instance when implementing custom BehaviorBase classes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum Action`

Members

	Member name	Description
	Create	Specifies that a new item is currently being drawn by a user.
	Modify	Specifies that an existing item is being modified.
	None	Specifies that there isn't any action being performed on an item.
	Split	Specifies that a segment of a link is being split.

AddGroupCmd Members

Implements creation of new groups.

The following tables list the members exposed by the AddGroupCmd type.

Public Constructors

	Name	Description
	AddGroupCmd	Overloaded.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)
	execute	This method is called internally by JDiagram when creating groups via the Factory.createGroup of DiagramNode.attachTo methods.
	getGroup	Gets the group added to the flowchart by this command.
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	This method is called by the UndoManager when redoing actions.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	This method is called by the **UndoManager** when undoing actions.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related. (Inherited from Command.)
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

See Also

AddGroupCmd Constructor

Overload List

Name	Description
AddGroupCmd (Group, DiagramItem)	Initializes a new instance of the AddGroupCmd class.
AddGroupCmd (Group, DiagramItem, boolean)	Initializes a new instance of the **AddGroupCmd** class.

See Also

AddGroupCmd Class
com.mindfusion.diagramming Namespace

AddGroupCmd Constructor (Group, DiagramItem)

Initializes a new instance of the AddGroupCmd class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AddGroupCmd (
    Group group,
    DiagramItem item
)
```

Parameters

group
The group that is added to the diagram by this command.

item
The master item of the group.

See Also

AddGroupCmd Constructor Overload List
AddGroupCmd Class
com.mindfusion.diagramming Namespace

AddGroupCmd Constructor (Group, DiagramItem, boolean)

Initializes a new instance of the AddGroupCmd class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public AddGroupCmd (
    Group group,
    DiagramItem item,
    boolean saveAttachments
)
```

Parameters

group
The group that is added to the diagram by this command.

item
The master item of the group.

saveAttachments
Specifies whether to save the attachment information for later redo.

AddGroupCmd Methods

AddGroupCmd.execute Method

This method is called internally by JDiagram when creating groups via the Factory.createGroup of DiagramNode.attachTo methods.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void execute (
    boolean undoEnabled
)
```

Parameters

undoEnabled
true if the undo manager is enabled at this time, otherwise **false**.

See Also

AddGroupCmd Members
AddGroupCmd Class
com.mindfusion.diagramming Namespace

AddGroupCmd.getGroup Method

Gets the group added to the flowchart by this command.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Group getGroup ()
```

Return Value

A Group instance.

See Also

AddGroupCmd Members
AddGroupCmd Class
com.mindfusion.diagramming Namespace

AddGroupCmd.redo Method

This method is called by the UndoManager when redoing actions.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void redo ()
```

See Also

AddGroupCmd Members
AddGroupCmd Class

AddItemCmd Methods

AddItemCmd.execute Method

This method is called internally when creating new items interactively or programmatically.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void execute (
    boolean undoEnabled
)
```

Parameters

undoEnabled
true if the undo manager is enabled at this time, otherwise **false**.

AddItemCmd Class
com.mindfusion.diagramming Namespace

AddItemCmd.getItem Method

Gets the item added to the flowchart by this command.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramItem getItem ()
```

Return Value

An instance of an DiagramItem -derived class.

AddToContainerCmd Members

Undoable command that implements an addition of a node to a container.

The following tables list the members exposed by the AddToContainerCmd type.

Protected Constructors

	Name	Description

	AddToContainerCmd	Intializes a new instance of the **AddToContainerCmd** class.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)
	execute	Carries out the command action.
	getContainer	Gets the container node associated with the command.
	getNodes	Gets the item associated with the command.
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	Redoes the command.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	Undoes the command.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related.
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative.

AddToContainerCmd Class
com.mindfusion.diagramming Namespace

AddToContainerCmd Constructor

Intializes a new instance of the AddToContainerCmd class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected AddToContainerCmd (
    ContainerNode container,
    DiagramNodeList nodes,
    boolean interactive
)
```

Parameters

container

nodes
The nodes added to the container by this command.

interactive

AddToContainerCmd Class
com.mindfusion.diagramming Namespace

AddToContainerCmd Methods

AddToContainerCmd.adopt Method

Merges adjacent commands in the history queue if they are related.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected boolean adopt (
    Command command
)
```

Parameters

command
The Command that might be adopted by this command.

Return Value

true if the specified command has been adopted; otherwise, **false**.

AddToContainerCmd.isContainerOf Method

Determines whether a command has been initiated by this command and should be treated as a derivative.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected boolean isContainerOf (
    Command command
)
```

Parameters

command
The Command for which to determine whether it is a derivative.

Return Value

true if the specified command should be considered a derivative; otherwise, **false**.

AeroEffect Members

Represents an effect that adds semitransparency to the node and emphasizes its outline by adding a shade and an inner stroke. This effect can be applied to the nodes in a Diagram by adding an instance of this class to the Diagram.getNodeEffects collection.

The following tables list the members exposed by the AeroEffect type.

Public Constructors

	Name	Description
	AeroEffect	Initializes a new instance of the **AeroEffect** class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from NodeEffect.)
	clone	NodeEffect.clone override.
	getInnerOutlineColor	Gets the color of the inner outline.
	getOpacity	Gets the opacity to apply to the node's background. Opacity varies in the range [0..1] where 0 indicates full transparency and 1 indicates the original transparency. Opacity has no effect on image backgrounds.

	getShadeColor	Gets the color of the shade.
	readExternal	NodeEffect.readExternal override.
	removePropertyChangeListener	(Inherited from NodeEffect.)
	setInnerOutlineColor	Sets the color of the inner outline.
	setOpacity	Sets the opacity to apply to the node's background. Opacity varies in the range [0..1] where 0 indicates full transparency and 1 indicates the original transparency. Opacity has no effect on image backgrounds.
	setShadeColor	Sets the color of the shade.
	writeExternal	NodeEffect.writeExternal override.

Anchoring Enumeration

The members of this enumeration specify whether the automatic layout algorithms and the link routing algorithm should align link ends to the anchor points of nodes. Use these constants as parameters of the RoutingOptions.setAnchoring method of the RoutingOptions class and the layout classes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum Anchoring
```

Members

	Member name	Description
	Ignore	Specifies that anchor points should be ignored.

	Keep	Specifies that links' original anchor points should be preserved.
	Reassign	Lets the layout algorithms align links to different anchor points.

AnchorPoint Class

Represent a point where a link can connect to a node. A set of anchor points is represented by the AnchorPattern class. Such a set can be assigned to a node by calling the setAnchorPattern method.

Syntax

Java

```
public class AnchorPoint implements Cloneable, Externalizable
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.AnchorPoint

See Also

AnchorPoint Members

Represent a point where a link can connect to a node. A set of anchor points is represented by the AnchorPattern class. Such a set can be assigned to a node by calling the setAnchorPattern method.

The following tables list the members exposed by the AnchorPoint type.

Public Constructors

	Name	Description
	AnchorPoint	Overloaded.

Public Methods

	Name	Description
	clone	Creates a clone of the anchor point.
	getAllowIncoming	Gets a value indicating whether this anchor point accepts incoming links.
	getAllowOutgoing	Gets a value indicating whether this anchor point accepts outgoing links.
	getColor	Gets the color used to draw this anchor point.
	getColumn	Gets the column to which this anchor point is related.
	getLinkOrientation	Gets the desired orientation of link segments that connect to this point.
	getMarkStyle	Gets a value indicating what mark is drawn at the position of this anchor point.
	getTag	Gets a custom data object assigned to this anchor point.
	getX	Gets the X position of the anchor point.
	getXUnit	Gets whether the point's X position is specified as percentage of node's size or fixed offset from the node's left side.
	getY	Gets the Y position of the anchor point.
	getYUnit	Gets whether the point's Y position is specified as percentage of node's size or fixed offset from the node's top side.
	readExternal	
	setAllowIncoming	Sets a value indicating whether this anchor point accepts incoming links.
	setAllowOutgoing	Sets a value indicating whether this anchor point accepts outgoing links.
	setColor	Sets the color used to draw this anchor point.

	setColumn	Sets the column to which this anchor point is related.
	setLinkOrientation	Sets the desired orientation of link segments that connect to this point.
	setMarkStyle	Sets a value indicating what mark is drawn at the position of this anchor point.
	setTag	Assigns a custom data object to this anchor point.
	setX	Sets the X position of the anchor point.
	setXUnit	Sets whether the point's **X** position is specified as percentage of node's size or fixed offset from the node's left side.
	setY	Sets the Y position of the anchor point.
	setYUnit	Sets whether the point's **Y** position is specified as percentage of node's size or fixed offset from the node's top side.
	writeExternal

AnchorPoint Constructor

Overload List

Name	Description
AnchorPoint (AnchorPoint)	Initializes a new AnchorPoint instance using the specified **AnchorPoint** as a prototype.
AnchorPoint (float, float)	Initializes a new **AnchorPoint** instance by setting its relative position in nodes. The point will allow both outgoing and incoming links.
AnchorPoint (float, float, boolean, boolean)	Initializes a new **AnchorPoint** instance by setting its relative position in nodes and specifying whether it will allow outgoing or incoming links.
AnchorPoint (float, float, boolean, boolean, Color, short)	Initializes a new **AnchorPoint** instance by setting its relative position in nodes and specifying whether it will allow outgoing or incoming links. The table column to which the anchor point is related is specified too.
AnchorPoint (float, float, boolean, boolean, Color, short, Object)	Initializes a new **AnchorPoint** instance by setting its relative position in nodes and specifying whether it will allow outgoing or incoming links. The table column to which the anchor point is related is specified too.

AnchorPoint (float, float, boolean, boolean, MarkStyle)	Initializes a new **AnchorPoint** instance by setting its relative position in nodes and specifying whether it will allow outgoing or incoming links. The shape of the anchor point mark is specified too.
AnchorPoint (float, float, boolean, boolean, MarkStyle, Color)	Initializes a new **AnchorPoint** instance by setting its relative position in nodes and specifying whether it will allow outgoing or incoming links. The shape and color of the anchor point mark are specified too.

AnchorPoint Constructor (AnchorPoint)

Initializes a new AnchorPoint instance using the specified **AnchorPoint** as a prototype.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnchorPoint (
    AnchorPoint prototype
)
```

Parameters

prototype
The AnchorPoint to use as a prototype.

Remarks

The properties of the new point are initialized from the property values of the prototype AnchorPoint.

AnchorPoint Constructor Overload List
AnchorPoint Class
com.mindfusion.diagramming Namespace

AnchorPoint Constructor (float, float)

Initializes a new AnchorPoint instance by setting its relative position in nodes. The point will allow both outgoing and incoming links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnchorPoint (
    float x,
    float y
)
```

Parameters

x
The horizontal position of the anchor point specified as percents of the node width.

y
The vertical position of the anchor point specified as percents of the node height.

See Also

AnchorPoint Constructor Overload List
AnchorPoint Class
com.mindfusion.diagramming Namespace

AnchorPoint Constructor (float, float, boolean, boolean)

Initializes a new AnchorPoint instance by setting its relative position in nodes and specifying whether it will allow outgoing or incoming links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnchorPoint (
    float x,
    float y,
    boolean allowIncoming,
    boolean allowOutgoing
)
```

Parameters

x
The horizontal position of the anchor point specified aspercents of the node width.

y
The vertical position of the anchor point specified aspercents of the node height.

allowIncoming
true if this point should accept incoming links, otherwise **false**.

allowOutgoing
true if this point should accept outgoing links, otherwise **false**.

AnchorPoint Constructor (float, float, boolean, boolean, Color, short)

Initializes a new AnchorPoint instance by setting its relative position in nodes and specifying whether it will allow outgoing or incoming links. The table column to which the anchor point is related is specified too.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnchorPoint (
    float x,
    float y,
    boolean allowIncoming,
    boolean allowOutgoing,
    Color color,
    short column
)
```

Parameters

x
The horizontal position of the anchor point specified as percents of the node width.

y
The vertical position of the anchor point specified as percents of the node height.

allowIncoming
true if this point accepts incoming links, otherwise **false**.

allowOutgoing
true if this point accepts outgoing links, otherwise **false**.

color
A **Color** object representing the color of the anchor point mark.

column
An index of a table column relatively to which the anchor point x position will be calculated.

See Also

AnchorPoint Constructor (float, float, boolean, boolean, Color, short, Object)

Initializes a new AnchorPoint instance by setting its relative position in nodes and specifying whether it will allow outgoing or incoming links. The table column to which the anchor point is related is specified too.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnchorPoint (
    float x,
```

```
    float y,
    boolean allowIncoming,
    boolean allowOutgoing,
    Color color,
    short column,
    Object tag
)
```

Parameters

x
The horizontal position of the anchor point specified as percents of the node width.

y
The vertical position of the anchor point specified as percents of the node height.

allowIncoming
true if this point should accept incoming links, otherwise **false**.

allowOutgoing
true if this point should accept outgoing links, otherwise **false**.

color
A Color object representing the color of the anchor point mark.

column
An index of a table column relatively to which the anchor point x position should be calculated.

tag
A custom data object associated with the anchor point.

AnchorPoint Constructor (float, float, boolean, boolean, MarkStyle)

Initializes a new AnchorPoint instance by setting its relative position in nodes and specifying whether it will allow outgoing or incoming links. The shape of the anchor point mark is specified too.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnchorPoint (
    float x,
    float y,
    boolean allowIncoming,
    boolean allowOutgoing,
    MarkStyle markStyle
)
```

Parameters

x
The horizontal position of the anchor point specified aspercents of the node width.

y

The vertical position of the anchor point specified aspercents of the node height.

allowIncoming
true if this point should acceptincoming links, otherwise false.

allowOutgoing
true if this point should acceptoutgoing links, otherwise false.

markStyle
A member of the MarkStyle enumeration.

AnchorPoint Constructor (float, float, boolean, boolean, MarkStyle, Color)

Initializes a new AnchorPoint instance by setting its relative position in nodes and specifying whether it will allow outgoing or incoming links. The shape and color of the anchor point mark are specified too.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnchorPoint (
    float x,
    float y,
    boolean allowIncoming,
    boolean allowOutgoing,
    MarkStyle markStyle,
    Color color
)
```

Parameters

x
The horizontal position of the anchor point specified aspercents of the node width.

y
The vertical position of the anchor point specified aspercents of the node height.

allowIncoming
true if this point should acceptincoming links, otherwise false.

allowOutgoing
true if this point should acceptoutgoing links, otherwise false.

markStyle
A member of the MarkStyle enumeration.

color
A Color object representingthe color of the anchor point mark.

AnchorPoint Methods

AnchorPoint.clone Method

Creates a clone of the anchor point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Object clone ()
```

Return Value

An AnchorPoint instance.

See Also

AnchorPoint Members

AnchorPoint.getAllowIncoming Method

Gets a value indicating whether this anchor point accepts incoming links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAllowIncoming ()
```

Return Value

true if incoming links can connect to this point, otherwise **false**.

AnchorPoint.getColor Method

Gets the color used to draw this anchor point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Color getColor ()
```

Return Value

A Color object representing the anchor point color.

See Also

AnchorPoint Members
AnchorPoint Class
com.mindfusion.diagramming Namespace

AnchorPoint.getColumn Method

Gets the column to which this anchor point is related.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public short getColumn ()
```

Return Value

An integer value specifying the column index.

See Also

AnchorPoint Members
AnchorPoint Class
com.mindfusion.diagramming Namespace

AnchorPoint.getLinkOrientation Method

Gets the desired orientation of link segments that connect to this point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Orientation getLinkOrientation ()
```

Return Value

A member of the Orientation enumeration. The default value is **Auto**.

Remarks

Currently, the value of this property is considered only by GridRouter.

See Also

AnchorPoint Members

AnchorPoint.getMarkStyle Method

Gets a value indicating what mark is drawn at the position of this anchor point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public MarkStyle getMarkStyle ()
```

Return Value

A member of the MarkStyle enumeration.

See Also

AnchorPoint Members

AnchorPoint.getX Method

Gets the X position of the anchor point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getX ()
```

Return Value

A float value specifying the point position as percent by the node width.

See Also

AnchorPoint Members
AnchorPoint Class
com.mindfusion.diagramming Namespace

AnchorPoint.getXUnit Method

Gets whether the point's X position is specified as percentage of node's size or fixed offset from the node's left side.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public UnitType getXUnit ()
```

Return Value

A member of the UnitType enumeration. The default value is **Percentage**.

See Also

AnchorPoint Members

public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

AnchorPoint Members
AnchorPoint Class
com.mindfusion.diagramming Namespace

AnchorPoint.setAllowIncoming Method

Sets a value indicating whether this anchor point accepts incoming links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowIncoming (
    boolean value
)
```

Parameters

value
true if incoming links can connect to this point, or otherwise **false**.

Remarks

true if incoming links can connect to this point, or otherwise **false**.

See Also

AnchorPoint Members

AnchorPoint.setAllowOutgoing Method

Sets a value indicating whether this anchor point accepts outgoing links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowOutgoing (
    boolean value
)
```

Parameters

value
true if outgoing links can connect to this point, or otherwise **false**.

Remarks

true if outgoing links can connect to this point, or otherwise **false**.

See Also

AnchorPoint Members
AnchorPoint Class
com.mindfusion.diagramming Namespace

AnchorPoint.setColor Method

Sets the color used to draw this anchor point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setColor (
    Color value
)
```

Parameters

value
A Color object representing the anchor point color.

See Also

AnchorPoint Members
AnchorPoint Class
com.mindfusion.diagramming Namespace

AnchorPoint.setColumn Method

Sets the column to which this anchor point is related.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setColumn (
    short value
)
```

Parameters

value
An integer value specifying the column index.

See Also

AnchorPoint Members
AnchorPoint Class
com.mindfusion.diagramming Namespace

AnchorPoint.setLinkOrientation Method

Sets the desired orientation of link segments that connect to this point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkOrientation (
    Orientation value
)
```

Parameters

value
A member of the Orientation enumeration.

Remarks

Currently, the value of this property is considered only by GridRouter.

See Also

AnchorPoint Members
AnchorPoint Class
com.mindfusion.diagramming Namespace

AnchorPoint.setMarkStyle Method

Sets a value indicating what mark is drawn at the position of this anchor point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMarkStyle (
    MarkStyle value
)
```

Parameters

value
A member of the MarkStyle enumeration. The default is **MarkStyle.X**.

Remarks

Specifies how anchor points are marked visually on the display. Custom code can be used to draw the marks by setting the property value to Custom and handling the drawAnchorPoint event.

See Also

AnchorPoint Members
AnchorPoint Class
com.mindfusion.diagramming Namespace

AnchorPoint.setTag Method

Assigns a custom data object to this anchor point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTag (
    Object tag
)
```

Parameters

tag
An Object containing custom data.

Remarks

If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the serializeTag event.

AnchorPointList Members

A strongly typed list of AnchorPoint objects.

The following tables list the members exposed by the AnchorPointList type.

Public Constructors

	Name	Description
	AnchorPointList	Overloaded.

Protected Fields

	Name	Description
	list	(Inherited from BaseList.)
	listEvent	(Inherited from BaseList.)
	notifyParent	(Inherited from BaseList.)

Public Methods

	Name	Description
	add	Adds a new element to the list. (Inherited from BaseList.)
	clear	Removes all elements from the list. (Inherited from BaseList.)
	contains	Determines if this list contains the specified element. (Inherited from BaseList.)

	first	Gets the first element of this list. (Inherited from BaseList.)
	get	Gets the element at the specified position in this list. (Inherited from BaseList.)
	last	Gets the last element of this list. (Inherited from BaseList.)
	readExternal	Loads the list's contents. (Inherited from BaseList.)
	remove	Overloaded. (Inherited from BaseList.)
	removeRange	Removes a range of elements from this list. (Inherited from BaseList.)
	set	Sets the element at the specified position in this list. (Inherited from BaseList.)
	size	Gets the number of elements in this list. (Inherited from BaseList.)
	writeExternal	Saves the list's contents. (Inherited from BaseList.)

Protected Methods

	Name	Description
	raiseAdding	Raises the adding event. (Inherited from BaseList.)
	raiseClearing	Raises the clearing event. (Inherited from BaseList.)
	raiseRemoving	Raises the removing event. (Inherited from BaseList.)

AnnealLayout Class

Implements a simulated annealing graph layout algorithm.

Syntax

Java
`public class AnnealLayout implements Layout`

Remarks

Simulated Annealing is a general-purpose optimization method used to solve large-scale combinatorial problems by simulating the process of heating and cooling of metal to achieve freedom from defects. Finding a nice arrangement of a graph is a combinatorial problem that can be reduced to assigning costs to graph configurations and finding the minimum cost configuration. In that case, a cost is assigned to a graph configuration by evaluating different aesthetic criteria such as distance between nodes, length of links and the number of link crossings.

The **AnnealLayout** class implements a Simulated Annealing graph layout algorithm that can be used to arrange JDiagram diagrams. To arrange a diagram, create an **AnnealLayout** instance, set its properties and call the arrange method.

The algorithm starts the simulation with the temperature set via setInitialTemperature, and runs several cooling stages, as set via setStages. At each stage the algorithm evaluates several graph configurations for each node, as set by calling setIterationsPerStage. At the end of each stage, the algorithm selects the configuration that has a minimum cost and decreases the temperature by multiplying it by getTemperatureScale. The relative weight of an aesthetic criterion relative to the other criteria is set via the setDistributionFactor, setLinkLengthFactor, setBoundaryFactor and setCrossingLinksCost methods.

Inheritance Hierarchy

java.lang.Object
com.mindfusion.diagramming.AnnealLayout

See Also

AnnealLayout Members
com.mindfusion.diagramming Namespace

AnnealLayout Members

Implements a simulated annealing graph layout algorithm.

The following tables list the members exposed by the AnnealLayout type.

Public Constructors

	Name	Description

	AnnealLayout	Initializes a new instance of the **AnnealLayout** class.

Public Methods

	Name	Description
	arrange	Applies the layout to the specified Diagram.
	getAnchoring	Gets a value specifying how links will be aligned to the anchor points of nodes.
	getBoundaryFactor	Gets a value indicating how important the distance from nodes to the layout area boundaries is relatively to the other criteria considered by the algorithm.
	getCrossingLinksCost	Gets a value specifying how important the low number of link crossings is relatively to the other criteria considered by the algorithm.
	getDistributionFactor	Gets a value indicating the importance of node distribution relatively to the other criteria considered by the algorithm.
	getInitialTemperature	Gets the initial temperature of the simulated annealing process.
	getIterationsPerStage	Gets how many node shift iterations to perform at each stage of the algorithm.
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph.
	getLayoutArea	Gets the size of the layout area.
	getLinkLengthFactor	Gets a value specifying how important the short length of links is relatively to the other criteria considered by the algorithm.
	getMultipleGraphsOrientation	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.
	getNodeLinkCrossingCost	Gets a value specifying how important the low number of crossings of links with edges is relatively to the other criteria considered by the algorithm.
	getNodeLinkDistFactor	Gets a value specifying the importance of the distance between nodes and links relative to the other criteria considered by the algorithm.
	getPrecision	Gets the cost calculations precision.
	getRandomize	Gets a value indicating whether the nodes should be placed at random positions when the layout routine starts.
	getRoot	Gets the diagram node that specifies which connected graph in the diagram should be arranged.
	getSplitGraph	Whether unconnected sub-graphs should be laid out independently from each other.
	getStages	Gets how many cooling stages the algorithm should simulate.

	getTemperatureScale	Gets how much the simulated temperature is decreased at each stage of the algorithm.
	getWidthHeightRatio	Gets what width / height ratio the layout area should have.
	init	Returns an AnnealLayoutBuilder object used to configure this AnnealLayout instance.
	setAnchoring	Sets a value specifying how links will be aligned to the anchor points of nodes.
	setBoundaryFactor	Sets a value indicating how important the distance from nodes to the layout area boundaries is relatively to the other criteria considered by the algorithm.
	setCrossingLinksCost	Sets a value specifying how important the low number of link crossings is relatively to the other criteria considered by the algorithm.
	setDistributionFactor	Sets a value indicating the importance of node distribution relatively to the other criteria considered by the algorithm.
	setInitialTemperature	Sets the initial temperature of the simulated annealing process.
	setIterationsPerStage	Sets how many node shift iterations to perform at each stage of the algorithm.
	setKeepGroupLayout	Sets a value indicating whether to treat each **Group** of nodes as a single vertex in the arranged graph.
	setLayoutArea	Sets the size of the layout area.
	setLinkLengthFactor	Sets a value specifying how important the short length of links is relatively to the other criteria considered by the algorithm.
	setMultipleGraphsOrientation	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.
	setNodeLinkCrossingCost	Sets a value specifying how important the low number of crossings of links with edges is relatively to the other criteria considered by the algorithm.
	setNodeLinkDistFactor	Sets a value specifying the importance of the distance between nodes and links relative to the other criteria considered by the algorithm.
	setPrecision	Sets the cost calculations precision. 1 specifies highest precision. Accepted values are between 0.9 and 1. The algorithm completes faster when running with a lower precision, but produces slightly worse results.
	setRandomize	Sets a value indicating whether the nodes should be placed at random positions when the layout routine starts.
	setRoot	Sets the diagram node that specifies which connected graph in the diagram should be arranged.
	setSplitGraph	Whether unconnected sub-graphs should be laid out independently from each other.
	setStages	Sets how many cooling stages the algorithm should simulate.

	setTemperatureScale	Sets how much the simulated temperature is decreased at each stage of the algorithm.
	setWidthHeightRatio	Sets what width / height ratio the layout area should have.
S	with	Returns an AnnealLayoutBuilder object used to configure and create new AnnealLayout instances.

AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout Constructor

Initializes a new instance of the AnnealLayout class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnnealLayout ()
```

See Also

AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout Methods

AnnealLayout.arrange Method

Applies the layout to the specified Diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram chart
)
```

Parameters

chart
A Diagram instance that should be laid out.

Return Value

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getAnchoring Method

Gets a value specifying how links will be aligned to the anchor points of nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Anchoring getAnchoring ()
```

Return Value

A member of the Anchoring enumeration.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getBoundaryFactor Method

Gets a value indicating how important the distance from nodes to the layout area boundaries is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public double getBoundaryFactor ()
```

Return Value

A multiplier applied to the node-to-boundary distance cost when evaluating the total cost of a graph configuration.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getCrossingLinksCost Method

Gets a value specifying how important the low number of link crossings is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public double getCrossingLinksCost ()
```

Return Value

A value added to the total cost of a graph configuration for each pair of crossing links.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getDistributionFactor Method

Gets a value indicating the importance of node distribution relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public double getDistributionFactor ()
```

Return Value

A multiplier applied to the node distribution cost when evaluating the total cost of a graph configuration.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getInitialTemperature Method

Gets the initial temperature of the simulated annealing process.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public double getInitialTemperature ()
```

Return Value

A double value specifying the initial temperature of the simulated process.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getIterationsPerStage Method

Gets how many node shift iterations to perform at each stage of the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getIterationsPerStage ()
```

Return Value

An integer value specifying the number of iterations.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getKeepGroupLayout Method

Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getKeepGroupLayout ()
```

Return Value

true if groups will be treated as single graph vertices, otherwise **false.**

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getLayoutArea Method

Gets the size of the layout area.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Rectangle2D.Float getLayoutArea ()
```

Return Value

The layout area coordinates.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getLinkLengthFactor Method

Gets a value specifying how important the short length of links is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public double getLinkLengthFactor ()
```

Return Value

A multiplier applied to the link length cost when evaluating the total cost of a graph configuration.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getMultipleGraphsOrientation Method

Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public MultipleGraphsPlacement getMultipleGraphsOrientation ()
```

Return Value

A member of the MultipleGraphsPlacement enumeration.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getNodeLinkCrossingCost Method

Gets a value specifying how important the low number of crossings of links with edges is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public double getNodeLinkCrossingCost ()
```

Return Value

A value added to the total cost of a graph configuration for each crossing of link and node.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getNodeLinkDistFactor Method

Gets a value specifying the importance of the distance between nodes and links relative to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public double getNodeLinkDistFactor ()
```

Return Value

A multiplier applied to the node-to-link distance cost when evaluating the total cost of a graph configuration.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getPrecision Method

Gets the cost calculations precision.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public double getPrecision ()
```

Return Value

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getRandomize Method

Gets a value indicating whether the nodes should be placed at random positions when the layout routine starts.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getRandomize ()
```

Return Value

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getRoot Method

Gets the diagram node that specifies which connected graph in the diagram should be arranged.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public DiagramNode getRoot ()
```

Return Value

A DiagramNode object whose containing graph will be arranged.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getSplitGraph Method

Whether unconnected sub-graphs should be laid out independently from each other.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public boolean getSplitGraph ()
```

Return Value

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getStages Method

Gets how many cooling stages the algorithm should simulate.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public int getStages ()
```

Return Value

The number of cooling stages.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getTemperatureScale Method

Gets how much the simulated temperature is decreased at each stage of the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public double getTemperatureScale ()
```

Return Value

A multiplier applied to the current temperature at the end of each cooling stage.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.getWidthHeightRatio Method

Gets what width / height ratio the layout area should have.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getWidthHeightRatio ()
```

Return Value

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.init Method

Returns an AnnealLayoutBuilder object used to configure this AnnealLayout instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnnealLayoutBuilder init ()
```

Return Value

An **AnnealLayoutBuilder** instance.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setAnchoring Method

Sets a value specifying how links will be aligned to the anchor points of nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAnchoring (
    Anchoring value
)
```

Parameters

value
A member of the Anchoring enumeration. The default value is **Ignore**.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setBoundaryFactor Method

Sets a value indicating how important the distance from nodes to the layout area boundaries is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setBoundaryFactor (
    double value
)
```

Parameters

value
A multiplier applied to the node-to-boundary distance cost when evaluating the total cost of a graph configuration. The default is 3000.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setCrossingLinksCost Method

Sets a value specifying how important the low number of link crossings is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setCrossingLinksCost (
    double value
)
```

Parameters

value
A value added to the total cost of a graph configuration for each pair of crossing links. The default is 100000.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setDistributionFactor Method

Sets a value indicating the importance of node distribution relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDistributionFactor (
    double value
)
```

Parameters

value
A multiplier applied to the node distribution cost when evaluating the total cost of a graph configuration. The default is 40000.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setInitialTemperature Method

Sets the initial temperature of the simulated annealing process.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setInitialTemperature (
    double value
)
```

Parameters

value
A double value specifying the initial temperature of the simulated process.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setIterationsPerStage Method

Sets how many node shift iterations to perform at each stage of the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIterationsPerStage (
    int value
)
```

Parameters

value
An integer value specifying the number of iterations. The default is 50.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setKeepGroupLayout Method

Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setKeepGroupLayout (
    boolean value
)
```

Parameters

value
true if groups must be treated as single graph vertices, otherwise **false**.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setLayoutArea Method

Sets the size of the layout area.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLayoutArea (
    Rectangle2D.Float value
)
```

Parameters

value
The layout area coordinates.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setLinkLengthFactor Method

Sets a value specifying how important the short length of links is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkLengthFactor (
    double value
)
```

Parameters

value
A multiplier applied to the link length cost when evaluating the total cost of a graph configuration. The default is 0.25.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setMultipleGraphsOrientation Method

Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMultipleGraphsOrientation (
    MultipleGraphsPlacement value
)
```

Parameters

value
A member of the MultipleGraphsPlacement enumeration. The default value is **Horizontal**.

Remarks

If the diagram contains several unconnected subgraphs, each of them is processed by the algorithm independently from the others. This property specifies how such subgraphs should be placed one relatively to another. The possible options are to arrange them in a row, in a column, or in such a way that the diagram covers a minimal area.

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setNodeLinkCrossingCost Method

Sets a value specifying how important the low number of crossings of links with edges is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setNodeLinkCrossingCost (
    double nodeLinkCrossingCost
)
```

Parameters

nodeLinkCrossingCost
A value added to the total cost of a graph configuration for each crossing of link and node. The default is 100000.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setNodeLinkDistFactor Method

Sets a value specifying the importance of the distance between nodes and links relative to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setNodeLinkDistFactor (
    double value
)
```

Parameters

value
A multiplier applied to the node-to-link distance cost when evaluating the total cost of a graph configuration. The default is 20000.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setPrecision Method

Sets the cost calculations precision. 1 specifies highest precision. Accepted values are between 0.9 and 1. The algorithm completes faster when running with a lower precision, but produces slightly worse results.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setPrecision (
    double precision
)
```

Parameters

precision

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setRandomize Method

Sets a value indicating whether the nodes should be placed at random positions when the layout routine starts.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRandomize (
    boolean value
)
```

Parameters

value

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setRoot Method

Sets the diagram node that specifies which connected graph in the diagram should be arranged.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRoot (
    DiagramNode value
)
```

Parameters

value
A DiagramNode object whose containing graph will be arranged.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setSplitGraph Method

Whether unconnected sub-graphs should be laid out independently from each other.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSplitGraph (
    boolean value
)
```

Parameters

value

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setStages Method

Sets how many cooling stages the algorithm should simulate.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setStages (
    int value
)
```

Parameters

value
The number of cooling stages.

See Also

AnnealLayout Members
AnnealLayout Class
com.mindfusion.diagramming Namespace

AnnealLayout.setTemperatureScale Method

Sets how much the simulated temperature is decreased at each stage of the algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTemperatureScale (
    double value
)
```

Parameters

value
A multiplier applied to the current temperature at the end of each cooling stage. The default value is 0.75

See Also

AnnealLayout Members

ArcTemplate Members

Represents an arc segment in a Shape definition.

The following tables list the members exposed by the ArcTemplate type.

Public Constructors

	Name	Description
	ArcTemplate	Overloaded.

Public Methods

	Name	Description
	getColor	Gets the color of this element. (Inherited from ElementTemplate.)
	getDashStyle	(Inherited from ElementTemplate.)
	getWidth	(Inherited from ElementTemplate.)
	setColor	(Inherited from ElementTemplate.)
	setDashStyle	(Inherited from ElementTemplate.)
	setWidth	(Inherited from ElementTemplate.)
	toDOM	

Protected Methods

	Name	Description
	getElementPen	Gets a pen used to render the element. If no pen properties are explicitly specified for this element, returns the pen passed as an argument. (Inherited from ElementTemplate.)

ArcTemplate Class
com.mindfusion.diagramming Namespace

ArcTemplate Constructor (float, float, float, float, float, float)

Initializes a new ArcTemplate instance with the specified bounding rectangle coordinates and start and sweep angles.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ArcTemplate (
    float x,
    float y,
    float w,
    float h,
    float a,
    float s
)
```

Parameters

x
The horizontal position of arc's containing ellipse,specified as percent by box width.

y
The vertical position of arc's containing ellipse,specified as percent by box height.

w
The width of the arc's containing ellipse,specified as percent by box width.

h
The height of the arc's containing ellipse,specified as percent by box height.

a
The start angle of the arc.

s
The sweep angle of the arc.

ArcTemplate Constructor Overload List
ArcTemplate Class
com.mindfusion.diagramming Namespace

ArcTemplate Constructor (float, float, float, float, float, float, Color, DashStyle, float)

Initializes a new ArcTemplate instance with the specified bounding rectangle coordinates and start and sweep angles.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ArcTemplate (
    float x,
    float y,
    float w,
    float h,
    float a,
    float s,
    Color color,
    DashStyle dashStyle,
    float width
)
```

Parameters

x
The horizontal position of arc's containing ellipse,specified as percents of box width.

y
The vertical position of arc's containing ellipse,specified as percents of box height.

w
The width of the arc's containing ellipse,specified as percents of box width.

h
The height of the arc's containing ellipse,specified as percents of box height.

a
The start angle of the arc.

s
The sweep angle of the arc.

color
The color of this segment.

dashStyle
The dash style of this segment.

width
The width of this segment.

AttachToLink Enumeration

The members of this enumeration specify how a node is attached to a link. These constants can be used as parameters of the DiagramNode.attachTo method of the DiagramNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public enum AttachToLink
```

Members

	Member name	Description
	LongestHSegment	The node is attached to and follows the longest horizontal segment of the link.
	Point	The node is attached to and follows the specified control point of the link.

	Segment	The node is attached to and follows the specified segment of the link.

See Also

com.mindfusion.diagramming Namespace

AttachToNode Enumeration

The members of this enumeration specify how a node is attached to another node. These constants can be used as parameters of the DiagramNode.attachTo method of the DiagramNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum AttachToNode`

Members

	Member name	Description
	BottomCenter	The attached node follows the bottom-center point of the master node.
	BottomLeft	The attached node follows the bottom-left point of the master node.
	BottomRight	The attached node follows the bottom-right point of the master node.
	MiddleLeft	The attached node follows the middle-left point of the master node.
	MiddleRight	The attached node follows the middle-right point of the master node.
	TopCenter	The attached node follows the top-center point of the master node.
	TopLeft	The attached node follows the top-left point of the master node.
	TopRight	The attached node follows the top-right point of the master node.

AutoResize Enumeration

The members of this enumeration specify whether the size of the document area should be automatically enlarged if needed, and to what direction it should be enlarged. These constants can be used as parameters of the setAutoResize method of the Diagram class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum AutoResize`

Members

	Member name	Description
	AllDirections	Enlarge the document size to all directions.
	None	Do not enlarge the document size automatically.
	RightAndDown	Enlarge the document size only to the right and downwards.

BaseList(E) Members

Implements common functionality of JDiagram List classes.

The following tables list the members exposed by the BaseList(E) type.

Protected Constructors

	Name	Description
	BaseList	Overloaded.

Protected Fields

	Name	Description
	list	
	listEvent	
	notifyParent	

Public Methods

	Name	Description
	add	Adds a new element to the list.
	clear	Removes all elements from the list.
	contains	Determines if this list contains the specified element.
	first	Gets the first element of this list.
	get	Gets the element at the specified position in this list.
	last	Gets the last element of this list.
	readExternal	Loads the list's contents.
	remove	Overloaded.
	removeRange	Removes a range of elements from this list.
	set	Sets the element at the specified position in this list.
	size	Gets the number of elements in this list.
	writeExternal	Saves the list's contents.

Protected Methods

	Name	Description
	raiseAdding	Raises the adding event.
	raiseClearing	Raises the clearing event.
	raiseRemoving	Raises the removing event.

BaseList(E) Constructor (Collection<E>)

Initializes a new instance of the BaseList class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected BaseList (
    Collection<E> c
)
```

Parameters

c
The collection whose elements to copy.

See Also

BaseList(E) Constructor Overload List
BaseList<E> Class
com.mindfusion.diagramming Namespace

BaseList(E) Constructor (int)

Initializes a new instance of the BaseList class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected BaseList (
    int capacity
)
```

Parameters

capacity
The initial capacity of the list.

See Also

BaseList(E) Constructor Overload List

com.mindfusion.diagramming Namespace

BaseList(E) Methods

BaseList(E).add Method

Adds a new element to the list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void add (
    int index,
    E element
)
```

Parameters

index
Index at which the specified element is to be inserted.

element
Element to be inserted.

See Also

BaseList(E) Members

BaseList(E).contains Method

Determines if this list contains the specified element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean contains (
    Object element
)
```

Parameters

element

Element to search the list for.

Return Value

true if this list contains the specified element, or false otherwise.

See Also

BaseList(E) Members
BaseList<E> Class
com.mindfusion.diagramming Namespace

BaseList(E).first Method

Gets the first element of this list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public E first ()
```

Return Value

The first element in this list.

See Also

BaseList(E).get Method

Gets the element at the specified position in this list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public E get (
    int index
)
```

Parameters

index
Index of the element to return.

Return Value

The element at the specified position in this list.

See Also

BaseList(E) Members
BaseList<E> Class
com.mindfusion.diagramming Namespace

BaseList(E).last Method

Gets the last element of this list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public E last ()
```

Return Value

The last element in this list.

BaseList(E).raiseAdding Method

Raises the adding event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void raiseAdding (
    E item,
    int index
)
```

Parameters

item
The element that should be added.

index
The element's index.

See Also

BaseList(E) Members
BaseList<E> Class

BaseList(E).raiseClearing Method

Raises the clearing event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

BaseList(E).raiseRemoving Method

Raises the removing event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void raiseRemoving (
    E item
)
```

Parameters

item
The element that should be removed.

See Also

BaseList(E) Members
BaseList<E> Class
com.mindfusion.diagramming Namespace

BaseList(E).readExternal Method

Loads the list's contents.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in
The stream to read the list from.

BaseList(E).remove Method

Overload List

Name	Description
BaseList(E).remove (int)	Removes the element at the specified position in this list.
BaseList(E).remove (Object)	Removes the specified element from this list.

See Also

BaseList(E) Members
BaseList<E> Class
com.mindfusion.diagramming Namespace

BaseList(E).remove Method (int)

Removes the element at the specified position in this list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public E remove (
    int index
)
```

Parameters

index
The index of the element to be removed.

Return Value

The element that was removed from the list.

See Also

remove Method Overload List
BaseList(E) Members
BaseList<E> Class

BaseList(E).removeRange Method

Removes a range of elements from this list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeRange (
    int fromIndex,
    int toIndex
)
```

Parameters

fromIndex
Index of first element to be removed.

toIndex
Index of last element to be removed.

BaseList(E) Members
BaseList<E> Class
com.mindfusion.diagramming Namespace

BaseList(E).set Method

Sets the element at the specified position in this list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public E set (
    int index,
    E element
)
```

Parameters

index
Index of the element to replace.

element
Element to be stored at the specified position.

Return Value

The element previously at the specified position.

See Also

BaseList(E) Members
BaseList<E> Class
com.mindfusion.diagramming Namespace

BaseList(E).size Method

Gets the number of elements in this list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int size ()
```

Return Value

An integer value specifying the number of elements.

See Also

BaseList(E).writeExternal Method

Saves the list's contents.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out
The stream to write the list to.

See Also

BaseList(E) Members
BaseList<E> Class
com.mindfusion.diagramming Namespace

Behavior Enumeration

The members of this enumeration specify how the component should respond to users actions. These constants can be used as arguments of the setBehavior method of the Diagram class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum Behavior
```

Members

	Member name	Description
	Custom	Specifies that user input will be handled by the BehaviorBase-derived object assigned to DiagramView.setCustomBehavior.

DoNothing	The control ignores users actions with the mouse, but raises the appropriate mouse events. This mode allows applications to implement their own mouse-drawing behavior, disabling the default JDiagram response to users actions.
DrawContainers	Drawing with the mouse creates ContainerNode instances.
DrawControls	Drawing with the mouse creates ControlNode instances.
DrawFreeForms	Drawing with the mouse creates FreeFormNode instances.
DrawFreeShapes	Points from user input are shown using a FreeFormNode instance. Once the user finishes drawing, the FreeFormNode is replaced by a ShapeNode with a matching shape from Diagram.FreeFormTargets list.
DrawLasso	Dragging with the mouse draws a selection lasso, raising the lassoDrawn event upon completion without selecting diagram items automatically.
DrawLinks	Drawing started over a node creates a DiagramLink. Otherwise a lasso rectangle is displayed allowing the selection of items.
DrawShapes	Drawing with the mouse creates ShapeNode instances.
DrawTables	Drawing with the mouse creates TableNode instances.
DrawTreeViews	Drawing with the mouse creates TreeViewNode instances.
LinkContainers	Drawing over empty document area creates a ContainerNode instance. Drawing started over a node creates a DiagramLink. </summary>
LinkControls	Drawing over an empty document region creates a **ControlNode** instance. Drawing started over a node creates a **DiagramLink**.
LinkFreeForms	Drawing over empty document area creates a FreeFormNode instance. Drawing started over a node creates a DiagramLink.
LinkFreeShapes	Points from user input are shown using a FreeFormNode instance. Once the user finishes drawing, the FreeFormNode is replaced by a ShapeNode with a matching shape from Diagram.FreeFormTargets list. Drawing started over a node creates a DiagramLink.
LinkShapes	A mode that is suitable for creating flowcharts and process diagrams. Drawing started over an empty document region creates a **ShapeNode** instance. Drawing started over a node creates a **DiagramLink**.
LinkTables	A mode that is suitable for creating entity-relationship diagrams. Drawing started over an empty document region creates a **TableNode** instance. Drawing started over a node creates a **DiagramLink**.
LinkTreeViews	Drawing over empty document area creates a TreeViewNode instance. Drawing started over a node creates a DiagramLink.

	Magnify	Dragging the mouse magnifies the view. Interactive creation or modification of items is disabled.
	Modify	Objects can be selected and modified. New objects cannot be created.
	MoveLabels	Dragging with the mouse moves the label under mouse pointer.
	MoveNodes	Dragging with the mouse moves the node under mouse pointer.
	Pan	Dragging the mouse pans the view. Interactive creation or modification of items is disabled.
	PanAndModify	Items can be selected and modified. New items cannot be created, and dragging without grabbing an adjustment handle pans the view.
	SelectOnly	Allow only selection of existing items. Modifying them or drawing new ones is disabled.
	Zoom	Dragging with the mouse draws a lasso tool that zooms the diagram view to selected rectangular area.

BehaviorBase Class

An abstract base class for types that define how the control reacts to users' actions with a mouse or other pointing devices.

Syntax

Java

```
public abstract class BehaviorBase extends Interaction
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.Interaction
    com.mindfusion.diagramming.BehaviorBase
      com.mindfusion.diagramming.DrawLinksBehavior
      com.mindfusion.diagramming.DrawNodesBehavior
      com.mindfusion.diagramming.LassoBehavior
      com.mindfusion.diagramming.LinkNodesBehavior
      com.mindfusion.diagramming.ModifyBehavior
      com.mindfusion.diagramming.MoveNodesBehavior
      com.mindfusion.diagramming.PanBehavior
      com.mindfusion.diagramming.SelectOnlyBehavior

See Also

BehaviorBase Members

An abstract base class for types that define how the control reacts to users' actions with a mouse or other pointing devices.

The following tables list the members exposed by the BehaviorBase type.

Protected Constructors

	Name	Description
	BehaviorBase	Initializes a new instance of the **BehaviorBase** class.

Protected Fields

	Name	Description
	currentCursor	
	diagramView	

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events.
	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves.
	pointerOver	Invoked when the mouse moves.
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events.

Protected Methods

	Name	Description
	createLink	
	getDiagram	
	getDiagramView	
	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state.
	setMouseCursor	Invoked while the mouse is moved to let your application set the mouse cursor.

	startDraw	Invoked when the user begins drawing inside the diagram canvas.
	startDrawCommon

BehaviorBase.pointerDown Method

Interaction.pointerDown override. Invoked in response to system pointer down events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void pointerDown (
    Point pointerPosition,
    MouseEvent e
)
```

Parameters

mousePosition
A Point instance that specifies the mouse pointer position.

e
The corresponding system **MouseEvent** object.

See Also

BehaviorBase Members
BehaviorBase Class
com.mindfusion.diagramming Namespace

BehaviorBase.pointerMove Method

Interaction.pointerMove override. Invoked when the pointer moves.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void pointerMove (
    Point pointerPosition,
    MouseEvent e
)
```

Parameters

mousePosition
A Point instance that specifies the mouse pointer position.

e
The corresponding system **MouseEvent** object.

See Also

BehaviorBase.pointerOver Method

Invoked when the mouse moves.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void pointerOver (
    Point pointerPosition,
    MouseEvent e
)
```

Parameters

mousePosition
A Point instance that specifies the mouse pointer position.

e

See Also

BehaviorBase Members
BehaviorBase Class
com.mindfusion.diagramming Namespace

BehaviorBase.pointerUp Method

Interaction.pointerUp override. Invoked in response to system pointer up events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void pointerUp (
    Point pointerPosition,
    MouseEvent e
)
```

Parameters

mousePosition
A Point instance that specifies the mouse pointer position.

e
The corresponding system **MouseEvent** object.

See Also

BehaviorBase Members
BehaviorBase Class
com.mindfusion.diagramming Namespace

BehaviorBase.setModfCursor Method

Updates the current cursor according to the specified cursor position and diagram state.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected CursorHint setModfCursor (
    Point2D point,
    AdjustmentHandle handle,
    boolean active,
    boolean autoh
)
```

Parameters

point
A Point2D instance that specifies the current mouse position.

handle
The adjustment handle located at mouse position.

active
Specifies whether the mouse is over the ActiveItem.

autoh
true when the mouse is over a DiagramItem and the ModificationStart property of the DiagramView is set to AutoHandles.

Return Value

A member of the CursorHint enumeration.

See Also

BehaviorBase Members
BehaviorBase Class
com.mindfusion.diagramming Namespace

BehaviorBase.setMouseCursor Method

Invoked while the mouse is moved to let your application set the mouse cursor.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected abstract CursorHint setMouseCursor (
    Point2D point,
    ByRef<Boolean> startInteraction
)
```

Parameters

point
A Point2D instance that specifies the position of the mouse cursor.

startInteraction
true if the user is going to create, delete, modify or select a DiagramItem; **false** if mouse behavior is not considered; in this case the mouse pointer is set to a default cursor according to the background LaneGrid.

Return Value

A member of the CursorHint enumeration.

See Also

BehaviorBase Members
BehaviorBase Class
com.mindfusion.diagramming Namespace

BehaviorBase.startDraw Method

Invoked when the user begins drawing inside the diagram canvas.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected abstract InteractionState startDraw (
    Point2D point,
```

```
    MouseEvent e
)
```

Parameters

point
The pointer position specified in the current MeasureUnit.

e
The original **MouseEvent** provided by the Java Swing framework.

Return Value

An instance of the InteractionState class, which specifies whether the user interaction should create or modify an item.

Remarks

To start creating an item, pass a new instance of a DiagramItem -derived class to the InteractionState constructor and set the constructor's action argument to Action.Create. Do not add the new item to the diagram's Items list nor call factory methods such as createShapeNode to add the new item to the diagram; the item will be added automatically when the user completes drawing it. If creating a link, use the DiagramLink constructor that takes a single DiagramNode argument, specifying the origin node.

To start modifying an item, provide a reference to an existing item as argument of the InteractionState constructor and set the action argument to Action.Modify.

BezierTemplate Members

Represents a Bezier curve in a Shape definition.

The following tables list the members exposed by the BezierTemplate type.

Public Constructors

	Name	Description
	BezierTemplate	Overloaded.

Public Methods

	Name	Description
	getColor	Gets the color of this element. (Inherited from ElementTemplate.)
	getDashStyle	(Inherited from ElementTemplate.)
	getWidth	(Inherited from ElementTemplate.)
	setColor	(Inherited from ElementTemplate.)
	setDashStyle	(Inherited from ElementTemplate.)
	setWidth	(Inherited from ElementTemplate.)
	toDOM	

Protected Methods

	Name	Description
	getElementPen	Gets a pen used to render the element. If no pen properties are explicitly specified for this element, returns the pen passed as an argument. (Inherited from ElementTemplate.)

BezierTemplate Class
com.mindfusion.diagramming Namespace

BezierTemplate Constructor

Overload List

Name	Description
BezierTemplate (float, float, float, float, float, float, float, float)	Initializes a new BezierTemplate instance with the specified coordinates of the segment control points.
BezierTemplate (float, float, float, float, float, float, float, float, Color, DashStyle, float)	Initializes a new **BezierTemplate** instance with the specified coordinates of the segment control points.

See Also

BezierTemplate Class
com.mindfusion.diagramming Namespace

BezierTemplate Constructor (float, float, float, float, float, float, float, float)

Initializes a new BezierTemplate instance with the specified coordinates of the segment control points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public BezierTemplate (
    float x1,
    float y1,
    float x2,
    float y2,
    float x3,
    float y3,
    float x4,
    float y4
)
```

Parameters

x1
X coordinate of the first control point specified as percent by the box width.

y1

Y coordinate of the first control point specified as percent of the box height.

x2
X coordinate of the second control point specified as percent of the box width.

y2
Y coordinate of the second control point specified as percent of the box height.

x3
X coordinate of the third control point specified as percent of the box width.

y3
Y coordinate of the third control point specified as percent of the box height.

x4
X coordinate of the fourth control point specified as percent of the box width.

y4
Y coordinate of the fourth control point specified as percent of the box height.

BezierTemplate Constructor Overload List
BezierTemplate Class
com.mindfusion.diagramming Namespace

BezierTemplate Constructor (float, float, float, float, float, float, float, float, Color, DashStyle, float)

Initializes a new BezierTemplate instance with the specified coordinates of the segment control points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public BezierTemplate (
    float x1,
    float y1,
    float x2,
    float y2,
    float x3,
    float y3,
    float x4,
    float y4,
    Color color,
    DashStyle dash,
    float width
)
```

Parameters

x1
X coordinate of the first control point specified aspercents of the box width.

y1
Y coordinate of the first control point specified aspercents of the box height.

x2
X coordinate of the second control point specified aspercents of the box width.

y2

Y coordinate of the second control point specified aspercents of the box height.

x3
X coordinate of the third control point specified aspercents of the box width.

y3
Y coordinate of the third control point specified aspercents of the box height.

x4
X coordinate of the fourth control point specified aspercents of the box width.

y4
Y coordinate of the fourth control point specified aspercents of the box height.

color
The color of this segment.

dash
The dash style of this segment.

width
The width of this segment.

CascadeLayout Class

Performs cascading layout on simple, connected graphs.

Syntax

Java
`public class CascadeLayout extends AbstractLayout`

Remarks

CascadeLayout places nodes on a virtual grid and arranges links orthogonally, such that if the source graph is planar all links are guaranteed to have no more than two bends and will not intersect. By default the layout method arranges nodes in rows and link segments in columns; this can be changed by setting the Orientation property.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.AbstractLayout
    com.mindfusion.diagramming.CascadeLayout

CascadeLayout Members
com.mindfusion.diagramming Namespace

CascadeLayout Members

Performs cascading layout on simple, connected graphs.

The following tables list the members exposed by the CascadeLayout type.

Public Constructors

	Name	Description
	CascadeLayout	Initializes a new instance of the **CascadeLayout** class.

Public Methods

	Name	Description
	arrange	Applies the layout on the specified subset of items from the specified Diagram instance.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)

	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getOrientation	Gets the orientation of the arranged graph.
	getPadding	Gets the spacing between nodes in adjacent layers.
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	init	Returns a CascadeLayoutBuilder object used to configure this CascadeLayout instance.
S	removeMidleSegmentPoint	(Inherited from AbstractLayout.)
	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setOrientation	Sets the orientation of the arranged graph.
	setPadding	Sets the spacing between nodes in adjacent layers.
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
S	with	Returns a CascadeLayoutBuilder object used to configure and create new CascadeLayout instances.

CascadeLayout Methods

CascadeLayout.arrange Method

Applies the layout on the specified subset of items from the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram
The Diagram that should be arranged.

items
A collection of nodes and links from diagram that define the subgraph to arrange.

Return Value

This method always returns true.

Cell Class

Represents a cell in a table. Cells are arranged in a grid of rows and columns, and can span more than one rows or columns if needed. Each cell can display an image and a text label.

Syntax

Java

```
public class Cell implements Cloneable, Externalizable, RenderTextCallback, InplaceEditable
```

Remarks

Cells are the building blocks of tables. They get their height and width indirectly, from the width of table columns and the height of table rows as set through the setWidth and setHeight methods. Cells can be made to span several rows and columns by calling their setRowSpan and setColumnSpan methods.

A cell can display a text label, as set by the setText method. The text alignment is set by calling setTextFormat. Color of the text in the cells is set by the setTextColor method.

The appearance of a cell can be customized further by the setBrush, setImage and setImageAlign methods.

Cell Members

Represents a cell in a table. Cells are arranged in a grid of rows and columns, and can span more than one rows or columns if needed. Each cell can display an image and a text label.

The following tables list the members exposed by the Cell type.

Public Constructors

	Name	Description
	Cell	Overloaded. Initializes a new instance of the **Cell** class.

Public Methods

	Name	Description
	clone	Creates a copy of the cell.
	getBrush	Gets the Brush used to fill the cell's interior.
	getColumnSpan	Gets the number of columns spanned by this cell.
	getEditRect	Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).
	getFont	Gets the font used to draw the text of this cell.
	getHyperLink	Gets the hyperlink associated with the cell.
	getImage	Gets the image that is displayed inside the cell.
	getImageAlign	Gets a value indicating how the image displayed inside the cell is aligned relatively to the cell bounds.
	getImagePadding	Gets the padding distance between cell's borders and **Image**.
	getImageUrl	Gets a URL used to load an image into this cell.
	getPlainText	Gets the plain text extracted from the formatted text by removing the formatting tags.
	getRowSpan	Gets the number of rows spanned by this cell.
	getTable	Gets the TableNode containing the cell.
	getTag	Gets user-defined data assigned to this cell.
	getText	Gets the text that is displayed inside the cell.
	getTextColor	Gets the color used to draw the text of this cell.
	getTextFormat	Gets a TextFormat object specifying how to format and align the text of this cell.
	getTextPadding	Gets the spacing between the cell's boundaries and its text.
	getTextSize	Gets the size of the text displayed in this cell.

	getTextToEdit	Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when this cell is edited in-place.
	getToolTip	Gets the tooltip text that is displayed when the pointer rests for a while over this cell.
	readExternal	Implements Externalizable.
	renderText	Styled text rendering callback.
	setBrush	Sets the Brush used to fill the cell's interior.
	setColumnSpan	Sets the number of columns spanned by this cell.
	setEditedText	Implements InplaceEditable.setEditedText. Assigns the edited text to the cell after in-place edit operation completes successfully
	setFont	Sets the font used to draw the text of this cell.
	setHyperLink	Sets the hyperlink associated with the cell.
	setImage	Sets the image that should be displayed inside the cell.
	setImageAlign	Sets a value indicating how the image displayed inside the cell should be aligned relatively to the cell bounds.
	setImagePadding	Sets the padding distance between cell's borders and **Image**.
	setImageUrl	Sets a URL used to load an image into this cell.
	setRowSpan	Sets the number of rows spanned by this cell.
	setTag	Assigns user-defined data to a cell.
	setText	Sets the text that should be displayed inside the cell.
	setTextColor	Sets the color used to draw the text of this cell.
	setTextFormat	Sets a TextFormat object specifying how to format and align the text of this cell.
	setTextPadding	Sets the spacing between the cell's boundaries and its text.
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests for a while over this cell.
	writeExternal	Implements Externalizable.

Protected Methods

	Name	Description
	loadFromJson	Loads the cell from a JSON object.
	loadFromXml	
	saveToJson	Saves the cell as a JSON object.
	saveToXml

Cell.getEditRect Method

Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getEditRect (
    DiagramItem item,
    Point2D mousePosition
)
```

Parameters

item
The TableNode whose cell's text will be edited.

mousePosition
A **Point2D** instance specifying the current pointer position.

Return Value

A **Rectangle2D** specifying where the edit box should be placed.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.getFont Method

Gets the font used to draw the text of this cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Font getFont ()
```

Return Value

A Font object representing the font used to draw this cell's text.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.getHyperLink Method

Gets the hyperlink associated with the cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public String getHyperLink ()
```

Return Value

A String containing the cell's hyperlink.

See Also

Cell Members
Cell Class

Cell.getImage Method

Gets the image that is displayed inside the cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Image getImage ()
```

Return Value

An instance of the **java.awt.Image** class.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.getImageAlign Method

Gets a value indicating how the image displayed inside the cell is aligned relatively to the cell bounds.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ImageAlign getImageAlign ()
```

Return Value

A member of the ImageAlign enumeration.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.getImagePadding Method

Gets the padding distance between cell's borders and Image.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Thickness getImagePadding ()
```

Return Value

A Thickness value specifying padding distance. The default value is **null**.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.getImageUrl Method

Gets a URL used to load an image into this cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getImageUrl ()
```

Return Value

a String containing the URL.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.getPlainText Method

Gets the plain text extracted from the formatted text by removing the formatting tags.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getPlainText ()
```

Return Value

A String containing the cell's text stripped fromformatting tags.

See Also

Cell Members

com.mindfusion.diagramming Namespace

Cell.setBrush Method

Sets the Brush used to fill the cell's interior.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBrush (
    Brush value
)
```

Parameters

value
A Brush object.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.setColumnSpan Method

Sets the number of columns spanned by this cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setColumnSpan (
    int value
)
```

Parameters

value
An integer value specifying the number of spanned columns.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.setEditedText Method

Implements InplaceEditable.setEditedText. Assigns the edited text to the cell after in-place edit operation completes successfully

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEditedText (
    String newText
)
```

Parameters

newText
The new text of this cell.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.setFont Method

Sets the font used to draw the text of this cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFont (
    Font font
)
```

Parameters

font
A Font object representing the font used to draw this cell's text.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.setHyperLink Method

Sets the hyperlink associated with the cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setHyperLink (
    String value
)
```

Parameters

value
A String containing the cell's hyperlink.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.setImage Method

Sets the image that should be displayed inside the cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setImage (
    Image value
)
```

Parameters

value
An instance of the **java.awt.Image** class.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace
setImageAlign Method
setImagePadding Method

Cell.setImageAlign Method

Sets a value indicating how the image displayed inside the cell should be aligned relatively to the cell bounds.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setImageAlign (
    ImageAlign value
)
```

Parameters

value
A member of the ImageAlign enumeration. The default value is **Fit**.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace
setImagePadding Method

Cell.setImagePadding Method

Sets the padding distance between cell's borders and Image.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setImagePadding (
    Thickness value
)
```

Parameters

value
A Thickness value specifying padding distance.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace
setImageAlign Method

Cell.setImageUrl Method

Sets a URL used to load an image into this cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImageUrl (
    String value
)
```

Parameters

value
A String containing the URL

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.setRowSpan Method

Sets the number of rows spanned by this cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRowSpan (
    int value
)
```

Parameters

value
An integer value specifying the number of spanned rows.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.setTag Method

Assigns user-defined data to a cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTag (
    Object value
)
```

Parameters

value
An Object containing custom data.

Remarks

If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event.

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.setText Method

Sets the text that should be displayed inside the cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setText (
    String value
)
```

Parameters

value
A String containing the cell's text.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.setTextColor Method

Sets the color used to draw the text of this cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTextColor (
    Color value
)
```

Parameters

value
A Color object representing the text color.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.setTextFormat Method

Sets a TextFormat object specifying how to format and align the text of this cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTextFormat (
    TextFormat value
)
```

Parameters

value
A TextFormat object specifying the text format and alignment.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace
setTextPadding Method

Cell.setTextPadding Method

Sets the spacing between the cell's boundaries and its text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTextPadding (
    Thickness value
)
```

Parameters

value
A Thickness instance specifying the size of the padding space left around the text.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace
getTextPadding Method
setText Method
setTextFormat Method

Cell.setToolTip Method

Sets the tooltip text that should be displayed when the pointer rests for a while over this cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setToolTip (
    String value
)
```

Parameters

value
A String containing the cell's tooltip.

See Also

Cell Members
Cell Class
com.mindfusion.diagramming Namespace

Cell.writeExternal Method

Implements Externalizable.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

See Also

CellEvent Class

Contains information passed to the cellClicked event defined in DiagramListener.

Syntax

Java
`public class CellEvent extends EventObject`

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject

CellEvent Members

Contains information passed to the cellClicked event defined in DiagramListener.

The following tables list the members exposed by the CellEvent type.

Public Constructors

	Name	Description
	CellEvent	Initializes a new **CellEvent** instance.

Public Methods

	Name	Description
	getCell	Gets a reference to the cell related to the event.
	getColumn	Gets the index of the cell column.
	getMouseButton	Gets the mouse button related to the event.
	getPointerPosition	Gets the pointer position.
	getRow	Gets the index of the cell row.
	getTable	Gets a reference to the table related to this event.

See Also

CellEvent Constructor

Initializes a new CellEvent instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CellEvent (
    Object source,
    Cell cell,
    int column,
    int row,
    Point2D position,
    int button
)
```

Parameters

source
The sender of this event.

cell
The Cell related to this event.

column
The cell column.

row
The cell row.

position
The position of the pointer at the time the event was raised.

button
A **MouseEvent** button constant.

See Also

CellEvent Class
com.mindfusion.diagramming Namespace

CellEvent Methods

CellEvent.getCell Method

Gets a reference to the cell related to the event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Cell getCell ()
```

Return Value

A reference to a Cell object.

See Also

CellEvent Members
CellEvent Class
com.mindfusion.diagramming Namespace

CellEvent.getColumn Method

Gets the index of the cell column.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getColumn ()
```

Return Value

An integer number specifying the cell column.

See Also

CellEvent Members
CellEvent Class
com.mindfusion.diagramming Namespace

CellEvent.getMouseButton Method

Gets the mouse button related to the event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getMouseButton ()
```

Return Value

One of the MouseEvent.BUTTON* constants.

See Also

CellEvent Members
CellEvent Class
com.mindfusion.diagramming Namespace

CellEvent.getPointerPosition Method

Gets the pointer position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Point2D.Float getPointerPosition ()
```

Return Value

A **Point2D.Float** object representing the pointer position in document coordinates.

See Also

CellEvent Members
CellEvent Class
com.mindfusion.diagramming Namespace

CellEvent.getRow Method

Gets the index of the cell row.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getRow ()
```

Return Value

An integer number specifying the cell row.

See Also

CellEvent Members
CellEvent Class
com.mindfusion.diagramming Namespace

CellEvent.getTable Method

Gets a reference to the table related to this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public TableNode getTable ()`

Return Value

A reference to a TableNode object.

See Also

CellEvent Members
CellEvent Class
com.mindfusion.diagramming Namespace

CellFrameStyle Enumeration

The members of this enumeration specify the style of the frame lines of tables' cells. They can be used as parameters of the setCellFrameStyle method of the TableNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum CellFrameStyle`

Members

	Member name	Description
	None	TableNode cells have no border.
	Simple	The borders of table cells are simple lines.
	System3D	The borders have 3D look.

com.mindfusion.diagramming Namespace

CellList Members

A strongly typed list of Cell objects.

The following tables list the members exposed by the CellList type.

Public Constructors

	Name	Description
	CellList	Initializes a new instance of the **CellList** class.

Protected Fields

	Name	Description
	list	(Inherited from BaseList.)
	listEvent	(Inherited from BaseList.)
	notifyParent	(Inherited from BaseList.)

Public Methods

	Name	Description
	add	Adds a new element to the list. (Inherited from BaseList.)
	clear	Removes all elements from the list. (Inherited from BaseList.)
	clone	
	contains	Determines if this list contains the specified element. (Inherited from BaseList.)
	first	Gets the first element of this list. (Inherited from BaseList.)
	get	Gets the element at the specified position in this list. (Inherited from BaseList.)
	last	Gets the last element of this list. (Inherited from BaseList.)
	readExternal	Loads the list's contents. (Inherited from BaseList.)
	remove	Overloaded. (Inherited from BaseList.)

	removeRange	Removes a range of elements from this list. (Inherited from BaseList.)
	set	Sets the element at the specified position in this list. (Inherited from BaseList.)
	size	Gets the number of elements in this list. (Inherited from BaseList.)
	writeExternal	Saves the list's contents. (Inherited from BaseList.)

Protected Methods

	Name	Description
	raiseAdding	Raises the adding event. (Inherited from BaseList.)
	raiseClearing	Raises the clearing event. (Inherited from BaseList.)
	raiseRemoving	Raises the removing event. (Inherited from BaseList.)

ChangeItemCmd Members

Handles undo / redo of property changes.

The following tables list the members exposed by the ChangeItemCmd type.

Public Constructors

	Name	Description
	ChangeItemCmd	Initializes a new **ChangeItemCmd** instance.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)

	execute	Overloaded.
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	This method is called by the UndoManager when redoing actions.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	This method is called by the **UndoManager** when undoing actions.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related. (Inherited from Command.)
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

See Also

ChangeItemCmd Class
com.mindfusion.diagramming Namespace

ChangeItemCmd Constructor

Initializes a new ChangeItemCmd instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ChangeItemCmd (
    DiagramItem item,
    String title
)
```

Parameters

item
The DiagramItem whose properties will be changed through this command.

title
A String containing the command title.

CircularLayout Members

Implements a circular graph layout algorithm. Nodes are distributed evenly on the circumference of a circle at positions that result in as few link crossing as possible.

The following tables list the members exposed by the CircularLayout type.

Public Constructors

	Name	Description
	CircularLayout	Initializes a new instance of the **CircularLayout** class with the default settings.

Public Methods

	Name	Description
	arrange	Overloaded.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from

		AbstractLayout.)
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	getRadius	Gets the radius of the layout circle.
	getSiftingRounds	Gets the number of sifts to perform during the layout.
	init	Returns a CircularLayoutBuilder object used to configure this CircularLayout instance.
S	removeMidleSegmentPoint	(Inherited from AbstractLayout.)
	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
	setRadius	Sets the radius of the layout circle.
	setSiftingRounds	Sets the number of sifts to perform during the layout.
S	with	Returns a CircularLayoutBuilder object used to configure and create new CircularLayout instances.

com.mindfusion.diagramming Namespace

CircularLayout Methods

CircularLayout.arrange Method

Overload List

Name	Description
CircularLayout.arrange (Diagram)	Applies the layout on the specified Diagram instance.
CircularLayout.arrange (Diagram, DiagramItemList)	Applies the layout on the specified subset of items from the specified **Diagram** instance.

See Also

CircularLayout Members
CircularLayout Class
com.mindfusion.diagramming Namespace

CircularLayout.arrange Method (Diagram)

Applies the layout on the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram
)
```

Parameters

diagram
The Diagram that should be arranged.

Return Value

This method always returns **true**.

See Also

arrange Method Overload List
CircularLayout Members
CircularLayout Class
com.mindfusion.diagramming Namespace

CircularLayout.arrange Method (Diagram, DiagramItemList)

Applies the layout on the specified subset of items from the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram
The Diagram that should be arranged.

items
A collection of nodes and links from diagram that define the subgraph to arrange.

Return Value

This method always returns **true**.

See Also

arrange Method Overload List
CircularLayout Members
CircularLayout Class
com.mindfusion.diagramming Namespace

CircularLayout.getRadius Method

Gets the radius of the layout circle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getRadius ()
```

Return Value

A float value specifying the radius. The default value is 60.

See Also

CircularLayout Members
CircularLayout Class
com.mindfusion.diagramming Namespace

CircularLayout.getSiftingRounds Method

Gets the number of sifts to perform during the layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getSiftingRounds ()
```

Return Value

An integer value specifying the number of sifting rounds. The default value is 1.

See Also

CircularLayout Members
CircularLayout Class
com.mindfusion.diagramming Namespace

CircularLayout.init Method

Returns a CircularLayoutBuilder object used to configure this CircularLayout instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public CircularLayoutBuilder init ()
```

Return Value

A **CircularLayoutBuilder** instance.

See Also

CircularLayout Members
CircularLayout Class
com.mindfusion.diagramming Namespace

CircularLayout.setRadius Method

Sets the radius of the layout circle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRadius (
    float value
)
```

Parameters

value
A float value specifying the radius.

See Also

CircularLayout Members
CircularLayout Class
com.mindfusion.diagramming Namespace

CircularLayout.setSiftingRounds Method

Sets the number of sifts to perform during the layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSiftingRounds (
    int value
)
```

Parameters

value
An integer value specifying the number of sifting rounds.

Remarks

After calculating the initial placement of nodes using a fast but inaccurate layout function, the algorithm can run a few sifting rounds to reduce the link crossings, as set in this property.

ClassDescriptor Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ClassDescriptor (
    Class<?> classType,
    String classId,
    int classVersion
)
```

Parameters

classType

classId

classVersion

See Also

Column Class

Represents a column of cells in a table.

Syntax

Java
`public class Column implements Cloneable, Externalizable`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.Column

See Also

Column Members
com.mindfusion.diagramming Namespace

Column Members

Represents a column of cells in a table.

The following tables list the members exposed by the Column type.

Public Constructors

	Name	Description
	Column	Overloaded. Initializes a new instance of the **Column** class.

Public Methods

	Name	Description
	clone	Copies the column properties to a new **Column** instance.
	getColumnStyle	Gets a value indicating whether this column is automatically resized when the table is resized.
	getWidth	Gets the width of this column.
	readExternal	Implements Externalizable.
	setColumnStyle	Sets a value indicating whether this column should be automatically resized when the table is resized.
	setWidth	Sets the width of this column and all cells inside it.

	writeExternal	Implements Externalizable.

Protected Methods

	Name	Description
	loadFromJson	Loads the column from a JSON object.
	loadFromXml	
	saveToJson	Saves the column as a JSON object.
	saveToXml	

See Also

Column Class
com.mindfusion.diagramming Namespace

Column Constructor

Initializes a new instance of the Column class.

Overload List

Name	Description
Column ()	Used internally to implement serialization functionality.
Column (TableNode)	Initializes a new instance of the **Column** class and assigns the specified table as its parent.

See Also

Column Class
com.mindfusion.diagramming Namespace

Column Constructor ()

Used internally to implement serialization functionality.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public Column ()`

See Also

Column Constructor Overload List
Column Class
com.mindfusion.diagramming Namespace

Column Constructor (TableNode)

Initializes a new instance of the Column class and assigns the specified table as its parent.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Column (
    TableNode table
)
```

Parameters

table
The TableNode that contains this column.

See Also

Column Constructor Overload List
Column Class
com.mindfusion.diagramming Namespace

Column Methods

Column.clone Method

Copies the column properties to a new Column instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object clone ()
```

Return Value

A Column instance.

See Also

Column Members
Column Class
com.mindfusion.diagramming Namespace

Column.getColumnStyle Method

Gets a value indicating whether this column is automatically resized when the table is resized.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ColumnStyle getColumnStyle ()
```

Return Value

A member of the ColumnStyle enumeration.

See Also

Column Members
Column Class
com.mindfusion.diagramming Namespace

Column.getWidth Method

Gets the width of this column.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getWidth ()
```

Return Value

A float value specifying the column width.

Remarks

The user can resize columns interactively when table's AllowResizeColumns property is enabled.

See Also

Column Members
Column Class
com.mindfusion.diagramming Namespace

Column.loadFromJson Method

Loads the column from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the column's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

Column Members
Column Class
com.mindfusion.diagramming Namespace

Column.loadFromXml Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

Column Members
Column Class
com.mindfusion.diagramming Namespace

Column.readExternal Method

Implements Externalizable.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

Column Members
Column Class
com.mindfusion.diagramming Namespace

Column.saveToJson Method

Saves the column as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

Column Members
Column Class
com.mindfusion.diagramming Namespace

Column.saveToXml Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
```

```
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

Column Members
Column Class
com.mindfusion.diagramming Namespace

Column.setColumnStyle Method

Sets a value indicating whether this column should be automatically resized when the table is resized.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setColumnStyle (
    ColumnStyle value
)
```

Parameters

value
A member of the ColumnStyle enumeration. The default is **FixedWidth**.

Remarks

This property is used for calculating the width of a table column. The column can have either a fixed width set through the Width property, or can be resized proportionally to the table width.

See Also

Column Members
Column Class
com.mindfusion.diagramming Namespace

Column.setWidth Method

Sets the width of this column and all cells inside it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setWidth (
    float value
)
```

Parameters

value
A float value specifying the column width.

Remarks

The user can resize columns interactively when table's AllowResizeColumns property is enabled.

ColumnList Members

A strongly typed list of Column objects.

The following tables list the members exposed by the ColumnList type.

Public Constructors

	Name	Description
	ColumnList	

Protected Fields

	Name	Description
	list	(Inherited from BaseList.)
	listEvent	(Inherited from BaseList.)
	notifyParent	(Inherited from BaseList.)

Public Methods

	Name	Description
	add	Adds a new element to the list. (Inherited from BaseList.)
	clear	Removes all elements from the list. (Inherited from BaseList.)
	clone	
	contains	Determines if this list contains the specified element. (Inherited from BaseList.)
	first	Gets the first element of this list. (Inherited from BaseList.)
	get	Gets the element at the specified position in this list. (Inherited from BaseList.)
	last	Gets the last element of this list. (Inherited from BaseList.)
	readExternal	Loads the list's contents. (Inherited from BaseList.)
	remove	Overloaded. (Inherited from BaseList.)
	removeRange	Removes a range of elements from this list. (Inherited from BaseList.)

	set	Sets the element at the specified position in this list. (Inherited from BaseList.)
	size	Gets the number of elements in this list. (Inherited from BaseList.)
	writeExternal	Saves the list's contents. (Inherited from BaseList.)

Protected Methods

	Name	Description
	raiseAdding	Raises the adding event. (Inherited from BaseList.)
	raiseClearing	Raises the clearing event. (Inherited from BaseList.)
	raiseRemoving	Raises the removing event. (Inherited from BaseList.)

ColumnStyle Enumeration

The members of this enumeration specify whether a table's column is automatically resized when the table is resized. These constants can be used as parameters of the setColumnStyle method of the Column class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum ColumnStyle`

Members

	Member name	Description
	AutoWidth	The column grows or shrinks automatically if the table is resized. The available width is divided equally between all AutoWidth columns.
	FixedWidth	The column width stays fixed even if the table is resized.

Command Members

Represents an action that can be undone or redone.

The following tables list the members exposed by the Command type.

Public Constructors

	Name	Description
	Command	Initializes a new **Command** instance.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command.
	execute	This method is called internally by JDiagram when performing the action.
	getSubCommands	Gets a collection of all command objects contained within the composite one.
	getTitle	Gets the title of this command.
	redo	This method is called by the UndoManager when redoing actions.
	setTitle	Sets the command title.
	undo	This method is called by the **UndoManager** when undoing actions.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related.
	getContext	Gets the command's context.
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative.

See Also

Command Class
com.mindfusion.diagramming Namespace

Command Constructor

Initializes a new Command instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Command (
    String title
)
```

Parameters

title
A String containing the command title.

See Also

Command Class
com.mindfusion.diagramming Namespace

Command Methods

Command.addSubCmd Method

Adds a command object to a compound command.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addSubCmd (
    Command cmd
)
```

Parameters

cmd
A subordinate action that should be executed, undone or redone together with this command.

See Also

Command Members
Command Class
com.mindfusion.diagramming Namespace

Command.adopt Method

Merges adjacent commands in the history queue if they are related.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected boolean adopt (
    Command command
)
```

Parameters

command
The Command that might be adopted by this command.

Return Value

true if the specified command has been adopted; otherwise, **false**.

See Also

Command Members
Command Class
com.mindfusion.diagramming Namespace

Command.execute Method

This method is called internally by JDiagram when performing the action.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public abstract void execute (
    boolean undoEnabled
)
```

Parameters

undoEnabled
true if the undo manager is enabled at this time, otherwise **false**.

See Also

Command Members
Command Class
com.mindfusion.diagramming Namespace

Command.getContext Method

Gets the command's context.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected CommandContext getContext ()
```

Return Value

See Also

Command Members
Command Class

Command.getSubCommands Method

Gets a collection of all command objects contained within the composite one.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public CommandList getSubCommands ()
```

Return Value

A CommandList containing the child commands.

See Also

Command Members
Command Class
com.mindfusion.diagramming Namespace

Command.getTitle Method

Gets the title of this command.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getTitle ()
```

Return Value

A String containing the command's title.

See Also

Command Members
Command Class
com.mindfusion.diagramming Namespace

Command.isContainerOf Method

Determines whether a command has been initiated by this command and should be treated as a derivative.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected boolean isContainerOf (
    Command command
)
```

Parameters

command
The Command for which to determine whether it is a derivative.

Return Value

true if the specified command should be considered a derivative; otherwise, **false**.

CommandHistory Members

Represent the command undo/redo history.

The following tables list the members exposed by the CommandHistory type.

Public Constructors

	Name	Description
	CommandHistory	Initializes a new **CommandHistory** instance.

Public Methods

	Name	Description
	clear	Clears the undo/redo history.
	getCapacity	Gets how much commands can be saved in the undo history.
	getNextRedo	Gets the command that will be redone by the next call to UndoManager.redo.
	getNextUndo	Gets the command that will be undone by the next call to UndoManager.undo.
	mergeUndoRecords	Merges several undo records into a single composite record.
	setCapacity	Sets the maximum number of commands that can be saved in the undo history.

CommandHistory.mergeUndoRecords Method

Merges several undo records into a single composite record.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean mergeUndoRecords (
    int numRecords,
    String title
)
```

Parameters

numRecords
Specifies how many records at the end of the command list should be merged.

title

Specifies the title of the new command.

Return Value

false if the commands saved in the history are less than *numRecords*; otherwise, **true**.

This method is called internally by JDiagram when performing the action.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void execute (
    boolean undoEnabled
)
```

Parameters

undoEnabled
true if the undo manager is enabled at this time, otherwise **false**.

CompositeNode Class

The **CompositeNode** class represents nodes that are defined via hierarchies of child components, arranged within layout panels.

Syntax

Java
`public class CompositeNode extends DiagramNode implements ComponentHost`

Remarks

Use the Components property to add components to the node. The components are arranged on top of each other by default. To apply custom arrangement logic either place the components inside a ContainerComponent, such as GridPanel, and add this **ContainerComponent** to the **CompositeNode** or override the arrangeComponents method to apply custom arrangement logic.

To search for a component given its name, use the findComponent method. To get a component at a specific position, use getComponentAt.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DiagramItem
    com.mindfusion.diagramming.DiagramNode
      com.mindfusion.diagramming.CompositeNode

CompositeNode Members

The CompositeNode class represents nodes that are defined via hierarchies of child components, arranged within layout panels.

The following tables list the members exposed by the **CompositeNode** type.

Public Constructors

	Name	Description
	CompositeNode	Overloaded.

Protected Fields

	Name	Description
	allowIncomingLinks	(Inherited from DiagramNode.)
	allowOutgoingLinks	(Inherited from DiagramNode.)
	anchorPattern	(Inherited from DiagramNode.)
	AV_Cancel	(Inherited from DiagramNode.)

	AV_EndModIncoming	(Inherited from DiagramNode.)
	AV_EndModOutgoing	(Inherited from DiagramNode.)
	AV_StartModIncoming	(Inherited from DiagramNode.)
	AV_StartModOutgoing	(Inherited from DiagramNode.)
	AV_UpdateIncoming	(Inherited from DiagramNode.)
	AV_UpdateOutgoing	(Inherited from DiagramNode.)
	AV_UpdIntscIncoming	(Inherited from DiagramNode.)
	AV_UpdIntscOutgoing	(Inherited from DiagramNode.)
	AV_UpdPosIncoming	(Inherited from DiagramNode.)
	AV_UpdPosOutgoing	(Inherited from DiagramNode.)
	bounds	(Inherited from DiagramNode.)
	brush	(Inherited from DiagramItem.)
	cycleDetected	(Inherited from DiagramItem.)
	cycleProtect	(Inherited from DiagramItem.)
	enabledHandles	(Inherited from DiagramNode.)
	handlesStyle	(Inherited from DiagramNode.)
	incomingLinks	(Inherited from DiagramNode.)
	masterGroup	(Inherited from DiagramNode.)
	modifyDX	(Inherited from DiagramItem.)
	modifyDY	(Inherited from DiagramItem.)
	modifyHandle	(Inherited from DiagramItem.)
	modifying	(Inherited from DiagramItem.)
	obstacle	(Inherited from DiagramNode.)
	outgoingLinks	(Inherited from DiagramNode.)
	pen	(Inherited from DiagramItem.)
	ptEnd	(Inherited from DiagramItem.)
	ptMdfLast	(Inherited from DiagramItem.)
	ptOrg	(Inherited from DiagramItem.)
	ptSavedEnd	(Inherited from DiagramItem.)
	ptSavedOrg	(Inherited from DiagramItem.)
	savedBounds	(Inherited from DiagramNode.)
	subordinateGroup	(Inherited from DiagramItem.)

Public Methods

	Name	Description
	addLabel	Overloaded. (Inherited from DiagramNode.)
	applyEffects	For internal use.
	arrangeComponents	Invokes when the components within this node are being arranged.
	as	Down-casts the item to specified type. (Inherited from DiagramItem.)
	attachTo	Overloaded. (Inherited from DiagramNode.)
	clone	Creates a copy of this item. (Inherited from DiagramItem.)
	containsComponent	Checks whether the specified component is contained in this node.
	containsPoint	Overloaded. (Inherited from DiagramNode.)
	detach	Detaches a node from its master group. (Inherited from DiagramNode.)
	docToComponent	Converts a point from document coordinates to the local coordinate space of a component inside this node.
	drawLocal	Draws the node on the specified Graphics2D surface.
	drawShadowLocal	Draws the shadow of this node on the specified Graphics2D surface.
	findComponent	Returns the child component with the specified name or null, if the component was not found.
	getAllIncomingLinks	Gets a collection of all links entering this node. (Inherited from DiagramNode.)
	getAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	getAllOutgoingLinks	Gets a collection of all links going out of this node. (Inherited from DiagramNode.)
	getAllowIncomingLinks	Gets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	getAllowOutgoingLinks	Gets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	getAnchorPattern	Gets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	getBounds	DiagramNode.getBounds override
	getBrush	Gets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	getCenter	Returns the center point of this node. (Inherited from DiagramNode.)
	getClipboard	Implements ComponentHost.getClipboard

	getComponentAt	Returns the component at the specified point, expressed in document coordinates.
	getComponents	Gets a list with the root components contained in the node.
	getConstraints	Gets the movement and size constraints applied to a node. (Inherited from DiagramNode.)
	getContainer	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	getEffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style. (Inherited from DiagramItem.)
	getEffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style. (Inherited from DiagramItem.)
	getEffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	getEffects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	getEnabledHandles	Gets a combination of NodeHandleType members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	getExpandable	Gets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	getExpanded	Gets a value indicating whether the tree branch that starts from a node is expanded or collapsed. (Inherited from DiagramNode.)
	getFocusedComponent	Implements ComponentHost.getFocusedComponent
	getFont	Gets the font used to draw the text of an item. (Inherited from DiagramItem.)
	getHandlesStyle	Gets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	getHyperLink	Gets the hyperlink associated with an item. (Inherited from DiagramItem.)

	getId	Gets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	getIncomingLinks	Gets the links coming into a node. (Inherited from DiagramNode.)
	getLabels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms. (Inherited from DiagramItem.)
	getLocalCenter	(Inherited from DiagramNode.)
	getLocked	Gets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	getMasterGroup	Gets the hierarchical group in which this node is a subordinate item. (Inherited from DiagramNode.)
	getMasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	getNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getObstacle	Gets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	getOpacity	Gets the opacity of this item. (Inherited from DiagramItem.)
	getOutgoingLinks	Gets the links going out from a node. (Inherited from DiagramNode.)
	getParent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	getPen	Gets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	getPrintable	Gets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	getRotatedBounds	Gets the bounding rectangle of this node, when it is rotated at the specified angle around the specified pivot. (Inherited from DiagramNode.)
	getRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	getRuntimeIndex	For internal use. (Inherited from DiagramItem.)
	getSelected	Gets a value indicating whether this item is selected. (Inherited from DiagramItem.)

	getShadowBrush	Gets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getStyle	Gets the style associated with the item. (Inherited from DiagramItem.)
	getSubordinateGroup	Gets the group of subordinated items attached to this one. (Inherited from DiagramItem.)
	getTag	Gets user-defined data assigned to an item. (Inherited from DiagramItem.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	getTextPadding	Gets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	getToolTip	Gets the tooltip text displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	getVisible	Gets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	getWeight	Gets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	getZIndex	Gets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	hasSubordinates	Checks whether there are any nodes attached to this item. (Inherited from DiagramItem.)
	hitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	hitTestHandle	DiagramItem.hitTestHandle override. (Inherited from DiagramNode.)
	init	Returns a CompositeNodeBuilder object used to configure this CompositeNode instance.
	invalidate	Overloaded.
	invalidateLayout	Overloaded.
	labelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	moveTo	Moves a node to the specified location. (Inherited from DiagramNode.)
S	nodesIntersect	Determines whether two nodes intersect. (Inherited from DiagramNode.)
	onDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)

	onDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	onDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	pointToComponent	For internal use.
	query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	readExternal	Implements Externalizable
	removeLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	resize	Sets the size of a node. (Inherited from DiagramNode.)
	setAllowIncomingLinks	Sets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	setAllowOutgoingLinks	Sets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	setAnchorPattern	Sets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	setBounds	Overloaded. (Inherited from DiagramNode.)
	setBoundsDirect	For internal use. (Inherited from DiagramNode.)
	setBrush	Sets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	setClipboard	Implements ComponentHost.setClipboard
	setConstraints	Sets constraints to the node size and movement direction. The constraints are applied when a user modifies the node interactively. They are not checked when the position of a node is set programmatically. (Inherited from DiagramNode.)
	setEnabledHandles	Sets a combination of **NodeHandleType** members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	setExpandable	Sets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	setExpanded	Expands or collapses the tree branch that starts from a node. (Inherited from DiagramNode.)
	setExpandedFlag	Changes the "expanded" flag without actually expanding or collapsing the tree branch that starts from a node. (Inherited from DiagramNode.)
	setFocusedComponent	Implements ComponentHost.setFocusedComponent

	setFont	Sets the font used to draw the text of an item. (Inherited from DiagramItem.)
	setHandlesStyle	Sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	setHyperLink	Sets the hyperlink associated with an item. (Inherited from DiagramItem.)
	setId	Assigns user-defined identifier to this item. (Inherited from DiagramItem.)
	setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	setLocked	Sets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	setObstacle	Sets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	setOpacity	Sets the opacity of this item. (Inherited from DiagramItem.)
	setPen	Sets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	setPrintable	Sets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	setRotationAngle	Sets the rotation angle of a node. (Inherited from DiagramNode.)
	setSelected	Selects or deselects an item. (Inherited from DiagramItem.)
	setShadowBrush	Sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setStyle	Sets the style associated with the item. (Inherited from DiagramItem.)
	setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event. (Inherited from DiagramItem.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)

	setTextPadding	Sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	setVisible	Sets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	setWeight	Sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	setZIndex	Sets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
S	with	Returns a CompositeNodeBuilder object used to configure and create new CompositeNode instances.
	writeExternal	Implements Externalizable
	zBottom	Moves an item to the bottom of the Z order. (Inherited from DiagramItem.)
	zLevelDown	Moves an item down in the Z order. (Inherited from DiagramItem.)
	zLevelUp	Moves an item up in the Z order. (Inherited from DiagramItem.)
	zTop	Moves an item to the top of the Z order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	allowCreate	DiagramItem.allowCreate override. (Inherited from DiagramNode.)
	allowModify	(Inherited from DiagramNode.)
	allowModifyImpl	(Inherited from DiagramNode.)
	cancelModify	DiagramItem.cancelModify override. Invoked when the interactive modification of this node has been canceled. (Inherited from DiagramNode.)
	completeCreate	DiagramItem.completeCreate override. (Inherited from DiagramNode.)
	completeModify	(Inherited from DiagramNode.)
	constraintsInfringed	(Inherited from DiagramNode.)
	createConnectionPoint	(Inherited from DiagramNode.)
	createProperties	DiagramItem.createProperties override. (Inherited from DiagramNode.)
	createState	DiagramItem.createState override. (Inherited from DiagramNode.)
	draw	DiagramItem.draw override. (Inherited from DiagramNode.)

	drawShadow	DiagramItem.drawShadow override. (Inherited from DiagramNode.)
	getLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getLocalBoundsD	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getMeasureUnit	(Inherited from DiagramItem.)
	getRepaintRect	DiagramItem.getRepaintRect override. (Inherited from DiagramNode.)
	getRgnInRect	Overloaded.
	getValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	groupContains	(Inherited from DiagramNode.)
	loadFromJson	Loads the node from a JSON object.
	loadFromXml	DiagramNode.loadFromXml override
	move	(Inherited from DiagramNode.)
	onAdd	Called when an item is added to a Diagram, either by the user, programmatically or by undo / redo. (Inherited from DiagramItem.)
	onChangeFont	(Inherited from DiagramItem.)
	onChangeTextPadding	(Inherited from DiagramItem.)
	onChildModified	Called when a group child node has been modified. Override this method if you need to know when a node from the **SubordinateGroup** is modified. (Inherited from DiagramItem.)
	onClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	onDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	onLoad	Called when this item is loaded from a file. (Inherited from DiagramItem.)
	onMeasureUnitChanged	
	onModify	Called when an item is modified (Inherited from DiagramNode.)
	onRemove	DiagramNode.onRemove override
	onRotationAngleChanged	Called when the node's rotation angle changes. (Inherited from DiagramNode.)
	onStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	onStyleFontChanged	Invoked when font property values of an associated style change. (Inherited from DiagramItem.)

	onUpdateBounds	DiagramNode.onUpdateBounds override
	parentConstraintsInfringed	(Inherited from DiagramNode.)
	putExpandable	(Inherited from DiagramNode.)
	putSelected	(Inherited from DiagramItem.)
	rectFromPoints	(Inherited from DiagramNode.)
	repaint	Overloaded. (Inherited from DiagramItem.)
	resizeToFitImage	(Inherited from DiagramNode.)
	restoreProperties	DiagramItem.restoreProperties override. (Inherited from DiagramNode.)
	restoreState	DiagramItem.restoreState override. (Inherited from DiagramNode.)
	saveProperties	DiagramItem.saveProperties override. (Inherited from DiagramNode.)
	saveState	DiagramItem.saveState override. (Inherited from DiagramNode.)
	saveToJson	Saves the node as a JSON object.
	saveToXml	DiagramNode.saveToXml override
	scaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	serializeComponents	Invoked to query whether the underlying component structure should be automatically serialized.
	setDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	setReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	shouldRender	Determines whether the item is rendered in the current context. (Inherited from DiagramItem.)
	shouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	startCreate	DiagramItem.startCreate override. (Inherited from DiagramNode.)
	startModify	DiagramItem.startModify override. Invoked when the user starts modifying this node interactively. (Inherited from DiagramNode.)
	updateCreate	DiagramItem.updateCreate override. (Inherited from DiagramNode.)
	updateLinkPositions	(Inherited from DiagramNode.)
	updateModify	DiagramItem.updateModify override. Invoked during interactive modification of this node. (Inherited from DiagramNode.)

CompositeNode Constructor (CompositeNode)

Initializes a new instance of the CompositeNode class using the specified diagram item as a prototype.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CompositeNode (
    CompositeNode prototype
)
```

Parameters

prototype
The item to use as a prototype. The properties of the new item are initialized from the property values of this item.

See Also

CompositeNode Constructor Overload List
CompositeNode Class
com.mindfusion.diagramming Namespace

CompositeNode Constructor (Diagram)

Initializes a new instance of the CompositeNode class with default values supplied form the specified Diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CompositeNode (
    Diagram diagram
)
```

Parameters

diagram
The Diagram from which to obtain default values for the node properties.

CompositeNode Methods

CompositeNode.applyEffects Method

For internal use.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void applyEffects (
    ComponentBase component,
    Object parameters,
    EffectPhase phase
)
```

Parameters

component

parameters

phase

CompositeNode.arrangeComponents Method

Invokes when the components within this node are being arranged.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void arrangeComponents (
    Rectangle2D.Float availableSpace,
    Graphics2D g2d
)
```

Parameters

availableSpace

g2d

CompositeNode Members
CompositeNode Class
com.mindfusion.diagramming Namespace

CompositeNode.containsComponent Method

Checks whether the specified component is contained in this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean containsComponent (
    ComponentBase component
)
```

Parameters

component
The component to check.

Return Value

true if the component is contained in the node; otherwise, false.

CompositeNode Members
CompositeNode Class
com.mindfusion.diagramming Namespace

CompositeNode.docToComponent Method

Converts a point from document coordinates to the local coordinate space of a component inside this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Point docToComponent (
    Point2D.Float docPoint,
    ComponentBase component
)
```

Parameters

docPoint
The point to convert.

component
The target component.

Return Value

A Point object representing the point in local coordinates.

CompositeNode.findComponent Method

Returns the child component with the specified name or null, if the component was not found.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ComponentBase findComponent (
    String name
)
```

Parameters

name
The name of the component to search for.

Return Value

An instance of the ComponentBase class identifying the found component or null.

CompositeNode.getComponentAt Method

Returns the component at the specified point, expressed in document coordinates.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ComponentBase getComponentAt (
    Point2D point
)
```

Parameters

point
A **Point2D** specifying the point to test, expressed in document coordinates.

Return Value

An instance of the ComponentBase class identifying the topmost component at the specified point, or **null** if none found.

CompositeNode.getRgnInRect Method (Rectangle2D.Float)

Creates a java.awt.Shape object specifying the node shape for a specified bounding rectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Shape getRgnInRect (
    Rectangle2D.Float rc
)
```

Parameters

rc
The target rectangle.

Return Value

A java.awt.Shape instance.

CompositeNode.getRgnInRect Method (Rectangle2D.Float, boolean)

Creates a java.awt.Shape object specifying the node shape for a specified bounding rectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Shape getRgnInRect (
    Rectangle2D.Float rc,
    boolean inLocal
)
```

Parameters

rc
The target rectangle.

inLocal
true if the shape's coordinate should be relative to the node.

Return Value

A java.awt.Shape instance.

invalidateLayout Method Overload List
CompositeNode Members
CompositeNode Class
com.mindfusion.diagramming Namespace

CompositeNode.loadFromJson Method

Loads the node from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

Remarks

By default, all components of a CompositeNode are saved in the JSON document along with their associated data. This will lead to wasted space if the instances of a derived class are built upon the same hierarchy of components and expose only a few properties corresponding to component attributes. The recommended approach of serializing such classes is to override serializeComponents and return **false** to stop the built-in serialization of components, and save / load the node properties from saveToJson / **loadFromJson** overrides.

CompositeNodeStyle Members

The following tables list the members exposed by the CompositeNodeStyle type.

Public Constructors

	Name	Description
	CompositeNodeStyle	Initializes a new instance of the CompositeNodeStyle class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from Style.)
	getBrush	Gets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	getEffects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	getFontFamily	Gets the font family of the item text. (Inherited from DiagramItemStyle.)

	getFontSize	Gets the font size of the item text. (Inherited from DiagramItemStyle.)
	getFontStyle	Gets the font style of the item text. (Inherited from DiagramItemStyle.)
	getFontUnit	Gets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	getShadowBrush	Gets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	getStroke	Gets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	getStrokeThickness	Gets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
	init	Returns a CompositeNodeStyleBuilder object used to configure this CompositeNodeStyle instance.
	readExternal	**Externalizable.readExternal** implementation. (Inherited from Style.)
	registerType	Associates a type with an alias. The alias is used when saving and loading objects of the specified type during style serialization and deserialization. (Inherited from Style.)
	removePropertyChangeListener	(Inherited from Style.)
	setBrush	Sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	setFontFamily	Sets the font family of the item text. (Inherited from DiagramItemStyle.)
	setFontSize	Sets the font size of the item text. (Inherited from DiagramItemStyle.)
	setFontStyle	Sets the font style of the item text. (Inherited from DiagramItemStyle.)
	setFontUnit	Sets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	setShadowBrush	Sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	setStroke	Sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	setStrokeThickness	Sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
	with	Returns a CompositeNodeStyleBuilder object used to configure and create new CompositeNodeStyle instances.

	writeExternal	**Externalizable.writeExternal** implementation. (Inherited from Style.)

Protected Methods

	Name	Description
	getValue	Gets the value of the specified property. (Inherited from Style.)
	isPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	loadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	loadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	registerProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	saveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	saveToXml	Saves the style content into an XML element. (Inherited from Style.)
	setValue	Sets the value of the specified property. (Inherited from Style.)
	unsetValue	Clears the value of the specified property. (Inherited from Style.)

CompositeRouter Class

Implements a chain of link routers (objects implementing LinkRouter interface) so that a link passes through the sequence until it gets routed successfully.

Syntax

Java
`public class CompositeRouter implements LinkRouter`

Remarks

By default diagram's LinkRouter is set to a **CompositeRouter** instance that chains PatternRouter and GridRouter. You can insert additional link routers into the Routers list, including custom implementations of **LinkRouter** if target diagram should favor some specific link paths.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.CompositeRouter

See Also

CompositeRouter Members
com.mindfusion.diagramming Namespace

CompositeRouter Members

Implements a chain of link routers (objects implementing LinkRouter interface) so that a link passes through the sequence until it gets routed successfully.

The following tables list the members exposed by the CompositeRouter type.

Public Constructors

	Name	Description
	CompositeRouter	Overloaded.

Public Methods

	Name	Description
	getDiagram	Gets the Diagram whose links will be routed.
	getMinLinkSpacing	Gets the minimal spacing between links when distributing.
	getRouters	Gets a list of router objects forming a chain through which links pass until they are routed successfully.
	routeLink	Implements LinkRouter.routeLink.
	routeLinks	Implements LinkRouter.routeLinks.
	setDiagram	Sets the **Diagram** whose links will be routed.
	setMinLinkSpacing	Sets the minimal spacing between links when distributing.
	setRouters	Sets a list of router objects forming a chain through which links pass until they are routed successfully.

See Also

CompositeRouter Constructor Overload List
CompositeRouter Class
com.mindfusion.diagramming Namespace

CompositeRouter Constructor (Diagram)

Initializes a new instance of the CompositeRouter class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CompositeRouter (
    Diagram diagram
)
```

Parameters

diagram
The Diagram whose links will be routed.

See Also

CompositeRouter Constructor Overload List
CompositeRouter Class
com.mindfusion.diagramming Namespace

CompositeRouter Methods

CompositeRouter.getDiagram Method

Gets the Diagram whose links will be routed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Diagram getDiagram ()
```

Return Value

A Diagram instance.

See Also

CompositeRouter Members
CompositeRouter Class
com.mindfusion.diagramming Namespace

CompositeRouter.getMinLinkSpacing Method

Gets the minimal spacing between links when distributing.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Double getMinLinkSpacing ()
```

Return Value

An optional **Double** value to apply as padding space between links. The default value is **null**.

Remarks

If this property is not set, links are pulled apart only if they would overlap, and distributed across fixed 1-cm space.

CompositeRouter.getRouters Method

Gets a list of router objects forming a chain through which links pass until they are routed successfully.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public List<LinkRouter> getRouters ()
```

Return Value

A list of objects implementing LinkRouter interface.

Remarks

By default the list contains PatternRouter and GridRouter objects.

CompositeRouter.routeLink Method

Implements LinkRouter.routeLink.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean routeLink (
    DiagramLink link,
    ConnectionPoint originConnection,
    ConnectionPoint destinationConnection,
    boolean nowCreating
)
```

Parameters

link
The DiagramLink to route.

originConnection

Represents connection to Origin node, potentially different from link's stored connection when modifying first control point.

destinationConnection
Represents connection to Destination node, potentially different from link's stored connection when modifying last control point.

nowCreating
Indicates whether link is currently being created.

Return Value

true if a path has been found successfully, otherwise **false**.

CompositeRouter.routeLinks Method

Implements LinkRouter.routeLinks.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkList routeLinks (
    DiagramLinkList links
)
```

Parameters

links
A list of DiagramLink objects that should be routed.

Return Value

A list of links that were not routed successfully.

See Also

CompositeRouter Members
CompositeRouter Class
com.mindfusion.diagramming Namespace

CompositeRouter.setDiagram Method

Sets the Diagram whose links will be routed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setDiagram (
    Diagram value
)
```

Parameters

value
A Diagram instance.

See Also

CompositeRouter Members
CompositeRouter Class
com.mindfusion.diagramming Namespace

CompositeRouter.setMinLinkSpacing Method

Sets the minimal spacing between links when distributing.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setMinLinkSpacing (
    Double value
)
```

Parameters

value
An optional **Double** value to apply as padding space between links.

Remarks

If this property is not set, links are pulled apart only if they would overlap, and distributed across fixed 1-cm space.

CompositeRouter Members
CompositeRouter Class
com.mindfusion.diagramming Namespace

CompositeRouter.setRouters Method

Sets a list of router objects forming a chain through which links pass until they are routed successfully.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRouters (
    List<LinkRouter> value
)
```

Parameters

value
A list of objects implementing LinkRouter interface.

See Also

CompositeRouter Members
CompositeRouter Class
com.mindfusion.diagramming Namespace

ConnectionPoint Class

This class represents a connection between an edge and a node in a graph. It decouples the DiagramLink class from the DiagramNode class, allowing edges to connect different types of nodes without knowing anything of their implementation details. Each **DiagramLink** object contains two **ConnectionPoint** instances describing the connections at both ends of the link.

Syntax

Java

```
public class ConnectionPoint implements Externalizable
```

Remarks

If custom nodes should store additional information about their connections, inherit the **ConnectionPoint** class, add the necessary members and return an instance of this class from the createConnectionPoint override. For example, TreeViewNode uses TreeViewConnectionPoint objects to store reference to the item associated with the connection.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.ConnectionPoint
    com.mindfusion.diagramming.TreeViewConnectionPoint

See Also

ConnectionPoint Members
com.mindfusion.diagramming Namespace

ConnectionPoint Members

This class represents a connection between an edge and a node in a graph. It decouples the DiagramLink class from the DiagramNode class, allowing edges to connect different types of nodes without knowing anything of their implementation details. Each **DiagramLink** object contains two ConnectionPoint instances describing the connections at both ends of the link.

The following tables list the members exposed by the **ConnectionPoint** type.

Public Constructors

	Name	Description
	ConnectionPoint	Overloaded.

Protected Fields

	Name	Description
	node	

Public Methods

	Name	Description
	addLinkToNode	Adds the link associated with this connection point to the associated node.
	anchorPointFromIndex	Returns the AnchorPoint instance with the specified index.
	calculateIntersections	Determines whether the end of a link should be aligned to the point where the node contour is intersected by the line connecting the centers of the connected nodes.
	canMoveLink	Checks whether the specified point, expressed in document coordinates, is a valid location for this connection point.
	getAnchorPos	Overloaded.
	getEndPoint	Calculates the coordinates of the this connection point expressed in document coordinates.
	getInitialPoint	Returns a point (usually the center of the bounding rectangle) contained within the associated node.
	getIntersection	Calculates the intersection point between the specified line segment and the contour of the node associated with this connection point.
	getNodeRect	Returns the bounding rectangle of the node associated with this connection point.
	getRelativePosition	Gets the position of this connection point, relative to the associated node's bounding rectangle, expressed in percents.
	getRow	Gets the index of a constituent item within the associated node where the link represented by this connection point is connected, or -1, if the link is connected to the node itself.
	linkChanges	Checks whether the relationship represented by the associated link would change if the link is attached to the specified node at the specified point.
	nodesIntersect	Checks whether the node associated with the current connection point and the node associated with the specified connection point intersect.
	readExternal	Deserializes the connection point data.

	removeLinkFromNode	Removes the link associated with this connection point from the associated node.
	sameNode	Checks whether the current connection point and the specified connection point are associated with the same node.
	saveEndRelative	Updates the coordinates of the connection point represented by this link, relative to the bounding rectangle of the associated node.
	setRelativePosition	Sets the position of this connection point, relative to the associated node's bounding rectangle, expressed in percents.
	writeExternal	Serializes the connection point data.

Protected Methods

	Name	Description
	getIncoming	Gets a flag indicating whether this connection point is at the origin or the destination of the associated link.
	getLink	Gets the link associated with this connection point.
	getNearestBorderPoint	Returns the nearest point lying on the node border.
	getNode	Gets the node associated with this connection point.
	updateFromPoint	Updates the connection state according to the specified point, without changing the related node.

ConnectionPoint Constructor (DiagramNode, DiagramLink, boolean)

Initializes a new instance of the ConnectionPoint class between the specified node and link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ConnectionPoint (
    DiagramNode node,
    DiagramLink link,
    boolean incoming
)
```

Parameters

node

The node whose connection to a link is managed by this ConnectionPoint.

link
The link whose connection to a node is managed by this ConnectionPoint.

incoming
Specifies which end of the link is represented by this ConnectionPoint.

ConnectionPoint.anchorPointFromIndex Method

Returns the AnchorPoint instance with the specified index.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnchorPoint anchorPointFromIndex (
    int index
)
```

Parameters

index
An index of a point within the target AnchorPattern.

Return Value

An instance of the AnchorPoint class.

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.calculateIntersections Method

Determines whether the end of a link should be aligned to the point where the node contour is intersected by the line connecting the centers of the connected nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean calculateIntersections ()
```

Return Value

true to align the link end; otherwise, **false**.

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.canMoveLink Method

Checks whether the specified point, expressed in document coordinates, is a valid location for this connection point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean canMoveLink (
    Point2D.Float point
)
```

Parameters

point
The **Point2D** to check for validity.

Return Value

true if the specified point represents a valid location for the connection point; otherwise, **false**.

ConnectionPoint.getIntersection Method

Calculates the intersection point between the specified line segment and the contour of the node associated with this connection point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Point2D getIntersection (
    Point2D pt1,
    Point2D pt2
)
```

Parameters

pt1

pt2

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.getLink Method

Gets the link associated with this connection point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DiagramLink getLink ()
```

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.getNearestBorderPoint Method

Returns the nearest point lying on the node border.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Point2D getNearestBorderPoint (
    Point2D point
)
```

Parameters

point
A **Point2D** instance specifying the point to align to node's borders.

Return Value

A **Point2D** instance containing coordinates of nearest border point.

ConnectionPoint Members
ConnectionPoint Class

ConnectionPoint.getNode Method

Gets the node associated with this connection point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DiagramNode getNode ()
```

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.getNodeRect Method

Returns the bounding rectangle of the node associated with this connection point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getNodeRect (
    boolean rotated
)
```

Parameters

rotated

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.getRelativePosition Method

Gets the position of this connection point, relative to the associated node's bounding rectangle, expressed in percents.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Point2D.Float getRelativePosition ()
```

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.getRow Method

Gets the index of a constituent item within the associated node where the link represented by this connection point is connected, or -1, if the link is connected to the node itself.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getRow ()
```

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.linkChanges Method

Checks whether the relationship represented by the associated link would change if the link is attached to the specified node at the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean linkChanges (
    DiagramNode node,
    Point2D point
)
```

Parameters

node

point

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.nodesIntersect Method

Checks whether the node associated with the current connection point and the node associated with the specified connection point intersect.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean nodesIntersect (
    ConnectionPoint connectionPoint
)
```

Parameters

connectionPoint

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.readExternal Method

Deserializes the connection point data.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.removeLinkFromNode Method

Removes the link associated with this connection point from the associated node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeLinkFromNode ()
```

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.sameNode Method

Checks whether the current connection point and the specified connection point are associated with the same node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean sameNode (
    ConnectionPoint otherConnectionPoint
)
```

Parameters

otherConnectionPoint

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.saveEndRelative Method

Updates the coordinates of the connection point represented by this link, relative to the bounding rectangle of the associated node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveEndRelative ()
```

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.setRelativePosition Method

Sets the position of this connection point, relative to the associated node's bounding rectangle, expressed in percents.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRelativePosition (
    Point2D.Float value
)
```

Parameters

value

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.updateFromPoint Method

Updates the connection state according to the specified point, without changing the related node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void updateFromPoint (
    Point2D point
)
```

Parameters

point

See Also

ConnectionPoint Members
ConnectionPoint Class
com.mindfusion.diagramming Namespace

ConnectionPoint.writeExternal Method

Serializes the connection point data.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

ContainerChildEvent Members

Contains arguments passed to ContainerChildEvent Handler.

The following tables list the members exposed by the ContainerChildEvent type.

Public Constructors

	Name	Description
	ContainerChildEvent	Represents methods that will handle containerChildAdded, containerChildRemoved events.

Public Methods

	Name	Description

	getAdjustmentHandle	Gets the adjustment handle being moved by the user. (Inherited from NodeEvent.)
	getContainer	The parent ContainerNode that the Node belongs.
	getLabel	Gets a NodeLabel related to this event. (Inherited from NodeEvent.)
	getMouseButton	Gets which mouse button has been pressed. (Inherited from NodeEvent.)
	getNode	Gets the node for which the event was raised. (Inherited from NodeEvent.)
	getNodeHandleType	Gets the type of adjustment handle moved by the user. (Inherited from NodeEvent.)
	getPointerPosition	Gets the current pointer position. (Inherited from NodeEvent.)
	setAdjustmentHandle	Sets the adjustment handle being moved by the user. (Inherited from NodeEvent.)
	setPointerPosition	Sets the current pointer position. (Inherited from NodeEvent.)
	toString	Returns the identifier of this **ContainerNode**.

ContainerChildEvent Class
com.mindfusion.diagramming Namespace

ContainerChildEvent Constructor

Represents methods that will handle containerChildAdded, containerChildRemoved events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ContainerChildEvent (
    Object source,
    ContainerNode container,
    DiagramNode node
)
```

Parameters

source
The source of the event.

container
A ContainerChildEvent that contains the event data.

node
A DiagramNode instance

See Also

ContainerChildEvent Class
com.mindfusion.diagramming Namespace

ContainerChildEvent Methods

ContainerChildEvent.getContainer Method

The parent ContainerNode that the Node belongs.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ContainerNode getContainer ()
```

Return Value

See Also

ContainerChildEvent Members
ContainerChildEvent Class
com.mindfusion.diagramming Namespace

ContainerChildEvent.toString Method

Returns the identifier of this ContainerNode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String toString ()
```

Return Value

See Also

ContainerChildEvent Members
ContainerChildEvent Class
com.mindfusion.diagramming Namespace

ContainerNode Class

Implements nodes that can contain other nodes.

Syntax

Java

```
public class ContainerNode
    extends DiagramNode
    implements InplaceEditable, Scrollable
```

Remarks

Users can drag nodes into a container interactively. When a dragged node is over a container, the container frame is painted using the HighlightPen property to indicate that the node would be added to the container.

Call the add method to add a node to container programmatically, and the remove method to remove a node from the container. Child nodes of a container are stored in its Children list. The Container property of child nodes returns their parent **ContainerNode**.

AutoShrink specifies whether the size of a container should shrink when a node is removed from it. The container node will not shrink to a size smaller than MinimumSize, even if it does not contain any items. Adding child nodes to a container will automatically grow its size, unless AutoGrow is set to **false**. Enable the Scrollable property to let users scroll container's content if it overflows.

A container node can be folded and unfolded, either interactively or programmatically, as specified through the Foldable and Folded properties. When a container is folded, it occupies a minimal area and its child nodes are hidden. You can get the original size of a folded container using the getUnfoldedSize method.

The Caption property specifies the caption text of a container node, and CaptionBrush specifies its color. Use the CaptionFormat property to define the alignment and position of the caption text. The height of the caption bar of a container can be set using the CaptionHeight property.

Inheritance Hierarchy

ContainerNode Members

Implements nodes that can contain other nodes.

The following tables list the members exposed by the ContainerNode type.

Public Constructors

	Name	Description
	ContainerNode	Overloaded.

Protected Fields

	Name	Description

	allowIncomingLinks	(Inherited from DiagramNode.)
	allowOutgoingLinks	(Inherited from DiagramNode.)
	anchorPattern	(Inherited from DiagramNode.)
	AV_Cancel	(Inherited from DiagramNode.)
	AV_EndModIncoming	(Inherited from DiagramNode.)
	AV_EndModOutgoing	(Inherited from DiagramNode.)
	AV_StartModIncoming	(Inherited from DiagramNode.)
	AV_StartModOutgoing	(Inherited from DiagramNode.)
	AV_UpdateIncoming	(Inherited from DiagramNode.)
	AV_UpdateOutgoing	(Inherited from DiagramNode.)
	AV_UpdIntscIncoming	(Inherited from DiagramNode.)
	AV_UpdIntscOutgoing	(Inherited from DiagramNode.)
	AV_UpdPosIncoming	(Inherited from DiagramNode.)
	AV_UpdPosOutgoing	(Inherited from DiagramNode.)
	bounds	(Inherited from DiagramNode.)
	brush	(Inherited from DiagramItem.)
	cycleDetected	(Inherited from DiagramItem.)
	cycleProtect	(Inherited from DiagramItem.)
	enabledHandles	(Inherited from DiagramNode.)
	handlesStyle	(Inherited from DiagramNode.)
	incomingLinks	(Inherited from DiagramNode.)
	masterGroup	(Inherited from DiagramNode.)
	modifyDX	(Inherited from DiagramItem.)
	modifyDY	(Inherited from DiagramItem.)
	modifyHandle	(Inherited from DiagramItem.)
	modifying	(Inherited from DiagramItem.)
	obstacle	(Inherited from DiagramNode.)
	outgoingLinks	(Inherited from DiagramNode.)
	pen	(Inherited from DiagramItem.)
	ptEnd	(Inherited from DiagramItem.)
	ptMdfLast	(Inherited from DiagramItem.)
	ptOrg	(Inherited from DiagramItem.)
	ptSavedEnd	(Inherited from DiagramItem.)

	ptSavedOrg	(Inherited from DiagramItem.)
	savedBounds	(Inherited from DiagramNode.)
	subordinateGroup	(Inherited from DiagramItem.)

Public Methods

	Name	Description
	add	Adds a node to this container.
	addLabel	Overloaded. (Inherited from DiagramNode.)
	as	Down-casts the item to specified type. (Inherited from DiagramItem.)
	attachTo	Overloaded. (Inherited from DiagramNode.)
	clone	DiagramItem.clone override. Creates a copy of this item.
	containsPoint	Overloaded. (Inherited from DiagramNode.)
	containsRecursively	Determines whether this container contains the specified node, either directly or recursively through other containers.
	createScrollCommand	Implements the Scrollable interface. Creates a ScrollContainerCmd instance that can be used to undo the scroll operation.
	detach	Detaches a node from its master group. (Inherited from DiagramNode.)
	draw	DiagramNode.draw override.
	drawLocal	Draws the container on the specified **Graphics2D** surface.
	getAllIncomingLinks	Gets a collection of all links entering this node. (Inherited from DiagramNode.)
	getAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	getAllOutgoingLinks	Gets a collection of all links going out of this node. (Inherited from DiagramNode.)
	getAllowAddChildren	Gets a value indicating whether child nodes can be added interactively to this container.
	getAllowIncomingLinks	Gets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	getAllowOutgoingLinks	Gets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	getAllowRemoveChildren	Gets a value indicating whether child nodes can be removed interactively from this container.
	getAnchorPattern	Gets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)

	getAutoDeleteChildren	Gets whether deleting this container should also remove its child items from the diagram.
	getAutoGrow	Gets a value indicating whether the container should grow in size when nodes are added to it.
	getAutoShrink	Gets a value indicating whether the container should shrink in size when nodes are removed from it.
	getBounds	Gets the node location and size. (Inherited from DiagramNode.)
	getBrush	Gets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	getCaption	Gets the container's caption text.
	getCaptionBackBrush	Gets the brush used to paint the caption bar of this container.
	getCaptionBrush	Gets the brush used to draw the container's caption text.
	getCaptionFormat	Gets the caption alignment and format.
	getCaptionHeight	Gets the height of the container's caption bar.
	getCenter	Returns the center point of this node. (Inherited from DiagramNode.)
	getChildren	Gets the child nodes of this container.
	getClipChildren	Gets a value indicating whether child items should be clipped by container boundaries.
	getConstraints	Gets the movement and size constraints applied to a node. (Inherited from DiagramNode.)
	getContainer	Gets the parent **ContainerNode** containing this node. (Inherited from DiagramNode.)
S	getContainer	Retrieves the container node (if any) the specified node belongs to.
	getCornerRadius	Gets the radius of node's corner arcs when its Shape is set to RoundedRectangle.
	getDividerPen	Gets the Pen used to draw the the divider line between node's caption bar and content area.
	getEditRect	Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).
	getEffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	getEffectiveCaptionBrush	Returns a Brush object representing the currently effective caption brush of the container.

	getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style. (Inherited from DiagramItem.)
	getEffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style. (Inherited from DiagramItem.)
	getEffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	getEffects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	getEnabledHandles	Gets a combination of NodeHandleType members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	getExpandable	Gets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	getExpanded	Gets a value indicating whether the tree branch that starts from a node is expanded or collapsed. (Inherited from DiagramNode.)
	getFoldable	Gets a value indicating whether the user is allowed to fold this container.
	getFolded	Gets a value indicating whether this container is folded.
	getFoldedSize	Gets the size of the container when folded.
	getFoldIconSize	Gets the size of the fold / unfold icon.
	getFont	Gets the font used to draw the text of an item. (Inherited from DiagramItem.)
	getHandlesStyle	Gets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	getHighlightPen	Gets the Pen used to draw the container frame lines when an item is dragged over the container.
	getHyperLink	Gets the hyperlink associated with an item. (Inherited from DiagramItem.)
	getId	Gets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from

		DiagramItem.)
	getIncomingLinks	Gets the links coming into a node. (Inherited from DiagramNode.)
	getLabels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms. (Inherited from DiagramItem.)
	getLocalCenter	(Inherited from DiagramNode.)
	getLocked	Gets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	getMargin	Gets how much space should be left between contained nodes and the container borders.
	getMasterGroup	Gets the hierarchical group in which this node is a subordinate item. (Inherited from DiagramNode.)
	getMasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	getMinimumSize	Gets the minimum size of the container.
	getNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getObstacle	Gets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	getOpacity	Gets the opacity of this item. (Inherited from DiagramItem.)
	getOutgoingLinks	Gets the links going out from a node. (Inherited from DiagramNode.)
	getParent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	getPen	Gets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	getPrintable	Gets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	getRotatedBounds	Gets the bounding rectangle of this node, when it is rotated at the specified angle around the specified pivot. (Inherited from DiagramNode.)
	getRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	getRuntimeIndex	For internal use. (Inherited from DiagramItem.)
	getScrollable	Gets a value indicating whether users are allowed to scroll the contents of this container.

	getScrollbarLargeChange	Implements the Scrollable interface. Gets the amount to scroll by when the user clicks above or below the scrollbar thumb.
	getScrollbarMaximum	Implements the Scrollable interface. Gets the maximum scroll position.
	getScrollX	Gets the container's horizontal scroll position.
	getScrollY	Gets the container's vertical scroll position.
	getSelected	Gets a value indicating whether this item is selected. (Inherited from DiagramItem.)
	getShadowBrush	Gets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShape	Gets the shape of this container.
	getStyle	Gets the style associated with the item. (Inherited from DiagramItem.)
	getSubordinateGroup	Gets the group of subordinated items attached to this one. (Inherited from DiagramItem.)
	getTag	Gets user-defined data assigned to an item. (Inherited from DiagramItem.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	getTextPadding	Gets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	getTextToEdit	Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when the container's caption is edited in-place.
	getToolTip	Gets the tooltip text displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	getUnfoldedSize	Returns the original size of a folded container.
	getVisible	DiagramItem.getVisible override.
	getWeight	Gets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	getZIndex	Gets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	hasSubordinates	Checks whether there are any nodes attached to this item. (Inherited from DiagramItem.)
	hitTest	DiagramItem.hitTest override.
	hitTestHandle	DiagramNode.hitTestHandle override.

	init	Returns a ContainerNodeBuilder object used to configure this ContainerNode instance.
	labelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	moveTo	Moves a node to the specified location. (Inherited from DiagramNode.)
	nodesIntersect	Determines whether two nodes intersect. (Inherited from DiagramNode.)
	onDragOut	Invoked when a diagram item is being dragged out of this node.
	onDragOver	Invoked when a diagram item is being dragged over this node.
	onDropOver	Invoked when a diagram item is dropped over this node.
	query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	readExternal	Implements Externalizable.
	remove	Removes a node from this container.
	removeLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	resize	Sets the size of a node. (Inherited from DiagramNode.)
	resizeToFitChildren	Resizes the container making it big enough to contain its child nodes.
	setAllowAddChildren	Sets a value indicating whether child nodes can be added interactively to this container.
	setAllowIncomingLinks	Sets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	setAllowOutgoingLinks	Sets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	setAllowRemoveChildren	Sets a value indicating whether child nodes can be removed interactively from this container.
	setAnchorPattern	Sets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	setAutoDeleteChildren	Sets whether deleting this container should also remove its child items from the diagram.
	setAutoGrow	Sets a value indicating whether the container should grow in size when nodes are added to it.
	setAutoShrink	Sets a value indicating whether the container should shrink in size when nodes are removed from it.
	setBounds	Overloaded. (Inherited from DiagramNode.)
	setBoundsDirect	For internal use. (Inherited from DiagramNode.)

	setBrush	Sets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	setCaption	Sets the container's caption text.
	setCaptionBackBrush	Sets the brush used to paint the caption bar of this container.
	setCaptionBrush	Sets the brush used to draw the container's caption text.
	setCaptionFormat	Sets the caption alignment and format.
	setCaptionHeight	Sets the height of the container's caption bar.
	setClipChildren	Sets a value indicating whether child items should be clipped by container boundaries.
	setConstraints	Sets constraints to the node size and movement direction. The constraints are applied when a user modifies the node interactively. They are not checked when the position of a node is set programmatically. (Inherited from DiagramNode.)
	setCornerRadius	Sets the radius of node's corner arcs when its Shape is set to RoundedRectangle.
	setDividerPen	Sets the **Pen** used to draw the the divider line between node's caption bar and content area.
	setEditedText	Implements InplaceEditable.setEditedText. Assigns the edited text to the container's caption after in-place edit operation completes successfully.
	setEnabledHandles	Sets a combination of **NodeHandleType** members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	setExpandable	Sets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	setExpanded	Expands or collapses the tree branch that starts from a node. (Inherited from DiagramNode.)
	setExpandedFlag	Changes the "expanded" flag without actually expanding or collapsing the tree branch that starts from a node. (Inherited from DiagramNode.)
	setFoldable	Sets a value indicating whether the user is allowed to fold this container. A foldable container can be folded and unfolded by clicking the up/down arrow displayed in the caption bar.
	setFolded	Sets a value indicating whether this container is folded. When folded, the container children are not visible, and only its caption bar is displayed.
	setFoldedSize	Sets the size of the container when folded.
	setFoldIconSize	Sets the size of the fold / unfold icon.

	setFont	Sets the font used to draw the text of an item. (Inherited from DiagramItem.)
	setHandlesStyle	Sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	setHighlightPen	Sets the Pen used to draw the container frame lines when an item is dragged over the container.
	setHyperLink	Sets the hyperlink associated with an item. (Inherited from DiagramItem.)
	setId	Assigns user-defined identifier to this item. (Inherited from DiagramItem.)
	setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	setLocked	Sets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	setMargin	Sets how much space should be left between contained nodes and the container borders.
	setMinimumSize	Sets the minimum size of the container. The container won't shrink smaller than that size, even if it does not contain any items.
	setObstacle	Sets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	setOpacity	Sets the opacity of this item. (Inherited from DiagramItem.)
	setPen	Sets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	setPrintable	Sets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	setRotationAngle	Sets the rotation angle of a node. (Inherited from DiagramNode.)
	setScrollable	Sets a value indicating whether users are allowed to scroll the contents of this container.
	setScrollX	Sets the container's horizontal scroll position.
	setScrollY	Sets the container's vertical scroll position.
	setSelected	Selects or deselects an item. (Inherited from DiagramItem.)
	setShadowBrush	Sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)

	setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShape	Sets the shape of this container.
	setStyle	Sets the style associated with the item. (Inherited from DiagramItem.)
	setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event. (Inherited from DiagramItem.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	setTextPadding	Sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	setVisible	Sets a value indicating whether the container is visible.
	setWeight	Sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	setZIndex	Sets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	updateBounds	
	updateBounds	Updates the container bounds to fit its contents.
	updateScrollPosition	Implements the Scrollable interface. Updates the node's scroll position from scrollbar's value.
S	with	Returns a ContainerNodeBuilder object used to configure and create new ContainerNode instances.
	writeExternal	Implements Externalizable.
	zBottom	Moves an item to the bottom of the Z order. (Inherited from DiagramItem.)
	zLevelDown	Moves an item down in the Z order. (Inherited from DiagramItem.)
	zLevelUp	Moves an item up in the Z order. (Inherited from DiagramItem.)
	zTop	Moves an item to the top of the Z order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	allowCreate	DiagramItem.allowCreate override. (Inherited from DiagramNode.)

	allowModify	(Inherited from DiagramNode.)
	allowModifyImpl	(Inherited from DiagramNode.)
	cancelModify	DiagramItem.cancelModify override. Invoked when the interactive modification of this node has been canceled. (Inherited from DiagramNode.)
	completeCreate	DiagramItem.completeCreate override. (Inherited from DiagramNode.)
	completeModify	(Inherited from DiagramNode.)
	constraintsInfringed	(Inherited from DiagramNode.)
	createConnectionPoint	(Inherited from DiagramNode.)
	createProperties	DiagramItem.createProperties override.
	createState	DiagramItem.createState override. (Inherited from DiagramNode.)
	drawShadow	DiagramItem.drawShadow override. (Inherited from DiagramNode.)
	drawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	getLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getLocalBoundsD	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getMeasureUnit	(Inherited from DiagramItem.)
	getRepaintRect	DiagramNode.getRepaintRect override.
	getValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	groupContains	(Inherited from DiagramNode.)
	loadFromJson	Loads the node from a JSON object.
	loadFromXml	Loads the item content from an XML element.
	move	(Inherited from DiagramNode.)
	onAdd	Called when an item is added to a Diagram, either by the user, programmatically or by undo / redo. (Inherited from DiagramItem.)
	onChangeFont	(Inherited from DiagramItem.)
	onChangeTextPadding	(Inherited from DiagramItem.)
	onChildModified	Called when a group child node has been modified.
	onClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	onDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)

	onLoad	DiagramItem.onLoad override.
	onMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	onModify	Called when an item is modified (Inherited from DiagramNode.)
	onRemove	
	onRotationAngleChanged	Called when the node's rotation angle changes. (Inherited from DiagramNode.)
	onSelectedChildrenModified	
	onStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	onStyleFontChanged	Invoked when font property values of an associated style change. (Inherited from DiagramItem.)
	onUpdateBounds	Invoked when the bounding rectangle of this node has changed. (Inherited from DiagramNode.)
	parentConstraintsInfringed	(Inherited from DiagramNode.)
	putExpandable	(Inherited from DiagramNode.)
	putSelected	(Inherited from DiagramItem.)
	rectFromPoints	(Inherited from DiagramNode.)
	repaint	Overloaded. (Inherited from DiagramItem.)
	resizeToFitImage	(Inherited from DiagramNode.)
	restoreProperties	DiagramItem.restoreProperties override.
	restoreState	DiagramItem.restoreState override. (Inherited from DiagramNode.)
	saveProperties	DiagramItem.saveProperties override.
	saveState	DiagramItem.saveState override. (Inherited from DiagramNode.)
	saveToJson	Saves the node as a JSON object.
	saveToXml	Saves the item content into an XML element.
	scaleElements	DiagramNode.scaleElements override.
	setDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	setReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	shouldRender	Determines whether the item is rendered in the current context. (Inherited from DiagramItem.)
	shouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)

	startCreate	DiagramItem.startCreate override. (Inherited from DiagramNode.)
	startModify	DiagramItem.startModify override. Invoked when the user starts modifying this node interactively. (Inherited from DiagramNode.)
	updateCreate	DiagramItem.updateCreate override. (Inherited from DiagramNode.)
	updateLinkPositions	(Inherited from DiagramNode.)
	updateModify	DiagramItem.updateModify override. Invoked during interactive modification of this node. (Inherited from DiagramNode.)

ContainerNode Constructor

Overload List

Name	Description
ContainerNode ()	Initializes a new instance of the ContainerNode class.
ContainerNode (ContainerNode)	Initializes a new instance of the **ContainerNode** class using the specified node as a prototype.
ContainerNode (Diagram)	Initializes a new instance of the **ContainerNode** class with the default values of the specified diagram.

See Also

ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode Constructor ()

Initializes a new instance of the ContainerNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ContainerNode ()
```

See Also

ContainerNode Constructor Overload List
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode Constructor (ContainerNode)

Initializes a new instance of the ContainerNode class using the specified node as a prototype.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ContainerNode (
    ContainerNode prototype
)
```

Parameters

prototype

See Also

ContainerNode Constructor Overload List
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode Constructor (Diagram)

Initializes a new instance of the ContainerNode class with the default values of the specified diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ContainerNode (
    Diagram parent
)
```

Parameters

parent

See Also

ContainerNode Constructor Overload List
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode Methods

ContainerNode.add Method

Adds a node to this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void add (
    DiagramNode node
)
```

Parameters

node
The DiagramNode that should be added to the container.

Remarks

By default, if container's bounding rectangle does not include specified node's bounds, the container grows automatically to accommodate the new node. To disable that, set AutoGrow to **false**.

Child nodes that have been added to a container are stored in its Children list. The parent ContainerNode of a child node can be accessed via the Container property.

remove Method
setAllowAddChildren Method

ContainerNode.clone Method

DiagramItem.clone override. Creates a copy of this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public DiagramItem clone (
    boolean clipboard
)
```

Parameters

clipboard
true if the copy will be stored in the OS clipboard, or **false** otherwise.

Return Value

A copy of this ContainerNode.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.containsRecursively Method

Determines whether this container contains the specified node, either directly or recursively through other containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean containsRecursively (
    DiagramNode node
)
```

Parameters

node
The DiagramNode to check.

Return Value

true if this container contains the node; otherwise, **false**.

See Also

ContainerNode Members

com.mindfusion.diagramming Namespace
getContainer Method

ContainerNode.createProperties Method

DiagramItem.createProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DiagramItemProperties createProperties ()
```

Return Value

An instance of the ContainerNodeProperties class.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.createScrollCommand Method

Implements the Scrollable interface. Creates a ScrollContainerCmd instance that can be used to undo the scroll operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Command createScrollCommand ()
```

Return Value

A ScrollContainerCmd instance.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.draw Method

DiagramNode.draw override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void draw (
    Graphics2D graphics,
    RenderOptions options
)
```

Parameters

graphics
A **Graphics2D** object where the node should be rendered.

options
Provides options for the drawing operation.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.drawLocal Method

Draws the container on the specified **Graphics2D** surface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void drawLocal (
    Graphics2D graphics,
    RenderOptions options
)
```

Parameters

graphics
A **Graphics2D** object where the node should be rendered.

options
Provides options for the drawing operation.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.getAllowAddChildren Method

Gets a value indicating whether child nodes can be added interactively to this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowAddChildren ()
```

Return Value

true if users are allowed to add child nodes to this container; otherwise, **false**.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

setAllowAddChildren Method
getAllowRemoveChildren Method

ContainerNode.getAllowRemoveChildren Method

Gets a value indicating whether child nodes can be removed interactively from this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowRemoveChildren ()
```

Return Value

true if users are allowed to remove child nodes from this container; otherwise, **false**.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setAllowRemoveChildren Method
getAllowAddChildren Method

ContainerNode.getAutoDeleteChildren Method

Gets whether deleting this container should also remove its child items from the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAutoDeleteChildren ()
```

Return Value

true to automatically delete child items, or **false** otherwise.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
getChildren Method

ContainerNode.getAutoGrow Method

Gets a value indicating whether the container should grow in size when nodes are added to it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAutoGrow ()
```

Return Value

true to grow container's size automatically, or **false** otherwise. The default value is **true**.

Remarks

When AutoGrow is enabled, the container size will grow to include newly added nodes when they wouldn't fit in its current size. The new Bounds of the container is set to the union of bounding rectangles of all child nodes inflated by Margin.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
getAutoShrink Method
resizeToFitChildren Method

ContainerNode.getAutoShrink Method

Gets a value indicating whether the container should shrink in size when nodes are removed from it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAutoShrink ()
```

Return Value

true if the container should shrink automatically; otherwise, **false**. The default is **false**.

Remarks

The container won't shrink to a size smaller than MinimumSize.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setAutoShrink Method
getAutoGrow Method
resizeToFitChildren Method

ContainerNode.getCaption Method

Gets the container's caption text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getCaption ()
```

Return Value

A **String** containing the caption text.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setCaption Method

ContainerNode.getCaptionBackBrush Method

Gets the brush used to paint the caption bar of this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getCaptionBackBrush ()
```

Return Value

An instance of a Brush -derived class.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

CaptionBrush Property
DividerPen Property

ContainerNode.getCaptionBrush Method

Gets the brush used to draw the container's caption text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getCaptionBrush ()
```

Return Value

An instance of a Brush -derived class.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setCaptionBrush Method

ContainerNode.getCaptionFormat Method

Gets the caption alignment and format.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public TextFormat getCaptionFormat ()
```

Return Value

An instance of the TextFormat class.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setCaptionFormat Method

ContainerNode.getCaptionHeight Method

Gets the height of the container's caption bar.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getCaptionHeight ()
```

Return Value

A **float** value specifying the height of the container caption.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setCaptionHeight Method

ContainerNode.getChildren Method

Gets the child nodes of this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ReadOnlyDiagramNodeList getChildren ()
```

Return Value

A list containing the child nodes of this container.

Remarks

Call the add method of ContainerNode to add a child node to the container. Call remove to remove a child node.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.getClipChildren Method

Gets a value indicating whether child items should be clipped by container boundaries.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getClipChildren ()
```

Return Value

true if child items should be clipped, otherwise **false**.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
getShape Method
getChildren Method

ContainerNode.getContainer Method

Retrieves the container node (if any) the specified node belongs to.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static ContainerNode getContainer (
    DiagramNode node
)
```

Parameters

node
The DiagramNode whose container you need to find.

Return Value

A ContainerNode that contains the specified node, or null if the node is not contained.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
containsRecursively Method

ContainerNode.getCornerRadius Method

Gets the radius of node's corner arcs when its Shape is set to RoundedRectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getCornerRadius ()
```

Return Value

The radius of node's corner arcs.

See Also

ContainerNode.getDividerPen Method

Gets the Pen used to draw the the divider line between node's caption bar and content area.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Pen getDividerPen ()
```

Return Value

A Pen instance. The default value is **null**.

Remarks

If DividerPen is not set, the divider line is drawn using the pen assigned to Pen property.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
Pen Property
CaptionBackBrush Property

ContainerNode.getEditRect Method

Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getEditRect (
    DiagramItem item,
    Point2D mousePosition
)
```

Parameters

item
A reference to this node.

mousePosition
A **Point2D** instance specifying the current pointer position.

Return Value

A **Rectangle2D** specifying where the edit box should be placed.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.getEffectiveCaptionBrush Method

Returns a Brush object representing the currently effective caption brush of the container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getEffectiveCaptionBrush ()
```

Return Value

An instance of a Brush -derived class.

Remarks

This method returns a brush corresponding to the container's CaptionBrush property if it has a local value set, or otherwise a brush corresponding to the ContainerNodeStyle.TextBrush property of the container's Style or current diagram Theme.

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
Styles and Themes

ContainerNode.getFoldable Method

Gets a value indicating whether the user is allowed to fold this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getFoldable ()
```

Return Value

true if the container can be folded; otherwise, **false**. Initialized with the value of ContainersFoldable.

Remarks

A foldable container can be folded and unfolded by clicking the up/down arrow displayed in the caption bar. The appearance of that icon can be customized by setting Renderers.FoldIconRenderer.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setFoldable Method
getFolded Method

ContainerNode.getFolded Method

Gets a value indicating whether this container is folded.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getFolded ()
```

Return Value

true if the container is folded; otherwise, **false**. The default is **false**.

Remarks

When folded, the container children are not visible, and only its caption bar is displayed.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setFolded Method
getFoldable Method
getFoldedSize Method

ContainerNode.getFoldedSize Method

Gets the size of the container when folded.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension2D getFoldedSize ()
```

Return Value

A **Dimension2D** instance specifying the folded size of a container. The default is **null**.

Remarks

If this property is not set, the width of the folded container is set to its MinimumSize.width, and the height to CaptionHeight.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setFoldedSize Method
getFolded Method

ContainerNode.getFoldIconSize Method

Gets the size of the fold / unfold icon.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Float getFoldIconSize ()
```

Return Value

An optional **Float** value specifying the size of fold / unfold icon. The default value is **null**.

Remarks

If this size is not specified, the fold icon is drawn as big as container's CaptionHeight.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.getHighlightPen Method

Gets the Pen used to draw the container frame lines when an item is dragged over the container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Pen getHighlightPen ()
```

Return Value

An instance of the Pen class.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setHighlightPen Method

ContainerNode.getMargin Method

Gets how much space should be left between contained nodes and the container borders.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getMargin ()
```

Return Value

A **float** value specifying the margin size.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setMargin Method

ContainerNode.getMinimumSize Method

Gets the minimum size of the container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension2D getMinimumSize ()
```

Return Value

A **Dimension2D** object specifying the minimum size. Initialized with the value of ContainerMinimumSize.

Remarks

The container won't shrink smaller than that size, even if it does not contain any items.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setMinimumSize Method

ContainerNode.getRepaintRect Method

DiagramNode.getRepaintRect override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Rectangle2D getRepaintRect (
    boolean includeConnected
)
```

Parameters

includeConnected
true is related items should be considered too, or **false** otherwise.

Return Value

A rectangular region that should be repainted when this node is modified.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.getScrollable Method

Gets a value indicating whether users are allowed to scroll the contents of this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getScrollable ()
```

Return Value

true if scrolling is allowed, or **false** otherwise.

Remarks

Note that in order to let container's contents overflow and become scrollable, you must either disable AutoGrow, or allow users reduce container size by changing HandlesStyle and EnabledHandles properties from their default MoveOnly / Move values.

getScrollY Method

ContainerNode.getScrollbarLargeChange Method

Implements the Scrollable interface. Gets the amount to scroll by when the user clicks above or below the scrollbar thumb.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getScrollbarLargeChange (
    boolean vertical
)
```

Parameters

vertical
true if scrolling using a vertical scrollbar, or **false** if horizontal one.

Return Value

A **float** value specifying the amount to scroll.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.getScrollbarMaximum Method

Implements the Scrollable interface. Gets the maximum scroll position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getScrollbarMaximum (
    boolean vertical
)
```

Parameters

vertical
true if scrolling using a vertical scrollbar, or **false** if horizontal one.

Return Value

The maximum scroll position for specified scroll direction.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.getScrollX Method

Gets the container's horizontal scroll position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getScrollX ()
```

Return Value

A **float** value indicating horizontal scroll offset.

See Also

ContainerNode Members

ContainerNode.getShape Method

Gets the shape of this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SimpleShape getShape ()
```

Return Value

A member of the SimpleShape enumeration.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setShape Method

ContainerNode.getTextToEdit Method

Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when the container's caption is edited in-place.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getTextToEdit ()
```

Return Value

A **String** containing the container's caption text.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.getUnfoldedSize Method

Returns the original size of a folded container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension2D getUnfoldedSize ()
```

Return Value

A **Dimension2D** object specifying the container's size.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.getVisible Method

DiagramItem.getVisible override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getVisible ()
```

Return Value

true if this container will be drawn on the diagram canvas, otherwise **false**.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setVisible Method

ContainerNode.hitTest Method

DiagramItem.hitTest override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem hitTest (
    Point2D point,
    float threshold,
    boolean onlyNodes,
    boolean onlyInteractive,
    boolean includeHandles,
    boolean includeLabels
)
```

Parameters

point
A Point2D value specifying the logical coordinates of a diagram point.

threshold
Specifies the size of the area around the item outlines where the point is still considered inside the item.

onlyNodes
true to exclude child links from the search.

onlyInteractive
true to exclude locked items from the search.

includeHandles
true to also consider adjustment handle locations (possibly outside of item's bounds).

includeLabels
true to also consider item label locations (possibly outside of item's bounds).

Return Value

The item that contains the specified point.

Remarks

This method performs recursive search if items contain child items.

ContainerNode.hitTestHandle Method

DiagramNode.hitTestHandle override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AdjustmentHandle hitTestHandle (
    Point2D point
)
```

Parameters

point

A Point2D value specifying where to look for a selection handle.

Return Value

An AdjustmentHandle instance representing the adjustment handle found at the specified location, or **null** if there is none.

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.init Method

Returns a ContainerNodeBuilder object used to configure this ContainerNode instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ContainerNodeBuilder init ()
```

Return Value

A **ContainerNodeBuilder** instance.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.loadFromJson Method

Loads the node from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the node's data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.loadFromXml Method

Loads the item content from an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Element containing the item's data.

context
Provides contextual information about the serialization process and some helper serialization methods.

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.onChildModified Method

Called when a group child node has been modified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onChildModified (
    DiagramNode node,
    AdjustmentHandle handle
)
```

Parameters

node

The DiagramNode that has been moved or resized.

handle
An AdjustmentHandles instance indicating which handle has been used to modify the node.

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.onDragOut Method

Invoked when a diagram item is being dragged out of this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void onDragOut (
    DiagramItem item
)
```

Parameters

item
The DiagramItem being dragged.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.onDragOver Method

Invoked when a diagram item is being dragged over this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean onDragOver (
    DiagramItem item
)
```

Parameters

item
The DiagramItem being dragged.

Return Value

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.onDropOver Method

Invoked when a diagram item is dropped over this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean onDropOver (
    DiagramItem item
)
```

Parameters

item
The DiagramItem being dragged.

Return Value

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.onLoad Method

DiagramItem.onLoad override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onLoad (
    Diagram diagram
)
```

Parameters

diagram
The Diagram being loaded.

ContainerNode.remove Method

Removes a node from this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void remove (
    DiagramNode node
)
```

Parameters

node
The DiagramNode that should be removed from the container.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
add Method
setAllowRemoveChildren Method
getChildren Method

ContainerNode.resizeToFitChildren Method

Resizes the container making it big enough to contain its child nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void resizeToFitChildren (
    boolean allowShrink,
```

```
    Dimension2D margins
)
```

Parameters

allowShrink

true to allow reducing container's size, or **false** otherwise.

margins

A **Dimension2D** specifying size of margin space left around container's child items.

ContainerNode.saveProperties Method

DiagramItem.saveProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveProperties (
    DiagramItemProperties props
```

```
)
```

Parameters

props

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.saveToJson Method

Saves the node as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.saveToXml Method

Saves the item content into an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Element the item's data should be stored into.

context
Provides contextual information about the serialization process and some helper serialization methods.

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.scaleElements Method

DiagramNode.scaleElements override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void scaleElements (
    float scale
)
```

Parameters

scale
The value by which to multiply node elements' sizes.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.setAllowAddChildren Method

Sets a value indicating whether child nodes can be added interactively to this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowAddChildren (
    boolean value
)
```

Parameters

value

true to allow adding child nodes, otherwise **false**. The default value is **true**.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
getAllowAddChildren Method
setAllowRemoveChildren Method
getChildren Method

ContainerNode.setAllowRemoveChildren Method

Sets a value indicating whether child nodes can be removed interactively from this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowRemoveChildren (
    boolean value
)
```

Parameters

value
true to allow removing child nodes, otherwise **false**. The default value is **true**.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
getAllowRemoveChildren Method
setAllowAddChildren Method
getChildren Method

ContainerNode.setAutoDeleteChildren Method

Sets whether deleting this container should also remove its child items from the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoDeleteChildren (
    boolean value
)
```

Parameters

value

true to automatically delete child items, or **false** otherwise.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
getChildren Method

ContainerNode.setAutoGrow Method

Sets a value indicating whether the container should grow in size when nodes are added to it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoGrow (
    boolean value
)
```

Parameters

value
true to grow container's size automatically, or **false** otherwise.

Remarks

When AutoGrow is enabled, the container size will grow to include newly added nodes when they wouldn't fit in its current size. The new Bounds of the container is set to the union of bounding rectangles of all child nodes inflated by Margin.

See Also

ContainerNode Members

setAutoShrink Method
resizeToFitChildren Method

ContainerNode.setAutoShrink Method

Sets a value indicating whether the container should shrink in size when nodes are removed from it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoShrink (
    boolean value
)
```

Parameters

value
true if the container should shrink automatically, or **false** otherwise. The default is **false**.

ContainerNode.setCaption Method

Sets the container's caption text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCaption (
    String value
)
```

Parameters

value

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.setCaptionBackBrush Method

Sets the brush used to paint the caption bar of this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCaptionBackBrush (
    Brush value
)
```

Parameters

value
An instance of Brush -derived class.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
CaptionHeight Property
CaptionBrush Property
DividerPen Property

ContainerNode.setCaptionBrush Method

Sets the brush used to draw the container's caption text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCaptionBrush (
    Brush value
)
```

Parameters

value
An instance of a Brush -derived class.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.setCaptionFormat Method

Sets the caption alignment and format.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCaptionFormat (
    TextFormat value
)
```

Parameters

value

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.setCaptionHeight Method

Sets the height of the container's caption bar.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCaptionHeight (
    float value
)
```

Parameters

value

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.setClipChildren Method

Sets a value indicating whether child items should be clipped by container boundaries.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setClipChildren (
    boolean value
)
```

Parameters

value
true to clip child items, otherwise **false**. The default value is **true**.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setShape Method
getChildren Method

ContainerNode.setCornerRadius Method

Sets the radius of node's corner arcs when its Shape is set to RoundedRectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCornerRadius (
    float value
)
```

Parameters

value
The radius of node's corner arcs.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.setDividerPen Method

Sets the Pen used to draw the the divider line between node's caption bar and content area.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDividerPen (
    Pen value
)
```

Parameters

value
A Pen instance.

Remarks

If **DividerPen** is not set, the divider line is drawn using the pen assigned to Pen property.

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
Pen Property
CaptionBackBrush Property

ContainerNode.setEditedText Method

Implements InplaceEditable.setEditedText. Assigns the edited text to the container's caption after in-place edit operation completes successfully.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEditedText (
    String newText
)
```

Parameters

newText
The new text of the container's caption.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.setFoldable Method

Sets a value indicating whether the user is allowed to fold this container. A foldable container can be folded and unfolded by clicking the up/down arrow displayed in the caption bar.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFoldable (
    boolean value
)
```

Parameters

value
true to let users fold this container, or **false** otherwise.

Remarks

A foldable container can be folded and unfolded by clicking the up/down arrow displayed in the caption bar. The appearance of that icon can be customized by setting Renderers.FoldIconRenderer.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

setFoldIconSize Method
setFolded Method

ContainerNode.setFolded Method

Sets a value indicating whether this container is folded. When folded, the container children are not visible, and only its caption bar is displayed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFolded (
    boolean value
)
```

Parameters

value
true if the container is folded, or **false** otherwise.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setFoldable Method
setFoldedSize Method

ContainerNode.setFoldedSize Method

Sets the size of the container when folded.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFoldedSize (
    Dimension2D value
)
```

Parameters

value
A **Dimension2D** instance specifying the folded size of a container. The default is **null**.

Remarks

If this property is not set, the width of the folded container is set to its MinimumSize.width, and the height to CaptionHeight.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.setFoldIconSize Method

Sets the size of the fold / unfold icon.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFoldIconSize (
    Float value
)
```

Parameters

value
A **Float** value specifying the size of fold / unfold icon.

Remarks

If this size is not specified, the fold icon is drawn as big as container's CaptionHeight.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setFoldable Method

ContainerNode.setHighlightPen Method

Sets the Pen used to draw the container frame lines when an item is dragged over the container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHighlightPen (
    Pen value
)
```

Parameters

value
A Pen object.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.setMargin Method

Sets how much space should be left between contained nodes and the container borders.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMargin (
    float value
)
```

Parameters

value

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.setMinimumSize Method

Sets the minimum size of the container. The container won't shrink smaller than that size, even if it does not contain any items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMinimumSize (
    Dimension2D value
)
```

Parameters

value

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.setScrollable Method

Sets a value indicating whether users are allowed to scroll the contents of this container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setScrollable (
    boolean value
)
```

Parameters

value
true if scrolling is allowed, or **false** otherwise.

Remarks

Note that in order to let container's contents overflow and become scrollable, you must either disable AutoGrow, or allow users reduce container size by changing HandlesStyle and EnabledHandles properties from their default MoveOnly / Move values.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace
setScrollX Method
setScrollY Method

ContainerNode.setScrollX Method

Sets the container's horizontal scroll position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setScrollX (
    float value
)
```

Parameters

value
A **float** value indicating horizontal scroll offset.

Remarks

ScrollX is one of the few properties that automatically create a record in the undo history. If you need to undo a sequence of property changes that includes **ScrollX** as a single operation, you will need to use composite undo commands.

See Also

ContainerNode Members
ContainerNode Class

setScrollY Method
setScrollable Method

ContainerNode.setScrollY Method

Sets the container's vertical scroll position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setScrollY (
    float value
)
```

Parameters

value
A **float** value indicating vertical scroll offset.

Remarks

ScrollY is one of the few properties that automatically create a record in the undo history. If you need to undo a sequence of property changes that includes **ScrollY** as a single operation, you will need to use composite undo commands.

ContainerNode.updateBounds Method (boolean)

Updates the container bounds to fit its contents.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void updateBounds (
    boolean includeLinks
)
```

Parameters

includeLinks
true if the new container bounds should include links between child nodes, otherwise **false**.

See Also

ContainerNode Members
ContainerNode Class
com.mindfusion.diagramming Namespace

ContainerNode.updateScrollPosition Method

Implements the Scrollable interface. Updates the node's scroll position from scrollbar's value.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void updateScrollPosition (
    float newValue,
    boolean vertical
)
```

Parameters

newValue
A **float** value specifying scroll offset.

vertical
true if scrolling using a vertical scrollbar, or **false** if horizontal one.

ContainerNodeStyle Members

Represents a reusable set of properties that define the appearance of container nodes.

The following tables list the members exposed by the ContainerNodeStyle type.

Public Constructors

	Name	Description
	ContainerNodeStyle	Initializes a new instance of the **ContainerNodeStyle** class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from Style.)
	getBrush	Gets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	getEffects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	getFontFamily	Gets the font family of the item text. (Inherited from DiagramItemStyle.)
	getFontSize	Gets the font size of the item text. (Inherited from DiagramItemStyle.)
	getFontStyle	Gets the font style of the item text. (Inherited from DiagramItemStyle.)
	getFontUnit	Gets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	getShadowBrush	Gets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	getStroke	Gets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	getStrokeThickness	Gets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
	init	Returns a ContainerNodeStyleBuilder object used to configure this ContainerNodeStyle instance.
	readExternal	**Externalizable.readExternal** implementation. (Inherited from Style.)
S	registerType	Associates a type with an alias. The alias is used when saving and loading objects of the specified type during style serialization and deserialization. (Inherited from Style.)
	removePropertyChangeListener	(Inherited from Style.)
	setBrush	Sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	setFontFamily	Sets the font family of the item text. (Inherited from DiagramItemStyle.)
	setFontSize	Sets the font size of the item text. (Inherited from DiagramItemStyle.)
	setFontStyle	Sets the font style of the item text. (Inherited from DiagramItemStyle.)
	setFontUnit	Sets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	setShadowBrush	Sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)

	setStroke	Sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	setStrokeThickness	Sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
S	with	Returns a ContainerNodeStyleBuilder object used to configure and create new ContainerNodeStyle instances.
	writeExternal	**Externalizable.writeExternal** implementation. (Inherited from Style.)

Protected Methods

	Name	Description
	getValue	Gets the value of the specified property. (Inherited from Style.)
	isPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	loadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	loadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	registerProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	saveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	saveToXml	Saves the style content into an XML element. (Inherited from Style.)
	setValue	Sets the value of the specified property. (Inherited from Style.)
	unsetValue	Clears the value of the specified property. (Inherited from Style.)

ContainerNodeStyle.with Method

Returns a ContainerNodeStyleBuilder object used to configure and create new ContainerNodeStyle instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public static ContainerNodeStyleBuilder with ()
```

Return Value

A **ContainerNodeStyleBuilder** instance.

ControlNode Class

ControlNode is an adapter class that enables using any **java.awt.Component** -derived object as a diagram node.

Syntax

```
Java
public class ControlNode extends DiagramNode
```

Remarks

A **ControlNode** object might be used to implement advanced entity viewers or editors. An instance of any **java.awt.Component** -derived class can be assigned to the Control property of the host node. That might be a standard Java Swing component such as a **JTable** or your own custom control.

If the Behavior property of DiagramView is set to DrawControls or LinkControls, then users are allowed to draw control host nodes interactively. Such host nodes will have their **Control** initialized to an instance of the type specified via DefaultControlType.

If a user presses the mouse button while the mouse pointer is over a hosted control, JDiagram will either pass the mouse event to the control, or will try to intercept it in order to start moving or resizing the host node. That depends on the value of the MouseInputMode property.

When serializing a diagram to XML, JDiagram uses the Java introspection API to get or set the simple attributes of hosted controls. It also raises the serializeControl and deserializeControl events to let you save the content of hosted nodes using custom code, in case the built-in serialization mechanism is not sufficient.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DiagramItem
    com.mindfusion.diagramming.DiagramNode
      com.mindfusion.diagramming.ControlNode

ControlNode Members

ControlNode is an adapter class that enables using any **java.awt.Component** -derived object as a diagram node.

The following tables list the members exposed by the **ControlNode** type.

Public Constructors

	Name	Description

	ControlNode	Overloaded.

Protected Fields

	Name	Description
	allowIncomingLinks	(Inherited from DiagramNode.)
	allowOutgoingLinks	(Inherited from DiagramNode.)
	anchorPattern	(Inherited from DiagramNode.)
	AV_Cancel	(Inherited from DiagramNode.)
	AV_EndModIncoming	(Inherited from DiagramNode.)
	AV_EndModOutgoing	(Inherited from DiagramNode.)
	AV_StartModIncoming	(Inherited from DiagramNode.)
	AV_StartModOutgoing	(Inherited from DiagramNode.)
	AV_UpdateIncoming	(Inherited from DiagramNode.)
	AV_UpdateOutgoing	(Inherited from DiagramNode.)
	AV_UpdIntscIncoming	(Inherited from DiagramNode.)
	AV_UpdIntscOutgoing	(Inherited from DiagramNode.)
	AV_UpdPosIncoming	(Inherited from DiagramNode.)
	AV_UpdPosOutgoing	(Inherited from DiagramNode.)
	bounds	(Inherited from DiagramNode.)
	brush	(Inherited from DiagramItem.)
	cycleDetected	(Inherited from DiagramItem.)
	cycleProtect	(Inherited from DiagramItem.)
	enabledHandles	(Inherited from DiagramNode.)
	handlesStyle	(Inherited from DiagramNode.)
	incomingLinks	(Inherited from DiagramNode.)
	masterGroup	(Inherited from DiagramNode.)
	modifyDX	(Inherited from DiagramItem.)
	modifyDY	(Inherited from DiagramItem.)
	modifyHandle	(Inherited from DiagramItem.)
	modifying	(Inherited from DiagramItem.)
	obstacle	(Inherited from DiagramNode.)
	outgoingLinks	(Inherited from DiagramNode.)
	pen	(Inherited from DiagramItem.)

	ptEnd	(Inherited from DiagramItem.)
	ptMdfLast	(Inherited from DiagramItem.)
	ptOrg	(Inherited from DiagramItem.)
	ptSavedEnd	(Inherited from DiagramItem.)
	ptSavedOrg	(Inherited from DiagramItem.)
	savedBounds	(Inherited from DiagramNode.)
	subordinateGroup	(Inherited from DiagramItem.)

Public Methods

	Name	Description
	addLabel	Overloaded. (Inherited from DiagramNode.)
	as	Down-casts the item to specified type. (Inherited from DiagramItem.)
	attachTo	Overloaded. (Inherited from DiagramNode.)
	clone	Creates a copy of this item. (Inherited from DiagramItem.)
	containsPoint	Overloaded. (Inherited from DiagramNode.)
	detach	Detaches a node from its master group. (Inherited from DiagramNode.)
	getAllIncomingLinks	Gets a collection of all links entering this node. (Inherited from DiagramNode.)
	getAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	getAllOutgoingLinks	Gets a collection of all links going out of this node. (Inherited from DiagramNode.)
	getAllowIncomingLinks	Gets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	getAllowOutgoingLinks	Gets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	getAnchorPattern	Gets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	getBounds	Gets the node location and size. (Inherited from DiagramNode.)
	getBrush	Gets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	getCenter	Returns the center point of this node. (Inherited from DiagramNode.)
	getConstraints	Gets the movement and size constraints applied to a node. (Inherited from DiagramNode.)

	getContainer	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	getControl	Gets the **java.awt.Component** hosted inside this node.
	getEffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style. (Inherited from DiagramItem.)
	getEffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style. (Inherited from DiagramItem.)
	getEffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	getEffects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	getEnabledHandles	Gets a combination of NodeHandleType members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	getExpandable	Gets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	getExpanded	Gets a value indicating whether the tree branch that starts from a node is expanded or collapsed. (Inherited from DiagramNode.)
	getFont	Gets the font used to draw the text of an item. (Inherited from DiagramItem.)
	getHandlesStyle	Gets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	getHyperLink	Gets the hyperlink associated with an item. (Inherited from DiagramItem.)
	getId	Gets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	getIncomingLinks	Gets the links coming into a node. (Inherited from DiagramNode.)

	getLabels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms. (Inherited from DiagramItem.)
	getLocalCenter	(Inherited from DiagramNode.)
	getLocked	Gets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	getMasterGroup	Gets the hierarchical group in which this node is a subordinate item. (Inherited from DiagramNode.)
	getMasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	getMouseInputMode	Gets whether mouse input is processed by the diagram or the hosted control.
	getNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getObstacle	Gets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	getOpacity	Gets the opacity of this item. (Inherited from DiagramItem.)
	getOutgoingLinks	Gets the links going out from a node. (Inherited from DiagramNode.)
	getParent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	getPen	Gets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	getPrintable	Gets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
S	getRotatedBounds	Gets the bounding rectangle of this node, when it is rotated at the specified angle around the specified pivot. (Inherited from DiagramNode.)
	getRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	getRuntimeIndex	For internal use. (Inherited from DiagramItem.)
	getSelected	Gets a value indicating whether this item is selected. (Inherited from DiagramItem.)
	getShadowBrush	Gets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)

	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getStyle	Gets the style associated with the item. (Inherited from DiagramItem.)
	getSubordinateGroup	Gets the group of subordinated items attached to this one. (Inherited from DiagramItem.)
	getTag	Gets user-defined data assigned to an item. (Inherited from DiagramItem.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	getTextPadding	Gets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	getToolTip	Gets the tooltip text displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	getVisible	Gets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	getWeight	Gets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	getZIndex	Gets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	hasSubordinates	Checks whether there are any nodes attached to this item. (Inherited from DiagramItem.)
	hitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	hitTestHandle	DiagramItem.hitTestHandle override. (Inherited from DiagramNode.)
	init	Returns a ControlNodeBuilder object used to configure this ControlNode instance.
	labelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	moveTo	Moves a node to the specified location. (Inherited from DiagramNode.)
S	nodesIntersect	Determines whether two nodes intersect. (Inherited from DiagramNode.)
	onDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	onDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	onDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)

	readExternal	Implements Externalizable.
	removeLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	resize	Sets the size of a node. (Inherited from DiagramNode.)
	setAllowIncomingLinks	Sets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	setAllowOutgoingLinks	Sets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	setAnchorPattern	Sets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	setBounds	Overloaded. (Inherited from DiagramNode.)
	setBoundsDirect	For internal use. (Inherited from DiagramNode.)
	setBrush	Sets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	setConstraints	Sets constraints to the node size and movement direction. The constraints are applied when a user modifies the node interactively. They are not checked when the position of a node is set programmatically. (Inherited from DiagramNode.)
	setControl	Sets the **java.awt.Component** that should be hosted inside this node.
	setEnabledHandles	Sets a combination of **NodeHandleType** members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	setExpandable	Sets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	setExpanded	Expands or collapses the tree branch that starts from a node. (Inherited from DiagramNode.)
	setExpandedFlag	Changes the "expanded" flag without actually expanding or collapsing the tree branch that starts from a node. (Inherited from DiagramNode.)
	setFont	Sets the font used to draw the text of an item. (Inherited from DiagramItem.)
	setHandlesStyle	Sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	setHyperLink	Sets the hyperlink associated with an item. (Inherited from DiagramItem.)
	setId	Assigns user-defined identifier to this item. (Inherited from DiagramItem.)
	setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from

		DiagramItem.)
	setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	setLocked	Sets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	setMouseInputMode	Sets whether mouse input is processed by the diagram or the hosted control.
	setObstacle	Sets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	setOpacity	Sets the opacity of this item. (Inherited from DiagramItem.)
	setPen	Sets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	setPrintable	Sets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	setRotationAngle	Sets the rotation angle of a node. (Inherited from DiagramNode.)
	setSelected	Selects or deselects an item. (Inherited from DiagramItem.)
	setShadowBrush	Sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setStyle	Sets the style associated with the item. (Inherited from DiagramItem.)
	setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event. (Inherited from DiagramItem.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	setTextPadding	Sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	setVisible	Sets a value indicating whether the node is visible.
	setWeight	Sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	setZIndex	Sets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)

	with	Returns a ControlNodeBuilder object used to configure and create new ControlNode instances.
	writeExternal	Implements Externalizable.
	zBottom	Moves an item to the bottom of the Z order. (Inherited from DiagramItem.)
	zLevelDown	Moves an item down in the Z order. (Inherited from DiagramItem.)
	zLevelUp	Moves an item up in the Z order. (Inherited from DiagramItem.)
	zTop	Moves an item to the top of the Z order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	allowCreate	DiagramItem.allowCreate override. (Inherited from DiagramNode.)
	allowModify	(Inherited from DiagramNode.)
	allowModifyImpl	(Inherited from DiagramNode.)
	cancelModify	DiagramItem.cancelModify override. Invoked when the interactive modification of this node has been canceled. (Inherited from DiagramNode.)
	completeCreate	DiagramItem.completeCreate override. (Inherited from DiagramNode.)
	completeModify	(Inherited from DiagramNode.)
	constraintsInfringed	(Inherited from DiagramNode.)
	createConnectionPoint	(Inherited from DiagramNode.)
	createProperties	DiagramItem.createProperties override.
	createState	DiagramItem.createState override. (Inherited from DiagramNode.)
	draw	DiagramItem.draw override. (Inherited from DiagramNode.)
	drawLocal	DiagramItem.drawShadow override. Draws the hosted control on the specified Graphics2D surface.
	drawShadow	**DiagramItem.drawShadow** override. (Inherited from DiagramNode.)
	drawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	getLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getLocalBoundsD	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)

	getMeasureUnit	(Inherited from DiagramItem.)
	getRepaintRect	DiagramItem.getRepaintRect override. (Inherited from DiagramNode.)
	getValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	groupContains	(Inherited from DiagramNode.)
	loadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
	loadFromXml	Loads the item content from an XML element.
	move	(Inherited from DiagramNode.)
	onAdd	DiagramItem.onAdd override.
	onChangeFont	(Inherited from DiagramItem.)
	onChangeTextPadding	(Inherited from DiagramItem.)
	onChildModified	Called when a group child node has been modified. Override this method if you need to know when a node from the **SubordinateGroup** is modified. (Inherited from DiagramItem.)
	onClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	onDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	onLoad	onLoad override.
	onMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	onModify	Called when an item is modified (Inherited from DiagramNode.)
	onRemove	DiagramItem.onRemove override.
	onRotationAngleChanged	Called when the node's rotation angle changes. (Inherited from DiagramNode.)
	onStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	onStyleFontChanged	Invoked when font property values of an associated style change. (Inherited from DiagramItem.)
	onUpdateBounds	DiagramNode.onUpdateBounds override.
	parentConstraintsInfringed	(Inherited from DiagramNode.)
	putExpandable	(Inherited from DiagramNode.)
	putSelected	(Inherited from DiagramItem.)
	rectFromPoints	(Inherited from DiagramNode.)
	repaint	Overloaded. (Inherited from DiagramItem.)

	resizeToFitImage	(Inherited from DiagramNode.)
	restoreProperties	DiagramItem.restoreProperties override.
	restoreState	DiagramItem.restoreState override. (Inherited from DiagramNode.)
	saveProperties	DiagramItem.saveProperties override.
	saveState	DiagramItem.saveState override. (Inherited from DiagramNode.)
	saveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	saveToXml	Saves the item content into an XML element.
	scaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	setDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	setReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	shouldRender	Determines whether the item is rendered in the current context. (Inherited from DiagramItem.)
	shouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	startCreate	DiagramItem.startCreate override. (Inherited from DiagramNode.)
	startModify	DiagramItem.startModify override. Invoked when the user starts modifying this node interactively. (Inherited from DiagramNode.)
	updateCreate	DiagramItem.updateCreate override. (Inherited from DiagramNode.)
	updateLinkPositions	(Inherited from DiagramNode.)
	updateModify	DiagramItem.updateModify override. Invoked during interactive modification of this node. (Inherited from DiagramNode.)

ControlNode Constructor

Overload List

Name	Description
ControlNode ()	Initializes a new instance of the ControlNode class.

ControlNode (ControlNode)	Initializes a new instance of the **ControlNode** class using the specified control node as a prototype.
ControlNode (Diagram)	Initializes a new instance of the **ControlNode** class with default values supplied form the specified Diagram.
ControlNode (DiagramView)	Initializes a new instance of the **ControlNode** class.
ControlNode (DiagramView, Component)	Initializes a new instance of the **ControlNode** class.

com.mindfusion.diagramming Namespace

ControlNode Constructor (ControlNode)

Initializes a new instance of the ControlNode class using the specified control node as a prototype.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ControlNode (
    ControlNode prototype
)
```

Parameters

prototype
The node to use as a prototype. The properties of the new node are initialized from the property values of this node.

See Also

ControlNode Constructor Overload List
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode Constructor (Diagram)

Initializes a new instance of the ControlNode class with default values supplied form the specified Diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ControlNode (
    Diagram parent
)
```

Parameters

parent
The Diagram from which to obtain default values for the node properties.

ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode Constructor (DiagramView)

Initializes a new instance of the ControlNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ControlNode (
    DiagramView diagramView
)
```

Parameters

diagramView
The DiagramView that should become a parent of the hosted control.

ControlNode Constructor (DiagramView, Component)

Initializes a new instance of the ControlNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ControlNode (
    DiagramView diagramView,
    Component control
)
```

Parameters

diagramView
The DiagramView that should become a parent of the hosted control.

control
The **java.awt.Component** that should be hosted inside this node.

ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode Methods

ControlNode.createProperties Method

DiagramItem.createProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DiagramItemProperties createProperties ()
```

Return Value

An instance of the ControlNodeProperties class.

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.drawLocal Method

DiagramItem.drawShadow override. Draws the hosted control on the specified Graphics2D surface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void drawLocal (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g
A Graphics2D object where the link should be rendered.

options
A RenderOptions object specifying options for the drawing operation.

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.getControl Method

Gets the **java.awt.Component** hosted inside this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Component getControl ()
```

Return Value

An instance of any **java.awt.Component** derived class.

Remarks

A ControlNode drawn by the user has its Control initialized to an instance of the DefaultControlType type. At any time you can assign another control to this property.

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace
setControl Method

ControlNode.getMouseInputMode Method

Gets whether mouse input is processed by the diagram or the hosted control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public MouseInputMode getMouseInputMode ()
```

Return Value

A member of the MouseInputMode enumeration.

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.init Method

Returns a ControlNodeBuilder object used to configure this ControlNode instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ControlNodeBuilder init ()
```

Return Value

A **ControlNodeBuilder** instance.

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.loadFromXml Method

Loads the item content from an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Element containing the item's data.

context
Provides contextual information about the serialization process and some helper serialization methods.

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.onAdd Method

DiagramItem.onAdd override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onAdd ()
```

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.onLoad Method

onLoad override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onLoad (
    Diagram diagram
)
```

Parameters

diagram
The Diagram whose content is being loaded.

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.onRemove Method

DiagramItem.onRemove override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onRemove ()
```

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.onUpdateBounds Method

DiagramNode.onUpdateBounds override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onUpdateBounds (
    Rectangle2D oldBounds
)
```

Parameters

oldBounds

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.readExternal Method

Implements Externalizable.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.restoreProperties Method

DiagramItem.restoreProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void restoreProperties (
    DiagramItemProperties props
)
```

Parameters

props
An instance of the ControlNodeProperties class.

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.saveProperties Method

DiagramItem.saveProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveProperties (
    DiagramItemProperties props
)
```

Parameters

props
An instance of the ControlNodeProperties class.

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.saveToXml Method

Saves the item content into an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Element the item's data should be stored into.

context
Provides contextual information about the serialization process and some helper serialization methods.

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.setControl Method

Sets the **java.awt.Component** that should be hosted inside this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setControl (
    Component value
```

```
)
```

Parameters

value
An instance of any **java.awt.Component** derived class.

Remarks

A ControlNode drawn by the user has its **Control** initialized to an instance of the DefaultControlType type. You can assign another control to this property at any time.

Example

The example below shows how to create a new **ControlNode** instance and set its control:

Java

```
ControlNode host = new ControlNode(diagramView);
host.setControl(new JTable(3, 3));
host.setMouseInputMode(MouseInputMode.HandledByHostedControl);
diagram.getNodes().add(host);
```

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.setMouseInputMode Method

Sets whether mouse input is processed by the diagram or the hosted control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMouseInputMode (
    MouseInputMode value
)
```

Parameters

value
A member of the MouseInputMode enumeration.

See Also

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.setVisible Method

Sets a value indicating whether the node is visible.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setVisible (
    boolean value
)
```

Parameters

value
true if the node should be visible,otherwise false.

ControlNode Members
ControlNode Class
com.mindfusion.diagramming Namespace

ControlNode.with Method

Returns a ControlNodeBuilder object used to configure and create new ControlNode instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static ControlNodeBuilder with ()
```

Return Value

A **ControlNodeBuilder** instance.

com.mindfusion.diagramming Namespace

ControlNodeEvent Members

Contains the arguments passes to handlers of the control host serialization events.

The following tables list the members exposed by the ControlNodeEvent type.

Public Constructors

	Name	Description
	ControlNodeEvent	Initializes a new instance of the **ControlNodeEvent** class.

Public Methods

	Name	Description

	getContext	Gets an XmlPersistContext object that provides serialization helper methods.
	getHandled	Gets a value indicating whether the event is handled.
	getNode	Gets a reference to the ControlNode being serialized or deserialized.
	getXmlElement	Gets an XML element that stores the control attributes.
	setHandled	Sets a value indicating whether the event is handled.

See Also

ControlNodeEvent Class
com.mindfusion.diagramming Namespace

ControlNodeEvent Constructor

Initializes a new instance of the ControlNodeEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ControlNodeEvent (
    Object source,
    ControlNode node,
    Element element,
    XmlPersistContext context
)
```

Parameters

source
Specifies the event source.

node
The ControlNode being serialized or deserialized.

element
The **org.w3c.dom.Element** that stores the control attributes.

context
An XmlPersistContext object that provides serialization helper methods.

See Also

ControlNodeEvent Class
com.mindfusion.diagramming Namespace

ControlNodeEvent Methods

ControlNodeEvent.getContext Method

Gets an XmlPersistContext object that provides serialization helper methods.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public XmlPersistContext getContext ()
```

Return Value

An XmlPersistContext instance.

See Also

ControlNodeEvent Members
ControlNodeEvent Class
com.mindfusion.diagramming Namespace

ControlNodeEvent.getHandled Method

Gets a value indicating whether the event is handled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getHandled ()
```

Return Value

true if some handler has already serialized the control, otherwise **false**.

See Also

ControlNodeEvent Members
ControlNodeEvent Class
com.mindfusion.diagramming Namespace

ControlNodeEvent.getNode Method

Gets a reference to the ControlNode being serialized or deserialized.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ControlNode getNode ()
```

Return Value

A ControlNode instance.

See Also

ControlNodeEvent Members
ControlNodeEvent Class
com.mindfusion.diagramming Namespace

ControlNodeEvent.getXmlElement Method

Gets an XML element that stores the control attributes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element getXmlElement ()
```

Return Value

An **org.w3c.dom.Element** instance.

See Also

ControlNodeEvent Members
ControlNodeEvent Class
com.mindfusion.diagramming Namespace

ControlNodeEvent.setHandled Method

Sets a value indicating whether the event is handled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHandled (
    boolean value
)
```

Parameters

value
true to indicate that the control has been serialized, otherwise **false**.

CursorHint Enumeration

Specifies what mouse cursor to display while a user interacts with the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum CursorHint
```

Members

	Member name	Description
	AllowLink	Indicates the cursor specified by the AllowLinkCursor property.
	CounterDiagonalResize	Indicates the cursor specified by the CounterDiagonalResizeCursor property.

	DiagonalResize	Indicates the cursor specified by the DiagonalResizeCursor property.
	Disallow	Indicates the cursor specified by the DisallowCursor property.
	DisallowLink	Indicates the cursor specified by the DisallowLinkCursor property.
	DontChange	Indicates the cursor specified by the Cursor property.
	DrawLink	Indicates the cursor specified by the DrawLinkCursor property.
	EditText	Indicates the cursor specified by the EditTextCursor property.
	HorizontalResize	Indicates the cursor specified by the HorizontalResizeCursor property.
	Move	Indicates the cursor specified by the MoveCursor property.
	Pointer	Indicates the cursor specified by the PointerCursor property.
	Rotate	Indicates the cursor specified by the RotateCursor property.
	VerticalResize	Indicates the cursor specified by the VerticalResizeCursor property.

CustomDraw Enumeration

The members of this enumeration specify what type of custom-drawing will be performed on an item. These constants can be used as parameters of the setCustomDraw method of the ShapeNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum CustomDraw`

Members

	Member name	Description
	Additional	Perform custom drawing additional to the standard one.
	Additional2	Perform custom drawing additional to the standard one.
	Additional3	Perform custom drawing additional to the standard one.
	Full	Do not execute any standard drawing code, but only custom one.

	None	Standard drawing.
	ShadowOnly	Custom draw only the item shadow.

com.mindfusion.diagramming Namespace

DecisionLayout Class

Implements a flowchart layout algorithm.

Syntax

Java

```
public class DecisionLayout extends AbstractLayout
```

Remarks

This algorithm arranges simple flowcharts consisting of decision boxes with up to three outgoing links per node and activity boxes with a single outgoing link per node. The nodes are arranged in columns and rows, whose distance depends on the HorizontalPadding and VerticalPadding property values. When links share the same row or column, they are placed at a distance specified via LinkPadding.

The layout arranges nodes recursively starting from StartNode. If **StartNode** is not specified, the algorithm selects the root of the deepest branch of the graph's spanning tree as start node.

The overall orientation of the layout can be set via the Orientation property. There is no distinction made between yes/no links, and the node sides by which links are aligned depend only on the order of links in OutgoingLinks collection. If you have a preferred position for links depending on their yes/no type, make sure the **OutgoingLinks** collections of nodes are sorted by links' logical values.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.AbstractLayout
    com.mindfusion.diagramming.DecisionLayout

FlowchartLayout Class

DecisionLayout Members

Implements a flowchart layout algorithm.

The following tables list the members exposed by the DecisionLayout type.

Public Constructors

	Name	Description

	DecisionLayout	Initializes a new instance of the **DecisionLayout** class with the default settings.

Public Methods

	Name	Description
	arrange	Applies the layout to the specified diagram.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getHorizontalPadding	Gets the horizontal distance between adjacent nodes.
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	getLinkPadding	Gets the distance between parallel links.
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getOrientation	Gets the orientation of the arranged diagram.
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	getStartNode	Gets the initial (top-left) node in the arranged diagram.
	getVerticalPadding	Gets the vertical distance between adjacent nodes.
	init	Returns a DecisionLayoutBuilder object used to configure this DecisionLayout instance.
S	removeMidleSegmentPoint	(Inherited from AbstractLayout.)
	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setHorizontalPadding	Sets the horizontal distance between adjacent nodes.

	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	setLinkPadding	Sets the distance between parallel links.
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setOrientation	Sets the orientation of the arranged diagram.
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
	setStartNode	Sets the initial (top-left) node in the arranged diagram.
	setVerticalPadding	Sets the vertical distance between adjacent nodes.
S	with	Returns a DecisionLayoutBuilder object used to configure and create new DecisionLayout instances.

Protected Methods

	Name	Description
	getDefaultMarginValue	Gets the default value of the **Margins** property.

DecisionLayout Members
DecisionLayout Class
com.mindfusion.diagramming Namespace

DecisionLayout.getDefaultMarginValue Method

Gets the default value of the Margins property.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected XDimension2D.Double getDefaultMarginValue ()
```

Return Value

See Also

DecisionLayout Members
DecisionLayout Class
com.mindfusion.diagramming Namespace

DecisionLayout.getHorizontalPadding Method

Gets the horizontal distance between adjacent nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getHorizontalPadding ()
```

Return Value

A real number specifying the distance between adjacent nodes. The default is 15.

See Also

DecisionLayout Members
DecisionLayout Class
com.mindfusion.diagramming Namespace

DecisionLayout.getLinkPadding Method

Gets the distance between parallel links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getLinkPadding ()
```

Return Value

A real number specifying the distance between parallel links. The default is 2.

DecisionLayout Members
DecisionLayout Class
com.mindfusion.diagramming Namespace

DecisionLayout.getOrientation Method

Gets the orientation of the arranged diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Orientation getOrientation ()
```

Return Value

A member of the Orientation enumeration. The default is Vertical.

See Also

DecisionLayout Members
DecisionLayout Class
com.mindfusion.diagramming Namespace

DecisionLayout.getStartNode Method

Gets the initial (top-left) node in the arranged diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode getStartNode ()
```

Return Value

A DiagramNode object that specifies the initial node. The default is **null**.

Remarks

If this property is **null**, the layout will pick-up the start node automatically.

DecisionLayout.getVerticalPadding Method

Gets the vertical distance between adjacent nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getVerticalPadding ()
```

Return Value

A real number specifying the distance between adjacent nodes. The default is 15.

DecisionLayout.init Method

Returns a DecisionLayoutBuilder object used to configure this DecisionLayout instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DecisionLayoutBuilder init ()
```

Return Value

A **DecisionLayoutBuilder** instance.

com.mindfusion.diagramming Namespace

DecisionLayout.setHorizontalPadding Method

Sets the horizontal distance between adjacent nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHorizontalPadding (
    float value
)
```

Parameters

value
A real number specifying the distance between adjacent nodes.

DecisionLayout.setLinkPadding Method

Sets the distance between parallel links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkPadding (
    float value
)
```

Parameters

value
A real number specifying the distance between parallel links.

DecisionLayout.setOrientation Method

Sets the orientation of the arranged diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setOrientation (
    Orientation value
)
```

Parameters

value
A member of the Orientation enumeration.

See Also

DecisionLayout Members
DecisionLayout Class
com.mindfusion.diagramming Namespace

DecisionLayout.setStartNode Method

Sets the initial (top-left) node in the arranged diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setStartNode (
    DiagramNode value
)
```

Parameters

value
A DiagramNode object that specifies the initial node.

Remarks

If this property is **null**, the layout will pick-up the start node automatically.

DecisionLayout.setVerticalPadding Method

Sets the vertical distance between adjacent nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setVerticalPadding (
    float value
)
```

Parameters

value
A real number specifying the distance between adjacent nodes.

DecisionLayout.with Method

Returns a DecisionLayoutBuilder object used to configure and create new DecisionLayout instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public static DecisionLayoutBuilder with ()`

Return Value

A **DecisionLayoutBuilder** instance.

DefaultPaletteModel Class

A default implementation of the PaletteModel.

Syntax

Java

`public class DefaultPaletteModel`
`    extends AbstractListModel<E>`
`    implements PaletteModel`

Remarks

DefaultPaletteModel is the standard implementation of the PaletteModel interface, providing a concrete list-based store for PaletteCategory objects. It manages category additions and removals while automatically notifying the Palette control to keep the user interface in sync.

Inheritance Hierarchy

java.lang.Object
  javax.swing.AbstractListModel(E)
    com.mindfusion.diagramming.DefaultPaletteModel

DefaultPaletteModel Members

A default implementation of the PaletteModel.

The following tables list the members exposed by the DefaultPaletteModel type.

Public Constructors

	Name	Description
	DefaultPaletteModel	Initializes a new instance of the **DefaultPaletteModel** class.

Public Methods

	Name	Description
	addCategory	Adds a category to the model.
	clear	Removes all categories from the model.
	getCategories	
	getElementAt	
	getSize	
	removeCategory	Removes a category from the model.

DefaultPaletteModel Methods

DefaultPaletteModel.addCategory Method

Adds a category to the model.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addCategory (
    PaletteCategory category
)
```

Parameters

category
The PaletteCategory to add.

See Also

DefaultPaletteModel Members
DefaultPaletteModel Class
com.mindfusion.diagramming Namespace
removeCategory Method

DefaultPaletteModel.clear Method

Removes all categories from the model.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void clear ()
```

See Also

DefaultPaletteModel Members
DefaultPaletteModel Class

DefaultPaletteModel.getElementAt Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public PaletteCategory getElementAt (
    int index
)
```

Parameters

index

Return Value

See Also

DefaultPaletteModel Members
DefaultPaletteModel Class
com.mindfusion.diagramming Namespace

DefaultPaletteModel.getSize Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getSize ()
```

Return Value

See Also

DefaultPaletteModel Members
DefaultPaletteModel Class
com.mindfusion.diagramming Namespace

DefaultPaletteModel.removeCategory Method

Removes a category from the model.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void removeCategory (
    PaletteCategory category
)
```

Parameters

category
The PaletteCategory to remove.

DefaultPaletteModel Class
com.mindfusion.diagramming Namespace
addCategory Method

DelKeyAction Enumeration

The members of this enumeration specify the type of action performed when the user presses the DEL key.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum DelKeyAction`

Members

	Member name	Description
	DeleteActiveItem	Indicates that only the ActiveItem is deleted.
	DeleteSelectedItems	Indicates that all selected items are deleted.
	None	Indicates that nothing happens.

com.mindfusion.diagramming Namespace

Diagram Class

The **Diagram** class represents a flow diagram.

Syntax

Java
`public class Diagram extends DiagramBase implements IItemFactory, ImageObserver`

Remarks

The diagram document contains connected nodes and links. Nodes are instances of the ShapeNode, TableNode, or ContainerNode classes. The nodes can be accessed through getNodes. Links in JDiagram are instances of the DiagramLink class and can be accessed through the getLinks method. Diagram items can be grouped in hierarchical structures and the so formed groups can be accessed by getGroups.

Managing items: Use the createShapeNode, createTableNode, createDiagramLink or createContainerNode methods of the Factory class to create new diagram items. Optionally, items can be created using the **new** operator and added to the diagram with the add method. Items are deleted using the remove method of the list returned by the getItems method.

The createGroup method creates a new hierarchical Group of items. The subordinated items in a group always follow the movement of their master item. Use the destroyGroup method to destroy a group.

Searching for a particular kind of items is done with the findLink, findNode and findGroup methods, which look for an item that has a particular Tag. To get whatever object is placed at a certain location, use the getItemAt, getNodeAt and getLinkAt methods.

Serialization: Binary serialization of diagrams is provided by the saveTo and loadFrom methods which serialize diagrams to / from Java streams or files. Use the saveToXml and loadFromXml methods to serialize a diagram into/from XML documents.

Controlling users actions: Users actions can be validated by handling some events declared in DiagramListener, fired while items are being created or modified. In addition, the **Diagram** class provides some methods that control user interaction. The setBehavior method specifies how user interaction is interpreted by creating nodes, links, selection, and so on. The order in which items are hit-tested when clicking on them depends on the value assigned through setHitTestPriority.

The following attribute setters let you control what kind of links users can create: setAllowLinksRepeat, setAllowSelfLoops, setAllowUnanchoredLinks, setAllowUnconnectedLinks. To specify whether users are allowed to edit the text of nodes by double-clicking, use setAllowInplaceEdit.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DiagramBase
    com.mindfusion.diagramming.Diagram
      com.mindfusion.diagramming.DiagramPage

Diagram Members

The Diagram class represents a flow diagram.

The following tables list the members exposed by the **Diagram** type.

Public Constructors

	Name	Description
	Diagram	Initializes a new instance of the **Diagram** class.

Public Methods

	Name	Description
	addDiagramListener	Registers listener so that it will receive events when users create, modify or delete diagram items.
	alignPointToGrid	Aligns a point to the alignment grid.
	arrange	Arranges the diagram using the specified graph layout algorithm.

	arrangeLinkLabels	Rearranges link labels whose AutoArrange property is enabled.
	changeUnit	Sets new MeasureUnit value and scales the coordinates of diagram items so that their absolute size remains unchanged.
	clearAll	Deletes all items from the diagram.
	copySelection	Creates a copy of the currently selected objects and groups.
	createImage	Overloaded. Creates a bitmap image representing the diagram contents.
	createItem	Implements the IItemFactory interface.
	createStyledText	Creates a styled text object for the specified text string.
	createThemeFromDefaults	Creates a Theme object representing the default properties of the diagram. This method is only for compatibility with files saved with versions earlier than 4.0.
	destroyGroup	Destroys the specified group. The group items are not deleted, unless its setAutoDeleteItems method is calles.
	draw	Renders the diagram on the specified **Graphics2D** object.
	drawAlignmentGuides	Draws the current alignment guides.
	drawLayer	Renders all items of a layer to the specified graphics.
	drawString	
	drawStyledText	
	drawTextObject	
	enumByReverseZ	Overloaded. Hit-tests diagram items in reverse Z order.
	enumTopLevelByReverseZ	Overloaded. Hit-tests diagram top-level items in reverse Z order.
	executeCommand	Executes a command and saves it in the undo/redo history.
	findGroup	Finds the group that has the specified tag.
	findLink	Finds the link that has the specified tag.
	findLinkById	Finds the link that has the specified id value.
	findNode	Finds the node that has the specified tag.
	findNodeById	Finds the node that has the specified id value.
	getActiveItem	Gets the active item.
	getActiveItemHandlesStyle	Gets the visual style of the manipulation handles displayed around the active item.
	getActiveLayer	Gets the zero-based index of the active layer.
	getAdjustmentHandlesSize	Gets the size of selection handles.
	getAlignmentGuidePen	Gets the pen used to draw alignment guides.

	getAlignToGrid	Gets a value indicating whether items are aligned to the alignment grid while users draw them.
	getAllowLinksRepeat	Gets a value indicating whether users are allowed to draw more than one links between the same nodes.
	getAllowMultipleResize	Gets whether multiple selected nodes can be resized simultaneously.
	getAllowSelfLoops	Gets whether users are allowed to draw reflexive links.
	getAllowSplitLinks	Gets whether link segments can be added and removed interactively.
	getAllowUnanchoredLinks	Gets a value indicating whether users are allowed to attach links to nodes that do not have any anchor points.
	getAllowUnconnectedLinks	Gets a value indicating whether users are allowed to draw unconnected links.
	getAutoAlignDistance	Gets the maximal horizontal or vertical distance at which a node aligns to the borders of other nodes.
	getAutoAlignNodes	Gets whether nodes should automatically align to the borders of other nodes during user interaction.
	getAutoCloseDistance	Gets the maximum distance between first and last points of a FreeFormNode for which the node's outline is closed automatically.
	getAutoDeleteLinks	Gets whether links are deleted automatically when their Origin or Destination is deleted.
	getAutoResize	Gets a value specifying whether the document scrollable area is resized automatically when users draw items near the edges of the diagram.
	getAutoSnapDistance	Specifies the maximum distance at which links auto-snap to nodes.
	getAutoSnapLinks	Gets the default value for the AutoSnapToNode property of new links.
	getBackBrush	Gets the diagram's background brush.
	getBackgroundImage	Gets the background image.
	getBackgroundImageAlign	Gets how the background image is positioned relatively to the scrollable area of the diagram.
	getBackgroundImageUrl	Gets the URL of the background image.
	getBookmarks	Gets a collection of all saved bookmarks / areas of interest defined in this diagram.
	getBounds	Gets the bounds of the scrollable area of the diagram.
	getBoundsPen	Gets the pen with which the diagram bounds are drawn.
	getCellCustomDraw	Gets the default type of custom painting applied to cells of new tables.
	getCellFrameStyle	Gets the default style of the cell frames of new tables.
	getClsidTable	Gets the table of registered item identifiers.

	getContainerCaption	Gets the default value for the Caption attribute of containers.
	getContainerCaptionHeight	Gets the default value for the CaptionHeight attribute of containers.
	getContainerHighlightPen	Gets the default value for the HighlightPen attribute of containers.
	getContainerMargin	Gets the default value for the Margin attribute of containers.
	getContainerMinimumSize	Gets the default value for the MinimumSize attribute of containers.
	getContainerNodeStyle	Gets the theme-level style for container nodes.
	getContainersFoldable	Gets the default value for the Foldable attribute of containers.
	getContentBounds	Returns the smallest rectangle that bounds all diagram items.
	getCrossingRadius	Gets the radius of the shapes drawn at link crossing points.
	getDefaultControlType	Gets the type of components that will be hosted by default in newly created ControlNode objects.
	getDefaultShape	Gets the default shape of nodes.
	getDiagramLinkStyle	Gets the theme-level style for diagram links.
	getDiagramListeners	Gets the list of currently registered event listeners.
	getDiagramStyle	Gets the theme-level style for the diagram.
	getDirty	Indicates whether the diagram has changed since the last save.
	getDisabledHandlesStyle	Gets the visual style of disabled manipulation handles.
	getDummy	
	getDynamicLinks	Gets a value indicating whether links automatically update their end points positions so that they will always point towards the node centers.
	getEffectiveBackBrush	Gets the currently effective background brush of the diagram. This property returns the BackBrush if it is not null, or the brush from the associated style or theme otherwise.
	getEnableLanes	Gets whether lanes are enabled.
	getEnableSpatialIndex	Gets whether to index item positions for faster hit-testing and viewport clipping queries.
	getEnableStyledText	Gets a value indicating whether new nodes display richly formatted text.
	getExpandButtonAction	Gets what should happen when a user clicks the +/- button that is displayed near expandable nodes.
	getExpandButtonPosition	Gets where expand/collapse buttons are located relatively to their nodes.

	getExpandOnIncoming	Gets which direction of links is considered the tree direction when expanding or collapsing diagram branches.
	getFactory	Gets a Factory instance that lets you add programmatically new items to the diagram.
	getFocusedComponent	Gets the component within this diagram which is currently holding the input focus.
	getFocusedManipulator	Gets the manipulator currently holding the input focus.
	getFoldedContainerSize	Gets the size of folded containers.
	getFont	Gets the default font for new diagram items.
S	getFormatBeingLoaded	Returns the file format id of the file currently being loaded.
	getFreeFormAttractDistance	Gets the radius around dragged free-form adjustment handle in which other points of **FreeFormNode** are modified too.
	getFreeFormTargets	Gets an array of Shape objects used to replace **FreeFormNode** instances with ShapeNode ones when Behavior is set to LinkFreeShapes or DrawFreeShapes.
	getGridColor	Gets the color of the alignment grid.
	getGridOffsetX	Gets the horizontal offset of the first point of the alignment grid.
	getGridOffsetY	Gets the vertical offset of the first point of the alignment grid.
	getGridSizeX	Gets the horizontal distance between grid points.
	getGridSizeY	Gets the vertical distance between grid points.
	getGridStyle	Gets the appearance style of the alignment grid.
	getGroups	Gets a collection of all groups in the diagram.
	getHitTestPriority	Gets a value indicating the order in which items are hit-tested.
	getHoverDelay	Gets the time in milliseconds that mouse pointer should remain stationary before reporting hover events.
	getImageDpiX	Specifies the default resolution of images.
	getImageDpiY	
	getInteraction	Gets an InteractionState instance representing the current action being carried out by the user.
	getItemAt	Overloaded.
	getItems	Gets a collection of all items in the diagram.
	getLaneGrid	Gets the Grid instance that represents the lane grid.
	getLayers	Gets a list of the layers in the current diagram.
	getLinkAt	Overloaded.
	getLinkBaseShape	Gets the default shape displayed at the origin of new links.

	getLinkBaseShapeSize	Gets the default size of the shape displayed at the origin of new links.
	getLinkBranchIndicator	
	getLinkBrush	Gets the default brush assigned to new links.
	getLinkCascadeOrientation	Gets the default orientation of the first segments of cascading links.
	getLinkCrossings	Gets what shapes are drawn at link crossing points.
	getLinkCustomDraw	Gets the default type of custom painting done on links.
	getLinkEndsMovable	Gets a value indicating that users are allowed to move the end points of a link after the link is created.
	getLinkHandlesStyle	Gets the default style of link selection handles.
	getLinkHeadShape	Gets the default shape displayed as head of new links.
	getLinkHeadShapeSize	Gets the default size of the shape displayed as arrowhead of new links.
	getLinkIntermediateShape	Gets the default shape displayed at the middle of links segments.
	getLinkIntermediateShapeSize	Gets the default size of the shape displayed at the middle of links segments.
	getLinkPen	Gets the default pen assigned to new links.
	getLinkRouter	Gets the component used to find paths for auto-routed links when diagram nodes are added or their positions change.
	getLinks	Gets a collection of all links in the diagram.
	getLinksAt	Returns the links that contain the specified point.
	getLinkSegments	Gets the default number of link segments.
	getLinkShape	Gets the default shape of links.
	getLinksRetainForm	Gets a value indicating whether new links are set to maintain their shapes while the nodes they connect are moved around.
	getLinkText	Gets the default text assigned to new links.
	getLinkTextStyle	Gets the default placement and orientation of links' text.
	getMeasureUnit	Gets the current unit of measure.
	getMergeThreshold	Gets the maximum distance between adjacent control points of a link at which the respective segments can be merged.
	getNearestNode	Returns the nearest node whose bounding rectangle is intersected by the circle, defined by origin point and radius.
	getNodeAt	Overloaded.

	getNodeEffects	Gets a collection with all effects applied to the nodes of this diagram.
	getNodes	Gets a collection of all nodes in the diagram.
	getNodesAt	Returns the nodes that contain the specified point.
	getNodesExpandable	Gets whether the tree branches that start from new nodes are expandable by default.
	getRecursiveExpand	Gets whether tree branches are expanded recursively.
	getRenderOptions	
	getRestrictItemsToBounds	Gets a value indicating whether users are allowed to move items outside the currently defined document bounds.
	getRoundedLinks	Gets if the joins between segments of Polyline and Cascading links should be rounded.
	getRoundedLinksRadius	Gets the radius of arc joins of rounded links' segments.
	getRouteLinks	Gets a value indicating whether links should avoid nodes by going the shortest path from their origin to their destination without crossing any other nodes.
	getRoutingOptions	Gets a RoutingOptions instance that lets you set various attributes of link routing algorithms.
	getSelectAfterCreate	Gets a value indicating whether newly created items are selected automatically.
	getSelectedItemHandlesStyle	Gets the visual style of the manipulation handles displayed around selected items.
	getSelection	Gets a Selection instance representing the current selection.
	getSelectionOnTop	Gets a value indicating whether selected items are drawn on top of the non-selected ones.
	getShadowBrush	Gets .the default brush used to paint the shadows cast by diagram items.
	getShadowOffsetX	Gets the default horizontal distance between shadows and the items that cast them.
	getShadowOffsetY	Gets the default vertical distance between shadows and the items that cast them.
	getShadowsStyle	Gets the style of shadows.
	getShapeBrush	Gets the default brush assigned to new nodes.
	getShapeCustomDraw	Gets whether new nodes should be custom drawn and what type of custom drawing will be performed on them.
	getShapeHandlesStyle	Gets the default value for the HandlesStyle property of new shape nodes.
	getShapeNodeStyle	Gets the theme-level style for shape nodes.
	getShapeOrientation	Gets the default shape definition orientation angle assigned to new nodes.

	getShapePen	Gets the default pen assigned to new nodes.
	getShapeText	Gets the default text assigned to new nodes.
	getShowAnchors	Gets a value indicating whether anchor points should be shown on screen.
	getShowDisabledHandles	Gets whether disabled manipulation handles are displayed.
	getShowGrid	Gets a value indicating whether the alignment grid is displayed.
	getShowHandlesOnDrag	Gets whether selection handles of objects under the pointer are displayed while another object is being modified.
	getSnapToAnchor	Gets a value indicating when links should snap to anchor points.
	getStyle	Gets the style associated with the diagram.
	getSvgNodeStyle	Gets the theme-level style for SVG nodes.
	getTableBrush	Gets the default brush assigned to new tables.
	getTableCaption	Gets the default caption text assigned to new tables.
	getTableCaptionHeight	Gets the default height of the caption bar of new tables.
	getTableColumnCount	Gets how many columns new tables have by default.
	getTableColumnWidth	Gets the default width of the columns of new tables.
	getTableConnectionStyle	Gets how users are allowed to link tables to each other - as integral entities, by rows, or both.
	getTableCustomDraw	Gets the default type of custom painting applied to new tables.
	getTableHandlesStyle	Gets the default style of table selection handles.
	getTableNodeStyle	Gets the theme-level style for table nodes.
	getTablePen	Gets the default pen assigned to new tables.
	getTableRowCount	Gets how many rows new tables have by default.
	getTableRowHeight	Gets the default height of the row of new tables.
	getTableShape	Gets the default value of the Shape property of new tables.
	getTablesScrollable	Gets a value indicating whether users are allowed to scroll new tables.
	getTag	Gets the custom data associated with this diagram.
	getTextColor	Gets the default text color that is assigned to new items.
	getTextFormat	Gets the default format and alignment of the text of new items.
	getTheme	Gets the theme associated with the diagram.
	getToolTip	Gets the tooltip text.

	getTreeViewNodeStyle	Gets the theme-level style for tree view nodes.
	getTypeTable	Gets the table of registered item types.
	getUndoManager	Gets the diagram's UndoManager.
	getValidityChecks	
	handleKeyDown	Propagates keyboard input to interested manipulators and components.
	handleKeyPress	Propagates keyboard input to interested manipulators.
	handleKeyUp	Propagates keyboard input to interested components.
	handlePointerMove	Propagates mouse input to interested manipulators.
	hitTestComponents	
	hitTestLabels	Returns the item label located at specified position.
	imageToDoc	Transforms points from the image coordinate space to the document coordinate space.
	imageToDocX	Converts from image coordinates to document coordinates.
	imageToDocY	Converts from image coordinates to document coordinates.
	imageUpdate	
	init	Returns a DiagramBuilder object used to configure this Diagram instance.
	isClassRegistered	
	isClientClassRegistered	
	isItemInteractive	Checks if the specified item can be modified interactively.
	isItemLocked	Checks if the specified item is locked.
	isItemVisible	Checks if the specified item is currently visible.
	items	Iterates over diagram items of the desired type
	loadFromJson	Overloaded.
	loadFromJsonString	Loads the diagram from a JSON-formatted string.
	loadFromString	Decodes diagram contents from a string previously created by saveToString.
	loadFromXml	Overloaded.
	measureString	Measures a text taking into consideration the current affine transform of the diagram.
	pasteSelection	Adds the specified items and groups to the specified diagram document.
	raiseActionRedone	Raises the actionRedone event.
	raiseActionUndone	Raises the actionUndone event.

	raiseCellTextEdited	Raises the DiagramListener.cellTextEdited event.
	raiseCellTextEditing	Raises the cellTextEditing event to validate entering in-place editing mode.
	raiseClicked	Overloaded.
	raiseDeleting	Raises the appropriate *Deleting (linkDeleting or nodeDeleting) event.
	raiseDoubleClicked	Overloaded.
	raiseLinkTextEdited	Raises the linkTextEdited event.
	raiseLinkTextEditing	Raises the linkTextEditing event to validate entering in-place editing mode.
	raiseNodeTextEdited	Raises the nodeTextEdited event.
	raiseNodeTextEditing	Raises the nodeTextEditing event to validate entering inplace edit mode.
	raiseTreeCollapsed	Raises the treeCollapsed event.
	raiseTreeExpanded	Raises the treeExpanded event.
	raiseTreeItemTextEdited	Raises the DiagramListener.treeItemTextEdited event.
	raiseViewRemoved	Raises the DiagramListener.viewRemoved event.
S	registerClass	Overloaded.
S	registerItemClass	Overloaded.
	removeDiagramListener	Unregisters listener so that it will no longer receive diagram events.
	repaint	Overloaded.
	resizeToFitItems	Overloaded.
	resumeLinkRouter	Called when the control ends a batch update operation that might affect many links.
	routeAllLinks	Overloaded.
	saveTo	Overloaded.
	saveToJson	Overloaded.
	saveToJsonString	Saves the diagram to a JSON-formatted string.
	saveToString	Overloaded. Saves the diagram contents into a string.
	saveToXml	Overloaded.
	setActiveItem	Sets the active item.
	setActiveLayer	Sets the zero-based index of the active layer.
	setAdjustmentHandlesSize	Sets the size of selection handles.
	setAlignmentGuidePen	Sets the pen used to draw alignment guides.

	setAlignToGrid	Sets a value indicating whether items should be aligned to the alignment grid while users draw them.
	setAllowLinksRepeat	Sets a value indicating whether users are allowed to draw more than one links between the same nodes.
	setAllowMultipleResize	Sets whether multiple selected nodes can be resized simultaneously.
	setAllowSelfLoops	Sets whether users are allowed to draw reflexive links.
	setAllowSplitLinks	Sets whether link segments can be added and removed interactively.
	setAllowUnanchoredLinks	Sets a value indicating whether users are allowed to attach links to nodes that do not have any anchor points.
	setAllowUnconnectedLinks	Sets a value indicating whether users are allowed to draw unconnected links.
	setAutoAlignDistance	Sets the maximal horizontal or vertical distance at which a node aligns to the borders of other nodes.
	setAutoAlignNodes	Sets whether nodes should automatically align to the borders of other nodes during user interaction.
	setAutoCloseDistance	Sets the maximum distance between first and last points of a **FreeFormNode** for which the node's outline is closed automatically.
	setAutoDeleteLinks	Sets whether links are deleted automatically when their **Origin** or **Destination** is deleted.
	setAutoResize	Sets a value specifying whether the document scrollable area should be resized automatically when users draw items near the edges of the diagram.
	setAutoSnapDistance	Specifies the maximum distance at which links auto-snap to nodes.
	setAutoSnapLinks	Sets the default value for the **AutoSnapToNode** property of new links.
	setBackBrush	Sets the diagram's background brush.
	setBackgroundImage	Overloaded.
	setBackgroundImageAlign	Sets how the background image should be positioned relatively to the scrollable area of the diagram.
	setBackgroundImageUrl	Sets the URL of the background image.
	setBounds	Overloaded.
	setBoundsPen	Sets the pen with which document bounds are drawn.
	setCellCustomDraw	Sets the default type of custom painting applied to cells of new tables.
	setCellFrameStyle	Sets the default style of the cell frames of new tables.
	setContainerCaption	Sets the default value for the caption of containers.
	setContainerCaptionHeight	Sets the default value for the caption height of containers.

	setContainerHighlightPen	Sets the default value for the HighlightPen of containers.
	setContainerMargin	Sets the default value for the Margin attribute of containers.
	setContainerMinimumSize	Sets the default value for the minimum size of containers.
	setContainersFoldable	Sets the default value for the Foldable property of containers.
	setCrossingRadius	Sets the radius of the shapes drawn at link crossing points.
	setDefaultControlType	Sets the type of components that will be hosted by default in newly created **ControlNode** objects.
	setDefaultShape	Sets the default shape that should be assigned to new nodes. The shape of individual nodes can be set by calling their ShapeNode.setShape method.
	setDirty	Overloaded. Lets you set or clear the diagram's modification flag.
	setDynamicLinks	Sets a value indicating whether links should automatically update their end points positions so that they will always point towards the node centers.
	setEnableLanes	Sets whether lanes are enabled.
	setEnableSpatialIndex	Sets whether to index item positions for faster hit-testing and viewport clipping queries.
	setEnableStyledText	Sets a value indicating whether newly created nodes should display richly formatted text.
	setExpandButtonAction	Sets what should happen when a user clicks the +/- button that is displayed near expandable nodes.
	setExpandButtonPosition	Sets where expand/collapse buttons are located relatively to their nodes.
	setExpandOnIncoming	Sets which direction of links is considered the tree direction when expanding or collapsing diagram branches.
	setFocusedComponent	Sets the component within this diagram which is currently holding the input focus.
	setFocusedManipulator	Sets the manipulator currently holding the input focus.
	setFoldedContainerSize	Sets the size of folded containers.
	setFont	Sets the default font for new diagram items.
	setFreeFormAttractDistance	Sets the radius around dragged free-form adjustment handle in which other points of **FreeFormNode** are modified too.
	setFreeFormTargets	Sets an array of **Shape** objects used to replace **FreeFormNode** instances with **ShapeNode** ones when Behavior is set to LinkFreeShapes or DrawFreeShapes.
	setGridColor	Sets the color of the alignment grid.
	setGridOffsetX	Sets the horizontal offset of the first point of the alignment grid.

	setGridOffsetY	Sets the vertical offset of the first point of the alignment grid.
	setGridSizeX	Sets the horizontal distance between grid points.
	setGridSizeY	Sets the vertical distance between grid points.
	setGridStyle	Sets the appearance style of the alignment grid.
	setHitTestPriority	Sets a value indicating the order in which items are hit-tested.
	setHoverDelay	Sets the time in milliseconds that mouse pointer should remain stationary before reporting hover events.
	setImageDpiX	Sets the default resolution of images.
	setImageDpiY	
	setLinkBaseShape	Sets what shape should be displayed at the origin of new links.
	setLinkBaseShapeSize	Sets the default size of the shape displayed at the origin of new links.
	setLinkBranchIndicator	
	setLinkBrush	Sets the default brush that should be assigned to new links.
	setLinkCascadeOrientation	Sets the default orientation of the first segments of cascading links.
	setLinkCrossings	Sets what shapes should be drawn at the points where links cross.
	setLinkCustomDraw	Sets the default type of custom painting done on links.
	setLinkEndsMovable	Sets a value indicating users are allowed to move the end points of a link after the link is created.
	setLinkHandlesStyle	Sets the style of selection handles that should be assigned to new links.
	setLinkHeadShape	Sets what shape should be displayed as arrowhead of new links.
	setLinkHeadShapeSize	Sets the default size of the shape displayed as arrowhead of new links.
	setLinkIntermediateShape	Sets what shape should be displayed at the middle of links segments.
	setLinkIntermediateShapeSize	Sets the default size of the shape displayed at the middle of links segments.
	setLinkPen	Sets the default pen that should be assigned to new links.
	setLinkRouter	Sets the component used to find paths for auto-routed links when diagram nodes are added or their positions change.
	setLinkSegments	Sets the default number of link segments.
	setLinkShape	Sets the style that should be assigned to new links.

	setLinksRetainForm	Sets a value indicating whether new links are set to maintain their shapes while the nodes they connect are moved around.
	setLinkText	Sets the default text that should be assigned to new links.
	setLinkTextStyle	Sets the default placement and orientation of the links labels.
	setMeasureUnit	Sets the units for measuring of lengths and sizes.
	setMergeThreshold	Sets the maximum distance between adjacent control points of a link at which the respective segments can be merged.
	setNodesExpandable	Sets whether the tree branches that start from new nodes should be expandable by default.
	setRecursiveExpand	Sets whether tree branches should be expanded recursively.
	setRestrictItemsToBounds	Sets a value indicating whether users are allowed to move items outside the currently define document bounds.
	setRoundedLinks	Sets if the joins between segments of Polyline and Cascading links should be rounded.
	setRoundedLinksRadius	Sets the radius of arc joins of rounded links' segments.
	setRouteLinks	Sets a value indicating whether links should avoid nodes by going the shortest path from their origin to their destination without crossing any other nodes.
	setSelectAfterCreate	Sets a value indicating whether newly created items should be selected automatically.
	setSelectionOnTop	Sets a value indicating whether selected items should be drawn on top of the non-selected ones.
	setShadowBrush	Sets the default brush used to paint the shadows cast by diagram items.
	setShadowOffset	Sets the distance at which shadows are offset from the items that cast them.
	setShadowOffsetX	Sets the default horizontal distance between shadows and the items that cast them.
	setShadowOffsetY	Sets the default vertical distance between shadows and the items that cast them.
	setShadowsStyle	Sets the style of shadows.
	setShapeBrush	Sets the default brush that should be assigned to new nodes.
	setShapeCustomDraw	Sets whether new nodes should be custom drawn and what type of custom drawing will be performed on them.
	setShapeHandlesStyle	Sets the default value for the HandlesStyle property of new shape nodes.
	setShapeOrientation	Sets the default shape definition orientation angle assigned to new nodes.

	setShapePen	Sets the default pen that should be assigned to new nodes.
	setShapeText	Sets the default text to new nodes.
	setShowAnchors	Sets a value indicating whether anchor points should be shown on screen.
	setShowDisabledHandles	Sets whether disabled manipulation handles will be displayed.
	setShowGrid	Sets a value indicating whether the alignment grid is displayed.
	setShowHandlesOnDrag	Sets whether selection handles of objects under the pointer are displayed while another object is being modified.
	setSnapToAnchor	Sets a value indicating when links should snap to anchor points.
	setStyle	Sets the style associated with the diagram.
	setTableBrush	Sets the default brush that is assigned to new tables.
	setTableCaption	Sets the default caption text that should be assigned to new tables.
	setTableCaptionHeight	Sets the default height of the caption bar of new tables.
	setTableColumnCount	Sets how many columns should be allocated to new tables.
	setTableColumnWidth	Sets the default width of columns in newly created tables.
	setTableConnectionStyle	Sets how users are allowed to link tables to each other - as integral entities, by rows, or both.
	setTableCustomDraw	Sets the default type of custom painting applied to new tables.
	setTableHandlesStyle	Sets the style of selection handles that should be assigned to new tables.
	setTablePen	Sets the default pen that should be assigned to new tables.
	setTableRowCount	Sets how many rows should be allocated to new tables.
	setTableRowHeight	Sets the default height of rows in newly created tables.
	setTableShape	Sets the default value of the **Shape** property of new tables.
	setTablesScrollable	Sets a value indicating whether users are allowed to scroll new tables.
	setTag	Associates a custom data with this diagram.
	setTextColor	Sets the default text color to be assigned to new items.
	setTextFormat	Sets the default format and alignment of the text of new items.
	setTheme	Sets the theme associated with the diagram.
	setToolTip	Sets the tooltip text that is displayed when the pointer hovers over an unoccupied area of the diagram.

	setValidityChecks	
	suspendLinkRouter	Called when the control starts a batch update operation that might affect many links. The diagram collects links specified through route and routeAllLinks calls and defers finding their paths to when **resumeLinkRouter** is called.
	updateRuntimeIndices	Assigns consecutive values to the RuntimeIndex property of items.
S	with	Returns a DiagramBuilder object used to configure and create new Diagram instances.

Protected Methods

	Name	Description
	getValue	Gets the effective value of the style property with the specified name.

Diagram Class
com.mindfusion.diagramming Namespace

Diagram Methods

Diagram.add Method

Overload List

Name	Description
Diagram.add (DiagramItem)	Adds a new item to the diagram.

Diagram.add (DiagramItem, boolean)	Adds a new item to the diagram and optionally selects it.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.add Method (DiagramItem)

Adds a new item to the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void add (
    DiagramItem item
)
```

Parameters

item
A DiagramItem that should be added to the diagram.

See Also

add Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.add Method (DiagramItem, boolean)

Adds a new item to the diagram and optionally selects it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void add (
    DiagramItem item,
    boolean select
)
```

Parameters

item
A DiagramItem that should be added to the diagram.

select

true if the item should be selected, otherwise **false**.

See Also

add Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.addDiagramListener Method

Registers listener so that it will receive events when users create, modify or delete diagram items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addDiagramListener (
    DiagramListener listener
)
```

Parameters

listener
An object implementing the DiagramListener interface.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
removeDiagramListener Method
getDiagramListeners Method

Diagram.alignPointToGrid Method

Aligns a point to the alignment grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Point2D.Float alignPointToGrid (
    Point2D.Float point
)
```

Parameters

point
A **Point2D.Float** object representing the point that must be aligned to the grid.

Return Value

A **Point2D.Float** object representing the aligned point.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.arrange Method

Arranges the diagram using the specified graph layout algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    AbstractLayout layout
)
```

Parameters

layout
An instance of an AbstractLayout subclass.

Return Value

true if the diagram has been arranged successfully, or **false** otherwise.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.arrangeLinkLabels Method

Rearranges link labels whose AutoArrange property is enabled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void arrangeLinkLabels ()
```

See Also

Diagram Members
Diagram Class

Diagram.changeUnit Method

Sets new MeasureUnit value and scales the coordinates of diagram items so that their absolute size remains unchanged.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void changeUnit (
    GraphicsUnit newUnit
)
```

Parameters

newUnit
A member of the GraphicsUnit enumeration.

Remarks

This method scales the coordinates of nodes' Bounds values and links' ControlPoints to preserve their size when measured in the new unit. In addition, it scales values of some size and distance -related properties such as HeadShapeSize and CaptionHeight.

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.clearAll Method

Deletes all items from the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void clearAll ()
```

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.copySelection Method

Creates a copy of the currently selected objects and groups.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SelectionCopy copySelection (
    Diagram source,
    boolean unconnectedLinks,
    boolean copyGroups
)
```

Parameters

source
The source diagram.

unconnectedLinks
true to allow copying unconnected links; otherwise, **false**.

copyGroups
true to copy group information; otherwise, **false**.

Return Value

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.createImage Method

Creates a bitmap image representing the diagram contents.

Overload List

Name	Description
Diagram.createImage ()	Creates a bitmap image representing the diagram contents.
Diagram.createImage (int)	Creates a bitmap image representing the diagram contents.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.createImage Method ()

Creates a bitmap image representing the diagram contents.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Image createImage ()
```

Return Value

java.awt.Image object containing a representation of the diagram.

See Also

createImage Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.createImage Method (int)

Creates a bitmap image representing the diagram contents.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public BufferedImage createImage (
    int imageType
)
```

Parameters

imageType
One of the BufferedImage type constants.

Return Value

A **java.awt.image.BufferedImage** object containinga representation of the diagram.

See Also

createImage Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.createItem Method

Implements the IItemFactory interface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Object createItem (
    String itemClass
)
```

Parameters

itemClass
The class string id of the item to create.

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.createStyledText Method

Creates a styled text object for the specified text string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Object createStyledText (
    Graphics2D graphics,
    String text,
    Font font
)
```

Parameters

graphics

text

font

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.createThemeFromDefaults Method

Creates a Theme object representing the default properties of the diagram. This method is only for compatibility with files saved with versions earlier than 4.0.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Theme createThemeFromDefaults ()
```

Return Value

An instance of the Theme class.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.destroyGroup Method

Destroys the specified group. The group items are not deleted, unless its setAutoDeleteItems method is calles.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void destroyGroup (
    Group group
)
```

Parameters

group
The Group to destroy.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.draw Method

Renders the diagram on the specified **Graphics2D** object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public void draw (
    Graphics2D graphics,
    RenderOptions options,
    Rectangle2D clipRect
)
```

Parameters

graphics
The **Graphics2D** surface to draw the diagram on.

options
A RenderOptions object specifying options for the drawing operation.

clipRect
A **Rectangle2D** specifying the current clipping rectangle.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.drawAlignmentGuides Method

Draws the current alignment guides.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void drawAlignmentGuides (
    Graphics2D graphics
)
```

Parameters

graphics
A **Graphics2D** instance.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.drawLayer Method

Renders all items of a layer to the specified graphics.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void drawLayer (
    Graphics2D g,
    Rectangle2D backgroundRect,
    int layerIndex,
    RenderOptions options
)
```

Parameters

g

backgroundRect

layerIndex

options

See Also

Diagram Members

Diagram.drawString Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void drawString (
    String text,
    Graphics2D graphics,
    Font font,
    Brush brush,
    Rectangle2D bounds,
    TextFormat format
)
```

Parameters

text

graphics

font

brush

bounds

format

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.drawStyledText Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void drawStyledText (
    Graphics2D graphics,
    String text,
    Font font,
    Rectangle2D textBounds,
    TextFormat format,
    Brush textBrush
)
```

Parameters

graphics

text

font

textBounds

format

textBrush

See Also

Diagram Members

Syntax

Java

```
public void enumTopLevelByReverseZ (
    Point2D hitTest,
    ProcessItem<DiagramItem> processItem
)
```

Parameters

hitTest

processItem

See Also

enumTopLevelByReverseZ Method Overload List
Diagram Members

Diagram.executeCommand Method

Executes a command and saves it in the undo/redo history.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void executeCommand (
    Command cmd
)
```

Parameters

cmd
The Command to execute.

See Also

Diagram Members

Diagram.findGroup Method

Finds the group that has the specified tag.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Group findGroup (
    Object tag
)
```

Parameters

tag
An Object to which the tag of the found group should be equal.

Return Value

A reference to the found Group.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.findLink Method

Finds the link that has the specified tag.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink findLink (
    Object tag
)
```

Parameters

tag
An Object to which the tag of the found link should be equal.

Return Value

A reference to the found DiagramLink.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.findLinkById Method

Finds the link that has the specified id value.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink findLinkById (
    Object id
)
```

Parameters

id
An Object to which the id of the found link should be equal.

Return Value

A reference to the found DiagramLink.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.findNode Method

Finds the node that has the specified tag.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode findNode (
    Object tag
)
```

Parameters

tag
An **Object** to which the tag of the found node should be equal.

Return Value

A reference to the found DiagramNode.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.findNodeById Method

Finds the node that has the specified id value.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode findNodeById (
    Object id
)
```

Parameters

id
An Object to which the id of the found node should be equal.

Return Value

A reference to the found DiagramNode.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getActiveItem Method

Gets the active item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem getActiveItem ()
```

Return Value

A reference to the active DiagramItem.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getActiveItemHandlesStyle Method

Gets the visual style of the manipulation handles displayed around the active item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public HandlesVisualStyle getActiveItemHandlesStyle ()
```

Return Value

A HandlesVisualStyle object representing the visual style of theselection handles of the active item.

Example

This style object provides Pen and Brush attributes that let you customize the appearance of adjustment handles drawn around the active item.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getActiveLayer Method

Gets the zero-based index of the active layer.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getActiveLayer ()
```

Return Value

An integer value that specifies the index of the active layer.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getAdjustmentHandlesSize Method

Gets the size of selection handles.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getAdjustmentHandlesSize ()
```

Return Value

A float value specifying the size of selection handles.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getAlignmentGuidePen Method

Gets the pen used to draw alignment guides.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Pen getAlignmentGuidePen ()
```

Return Value

A Pen instance.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
setAlignmentGuidePen method

Diagram.getAlignToGrid Method

Gets a value indicating whether items are aligned to the alignment grid while users draw them.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAlignToGrid ()
```

Return Value

true if items are automatically aligned to the grid, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getAllowLinksRepeat Method

Gets a value indicating whether users are allowed to draw more than one links between the same nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAllowLinksRepeat ()
```

Return Value

true if users are allowed to draw more than one link between the same nodes, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getAllowMultipleResize Method

Gets whether multiple selected nodes can be resized simultaneously.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowMultipleResize ()
```

Return Value

true to let the user resize multiple selected nodes; otherwise, **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getAllowSelfLoops Method

Gets whether users are allowed to draw reflexive links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowSelfLoops ()
```

Return Value

true if users are allowed to draw reflexive links, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getAllowSplitLinks Method

Gets whether link segments can be added and removed interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAllowSplitLinks ()
```

Return Value

true to make new links splittable by default, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getAllowUnanchoredLinks Method

Gets a value indicating whether users are allowed to attach links to nodes that do not have any anchor points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAllowUnanchoredLinks ()
```

Return Value

true if users are allowed to attach links to nodes that do not have anchor points, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getAllowUnconnectedLinks Method

Gets a value indicating whether users are allowed to draw unconnected links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAllowUnconnectedLinks ()
```

Return Value

true if users are allowed to draw unconnected links, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getAutoAlignDistance Method

Gets the maximal horizontal or vertical distance at which a node aligns to the borders of other nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getAutoAlignDistance ()
```

Return Value

A float value specifying the maximal distance.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
setAutoAlignDistance Method

Diagram.getAutoAlignNodes Method

Gets whether nodes should automatically align to the borders of other nodes during user interaction.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAutoAlignNodes ()
```

Return Value

true if nodes should align, otherwise **false**. The default value is **false**.

See Also

Diagram Members
Diagram Class

Diagram.getAutoCloseDistance Method

Gets the maximum distance between first and last points of a FreeFormNode for which the node's outline is closed automatically.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getAutoCloseDistance ()
```

Return Value

A **float** value.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
Closed Property

Diagram.getAutoDeleteLinks Method

Gets whether links are deleted automatically when their Origin or Destination is deleted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAutoDeleteLinks ()
```

Return Value

true if links are deleted automatically, or **false** otherwise. The default value is **true**.

Remarks

If this property is set to **false**, deleting a node will leave its links in the diagram as unconnected links.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
DelKeyAction Property

Diagram.getAutoResize Method

Gets a value specifying whether the document scrollable area is resized automatically when users draw items near the edges of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AutoResize getAutoResize ()
```

Return Value

A member of the AutoResize enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getAutoSnapDistance Method

Specifies the maximum distance at which links auto-snap to nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getAutoSnapDistance ()
```

Return Value

A float value specifying the maximum distance.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getAutoSnapLinks Method

Gets the default value for the AutoSnapToNode property of new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAutoSnapLinks ()
```

Return Value

true to snap links to nearest node, otherwise **false**; the default value is **false**.

Remarks

Only nodes at a distance smaller than AutoSnapDistance are considered. A link does not snap to its current origin or destination nodes if that would create a self-loop.

com.mindfusion.diagramming Namespace

Diagram.getBackBrush Method

Gets the diagram's background brush.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getBackBrush ()
```

Return Value

The background Brush.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getBackgroundImage Method

Gets the background image.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Image getBackgroundImage ()
```

Return Value

The background **java.awt.Image** object.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getBackgroundImageAlign Method

Gets how the background image is positioned relatively to the scrollable area of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ImageAlign getBackgroundImageAlign ()
```

Return Value

A member of the ImageAlign enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getBackgroundImageUrl Method

Gets the URL of the background image.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getBackgroundImageUrl ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getBookmarks Method

Gets a collection of all saved bookmarks / areas of interest defined in this diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ObservableList<DiagramBookmark> getBookmarks ()
```

Return Value

An ObservableList of DiagramBookmark objects.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getBounds Method

Gets the bounds of the scrollable area of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Rectangle2D.Float getBounds ()
```

Return Value

A **Rectangle2D.Float** object representing the current diagram scrollable region.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getBoundsPen Method

Gets the pen with which the diagram bounds are drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Pen getBoundsPen ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getCellCustomDraw Method

Gets the default type of custom painting applied to cells of new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public CustomDraw getCellCustomDraw ()
```

Return Value

A member of the CustomDraw enumeration. The default is **CustomDraw.None**.

Remarks

This value is assigned to the CellCustomDraw property of new tables.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getCellFrameStyle Method

Gets the default style of the cell frames of new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public CellFrameStyle getCellFrameStyle ()
```

Return Value

A member of the CellFrameStyle enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getClsidTable Method

Gets the table of registered item identifiers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public HashMap<String, ClassDescriptor> getClsidTable ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getContainerCaption Method

Gets the default value for the Caption attribute of containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public String getContainerCaption ()
```

Return Value

A **String** containing the default caption string.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getContainerCaptionHeight Method

Gets the default value for the CaptionHeight attribute of containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getContainerCaptionHeight ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getContainerHighlightPen Method

Gets the default value for the HighlightPen attribute of containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Pen getContainerHighlightPen ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getContainerMargin Method

Gets the default value for the Margin attribute of containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getContainerMargin ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getContainerMinimumSize Method

Gets the default value for the MinimumSize attribute of containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Dimension2D getContainerMinimumSize ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getContainerNodeStyle Method

Gets the theme-level style for container nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ContainerNodeStyle getContainerNodeStyle ()
```

Return Value

A ContainerNodeStyle instance.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getContainersFoldable Method

Gets the default value for the Foldable attribute of containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getContainersFoldable ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getContentBounds Method

Returns the smallest rectangle that bounds all diagram items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getContentBounds (
    boolean forPrint,
    boolean onlyVisible
)
```

Parameters

forPrint
Specifies whether only printable items should be considered.

onlyVisible
Specifies whether only visible items should be considered.

Return Value

A Rectangle2D instance representing the smallest rectangle that bounds all diagram items.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getCrossingRadius Method

Gets the radius of the shapes drawn at link crossing points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getCrossingRadius ()
```

Return Value

A float value specifying the size of the shapes drawn at link intersection points.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getDefaultControlType Method

Gets the type of components that will be hosted by default in newly created ControlNode objects.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Class<? extends Component> getDefaultControlType ()
```

Return Value

A **Class** instance specifying a **java.awt.Component** -derived type.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
setDefaultControlType Method

Diagram.getDefaultShape Method

Gets the default shape of nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Shape getDefaultShape ()
```

Return Value

The default Shape object that is assigned to newly created nodes.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getDiagramLinkStyle Method

Gets the theme-level style for diagram links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramLinkStyle getDiagramLinkStyle ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getDiagramListeners Method

Gets the list of currently registered event listeners.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public EventListenerList getDiagramListeners ()
```

Return Value

A **javax.swing.event.EventListenerList** instance.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
addDiagramListener Method

Diagram.getDiagramStyle Method

Gets the theme-level style for the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramStyle getDiagramStyle ()
```

Return Value

A DiagramStyle instance.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getDirty Method

Indicates whether the diagram has changed since the last save.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getDirty ()
```

Return Value

true if there diagram has changed since the last save, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getDisabledHandlesStyle Method

Gets the visual style of disabled manipulation handles.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public HandlesVisualStyle getDisabledHandlesStyle ()
```

Return Value

A HandlesVisualStyle object representing the visual style ofdisabled selection handles.

Remarks

This style object provides Pen and Brush attributes that let you customize the appearance of disabled adjustment handles.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getDummy Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DummyNode getDummy ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getDynamicLinks Method

Gets a value indicating whether links automatically update their end points positions so that they will always point towards the node centers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getDynamicLinks ()
```

Return Value

true if newly created links are set to update their end point positions automatically, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getEffectiveBackBrush Method

Gets the currently effective background brush of the diagram. This property returns the BackBrush if it is not null, or the brush from the associated style or theme otherwise.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getEffectiveBackBrush ()
```

Return Value

A Brush instance.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getEnableLanes Method

Gets whether lanes are enabled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getEnableLanes ()
```

Return Value

true if lanes are enabled; otherwise, **false**. The default is **false**.

Remarks

The swimlane grid can be customized through the Grid instance returned by getLaneGrid.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
setEnableLanes method

Diagram.getEnableSpatialIndex Method

Gets whether to index item positions for faster hit-testing and viewport clipping queries.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getEnableSpatialIndex ()
```

Return Value

true to enable spatial indexing, or **false** otherwise. The default value is **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getEnableStyledText Method

Gets a value indicating whether new nodes display richly formatted text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getEnableStyledText ()
```

Return Value

true if text formatting tags are processed by default, otherwise false.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getExpandButtonAction Method

Gets what should happen when a user clicks the +/- button that is displayed near expandable nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ExpandButtonAction getExpandButtonAction ()
```

Return Value

A member of the ExpandButtonAction enumeration; the default value is **ExpandTreeBranch**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getExpandButtonPosition Method

Gets where expand/collapse buttons are located relatively to their nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ExpandButtonPosition getExpandButtonPosition ()
```

Return Value

A member of the ExpandButtonPosition enumeration. The default is **OuterRight**.

Remarks

If diagram links tend to flow vertically, it would be useful to have the expand/collapse buttons stay at the left- or right-hand side of nodes. If diagram links tend to flow horizontally, choose position for expand buttons such that they stay above or below nodes. That will prevent button icons from being overlapped by links.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
setExpandButtonPosition Method
getExpandButtonAction Method
getNodesExpandable Method

Diagram.getExpandOnIncoming Method

Gets which direction of links is considered the tree direction when expanding or collapsing diagram branches.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getExpandOnIncoming ()
```

Return Value

true is tree branches are expanded in the direction of incoming links, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getFactory Method

Gets a Factory instance that lets you add programmatically new items to the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Factory getFactory ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getFocusedComponent Method

Gets the component within this diagram which is currently holding the input focus.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ComponentBase getFocusedComponent ()
```

Return Value

An instance of ComponentBase -derived class that should receive keyboard events.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getFocusedManipulator Method

Gets the manipulator currently holding the input focus.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Manipulator getFocusedManipulator ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getFoldedContainerSize Method

Gets the size of folded containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Dimension2D getFoldedContainerSize ()
```

Return Value

A **Dimension2D** instance specifying the size of folded containers. The default value is **null**.

Remarks

The FoldedSize property of new containers is initialized with this value.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getFont Method

Gets the default font for new diagram items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Font getFont ()
```

Return Value

A **Font** object.

See Also

Diagram Members
Diagram Class

Diagram.getFormatBeingLoaded Method

Returns the file format id of the file currently being loaded.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static int getFormatBeingLoaded ()
```

Return Value

An integer value specifying the file version.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getFreeFormAttractDistance Method

Gets the radius around dragged free-form adjustment handle in which other points of FreeFormNode are modified too.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getFreeFormAttractDistance ()
```

Return Value

A **float** value.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getFreeFormTargets Method

Gets an array of Shape objects used to replace FreeFormNode instances with ShapeNode ones when Behavior is set to LinkFreeShapes or DrawFreeShapes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Shape[] getFreeFormTargets ()
```

Return Value

A Shape array.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getGridColor Method

Gets the color of the alignment grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Color getGridColor ()
```

Return Value

A **Color** object representing the grid color.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getGridOffsetX Method

Gets the horizontal offset of the first point of the alignment grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getGridOffsetX ()
```

Return Value

A float value that specifies the horizontal grid offset.

Remarks

The property specifies the offset of the first point of the alignment grid. The default value NaN makes the grid start at offset GridSizeX / 2.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
getShowGrid Method
getGridOffsetY Method
getMeasureUnit Method

Diagram.getGridOffsetY Method

Gets the vertical offset of the first point of the alignment grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getGridOffsetY ()
```

Return Value

A float value that specifies the vertical grid offset.

Remarks

The property specifies the offset of the first point of the alignment grid. The default value NaN makes the grid start at offset GridSizeY / 2.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

getMeasureUnit Method

Diagram.getGridSizeX Method

Gets the horizontal distance between grid points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getGridSizeX ()
```

Return Value

An integer value specifying the horizontal distance between grid points.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getGridSizeY Method

Gets the vertical distance between grid points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getGridSizeY ()
```

Return Value

An integer value specifying the vertical distance between grid points.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getGridStyle Method

Gets the appearance style of the alignment grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public GridStyle getGridStyle ()
```

Return Value

A member of the GridStyle enumeration.

See Also

Diagram Members
Diagram Class

Diagram.getGroups Method

Gets a collection of all groups in the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public GroupList getGroups ()
```

Return Value

A GroupList containing all groups in the diagram.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getHitTestPriority Method

Gets a value indicating the order in which items are hit-tested.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public HitTestPriority getHitTestPriority ()
```

Return Value

A member of the HitTestPriority enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getHoverDelay Method

Gets the time in milliseconds that mouse pointer should remain stationary before reporting hover events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getHoverDelay ()
```

Return Value

An integer value specifying milliseconds. The default value is 1500.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
nodeHovered Event
linkHovered Event
TrackPointedItem Property

Diagram.getImageDpiX Method

Specifies the default resolution of images.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getImageDpiX ()
```

Return Value

Remarks

It is used for conversion between image (pixel) coordinates and document coordinates. Some image formats contain this information and some not. Java has no standard way to obtain it, so this property is used instead. Zero means use default value. The default value is obtained from **Toolkit.getScreenResolution**.

See Also

public int getImageDpiY ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getInteraction Method

Gets an InteractionState instance representing the current action being carried out by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public InteractionState getInteraction ()`

Return Value

The current InteractionState.

Diagram.getItemAt Method

Overload List

Name	Description
Diagram.getItemAt (Point2D, boolean)	Returns the top-most item that contains the specified point.
Diagram.getItemAt (Point2D, boolean, boolean)	Returns the top-most item that contains the specified point.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getItemAt Method (Point2D, boolean)

Returns the top-most item that contains the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem getItemAt (
    Point2D point,
    boolean excludeLocked
)
```

Parameters

point
A Point2D object specifying where to look for an item.

excludeLocked
true if locked items should be excluded from the search, otherwise **false**.

Return Value

The DiagramItem found at the specified position.

See Also

getItemAt Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getItemAt Method (Point2D, boolean, boolean)

Returns the top-most item that contains the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem getItemAt (
    Point2D point,
    boolean excludeLocked,
    boolean excludeModified
)
```

Parameters

point
A Point2D.Float object specifying where to look for an item.

excludeLocked
true if locked items should be excluded from the search, otherwise **false**.

excludeModified
true if modified items should be excluded from the search, otherwise **false**.

Return Value

The DiagramItem found at the specified position.

See Also

getItemAt Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getItems Method

Gets a collection of all items in the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItemList getItems ()
```

Return Value

An DiagramItemList containing all items in the diagram.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLaneGrid Method

Gets the Grid instance that represents the lane grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Grid getLaneGrid ()
```

Return Value

An instance of the Grid class.

Remarks

The Grid object gives you full control over the lane grid. For example, it lets you set the number of rows and columns in the grid, add headers, customize the appearance, subscribe to events and so on.

To show the swimlane grid, set the EnableLanes property to **true**.

Diagram.getLayers Method

Gets a list of the layers in the current diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public List<Layer> getLayers ()
```

Return Value

A list of Layer objects.

Diagram.getLinkAt Method

Overload List

Name	Description
Diagram.getLinkAt (Point2D, double, boolean)	Returns the top-most link that passes near the specified point.
Diagram.getLinkAt (Point2D, double, boolean, boolean)	Returns the top-most link that passes near the specified point.
Diagram.getLinkAt (Point2D, double, boolean, boolean, ByRef)	Returns the top-most link that passes near the specified point.
Diagram.getLinkAt (Point2D.Float, float)	Returns the top-most link that passes near the specified point.

Diagram.getLinkAt Method (Point2D, double, boolean)

Returns the top-most link that passes near the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink getLinkAt (
    Point2D point,
    double maxDist,
    boolean exclLocked
)
```

Parameters

point
A **Point2D** object specifying where to look for a link.

maxDist
Specifies the maximum allowed distance from the point to the link.

exclLocked
true if locked links should be excluded from the search, otherwise **false**.

Return Value

The DiagramLink found at the specified position.

See Also

getLinkAt Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkAt Method (Point2D, double, boolean, boolean)

Returns the top-most link that passes near the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink getLinkAt (
    Point2D point,
    double maxDist,
    boolean excludeLocked,
    boolean excludeModified
)
```

Parameters

point
A **Point2D** object specifying where to look for a link.

maxDist
Specifies the maximum allowed distance from the point to the link.

excludeLocked
true if locked links should be excluded from the search, otherwise **false**.

excludeModified
true if modified links should be excluded from the search, otherwise **false**.

Return Value

The DiagramLink found at the specified position.

See Also

getLinkAt Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkAt Method (Point2D, double, boolean, boolean, ByRef<Integer>)

Returns the top-most link that passes near the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink getLinkAt (
    Point2D point,
    double maxDist,
    boolean excludeLocked,
    boolean excludeModified,
    ByRef<Integer> segmNum
)
```

Parameters

point
A Point2D objectspecifying where to look for a link.

maxDist
Specifies the maximum allowed distancefrom the point to the link.

excludeLocked
true if locked links should be excluded from the search, otherwise **false**.

excludeModified
true if links being modified should be excluded from the search, otherwise **false**.

segmNum
An output parameter that returns the index of the link segment that is closest to the specified point

Return Value

The DiagramLink found at the specified position.

See Also

getLinkAt Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkAt Method (Point2D.Float, float)

Returns the top-most link that passes near the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink getLinkAt (
    Point2D.Float point,
    float maxDist
)
```

Parameters

point
A **Point2D.Float** object specifying where to look for a link.

maxDist
Specifies the maximum allowed distance from the point to the link.

Return Value

The DiagramLink found at the specified position.

See Also

getLinkAt Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkBaseShape Method

Gets the default shape displayed at the origin of new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Shape getLinkBaseShape ()
```

Return Value

A Shape instance that represents an arrowhead shape. The default is None.

Remarks

This property specifies the default shape displayed as arrowhead at the links' origin points. The ArrowHeads class exposes several predefined shapes as static properties.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkBaseShapeSize Method

Gets the default size of the shape displayed at the origin of new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getLinkBaseShapeSize ()
```

Return Value

A float value specifying the default size of the shapes displayed at the link base.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkBranchIndicator Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public BranchIndicator getLinkBranchIndicator ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkBrush Method

Gets the default brush assigned to new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getLinkBrush ()
```

Return Value

A Brush object that is assigned to newly created links.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkCascadeOrientation Method

Gets the default orientation of the first segments of cascading links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Orientation getLinkCascadeOrientation ()
```

Return Value

A member of the Orientation enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkCrossings Method

Gets what shapes are drawn at link crossing points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public LinkCrossings getLinkCrossings ()
```

Return Value

A member of the LinkCrossings enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkCustomDraw Method

Gets the default type of custom painting done on links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CustomDraw getLinkCustomDraw ()
```

Return Value

A member of the CustomDraw enumeration. The default is **None**.

Remarks

This property specifies whether and how custom painting of links is performed. Its value is assigned to the CustomDraw property of new links.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkEndsMovable Method

Gets a value indicating that users are allowed to move the end points of a link after the link is created.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getLinkEndsMovable ()
```

Return Value

true if users are allowed to move the end points of new links, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkHandlesStyle Method

Gets the default style of link selection handles.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public HandlesStyle getLinkHandlesStyle ()
```

Return Value

A member of the HandlesStyle enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkHeadShape Method

Gets the default shape displayed as head of new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Shape getLinkHeadShape ()
```

Return Value

A Shape instance that represents an arrowhead shape. The default is Arrow.

Remarks

This property specifies the default shape displayed as arrowhead at the links' end points. The ArrowHeads class exposes several predefined shapes as static properties.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkHeadShapeSize Method

Gets the default size of the shape displayed as arrowhead of new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getLinkHeadShapeSize ()
```

Return Value

A float value specifying the default arrowhead size.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkIntermediateShape Method

Gets the default shape displayed at the middle of links segments.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Shape getLinkIntermediateShape ()
```

Return Value

A Shape instance that represents an arrowhead shape. The default is None.

Remarks

The property specifies default shape to be displayed at the middle of each segment of new links. It facilitates users by following the path of a link across the diagram, especially for longer links in large documents. The ArrowHeads class exposes several predefined shapes as static properties.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkIntermediateShapeSize Method

Gets the default size of the shape displayed at the middle of links segments.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getLinkIntermediateShapeSize ()
```

Return Value

A float value specifying the default size of the shapes displayed in the middles of link segments.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkPen Method

Gets the default pen assigned to new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Pen getLinkPen ()
```

Return Value

A Pen object that is assigned to newly created links.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkRouter Method

Gets the component used to find paths for auto-routed links when diagram nodes are added or their positions change.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public LinkRouter getLinkRouter ()
```

Return Value

An instance of a class implementing the LinkRouter interface.

Remarks

The default value is a CompositeRouter instance that chains PatternRouter and GridRouter.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
AutoRoute Property
RouteLinks Property
routeAllLinks Method
CompositeRouter Class
GridRouter Class
PatternRouter Class
QuickRouter Class

Diagram.getLinks Method

Gets a collection of all links in the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkList getLinks ()
```

Return Value

An DiagramLinkList containing all links in the diagram.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinksAt Method

Returns the links that contain the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkList getLinksAt (
    Point2D.Float point
```

```
)
```

Parameters

point
A Point2D object specifying the location at which to look for links.

Return Value

A DiagramLinkList instance containing the links lying at the specified location.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkSegments Method

Gets the default number of link segments.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getLinkSegments ()
```

Return Value

An integer value specifying the default number of link segments.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkShape Method

Gets the default shape of links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkShape getLinkShape ()
```

Return Value

A member of the LinkShape enumeration. The default value is **Polyline**.

Remarks

Use this property to specify how new links are composed and what they look like. The segments of a link could be curves or straight lines, and they might be restricted to be horizontal / vertical only.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinksRetainForm Method

Gets a value indicating whether new links are set to maintain their shapes while the nodes they connect are moved around.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getLinksRetainForm ()
```

Return Value

true if newly created links keep their shapes, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getLinkText Method

Gets the default text assigned to new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getLinkText ()
```

Return Value

A **String** containing the default link text.

See Also

Diagram Members
Diagram Class

Diagram.getLinkTextStyle Method

Gets the default placement and orientation of links' text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkTextStyle getLinkTextStyle ()
```

Return Value

A member of the LinkTextStyle enumeration. The default value is **Center**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getMeasureUnit Method

Gets the current unit of measure.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public GraphicsUnit getMeasureUnit ()
```

Return Value

A member of the GraphicsUnit enumeration. The default value is Millimeter.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getMergeThreshold Method

Gets the maximum distance between adjacent control points of a link at which the respective segments can be merged.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getMergeThreshold ()
```

Return Value

A float value specifying the maximal merge distance.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getNearestNode Method

Returns the nearest node whose bounding rectangle is intersected by the circle, defined by origin point and radius.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramNode getNearestNode (
    Point2D point,
    float maxDistance,
    DiagramNode ignored
)
```

Parameters

point
A Point2D object specifying where to look for nodes.

maxDistance
The maximum distance from point where to look for nodes.

ignored
Exclude this node from the search.

Return Value

The DiagramNode closest to point if one is found within the specified distance.

Remarks

The last argument is useful when calling this method from nodeCreated and nodeModified handlers and the affected node should not be included in the search.

See Also

Diagram.getNodeAt Method

Overload List

Name	Description
Diagram.getNodeAt (Point2D)	Returns the top-most node that contains the specified point.
Diagram.getNodeAt (Point2D, boolean)	Returns the topmost node that lies at the specified position.
Diagram.getNodeAt (Point2D, boolean, boolean)	Returns the top-most node that contains the specified point.
Diagram.getNodeAt (Point2D, float)	Returns the top-most node that contains the specified point.

See Also

com.mindfusion.diagramming Namespace

Diagram.getNodeAt Method (Point2D)

Returns the top-most node that contains the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode getNodeAt (
    Point2D point
)
```

Parameters

point
A Point2D object specifying where to look for a node.

Return Value

The DiagramNode found at the specified position.

See Also

getNodeAt Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getNodeAt Method (Point2D, boolean)

Returns the topmost node that lies at the specified position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode getNodeAt (
    Point2D point,
    boolean excludeLocked
)
```

Parameters

point
A **Point2D** object specifying where to look for a node.

excludeLocked
Specifies whether locked nodes should be excluded from the search.

Return Value

A DiagramNode instance if a node lies at the specified location, otherwise **null**.

See Also

getNodeAt Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getNodeAt Method (Point2D, boolean, boolean)

Returns the top-most node that contains the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode getNodeAt (
    Point2D point,
    boolean excludeLocked,
    boolean excludeSelected
)
```

Parameters

point
A **Point2D** object specifying where to look for a node.

excludeLocked
true if locked items should be excluded from the search, otherwise **false**.

excludeSelected

true if selected items should be excluded from the search, otherwise **false**.

Return Value

The DiagramNode found at the specified position.

See Also

getNodeAt Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getNodeAt Method (Point2D, float)

Returns the top-most node that contains the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode getNodeAt (
    Point2D point,
    float threshold
)
```

Parameters

point
A **Point2D** object specifying where to look for a node.

threshold
Allowed distance from the node.

Return Value

The DiagramNode found at the specified position.

See Also

getNodeAt Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getNodeEffects Method

Gets a collection with all effects applied to the nodes of this diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public List<NodeEffect> getNodeEffects ()
```

Return Value

A list of NodeEffect objects.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getNodes Method

Gets a collection of all nodes in the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNodeList getNodes ()
```

Return Value

A ShapeNodeList containing all nodes in the diagram.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getNodesAt Method

Returns the nodes that contain the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNodeList getNodesAt (
    Point2D.Float point
)
```

Parameters

point
A **Point2D.Float** object specifying where to look for nodes.

Return Value

A DiagramNodeList containing all nodes found at the specified position.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getNodesExpandable Method

Gets whether the tree branches that start from new nodes are expandable by default.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getNodesExpandable ()
```

Return Value

true if nodes are expandable by default, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getRecursiveExpand Method

Gets whether tree branches are expanded recursively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getRecursiveExpand ()
```

Return Value

true if tree branches are expanded recursively.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getRenderOptions Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public RenderOptions getRenderOptions ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getRestrictItemsToBounds Method

Gets a value indicating whether users are allowed to move items outside the currently defined document bounds.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public RestrictToBounds getRestrictItemsToBounds ()
```

Return Value

A member of the RestrictToBounds enumeration. The default value is **Intersection**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getRoundedLinks Method

Gets if the joins between segments of Polyline and Cascading links should be rounded.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getRoundedLinks ()
```

Return Value

true to use rounded segment joins; otherwise, **false**. The default is **false**.

Remarks

The value of this property is considered when drawing links whose Shape is set to Polyline or Cascading. If the property is enabled, the joins between the segments of all such links are drawn as arcs, whose radius equals the value of RoundedLinksRadius.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getRoundedLinksRadius Method

Gets the radius of arc joins of rounded links' segments.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getRoundedLinksRadius ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getRouteLinks Method

Gets a value indicating whether links should avoid nodes by going the shortest path from their origin to their destination without crossing any other nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getRouteLinks ()
```

Return Value

true to route links, or **false** otherwise. The default is **false**.

Remarks

The value of RouteLinks is used to initialize the AutoRoute property of new links. If a node is moved or resized, all links that intersect with its new position and have AutoRoute enabled are rerouted. Keep in mind that number of link segments will probably change when routing is enabled.

RoutingOptions allows tuning the routing algorithm. The most important options are the cost values exposed as LengthCost, TurnCost and CrossingCost properties. They greatly influence the shape of the generated route.

com.mindfusion.diagramming Namespace
routeAllLinks Method
DynamicLinks Property
LinkCrossings Property
LinkRouter Property

Diagram.getRoutingOptions Method

Gets a RoutingOptions instance that lets you set various attributes of link routing algorithms.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public RoutingOptions getRoutingOptions ()
```

Return Value

A reference to a RoutingOptions object.

Remarks

RoutingOptions values are considered mainly by GridRouter.

Diagram.getSelectedItemHandlesStyle Method

Gets the visual style of the manipulation handles displayed around selected items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public HandlesVisualStyle getSelectedItemHandlesStyle ()
```

Return Value

A HandlesVisualStyle object representing the visual style ofselection handles.

Remarks

This style object provides Pen and Brush attributes that let you customize the appearance of adjustment handles drawn around selected items.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getSelection Method

Gets a Selection instance representing the current selection.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Selection getSelection ()
```

Return Value

A reference to the Selection object.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getSelectionOnTop Method

Gets a value indicating whether selected items are drawn on top of the non-selected ones.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getSelectionOnTop ()
```

Return Value

true if selected items are drawn above non-selected ones, otherwise **false**.

Diagram.getShadowBrush Method

Gets .the default brush used to paint the shadows cast by diagram items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getShadowBrush ()
```

Return Value

A Brush object representing the shadow brush.

Example

An instance of a Brush -derived class. The default is SolidBrush(new Color(110, 110, 140).

See Also

Diagram Members
Diagram Class

Diagram.getShadowOffsetX Method

Gets the default horizontal distance between shadows and the items that cast them.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getShadowOffsetX ()
```

Return Value

A float value specifying the horizontal shadow offset.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getShadowOffsetY Method

Gets the default vertical distance between shadows and the items that cast them.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getShadowOffsetY ()
```

Return Value

A float value specifying the vertical shadow offset.

See Also

Diagram Members
Diagram Class

Diagram.getShapeBrush Method

Gets the default brush assigned to new nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getShapeBrush ()
```

Return Value

A Brush object.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getShapeCustomDraw Method

Gets whether new nodes should be custom drawn and what type of custom drawing will be performed on them.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public CustomDraw getShapeCustomDraw ()
```

Return Value

A member of the CustomDraw enumeration. The default is **None**.

See Also

Diagram.getShapeHandlesStyle Method

Gets the default value for the HandlesStyle property of new shape nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public HandlesStyle getShapeHandlesStyle ()
```

Return Value

A member of the HandlesStyle enumeration. The default value is **SquareHandles**.

See Also

Diagram.getShapePen Method

Gets the default pen assigned to new nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Pen getShapePen ()
```

Return Value

A Pen object.

See Also

Diagram Members

com.mindfusion.diagramming Namespace

Diagram.getShapeText Method

Gets the default text assigned to new nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public String getShapeText ()
```

Return Value

A **String** containing the default box text.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getShowAnchors Method

Gets a value indicating whether anchor points should be shown on screen.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ShowAnchors getShowAnchors ()
```

Return Value

A member of the ShowAnchors enumeration. The default value is **Auto**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getShowDisabledHandles Method

Gets whether disabled manipulation handles are displayed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getShowDisabledHandles ()
```

Return Value

true if disabled selection handles are shown, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getShowGrid Method

Gets a value indicating whether the alignment grid is displayed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getShowGrid ()
```

Return Value

true if the alignment grid is drawn on the screen, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getShowHandlesOnDrag Method

Gets whether selection handles of objects under the pointer are displayed while another object is being modified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getShowHandlesOnDrag ()
```

Return Value

true to display selection handles, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getSnapToAnchor Method

Gets a value indicating when links should snap to anchor points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public SnapToAnchor getSnapToAnchor ()
```

Return Value

A member of the SnapToAnchor enumeration. The default is **OnCreate**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getStyle Method

Gets the style associated with the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramStyle getStyle ()
```

Return Value

An instance of the DiagramStyle class.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getSvgNodeStyle Method

Gets the theme-level style for SVG nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SvgNodeStyle getSvgNodeStyle ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTableBrush Method

Gets the default brush assigned to new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getTableBrush ()
```

Return Value

A Brush object that is assigned to newly created tables.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTableCaption Method

Gets the default caption text assigned to new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getTableCaption ()
```

Return Value

A **String** containing the default table caption.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTableCaptionHeight Method

Gets the default height of the caption bar of new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getTableCaptionHeight ()
```

Return Value

A float value specifying the default height of table caption bars.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTableColumnCount Method

Gets how many columns new tables have by default.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getTableColumnCount ()
```

Return Value

An integer value specifying the default number of table columns.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTableColumnWidth Method

Gets the default width of the columns of new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getTableColumnWidth ()
```

Return Value

A float value specifying the default width of table columns.

See Also

Diagram Members
Diagram Class

Diagram.getTableConnectionStyle Method

Gets how users are allowed to link tables to each other - as integral entities, by rows, or both.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public TableConnectionStyle getTableConnectionStyle ()
```

Return Value

A member of the TableConnectionStyle enumeration. The default value is **Rows**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTableCustomDraw Method

Gets the default type of custom painting applied to new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public CustomDraw getTableCustomDraw ()
```

Return Value

A member of the CustomDraw enumeration.

Remarks

This value is assigned to the CustomDraw property of new tables.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTableHandlesStyle Method

Gets the default style of table selection handles.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public HandlesStyle getTableHandlesStyle ()
```

Return Value

A member of the HandlesStyle enumeration. The default value is **DashFrame**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTableNodeStyle Method

Gets the theme-level style for table nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public TableNodeStyle getTableNodeStyle ()
```

Return Value

An instance of the TableNodeStyle class.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTablePen Method

Gets the default pen assigned to new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Pen getTablePen ()
```

Return Value

A Pen object that is assigned to newly created tables.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTableRowCount Method

Gets how many rows new tables have by default.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getTableRowCount ()
```

Return Value

An integer value specifying the default number of table rows.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTableRowHeight Method

Gets the default height of the row of new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getTableRowHeight ()
```

Return Value

A float value specifying the default height of table rows.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTableShape Method

Gets the default value of the Shape property of new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public SimpleShape getTableShape ()
```

Return Value

A member of the SimpleShape enumeration. The default value is **Rectangle**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTablesScrollable Method

Gets a value indicating whether users are allowed to scroll new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getTablesScrollable ()
```

Return Value

true if the rows of newly created tables can be scrolled up or down, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTag Method

Gets the custom data associated with this diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public Object getTag ()
```

Return Value

An **Object** assigned to the diagram by using setTag.

Remarks

If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the serializeTag event.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTextColor Method

Gets the default text color that is assigned to new items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Color getTextColor ()
```

Return Value

A **Color** object representing the default text color.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTextFormat Method

Gets the default format and alignment of the text of new items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TextFormat getTextFormat ()
```

Return Value

A TextFormat object specifying the text format and alignment.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTheme Method

Gets the theme associated with the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Theme getTheme ()
```

Return Value

An instance of the Theme class.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getToolTip Method

Gets the tooltip text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getToolTip ()
```

Return Value

A **String** containing the tooltip text.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTreeViewNodeStyle Method

Gets the theme-level style for tree view nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public TreeViewNodeStyle getTreeViewNodeStyle ()
```

Return Value

An instance of the TreeViewNodeStyle class.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getTypeTable Method

Gets the table of registered item types.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public HashMap<Class<?>, ClassDescriptor> getTypeTable ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getUndoManager Method

Gets the diagram's UndoManager.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public UndoManager getUndoManager ()
```

Return Value

An UndoManager object.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getValidityChecks Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getValidityChecks ()
```

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.getValue Method

Gets the effective value of the style property with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Object getValue (
    String name
)
```

Parameters

name
The name of a styleable property.

Return Value

The effective value of the specified property.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.handleKeyDown Method

Propagates keyboard input to interested manipulators and components.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean handleKeyDown (
    int keyCode,
    int modifiers
)
```

Parameters

keyCode

modifiers

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.handleKeyPress Method

Propagates keyboard input to interested manipulators.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void handleKeyPress (
    Character keyChar
)
```

Parameters

keyChar

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.handleKeyUp Method

Propagates keyboard input to interested components.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void handleKeyUp (
    int keyCode,
    int modifiers
)
```

Parameters

keyCode

modifiers

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.handlePointerMove Method

Propagates mouse input to interested manipulators.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CursorHint handlePointerMove (
    Point2D point
)
```

Parameters

point
The current pointer position.

Return Value

Remarks

A member of the CursorHint enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.hitTestComponents Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ComponentBase hitTestComponents (
    Point2D point
)
```

Parameters

point

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.hitTestLabels Method

Returns the item label located at specified position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ItemLabel hitTestLabels (
    Point2D point
)
```

Parameters

point
A **Point2D** specifying where to look for labels.

Return Value

An ItemLabel instance, or **null** if there was no label found.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
LinkLabel Class
NodeLabel Class

Diagram.imageToDoc Method

Transforms points from the image coordinate space to the document coordinate space.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Point2D.Float imageToDoc (
    int x,
    int y
)
```

Parameters

x

y

Return Value

A **Point2D.Float** object, which represents the document coordinates of image point.

Remarks

Images have its own coordinate space probably different than device space because they may have different resolution than the screen.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.imageToDocX Method

Converts from image coordinates to document coordinates.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public double imageToDocX (
    int x
)
```

Parameters

x
An image point x coordinate

Return Value

The document x coordinate for the image point.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.imageToDocY Method

Converts from image coordinates to document coordinates.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public double imageToDocY (
    int y
)
```

Parameters

y
An image point y coordinate

Return Value

The document y coordinate for the image point.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.imageUpdate Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean imageUpdate (
    Image img,
    int infoflags,
    int x,
    int y,
    int width,
    int height
)
```

Parameters

img

infoflags

x

y

width

height

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.init Method

Returns a DiagramBuilder object used to configure this Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramBuilder init ()
```

Return Value

A **DiagramBuilder** instance.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.isClassRegistered Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static boolean isClassRegistered (
    Class classType
)
```

Parameters

classType

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.isClientClassRegistered Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static boolean isClientClassRegistered (
    Class classType
)
```

Parameters

classType

Return Value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.isItemInteractive Method

Checks if the specified item can be modified interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean isItemInteractive (
    DiagramItem item
)
```

Parameters

item
The DiagramItem to check.

Return Value

true, if the item is currently visible and unlocked and it is not associated with a hidden or locked layer; otherwise, **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.isItemLocked Method

Checks if the specified item is locked.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean isItemLocked (
    DiagramItem item
)
```

Parameters

item
The DiagramItem to check.

Return Value

true, if the item's Locked property is set to true or if the item is associated with a locked layer; otherwise, **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.isItemVisible Method

Checks if the specified item is currently visible.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean isItemVisible (
    DiagramItem item
)
```

Parameters

item
The DiagramItem to check.

Return Value

true if the item's Visible property is set to true and the item is not associated with a hidden layer; otherwise, **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.items<T> Method

Iterates over diagram items of the desired type

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public <T> Iterable<T> items (
    Class<T> desiredType
)
```

Parameters

desiredType
A Class specifying the type of items to iterate over.

Return Value

Iterable<T> which lets you iterate the specified items

Diagram.loadFrom Method

Overload List

Name	Description
Diagram.loadFrom (InputStream)	Loads the diagram contents from a stream.
Diagram.loadFrom (String)	Loads the diagram contents from a file.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.loadFrom Method (InputStream)

Loads the diagram contents from a stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFrom (
    InputStream in
)
```

Parameters

in
A **java.io.InputStream** from which to load the diagram contents.

See Also

loadFrom Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.loadFrom Method (String)

Loads the diagram contents from a file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFrom (
    String fileName
)
```

Parameters

fileName
The name of the file from which the diagram contents should be loaded.

See Also

loadFrom Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.loadFromJson Method

Overload List

Name	Description
Diagram.loadFromJson (InputStream)	Loads the diagram from a JSON stream.
Diagram.loadFromJson (JsonObject, JsonPersistContext)	Loads the diagram from a JSON object.
Diagram.loadFromJson (String)	Loads the diagram from a JSON file.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.loadFromJson Method (InputStream)

Loads the diagram from a JSON stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromJson (
    InputStream stream
)
```

Parameters

stream
A **java.io.InputStream** instance from which to load diagram data in JSON format.

See Also

loadFromJson Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
saveToJson Method

Diagram.loadFromJson Method (JsonObject, JsonPersistContext)

Loads the diagram from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromJson (
    JsonObject diagramObj,
    JsonPersistContext context
)
```

Parameters

diagramObj
A JsonObject containing diagram data.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

loadFromJson Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
saveToJson Method

Diagram.loadFromJson Method (String)

Loads the diagram from a JSON file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromJson (
    String fileName
)
```

Parameters

fileName
A string specifying the file name or full path.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
saveToJson Method

Diagram.loadFromJsonString Method

Loads the diagram from a JSON-formatted string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromJsonString (
    String json
)
```

Parameters

json
A string created by the saveToJsonString method.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
saveToJsonString Method
loadFromString Method
saveToString Method

Diagram.loadFromString Method

Decodes diagram contents from a string previously created by saveToString.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromString (
    String chartData
)
```

Parameters

chartData
A string containing the serialized diagram contents.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.loadFromXml Method

Overload List

Name	Description
Diagram.loadFromXml (Document, boolean)	Loads the contents of the XML diagram document.
Diagram.loadFromXml (InputSource)	Loads the contents of the XML diagram document.

Diagram.loadFromXml (InputStream)	Loads the contents of the XML diagram document.
Diagram.loadFromXml (String)	Loads the contents of the XML diagram document.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.loadFromXml Method (Document, boolean)

Loads the contents of the XML diagram document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    Document document,
    boolean freeProcessedXml
)
```

Parameters

document
A DOM Document object from which to load the diagram data.

freeProcessedXml

See Also

loadFromXml Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.loadFromXml Method (InputSource)

Loads the contents of the XML diagram document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    InputSource source
)
```

Parameters

source

An **InputSource** where the XML markup should be read from.

See Also

loadFromXml Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.loadFromXml Method (InputStream)

Loads the contents of the XML diagram document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    InputStream stream
)
```

Parameters

stream
A **java.io.InputStream** where the XML markup should be read from.

See Also

loadFromXml Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.loadFromXml Method (String)

Loads the contents of the XML diagram document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    String fileName
)
```

Parameters

fileName
The name of the XML file the data should be read from.

See Also

loadFromXml Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.measureString Method

Measures a text taking into consideration the current affine transform of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension2D measureString (
    String text,
    Font font
)
```

Parameters

text
The **String** to measure.

font
A **Font** that will be used to render the text.

Return Value

This method returns a **Dimension2D** object that represents the size of the string text when drawn with the font parameter and the string parameter.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.pasteSelection Method

Adds the specified items and groups to the specified diagram document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean pasteSelection (
    Diagram doc,
    SelectionCopy data,
    CompositeCmd cmd,
    float dx,
    float dy
)
```

Parameters

doc
A Diagram object to which the items should be added.

data
A SelectionCopy object returned by a previous call to copySelection.

cmd
A CompositeCmd object where the items state should be recorded for later undo or redo.

dx
Horizontal offset of pasted items from their original positions.

dy
Vertical offset of pasted items from their original positions.

Return Value

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.raiseActionRedone Method

Raises the actionRedone event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void raiseActionRedone (
    Command command
)
```

Parameters

command

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.raiseActionUndone Method

Raises the actionUndone event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void raiseActionUndone (
    Command command
)
```

Parameters

command

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.raiseCellTextEdited Method

Raises the DiagramListener.cellTextEdited event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void raiseCellTextEdited (
    Cell cell,
    String oldText,
    String newText,
    int column,
    int row
)
```

Parameters

cell
The Cell whose text has been edited.

oldText
The old text.

newText
The new text.

column
The column index of the cell.

row
The row index of the cell.

com.mindfusion.diagramming Namespace

Diagram.raiseCellTextEditing Method

Raises the cellTextEditing event to validate entering in-place editing mode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean raiseCellTextEditing (
    TableNode table,
    int column,
    int row
)
```

Parameters

table
The TableNode related to the event.

column
The zero-based index of the table column related to the event.

row
The zero-based index of the table row related to the event.

Return Value

true if the event handlers allow the operation, otherwise **false**.

com.mindfusion.diagramming Namespace

Diagram.raiseClicked Method (DiagramItem, Point2D, int)

Raises the appropriate *Clicked (cellClicked, nodeClicked or linkClicked) event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void raiseClicked (
    DiagramItem item,
    Point2D pointerPosition,
    int mouseButton
)
```

Parameters

item
The DiagramItem that has been clicked.

mousePosition
The mouse position in logical diagram coordinates.

mouseButton
Indicates which button has been clicked.

See Also

raiseClicked Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.raiseClicked Method (int, Point2D)

Raises the DiagramListener.clicked event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void raiseClicked (
    int mouseButton,
    Point2D pointerPosition
)
```

Parameters

mouseButton
Indicates which mouse button has been pressed.

mousePosition
The mouse position in logical diagram coordinates.

See Also

raiseClicked Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.raiseDeleting Method

Raises the appropriate *Deleting (linkDeleting or nodeDeleting) event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean raiseDeleting (
    DiagramItem item
)
```

Parameters

item
The DiagramItem that will be deleted.

Return Value

true if the item should be deleted, otherwise **false**.

Diagram.raiseDoubleClicked Method

Overload List

Name	Description
Diagram.raiseDoubleClicked (DiagramItem, Point2D, int)	Raises the appropriate doubleClicked event.
Diagram.raiseDoubleClicked (int, Point2D)	Raises the **DiagramListener.doubleClicked** event.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.raiseDoubleClicked Method (DiagramItem, Point2D, int)

Raises the appropriate doubleClicked event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void raiseDoubleClicked (
    DiagramItem item,
    Point2D pointerPosition,
    int mouseButton
)
```

Parameters

item
The DiagramItem that has been clicked.

mousePosition
The mouse position in logical diagram coordinates.

mouseButton
Indicates which button has been clicked.

See Also

raiseDoubleClicked Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.raiseDoubleClicked Method (int, Point2D)

Raises the DiagramListener.doubleClicked event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void raiseDoubleClicked (
    int mouseButton,
    Point2D pointerPosition
)
```

Parameters

mouseButton
Indicates which mouse button has been pressed.

mousePosition
The mouse position in logical diagram coordinates.

com.mindfusion.diagramming Namespace

Diagram.raiseLinkTextEdited Method

Raises the linkTextEdited event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void raiseLinkTextEdited (
    DiagramLink link,
    String oldText,
    String newText,
    LinkLabel label
)
```

Parameters

link
The DiagramLink whose text has been edited.

oldText
The old text.

newText
The new text.

label
The LinkLabel related to the event.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.raiseLinkTextEditing Method

Raises the linkTextEditing event to validate entering in-place editing mode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean raiseLinkTextEditing (
    DiagramLink link
)
```

Parameters

link
The DiagramLink whose text will be edited.

Return Value

true if the event handlers allow the operation, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.raiseNodeTextEdited Method

Raises the nodeTextEdited event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void raiseNodeTextEdited (
    DiagramNode node,
    String oldText,
    String newText,
    NodeLabel label
)
```

Parameters

node
The node whose text has been edited.

oldText
The old text.

newText
The new text.

label
The NodeLabel related to the event.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.raiseNodeTextEditing Method

Raises the nodeTextEditing event to validate entering inplace edit mode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean raiseNodeTextEditing (
    DiagramNode node,
    NodeLabel label
)
```

Parameters

node
The DiagramNode whose text will be edited.

label
The NodeLabel related to the event.

Return Value

true if the event handlers allow the operation, otherwise **false**.

com.mindfusion.diagramming Namespace

Diagram.raiseTreeCollapsed Method

Raises the treeCollapsed event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void raiseTreeCollapsed (
    DiagramNode root
)
```

Parameters

root
The root node of the collapsed branch.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.raiseTreeExpanded Method

Raises the treeExpanded event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void raiseTreeExpanded (
    DiagramNode root
)
```

Parameters

root
The root node of the expanded branch.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.raiseTreeItemTextEdited Method

Raises the DiagramListener.treeItemTextEdited event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void raiseTreeItemTextEdited (
    TreeViewItem item,
    String oldText,
    String newText
)
```

Parameters

item
A TreeViewItem instance.

oldText
The item's original text.

newText
The item's old text.

Diagram.registerClass Method (Class<?>, String, int)

Registers a diagram item or lane header class for serialization support.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static void registerClass (
    Class<?> classType,
    String classId,
    int classVersion
)
```

Parameters

classType
A Type instance identifying the class.

classId
A class identifier to use when saving and loading objects of the specified type.

classVersion

A revision number of the serialization format.

See Also

registerClass Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.registerClass Method (Class<?>, String, int, String)

Registers a diagram item or lane header class for serialization support.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static void registerClass (
    Class<?> classType,
    String classId,
    int classVersion,
    String clientClass
)
```

Parameters

classType
A Type instance identifying the class.

classId
A class identifier to use when saving and loading objects of the specified type.

classVersion
A revision number of the serialization format.

clientClass
A class identifier to use when serializing objects of the specified type to JSON.

Diagram.registerItemClass Method (Class<?>, String, int)

Registers a diagram item class for serialization support.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static void registerItemClass (
    Class<?> itemClass,
    String classId,
    int classVersion
)
```

Parameters

itemClass
A Class instance identifying the item class.

classId
A class identifier to use when saving and loading items of the specified type.

classVersion
A revision number of the item's class serialization format.

See Also

registerItemClass Method Overload List
Diagram Members

com.mindfusion.diagramming Namespace

Diagram.registerItemClass Method (Class<?>, String, int, String)

Registers a diagram item class for serialization support.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static void registerItemClass (
    Class<?> itemClass,
    String classId,
    int classVersion,
```

```
    String clientClass
)
```

Parameters

itemClass
A Class instance identifying the item class.

classId
A class identifier to use when saving and loading items of the specified type.

classVersion
A revision number of the item's class serialization format.

clientClass
A class identifier to use when serializing item of the specified type to JSON.

Diagram.removeDiagramListener Method

Unregisters listener so that it will no longer receive diagram events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeDiagramListener (
    DiagramListener listener
)
```

Parameters

listener
An object implementing the DiagramListener interface.

com.mindfusion.diagramming Namespace

Diagram.repaint Method ()

Repaints the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void repaint ()
```

See Also

repaint Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.repaint Method (boolean)

Causes the entire visible diagram area to be repainted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void repaint (
    boolean redrawCacheImage
)
```

Parameters

redrawCacheImage

See Also

repaint Method Overload List
Diagram Members

Diagram Class
com.mindfusion.diagramming Namespace

Diagram.repaint Method (Object, Rectangle2D)

Repaints the specified region of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void repaint (
    Object sender,
    Rectangle2D docRect
)
```

Parameters

sender

docRect

See Also

repaint Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.repaint Method (Rectangle2D)

Repaints the specified region of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void repaint (
    Rectangle2D docRect
)
```

Parameters

docRect
A **Rectangle2D** object representing the region of the diagram that should be repainted.

See Also

repaint Method Overload List

Diagram.resizeToFitItems Method

Overload List

Name	Description
Diagram.resizeToFitItems (float)	Resizes the document area so that it fits exactly the diagram items.
Diagram.resizeToFitItems (float, boolean)	Resizes the document area so that it fits exactly the diagram items.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.resizeToFitItems Method (float)

Resizes the document area so that it fits exactly the diagram items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void resizeToFitItems (
    float margins
)
```

Parameters

margins
A float value specifying how much space to leave between the items and the document borders.

See Also

resizeToFitItems Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.resizeToFitItems Method (float, boolean)

Resizes the document area so that it fits exactly the diagram items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void resizeToFitItems (
    float margins,
    boolean onlyVisible
)
```

Parameters

margins
A float value specifying how much space to leave between the items and the document borders.

onlyVisible
true to include only visible items in the new document size, otherwise **false**.

See Also

resizeToFitItems Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.resumeLinkRouter Method

Called when the control ends a batch update operation that might affect many links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void resumeLinkRouter (
    boolean routeDeferredLinks
)
```

Parameters

routeDeferredLinks
true if the links should be routed, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.routeAllLinks Method

Overload List

Name	Description

Diagram.routeAllLinks ()	Routes all links in the diagram so that they will not cross any node.
Diagram.routeAllLinks (DiagramLinkList)	Reroutes the specified links.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.routeAllLinks Method ()

Routes all links in the diagram so that they will not cross any node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void routeAllLinks ()
```

Remarks

Each link is routed so that it goes the shortest possible way between the nodes it links without crossing any other nodes. To do so, this method might modify the number of link segments. The value of AutoRoute is not considered when **routeAllLinks** executes.

RoutingOptions allows tuning the routing algorithm. The most important options are the cost values exposed as LengthCost, TurnCost and CrossingCost properties. They greatly influence the shape of the generated route.

See Also

routeAllLinks Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
RouteLinks Property
LinkRouter Property

Diagram.routeAllLinks Method (DiagramLinkList)

Reroutes the specified links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void routeAllLinks (
    DiagramLinkList linksToRoute
```

```
)
```

Parameters

linksToRoute
A list of diagram links.

See Also

routeAllLinks Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.saveTo Method

Overload List

Name	Description
Diagram.saveTo (OutputStream)	Saves the diagram contents into a stream.
Diagram.saveTo (String)	Saves the diagram contents into a file.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.saveTo Method (OutputStream)

Saves the diagram contents into a stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveTo (
    OutputStream out
)
```

Parameters

out
A **java.io.OutputStream** where the diagram contents should be saved.

See Also

saveTo Method Overload List
Diagram Members

Diagram Class
com.mindfusion.diagramming Namespace

Diagram.saveTo Method (String)

Saves the diagram contents into a file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveTo (
    String fileName
)
```

Parameters

fileName
The name of the file into which the diagram contents should be saved.

See Also

saveTo Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.saveToJson Method

Overload List

Name	Description
Diagram.saveToJson (JsonObject, JsonPersistContext)	Saves the diagram to a JSON object.
Diagram.saveToJson (OutputStream)	Saves the diagram into a JSON stream.
Diagram.saveToJson (String)	Saves the diagram into a JSON file.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.saveToJson Method (JsonObject, JsonPersistContext)

Saves the diagram to a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToJson (
    JsonObject diagramObj,
    JsonPersistContext context
)
```

Parameters

diagramObj
A JsonObject the diagram's data should be stored into.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

saveToJson Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
loadFromJson Method

Diagram.saveToJson Method (OutputStream)

Saves the diagram into a JSON stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToJson (
    OutputStream stream
)
```

Parameters

stream
A **java.io.OutputStream** instance to which to write the diagram data in JSON format.

See Also

saveToJson Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
loadFromJson Method

Diagram.saveToJson Method (String)

Saves the diagram into a JSON file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void saveToJson (
    String fileName
)
```

Parameters

fileName
A string specifying the file name or full path.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
loadFromJson Method
saveToJsonString Method

Diagram.saveToJsonString Method

Saves the diagram to a JSON-formatted string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public String saveToJsonString ()
```

Return Value

A string containing the diagram's JSON representation.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
loadFromJsonString Method
saveToJson Method
saveToString Method
loadFromString Method

Diagram.saveToString Method

Saves the diagram contents into a string.

Overload List

Name	Description
Diagram.saveToString ()	Saves the diagram contents into a string.
Diagram.saveToString (SaveToStringFormat, boolean)	Saves the diagram contents into a string.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.saveToString Method ()

Saves the diagram contents into a string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String saveToString ()
```

Return Value

A String containing the base64 encoded diagram contents.

See Also

saveToString Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.saveToString Method (SaveToStringFormat, boolean)

Saves the diagram contents into a string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String saveToString (
    SaveToStringFormat format,
    boolean includeUnalteredProperties
)
```

Parameters

format
A member of the SaveToStringFormat enumeration indicating the output format.

includeUnalteredProperties
true to serialize all properties; **false** to serialize only properties with non-default values.

Return Value

A String containing the serialized form of the diagram.

See Also

saveToString Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
loadFromString Method

Diagram.saveToXml Method

Overload List

Name	Description
Diagram.saveToXml (Document)	Saves the diagram to the specified XML document.
Diagram.saveToXml (Document, boolean)	Saves the diagram to the specified XML document.
Diagram.saveToXml (OutputStream, boolean)	Saves the diagram to the specified XML document.
Diagram.saveToXml (String)	Saves the diagram to the specified XML document.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.saveToXml Method (Document)

Saves the diagram to the specified XML document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    Document document
)
```

Parameters

document
A DOM Document object where the diagram should be saved.

See Also

saveToXml Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.saveToXml Method (Document, boolean)

Saves the diagram to the specified XML document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    Document document,
    boolean includeUnalteredProperties
)
```

Parameters

document
A DOM Document object where the diagram should be saved.

includeUnalteredProperties
true to serialize all properties; **false** to serialize only properties with non-default values.

See Also

saveToXml Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.saveToXml Method (OutputStream, boolean)

Saves the diagram to the specified XML document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    OutputStream stream,
    boolean includeUnalteredProperties
)
```

Parameters

stream
A **java.io.OutputStream** where the XML markup should be serialized.

includeUnalteredProperties
true to serialize all properties; **false** to serialize only properties with non-default values.

See Also

saveToXml Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.saveToXml Method (String)

Saves the diagram to the specified XML document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    String fileName
)
```

Parameters

fileName
The full path and name of the disk file where the diagram should be saved.

See Also

saveToXml Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setActiveItem Method

Sets the active item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setActiveItem (
    DiagramItem value
)
```

Parameters

value
A reference to an DiagramItem that should be made the active one.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setActiveLayer Method

Sets the zero-based index of the active layer.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setActiveLayer (
    int value
)
```

Parameters

value
An integer value that specifies the index of the active layer.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setAdjustmentHandlesSize Method

Sets the size of selection handles.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAdjustmentHandlesSize (
    float value
)
```

Parameters

value
A float value specifying the size of selection handles.

See Also

Diagram.setAlignmentGuidePen Method

Sets the pen used to draw alignment guides.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAlignmentGuidePen (
    Pen value
)
```

Parameters

value
A Pen instance.

Remarks

This pen is used to draw alignment guides shown when AutoAlignNodes is enabled.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
getAlignmentGuidePen method

Diagram.setAlignToGrid Method

Sets a value indicating whether items should be aligned to the alignment grid while users draw them.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAlignToGrid (
    boolean value
)
```

Parameters

value
true if items should be automatically aligned to the grid, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setAllowLinksRepeat Method

Sets a value indicating whether users are allowed to draw more than one links between the same nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowLinksRepeat (
    boolean value
)
```

Parameters

value
true if users are allowed to draw more than one link between the same nodes, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setAllowMultipleResize Method

Sets whether multiple selected nodes can be resized simultaneously.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowMultipleResize (
    boolean value
)
```

Parameters

value
true to let the user resize multiple selected nodes; otherwise, **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setAllowSelfLoops Method

Sets whether users are allowed to draw reflexive links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowSelfLoops (
    boolean value
)
```

Parameters

value
true if users are allowed to draw reflexive links, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setAllowSplitLinks Method

Sets whether link segments can be added and removed interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowSplitLinks (
    boolean value
)
```

Parameters

value
true to make new links splittable by default, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setAllowUnanchoredLinks Method

Sets a value indicating whether users are allowed to attach links to nodes that do not have any anchor points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setAllowUnanchoredLinks (
    boolean value
)
```

Parameters

value
true to lets users attach links to nodes that do not have anchor points, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setAllowUnconnectedLinks Method

Sets a value indicating whether users are allowed to draw unconnected links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setAllowUnconnectedLinks (
    boolean value
)
```

Parameters

value
true if users are allowed to draw unconnected links, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setAutoAlignDistance Method

Sets the maximal horizontal or vertical distance at which a node aligns to the borders of other nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoAlignDistance (
    float value
)
```

Parameters

value
A float value specifying the maximal distance. The default value is 3.

Remarks

To enable node alignment, set AutoAlignNodes to true. When either the horizontal or vertical borders of the dragged node are within the specified distance from the respective borders of a nearby node, the dragged node snaps to a position where the borders are aligned.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
getAutoAlignDistance Method

Diagram.setAutoAlignNodes Method

Sets whether nodes should automatically align to the borders of other nodes during user interaction.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoAlignNodes (
    boolean value
)
```

Parameters

value
true if nodes should align, otherwise **false**. The default value is **false**.

Remarks

When either the horizontal or vertical borders of the dragged node are within AutoAlignDistance from the respective borders of a nearby node, the dragged node snaps to a position where the borders are aligned. In addition, an alignment guide that indicates which borders are aligned is drawn using the pen specified via AlignmentGuidePen.

com.mindfusion.diagramming Namespace
getAutoAlignNodes Method

Diagram.setAutoCloseDistance Method

Sets the maximum distance between first and last points of a FreeFormNode for which the node's outline is closed automatically.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoCloseDistance (
    float value
)
```

Parameters

value
A **float** value.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
Closed Property

Diagram.setAutoDeleteLinks Method

Sets whether links are deleted automatically when their Origin or Destination is deleted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoDeleteLinks (
    boolean value
)
```

Parameters

value
true to delete links along with the nodes they connect, or **false** otherwise.

Remarks

If this property is set to **false**, deleting a node will leave its links in the diagram as unconnected links.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
DelKeyAction Property

Diagram.setAutoResize Method

Sets a value specifying whether the document scrollable area should be resized automatically when users draw items near the edges of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoResize (
    AutoResize value
)
```

Parameters

value
A member of the AutoResize enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setAutoSnapDistance Method

Specifies the maximum distance at which links auto-snap to nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoSnapDistance (
    float value
)
```

Parameters

value
A float value specifying the maximum distance.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
setAutoSnapLinks Method

Diagram.setAutoSnapLinks Method

Sets the default value for the AutoSnapToNode property of new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setAutoSnapLinks (
    boolean value
)
```

Parameters

value
true to snap links to nearest node, otherwise **false**; the default value is **false**.

Remarks

Only nodes at a distance smaller than AutoSnapDistance are considered. A link does not snap to its current origin or destination nodes if that would create a self-loop.

Diagram.setBackBrush Method

Sets the diagram's background brush.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setBackBrush (
    Brush value
)
```

Parameters

value
A Brush object representing the background brush.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setBackgroundImage Method

Overload List

Name	Description
Diagram.setBackgroundImage (Image)	Sets the background image. The BackgroundImageUrl attribute is reset to null.
Diagram.setBackgroundImage (Image, String)	Allows setting of both **BackgroundImage** and **BackgroundImageUrl** attributes as other setters reset the skipped argument.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setBackgroundImage Method (Image)

Sets the background image. The BackgroundImageUrl attribute is reset to null.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBackgroundImage (
    Image value
)
```

Parameters

value
The background **java.awt.Image** object.

See Also

setBackgroundImage Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setBackgroundImage Method (Image, String)

Allows setting of both BackgroundImage and BackgroundImageUrl attributes as other setters reset the skipped argument.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBackgroundImage (
    Image img,
    String url
)
```

Parameters

img
The **java.awt.Image** object that should be displayed in the background.

url
A string specifying the image URL.

Remarks

If the image is not null, then no download is performed. It is assumed that the specified image is located at the specified URL. This setter is preferred when the image is already available and it is desirable that the url is also present.

See Also

setBackgroundImage Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setBackgroundImageAlign Method

Sets how the background image should be positioned relatively to the scrollable area of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBackgroundImageAlign (
    ImageAlign value
)
```

Parameters

value
A member of the ImageAlign enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setBackgroundImageUrl Method

Sets the URL of the background image.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

`public void setBackgroundImageUrl (`
`  String value`
`)`

Parameters

value
The URL of the background image.

Remarks

Default applet security allows only images on the same server. URL may be relative to the document base for applets or current dir for applications. It is assumed that the specified image is located at the specified URL.

Diagram.setBounds Method

Overload List

Name	Description
Diagram.setBounds (Rectangle2D)	Sets the bounds of the scrollable area of the diagram.
Diagram.setBounds (Rectangle2D.Float)	Sets the size of the diagram's scrollable area.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setBounds Method (Rectangle2D)

Sets the bounds of the scrollable area of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

`public void setBounds (`
`  Rectangle2D value`
`)`

Parameters

value
A **Rectangle2D** object representing the document scrollable region.

See Also

setBounds Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setBounds Method (Rectangle2D.Float)

Sets the size of the diagram's scrollable area.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBounds (
    Rectangle2D.Float value
)
```

Parameters

value

See Also

setBounds Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setBoundsPen Method

Sets the pen with which document bounds are drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBoundsPen (
    Pen value
)
```

Parameters

value
A Pen object that should be assigned to the diagram bounds.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setCellCustomDraw Method

Sets the default type of custom painting applied to cells of new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCellCustomDraw (
    CustomDraw value
)
```

Parameters

value
A member of the CustomDraw enumeration.

Remarks

This value is assigned to the CellCustomDraw property of new tables.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setCellFrameStyle Method

Sets the default style of the cell frames of new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCellFrameStyle (
    CellFrameStyle value
)
```

Parameters

value
A member of the CellFrameStyle enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setContainerCaption Method

Sets the default value for the caption of containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setContainerCaption (
    String containerCaption
)
```

Parameters

containerCaption
A **String** containing the default caption string.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setContainerCaptionHeight Method

Sets the default value for the caption height of containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setContainerCaptionHeight (
    float containerCaptionHeight
)
```

Parameters

containerCaptionHeight

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setContainerHighlightPen Method

Sets the default value for the HighlightPen of containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setContainerHighlightPen (
    Pen containerHighlightPen
)
```

Parameters

containerHighlightPen
A Pen object.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setContainerMargin Method

Sets the default value for the Margin attribute of containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setContainerMargin (
    float containerMargin
)
```

Parameters

containerMargin

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setContainerMinimumSize Method

Sets the default value for the minimum size of containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setContainerMinimumSize (
    Dimension2D containerMinimumSize
)
```

Parameters

containerMinimumSize

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setContainersFoldable Method

Sets the default value for the Foldable property of containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setContainersFoldable (
    boolean containersFoldable
)
```

Parameters

containersFoldable

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setCrossingRadius Method

Sets the radius of the shapes drawn at link crossing points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setCrossingRadius (
    float value
)
```

Parameters

value
A float value specifying the size of the shapes drawn at link intersection points.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setDefaultControlType Method

Sets the type of components that will be hosted by default in newly created ControlNode objects.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDefaultControlType (
    Class<? extends Component> value
)
```

Parameters

value
A Class instance specifying a java.awt.Component -derived type.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setDefaultShape Method

Sets the default shape that should be assigned to new nodes. The shape of individual nodes can be set by calling their ShapeNode.setShape method.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDefaultShape (
    Shape value
)
```

Parameters

value
The default Shape object that should be assigned to newly created nodes.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setDirty Method

Lets you set or clear the diagram's modification flag.

Overload List

Name	Description
Diagram.setDirty ()	Marks the diagram as modified.
Diagram.setDirty (boolean)	Lets you set or clear the diagram's modification flag.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setDirty Method ()

Marks the diagram as modified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public void setDirty ()`

See Also

setDirty Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setDirty Method (boolean)

Lets you set or clear the diagram's modification flag.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDirty (
    boolean value
)
```

Parameters

value
true to mark the diagram as changed, otherwise **false**.

See Also

setDirty Method Overload List
Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setDynamicLinks Method

Sets a value indicating whether links should automatically update their end points positions so that they will always point towards the node centers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDynamicLinks (
    boolean value
)
```

Parameters

value
true if newly created links should be set to update their end point positions automatically, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setEnableLanes Method

Sets whether lanes are enabled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableLanes (
    boolean value
)
```

Parameters

value
true to display the swimlane grid; otherwise, **false**. The default is **false**.

Remarks

The swimlane grid can be customized through the Grid instance returned by getLaneGrid.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
getEnableLanes method

Diagram.setEnableSpatialIndex Method

Sets whether to index item positions for faster hit-testing and viewport clipping queries.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableSpatialIndex (
    boolean value
)
```

Parameters

value
true to enable spatial indexing, or **false** otherwise.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setEnableStyledText Method

Sets a value indicating whether newly created nodes should display richly formatted text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableStyledText (
    boolean value
)
```

Parameters

value
true if text formatting tags should be processed by default, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setExpandButtonAction Method

Sets what should happen when a user clicks the +/- button that is displayed near expandable nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setExpandButtonAction (
    ExpandButtonAction value
)
```

Parameters

value
A member of the ExpandButtonAction enumeration; the default value is **ExpandTreeBranch**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setExpandButtonPosition Method

Sets where expand/collapse buttons are located relatively to their nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setExpandButtonPosition (
    ExpandButtonPosition value
)
```

Parameters

value
A member of the ExpandButtonPosition enumeration. The default is **OuterRight**.

Remarks

If diagram links tend to flow vertically, it would be useful to have the expand/collapse buttons stay at the left- or right-hand side of nodes. If diagram links tend to flow horizontally, choose position for expand buttons such that they stay above or below nodes. That will prevent button icons from being overlapped by links.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
setExpandButtonAction Method
setNodesExpandable Method

Diagram.setExpandOnIncoming Method

Sets which direction of links is considered the tree direction when expanding or collapsing diagram branches.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setExpandOnIncoming (
    boolean value
)
```

Parameters

value
true is tree branches should be expanded in the direction of incoming links, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setFocusedComponent Method

Sets the component within this diagram which is currently holding the input focus.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFocusedComponent (
    ComponentBase value
)
```

Parameters

value
An instance of ComponentBase -derived class that should receive keyboard events.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setFocusedManipulator Method

Sets the manipulator currently holding the input focus.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFocusedManipulator (
    Manipulator value
)
```

Parameters

value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setFoldedContainerSize Method

Sets the size of folded containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFoldedContainerSize (
    Dimension2D value
)
```

Parameters

value
A **Dimension2D** instance specifying the size of folded containers. The default value is **null**.

Remarks

The FoldedSize property of new containers is initialized with this value.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setFont Method

Sets the default font for new diagram items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFont (
    Font value
)
```

Parameters

value
A Font object.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setFreeFormAttractDistance Method

Sets the radius around dragged free-form adjustment handle in which other points of FreeFormNode are modified too.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFreeFormAttractDistance (
    float value
)
```

Parameters

value
A **float** value.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setFreeFormTargets Method

Sets an array of Shape objects used to replace FreeFormNode instances with ShapeNode ones when Behavior is set to LinkFreeShapes or DrawFreeShapes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFreeFormTargets (
    Shape[] value
)
```

Parameters

value
A Shape array.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setGridColor Method

Sets the color of the alignment grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setGridColor (
    Color value
)
```

Parameters

value
A **Color** object representing the grid color.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setGridOffsetX Method

Sets the horizontal offset of the first point of the alignment grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setGridOffsetX (
    float value
)
```

Parameters

value
A float value that specifies the horizontal grid offset.

Remarks

The property specifies the offset of the first point of the alignment grid. The default value NaN makes the grid start at offset GridSizeX / 2.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
setShowGrid Method
setGridOffsetY Method
setMeasureUnit Method

Diagram.setGridOffsetY Method

Sets the vertical offset of the first point of the alignment grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setGridOffsetY (
    float value
)
```

Parameters

value
A float value that specifies the vertical grid offset.

Remarks

The property specifies the offset of the first point of the alignment grid. The default value NaN makes the grid start at offset GridSizeY / 2.

Diagram.setHitTestPriority Method

Sets a value indicating the order in which items are hit-tested.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHitTestPriority (
    HitTestPriority value
)
```

Parameters

value
A member of the HitTestPriority enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setHoverDelay Method

Sets the time in milliseconds that mouse pointer should remain stationary before reporting hover events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHoverDelay (
    int value
)
```

Parameters

value
An integer value specifying milliseconds.

Diagram.setLinkBaseShape Method

Sets what shape should be displayed at the origin of new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkBaseShape (
    Shape value
)
```

Parameters

value
A Shape instance that represents an arrowhead shape. The default is None.

Remarks

This property specifies the default shape displayed as arrowhead at the links' origin points. The ArrowHeads class exposes several predefined shapes as static properties.

See Also

Diagram Members
Diagram Class

Diagram.setLinkBaseShapeSize Method

Sets the default size of the shape displayed at the origin of new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void setLinkBaseShapeSize (
    float value
)
```

Parameters

value
A float value specifying the default size of the shapesdisplayed at the link base.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkBranchIndicator Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void setLinkBranchIndicator (
    BranchIndicator value
)
```

Parameters

value

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkBrush Method

Sets the default brush that should be assigned to new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setLinkBrush (
    Brush value
)
```

Parameters

value
A Brush object that should be assigned to newly created links.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkCascadeOrientation Method

Sets the default orientation of the first segments of cascading links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setLinkCascadeOrientation (
    Orientation value
)
```

Parameters

value
A member of the Orientation enumeration.

Remarks

Use this property to specify the default orientation of the first segment of DiagramLink objects whose Shape is set to Cascading. The default value, **Auto**, lets the component decide whether to draw the first segment horizontally or vertically.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkCrossings Method

Sets what shapes should be drawn at the points where links cross.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setLinkCrossings (
    LinkCrossings value
)
```

Parameters

value
A member of the LinkCrossings enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkCustomDraw Method

Sets the default type of custom painting done on links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setLinkCustomDraw (
    CustomDraw value
)
```

Parameters

value
A member of the CustomDraw enumeration.

Remarks

This property specifies whether and how custom painting of links is performed. Its value is assigned to the CustomDraw property of new links.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkEndsMovable Method

Sets a value indicating users are allowed to move the end points of a link after the link is created.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setLinkEndsMovable (
    boolean value
)
```

Parameters

value
true if users are allowed to move the end pointsof new links, otherwise false.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkHandlesStyle Method

Sets the style of selection handles that should be assigned to new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setLinkHandlesStyle (
    HandlesStyle value
)
```

Parameters

value
A member of the HandlesStyle enumeration.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkHeadShape Method

Sets what shape should be displayed as arrowhead of new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkHeadShape (
    Shape value
)
```

Parameters

value
A Shape instance that represents an arrowhead shape. The default is Arrow.

Remarks

This property specifies the default shape displayed as arrowhead at the links' end points. The ArrowHeads class exposes several predefined shapes as static properties.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkHeadShapeSize Method

Sets the default size of the shape displayed as arrowhead of new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkHeadShapeSize (
    float value
)
```

Parameters

value
A float value specifying the default arrowhead size.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkIntermediateShape Method

Sets what shape should be displayed at the middle of links segments.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkIntermediateShape (
    Shape value
)
```

Parameters

value

A Shape instance that represents an arrowhead shape. The default is None.

Remarks

The property specifies default shape to be displayed at the middle of each segment of new links. It facilitates users by following the path of a link across the diagram, especially for longer links in large documents. The ArrowHeads class exposes several predefined shapes as static properties.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkIntermediateShapeSize Method

Sets the default size of the shape displayed at the middle of links segments.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkIntermediateShapeSize (
    float value
)
```

Parameters

value

A float value specifying the default size of the shapesdisplayed in the middles of link segments.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkPen Method

Sets the default pen that should be assigned to new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkPen (
    Pen value
)
```

Parameters

value
A Pen object that should be assignedto newly created links.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkRouter Method

Sets the component used to find paths for auto-routed links when diagram nodes are added or their positions change.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkRouter (
    LinkRouter value
)
```

Parameters

value
An instance of a class implementing the LinkRouter interface.

Remarks

The default value is a CompositeRouter instance that chains PatternRouter and GridRouter.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
AutoRoute Property
RouteLinks Property
routeAllLinks Method
CompositeRouter Class
GridRouter Class

Diagram.setLinkSegments Method

Sets the default number of link segments.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkSegments (
    int value
)
```

Parameters

value
An integer value specifying the default number of link segments.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkShape Method

Sets the style that should be assigned to new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkShape (
    LinkShape value
)
```

Parameters

value
A member of the LinkShape enumeration.

Remarks

Use this property to specify what kind of segments new links are composed of. Curved links can be created using Bezier or **Spline** styles. Straight-segment links can be created using **Polyline** and **Cascading** styles, the latter one restricting segments to horizontal and vertical direction, orienting each segment orthogonally to its neighbor.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinksRetainForm Method

Sets a value indicating whether new links are set to maintain their shapes while the nodes they connect are moved around.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinksRetainForm (
    boolean value
)
```

Parameters

value
true if newly created links should preserve their shapes, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkText Method

Sets the default text that should be assigned to new links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkText (
    String value
)
```

Parameters

value
A **String** containing the default link text.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setLinkTextStyle Method

Sets the default placement and orientation of the links labels.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setLinkTextStyle (
    LinkTextStyle value
)
```

Parameters

value
A member of the LinkTextStyle enumeration. The default value is **Center**.

Remarks

The value of this property is used to initialize the TextStyle property of new links.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setMeasureUnit Method

Sets the units for measuring of lengths and sizes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setMeasureUnit (
    GraphicsUnit value
)
```

Parameters

value
A member of the GraphicsUnit enumeration.

Remarks

Many properties in the JDiagram API are used to specify the dimensions of diagram items or the size of various visual elements, for example, selection handles, arrowhead shapes, frame widths, and so on. **MeasureUnit** specifies the measure of length in which these size values are defined.

Setting new measure unit through this property will not re-scale diagram elements automatically to preserve their actual size. If you need that, call the changeUnit method.

See Also

Diagram.setMergeThreshold Method

Sets the maximum distance between adjacent control points of a link at which the respective segments can be merged.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMergeThreshold (
    float value
)
```

Parameters

value
A float value specifying the maximal merge distance.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setNodesExpandable Method

Sets whether the tree branches that start from new nodes should be expandable by default.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setNodesExpandable (
    boolean value
)
```

Parameters

value
true if nodes should be expandable by default,otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setRecursiveExpand Method

Sets whether tree branches should be expanded recursively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRecursiveExpand (
    boolean value
)
```

Parameters

value
true if tree branches should be expanded recursively.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setRestrictItemsToBounds Method

Sets a value indicating whether users are allowed to move items outside the currently define document bounds.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRestrictItemsToBounds (
    RestrictToBounds value
)
```

Parameters

value
A member of the RestrictToBounds enumeration.

Remarks

Use this property to specify whether diagram elements can be drawn or moved outside the document area. It is possible to specify that items have to be entirely inside, partly outside or there is no restriction.

If there is no restriction and AutoResize is disabled, users could place an item to a position where they cannot reach it by scrolling. That might be interpreted as an item deletion operation by handling the nodeModified event and deleting the item if it is outside the document boundaries.

See Also

Diagram.setRoundedLinks Method

Sets if the joins between segments of Polyline and Cascading links should be rounded.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRoundedLinks (
    boolean roundedLinks
)
```

Parameters

roundedLinks
true to use rounded segment joins; otherwise, **false**. The default is **false**.

Remarks

The value of this property is considered when drawing links whose Shape is set to Polyline or Cascading. If the property is enabled, the joins between the segments of all such links are drawn as arcs, whose radius equals the value of RoundedLinksRadius.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setRoundedLinksRadius Method

Sets the radius of arc joins of rounded links' segments.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRoundedLinksRadius (
    float radius
)
```

Parameters

radius
A float value specifying the radius length. The default is 2.

Remarks

The value of this property is used when RoundedLinks is enabled. It specifies the radius of the arcs drawn as joins between link segments.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setRouteLinks Method

Sets a value indicating whether links should avoid nodes by going the shortest path from their origin to their destination without crossing any other nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRouteLinks (
    boolean value
)
```

Parameters

value
true to route links, or **false** otherwise. The default is **false**.

Remarks

The value of RouteLinks is used to initialize the AutoRoute property of new links. If a node is moved or resized, all links that intersect with its new position and have AutoRoute enabled are rerouted. Keep in mind that number of link segments will probably change when routing is enabled.

RoutingOptions allows tuning the routing algorithm. The most important options are the cost values exposed as LengthCost, TurnCost and CrossingCost properties. They greatly influence the shape of the generated route.

Diagram.setSelectAfterCreate Method

Sets a value indicating whether newly created items should be selected automatically.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setSelectAfterCreate (
    boolean value
)
```

Parameters

value
true if newly created items should be selected automatically, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setSelectionOnTop Method

Sets a value indicating whether selected items should be drawn on top of the non-selected ones.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setSelectionOnTop (
    boolean value
)
```

Parameters

value
true if selected items should be drawn above non-selected ones, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setShadowBrush Method

Sets the default brush used to paint the shadows cast by diagram items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public void setShadowBrush (
    Brush value
)
```

Parameters

value
A Brush object representing the shadow brush.

Remarks

Use the property to specify an initial value for the ShadowBrush property of new diagram elements.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setShadowOffset Method

Sets the distance at which shadows are offset from the items that cast them.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShadowOffset (
    float x,
    float y
)
```

Parameters

x
Specifies the horizontal shadow offset.

y
Specifies the vertical shadow offset.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setShadowOffsetX Method

Sets the default horizontal distance between shadows and the items that cast them.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShadowOffsetX (
    float value
)
```

Parameters

value
A float value specifying the horizontal shadow offset.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setShadowOffsetY Method

Sets the default vertical distance between shadows and the items that cast them.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShadowOffsetY (
    float value
)
```

Parameters

value
A float value specifying the vertical shadow offset.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setShadowsStyle Method

Sets the style of shadows.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShadowsStyle (
    ShadowsStyle value
)
```

Parameters

value
A member of the ShadowsStyle enumeration.

Remarks

This property specifies how the shadows of diagram items are drawn. If its value is None, no shadows are painted. **OneLevel** makes all shadows paint on the lowest z-level, not covering any items. Thus the diagram items will seem to appear on the same z-level. **ZOrder** makes the shadow paint immediately under their items, possibly covering other items. This style gives more 3D-like outlook to the diagram.

ShadowOffsetY Property

Diagram.setShapeBrush Method

Sets the default brush that should be assigned to new nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShapeBrush (
    Brush value
)
```

Parameters

value
A Brush object.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setShapeCustomDraw Method

Sets whether new nodes should be custom drawn and what type of custom drawing will be performed on them.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShapeCustomDraw (
    CustomDraw value
)
```

Parameters

value
A member of the CustomDraw enumeration.

Remarks

This property specifies whether and how custom painting of shape nodes is performed. Its value is assigned to the CustomDraw property of new shape nodes.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace
drawNode Event

Diagram.setShapeHandlesStyle Method

Sets the default value for the HandlesStyle property of new shape nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShapeHandlesStyle (
    HandlesStyle value
)
```

Parameters

value
A member of the HandlesStyle enumeration.

Remarks

This property contains the default value for the HandlesStyle property of new shape nodes, created either programmatically or by the user. **HandlesStyle** specifies how selected nodes are indicated visually, and how they can be moved, resized or connected to other objects.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setShapeOrientation Method

Sets the default shape definition orientation angle assigned to new nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShapeOrientation (
    float value
)
```

Parameters

value
The default orientation applied to shape definitions when assigning shapes to nodes.

Diagram.setShapeText Method

Sets the default text to new nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setShapeText (
    String value
)
```

Parameters

value
A **String** containing the default box text.

Diagram.setShowAnchors Method

Sets a value indicating whether anchor points should be shown on screen.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setShowAnchors (
    ShowAnchors value
)
```

Parameters

value
A member of the ShowAnchors enumeration.

Anchor Points and Patterns

Diagram.setShowDisabledHandles Method

Sets whether disabled manipulation handles will be displayed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShowDisabledHandles (
    boolean value
)
```

Parameters

value
true if disabled selection handles are drawn, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setShowGrid Method

Sets a value indicating whether the alignment grid is displayed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShowGrid (
    boolean value
)
```

Parameters

value
true if the alignment grid is drawn on the screen, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setShowHandlesOnDrag Method

Sets whether selection handles of objects under the pointer are displayed while another object is being modified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShowHandlesOnDrag (
    boolean value
)
```

Parameters

value
true to display selection handles, otherwise **false**.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setSnapToAnchor Method

Sets a value indicating when links should snap to anchor points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSnapToAnchor (
    SnapToAnchor value
)
```

Parameters

value
A member of the SnapToAnchor enumeration.

Remarks

The default value OnCreate, specifies that links are snapped to anchor points when they are created, but allows the user to move the link ends to different locations of a node. The **OnCreateOrModify** value makes link ends points connect to node anchors both if links are created or modified.

Diagram.setTableCaption Method

Sets the default caption text that should be assigned to new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTableCaption (
    String value
)
```

Parameters

value
A **String** containing the default table caption.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setTableCaptionHeight Method

Sets the default height of the caption bar of new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTableCaptionHeight (
    float value
)
```

Parameters

value
A float value specifying the default height of table caption bars.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setTableColumnCount Method

Sets how many columns should be allocated to new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTableColumnCount (
    int value
)
```

Parameters

value
An integer value specifying the default number of table columns.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setTableColumnWidth Method

Sets the default width of columns in newly created tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTableColumnWidth (
    float value
)
```

Parameters

value
A float value specifying the default width of table columns.

See Also

Diagram Members
Diagram Class
com.mindfusion.diagramming Namespace

Diagram.setTableConnectionStyle Method

Sets how users are allowed to link tables to each other - as integral entities, by rows, or both.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTableConnectionStyle (
    TableConnectionStyle value
)
```

Parameters

value
A member of the TableConnectionStyle enumeration.

Remarks

The value of **TableConnectionStyle** is used to initialize the ConnectionStyle property of new tables. There are three possible ways to relate tables to other nodes. This property specifies how users are allowed to create such relations:

- Rows - relation ends are the rows of a table. A link connected to the table is connected to a particular row. This mode is convenient for database diagrams.
- **Table** - relations target tables as integral entities, and not any particular row. This mode is convenient for class diagrams.
- **Both** - a mixed mode where links can target either a row of a table or the table itself.

Programmatically, links can be connected to a table in any way, regardless of the table's **ConnectionStyle**. The value of ConnectionStyle is considered only when end-users draw links to or from a table. To link to a table as an entity and not to a specific row, pass -1 as row argument of the createDiagramLink method.

Diagram.setTableCustomDraw Method

Sets the default type of custom painting applied to new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTableCustomDraw (
    CustomDraw value
)
```

Parameters

value
A member of the CustomDraw enumeration.

Remarks

This value is assigned to the CustomDraw property of new tables.

com.mindfusion.diagramming Namespace

Diagram.setTableHandlesStyle Method

Sets the style of selection handles that should be assigned to new tables.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTableHandlesStyle (
    HandlesStyle value
)
```

Parameters

value
A member of the HandlesStyle enumeration.

Remarks

Default value for the HandlesStyle property of new tables, created either programmatically or by the user. That property specifies how selected tables are indicated visually, and how they can be moved, resized or connected to other objects.

Diagram.setValidityChecks Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setValidityChecks (
    boolean value
)
```

Parameters

value

See Also

Diagram Members

com.mindfusion.diagramming Namespace

Diagram.suspendLinkRouter Method

Called when the control starts a batch update operation that might affect many links. The diagram collects links specified through route and routeAllLinks calls and defers finding their paths to when resumeLinkRouter is called.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void suspendLinkRouter ()
```

Diagram.updateRuntimeIndices Method

Assigns consecutive values to the RuntimeIndex property of items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void updateRuntimeIndices ()
```

com.mindfusion.diagramming Namespace

Diagram.with Method

Returns a DiagramBuilder object used to configure and create new Diagram instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static DiagramBuilder with ()
```

Return Value

A **DiagramBuilder** instance.

DiagramAdapter Class

Provides empty implementations for the methods defined in the DiagramListener interface. This lets you override only the handlers for the events you are interested in, instead of implementing all methods of **DiagramListener**.

Syntax

Java

```
public class DiagramAdapter implements DiagramListener
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DiagramAdapter

DiagramAdapter Members

Provides empty implementations for the methods defined in the DiagramListener interface. This lets you override only the handlers for the events you are interested in, instead of implementing all methods of **DiagramListener**.

The following tables list the members exposed by the DiagramAdapter type.

Public Constructors

	Name	Description
	DiagramAdapter	

Public Methods

	Name	Description
	actionRecorded	Raised when an action is recorded in the undo buffer.
	actionRecording	A validation event raised before an action is recorded in the undo buffer.
	actionRedone	Raised when an action is redone.
	actionUndone	Raised when an action is undone.
	activeLayerChanged	Raised when the diagram's active layer has changed.
	cellClicked	Called when a table cell is clicked.
	cellDoubleClicked	Raised when the user double-clicks a table's cell.
	cellTextEdited	Raised when the user edits the text of a table's cell.
	cellTextEditing	A validation event that lets you prevent users from editing the text of a table's cell.
	clicked	Raised when the user clicks the diagram at a point where no items are located.
	containerChildAdded	Raised when a node is added to a ContainerNode, either programmatically or by the user.
	containerChildRemoved	Raised when a node is removed from a **ContainerNode**, either programmatically or by the user.
	containerFolded	Raised when the user folds a container by clicking the arrow-up button in the container's caption bar.
	containerUnfolded	Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar.
	createEditControl	Called to let you create a custom in-place editor control.
	deserializeControl	Lets you load the attributes of controls hosted inside ControlNode objects.
	deserializeTag	Raised when the Diagram.setTag of a diagram item must be deserialized from XML format.
	destroyEditControl	Called to let you destroy a custom in-place editor control.

	doubleClicked	Raised when the user double-clicks the diagram at a point where no items are located.
	drawAdjustmentHandles	Raised when custom adjustment handles must be drawn.
	drawAnchorPoint	Raised when an anchor point must be custom drawn.
	drawBackground	Raised to let you custom draw the diagram background.
	drawCell	Raised when a table's cell must be custom drawn.
	drawForeground	Raised to let you custom draw the diagram foreground.
	drawLink	Raised when a diagram link must be custom drawn.
	drawNode	Raised when a diagram node must be custom drawn.
	enterInplaceEditMode	Called when entering in-place editing mode.
	expandButtonClicked	Raised when the user clicks the [+/-] button of a DiagramNode.setExpandable node.
	groupDestroyed	Raised when a Group object is destroyed.
	hitTestAdjustmentHandles	Raised to perform custom hit testing of item's adjustment handles.
	imageLoaded	Called when image download initiated with Diagram.setImageUrl completes
	initializeLasso	Raised when the user starts drawing a selection lasso, before it is rendered on screen.
	initializeLink	Raised when the user starts drawing a new link, just after the DiagramLink instance is created.
	initializeNode	Raised when the user starts drawing a new node, just after the DiagramNode instance is created.
	itemAdded	Raised when an item is added to the diagram, either programmatically or interactively.
	itemLoaded	Raised when an item is loaded from a file.
	itemRemoved	Raised when an item is removed from the diagram, either programmatically or interactively.
	jsonDeserializeTag	Raised when the Tag of a diagram item must be deserialized from JSON format.
	jsonSerializeTag	Raised when the **Tag** of a diagram item must be serialized into an JSON document.
	lassoDrawn	Raised when the user completes drawing a selection lasso.
	leaveInplaceEditMode	Called when an in-place editing is accepted or rejected.
	linkActivated	Raised when a link becomes the Diagram.setActiveItem.
	linkClicked	Raised when the user clicks a link.
	linkCreated	Raised when the user draws a new link.
	linkCreating	A validation event raised while the user is drawing a new link.

	linkDeactivated	Raised when a link is no longer the **Diagram.setActiveItem**.
	linkDeleted	Raised when a link is deleted, either programmatically or by the user.
	linkDeleting	Raised when the user tries to delete a link, this event lets you cancel the operation.
	linkDeselected	Raised when a link is deselected, either programmatically or by the user.
	linkDoubleClicked	Raised when the user double-clicks a link.
	linkHovered	Fired when the mouse pointer hovers over a link. Call setTrackPointedItem to enable this event.
	linkModified	Raised when the user moves any control point of a link.
	linkModifying	A validation event raised while the user is modifying a link.
	linkPointerEnter	Fired when the mouse pointer enters the boundaries of a link. Call **setTrackPointedItem** to enable this event.
	linkPointerLeave	Fired when the mouse pointer leaves the boundaries of a link. Call **setTrackPointedItem** to enable this event.
	linkRouted	Raised when a link is routed by the auto-routing algorithm.
	linkSelected	Raised when a link is selected, either programmatically or by the user.
	linkSelecting	Raised when the user tries to select a link, this event lets you cancel the operation.
	linkSplit	Raised when the user splits a link segment interactively.
	linkStartModifying	A validation event raised when the user starts modifying a link.
	linkTextEdited	Raised when the user edits the text of a link.
	linkTextEditing	A validation event that lets you approve or reject changes made to the text of a link.
	nodeActivated	Raised when a node becomes the **Diagram.setActiveItem**.
	nodeClicked	Raised when the user clicks a node.
	nodeCreated	Raised when the user draws a new node.
	nodeCreating	A validation event raised while the user is drawing a new node.
	nodeDeactivated	Raised when a node is no longer the **Diagram.setActiveItem**.
	nodeDeleted	Raised when a node is deleted, either programmatically or by the user.
	nodeDeleting	Raised when the user tries to delete a node, this event lets you cancel the operation.
	nodeDeselected	Raised when a node is deselected, either programmatically or by the user.

nodeDoubleClicked	Raised when the user double-clicks a node.
nodeHovered	Fired when the mouse pointer hovers over a node. Call **setTrackPointedItem** to enable this event.
nodeModified	Raised when the user moves or resizes a node.
nodeModifying	A validation event raised while the user is moving or resizing a node.
nodePointerEnter	Fired when the mouse pointer enters the boundaries of a node. Call **setTrackPointedItem** to enable this event.
nodePointerLeave	Fired when the mouse pointer leaves the boundaries of a node. Call **setTrackPointedItem** to enable this event.
nodeSelected	Raised when a node is selected, either programmatically or by the user.
nodeSelecting	Raised when the user tries to select a node, this event lets you cancel the operation.
nodeStartModifying	A validation event raised when the user starts modifying a node.
nodeTextEdited	Raised when the user edits the text of a node.
nodeTextEditing	A validation event that lets you approve or reject changes made to the text of a node.
repaint	Raised when the diagram views should be repainted.
requestCacheReset	Raised when an object within the diagram requests a reset of the cached bitmap.
selectionChanged	Called when an item is added to or removed from the selection.
selectionModified	Called when multiple selected items are moved or resized.
selectionModifying	Raised while the user is moving or resizing multiple selected items, this event lets you cancel the modification.
serializeControl	Lets you save the attributes of controls hosted inside **ControlNode** objects.
serializeTag	Raised when the **Diagram.setTag** of a diagram item must be serialized into an XML document.
setSelfLoopShape	Raised when a link becomes a self-loop, giving you a chance to override the default look shape.
tableColumnResized	Raised when the user finishes resizing a column in a table.
tableColumnResizing	Raised when the user resizes a column in a table interactively.
tableRowResized	Raised when the user finishes resizing a row in a table.
tableRowResizing	Raised when the user resizes a row in a table interactively.
tableSectionCollapsed	Called when a table section is collapsed
tableSectionExpanded	Called when a table section is expanded

	treeCollapsed	Raised when a user collapses a tree branch by clicking the [-] button of a **DiagramNode.setExpandable** node.
	treeExpanded	Raised when a user expands a tree branch by clicking the [+] button of a **DiagramNode.setExpandable** node.
	treeItemTextEdited	Raised when the text of a TreeViewItem has been edited.
	validateAnchorPoint	A validation event that lets you approve or reject connecting a link to an anchor point.
	viewportChanged	
	viewRemoved	Raised when a DiagramView is detached from this diagram.

DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter Methods

DiagramAdapter.actionRecorded Method

Raised when an action is recorded in the undo buffer.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void actionRecorded (
    UndoEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.actionRecording Method

A validation event raised before an action is recorded in the undo buffer.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void actionRecording (
    UndoValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.actionRedone Method

Raised when an action is redone.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void actionRedone (
    UndoEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.actionUndone Method

Raised when an action is undone.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void actionUndone (
    UndoEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.activeLayerChanged Method

Raised when the diagram's active layer has changed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void activeLayerChanged (
    EventObject e
)
```

Parameters

e
An EventObject instance providing more information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.cellClicked Method

Called when a table cell is clicked.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void cellClicked (
    CellEvent e
)
```

Parameters

e
A CellEvent object providing information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.cellDoubleClicked Method

Raised when the user double-clicks a table's cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void cellDoubleClicked (
    CellEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.cellTextEdited Method

Raised when the user edits the text of a table's cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void cellTextEdited (
    EditCellTextEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.cellTextEditing Method

A validation event that lets you prevent users from editing the text of a table's cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void cellTextEditing (
    CellValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.clicked Method

Raised when the user clicks the diagram at a point where no items are located.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void clicked (
    DiagramEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.containerChildAdded Method

Raised when a node is added to a ContainerNode, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void containerChildAdded (
    ContainerChildEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.containerChildRemoved Method

Raised when a node is removed from a ContainerNode, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void containerChildRemoved (
    ContainerChildEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.containerFolded Method

Raised when the user folds a container by clicking the arrow-up button in the container's caption bar.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void containerFolded (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.containerUnfolded Method

Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void containerUnfolded (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.createEditControl Method

Called to let you create a custom in-place editor control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void createEditControl (
    InPlaceEditEvent e
)
```

Parameters

e
An InPlaceEditEvent object providing information about the event.

Remarks

This event is raised if AllowInplaceEdit is enabled and the user double-clicks an item, or when the application invokes the beginEdit method of DiagramView. If the event is not handled, or if EditControl is set to **null**, MindFusion.Diagramming displays a **JTextArea** component to allow editing the item's text. If you prefer to use the built-in **JTextArea**, you can still customize it by handling the enterInplaceEditMode event.

Note that if you create a custom editor control, you must transfer the values entered into it to the respective properties of the edited diagram item. You could do that in response to the destroyEditControl event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.deserializeControl Method

Lets you load the attributes of controls hosted inside ControlNode objects.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void deserializeControl (
    ControlNodeEvent e
)
```

Parameters

e
A ControlNodeEvent instance providing more information about the event.

Remarks

Handle this event to load the content of nodes saved using serializeControl.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.deserializeTag Method

Raised when the Diagram.setTag of a diagram item must be deserialized from XML format.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void deserializeTag (
    SerializeTagEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.destroyEditControl Method

Called to let you destroy a custom in-place editor control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void destroyEditControl (
    InPlaceEditEvent e
)
```

Parameters

e
An InPlaceEditEvent object providing information about the event.

Remarks

This event is raised when the user clicks outside the editor, or when the endEdit method is invoked. Handle it to hide or destroy the edit control. You might also implement the copying of values from the editor to the diagram item's properties in this event handler.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.doubleClicked Method

Raised when the user double-clicks the diagram at a point where no items are located.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void doubleClicked (
    DiagramEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.drawAdjustmentHandles Method

Raised when custom adjustment handles must be drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void drawAdjustmentHandles (
    DrawItemEvent e
)
```

Parameters

e
A DrawItemEvent instance providing more information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.drawAnchorPoint Method

Raised when an anchor point must be custom drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void drawAnchorPoint (
    DrawAnchorPointEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.drawBackground Method

Raised to let you custom draw the diagram background.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void drawBackground (
    DiagramEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.drawCell Method

Raised when a table's cell must be custom drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void drawCell (
    DrawCellEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.drawForeground Method

Raised to let you custom draw the diagram foreground.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void drawForeground (
    DiagramEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.drawLink Method

Raised when a diagram link must be custom drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void drawLink (
    DrawLinkEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.drawNode Method

Raised when a diagram node must be custom drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void drawNode (
    DrawNodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.enterInplaceEditMode Method

Called when entering in-place editing mode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void enterInplaceEditMode (
    InPlaceEditEvent e
)
```

Parameters

e
An InPlaceEditEvent object providing information about the event.

Remarks

This event allows setting properties of the **JTextArea** component used for in-place editing or attaching custom event handlers to that control. Note that you can use a custom control for in-place editing. This can be done by handling createEditControl and specifying what object should be used as an editor by assigning it to EditControl.

See Also

DiagramAdapter Members

com.mindfusion.diagramming Namespace

DiagramAdapter.expandButtonClicked Method

Raised when the user clicks the [+/-] button of a DiagramNode.setExpandable node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void expandButtonClicked (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.groupDestroyed Method

Raised when a Group object is destroyed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void groupDestroyed (
    GroupEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.hitTestAdjustmentHandles Method

Raised to perform custom hit testing of item's adjustment handles.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void hitTestAdjustmentHandles (
    HitTestEvent e
)
```

Parameters

e
A HitTestEvent instance providing more information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.imageLoaded Method

Called when image download initiated with Diagram.setImageUrl completes

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void imageLoaded (
    ImageLoadedEvent e
)
```

Parameters

e
An ImageLoadedEvent object that provides more information about the event.

See Also

DiagramAdapter Members

DiagramAdapter.initializeLasso Method

Raised when the user starts drawing a selection lasso, before it is rendered on screen.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void initializeLasso (
    SelectionEvent e
)
```

Parameters

e
A SelectionEvent providing information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.initializeLink Method

Raised when the user starts drawing a new link, just after the DiagramLink instance is created.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void initializeLink (
    LinkEvent e
)
```

Parameters

e
A LinkEvent instance containing event data.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.initializeNode Method

Raised when the user starts drawing a new node, just after the DiagramNode instance is created.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void initializeNode (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.itemAdded Method

Raised when an item is added to the diagram, either programmatically or interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void itemAdded (
    ItemEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.itemLoaded Method

Raised when an item is loaded from a file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void itemLoaded (
    ItemEvent e
)
```

Parameters

e

An ItemEvent instance providing more information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.itemRemoved Method

Raised when an item is removed from the diagram, either programmatically or interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void itemRemoved (
    ItemEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.jsonDeserializeTag Method

Raised when the Tag of a diagram item must be deserialized from JSON format.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void jsonDeserializeTag (
    JsonSerializeTagEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.jsonSerializeTag Method

Raised when the Tag of a diagram item must be serialized into an JSON document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void jsonSerializeTag (
    JsonSerializeTagEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.lassoDrawn Method

Raised when the user completes drawing a selection lasso.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void lassoDrawn (
    SelectionEvent e
)
```

Parameters

e
A SelectionEvent providing information about the event.

Remarks

This event is best used in conjunction with the DrawLasso behavior, which disables standard selection logic. Upon completing a lasso gesture, you might want to trigger immediate actions based on the lassoed area, such as:

- Opening a custom context menu or UI panel styled for bulk operations.
- Creating a visual screenshot / export of only that specific region.

- Implementing custom selection logic or filters (e.g. select nodes of a specific type, or select only links).
- Bookmarking the selected area (adding it to Bookmarks).

initializeLasso Event
selectionChanged Event

DiagramAdapter.leaveInplaceEditMode Method

Called when an in-place editing is accepted or rejected.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void leaveInplaceEditMode (
    InPlaceEditEvent e
)
```

Parameters

e
An InPlaceEditEvent object providing information about the event.

Remarks

This event is raised in all situations that lead to closing the inplace-edit control, for example, when the user accepts or cancels the changes made to an item's text, or when the endEdit method is called.

If you have created a custom edit control by handling the createEditControl event, EditControl refers to the custom editor. Otherwise, it is a **JTextArea** instance.

DiagramAdapter.linkClicked Method

Raised when the user clicks a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkClicked (
    LinkEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkCreated Method

Raised when the user draws a new link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkCreated (
    LinkEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkCreating Method

A validation event raised while the user is drawing a new link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkCreating (
    LinkValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkDeactivated Method

Raised when a link is no longer the Diagram.setActiveItem.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkDeactivated (
    LinkEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkDeleted Method

Raised when a link is deleted, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkDeleted (
    LinkEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkDeleting Method

Raised when the user tries to delete a link, this event lets you cancel the operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkDeleting (
    LinkValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkDeselected Method

Raised when a link is deselected, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkDeselected (
    LinkEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkDoubleClicked Method

Raised when the user double-clicks a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkDoubleClicked (
    LinkEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkHovered Method

Fired when the mouse pointer hovers over a link. Call setTrackPointedItem to enable this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkHovered (
    LinkEvent e
)
```

Parameters

e
A LinkEvent object providing information about the event.

Remarks

This event fires when the mouse pointer rests over a link for HoverDelay milliseconds.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkModified Method

Raised when the user moves any control point of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkModified (
    LinkEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkModifying Method

A validation event raised while the user is modifying a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkModifying (
    LinkValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkPointerEnter Method

Fired when the mouse pointer enters the boundaries of a link. Call setTrackPointedItem to enable this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkPointerEnter (
    LinkEvent e
)
```

Parameters

e
A LinkEvent object providing information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkPointerLeave Method

Fired when the mouse pointer leaves the boundaries of a link. Call setTrackPointedItem to enable this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkPointerLeave (
    LinkEvent e
)
```

Parameters

e
A LinkEvent object providing information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkRouted Method

Raised when a link is routed by the auto-routing algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkRouted (
    LinkEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkSelected Method

Raised when a link is selected, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkSelected (
    LinkEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class

DiagramAdapter.linkSelecting Method

Raised when the user tries to select a link, this event lets you cancel the operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkSelecting (
    LinkValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkSplit Method

Raised when the user splits a link segment interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkSplit (
    LinkEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkStartModifying Method

A validation event raised when the user starts modifying a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkStartModifying (
    LinkValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkTextEdited Method

Raised when the user edits the text of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkTextEdited (
    EditLinkTextEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.linkTextEditing Method

A validation event that lets you approve or reject changes made to the text of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void linkTextEditing (
    LinkValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeActivated Method

Raised when a node becomes the Diagram.setActiveItem.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeActivated (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeClicked Method

Raised when the user clicks a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeClicked (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeCreated Method

Raised when the user draws a new node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeCreated (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeCreating Method

A validation event raised while the user is drawing a new node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeCreating (
    NodeValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeDeactivated Method

Raised when a node is no longer the Diagram.setActiveItem.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeDeactivated (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeDeleted Method

Raised when a node is deleted, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeDeleted (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeDeleting Method

Raised when the user tries to delete a node, this event lets you cancel the operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeDeleting (
    NodeValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeDeselected Method

Raised when a node is deselected, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeDeselected (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeDoubleClicked Method

Raised when the user double-clicks a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeDoubleClicked (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeHovered Method

Fired when the mouse pointer hovers over a node. Call setTrackPointedItem to enable this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeHovered (
    NodeEvent e
)
```

Parameters

e
A NodeEvent object providing information about the event.

Remarks

This event fires when the mouse pointer rests over a node for HoverDelay milliseconds.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeModified Method

Raised when the user moves or resizes a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeModified (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeModifying Method

A validation event raised while the user is moving or resizing a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeModifying (
    NodeValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodePointerEnter Method

Fired when the mouse pointer enters the boundaries of a node. Call setTrackPointedItem to enable this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodePointerEnter (
    NodeEvent e
)
```

Parameters

e
A NodeEvent object providing information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodePointerLeave Method

Fired when the mouse pointer leaves the boundaries of a node. Call setTrackPointedItem to enable this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodePointerLeave (
    NodeEvent e
)
```

Parameters

e
A NodeEvent object providing information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeSelected Method

Raised when a node is selected, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeSelected (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeSelecting Method

Raised when the user tries to select a node, this event lets you cancel the operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeSelecting (
    NodeValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeStartModifying Method

A validation event raised when the user starts modifying a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeStartModifying (
    NodeValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeTextEdited Method

Raised when the user edits the text of a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```java
public void nodeTextEdited (
    EditNodeTextEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.nodeTextEditing Method

A validation event that lets you approve or reject changes made to the text of a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```java
public void nodeTextEditing (
    NodeValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.repaint Method

Raised when the diagram views should be repainted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```java
public void repaint (
    RepaintEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.requestCacheReset Method

Raised when an object within the diagram requests a reset of the cached bitmap.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void requestCacheReset (
    EventObject e
)
```

Parameters

e
An EventObject instance providing more information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.selectionChanged Method

Called when an item is added to or removed from the selection.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void selectionChanged (
    EventObject e
)
```

Parameters

e
An **EventObject** providing information about the event.

Remarks

Use the Nodes and Links properties of the diagram's Selection to find out which items are currently selected.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.selectionModified Method

Called when multiple selected items are moved or resized.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void selectionModified (
    SelectionEvent e
)
```

Parameters

e
A SelectionEvent providing information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.selectionModifying Method

Raised while the user is moving or resizing multiple selected items, this event lets you cancel the modification.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void selectionModifying (
    SelectionValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter.serializeControl Method

Lets you save the attributes of controls hosted inside ControlNode objects.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void serializeControl (
    ControlNodeEvent e
)
```

Parameters

e
A ControlNodeEvent instance providing more information about the event.

Remarks

By default, the diagram component saves and loads hosted controls by getting or setting their property values via the Java introspection API. If the default mechanism cannot serialize the content of nodes automatically, the serializeControl and deserializeControl events can be handled to implement custom serialization.

Example

Java

```
diagram.addDiagramListener(new DiagramAdapter() {
    @Override
    public void serializeControl(ControlNodeEvent e)
    {
        JButton button = (JButton)e.getNode().getControl();
        e.getContext().writeString(button.getText(), "Text", e.getXmlElement());
        e.setHandled(true);
    };

    @Override
    public void deserializeControl(ControlNodeEvent e)
    {
        JButton button = new JButton();
        try
        {
            button.setText(e.getContext().readString("Text", e.getXmlElement()));
        }
        catch (TransformerException ex)
        {
            ex.printStackTrace();
        }
        e.getNode().setControl(button);
        e.setHandled(true);
    };
}
```

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.serializeTag Method

Raised when the Diagram.setTag of a diagram item must be serialized into an XML document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void serializeTag (
    SerializeTagEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.setSelfLoopShape Method

Raised when a link becomes a self-loop, giving you a chance to override the default look shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSelfLoopShape (
    LinkShapeEvent e
)
```

Parameters

e
A LinkShapeEvent instance providing more information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.tableColumnResized Method

Raised when the user finishes resizing a column in a table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void tableColumnResized (
    CellEvent e
)
```

Parameters

e
A CellEvent object providing information about this event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.tableColumnResizing Method

Raised when the user resizes a column in a table interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void tableColumnResizing (
    CellValidationEvent e
)
```

Parameters

e
A CellValidationEvent object providing information about this event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.tableRowResized Method

Raised when the user finishes resizing a row in a table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void tableRowResized (
    CellEvent e
)
```

Parameters

e
A CellEvent object providing information about this event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.tableRowResizing Method

Raised when the user resizes a row in a table interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void tableRowResizing (
    CellValidationEvent e
)
```

Parameters

e
A CellValidationEvent object providing information about this event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.tableSectionCollapsed Method

Called when a table section is collapsed

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public void tableSectionCollapsed (
    RowEvent e
)
```

Parameters

e
A RowEvent object providing information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.tableSectionExpanded Method

Called when a table section is expanded

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void tableSectionExpanded (
    RowEvent e
)
```

Parameters

e
A RowEvent object providing information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.treeCollapsed Method

Raised when a user collapses a tree branch by clicking the [-] button of a DiagramNode.setExpandable node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void treeCollapsed (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.treeExpanded Method

Raised when a user expands a tree branch by clicking the [+] button of a DiagramNode.setExpandable node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void treeExpanded (
    NodeEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.treeItemTextEdited Method

Raised when the text of a TreeViewItem has been edited.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void treeItemTextEdited (
    EditTreeItemTextEvent e
)
```

Parameters

e
An EditTreeItemTextEvent instance providing more information about the event.

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.validateAnchorPoint Method

A validation event that lets you approve or reject connecting a link to an anchor point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void validateAnchorPoint (
    LinkValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.viewportChanged Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void viewportChanged ()
```

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramAdapter.viewRemoved Method

Raised when a DiagramView is detached from this diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void viewRemoved (
    ValidationEvent e
)
```

Parameters

e

See Also

DiagramAdapter Members
DiagramAdapter Class
com.mindfusion.diagramming Namespace

DiagramBase Class

The base class of the Diagram and DiagramDocument classes.

Syntax

Java

```
public abstract class DiagramBase
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DiagramBase
    com.mindfusion.diagramming.Diagram
    com.mindfusion.diagramming.DiagramDocument

See Also

DiagramBase Members
com.mindfusion.diagramming Namespace

DiagramBase Members

The base class of the Diagram and DiagramDocument classes.

The following tables list the members exposed by the DiagramBase type.

Protected Constructors

	Name	Description
	DiagramBase	Initializes a new instance of the **DiagramBase** class.

Public Methods

	Name	Description

	addDiagramListener	Registers listener so that it will receive events when users create, modify or delete diagram items.
	removeDiagramListener	Unregisters listener so that it will no longer receive diagram events.

See Also

DiagramBase Class
com.mindfusion.diagramming Namespace

DiagramBase Constructor

Initializes a new instance of the DiagramBase class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DiagramBase ()
```

See Also

DiagramBase Class
com.mindfusion.diagramming Namespace

DiagramBase Methods

DiagramBase.addDiagramListener Method

Registers listener so that it will receive events when users create, modify or delete diagram items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public abstract void addDiagramListener (
    DiagramListener listener
)
```

Parameters

listener
An object implementing the DiagramListener interface.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.removeDiagramListener Method

Unregisters listener so that it will no longer receive diagram events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public abstract void removeDiagramListener (
    DiagramListener listener
)
```

Parameters

listener
An object implementing the DiagramListener interface.

See Also

DiagramBase Members
DiagramBase Class
com.mindfusion.diagramming Namespace

DiagramBookmark Class

Represents a saved logical area of interest or landmark zone within a diagram.

Syntax

Java

```
public class DiagramBookmark implements NotifyPropertyChanged
```

Remarks

Instances of this class are stored by the Bookmarks collection of a Diagram. Each bookmark contains coordinates, Title, Brush, Icon, which are persisted with the diagram in XML and JSON formats. These can be used to associate additional metadata with specific sections of flowcharts, floorplans, etc.

Inheritance Hierarchy

java.lang.Object
com.mindfusion.diagramming.DiagramBookmark

See Also

DiagramBookmark Members
com.mindfusion.diagramming Namespace

DiagramBookmark Members

Represents a saved logical area of interest or landmark zone within a diagram.

The following tables list the members exposed by the DiagramBookmark type.

Public Constructors

	Name	Description
	DiagramBookmark	Initializes a new instance of the **DiagramBookmark** class.

Public Methods

	Name	Description
	addPropertyChangeListener	
	getBrush	Gets the custom visual brush used to outline or highlight this zone.
	getIcon	Gets the optional image icon used to represent this bookmark pin.
	getTargetBounds	Gets the logical boundaries of this bookmark zone in diagram document units.
	getTitle	Gets the display title of this bookmark.
	loadFromJson	Loads the bookmark content from a JsonObject.
	loadFromXml	Loads the bookmark content from an XML element.
	removePropertyChangeListener	
	saveToJson	Saves the bookmark content into a JsonObject.
	saveToXml	Saves the bookmark content into an XML element.
	setBrush	Sets the custom visual brush used to outline or highlight this zone.
	setIcon	Sets the optional image icon used to represent this bookmark pin.
	setTargetBounds	Sets the logical boundaries of this bookmark zone in diagram document units.
	setTitle	Sets the display title of this bookmark.

com.mindfusion.diagramming Namespace

DiagramBookmark Constructor

Initializes a new instance of the DiagramBookmark class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramBookmark ()
```

See Also

DiagramBookmark Class
com.mindfusion.diagramming Namespace

DiagramBookmark Methods

DiagramBookmark.addPropertyChangeListener Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void addPropertyChangeListener (
    PropertyChangeListener listener
)
```

Parameters

listener

DiagramBookmark Members
DiagramBookmark Class
com.mindfusion.diagramming Namespace

DiagramBookmark.getBrush Method

Gets the custom visual brush used to outline or highlight this zone.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getBrush ()
```

Return Value

A Brush instance, or null.

See Also

DiagramBookmark Members
DiagramBookmark Class
com.mindfusion.diagramming Namespace

DiagramBookmark.getIcon Method

Gets the optional image icon used to represent this bookmark pin.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Image getIcon ()
```

Return Value

An **Image** instance, or null.

See Also

DiagramBookmark Members
DiagramBookmark Class
com.mindfusion.diagramming Namespace

DiagramBookmark.getTargetBounds Method

Gets the logical boundaries of this bookmark zone in diagram document units.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Rectangle2D getTargetBounds ()
```

Return Value

A **Rectangle2D** specifying the target bounds.

See Also

DiagramBookmark Members
DiagramBookmark Class
com.mindfusion.diagramming Namespace

DiagramBookmark.getTitle Method

Gets the display title of this bookmark.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public String getTitle ()
```

Return Value

A **String** containing the title.

See Also

DiagramBookmark Members
DiagramBookmark Class
com.mindfusion.diagramming Namespace

DiagramBookmark.loadFromJson Method

Loads the bookmark content from a JsonObject.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject to read from.

context
A JsonPersistContext context.

See Also

DiagramBookmark Members
DiagramBookmark Class
com.mindfusion.diagramming Namespace

DiagramBookmark.loadFromXml Method

Loads the bookmark content from an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

An XML **Element** to read from.

context

An XmlPersistContext context.

DiagramBookmark Members
DiagramBookmark Class
com.mindfusion.diagramming Namespace

DiagramBookmark.removePropertyChangeListener Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removePropertyChangeListener (
    PropertyChangeListener listener
)
```

Parameters

listener

See Also

DiagramBookmark Members
DiagramBookmark Class
com.mindfusion.diagramming Namespace

DiagramBookmark.saveToJson Method

Saves the bookmark content into a JsonObject.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject to write to.

context
A JsonPersistContext context.

See Also

DiagramBookmark Members
DiagramBookmark Class
com.mindfusion.diagramming Namespace

DiagramBookmark.saveToXml Method

Saves the bookmark content into an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An XML **Element** to write to.

context
An XmlPersistContext context.

DiagramBookmark.setBrush Method

Sets the custom visual brush used to outline or highlight this zone.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBrush (
    Brush value
)
```

Parameters

value
A Brush instance, or null.

See Also

DiagramBookmark Members
DiagramBookmark Class
com.mindfusion.diagramming Namespace

DiagramBookmark.setIcon Method

Sets the optional image icon used to represent this bookmark pin.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIcon (
    Image value
)
```

Parameters

value
An **Image** instance, or null.

See Also

DiagramBookmark Members
DiagramBookmark Class

DiagramBookmark.setTargetBounds Method

Sets the logical boundaries of this bookmark zone in diagram document units.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTargetBounds (
    Rectangle2D value
)
```

Parameters

value
A **Rectangle2D** specifying the target bounds.

See Also

DiagramBookmark Members
DiagramBookmark Class
com.mindfusion.diagramming Namespace

DiagramBookmark.setTitle Method

Sets the display title of this bookmark.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTitle (
    String value
)
```

Parameters

value
A **String** containing the title.

DiagramDocument Members

Represents a collection of diagram pages.

The following tables list the members exposed by the DiagramDocument type.

Public Constructors

	Name	Description
	DiagramDocument	

Public Methods

	Name	Description
	addDiagramListener	DiagramBase.addDiagramListener override.
	getDirty	Gets a value indicating whether the document has changed since the last save.
	getPages	Gets a list of the diagram pages contained in this document.
	loadFrom	Loads the document contents from a stream.
	loadFromFile	Loads the document from the specified file.
	loadFromJson	Overloaded.
	loadFromJsonString	Loads the diagram document from a JSON-formatted string.
	loadFromString	Loads a diagram from the specified string.
	loadFromXml	Overloaded.
	removeDiagramListener	DiagramBase.removeDiagramListener override.
	saveTo	Saves the diagram contents into a stream.
	saveToFile	Saves the document to the specified file in a binary format.
	saveToJson	Overloaded.
	saveToJsonString	Saves the diagram document to a JSON-formatted string.
	saveToString	Overloaded.
	saveToXml	Overloaded.

DiagramDocument.loadFrom Method

Loads the document contents from a stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFrom (
    InputStream in
)
```

Parameters

in
A **java.io.InputStream** from which to load the diagram contents.

See Also

DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace

DiagramDocument.loadFromFile Method

Loads the document from the specified file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void loadFromFile (
    String fileName
)
```

Parameters

fileName
The name of the file to load from.

DiagramDocument.loadFromJson Method (InputStream)

Loads the diagram document from a stream in JSON format.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void loadFromJson (
    InputStream stream
```

```
)
```

Parameters

stream
A **java.io.InputStream** instance from which to load document data in JSON format.

See Also

loadFromJson Method Overload List
DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace
saveToJson Method

DiagramDocument.loadFromJson Method (JsonObject)

Loads the diagram document from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromJson (
    JsonObject documentObj
)
```

Parameters

documentObj
A JsonObject representing the document.

See Also

loadFromJson Method Overload List
DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace
saveToJson Method

DiagramDocument.loadFromJson Method (String)

Loads the diagram document from a JSON file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromJson (
    String fileName
)
```

Parameters

fileName
A string specifying the file name or full path.

See Also

loadFromJson Method Overload List
DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace
saveToJson Method

DiagramDocument.loadFromJsonString Method

Loads the diagram document from a JSON-formatted string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromJsonString (
    String json
)
```

Parameters

json
A string containing the JSON representation of the document.

See Also

DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace

DiagramDocument.loadFromString Method

Loads a diagram from the specified string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromString (
    String str
)
```

Parameters

str

See Also

DiagramDocument Members

DiagramDocument.loadFromXml Method

Overload List

Name	Description
DiagramDocument.loadFromXml (Document)	Loads the document from the specified XML **Document** object.
DiagramDocument.loadFromXml (InputStream)	Loads the contents of the XML diagram document.
DiagramDocument.loadFromXml (String)	Loads the document from the specified XML file.

See Also

DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace

DiagramDocument.loadFromXml Method (Document)

Loads the document from the specified XML **Document** object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    Document document
)
```

Parameters

document
A **Document** object from which to load the diagram data.

See Also

loadFromXml Method Overload List
DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace

DiagramDocument.loadFromXml Method (InputStream)

Loads the contents of the XML diagram document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    InputStream stream
)
```

Parameters

stream
An InputStream where the XML markup should be read from.

See Also

loadFromXml Method Overload List
DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace

DiagramDocument.loadFromXml Method (String)

Loads the document from the specified XML file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    String fileName
)
```

Parameters

fileName
The name of the XML file the data should be read from.

See Also

loadFromXml Method Overload List

DiagramDocument.saveTo Method

Saves the diagram contents into a stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveTo (
    OutputStream out
)
```

Parameters

out
A **java.io.OutputStream** where the diagram contents should be saved.

See Also

DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace

DiagramDocument.saveToFile Method

Saves the document to the specified file in a binary format.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToFile (
    String fileName
)
```

Parameters

fileName
The full path and name of the disk file where the document should be saved.

See Also

DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace

DiagramDocument.saveToJson Method

Overload List

Name	Description
DiagramDocument.saveToJson (JsonObject, JsonPersistContext)	Saves the diagram document to a JSON object.
DiagramDocument.saveToJson (OutputStream)	Saves the diagram document into a stream in JSON format.
DiagramDocument.saveToJson (String)	Saves the diagram document into a JSON file.

See Also

DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace

DiagramDocument.saveToJson Method (JsonObject, JsonPersistContext)

Saves the diagram document to a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToJson (
    JsonObject documentObj,
    JsonPersistContext context
)
```

Parameters

documentObj
A JsonObject representing the document.

context
A JsonPersistContext object.

loadFromJson Method

DiagramDocument.saveToJson Method (OutputStream)

Saves the diagram document into a stream in JSON format.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToJson (
    OutputStream stream
)
```

Parameters

stream
A **java.io.OutputStream** instance to which to write the document data in JSON format.

See Also

saveToJson Method Overload List
DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace
loadFromJson Method

DiagramDocument.saveToJson Method (String)

Saves the diagram document into a JSON file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToJson (
    String fileName
)
```

Parameters

fileName

A string specifying the file name or full path.

See Also

saveToJson Method Overload List
DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace
loadFromJson Method

DiagramDocument.saveToJsonString Method

Saves the diagram document to a JSON-formatted string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public String saveToJsonString ()`

Return Value

A string containing the JSON representation of the document.

See Also

DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace

DiagramDocument.saveToString Method

Overload List

Name	Description
DiagramDocument.saveToString ()	Saves the diagram contents into a string.
DiagramDocument.saveToString (SaveToStringFormat, boolean)	Saves the diagram contents into a string.

See Also

DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace

DiagramDocument.saveToString Method ()

Saves the diagram contents into a string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String saveToString ()
```

Return Value

A String containing the base64 encoded diagram contents.

See Also

saveToString Method Overload List
DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace
loadFromString Method

DiagramDocument.saveToString Method (SaveToStringFormat, boolean)

Saves the diagram contents into a string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String saveToString (
    SaveToStringFormat format,
    boolean includeUnalteredProperties
)
```

Parameters

format
A member of the SaveToStringFormat enumeration indicating the output format.

includeUnalteredProperties
true to serialize all properties; **false** to serialize only properties with non-default values.

Return Value

A String containing the serialized form of the diagram.

See Also

saveToString Method Overload List
DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace
loadFromString Method

DiagramDocument.saveToXml Method

Overload List

Name	Description
DiagramDocument.saveToXml (Document)	Saves the document to the specified **Document** object.
DiagramDocument.saveToXml (Document, boolean)	Saves the document to the specified **Document** object.
DiagramDocument.saveToXml (OutputStream, boolean)	Saves the diagram to the specified XML document.
DiagramDocument.saveToXml (String)	Saves the diagram to the specified XML document.

DiagramDocument.saveToXml Method (Document)

Saves the document to the specified **Document** object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    Document document
)
```

Parameters

document
A **Document** object where the document should be saved.

See Also

saveToXml Method Overload List
DiagramDocument Members
DiagramDocument Class
com.mindfusion.diagramming Namespace

DiagramDocument.saveToXml Method (Document, boolean)

Saves the document to the specified **Document** object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void saveToXml (
    Document document,
    boolean includeUnalteredProperties
)
```

Parameters

document
An XML **Document** object where the document should be saved.

includeUnalteredProperties
true if properties that have their default value should be saved; otherwise, **false**.

See Also

saveToXml Method Overload List
DiagramDocument Members
DiagramDocument Class

DiagramEvent Constructor Overload List
DiagramEvent Class
com.mindfusion.diagramming Namespace

DiagramEvent Constructor (Object, Point2D, int)

Initializes a new DiagramEvent instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramEvent (
    Object source,
    Point2D position,
    int button
)
```

Parameters

source
The sender of this event.

position
Specifies the mouse pointer position.

button

DiagramEvent Methods

DiagramEvent.getClipRect Method

Gets the current clipping rectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getClipRect ()
```

Return Value

A **Rectangle2D** instance.

See Also

DiagramEvent Members
DiagramEvent Class
com.mindfusion.diagramming Namespace

DiagramEvent.getGraphics Method

Gets a **Graphics2D** object whose methods should be used to draw the custom graphics.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Graphics2D getGraphics ()
```

Return Value

A **Graphics2D** instance.

DiagramEvent.getPointerPosition Method

Gets the pointer position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Point2D.Float getPointerPosition ()
```

Return Value

A **Point2D.Float** object representing the pointer position in document coordinates.

See Also

DiagramEvent Members
DiagramEvent Class
com.mindfusion.diagramming Namespace

DiagramEvent.getVisibleRect Method

Gets what part of the diagram is currently visible.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getVisibleRect ()
```

Return Value

A **Rectangle2D** instance

See Also

DiagramEvent Class
com.mindfusion.diagramming Namespace

DiagramItem Class

The **DiagramItem** class represents an element in a diagram. It defines the basic drawing, interaction, undo/redo and serialization functionality for all the types of elements that can be contained in JDiagram documents.

Syntax

Java

```
public abstract class DiagramItem implements Externalizable
```

Remarks

The interior and borders of the diagram items are painted using the brush and pen specified by setBrush and setPen. The font of items text is set by the setFont method.

The order in which items are painted from bottom to top is called the Z-order. Moving items up or down the Z-order can be done by means of the zBottom, zTop, zLevelUp and zLevelDown methods. Accessing and setting the index of an item in the Z-order can be done using setZIndex and getZIndex.

A hierarchy of items can be built, such that when an item higher in the hierarchy is moved, all subordinated items move too. The immediate subordinates of an item are represented by a Group instance. The group of items attached to another item can be accessed by the getSubordinateGroup method of the latter. getMasterGroup gets the group in which an object is subordinate.

Every item can cast a shadow, whose offset from the object is specified by the setShadowOffsetX and setShadowOffsetY methods. The shadow is painted using the brush specified via setShadowBrush.

An application can associate custom data with an item by means of the getTag and setTag methods. The tags are only meant to hold data related to the entities represented by the chart items. They are not used or modified by JDiagram in any way. The tags are saved and loaded together with the diagram elements when serializing the document to a disk file or a stream.

Items can be locked for interactive modification by the setLocked method. Locked items can still be modified programmatically. Items can also be marked as locked for automatic layout methods by the setIgnoreLayout method.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DiagramItem
    com.mindfusion.diagramming.DiagramLink
    com.mindfusion.diagramming.DiagramNode
    com.mindfusion.diagramming.Selection

DiagramItem Members

The DiagramItem class represents an element in a diagram. It defines the basic drawing, interaction, undo/redo and serialization functionality for all the types of elements that can be contained in JDiagram documents.

The following tables list the members exposed by the **DiagramItem** type.

Public Constructors

	Name	Description
	DiagramItem	Overloaded. Initializes a new instance of the **DiagramItem** class.

Protected Fields

	Name	Description

	brush	
	cycleDetected	
	cycleProtect	
	modifyDX	
	modifyDY	
	modifyHandle	
	modifying	
	pen	
	ptEnd	
	ptMdfLast	
	ptOrg	
	ptSavedEnd	
	ptSavedOrg	
	subordinateGroup	

Public Methods

	Name	Description
	as	Down-casts the item to specified type.
	clone	Creates a copy of this item.
	containsPoint	Overloaded.
	getBounds	Gets the item bounds in logical document coordinates.
	getBrush	Gets the brush used to fill the item's interior.
	getEffectiveBrush	Gets the effective brush of the item.
	getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style.
	getEffectivePen	Gets the effective pen of the item.
	getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style.
	getEffectiveTextBrush	Gets the effective text brush of the item.
	getFont	Gets the font used to draw the text of an item.
	getHyperLink	Gets the hyperlink associated with an item.

	getId	Gets user-defined identifier associated with this item.
	getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms.
	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer.
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms.
	getLocked	Gets a value indicating whether users are allowed to modify an item.
	getMasterGroup	Gets the hierarchical group in which this item is a subordinate.
	getOpacity	Gets the opacity of this item.
	getParent	Gets the diagram that contains this item.
	getPen	Gets the pen used to draw the item frame lines.
	getPrintable	Gets a value indicating whether an item will be printed.
	getRuntimeIndex	For internal use.
	getSelected	Gets a value indicating whether this item is selected.
	getShadowBrush	Gets the brush used to paint the item's shadow.
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it.
	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it.
	getStyle	Gets the style associated with the item.
	getSubordinateGroup	Gets the group of subordinated items attached to this one.
	getTag	Gets user-defined data assigned to an item.
	getTextBrush	Gets the brush used to paint texts inside the item.
	getTextPadding	Gets the spacing between the item boundaries and its text.
	getToolTip	Gets the tooltip text displayed when the pointer rests over this item.
	getVisible	Gets a value indicating whether an item is visible.
	getWeight	Gets a weight value used in layout and path-finding algorithms.
	getZIndex	Gets the position of an item within the diagram's Z-order.
	hasSubordinates	Checks whether there are any nodes attached to this item.
	hitTest	Returns the diagram item that contains the specified point.
	hitTestHandle	Determines whether a selection handle of this item is located at the specified point.

labelFromPoint	Returns the label whose layout rectangle contains the specified point.
query	Returns the items that can be reached from this item by following the path specified in the given query expression.
readExternal	Implements Externalizable.
setBrush	Sets the brush used to fill the item's interior.
setFont	Sets the font used to draw the text of an item.
setHyperLink	Sets the hyperlink associated with an item.
setId	Assigns user-defined identifier to this item.
setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms.
setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer.
setLocked	Sets a value indicating whether users are allowed to modify an item.
setOpacity	Sets the opacity of this item.
setPen	Sets the pen used to draw the item frame lines.
setPrintable	Sets a value indicating whether an item will be printed.
setSelected	Selects or deselects an item.
setShadowBrush	Sets the brush used to paint the item's shadow.
setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it.
setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it.
setStyle	Sets the style associated with the item.
setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event.
setTextBrush	Sets the brush used to paint texts inside the item.
setTextPadding	Sets the spacing between the item boundaries and its text.
setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item.
setVisible	Sets a value indicating whether an item is visible.
setWeight	Sets a weight value used in layout and path-finding algorithms.
setZIndex	Sets the position of an item within the diagram's Z-order.
writeExternal	Implements Externalizable.

	zBottom	Moves an item to the bottom of the Z order.
	zLevelDown	Moves an item down in the Z order.
	zLevelUp	Moves an item up in the Z order.
	zTop	Moves an item to the top of the Z order.

Protected Methods

	Name	Description
	allowCreate	Invoked while the user draws this item to test whether the operation can be completed in the current context.
	allowModify	Invoked during interactive modification of items to test whether the operation can be completed in the current context.
	cancelModify	Invoked when the interactive modification of this item has been canceled.
	completeCreate	Invoked when the user finishes drawing this item.
	completeModify	Invoked when the item modification has been completed.
	createProperties	Creates an item property set corresponding to the type of this diagram item. This method is invoked by the undo/redo subsystem when creating a ChangeItemCmd instance.
	createState	Creates an item state corresponding to the type of this diagram item.
	draw	Draws the item on the specified **Graphics2D** surface.
	drawShadow	Draws the shadow of this diagram item.
	getMeasureUnit	
	getRepaintRect	Gets the repaint region for this item, taking into account factors such as pen, selection handles and shadow.
	getValue	Gets the effective value of the style property with the specified name.
	loadFromJson	Loads the item from a JSON object.
	loadFromXml	Loads the item content from an XML element.
	onAdd	Called when an item is added to a Diagram, either by the user, programmatically or by undo / redo.
	onChangeFont	
	onChangeTextPadding	
	onChildModified	Called when a group child node has been modified. Override this method if you need to know when a node from the **SubordinateGroup** is modified.
	onClick	Invoked when the user clicks this item.
	onDoubleClick	Invoked when the user double-clicks this item.

	onLoad	Called when this item is loaded from a file.
	onMeasureUnitChanged	Called when the diagram's MeasureUnit changes.
	onRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or by undo / redo.
	onStyleChanged	Invoked when the associated style or theme have changed.
	onStyleFontChanged	Invoked when font property values of an associated style change.
	putSelected	
	repaint	Overloaded.
	restoreProperties	Restores the properties of this diagram item. This method is invoked by the undo/redo subsystem when undoing or redoing a **ChangeItemCmd** instance.
	restoreState	Restores the state of this diagram item.
	saveProperties	Saves the properties of this diagram item. This method is invoked by the undo/redo subsystem when saving a **ChangeItemCmd** instance.
	saveState	Saves the state of this diagram item.
	saveToJson	Saves the item as a JSON object.
	saveToXml	Saves the item content into an XML element.
	setDiagramDirty	Marks the diagram as changed.
	shouldRender	Determines whether the item is rendered in the current context.
	startCreate	Invoked once when the user starts drawing a new item interactively.
	startModify	Invoked when the user starts modifying this item interactively.
	updateCreate	Invoked during interactive creation of this item.
	updateModify	Invoked during interactive modification of this item.

DiagramItem Constructor

Initializes a new instance of the DiagramItem class.

Overload List

Name	Description
DiagramItem ()	Initializes a new instance of the **DiagramItem** class.
DiagramItem (Diagram)	Initializes a new **DiagramItem** instance by copying property values from a Diagram's default-value instance members.
DiagramItem (DiagramItem)	Initializes a new **DiagramItem** instance by copying property values from another DiagramItem's instance members.

See Also

DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem Constructor ()

Initializes a new instance of the DiagramItem class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramItem ()
```

See Also

DiagramItem Constructor Overload List
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem Constructor (Diagram)

Initializes a new DiagramItem instance by copying property values from a Diagram's default-value instance members.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramItem (
    Diagram parent
)
```

Parameters

parent
A Diagram instance whose default item attributes are copied to this item.

See Also

DiagramItem Constructor Overload List
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem Constructor (DiagramItem)

Initializes a new DiagramItem instance by copying property values from another DiagramItem's instance members.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramItem (
    DiagramItem prototype
)
```

Parameters

prototype
A DiagramItem instance whose attributes are copied to this item.

See Also

DiagramItem Constructor Overload List
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem Methods

DiagramItem.allowCreate Method

Invoked while the user draws this item to test whether the operation can be completed in the current context.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected abstract boolean allowCreate (
    Point2D current,
    InteractionState ist
)
```

Parameters

current
A **Point2D** specifying the current pointer position.

ist
An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the creation of this item; otherwise, **false**.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.allowModify Method

Invoked during interactive modification of items to test whether the operation can be completed in the current context.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected abstract boolean allowModify (
    Point2D current,
    InteractionState ist
)
```

Parameters

current
A **Point2D** specifying the current pointer position.

ist
An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the modification of this item; otherwise, **false**.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.as<T> Method

Down-casts the item to specified type.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public <T> T as (
    Class<T> type
)
```

Parameters

type
A **Class** instance specifying the target type.

Return Value

This item cast to specified type, or **null** if it's of a different type.

Remarks

Syntax sugar for a slightly shorter type checking and casting.

Example

Java

```
public void nodeCreated(NodeEvent e)
{
    ContainerNode container = e.getNode().as(ContainerNode.class);
    if (container != null)
    {
```

```
        ...
    }
}

// alternative to

public void nodeCreated(NodeEvent e)
{
    if (e.getNode() instanceof ContainerNode)
    {
        ContainerNode container = (ContainerNode)e.getNode();
        ...
    }
}
```

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.cancelModify Method

Invoked when the interactive modification of this item has been canceled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void cancelModify (
    InteractionState ist
)
```

Parameters

ist
An InteractionState object containing more information about the current state of the operation.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.clone Method

Creates a copy of this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem clone (
    boolean clipboard
```

```
)
```

Parameters

clipboard
true if the copy will be stored in the Windows clipboard; otherwise, **false**.

Return Value

A copy of this item.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.completeCreate Method

Invoked when the user finishes drawing this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void completeCreate (
    Point2D end
)
```

Parameters

end
A **Point2D** specifying the current pointer position.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.completeModify Method

Invoked when the item modification has been completed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void completeModify (
    Point2D end,
    InteractionState ist
)
```

Parameters

end
A **Point2D** specifying the current pointer position.

ist
An InteractionState object containing more information about the current state of the operation.

DiagramItem.containsPoint Method

Overload List

Name	Description
DiagramItem.containsPoint (Point2D)	Determines whether this item contains the specified point.
DiagramItem.containsPoint (Point2D, float)	Determines whether this item contains the specified point.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.containsPoint Method (Point2D)

Determines whether this item contains the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public abstract boolean containsPoint (
    Point2D point
)
```

Parameters

point
The point to check.

Return Value

true it this item contains the specified point; otherwise, **false**.

Remarks

This method is used during hit-testing to determine if the pointer is inside an item.

See Also

containsPoint Method Overload List
DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace
hitTest Method

DiagramItem.containsPoint Method (Point2D, float)

Determines whether this item contains the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public abstract boolean containsPoint (
    Point2D point,
    float threshold
)
```

Parameters

point
A **Point2D** value specifying the logical coordinates of a diagram point.

threshold
Specifies the size of the area around the item outlines where the point is still considered inside the item.

Return Value

true it this item contains the specified point; otherwise, **false**.

Remarks

This method is used during hit-testing to determine if the pointer is inside an item.

See Also

containsPoint Method Overload List
DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace
hitTest Method

DiagramItem.createProperties Method

Creates an item property set corresponding to the type of this diagram item. This method is invoked by the undo/redo subsystem when creating a ChangeItemCmd instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DiagramItemProperties createProperties ()
```

Return Value

A DiagramItemProperties-derived object containing a snapshot of the item's properties.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.createState Method

Creates an item state corresponding to the type of this diagram item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DiagramItemState createState ()
```

Return Value

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.draw Method

Draws the item on the specified **Graphics2D** surface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected abstract void draw (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g
The **Graphics2D** surface to draw the item on.

options
A RenderOptions object specifying options for the drawing operation.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.drawShadow Method

Draws the shadow of this diagram item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected abstract void drawShadow (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g
A **Graphics2D** object where the shadow should be rendered.

options
A RenderOptions object specifying options for the drawing operation.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getBounds Method

Gets the item bounds in logical document coordinates.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public abstract Rectangle2D.Float getBounds ()
```

Return Value

A **Rectangle2D** object representing the item's bounds.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getBrush Method

Gets the brush used to fill the item's interior.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getBrush ()
```

Return Value

A Brush -derived object representing the item's brush.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace
Pen Property
Opacity Property

DiagramItem.getEffectiveBrush Method

Gets the effective brush of the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getEffectiveBrush ()
```

Return Value

A Brush instance.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getEffectiveFont Method

Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Font getEffectiveFont ()
```

Return Value

A **Font** instance.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getEffectivePen Method

Gets the effective pen of the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Pen getEffectivePen ()
```

Return Value

A Pen instance.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getEffectiveShadowBrush Method

Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a

system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public Brush getEffectiveShadowBrush ()`

Return Value

A Brush instance.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getEffectiveTextBrush Method

Gets the effective text brush of the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public Brush getEffectiveTextBrush ()`

Return Value

A Brush instance.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getFont Method

Gets the font used to draw the text of an item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public Font getFont ()`

Return Value

A Font object representing the font usedto draw this item's text.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getHyperLink Method

Gets the hyperlink associated with an item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getHyperLink ()
```

Return Value

A **String** containing the hyperlink.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getId Method

Gets user-defined identifier associated with this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object getId ()
```

Return Value

A custom id Object.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getIgnoreLayout Method

Gets a value indicating whether an item should be ignored by the automatic layout algorithms.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getIgnoreLayout ()
```

Return Value

true if the item is ignored by layout algorithms, otherwise **false**.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getLayerIndex Method

Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getLayerIndex ()
```

Return Value

An integer value specifying the layer index.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getLayoutTraits Method

Returns a hashtable containing properties specific to layout algorithms.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Hashtable<Object, Object> getLayoutTraits ()
```

Return Value

A hashtable of key-value pairs that define layout-specific properties for this item.

Remarks

Values from this hashtable are used by the following layout classes:

- SpringLayout looks for values associated with SpringLayoutTraits members.
- TreeLayout looks for values associated with TreeLayoutTraits members.
- SwimlaneLayout looks for values associated with SwimlaneLayoutTraits members.
- LayeredLayout looks for values associated with LayeredLayoutTraits members.
- HierarchicalLayout looks for values associated with HierarchicalLayoutTraits members.

DiagramItem.getLocked Method

Gets a value indicating whether users are allowed to modify an item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getLocked ()
```

Return Value

true if the item cannot be modified,otherwise **false**.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getMasterGroup Method

Gets the hierarchical group in which this item is a subordinate.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Group getMasterGroup ()
```

Return Value

A Group to which this item is attached.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getMeasureUnit Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

`protected GraphicsUnit getMeasureUnit ()`

Return Value

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getOpacity Method

Gets the opacity of this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public float getOpacity ()`

Return Value

A float value between 0 and 1 specifying the item's opacity.

Remarks

This value is applied as a factor multiplying the alpha channel of all colors in the item's graphics.

com.mindfusion.diagramming Namespace

DiagramItem.getRepaintRect Method

Gets the repaint region for this item, taking into account factors such as pen, selection handles and shadow.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected Rectangle2D getRepaintRect (
    boolean includeConnected
)
```

Parameters

includeConnected
true if related items should be considered too; otherwise, **false**.

Return Value

A rectangular region that should be repainted when this item is modified.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getRuntimeIndex Method

For internal use.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getRuntimeIndex ()
```

Return Value

A sequential integer id for this item.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getSelected Method

Gets a value indicating whether this item is selected.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getSelected ()
```

Return Value

true if the item is selected, otherwise **false**.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getShadowBrush Method

Gets the brush used to paint the item's shadow.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getShadowBrush ()
```

Return Value

An instance of a Brush -derived class. Initialized with the value of ShadowBrush.

Remarks

The shadow of an item has the same shape as the item, but is painted with a different brush and with some offset from the item position. This property specifies the brush used to paint the item's shadow.

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getShadowOffsetX Method

Gets the horizontal distance between a shadow and the item that casts it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getShadowOffsetX ()
```

Return Value

A float value representing the horizontal offset of the item's shadow.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getShadowOffsetY Method

Gets the vertical distance between a shadow and the item that casts it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getShadowOffsetY ()
```

Return Value

A float value representing the vertical offset of the item's shadow.

See Also

DiagramItem Members

DiagramItem.getStyle Method

Gets the style associated with the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItemStyle getStyle ()
```

Return Value

A DiagramItemStyle instance.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getSubordinateGroup Method

Gets the group of subordinated items attached to this one.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Group getSubordinateGroup ()
```

Return Value

A reference to a Group for which this item is the master item.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getTag Method

Gets user-defined data assigned to an item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object getTag ()
```

Return Value

A custom data **Object**.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getTextBrush Method

Gets the brush used to paint texts inside the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getTextBrush ()
```

Return Value

A Brush instance.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getTextPadding Method

Gets the spacing between the item boundaries and its text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Thickness getTextPadding ()
```

Return Value

A Thickness instance specifying the size of the padding space left around the text.

See Also

DiagramItem Members
DiagramItem Class

DiagramItem.getToolTip Method

Gets the tooltip text displayed when the pointer rests over this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getToolTip ()
```

Return Value

A **String** that contains the tooltip text.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getValue Method

Gets the effective value of the style property with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Object getValue (
    String name
)
```

Parameters

name
The name of a styleable property.

Return Value

The effective value of the specified property.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getVisible Method

Gets a value indicating whether an item is visible.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getVisible ()
```

Return Value

true if the item is visible, otherwise **false**.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getWeight Method

Gets a weight value used in layout and path-finding algorithms.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getWeight ()
```

Return Value

A float value representing the item's weight.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.getZIndex Method

Gets the position of an item within the diagram's Z-order.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getZIndex ()
```

Return Value

An integer value specifying the position of the item within the diagram Z-order.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.hasSubordinates Method

Checks whether there are any nodes attached to this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean hasSubordinates ()
```

Return Value

true if there are some nodes attached to this item, otherwise **false**.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.hitTest Method

Returns the diagram item that contains the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem hitTest (
    Point2D point,
    float threshold,
    boolean onlyNodes,
    boolean onlyInteractive,
    boolean includeHandles,
    boolean includeLabels
)
```

Parameters

point

A **Point2D** value specifying the logical coordinates of a diagram point.

threshold
Specifies the size of the area around the item outlines where the point is still considered inside the item.

onlyNodes
true to exclude child links from the search.

onlyInteractive
true to exclude locked items from the search.

includeHandles
true to also consider adjustment handle locations (possibly outside of item's bounds).

includeLabels
true to also consider item label locations (possibly outside of item's bounds).

Return Value

The item that contains the specified point.

Remarks

This method performs recursive search if items contain child items.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace
containsPoint Method

DiagramItem.hitTestHandle Method

Determines whether a selection handle of this item is located at the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public abstract AdjustmentHandle hitTestHandle (
    Point2D point
)
```

Parameters

point
A **Point2D** instance specifying the location where to look for adjustment handles.

Return Value

Returns an AdjustmentHandle instance representing the adjustment handle found at the specified location, or **null** if there is none.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.labelFromPoint Method

Returns the label whose layout rectangle contains the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ItemLabel labelFromPoint (
    Point2D point
)
```

Parameters

point
A **Point2D** instance.

Return Value

The ItemLabel that contains the specified point.

DiagramItem.loadFromJson Method

Loads the item from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the item's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

Remarks

This method is invoked when an item is being deserialized from a diagram file saved in JSON format.

See Also

DiagramItem Members

com.mindfusion.diagramming Namespace

DiagramItem.loadFromXml Method

Loads the item content from an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An **XmlElement** containing the item's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods

DiagramItem.onChildModified Method

Called when a group child node has been modified. Override this method if you need to know when a node from the SubordinateGroup is modified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onChildModified (
    DiagramNode node,
    AdjustmentHandle handle
)
```

Parameters

node
The node that has been modified.

handle
The adjustment handle used to modify the node.

DiagramItem.onClick Method

Invoked when the user clicks this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onClick (
    int mouseButton,
    Point2D pointerPosition
)
```

Parameters

mouseButton
Specifies the mouse button used to click the item.

mousePosition
Specifies the mouse position.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.onDoubleClick Method

Invoked when the user double-clicks this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onDoubleClick (
    int mouseButton,
    Point2D pointerPosition
)
```

Parameters

mouseButton
Specifies the mouse button used to click the item.

mousePosition
Specifies the mouse position

    boolean newVal
)
```

Parameters

newVal

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.query Method

Returns the items that can be reached from this item by following the path specified in the given query expression.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItemList query (
    String query
)
```

Parameters

query
A query expression consisting of selectors and boolean predicates.

Return Value

A DiagramItemList collection of the found items.

Remarks

The query string consists of selectors, where each selector specifies the next items that should be selected starting from the current one.

The following selectors can be applied to a node:

links	Selects all links connected to the current node
inlinks	Selects the incoming links of the current node
outlinks	Selects the outgoing links of the current node
parent	Selects the parent item of the current node if it is in a group
children	Selects the child nodes of the current node if it is in a group

The following selectors can be applied to a link:

nodes	Selects the two nodes connected by the current link
origin	Selects the Origin node of the current link
destination	Selects the Destination node of the current link
children	Selects the child nodes of the current link if it is in a group.

Selectors must be separated by the / character. The results returned by a selector can be also filtered using a predicate expression, enclosed in square brackets after the selector name. The predicate expression can include C# like boolean and arithmetic operators, and one of the following property identifiers:

tag	Returns the value of the Tag property.
text	Returns the value of the Text property.
weight	Returns the value of the Weight property.

Example

The following code selects nodes two levels below the current one in a tree or layered graph.

Java

```
DiagramItemList items = diagram.getActiveItem().query(
    "outlinks/destination/outlinks/destination");
diagram.getSelection().clear();
for (DiagramItem item : items)
    item.setSelected(true);
```

The following code finds the neighbors of the currently selected node that can be reached from it by following links with Weight greater than 3.

Java

```
DiagramItemList items = diagram.getActiveItem().query(
 "outlinks[weight>3]/destination");
```

The following example finds the destination nodes of links labeled "exception" going out of children of the current node's group.

Java

```
DiagramItemList items = diagram.getActiveItem().query(
    "children/outlinks[text==\"exception\"]/destination");
```

DiagramItem.repaint Method

Overload List

Name	Description
DiagramItem.repaint ()	Repaints the region of the diagram where this item is located. Call this method to repaint the diagram after changing appearance attributes of this item.
DiagramItem.repaint (boolean)	Repaints the specified region of the diagram.
DiagramItem.repaint (Rectangle2D)	Repaints the specified region of the diagram.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.repaint Method ()

Repaints the region of the diagram where this item is located. Call this method to repaint the diagram after changing appearance attributes of this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void repaint ()
```

See Also

repaint Method Overload List
DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.repaint Method (boolean)

Repaints the specified region of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void repaint (
    boolean includeConnected
)
```

Parameters

includeConnected

See Also

repaint Method Overload List
DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.repaint Method (Rectangle2D)

Repaints the specified region of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void repaint (
    Rectangle2D invalidRect
)
```

Parameters

invalidRect

DiagramItem.restoreProperties Method

Restores the properties of this diagram item. This method is invoked by the undo/redo subsystem when undoing or redoing a ChangeItemCmd instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void restoreProperties (
    DiagramItemProperties props
)
```

Parameters

props
A DiagramItemProperties-derived object containing a snapshot of the item's properties.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.restoreState Method

Restores the state of this diagram item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void restoreState (
    DiagramItemState state
)
```

Parameters

state

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.saveProperties Method

Saves the properties of this diagram item. This method is invoked by the undo/redo subsystem when saving a ChangeItemCmd instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveProperties (
    DiagramItemProperties props
)
```

Parameters

props
A DiagramItemProperties-derived object where the item's properties should be saved.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.saveState Method

Saves the state of this diagram item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveState (
    DiagramItemState state
)
```

Parameters

state

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.saveToJson Method

Saves the item as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

Remarks

This method is invoked when an item is being serialized into a JSON-format diagram file.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.saveToXml Method

Saves the item content into an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

An **Element** the item's data should be stored into.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setBrush Method

Sets the brush used to fill the item's interior.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBrush (
    Brush value
)
```

Parameters

value

A Brush -derived object representing the item's brush.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

Opacity Property

DiagramItem.setDiagramDirty Method

Marks the diagram as changed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void setDiagramDirty ()
```

See Also

DiagramItem Members
DiagramItem Class

DiagramItem.setFont Method

Sets the font used to draw the text of an item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFont (
    Font value
)
```

Parameters

value
A **Font** object representing the fontused to draw this item's text.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setHyperLink Method

Sets the hyperlink associated with an item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHyperLink (
    String value
)
```

Parameters

value
A **String** containing the hyperlink.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setId Method

Assigns user-defined identifier to this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setId (
    Object value
)
```

Parameters

value
An Object containing custom data.

Remarks

If the id object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the serializeTag event.

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setIgnoreLayout Method

Sets a value indicating whether an item should be ignored by the automatic layout algorithms.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIgnoreLayout (
    boolean value
)
```

Parameters

value
true if the item should be ignored by automatic layout algorithms, otherwise **false**.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setLayerIndex Method

Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLayerIndex (
    int value
)
```

Parameters

value
An integer value specifying the layer index.

See Also

DiagramItem Members

com.mindfusion.diagramming Namespace

DiagramItem.setLocked Method

Sets a value indicating whether users are allowed to modify an item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLocked (
    boolean value
)
```

Parameters

value
true if the item should not be modified, otherwise **false**.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setOpacity Method

Sets the opacity of this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setOpacity (
    float value
)
```

Parameters

value
A float value between 0 and 1 specifying the item's opacity.

Remarks

This value is applied as a factor multiplying the alpha channel of all colors in the item's graphics.

DiagramItem.setShadowBrush Method

Sets the brush used to paint the item's shadow.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShadowBrush (
    Brush value
)
```

Parameters

value
An instance of a Brush -derived class. Initialized with the value of ShadowBrush.

Remarks

The shadow of an item has the same shape as the item, but is painted with a different brush and with some offset from the item position. This property specifies the brush used to paint the item's shadow.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setShadowOffsetX Method

Sets the horizontal distance between a shadow and the item that casts it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShadowOffsetX (
    float value
)
```

Parameters

value
A float value representing the horizontal offset of the item's shadow.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setShadowOffsetY Method

Sets the vertical distance between a shadow and the item that casts it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setShadowOffsetY (
    float value
)
```

Parameters

value
A float value representing the vertical offset of the item's shadow.

Sets the style associated with the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setStyle (
    DiagramItemStyle value
)
```

Parameters

value
A DiagramItemStyle instance.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setTag Method

Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTag (
    Object value
)
```

Parameters

value
An **Object** containing custom data.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setTextBrush Method

Sets the brush used to paint texts inside the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTextBrush (
    Brush value
)
```

Parameters

value
A Brush instance.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setTextPadding Method

Sets the spacing between the item boundaries and its text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTextPadding (
    Thickness value
)
```

Parameters

value
A Thickness instance specifying the size of the padding space left around the text.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setToolTip Method

Sets the tooltip text that should be displayed when the pointer rests over this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setToolTip (
    String value
)
```

Parameters

value
A **String** that contains the tooltip text.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setVisible Method

Sets a value indicating whether an item is visible.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setVisible (
    boolean value
)
```

Parameters

value
true if the item should be visible,otherwise **false**.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setWeight Method

Sets a weight value used in layout and path-finding algorithms.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setWeight (
    float value
)
```

Parameters

value
A float value representing the item's weight.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.setZIndex Method

Sets the position of an item within the diagram's Z-order.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setZIndex (
    int value
)
```

Parameters

value
An integer value specifying the position of the item within the diagram Z-order.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.shouldRender Method

Determines whether the item is rendered in the current context.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected boolean shouldRender ()
```

Return Value

true to draw the item; otherwise, **false**.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.startCreate Method

Invoked once when the user starts drawing a new item interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void startCreate (
    Point2D org
)
```

Parameters

org
A **Point2D** specifying the pointer position.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.startModify Method

Invoked when the user starts modifying this item interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void startModify (
    Point2D org,
    AdjustmentHandle handle,
    InteractionState ist
)
```

Parameters

org
The initial mouse position.

handle
The adjustment handle used to modify this item.

ist
An InteractionState object containing more information about the current state of the operation.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.updateCreate Method

Invoked during interactive creation of this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void updateCreate (
    Point2D current
)
```

Parameters

current
A **Point2D** specifying the pointer position.

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.updateModify Method

Invoked during interactive modification of this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void updateModify (
    Point2D current,
    InteractionState ist
)
```

Parameters

current
A **Point2D** specifying the pointer position.

ist
An InteractionState object containing more information about the current state of the operation.

com.mindfusion.diagramming Namespace

DiagramItem.zBottom Method

Moves an item to the bottom of the Z order.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void zBottom (
    boolean keepInLayer
)
```

Parameters

keepInLayer

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.zLevelDown Method

Moves an item down in the Z order.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void zLevelDown (
    boolean keepInLayer
)
```

Parameters

keepInLayer

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.zLevelUp Method

Moves an item up in the Z order.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public void zLevelUp (
    boolean keepInLayer
)
```

Parameters

keepInLayer

See Also

DiagramItem Members
DiagramItem Class
com.mindfusion.diagramming Namespace

DiagramItem.zTop Method

Moves an item to the top of the Z order.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void zTop (
    boolean keepInLayer
)
```

Parameters

keepInLayer

DiagramItemList Members

A strongly typed list of DiagramItem objects.

The following tables list the members exposed by the DiagramItemList type.

Public Constructors

	Name	Description
	DiagramItemList	

Protected Fields

	Name	Description
	list	(Inherited from BaseList.)
	listEvent	(Inherited from BaseList.)
	notifyParent	(Inherited from BaseList.)

Public Methods

	Name	Description
	add	Adds a new element to the list. (Inherited from BaseList.)
	clear	Removes all elements from the list. (Inherited from BaseList.)
	clone	
	contains	Determines if this list contains the specified element. (Inherited from BaseList.)
	first	Gets the first element of this list. (Inherited from BaseList.)
	get	Gets the element at the specified position in this list. (Inherited from BaseList.)
	last	Gets the last element of this list. (Inherited from BaseList.)
	readExternal	Loads the list's contents. (Inherited from BaseList.)
	remove	Overloaded. (Inherited from BaseList.)
	removeRange	Removes a range of elements from this list. (Inherited from BaseList.)
	set	Sets the element at the specified position in this list. (Inherited from BaseList.)
	size	Gets the number of elements in this list. (Inherited from BaseList.)

	writeExternal	Saves the list's contents. (Inherited from BaseList.)

Protected Methods

	Name	Description
	raiseAdding	Raises the adding event. (Inherited from BaseList.)
	raiseClearing	Raises the clearing event. (Inherited from BaseList.)
	raiseRemoving	Raises the removing event. (Inherited from BaseList.)

DiagramItemStyle Members

Represents a reusable set of properties that define the appearance of diagram items.

The following tables list the members exposed by the DiagramItemStyle type.

Protected Constructors

	Name	Description
	DiagramItemStyle	Initializes a new instance of the **DiagramItemStyle** class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from Style.)
	getBrush	Gets the brush used to fill the interior of the item.
	getFontFamily	Gets the font family of the item text.
	getFontSize	Gets the font size of the item text.
	getFontStyle	Gets the font style of the item text.
	getFontUnit	Gets the measure unit used to specify font size.
	getShadowBrush	Gets the brush used to paint the shadow of the item.
	getStroke	Gets the brush used to paint the outline of the item.
	getStrokeThickness	Gets the thickness of the item's outline, expressed in the current units of measure.
	getTextBrush	Gets the brush used to paint texts inside the item.
	readExternal	**Externalizable.readExternal** implementation. (Inherited from Style.)
S	registerType	Associates a type with an alias. The alias is used when saving and loading objects of the specified type during style serialization and deserialization. (Inherited from Style.)

	removePropertyChangeListener	(Inherited from Style.)
	setBrush	Sets the brush used to fill the interior of the item.
	setFontFamily	Sets the font family of the item text.
	setFontSize	Sets the font size of the item text.
	setFontStyle	Sets the font style of the item text.
	setFontUnit	Sets the measure unit used to specify font size.
	setShadowBrush	Sets the brush used to paint the shadow of the item.
	setStroke	Sets the brush used to paint the outline of the item.
	setStrokeThickness	Sets the thickness of the item's outline, expressed in the current units of measure.
	setTextBrush	Sets the brush used to paint texts inside the item.
	writeExternal	**Externalizable.writeExternal** implementation. (Inherited from Style.)

Protected Methods

	Name	Description
	getValue	Gets the value of the specified property. (Inherited from Style.)
	isPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	loadFromJson	Loads the style content from a JsonObject.
	loadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	registerProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	saveToJson	Saves the style content into a JsonObject.
	saveToXml	Saves the style content into an XML element. (Inherited from Style.)
	setValue	Sets the value of the specified property. (Inherited from Style.)
	unsetValue	Clears the value of the specified property. (Inherited from Style.)

DiagramItemStyle.loadFromJson Method

Loads the style content from a JsonObject.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the style's data.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

DiagramItemStyle Members
DiagramItemStyle Class
com.mindfusion.diagramming Namespace

DiagramItemStyle.saveToJson Method

Saves the style content into a JsonObject.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject the style's data should be stored into.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

DiagramLink Class

Links between nodes in JDiagram diagrams are represented by instances of the **DiagramLink** class.

Syntax

Java

```
public class DiagramLink extends DiagramItem implements InplaceEditable, Routable
```

Remarks

Links connect at most two nodes, which can be accessed by the getOrigin and getDestination methods. If linked to node anchor points, the point indices can be accessed using the getOriginAnchor and getDestinationAnchor methods. To control whether users are allowed to move link end points, call one or both of the setAllowMoveStart and setAllowMoveEnd.

Links are built of smaller parts, called segments, which can be straight lines, cascading orthogonal lines or Bezier curves. The type of segments can be set through the setStyle method. The number of links segments is specified by the setSegmentCount method. Access to the control point locations is provided by the getControlPoints method.

Usually only the start and end segments of a link are updated if the nodes it connects are moved around. Number, orientation and/or position of link segments can change dynamically in various ways depending on the values set through setAutoRoute, setDynamic and setRetainForm. The setCascadeOrientation method lets you specify the orientation of the first segment of a link of style Cascading.

If AutoSnapToNode is enabled, a link automatically aligns its end points to the border of the origin or destination nodes when a user moves the first or last control points. This has a higher priority than aligning to the grid, but a lower priority than aligning to an anchor point.

Links can display distinct arrowhead shapes at their ends. These shapes can be set by the setHeadShape and setBaseShape methods. The size of the arrowhead and base shapes can be specified respectively via the setHeadShapeSize and setBaseShapeSize methods. Arrowhead shapes can be displayed in the middle of each segment to facilitate users by distinguishing different links. The type and size of these shapes is set by the setIntermediateShape and setIntermediateShapeSize methods. The outlines of arrowhead shapes are painted with the pen specified by setHeadPen.

Links can have some text associated with them, displayed as specified in the setText, setTextBrush and setTextStyle methods. It is also possible to display multiple labels, added via the addLabel method. They are rendered using the font and text color associated with the link by default, but can be customized with distinct fonts, colors and text alignments through the methods of LinkLabel.

DiagramLink Members

Links between nodes in JDiagram diagrams are represented by instances of the DiagramLink class.

The following tables list the members exposed by the **DiagramLink** type.

Public Constructors

	Name	Description
	DiagramLink	Overloaded.

Protected Fields

	Name	Description
	brush	(Inherited from DiagramItem.)
	cycleDetected	(Inherited from DiagramItem.)
	cycleProtect	(Inherited from DiagramItem.)
	modifyDX	(Inherited from DiagramItem.)
	modifyDY	(Inherited from DiagramItem.)
	modifyHandle	(Inherited from DiagramItem.)
	modifying	(Inherited from DiagramItem.)
	pen	(Inherited from DiagramItem.)
	ptEnd	(Inherited from DiagramItem.)
	ptMdfLast	(Inherited from DiagramItem.)
	ptOrg	(Inherited from DiagramItem.)
	ptSavedEnd	(Inherited from DiagramItem.)
	ptSavedOrg	(Inherited from DiagramItem.)
	subordinateGroup	(Inherited from DiagramItem.)

Public Methods

	Name	Description
	addLabel	Overloaded. Adds a new label to this link.
	applyRoute	
	as	Down-casts the item to specified type. (Inherited from DiagramItem.)

	clone	Creates a copy of this link.
	containsPoint	Overloaded.
	createRouteDescriptor	
	drawArrowhead	Draws an arrowhead shape.
	getAllowMoveEnd	Gets a value indicating whether users are allowed to move the last control point of a link.
	getAllowMoveStart	Gets a value indicating whether users are allowed to move the first control point of a link.
	getAutoRoute	Gets a value indicating whether a link should avoid nodes by going the shortest path from its origin to its destination without crossing any other nodes.
	getAutoSnapToNode	Gets a value indicating whether a link end point should automatically snap to the nearest diagram node while the user moves the point's adjustment handle.
	getBaseBrush	Gets the brush used to fill the arrowhead drawn at the link base.
	getBaseShape	Gets the shape that is displayed at the origin of a link.
	getBaseShapeSize	Gets the size of the shape displayed at the origin of a link.
	getBounds	Gets the smallest rectangle that bounds all points of a link.
	getBrush	Gets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	getCascadeOrientation	Gets the orientation of the first segment of a cascading link.
	getControlPoints	Gets the list of control points of a link.
	getCustomDraw	Gets the type of custom drawing performed on this link.
	getDestination	Gets the destination node of a link.
	getDestinationAnchor	Gets the index of the anchor point to which a link is connected at its destination.
	getDestinationConnection	Gets the ConnectionPoint object representing the link connection to its destination node.
	getDestinationIndex	Gets the index of the row of a table or the anchor point of a box to which a link is connected.
	getDynamic	Gets whether a link should automatically update the position of its end points while a node related to the link is moved, so that the link end segments always point to the center of the link's nodes.
	getEditRect	Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).
	getEffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)

	getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style. (Inherited from DiagramItem.)
	getEffectiveHeadPen	Creates a Pen object representing the currently effective head pen of the link. This method returns a pen corresponding to the link's DiagramLink.getHeadPen if it is not null, or a pen with the DiagramLinkStyle.getHeadStroke and DiagramLinkStyle.getHeadStrokeThickness properties of the link's style.
	getEffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style. (Inherited from DiagramItem.)
	getEffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	getEndPoint	Gets the position of the last control point of this link.
	getFont	Gets the font used to draw the text of an item. (Inherited from DiagramItem.)
	getHandlesStyle	Gets the appearance of the link's selection handles.
	getHeadBrush	Gets the brush used to fill the arrowhead drawn at the link's destination.
	getHeadPen	Gets the pen used to draw the arrowhead shapes outlines.
	getHeadShape	Gets the shape of this link's arrowhead.
	getHeadShapeSize	Gets the size of the arrowhead shape.
	getHyperLink	Gets the hyperlink associated with an item. (Inherited from DiagramItem.)
	getId	Gets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	getIntermediateBrush	Gets the brush used to fill the arrowheads drawn at the middle of link segments.
	getIntermediateShape	Gets the shape that is displayed at the middle of each segment of a link.
	getIntermediateShapeSize	Gets the size of the shape displayed at the middle of each segment of a link.
	getLabels	Returns the list of all labels displayed by this link.

	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms. (Inherited from DiagramItem.)
	getLength	Gets the length of this link.
	getLocked	Gets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	getLongestHSegment	Returns the index of the longest non-vertical segment of the link.
	getMasterGroup	Gets the hierarchical group in which this item is a subordinate. (Inherited from DiagramItem.)
	getOpacity	Gets the opacity of this item. (Inherited from DiagramItem.)
	getOrigin	Gets the origin node of a link.
	getOriginAnchor	Gets the index of the anchor point to which a link is connected at its origin.
	getOriginConnection	Gets the **ConnectionPoint** object representing the link connection to its origin node.
	getOriginIndex	Gets the index of the row of a table or the anchor point of a box to which a link is connected.
	getParent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	getPen	Gets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	getPrintable	Gets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	getRetainForm	Gets a value indicating whether a link should preserve its original shape while the nodes related to that link are moved around.
	getRuntimeIndex	For internal use. (Inherited from DiagramItem.)
	getSegmentCount	Gets the number of segments of this link.
	getSelected	Gets a value indicating whether this item is selected. (Inherited from DiagramItem.)
	getShadowBrush	Gets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShape	Gets the shape of a link.
	getStartPoint	Gets the position of the first control point of this link.

	getStyle	Gets the style associated with the item. (Inherited from DiagramItem.)
	getSubordinateGroup	Gets the group of subordinated items attached to this one. (Inherited from DiagramItem.)
	getTag	Gets user-defined data assigned to an item. (Inherited from DiagramItem.)
	getText	Gets the text of the link's label.
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	getTextPadding	Gets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	getTextStyle	Gets the link's text placement and orientation.
	getTextToEdit	Implements InplaceEditable.getTextToEdit. Returns the string that should be displayed initially when the link's text is edited in-place.
	getToolTip	Gets the tooltip text displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	getVisible	Gets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	getWeight	Gets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	getZIndex	Gets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	hasSubordinates	Checks whether there are any nodes attached to this item. (Inherited from DiagramItem.)
	hitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	hitTestHandle	DiagramItem.hitTestHandle override.
	init	Returns a DiagramLinkBuilder object used to configure this DiagramLink instance.
	intersects	Overloaded.
	isConnected	Gets a value indicating whether a link is connected to any nodes.
	labelFromPoint	Returns the label whose layout rectangle contains the specified point.
	query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	readExternal	Implements Externalizable.
	reassignAnchorPoints	Chooses new anchor points for a link.
	removeLabel	Removes the specified label from this link.

	route	Sets the link control points so that a link goes between its related nodes without crossing other nodes.
	setAllowMoveEnd	Sets a value indicating whether users are allowed to move the last control point of a link.
	setAllowMoveStart	Sets a value indicating whether users are allowed to move the first control point of a link.
	setAutoRoute	Sets a value indicating whether a link should avoid nodes by going the shortest path from its origin to its destination without crossing any other nodes.uld automatically find its way between nodes so that it will not cross other nodes.
	setAutoSnapToNode	Sets a value indicating whether a link end point should automatically snap to the nearest diagram node while the user moves the point's adjustment handle.
	setBaseBrush	Sets a brush used to fill the arrowhead drawn at the link base.
	setBaseShape	Sets the shape that is displayed at the origin of a link.
	setBaseShape	
	setBaseShapeSize	Sets the size of the shape displayed at the origin of a link.
	setBrush	Sets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	setCascadeOrientation	Sets the orientation of the first segment of a cascading link.
	setCustomDraw	Sets the type of custom drawing performed on this link.
	setDestination	Sets the destination node of a link.
	setDestinationAnchor	Sets the anchor point to which a link is connected at its destination.
	setDestinationConnection	Sets the **ConnectionPoint** object representing the link connection to its destination node.
	setDestinationIndex	Sets the row of a table or the anchor point of a node to which a link is connected.
	setDynamic	Sets whether a link should automatically update the position of its end points while a node related to the link is moved, so that the link end segments always point to the center of the link's nodes.
	setEditedText	Implements InplaceEditable.setEditedText. Assigns the edited text to this link after in-place edit operation completes successfully.
	setEndPoint	Sets the position of the last control point of this link.
	setFont	Sets the font used to draw the text of an item. (Inherited from DiagramItem.)
	setHandlesStyle	Sets the appearance of the link's selection handles.
	setHeadBrush	Sets a brush used to fill the arrowhead drawn at the link's destination.

	setHeadPen	Sets the pen used to draw the arrowhead shapes outlines.
	setHeadShape	
	setHeadShape	Sets the shape of the link's arrowhead.
	setHeadShapeSize	Sets the size of the arrowhead shape.
	setHyperLink	Sets the hyperlink associated with an item. (Inherited from DiagramItem.)
	setId	Assigns user-defined identifier to this item. (Inherited from DiagramItem.)
	setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	setIntermediateBrush	Sets a brush used to fill the arrowheads drawn at the middle of link segments.
	setIntermediateShape	Sets the shape that is displayed at the middle of each segment of a link.
	setIntermediateShape	
	setIntermediateShapeSize	Sets the size of the shape displayed at the middle of each segment of a link.
	setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	setLocked	Sets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	setOpacity	Sets the opacity of this item. (Inherited from DiagramItem.)
	setOrigin	Sets the origin node of a link.
	setOriginAnchor	Sets the anchor point to which a link is connected at its origin.
	setOriginConnection	Sets the **ConnectionPoint** object representing the link connection to its origin node.
	setOriginIndex	Sets the row of a table or the anchor point of a box to which a link is connected.
	setPen	Sets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	setPrintable	Sets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	setRetainForm	Sets a value indicating whether a link should preserve its original shape while the nodes related to that link are moved around.
	setSegmentCount	Sets the number of segments of this link.
	setSelected	Selects or deselects an item. (Inherited from DiagramItem.)
	setShadowBrush	Sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)

	setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShape	Sets the shape of a link.
	setStartPoint	Sets the position of the first control point of this link.
	setStyle	Sets the style associated with the item. (Inherited from DiagramItem.)
	setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event. (Inherited from DiagramItem.)
	setText	Sets the text displayed over a link.
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	setTextPadding	Sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	setTextStyle	Sets the link's text placement and orientation.
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	setVisible	Specifies whether the link should be drawn on the screen.
	setWeight	Sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	setZIndex	Sets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	updateFromPoints	Overloaded.
S	with	Returns a DiagramLinkBuilder object used to configure and create new DiagramLink instances.
	writeExternal	Implements Externalizable.
	zBottom	Moves an item to the bottom of the Z order. (Inherited from DiagramItem.)
	zLevelDown	Moves an item down in the Z order. (Inherited from DiagramItem.)
	zLevelUp	Moves an item up in the Z order. (Inherited from DiagramItem.)
	zTop	Moves an item to the top of the Z order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description

allowCreate	DiagramItem.allowCreate override. Invoked while the user draws this item to test whether the operation can be completed in the current context.
allowModify	DiagramItem.allowModify override. Invoked during interactive modification of items to test whether the operation can be completed in the current context.
cancelModify	DiagramItem.cancelModify override. Invoked when the interactive modification of this link has been canceled.
completeCreate	DiagramItem.completeCreate override. Invoked when the user finishes drawing this item.
completeModify	DiagramItem.completeModify override.
createProperties	DiagramItem.createProperties override.
createState	DiagramItem.createState override.
draw	Draws the link on the specified **Graphics2D** surface.
drawShadow	DiagramItem.drawShadow override. Draws the link's shadow on the specified Graphics2D surface.
getMeasureUnit	(Inherited from DiagramItem.)
getRepaintRect	DiagramItem.getRepaintRect override.
getValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
loadFromJson	Loads the link from a JSON object.
loadFromXml	Loads the link content from an XML element.
onAdd	DiagramItem.onAdd override.
onChangeFont	
onChangeTextPadding	(Inherited from DiagramItem.)
onChildModified	Called when a group child node has been modified. Override this method if you need to know when a node from the **SubordinateGroup** is modified. (Inherited from DiagramItem.)
onClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
onDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
onLoad	DiagramItem.onLoad override.
onMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
onModify	Called when an item is modified
onRemove	Called when an item is removed from a Diagram, either by the user, programmatically or by undo / redo. (Inherited from DiagramItem.)

	onStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	onStyleFontChanged	Invoked when font property values of an associated style change. (Inherited from DiagramItem.)
	putSelected	(Inherited from DiagramItem.)
	repaint	Overloaded. (Inherited from DiagramItem.)
	restoreProperties	DiagramItem.restoreProperties override.
	restoreState	DiagramItem.restoreState override.
	saveProperties	DiagramItem.saveProperties override.
	saveState	DiagramItem.saveState override.
	saveToJson	Saves the link as a JSON object.
	saveToXml	Saves the link content into an XML element.
	setDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	shouldRender	Determines whether the item is rendered in the current context. (Inherited from DiagramItem.)
	startCreate	DiagramItem.startCreate override. Invoked once when the user starts drawing a new item interactively.
	startModify	DiagramItem.startModify override. Invoked when the user starts modifying this link interactively.
	updateCreate	DiagramItem.updateCreate override. Invoked during interactive creation of this item.
	updateModify	DiagramItem.updateModify override. Invoked during interactive modification of this item.

DiagramLink Constructor

Overload List

Name	Description
DiagramLink ()	Used internally to implement serialization functionality.
DiagramLink (Diagram)	Initializes a new instance of the DiagramLink class by setting its properties to the default values defined in the specified diagram.
DiagramLink (Diagram, DiagramNode, DiagramNode)	Initializes a new instance of the **DiagramLink** class by setting its properties to the default values defined in the

	specified diagram, and setting the specified nodes as link's origin and destination.
DiagramLink (Diagram, DiagramNode, Point2D)	Initializes a new instance of the **DiagramLink** class by setting its properties to the default values defined in the specified diagram, and setting the specified nodes as link's origin and destination.
DiagramLink (Diagram, Point2D, DiagramNode)	Initializes a new instance of the DiagramLink class by setting its properties to the default values defined in the specified diagram, and setting the specified nodes as link's origin and destination.
DiagramLink (Diagram, Point2D, Point2D)	Initializes a new instance of the DiagramLink class by setting its properties to the default values defined in the specified diagram, and setting the specified points as link's origin and destination.
DiagramLink (DiagramLink, DiagramNode, DiagramNode)	Initializes a new instance of the DiagramLink class by copying its properties from another link, and setting the specified nodes as link's origin and destination.

DiagramLink Constructor ()

Used internally to implement serialization functionality.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink ()
```

See Also

DiagramLink Constructor Overload List
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink Constructor (Diagram)

Initializes a new instance of the DiagramLink class by setting its properties to the default values defined in the specified diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink (
    Diagram parent
)
```

Parameters

parent
A Diagram instance whose default linkattributes are copied to this link.

See Also

DiagramLink Constructor Overload List
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink Constructor (Diagram, DiagramNode, DiagramNode)

Initializes a new instance of the DiagramLink class by setting its properties to the default values defined in the specified diagram, and setting the specified nodes as link's origin and destination.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink (
    Diagram parent,
    DiagramNode src,
    DiagramNode dest
)
```

Parameters

parent
A Diagram instance whose default linkattributes are copied to this link.

src
A DiagramNode -derived object representing thelink origin node.

dest
A **DiagramNode** -derived object representing thelink destination node.

See Also

DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink Constructor (Diagram, DiagramNode, Point2D)

Initializes a new instance of the DiagramLink class by setting its properties to the default values defined in the specified diagram, and setting the specified nodes as link's origin and destination.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink (
    Diagram parent,
    DiagramNode src,
    Point2D dest
)
```

Parameters

parent
A Diagram instance whose default linkattributes are copied to this link.

src
A DiagramNode -derived object representing thelink origin node.

dest
A **Point2D** object representing thelink destination point.

See Also

DiagramLink Constructor Overload List

DiagramLink Constructor (Diagram, Point2D, DiagramNode)

Initializes a new instance of the DiagramLink class by setting its properties to the default values defined in the specified diagram, and setting the specified nodes as link's origin and destination.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink (
    Diagram parent,
    Point2D src,
    DiagramNode dest
)
```

Parameters

parent
A Diagram instance whose default linkattributes are copied to this link.

src
A **Point2D** object representing thelink origin point.

dest
A DiagramNode -derived object representing thelink destination node.

See Also

DiagramLink Constructor Overload List
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink Constructor (Diagram, Point2D, Point2D)

Initializes a new instance of the DiagramLink class by setting its properties to the default values defined in the specified diagram, and setting the specified points as link's origin and destination.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink (
    Diagram parent,
    Point2D src,
    Point2D dest
)
```

Parameters

parent
A Diagram instance whose default linkattributes are copied to this link.

src
A **Point2D** object representing thelink origin point.

dest
A **Point2D** object representing thelink destination point.

DiagramLink Constructor (DiagramLink, DiagramNode, DiagramNode)

Initializes a new instance of the DiagramLink class by copying its properties from another link, and setting the specified nodes as link's origin and destination.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink (
    DiagramLink prototype,
    DiagramNode src,
    DiagramNode dest
)
```

Parameters

prototype
An DiagramLink instance whose attributes arecopied to this link.

src
A DiagramNode -derived object representing thelink origin node.

dest
A **DiagramNode** -derived object representing thelink destination node.

DiagramLink.addLabel Method (LinkLabel)

Adds a new label to this link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addLabel (
    LinkLabel label
)
```

Parameters

label
A LinkLabel instance.

Remarks

The label can be associated with a specific segment or control point of the link, or its position can be specified as a point along the link's length. To set the position of a label, call setSegmentPosition, setControlPointPosition or setLinkLengthPosition. Each label can be rendered using different color and font, specified via the setTextColor and setFont methods.

setText Method
getLabels Method
removeLabel Method

DiagramLink.addLabel Method (String)

Adds a new label to this link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkLabel addLabel (
    String text
)
```

Parameters

text
The label's text.

Return Value

A LinkLabel instance.

Remarks

The label can be associated with a specific segment or control point of the link, or its position can be specified as a point along the link's length. To set the position of a label, call setSegmentPosition, setControlPointPosition or setLinkLengthPosition. Each label can be rendered using different color and font, specified via the setTextColor and setFont methods.

DiagramLink.allowCreate Method

DiagramItem.allowCreate override. Invoked while the user draws this item to test whether the operation can be completed in the current context.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected boolean allowCreate (
    Point2D current,
    InteractionState ist
)
```

Parameters

current

A **Point2D** specifying the current pointer position.

ist

An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the creation of this link; otherwise, **false**.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.allowModify Method

DiagramItem.allowModify override. Invoked during interactive modification of items to test whether the operation can be completed in the current context.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected boolean allowModify (
    Point2D current,
    InteractionState ist
)
```

Parameters

current

A **Point2D** specifying the current pointer position.

ist

An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the modification of this link; otherwise, **false**.

See Also

DiagramLink Members

DiagramLink.applyRoute Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void applyRoute (
    ArrayList<Point> routePoints,
    RouteDescriptor routeDescriptor,
    PointList resultPoints
)
```

Parameters

routePoints

routeDescriptor

resultPoints

See Also

DiagramLink Members
DiagramLink Class

DiagramLink.cancelModify Method

DiagramItem.cancelModify override. Invoked when the interactive modification of this link has been canceled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void cancelModify (
    InteractionState ist
)
```

Parameters

ist
An InteractionState object containing more information about the current state of the operation.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.clone Method

Creates a copy of this link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem clone (
    boolean clipboard
)
```

Parameters

clipboard
true if the copy will be stored in the Windows clipboard; otherwise, **false**.

Return Value

An instance of the DiagramLink class.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.completeCreate Method

DiagramItem.completeCreate override. Invoked when the user finishes drawing this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void completeCreate (
    Point2D end
)
```

Parameters

end
A **Point2D** specifying the pointer position.

See Also

DiagramLink.completeModify Method

DiagramItem.completeModify override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void completeModify (
    Point2D end,
    InteractionState ist
)
```

Parameters

end
A **Point2D** specifying the pointer position.

ist
An InteractionState object containing more information about the current state of the operation.

DiagramLink.containsPoint Method (Point2D)

DiagramItem.containsPoint override. Checks whether this link contains the specified point. This method is called during hit-testing to determine if the mouse is over the link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean containsPoint (
    Point2D point
)
```

Parameters

point
The point to check.

Return Value

true it this link contains the specified point; otherwise, **false**.

See Also

labelFromPoint Method

DiagramLink.containsPoint Method (Point2D, float)

DiagramItem.containsPoint override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean containsPoint (
    Point2D point,
    float threshold
)
```

Parameters

point
A **Point2D** value specifying the logical coordinates of a diagram point.

threshold
Specifies the size of the area around the item outlines where the point is still considered inside the item.

Return Value

true it this item contains the specified point; otherwise, **false**.

DiagramLink.draw Method

Draws the link on the specified **Graphics2D** surface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void draw (
    Graphics2D graphics,
    RenderOptions options
)
```

Parameters

graphics
An **Graphics2D** object where the link should be rendered.

options
Provides options for the drawing operation.

See Also

DiagramLink Members

com.mindfusion.diagramming Namespace

DiagramLink.drawArrowhead Method

Draws an arrowhead shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void drawArrowhead (
    Graphics2D graphics,
    Pen pen,
```

```
    Brush b,
    Shape shape,
    Point2D pivot,
    Point2D position,
    Point2D segmentStart,
    double size,
    boolean shadow
)
```

Parameters

graphics
The **Graphics2D** surface to draw the shape on.

pen
A Pen instance used to draw the shape outline.

b
A Brush instance used to fill the shape.

shape
A Shape instance that defines the arrowhead geometry.

pivot
A Point2D specified in percents that corresponds to the arrowhead tip position within the **Shape** geometry.

position
A point on the drawing surface where the arrowhead tip should be located.

segmentStart
A point specifying the arrowhead direction.

size
A double value that specifies the arrowhead size.

shadow

Remarks

This method lets you draw any Shape object at arbitrary position and angle, and is useful for rendering arrowhead shapes when custom-drawing links.

DiagramLink.drawShadow Method

DiagramItem.drawShadow override. Draws the link's shadow on the specified Graphics2D surface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void drawShadow (
    Graphics2D graphics,
    RenderOptions options
)
```

Parameters

graphics
A **Graphics2D** instance.

options
Provides options for the drawing operation.

DiagramLink.getAllowMoveEnd Method

Gets a value indicating whether users are allowed to move the last control point of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowMoveEnd ()
```

Return Value

true if the last control point can be moved, otherwise **false**.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.getAllowMoveStart Method

Gets a value indicating whether users are allowed to move the first control point of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowMoveStart ()
```

Return Value

true if the first control point can be moved, otherwise **false**.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.getAutoRoute Method

Gets a value indicating whether a link should avoid nodes by going the shortest path from its origin to its destination without crossing any other nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAutoRoute ()
```

Return Value

true to route this link, or **false** otherwise. Initialized with the value of RouteLinks.

Remarks

If **AutoRoute** is enabled, a link automatically finds the shortest possible path between its origin and destination that doesn't intersect Obstacle nodes. The number and orientation of the link's segments are updated when the nodes it links are moved around. The positions of end points of a routed link are not changed, unless the link is also set to Dynamic.

It is best to use AutoRoute with links of the Cascading style. Note that automatic routing overrides the RetainForm behavior.

Performance note

Links whose **AutoRoute** property is enabled are re-routed when they intersect with newly added nodes. Consequently, when constructing a large diagram programmatically, each link could be re-routed multiple times, once for each newly added node whose location arguments collide with link's bounding rectangle. That might slow down diagram generation a lot. To avoid that, create all nodes before adding the links; that requires a single calculation for each link's route. Alternatively, enclose batch creation operations within suspendLinkRouter and resumeLinkRouter calls.

LinkRouter Property

DiagramLink.getAutoSnapToNode Method

Gets a value indicating whether a link end point should automatically snap to the nearest diagram node while the user moves the point's adjustment handle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAutoSnapToNode ()
```

Return Value

true to snap links to nearest node; otherwise, **false**.

Remarks

Only nodes at a distance smaller than AutoSnapDistance are considered. A link does not snap to its current origin or destination nodes if that would create a self-loop. If there is an AnchorPattern assigned to a node, the link snaps to an anchor point instead of a border point.

DiagramLink.getBaseBrush Method

Gets the brush used to fill the arrowhead drawn at the link base.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getBaseBrush ()
```

Return Value

An instance of a Brush -derived class. The default value is null.

See Also

getHeadBrush Method
getIntermediateBrush Method
getBaseShape Method

DiagramLink.getBaseShape Method

Gets the shape that is displayed at the origin of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Shape getBaseShape ()
```

Return Value

A Shape instance that represents an arrowhead shape. Initialized with the value of LinkBaseShape.

Remarks

The property specifies the shape that is displayed at the beginning of a link, that is, the point where it is connected with its Origin node. This shape is rotated simultaneously with the first segment of the link so that it follows the overall link direction.

The ArrowHeads class exposes several predefined shapes as static properties.

DiagramLink.getBounds Method

Gets the smallest rectangle that bounds all points of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D.Float getBounds ()
```

Return Value

A **Rectangle2D.Float** object representing the link's bounding rectangle.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.getCascadeOrientation Method

Gets the orientation of the first segment of a cascading link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Orientation getCascadeOrientation ()
```

Return Value

A member of the Orientation enumeration. Initialized with the value of LinkCascadeOrientation.

Remarks

Use this property to specify the orientation of the first segment of a link whose Shape is set to Cascading. The first segment also defines the orientation of all subsequent segments in the cascade, because each next segment changes its orientation alternately to the previous one.

If the property is set to Auto, users may change the orientation of a cascading link interactively. That can be done by dragging the control point next to the first or last one to its opposite corner in the rectangle defined by its two adjacent segments. Depending on the value of AllowSplitLinks, the link orientation is changed by either inserting a new segment and changing only the orientation of the first or last segment (AllowSplitLinks is **true**), or by changing the orientation of all segments of the link (**AllowSplitLinks** is **false**).

com.mindfusion.diagramming Namespace

DiagramLink.getCustomDraw Method

Gets the type of custom drawing performed on this link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public CustomDraw getCustomDraw ()`

Return Value

A member of the CustomDraw enumeration.

Remarks

This property allows invoking custom painting code for a link. That code must execute in response to the drawLink event. There are several modes of custom painting, allowing the custom code to paint the link entirely, or do that in addition to what JDiagram paints by default. The following CustomDraw members can be assigned to this property to specify the custom painting mode:

Member name	Description
None	Do not perform custom drawing, let all painting be done by JDiagram.
Additional	The custom painting code executes after the link segments and arrowhead shapes are painted by JDiagram, but before text is rendered.
Full	The component does not do any standard drawing, the entire painting of the link is done by the application.

ShadowOnly	Only the shadow of the link is painted by custom code, the link itself is drawn by the component.

DiagramLink.getDynamic Method

Gets whether a link should automatically update the position of its end points while a node related to the link is moved, so that the link end segments always point to the center of the link's nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getDynamic ()
```

Return Value

true if the link updates its end points automatically, otherwise **false**.

DiagramLink.getEditRect Method

Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getEditRect (
    DiagramItem item,
    Point2D mousePosition
)
```

Parameters

item
A reference to this link.

mousePosition
A **Point2D** instance specifying the current pointer position.

Return Value

A **Rectangle2D** specifying where the edit box should be placed.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.getEffectiveHeadPen Method

Creates a Pen object representing the currently effective head pen of the link. This method returns a pen corresponding to the link's DiagramLink.getHeadPen if it is not null, or a pen with the DiagramLinkStyle.getHeadStroke and DiagramLinkStyle.getHeadStrokeThickness properties of the link's style.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Pen getEffectiveHeadPen ()
```

Return Value

A Pen instance.

See Also

DiagramLink Members

DiagramLink.getEndPoint Method

Gets the position of the last control point of this link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Point2D.Float getEndPoint ()
```

Return Value

A **Point2D.Float** instance.

Remarks

This method is a shortcut for getting the last element of ControlPoints.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.getHandlesStyle Method

Gets the appearance of the link's selection handles.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public HandlesStyle getHandlesStyle ()
```

Return Value

A member of the HandlesStyle enumeration. Initialized with the value of LinkHandlesStyle.

Remarks

Specifies how link's selection status is indicated visually. You can choose between the following styles:

Member name	Description
SquareHandles	The selection is indicated by drawing square handles at the position of each control point.
DashFrame	The selection is indicated by drawing dashed line segments along the link's segments. In addition, there are square selection handles drawn at the location of each control point of the link.
Custom	JDiagram raises the drawAdjustmentHandles events to let your application perform custom drawing of link's selection handles.

DiagramLink.getHeadShape Method

Gets the shape of this link's arrowhead.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Shape getHeadShape ()
```

Return Value

A Shape instance that represents an arrowhead shape. Initialized with the value of LinkHeadShape.

Remarks

The property specifies what shape is displayed as an arrowhead. This shape is rotated simultaneously with the last segment of the link so that it follows the overall link direction.

The ArrowHeads class exposes several predefined shapes as static properties.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public Shape getIntermediateShape ()
```

Return Value

A Shape instance that represents an arrowhead shape. Initialized with the value of LinkIntermediateShape.

Remarks

The property specifies what shape to display at the middle of each segment of a link. This could help users to see more easily the direction of long links. The ArrowHeads class exposes several predefined shapes as static properties.

DiagramLink.getSegmentCount Method

Gets the number of segments of this link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getSegmentCount ()
```

Return Value

An integer value specifying the number of segments in the link.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.getShape Method

Gets the shape of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkShape getShape ()
```

Return Value

A member of the LinkShape enumeration. Initialized with the value of getLinkShape.

Remarks

This property specifies whether the segments of a link are straight lines or curves. Its value together with SegmentCount also specifies the number of ControlPoints. Each Bezier segment is defined by four control points, where the second and third ones do not lie on the segment but specify its curvature. All other **LinkShape** types are defined by two control points per segment. Adjacent segments share a control point, and when moved it will modify both of them.

Cascading links consist of straight lines whose orientation is constrained to strictly horizontal or vertical, where adjacent segments are orthogonal to each other. The orientation of the first segment of a cascading link depends on the value of CascadeOrientation. If that property is set to Auto, users may change the cascade orientation interactively.

Each control point of a **Spline** or **Polyline** link can be moved freely, independently from each other, and the link will pass through all control points drawn respectively as an interpolating spline curve or as a polygonal chain.

DiagramLink.onModify Method

Called when an item is modified

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void onModify (
    Point2D mousePosition,
    int adjustmentHandle
)
```

Parameters

mousePosition
Specifies the mouse position.

adjustmentHandle
The adjustment handle used to modify the node.

DiagramLink.saveToJson Method

Saves the link as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

DiagramLink.saveToXml Method

Saves the link content into an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An **XmlElement** the link's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

com.mindfusion.diagramming Namespace

DiagramLink.setAllowMoveStart Method

Sets a value indicating whether users are allowed to move the first control point of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setAllowMoveStart (
    boolean value
)
```

Parameters

value
true if the first control point can be moved,otherwise **false**.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.setAutoRoute Method

Sets a value indicating whether a link should avoid nodes by going the shortest path from its origin to its destination without crossing any other nodes.uld automatically find its way between nodes so that it will not cross other nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setAutoRoute (
    boolean value
```

```
)
```

Parameters

value
true if the link should be routed automatically, otherwise **false**.

Remarks

If AutoRoute is enabled, a link automatically finds the shortest possible path between its origin and destination that doesn't intersect Obstacle nodes. The number and orientation of the link's segments are updated when the nodes it links are moved around. The positions of end points of a routed link are not changed, unless the link is also set to Dynamic.

It is best to use **AutoRoute** with links of the Cascading style. Note that automatic routing overrides the RetainForm behavior.

Performance note

Links whose **AutoRoute** property is enabled are re-routed when they intersect with newly added nodes. Consequently, when constructing a large diagram programmatically, each link could be re-routed multiple times, once for each newly added node whose location arguments collide with link's bounding rectangle. That might slow down diagram generation a lot. To avoid that, create all nodes before adding the links; that requires a single calculation for each link's route. Alternatively, enclose batch creation operations within suspendLinkRouter and resumeLinkRouter calls.

Dynamic Property
SegmentCount Property
LinkRouter Property

DiagramLink.setAutoSnapToNode Method

Sets a value indicating whether a link end point should automatically snap to the nearest diagram node while the user moves the point's adjustment handle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoSnapToNode (
    boolean value
)
```

Parameters

value
true to snap links to nearest node; otherwise, **false**.

Remarks

Only nodes at a distance smaller than AutoSnapDistance are considered. A link does not snap to its current origin or destination nodes if that would create a self-loop. If there is an AnchorPattern assigned to a node, the link snaps to an anchor point instead of a border point.

DiagramLink.setBaseBrush Method

Sets a brush used to fill the arrowhead drawn at the link base.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBaseBrush (
    Brush value
)
```

Parameters

value
An instance of a Brush -derived class. The default value is null.

See Also

getBaseBrush Method
setHeadBrush Method
setIntermediateBrush Method

DiagramLink.setBaseShape Method

Sets the shape that is displayed at the origin of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBaseShape (
    Shape value
)
```

Parameters

value

A Shape instance that represents an arrowhead shape. Initialized with the value of LinkBaseShape.

Remarks

This property specifies the shape that is displayed at the beginning of a link, that is, the point where it is connected with its Origin node. This shape is rotated simultaneously with the first segment of the link so that it follows the overall link direction.

The ArrowHeads class exposes several predefined shapes as static properties.

com.mindfusion.diagramming Namespace

DiagramLink.setBaseShapeSize Method

Sets the size of the shape displayed at the origin of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBaseShapeSize (
    float value
)
```

Parameters

value
A float value specifying the shape size.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.setCascadeOrientation Method

Sets the orientation of the first segment of a cascading link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCascadeOrientation (
    Orientation value
)
```

Parameters

value
A member of the Orientation enumeration.

Remarks

Use this property to specify the orientation of the first segment of a link whose Shape is set to Cascading. The first segment also defines the orientation of all subsequent segments in the cascade, because each next segment changes its orientation alternately to the previous one.

If the property is set to Auto, users may change the orientation of a cascading link interactively. That can be done by dragging the control point next to the first or last one to its opposite corner in the rectangle

defined by its two adjacent segments. Depending on the value of AllowSplitLinks, the link orientation is changed by either inserting a new segment and changing only the orientation of the first or last segment (AllowSplitLinks is **true**), or by changing the orientation of all segments of the link (**AllowSplitLinks** is **false**).

DiagramLink.setCustomDraw Method

Sets the type of custom drawing performed on this link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCustomDraw (
    CustomDraw value
)
```

Parameters

value
A member of the CustomDraw enumeration.

Remarks

This property allows invoking custom painting code for a link. That code must execute in response to the drawLink event. There are several modes of custom painting, allowing the custom code to paint the link entirely, or do that in addition to what JDiagram paints by default. The following CustomDraw members can be assigned to this property to specify the custom painting mode:

Member name	Description
None	Do not perform custom drawing, let all painting be done by JDiagram.
Additional	The custom painting code executes after the link segments and arrowhead shapes are painted by JDiagram, but before text is rendered.
Full	The component does not do any standard drawing, the entire painting of the link is done by the application.
ShadowOnly	Only the shadow of the link is painted by custom code, the link itself is drawn by the component.

See Also

DiagramLink.setDestination Method

Sets the destination node of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDestination (
    DiagramNode value
)
```

Parameters

value
A DiagramNode object representing the link destination.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.setDestinationAnchor Method

Sets the anchor point to which a link is connected at its destination.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDestinationAnchor (
    int value
)
```

Parameters

value
An integer value specifying the index of the destination anchor point.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.setDestinationConnection Method

Sets the ConnectionPoint object representing the link connection to its destination node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDestinationConnection (
    ConnectionPoint value
)
```

Parameters

value
An instance of ConnectionPoint or derived class.

See Also

DiagramLink Members
DiagramLink Class

DiagramLink.setDynamic Method

Sets whether a link should automatically update the position of its end points while a node related to the link is moved, so that the link end segments always point to the center of the link's nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setDynamic (
    boolean value
)
```

Parameters

value
true if the link should update its end points positions automatically, otherwise **false**.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.setEditedText Method

Implements InplaceEditable.setEditedText. Assigns the edited text to this link after in-place edit operation completes successfully.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setEditedText (
    String newText
)
```

Parameters

newText
The new text of this link.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.setEndPoint Method

Sets the position of the last control point of this link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEndPoint (
    Point2D.Float value
)
```

Parameters

value
A **Point2D.Float** instance.

Remarks

This method is a shortcut for setting the last element of ControlPoints.

See Also

DiagramLink Members
DiagramLink Class
com.mindfusion.diagramming Namespace

DiagramLink.setHandlesStyle Method

Sets the appearance of the link's selection handles.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHandlesStyle (
    HandlesStyle value
)
```

Parameters

value
A member of the HandlesStyle enumeration.

Remarks

Specifies how link's selection status is indicated visually. You can choose between the following styles:

Member name	Description
SquareHandles	The selection is indicated by drawing square handles at the position of each control point.
DashFrame	The selection is indicated by drawing dashed line segments along the link's segments. In addition, there are square selection handles drawn at the location of each control point of the link.
Custom	JDiagram raises the drawAdjustmentHandles events to let your application perform custom drawing of link's selection handles.

Sets the shape of the link's arrowhead.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHeadShape (
    Shape value
)
```

Parameters

value
A Shape instance that represents an arrowhead shape. Initialized with the value of LinkHeadShape.

Remarks

The property specifies what shape is displayed as an arrowhead. This shape is rotated simultaneously with the last segment of the link so that it follows the overall link direction.

The ArrowHeads class exposes several predefined shapes as static properties.

setBaseBrush Method

DiagramLink.setIntermediateShape Method

Sets the shape that is displayed at the middle of each segment of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIntermediateShape (
    Shape value
)
```

Parameters

value
A Shape instance that represents an arrowhead shape. Initialized with the value of LinkIntermediateShape.

Remarks

The property specifies what shape to display at the middle of each segment of a link. This could help users to see more easily the direction of long links. The ArrowHeads class exposes several predefined shapes as static properties.

DiagramLink.setShape Method

Sets the shape of a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setShape (
    LinkShape value
)
```

Parameters

value
A member of the LinkShape enumeration.

Remarks

This property specifies whether the segments of a link are straight lines or curves. Its value together with SegmentCount also specifies the number of ControlPoints. Each Bezier segment is defined by four control points, where the second and third ones do not lie on the segment but specify its curvature. All other **LinkShape** types are defined by two control points per segment. Adjacent segments share a control point, and when moved it will modify both of them.

Cascading links consist of straight lines whose orientation is constrained to strictly horizontal or vertical, where adjacent segments are orthogonal to each other. The orientation of the first segment of a cascading link depends on the value of CascadeOrientation. If that property is set to Auto, users may change the cascade orientation interactively.

Each control point of a **Spline** or **Polyline** link can be moved freely, independently from each other, and the link will pass through all control points drawn respectively as an interpolating spline curve or as a polygonal chain.

DiagramLink.setText Method

Sets the text displayed over a link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setText (
    String value
)
```

Parameters

value
A string containing the text

Remarks

Sets the text that should be drawn over a link. Use this to provide to end-users a short description of the relation's purpose. The text appearance can be customized through the TextBrush and TextStyle properties.

Apart from main text, it is possible to display multiple labels per link via the LinkLabel class. Labels can automatically avoid overlapping nodes or other labels when their AutoArrange property is set.

DiagramLink.updateFromPoints Method ()

Updates a link after its control point positions are changed programmatically.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public void updateFromPoints ()`

See Also

updateFromPoints Method Overload List
DiagramLink Members
DiagramLink Class

DiagramLink.updateFromPoints Method (boolean)

Updates the link's internal state after the link's control points have been changed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void updateFromPoints (
    boolean updateGroups
)
```

Parameters

updateGroups
true to update the positions of nodes attached to the link; otherwise, **false**.

com.mindfusion.diagramming Namespace

DiagramLink.updateModify Method

DiagramItem.updateModify override. Invoked during interactive modification of this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void updateModify (
    Point2D current,
    InteractionState ist
)
```

Parameters

current
A **Point2D** specifying the pointer position.

ist
An InteractionState object containing more information about the current state of the operation.

DiagramLink.with Method

Returns a DiagramLinkBuilder object used to configure and create new DiagramLink instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public static DiagramLinkBuilder with ()
```

Return Value

A **DiagramLinkBuilder** instance.

DiagramLink.writeExternal Method

Implements Externalizable.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

DiagramLinkList Members

A strongly typed list of DiagramLink objects.

The following tables list the members exposed by the DiagramLinkList type.

Public Constructors

	Name	Description
	DiagramLinkList	

Protected Fields

	Name	Description
	list	(Inherited from BaseList.)
	listEvent	(Inherited from BaseList.)
	notifyParent	(Inherited from BaseList.)

Public Methods

	Name	Description
	add	Adds a new element to the list. (Inherited from BaseList.)
	clear	Removes all elements from the list. (Inherited from BaseList.)
	clone	
	contains	Determines if this list contains the specified element. (Inherited from BaseList.)
	first	Gets the first element of this list. (Inherited from BaseList.)
	get	Gets the element at the specified position in this list. (Inherited from BaseList.)
	last	Gets the last element of this list. (Inherited from BaseList.)
	readExternal	Loads the list's contents. (Inherited from BaseList.)
	remove	Overloaded. (Inherited from BaseList.)
	removeRange	Removes a range of elements from this list. (Inherited from BaseList.)

	set	Sets the element at the specified position in this list. (Inherited from BaseList.)
	size	Gets the number of elements in this list. (Inherited from BaseList.)
	writeExternal	Saves the list's contents. (Inherited from BaseList.)

Protected Methods

	Name	Description
	raiseAdding	Raises the adding event. (Inherited from BaseList.)
	raiseClearing	Raises the clearing event. (Inherited from BaseList.)
	raiseRemoving	Raises the removing event. (Inherited from BaseList.)

DiagramLinkProperties Class

Stores the values of DiagramLink properties during undo / redo operations. If you need to implement undo support for the additional properties defined by a class derived from **DiagramLink**, do so by deriving from DiagramLinkProperties and overriding the DiagramLink.saveProperties, DiagramLink.restoreProperties, and DiagramLink.createProperties methods.

Syntax

Java
`public class DiagramLinkProperties extends DiagramItemProperties`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DiagramItemProperties
    com.mindfusion.diagramming.DiagramLinkProperties

See Also

DiagramLinkStyle Members

Represents a reusable set of properties that define the appearance of diagram links.

The following tables list the members exposed by the DiagramLinkStyle type.

Public Constructors

	Name	Description
	DiagramLinkStyle	Initializes a new instance of the **DiagramLinkStyle** class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from Style.)
	getBrush	Gets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	getFontFamily	Gets the font family of the item text. (Inherited from DiagramItemStyle.)
	getFontSize	Gets the font size of the item text. (Inherited from DiagramItemStyle.)
	getFontStyle	Gets the font style of the item text. (Inherited from DiagramItemStyle.)
	getFontUnit	Gets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	getHeadStroke	Gets the brush used to paint the arrowhead outlines of this brush.
	getHeadStrokeThickness	Gets the outline thickness of the arrowheads of this brush, expressed in the current units of measure.
	getShadowBrush	Gets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	getStroke	Gets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	getStrokeThickness	Gets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
	init	Returns a DiagramLinkStyleBuilder object used to configure this DiagramLinkStyle instance.

	readExternal	**Externalizable.readExternal** implementation. (Inherited from Style.)
S	registerType	Associates a type with an alias. The alias is used when saving and loading objects of the specified type during style serialization and deserialization. (Inherited from Style.)
	removePropertyChangeListener	(Inherited from Style.)
	setBrush	Sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	setFontFamily	Sets the font family of the item text. (Inherited from DiagramItemStyle.)
	setFontSize	Sets the font size of the item text. (Inherited from DiagramItemStyle.)
	setFontStyle	Sets the font style of the item text. (Inherited from DiagramItemStyle.)
	setFontUnit	Sets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	setHeadStroke	Sets the brush used to paint the arrowhead outlines of this brush.
	setHeadStrokeThickness	Sets the outline thickness of the arrowheads of this brush, expressed in the current units of measure.
	setShadowBrush	Sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	setStroke	Sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	setStrokeThickness	Sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
S	with	Returns a DiagramLinkStyleBuilder object used to configure and create new DiagramLinkStyle instances.
	writeExternal	**Externalizable.writeExternal** implementation. (Inherited from Style.)

Protected Methods

	Name	Description
	getValue	Gets the value of the specified property. (Inherited from Style.)
	isPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	loadFromJson	Loads the style content from a JsonObject.
	loadFromXml	Loads the style content from an XML element. (Inherited from Style.)

	registerProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	saveToJson	Saves the style content into a JsonObject.
	saveToXml	Saves the style content into an XML element. (Inherited from Style.)
	setValue	Sets the value of the specified property. (Inherited from Style.)
	unsetValue	Clears the value of the specified property. (Inherited from Style.)

DiagramLinkStyle Constructor

Initializes a new instance of the DiagramLinkStyle class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkStyle ()
```

See Also

DiagramLinkStyle Class
com.mindfusion.diagramming Namespace

DiagramLinkStyle Methods

DiagramLinkStyle.getHeadStroke Method

Gets the brush used to paint the arrowhead outlines of this brush.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getHeadStroke ()
```

Return Value

A Brush instance.

DiagramLinkStyle Members
DiagramLinkStyle Class
com.mindfusion.diagramming Namespace

DiagramLinkStyle.getHeadStrokeThickness Method

Gets the outline thickness of the arrowheads of this brush, expressed in the current units of measure.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public double getHeadStrokeThickness ()
```

Return Value

A **double** value specifying the stroke thickness.

See Also

DiagramLinkStyle Members
DiagramLinkStyle Class
com.mindfusion.diagramming Namespace

DiagramLinkStyle.init Method

Returns a DiagramLinkStyleBuilder object used to configure this DiagramLinkStyle instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkStyleBuilder init ()
```

Return Value

A **DiagramLinkStyleBuilder** instance.

See Also

DiagramLinkStyle Members
DiagramLinkStyle Class
com.mindfusion.diagramming Namespace

DiagramLinkStyle.loadFromJson Method

Loads the style content from a JsonObject.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the style's data.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

DiagramLinkStyle Members
DiagramLinkStyle Class
com.mindfusion.diagramming Namespace

DiagramLinkStyle.saveToJson Method

Saves the style content into a JsonObject.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject the style's data should be stored into.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

DiagramLinkStyle.setHeadStroke Method

Sets the brush used to paint the arrowhead outlines of this brush.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHeadStroke (
    Brush value
)
```

Parameters

value
A Brush instance.

DiagramLinkStyle.setHeadStrokeThickness Method

Sets the outline thickness of the arrowheads of this brush, expressed in the current units of measure.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHeadStrokeThickness (
    double value
)
```

Parameters

value
A **double** value specifying the stroke thickness.

DiagramListener Interface

Defines events raised by JDiagram in response to users actions.

Syntax

Java
`public interface DiagramListener extends EventListener`

Inheritors

com.mindfusion.diagramming.DiagramAdapter

See Also

DiagramListener Members
com.mindfusion.diagramming Namespace

DiagramListener Members

Defines events raised by JDiagram in response to users actions.

The following tables list the members exposed by the DiagramListener type.

Public Methods

	Name	Description
	actionRecorded	Raised when an action is recorded in the undo buffer.
	actionRecording	A validation event raised before an action is recorded in the undo buffer.
	actionRedone	Raised when an action is redone.
	actionUndone	Raised when an action is undone.
	activeLayerChanged	Raised when the diagram's active layer has changed.

	cellClicked	Called when a table cell is clicked.
	cellDoubleClicked	Raised when the user double-clicks a table's cell.
	cellTextEdited	Raised when the user edits the text of a table's cell.
	cellTextEditing	A validation event that lets you prevent users from editing the text of a table's cell.
	clicked	Raised when the user clicks the diagram at a point where no items are located.
	containerChildAdded	Raised when a node is added to a ContainerNode, either programmatically or by the user.
	containerChildRemoved	Raised when a node is removed from a **ContainerNode**, either programmatically or by the user.
	containerFolded	Raised when the user folds a container by clicking the arrow-up button in the container's caption bar.
	containerUnfolded	Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar.
	createEditControl	Called to let you create a custom in-place editor control.
	deserializeControl	Lets you load the attributes of controls hosted inside ControlNode objects.
	deserializeTag	Raised when the Diagram.setTag of a diagram item must be deserialized from XML format.
	destroyEditControl	Called to let you destroy a custom in-place editor control.
	doubleClicked	Raised when the user double-clicks the diagram at a point where no items are located.
	drawAdjustmentHandles	Raised when custom adjustment handles must be drawn.
	drawAnchorPoint	Raised when an anchor point must be custom drawn.
	drawBackground	Raised to let you custom draw the diagram background.
	drawCell	Raised when a table's cell must be custom drawn.
	drawForeground	Raised to let you custom draw the diagram foreground.
	drawLink	Raised when a diagram link must be custom drawn.
	drawNode	Raised when a diagram node must be custom drawn.
	enterInplaceEditMode	Called when entering in-place editing mode.
	expandButtonClicked	Raised when the user clicks the [+/-] button of a DiagramNode.setExpandable node.
	groupDestroyed	Raised when a Group object is destroyed.
	hitTestAdjustmentHandles	Raised to perform custom hit testing of item's adjustment handles.
	imageLoaded	Called when image download initiated with Diagram.setBackgroundImageUrl completes.

	initializeLasso	Raised when the user starts drawing a selection lasso, before it is rendered on screen.
	initializeLink	Raised when the user starts drawing a new link, just after the DiagramLink instance is created.
	initializeNode	Raised when the user starts drawing a new node, just after the DiagramNode instance is created.
	itemAdded	Raised when an item is added to the diagram, either programmatically or interactively.
	itemLoaded	Raised when an item is loaded from a file.
	itemRemoved	Raised when an item is removed from the diagram, either programmatically or interactively.
	jsonDeserializeTag	Raised when the Tag of a diagram item must be deserialized from JSON.
	jsonSerializeTag	Raised when the **Tag** of a diagram item must be serialized to JSON.
	lassoDrawn	Raised when the user completes drawing a selection lasso.
	leaveInplaceEditMode	Called when an in-place editing is accepted or rejected.
	linkActivated	Raised when a link becomes the Diagram.setActiveItem.
	linkClicked	Raised when the user clicks a link.
	linkCreated	Raised when the user draws a new link.
	linkCreating	A validation event raised while the user is drawing a new link.
	linkDeactivated	Raised when a link is no longer the **Diagram.setActiveItem**.
	linkDeleted	Raised when a link is deleted, either programmatically or by the user.
	linkDeleting	Raised when the user tries to delete a link, this event lets you cancel the operation.
	linkDeselected	Raised when a link is deselected, either programmatically or by the user.
	linkDoubleClicked	Raised when the user double-clicks a link.
	linkHovered	Fired when the mouse pointer hovers over a link. Call setTrackPointedItem to enable this event.
	linkModified	Raised when the user moves any control point of a link.
	linkModifying	A validation event raised while the user is modifying a link.
	linkPointerEnter	Fired when the mouse pointer enters the boundaries of a link. Call **setTrackPointedItem** to enable this event.
	linkPointerLeave	Fired when the mouse pointer leaves the boundaries of a link. Call **setTrackPointedItem** to enable this event.
	linkRouted	Raised when a link is routed by the auto-routing algorithm.

	linkSelected	Raised when a link is selected, either programmatically or by the user.
	linkSelecting	Raised when the user tries to select a link, this event lets you cancel the operation.
	linkSplit	Raised when the user splits a link segment interactively.
	linkStartModifying	A validation event raised when the user starts modifying a link.
	linkTextEdited	Raised when the user edits the text of a link.
	linkTextEditing	A validation event that lets you approve or reject changes made to the text of a link.
	nodeActivated	Raised when a node becomes the **Diagram.setActiveItem**.
	nodeClicked	Raised when the user clicks a node.
	nodeCreated	Raised when the user draws a new node.
	nodeCreating	A validation event raised while the user is drawing a new node.
	nodeDeactivated	Raised when a node is no longer the active item.
	nodeDeleted	Raised when a node is deleted, either programmatically or by the user.
	nodeDeleting	Raised when the user tries to delete a node, this event lets you cancel the operation.
	nodeDeselected	Raised when a node is deselected, either programmatically or by the user.
	nodeDoubleClicked	Raised when the user double-clicks a node.
	nodeHovered	Fired when the mouse pointer hovers over a node. Call **setTrackPointedItem** to enable this event.
	nodeModified	Raised when the user moves or resizes a node.
	nodeModifying	A validation event raised while the user is moving or resizing a node.
	nodePointerEnter	Fired when the mouse pointer enters the boundaries of a node. Call **setTrackPointedItem** to enable this event.
	nodePointerLeave	Fired when the mouse pointer leaves the boundaries of a node. Call **setTrackPointedItem** to enable this event.
	nodeSelected	Raised when a node is selected, either programmatically or by the user.
	nodeSelecting	Raised when the user tries to select a node, this event lets you cancel the operation.
	nodeStartModifying	A validation event raised when the user starts modifying a node.
	nodeTextEdited	Raised when the user edits the text of a node.
	nodeTextEditing	A validation event that lets you approve or reject changes made to the text of a node.

	repaint	Raised when the diagram views should be repainted.
	requestCacheReset	Raised when an object within the diagram requests a reset of the cached bitmap.
	selectionChanged	Called when an item is added to or removed from the selection.
	selectionModified	Called when multiple selected items are moved or resized.
	selectionModifying	Raised while the user is moving or resizing multiple selected items, this event lets you cancel the modification.
	serializeControl	Lets you save the attributes of controls hosted inside **ControlNode** objects.
	serializeTag	Raised when the tag of a diagram item must be serialized into an XML document.
	setSelfLoopShape	Raised when a link becomes a self-loop, giving you a chance to override the default look shape.
	tableColumnResized	Raised when the user finishes resizing a column in a table.
	tableColumnResizing	Raised when the user resizes a column in a table interactively.
	tableRowResized	Raised when the user finishes resizing a row in a table.
	tableRowResizing	Raised when the user resizes a row in a table interactively.
	tableSectionCollapsed	Called when a table section is collapsed
	tableSectionExpanded	Called when a table section is expanded
	treeCollapsed	Raised when a user collapses a tree branch by clicking the [-] button of a expandable node.
	treeExpanded	Raised when a user expands a tree branch by clicking the [+] button of a expandable node.
	treeItemTextEdited	Raised when the user edits the text of a tree item.
	validateAnchorPoint	A validation event that lets you approve or reject connecting a link to an anchor point.
	viewportChanged	
	viewRemoved	Raised when a DiagramView is detached from this diagram.

DiagramListener Methods

DiagramListener.actionRecorded Method

Raised when an action is recorded in the undo buffer.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void actionRecorded (
    UndoEvent e
)
```

Parameters

e

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.actionRecording Method

A validation event raised before an action is recorded in the undo buffer.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void actionRecording (
    UndoValidationEvent e
)
```

Parameters

e

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.actionRedone Method

Raised when an action is redone.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public void actionRedone (
    UndoEvent e
)
```

Parameters

e

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.actionUndone Method

Raised when an action is undone.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void actionUndone (
    UndoEvent e
)
```

Parameters

e

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.activeLayerChanged Method

Raised when the diagram's active layer has changed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void activeLayerChanged (
    EventObject e
)
```

Parameters

e

An EventObject providing more information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.cellClicked Method

Called when a table cell is clicked.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void cellClicked (
    CellEvent e
)
```

Parameters

e
A CellEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.cellDoubleClicked Method

Raised when the user double-clicks a table's cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void cellDoubleClicked (
    CellEvent e
)
```

Parameters

e

See Also

DiagramListener Members
DiagramListener Interface

DiagramListener.cellTextEdited Method

Raised when the user edits the text of a table's cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void cellTextEdited (
    EditCellTextEvent e
)
```

Parameters

e
A EditCellTextEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.cellTextEditing Method

A validation event that lets you prevent users from editing the text of a table's cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void cellTextEditing (
    CellValidationEvent e
)
```

Parameters

e
A CellValidationEvent object providing information about the event.

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.clicked Method

Raised when the user clicks the diagram at a point where no items are located.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void clicked (
    DiagramEvent e
)
```

Parameters

e
A DiagramEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.containerChildAdded Method

Raised when a node is added to a ContainerNode, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void containerChildAdded (
    ContainerChildEvent e
)
```

Parameters

e
A ContainerChildEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.containerChildRemoved Method

Raised when a node is removed from a ContainerNode, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void containerChildRemoved (
    ContainerChildEvent e
)
```

Parameters

e
A ContainerChildEvent object providing information about the event.

DiagramListener.containerFolded Method

Raised when the user folds a container by clicking the arrow-up button in the container's caption bar.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

void containerFolded (
    NodeEvent e
)
```

Parameters

e
A NodeEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.containerUnfolded Method

Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
void containerUnfolded (
    NodeEvent e
)
```

Parameters

e
A NodeEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.createEditControl Method

Called to let you create a custom in-place editor control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void createEditControl (
    InPlaceEditEvent e
)
```

Parameters

e
An InPlaceEditEvent object providing information about the event.

Remarks

This event is raised if AllowInplaceEdit is enabled and the user double-clicks an item, or when the application invokes the beginEdit method of DiagramView. If the event is not handled, or if EditControl is set to **null**, MindFusion.Diagramming displays a **JTextArea** component to allow editing the item's text. If you prefer to use the built-in **JTextArea**, you can still customize it by handling the enterInplaceEditMode event.

Note that if you create a custom editor control, you must transfer the values entered into it to the respective properties of the edited diagram item. You could do that in response to the destroyEditControl event.

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.deserializeControl Method

Lets you load the attributes of controls hosted inside ControlNode objects.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void deserializeControl (
    ControlNodeEvent e
)
```

Parameters

e
A ControlNodeEvent instance providing more information about the event.

Remarks

Handle this event to load the content of nodes saved using serializeControl.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.deserializeTag Method

Raised when the Diagram.setTag of a diagram item must be deserialized from XML format.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void deserializeTag (
    SerializeTagEvent e
)
```

Parameters

e
A SerializeTagEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.destroyEditControl Method

Called to let you destroy a custom in-place editor control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

void destroyEditControl (
    InPlaceEditEvent e
)
```

Parameters

e
An InPlaceEditEvent object providing information about the event.

Remarks

This event is raised when the user clicks outside the editor, or when the endEdit method is invoked. Handle it to hide or destroy the edit control. You might also implement the copying of values from the editor to the diagram item's properties in this event handler.

DiagramListener.drawAdjustmentHandles Method

Raised when custom adjustment handles must be drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
void drawAdjustmentHandles (
    DrawItemEvent e
)
```

Parameters

e
A DrawItemEvent instance providing more information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.drawAnchorPoint Method

Raised when an anchor point must be custom drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void drawAnchorPoint (
    DrawAnchorPointEvent e
)
```

Parameters

e
A DrawAnchorPointEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface

DiagramListener.drawBackground Method

Raised to let you custom draw the diagram background.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void drawBackground (
    DiagramEvent e
)
```

Parameters

e

A DiagramEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.drawCell Method

Raised when a table's cell must be custom drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void drawCell (
    DrawCellEvent e
)
```

Parameters

e

A DrawCellEvent object providing information about the event.

Example

Java

```
table.setCellCustomDraw(CustomDraw.Additional);

@Override
public void drawCell(DrawCellEvent e)
{
    Graphics2D g = (Graphics2D)e.getGraphics().create();
    Rectangle2D.Float rect = new Rectangle2D.Float();
    rect.setFrame(e.getBounds());

    Ellipse2D el = new Ellipse2D.Float(rect.x + 1, rect.y + 1, 2, 2);
    g.setPaint(Color.cyan);
    g.draw(el);
}
```

com.mindfusion.diagramming Namespace
CellCustomDraw Property

DiagramListener.drawForeground Method

Raised to let you custom draw the diagram foreground.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void drawForeground (
    DiagramEvent e
)
```

Parameters

e
An instance of the DiagramEvent class providing more information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.drawLink Method

Raised when a diagram link must be custom drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void drawLink (
    DrawLinkEvent e
)
```

Parameters

e
An DrawLinkEvent object that provides more information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.drawNode Method

Raised when a diagram node must be custom drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void drawNode (
    DrawNodeEvent e
)
```

Parameters

e
A DrawNodeEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.enterInplaceEditMode Method

Called when entering in-place editing mode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void enterInplaceEditMode (
    InPlaceEditEvent e
)
```

Parameters

e
An InPlaceEditEvent object providing information about the event.

Remarks

This event allows setting properties of the **JTextArea** component used for in-place editing or attaching custom event handlers to that control. Note that you can use a custom control for in-place editing. This can be done by handling createEditControl and specifying what object should be used as an editor by assigning it to EditControl.

DiagramListener.initializeLasso Method

Raised when the user starts drawing a selection lasso, before it is rendered on screen.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
void initializeLasso (
    SelectionEvent e
)
```

Parameters

e
A SelectionEvent providing information about the event.

Remarks

This event is raised immediately after the user starts drawing the lasso tool.

DiagramListener.itemAdded Method

Raised when an item is added to the diagram, either programmatically or interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void itemAdded (
    ItemEvent e
)
```

Parameters

e

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.itemLoaded Method

Raised when an item is loaded from a file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void itemLoaded (
    ItemEvent e
)
```

Parameters

e

An ItemEvent instance providing more information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.itemRemoved Method

Raised when an item is removed from the diagram, either programmatically or interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void itemRemoved (
    ItemEvent e
)
```

Parameters

e

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.jsonDeserializeTag Method

Raised when the Tag of a diagram item must be deserialized from JSON.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void jsonDeserializeTag (
    JsonSerializeTagEvent e
)
```

Parameters

e

Remarks

You can handle this event to deserialize non-primitive Id or Tag objects.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.jsonSerializeTag Method

Raised when the Tag of a diagram item must be serialized to JSON.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void jsonSerializeTag (
    JsonSerializeTagEvent e
)
```

Parameters

e

Remarks

You can handle this event to serialize non-primitive Id or Tag objects.

Example

The following code shows how to serialize a simple structure as a JsonObject. **JsonObject** derives from **HashMap<String, JsonValue>**, where JsonValue is a boxing class that can contain primitive values and **JsonObject** itself (so you could nest objects).

Java

```
diagram.addDiagramListener(new DiagramAdapter()
{
    @Override
    public void jsonSerializeTag(JsonSerializeTagEvent e)
    {
        if ("Tag".equals(e.getPropertyName()) && e.getTag() instanceof MyTag)
        {
            MyTag myTag = (MyTag) e.getTag();
            e.setRepresentation(myTag.writeJson());
            e.setHandled(true);
        }
    }

    @Override
    public void jsonDeserializeTag(JsonSerializeTagEvent e)
    {
        if ("Tag".equals(e.getPropertyName()) && e.getObject() instanceof DiagramItem)
        {
            MyTag myTag = new MyTag();
```

```
            myTag.readJson(e.getRepresentation());
            e.setTag(myTag);
            e.setHandled(true);
        }
    }
}

public class MyTag
{
    private String name;
    private double value;
    private boolean flag;

    public MyTag() {}

    public MyTag(String name, double value, boolean flag)
    {
        this.name = name;
        this.value = value;
        this.flag = flag;
    }

    public String getName() { return name; }
    public void setName(String name)
    {
        this.name = name;
    }

    public double getValue() { return value; }
    public void setValue(double value)
    {
        this.value = value;
    }

    public boolean getFlag() { return flag; }
    public void setFlag(boolean flag)
    {
        this.flag = flag;
    }

    public JsonObject writeJson()
    {
        JsonObject obj = new JsonObject();
        obj.put("Name", new JsonValue(name));
        obj.put("Value", new JsonValue(value));
        obj.put("Flag", new JsonValue(flag));
        return obj;
    }

    public void readJson(JsonObject json)
    {
        this.name = JsonValue.toString(json.getValue("Name"));
        this.value = JsonValue.toDouble(json.getValue("Value"));
        this.flag = JsonValue.toBoolean(json.getValue("Flag"));
    }
}
```

DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.lassoDrawn Method

Raised when the user completes drawing a selection lasso.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void lassoDrawn (
    SelectionEvent e
)
```

Parameters

e
A SelectionEvent providing information about the event.

Remarks

This event is best used in conjunction with the DrawLasso behavior, which disables standard selection logic. Upon completing a lasso gesture, you might want to trigger immediate actions based on the lassoed area, such as:

- Opening a custom context menu or UI panel styled for bulk operations.
- Creating a visual screenshot / export of only that specific region.
- Implementing custom selection logic or filters (e.g. select nodes of a specific type, or select only links).
- Bookmarking the selected area (adding it to Bookmarks).

DiagramListener.leaveInplaceEditMode Method

Called when an in-place editing is accepted or rejected.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void leaveInplaceEditMode (
    InPlaceEditEvent e
)
```

Parameters

e
An InPlaceEditEvent object providing information about the event.

Remarks

This event is raised in all situations that lead to closing the inplace-edit control, for example, when the user accepts or cancels the changes made to an item's text, or when the endEdit method is called.

If you have created a custom edit control by handling the createEditControl event, EditControl refers to the custom editor. Otherwise, it is a **JTextArea** instance.

DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.nodeDeactivated Method

Raised when a node is no longer the active item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeDeactivated (
    NodeEvent e
)
```

Parameters

e

A NodeEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace
Diagram.setActiveItem Method
Diagram.getActiveItem Method

DiagramListener.nodeDeleted Method

Raised when a node is deleted, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeDeleted (
    NodeEvent e
)
```

Parameters

e
A NodeEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.nodeDeleting Method

Raised when the user tries to delete a node, this event lets you cancel the operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeDeleting (
    NodeValidationEvent e
)
```

Parameters

e
A NodeValidationEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.nodeDeselected Method

Raised when a node is deselected, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeDeselected (
    NodeEvent e
)
```

Parameters

e
A NodeEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.nodeDoubleClicked Method

Raised when the user double-clicks a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeDoubleClicked (
    NodeEvent e
)
```

Parameters

e
A NodeEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.nodeHovered Method

Fired when the mouse pointer hovers over a node. Call setTrackPointedItem to enable this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

void nodeHovered (
    NodeEvent e
)
```

Parameters

e
A NodeEvent object providing information about the event.

Remarks

This event fires when the mouse pointer rests over a node for HoverDelay milliseconds.

com.mindfusion.diagramming Namespace

DiagramListener.nodeModified Method

Raised when the user moves or resizes a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void nodeModified (
    NodeEvent e
)
```

Parameters

e
A NodeEvent object providing information about the event.

DiagramListener.nodeModifying Method

A validation event raised while the user is moving or resizing a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeModifying (
    NodeValidationEvent e
)
```

Parameters

e

A NodeValidationEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface

DiagramListener.nodePointerEnter Method

Fired when the mouse pointer enters the boundaries of a node. Call setTrackPointedItem to enable this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void nodePointerEnter (
    NodeEvent e
)
```

Parameters

e

A NodeEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.nodePointerLeave Method

Fired when the mouse pointer leaves the boundaries of a node. Call setTrackPointedItem to enable this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void nodePointerLeave (
    NodeEvent e
```

```
)
```

Parameters

e
A NodeEvent object providing information about the event.

See Also

DiagramListener Members

DiagramListener.nodeSelected Method

Raised when a node is selected, either programmatically or by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeSelected (
    NodeEvent e
)
```

Parameters

e
A NodeEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface

DiagramListener.nodeSelecting Method

Raised when the user tries to select a node, this event lets you cancel the operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeSelecting (
    NodeValidationEvent e
)
```

Parameters

e

A NodeValidationEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.nodeStartModifying Method

A validation event raised when the user starts modifying a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeStartModifying (
    NodeValidationEvent e
)
```

Parameters

e
A NodeValidationEvent object providing information about the event.

See Also

DiagramListener Members

com.mindfusion.diagramming Namespace

DiagramListener.nodeTextEdited Method

Raised when the user edits the text of a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeTextEdited (
    EditNodeTextEvent e
)
```

Parameters

e
A EditNodeTextEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.nodeTextEditing Method

A validation event that lets you approve or reject changes made to the text of a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void nodeTextEditing (
    NodeValidationEvent e
)
```

Parameters

e
A NodeValidationEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface

DiagramListener.repaint Method

Raised when the diagram views should be repainted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void repaint (
    RepaintEvent e
)
```

Parameters

e
A RepaintEvent object providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.requestCacheReset Method

Raised when an object within the diagram requests a reset of the cached bitmap.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void requestCacheReset (
    EventObject e
)
```

Parameters

e
An EventObject providing more information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.selectionChanged Method

Called when an item is added to or removed from the selection.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void selectionChanged (
    EventObject e
)
```

Parameters

e
An **EventObject** providing information about the event.

Remarks

Use the Nodes and Links properties of the diagram's Selection to find out which items are currently selected.

lassoDrawn Event

DiagramListener.selectionModified Method

Called when multiple selected items are moved or resized.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void selectionModified (
    SelectionEvent e
)
```

Parameters

e
A SelectionEvent providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.selectionModifying Method

Raised while the user is moving or resizing multiple selected items, this event lets you cancel the modification.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void selectionModifying (
    SelectionValidationEvent e
)
```

Parameters

e
A SelectionValidationEvent instance providing information about the event.

See Also

DiagramListener Members
DiagramListener Interface
com.mindfusion.diagramming Namespace

DiagramListener.serializeControl Method

Lets you save the attributes of controls hosted inside ControlNode objects.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void serializeControl (
    ControlNodeEvent e
)
```

Parameters

e
A ControlNodeEvent instance providing more information about the event.

Remarks

By default, the diagram component saves and loads hosted controls by getting or setting their property values via the Java introspection API. If the default mechanism cannot serialize the content of nodes automatically, the **serializeControl** and deserializeControl events can be handled to implement custom serialization.

Example

Java

```
diagram.addDiagramListener(new DiagramAdapter() {
    @Override
    public void serializeControl(ControlNodeEvent e)
    {
        JButton button = (JButton)e.getNode().getControl();
        e.getContext().writeString(button.getText(), "Text", e.getXmlElement());
        e.setHandled(true);
    };

    @Override
    public void deserializeControl(ControlNodeEvent e)
    {
        JButton button = new JButton();
        try
        {
            button.setText(e.getContext().readString("Text", e.getXmlElement()));
        }
        catch (TransformerException ex)
        {
            ex.printStackTrace();
        }
        e.getNode().setControl(button);
        e.setHandled(true);
    };
}
```

DiagramListener.serializeTag Method

Raised when the tag of a diagram item must be serialized into an XML document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void serializeTag (
    SerializeTagEvent e
)
```

Parameters

e
A SerializeTagEvent object providing information about the event.

Diagram.setTag Method
Diagram.getTag Method

DiagramListener.setSelfLoopShape Method

Raised when a link becomes a self-loop, giving you a chance to override the default look shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

void setSelfLoopShape (
    LinkShapeEvent e
)
```

Parameters

e
A LinkShapeEvent instance providing more information about the event.

DiagramListener.tableColumnResized Method

Raised when the user finishes resizing a column in a table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void tableColumnResized (
    CellEvent e
)
```

Parameters

e
A CellEvent object providing information about this event.

DiagramListener.tableColumnResizing Method

Raised when the user resizes a column in a table interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void tableColumnResizing (
    CellValidationEvent e
)
```

Parameters

e
A CellValidationEvent object providing information about this event.

DiagramListener.tableRowResized Method

Raised when the user finishes resizing a row in a table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void tableRowResized (
    CellEvent e
)
```

Parameters

e
A CellEvent object providing information about this event.

DiagramListener.tableRowResizing Method

Raised when the user resizes a row in a table interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void tableRowResizing (
    CellValidationEvent e
)
```

Parameters

e
A CellValidationEvent object providing information about this event.

DiagramListener.tableSectionCollapsed Method

Called when a table section is collapsed

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void tableSectionCollapsed (
    RowEvent e
)
```

Parameters

e
A RowEvent object providing information about the event.

See Also

DiagramListener Members

DiagramListener.tableSectionExpanded Method

Called when a table section is expanded

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void tableSectionExpanded (
    RowEvent e
)
```

Parameters

e
A RowEvent object providing information about the event.

DiagramListener.treeCollapsed Method

Raised when a user collapses a tree branch by clicking the [-] button of a expandable node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void treeCollapsed (
    NodeEvent e
)
```

Parameters

e
A NodeEvent object providing information about the event.

DiagramListener.validateAnchorPoint Method

A validation event that lets you approve or reject connecting a link to an anchor point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void validateAnchorPoint (
    LinkValidationEvent e
)
```

Parameters

e
A LinkValidationEvent object providing information about the event.

DiagramListener.viewRemoved Method

Raised when a DiagramView is detached from this diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void viewRemoved (
    ValidationEvent e
)
```

Parameters

e

A ValidationEvent object providing information about the event.

DiagramNode Class

DiagramNode is an abstract base class from which the ShapeNode, TableNode and ContainerNode classes derive. **DiagramNode** instances can represent graph vertices, nodes in organizational or flow diagrams, entities in ER diagrams, and so on.

Syntax

Java

```
public abstract class DiagramNode extends DiagramItem
```

Remarks

Use the setBounds method to set the location and size of a node. To move a node without changing its size, call the moveTo method. To change only the size of a node, invoke the resize method.

Constraints upon how users are allowed to modify a node can be set by the setConstraints and setEnabledHandles methods. The former specifies constraints on the allowed move direction and node size. The latter enables or disables specific manipulation handles of a node.

Relations between nodes are indicated by linking the nodes with DiagramLink objects. Links are directional links, so each node has two collections referring to links, which can be accessed by getIncomingLinks and getOutgoingLinks. setAnchorPattern lets you define to which points of a node incoming or outgoing links can be connected. You can specify whether a node accepts incoming links by the setAllowIncomingLinks method, and outgoing links by the setAllowOutgoingLinks method.

A user is allowed to expand or collapse the tree branch that starts from a node if setExpandable is called for that node. Use getExpanded to find out whether the branch starting from a node is expanded or not.

Nodes can be attached to other items, and be used as simple labels, image-holders or other kinds of UI elements. The attachTo method creates a Group instance if necessary, and calls the group's appropriate attachTo* method.

DiagramNode Members

DiagramNode is an abstract base class from which the ShapeNode, TableNode and ContainerNode classes derive. **DiagramNode** instances can represent graph vertices, nodes in organizational or flow diagrams, entities in ER diagrams, and so on.

The following tables list the members exposed by the **DiagramNode** type.

Public Constructors

	Name	Description
	DiagramNode	Overloaded.

Protected Fields

	Name	Description
	allowIncomingLinks	
	allowOutgoingLinks	
	anchorPattern	
	AV_Cancel	
	AV_EndModIncoming	
	AV_EndModOutgoing	
	AV_StartModIncoming	
	AV_StartModOutgoing	
	AV_UpdateIncoming	
	AV_UpdateOutgoing	
	AV_UpdIntscIncoming	
	AV_UpdIntscOutgoing	
	AV_UpdPosIncoming	
	AV_UpdPosOutgoing	
	bounds	
	brush	(Inherited from DiagramItem.)
	cycleDetected	(Inherited from DiagramItem.)

	cycleProtect	(Inherited from DiagramItem.)
	enabledHandles	
	handlesStyle	
	incomingLinks	
	masterGroup	
	modifyDX	(Inherited from DiagramItem.)
	modifyDY	(Inherited from DiagramItem.)
	modifyHandle	(Inherited from DiagramItem.)
	modifying	(Inherited from DiagramItem.)
	obstacle	
	outgoingLinks	
	pen	(Inherited from DiagramItem.)
	ptEnd	(Inherited from DiagramItem.)
	ptMdfLast	(Inherited from DiagramItem.)
	ptOrg	(Inherited from DiagramItem.)
	ptSavedEnd	(Inherited from DiagramItem.)
	ptSavedOrg	(Inherited from DiagramItem.)
	savedBounds	
	subordinateGroup	(Inherited from DiagramItem.)

Public Methods

	Name	Description
	addLabel	Overloaded.
	as	Down-casts the item to specified type. (Inherited from DiagramItem.)
	attachTo	Overloaded.
	clone	Creates a copy of this item. (Inherited from DiagramItem.)
	containsPoint	Overloaded.
	detach	Detaches a node from its master group.
	getAllIncomingLinks	Gets a collection of all links entering this node.
	getAllLinks	Gets all links connected to this node.
	getAllOutgoingLinks	Gets a collection of all links going out of this node.
	getAllowIncomingLinks	Gets a value indicating whether users are allowed to draw links to this node.

	getAllowOutgoingLinks	Gets a value indicating whether users are allowed to draw links from this node.
	getAnchorPattern	Gets the anchor points to which link end points are aligned when links connect to this node.
	getBounds	Gets the node location and size.
	getBrush	Gets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	getCenter	Returns the center point of this node.
	getConstraints	Gets the movement and size constraints applied to a node.
	getContainer	Gets the parent **ContainerNode** containing this node.
	getEffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style. (Inherited from DiagramItem.)
	getEffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style. (Inherited from DiagramItem.)
	getEffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	getEffects	Gets a collection with all effects applied to this node.
	getEnabledHandles	Gets a combination of NodeHandleType members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node.
	getExpandable	Gets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node.
	getExpanded	Gets a value indicating whether the tree branch that starts from a node is expanded or collapsed.
	getFont	Gets the font used to draw the text of an item. (Inherited from DiagramItem.)
	getHandlesStyle	Gets a value indicating how the node adjustment handles behave and what do they look like.
	getHyperLink	Gets the hyperlink associated with an item. (Inherited from DiagramItem.)

	getId	Gets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	getIncomingLinks	Gets the links coming into a node.
	getLabels	Returns the list of supplementary labels displayed by this node.
	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms. (Inherited from DiagramItem.)
	getLocalCenter	
	getLocked	Gets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	getMasterGroup	Gets the hierarchical group in which this node is a subordinate item.
	getMasterItem	Returns the node's **Container** or main item of **MasterGroup**.
	getNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point.
	getObstacle	Gets a value indicating whether the link routing algorithm should consider this node an obstacle.
	getOpacity	Gets the opacity of this item. (Inherited from DiagramItem.)
	getOutgoingLinks	Gets the links going out from a node.
	getParent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	getPen	Gets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	getPrintable	Gets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
S	getRotatedBounds	Gets the bounding rectangle of this node, when it is rotated at the specified angle around the specified pivot.
	getRotationAngle	Gets the rotation angle of this node.
	getRuntimeIndex	For internal use. (Inherited from DiagramItem.)
	getSelected	Gets a value indicating whether this item is selected. (Inherited from DiagramItem.)
	getShadowBrush	Gets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)

	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getStyle	Gets the style associated with the item. (Inherited from DiagramItem.)
	getSubordinateGroup	Gets the group of subordinated items attached to this one. (Inherited from DiagramItem.)
	getTag	Gets user-defined data assigned to an item. (Inherited from DiagramItem.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	getTextPadding	Gets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	getToolTip	Gets the tooltip text displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	getVisible	Gets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	getWeight	Gets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	getZIndex	Gets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	hasSubordinates	Checks whether there are any nodes attached to this item. (Inherited from DiagramItem.)
	hitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	hitTestHandle	DiagramItem.hitTestHandle override.
	labelFromPoint	Returns the label whose layout rectangle contains the specified point.
	moveTo	Moves a node to the specified location.
S	nodesIntersect	Determines whether two nodes intersect.
	onDragOut	Invoked when a diagram item is being dragged out of this node.
	onDragOver	Invoked when a diagram item is being dragged over this node.
	onDropOver	Invoked when a diagram item is dropped over this node.
	query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	readExternal	Implements Externalizable.
	removeLabel	Removes the specified label from this node.
	resize	Sets the size of a node.
	setAllowIncomingLinks	Sets a value indicating whether users are allowed to draw links to this node.

	setAllowOutgoingLinks	Sets a value indicating whether users are allowed to draw links from this node.
	setAnchorPattern	Sets the anchor points to which link end points are aligned when links connect to this node.
	setBounds	Overloaded.
	setBoundsDirect	For internal use.
	setBrush	Sets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	setConstraints	Sets constraints to the node size and movement direction. The constraints are applied when a user modifies the node interactively. They are not checked when the position of a node is set programmatically.
	setEnabledHandles	Sets a combination of **NodeHandleType** members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node.
	setExpandable	Sets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node.
	setExpanded	Expands or collapses the tree branch that starts from a node.
	setExpandedFlag	Changes the "expanded" flag without actually expanding or collapsing the tree branch that starts from a node.
	setFont	Sets the font used to draw the text of an item. (Inherited from DiagramItem.)
	setHandlesStyle	Sets a value indicating how the node adjustment handles behave and what do they look like.
	setHyperLink	Sets the hyperlink associated with an item. (Inherited from DiagramItem.)
	setId	Assigns user-defined identifier to this item. (Inherited from DiagramItem.)
	setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	setLocked	Sets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	setObstacle	Sets a value indicating whether the link routing algorithm should consider this node an obstacle.
	setOpacity	Sets the opacity of this item. (Inherited from DiagramItem.)
	setPen	Sets the pen used to draw the item frame lines. (Inherited from DiagramItem.)

	setPrintable	Sets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	setRotationAngle	Sets the rotation angle of a node.
	setSelected	Selects or deselects an item. (Inherited from DiagramItem.)
	setShadowBrush	Sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setStyle	Sets the style associated with the item. (Inherited from DiagramItem.)
	setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event. (Inherited from DiagramItem.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	setTextPadding	Sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	setVisible	Sets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	setWeight	Sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	setZIndex	Sets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	writeExternal	Implements Externalizable.
	zBottom	Moves an item to the bottom of the Z order. (Inherited from DiagramItem.)
	zLevelDown	Moves an item down in the Z order. (Inherited from DiagramItem.)
	zLevelUp	Moves an item up in the Z order. (Inherited from DiagramItem.)
	zTop	Moves an item to the top of the Z order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	allowCreate	DiagramItem.allowCreate override.

allowModify	
allowModifyImpl	
cancelModify	DiagramItem.cancelModify override. Invoked when the interactive modification of this node has been canceled.
completeCreate	DiagramItem.completeCreate override.
completeModify	
constraintsInfringed	
createConnectionPoint	
createProperties	DiagramItem.createProperties override.
createState	DiagramItem.createState override.
draw	DiagramItem.draw override.
drawLocal	Override in a derived class to provide implementation specific drawing for the node.
drawShadow	DiagramItem.drawShadow override.
drawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node.
getLocalBounds	Gets this node's bounding rectangle in local coordinates.
getLocalBoundsD	Gets this node's bounding rectangle in local coordinates.
getMeasureUnit	(Inherited from DiagramItem.)
getRepaintRect	DiagramItem.getRepaintRect override.
getValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
groupContains	
loadFromJson	Loads the node from a JSON object.
loadFromXml	
move	
onAdd	Called when an item is added to a Diagram, either by the user, programmatically or by undo / redo. (Inherited from DiagramItem.)
onChangeFont	(Inherited from DiagramItem.)
onChangeTextPadding	(Inherited from DiagramItem.)
onChildModified	Called when a group child node has been modified. Override this method if you need to know when a node from the **SubordinateGroup** is modified. (Inherited from DiagramItem.)
onClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)

	onDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	onLoad	Called when this item is loaded from a file. (Inherited from DiagramItem.)
	onMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	onModify	Called when an item is modified
	onRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or by undo / redo.
	onRotationAngleChanged	Called when the node's rotation angle changes.
	onStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	onStyleFontChanged	Invoked when font property values of an associated style change. (Inherited from DiagramItem.)
	onUpdateBounds	Invoked when the bounding rectangle of this node has changed.
	parentConstraintsInfringed	
	putExpandable	
	putSelected	(Inherited from DiagramItem.)
	rectFromPoints	
	repaint	Overloaded. (Inherited from DiagramItem.)
	resizeToFitImage	
	restoreProperties	DiagramItem.restoreProperties override.
	restoreState	DiagramItem.restoreState override.
	saveProperties	DiagramItem.saveProperties override.
	saveState	DiagramItem.saveState override.
	saveToJson	Saves the node as a JSON object.
	saveToXml	
	scaleElements	Scales the node's elements by specified amount.
	setDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	setReflexive	Invoked to let a node set the shape of a reflexive link connected to it.
	shouldRender	Determines whether the item is rendered in the current context. (Inherited from DiagramItem.)
	shouldRenderAnchors	Determines whether the node should render its anchor points.
	startCreate	DiagramItem.startCreate override.

	startModify	DiagramItem.startModify override. Invoked when the user starts modifying this node interactively.
	updateCreate	DiagramItem.updateCreate override.
	updateLinkPositions	
	updateModify	DiagramItem.updateModify override. Invoked during interactive modification of this node.

DiagramNode Constructor

Overload List

Name	Description
DiagramNode ()	Initializes a new instance of the DiagramNode class.
DiagramNode (Diagram)	Initializes a new **DiagramNode** instance by setting its properties to the default values defined in the specified Diagram.
DiagramNode (DiagramNode)	Initializes a new **DiagramNode** instance by copying its properties from the specified prototype node.

See Also

DiagramNode Constructor ()

Initializes a new instance of the DiagramNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode ()
```

See Also

DiagramNode Constructor Overload List
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode Constructor (Diagram)

Initializes a new DiagramNode instance by setting its properties to the default values defined in the specified Diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode (
    Diagram parent
)
```

Parameters

parent
A Diagram instance whose default nodeattributes are copied to this node.

See Also

DiagramNode Constructor Overload List
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode Constructor (DiagramNode)

Initializes a new DiagramNode instance by copying its properties from the specified prototype node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

`public DiagramNode (`
`  DiagramNode prototype`
`)`

Parameters

prototype
A DiagramNode instance whose attributes arecopied to this node.

See Also

DiagramNode Constructor Overload List
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode Methods

DiagramNode.addLabel Method

Overload List

Name	Description
DiagramNode.addLabel (NodeLabel)	Adds the specified label to this node.
DiagramNode.addLabel (String)	Adds a new label to this node.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.addLabel Method (NodeLabel)

Adds the specified label to this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

`public void addLabel (`
`  NodeLabel label`
`)`

Parameters

label
A NodeLabel instance.

Remarks

An item's main text content is specified via its Text property. Call addLabel if you need to display additional text labels, such as identifiers or hints to the user.

Position of labels can be specified by calling methods such as setCornerPosition. You can let users move labels interactively by setting the Behavior property of DiagramView to MoveLabels.

See Also

addLabel Method Overload List
DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace
removeLabel Method

DiagramNode.addLabel Method (String)

Adds a new label to this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeLabel addLabel (
    String text
)
```

Parameters

text
The label's text.

Return Value

A NodeLabel instance.

Remarks

An item's main text content is specified via its Text property. Call addLabel if you need to display additional text labels, such as identifiers or hints to the user.

Position of labels can be specified by calling methods such as setCornerPosition. You can let users move labels interactively by setting the Behavior property of DiagramView to MoveLabels.

DiagramNode.allowCreate Method

DiagramItem.allowCreate override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected boolean allowCreate (
    Point2D current,
    InteractionState ist
)
```

Parameters

current
The current mouse position.

ist
An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the creation of this item, or **false** otherwise.

DiagramNode.attachTo Method

Overload List

Name	Description
DiagramNode.attachTo (DiagramLink, AttachToLink, int)	Attaches a node to a segment or point of the specified link.
DiagramNode.attachTo (DiagramNode, AttachToNode)	Attaches a node to a corner or side of another node.
DiagramNode.attachTo (DiagramNode, float, float, float, float)	Attaches a node to another node, so that the attached node will always cover a proportional part of the master node, specified in percents.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.attachTo Method (DiagramLink, AttachToLink, int)

Attaches a node to a segment or point of the specified link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void attachTo (
    DiagramLink link,
    AttachToLink attType,
    int index
)
```

Parameters

link
An DiagramLink to which to attach this node.

attType
A member of the AttachToLink enumeration specifying whether to attach the node to a segment or to a control point of the link.

index
An index of link's control point or segment, depending on the attType value.

Remarks

This method attaches the node to a control point or segment of the specified link. If there isn't a Group instance already associated with the master item, one is created automatically by this method. The group is then accessible through the master's SubordinateGroup property, or this node's MasterGroup property.

The node is attached by calling the attachToLinkPoint or attachToLinkSegment methods of **Group**, depending on the value of the *attType* argument. The attached node then maintains its original offset from a link's point or segment when link's shape changes.

See Also

attachTo Method Overload List
DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace
detach Method

DiagramNode.attachTo Method (DiagramNode, AttachToNode)

Attaches a node to a corner or side of another node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void attachTo (
    DiagramNode node,
```

```
    AttachToNode attType
)
```

Parameters

node
A DiagramNode to which to attach this node.

attType
A member of the AttachToNode enumeration.

Remarks

This method attaches the current node to the corner of another node. If there isn't a Group instance already associated with the master item, one is created automatically by this method. The group is then accessible by the master's SubordinateGroup property, or this node's MasterGroup property.

The node is attached by calling the attachToCorner method of **Group**. The attached node then maintains its original offset from another node's corner point.

See Also

attachTo Method Overload List
DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace
detach Method

DiagramNode.attachTo Method (DiagramNode, float, float, float, float)

Attaches a node to another node, so that the attached node will always cover a proportional part of the master node, specified in percents.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void attachTo (
    DiagramNode node,
    float percentX1,
    float percentY1,
    float percentX2,
    float percentY2
)
```

Parameters

node
A DiagramNode to which to attach this node.

percentX1
A float percent value specifying to what X position in the master node to attach the left side of this node.

percentY1
A float percent value specifying to what Y position in the master node to attach the top side of this node.

percentX2

A float percent value specifying to what X position in the master node to attach the right side of this node.

percentY2
A float percent value specifying to what Y position in the master node to attach the bottom side of this node.

DiagramNode.cancelModify Method

DiagramItem.cancelModify override. Invoked when the interactive modification of this node has been canceled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void cancelModify (
    InteractionState ist
)
```

Parameters

ist
An InteractionState object containing more information about the current state of the operation.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.completeCreate Method

DiagramItem.completeCreate override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void completeCreate (
    Point2D end
)
```

Parameters

end
The final mouse position.

DiagramNode.containsPoint Method (Point2D)

DiagramItem.containsPoint override. Checks whether this node contains the specified point. This method is called during hit-testing to determine if the mouse is over the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean containsPoint (
    Point2D point
)
```

Parameters

point
The point to check.

Return Value

true it this node contains the specified point, or **false** otherwise.

See Also

containsPoint Method Overload List
DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.containsPoint Method (Point2D, float)

DiagramItem.containsPoint override. Checks whether this node contains the specified point. This method is called during hit-testing to determine if the mouse is over the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean containsPoint (
    Point2D point,
    float threshold
)
```

Parameters

point
The point to check.

threshold
Specifies the size of the area around the node outlines where the point is still considered inside.

Return Value

true it this node contains the specified point, or **false** otherwise.

DiagramNode.draw Method

DiagramItem.draw override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void draw (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g
The **Graphics2D** surface to draw the item on.

options
A RenderOptions object specifying options for the drawing operation.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.drawLocal Method

Override in a derived class to provide implementation specific drawing for the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void drawLocal (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g
The **Graphics2D** surface to draw the item on.

options
Provides options for the drawing operation.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.drawShadow Method

DiagramItem.drawShadow override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void drawShadow (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g
A **Graphics2D** instance.

options
Provides options for the drawing operation.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.drawShadowLocal Method

Override in a derived class to provide implementation specific drawing for the shadow of the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void drawShadowLocal (
    Graphics2D graphics,
    RenderOptions options
)
```

Parameters

graphics
The **Graphics2D** object where the shadow should be rendered.

options
Provides options for the drawing operation.

DiagramNode.getAllIncomingLinks Method

Gets a collection of all links entering this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramLinkList getAllIncomingLinks ()
```

Return Value

A DiagramLinkList containing all incoming links.

Remarks

This method returns IncomingLinks when the node does not contain constituent parts that can be related by links, such as TableNode rows or TreeViewNode items. Otherwise, the method also collects all links that enter the child items.

See Also

getAllOutgoingLinks Method

DiagramNode.getAllLinks Method

Gets all links connected to this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramLinkList getAllLinks ()
```

Return Value

A DiagramLinkList containing the links connected to this node.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.getAllOutgoingLinks Method

Gets a collection of all links going out of this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkList getAllOutgoingLinks ()
```

Return Value

A DiagramLinkList containing all outgoing links.

Remarks

This method returns OutgoingLinks when the node does not contain constituent parts that can be related by links, such as TableNode rows or TreeViewNode items. Otherwise, the method also collects all links that go out of the child items.

DiagramNode.getAnchorPattern Method

Gets the anchor points to which link end points are aligned when links connect to this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnchorPattern getAnchorPattern ()
```

Return Value

An AnchorPattern object that defines the anchor points for this node.

Remarks

If this property is not set for a ShapeNode, the control will use the points defined in the node's associated Shape.

DiagramNode.getBounds Method

Gets the node location and size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Rectangle2D.Float getBounds ()
```

Return Value

A **Rectangle2D.Float** object representing the node bounds.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.getCenter Method

Returns the center point of this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Point2D getCenter ()
```

Return Value

A **Point2D** instance specifying the node center.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.getConstraints Method

Gets the movement and size constraints applied to a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public NodeConstraints getConstraints ()
```

Return Value

A NodeConstraints object.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.getContainer Method

Gets the parent ContainerNode containing this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ContainerNode getContainer ()
```

Return Value

The parent ContainerNode of this node.

Remarks

Call the add method of ContainerNode to add a child node to the container. Call remove to remove a child node.

DiagramNode Class
com.mindfusion.diagramming Namespace
getMasterItem Method
ContainerNode.getChildren Method

DiagramNode.getEffects Method

Gets a collection with all effects applied to this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public List<NodeEffect> getEffects ()
```

Return Value

A list of NodeEffect objects.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.getEnabledHandles Method

Gets a combination of NodeHandleType members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public EnumSet<NodeHandleType> getEnabledHandles ()
```

Return Value

A set of NodeHandleType members. The default value is AdjustmentHandles.DisableRotation.

Remarks

Disabling some selection handles allows restricting the types of modifications that users can perform on a node. Each manipulation handle can be enabled or disabled by adding or removing its corresponding enum element from the set.

For example, to make a node resizable only horizontally, set this property to a combination of the Move, **ResizeMiddleLeft** and **ResizeMiddleRight** flags. That will disable all manipulation handles, except the left and right ones, which allow horizontal resizing, and the central one allowing movement of the node.

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.getExpandable Method

Gets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getExpandable ()
```

Return Value

true if the tree branch that starts from this node, can be expanded or collapsed by users, otherwise **false**.

Remarks

This property is useful mostly when nodes form a tree-like hierarchical structure. If it is enabled, a small [±] button is drawn beside the node. Clicking that button either shows or hides all children of this node in the tree. It depends on the diagram's ExpandOnIncoming property which items connected to a node are considered its children. The tree expansion continues recursively down the child nodes if the RecursiveExpand property is enabled.

The appearance of the collapse / expand icon can be customized by setting Renderers.ExpandIconRenderer.

DiagramNode.getNearestBorderPoint Method

Returns a point that lies on the outline of this node, at the shortest distance from the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Point2D getNearestBorderPoint (
    Point2D point
)
```

Parameters

point
A **Point2D** instance.

Return Value

A **Point2D** instance representing the border point at shortest distance from the specified point.

com.mindfusion.diagramming Namespace

DiagramNode.hitTestHandle Method

DiagramItem.hitTestHandle override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public AdjustmentHandle hitTestHandle (
    Point2D point
)
```

Parameters

point
A **Point2D** instance specifying the location where to look for adjustment handles.

Return Value

Returns a NodeAdjustmentHandle instance representing the adjustment handle found at the specified location, or **null** if there is none.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.labelFromPoint Method

Returns the label whose layout rectangle contains the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ItemLabel labelFromPoint (
    Point2D point
)
```

Parameters

point
A **Point2D** instance.

Return Value

The NodeLabel that contains the specified point.

DiagramNode.loadFromJson Method

Loads the node from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

Remarks

This method is invoked when an item is being deserialized from a diagram file saved in JSON format.

    double y
)
```

Parameters

x

y

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.moveTo Method

Moves a node to the specified location.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void moveTo (
    float x,
    float y
)
```

Parameters

x
The new horizontal position of the node.

y
The new vertical position of the node.

See Also

DiagramNode Members

com.mindfusion.diagramming Namespace

DiagramNode.nodesIntersect Method

Determines whether two nodes intersect.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static boolean nodesIntersect (
    DiagramNode node1,
    DiagramNode node2
)
```

Parameters

node1
The first node.

node2
The second node.

Return Value

true if the nodes intersect, otherwise **false**.

DiagramNode.onDragOut Method

Invoked when a diagram item is being dragged out of this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void onDragOut (
    DiagramItem item
)
```

Parameters

item
The DiagramItem that is dragged out of the node.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.onDragOver Method

Invoked when a diagram item is being dragged over this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean onDragOver (
    DiagramItem item
)
```

Parameters

item
The DiagramItem that is dragged over the node.

Return Value

false if the diagram should notify nodes below this one; otherwise, **true**.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.onDropOver Method

Invoked when a diagram item is dropped over this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean onDropOver (
    DiagramItem item
)
```

Parameters

item
The DiagramItem that is dropped over the node.

Return Value

false if the diagram should notify nodes below this one; otherwise, **true**.

DiagramNode.onModify Method

Called when an item is modified

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onModify (
    Point2D mousePosition,
    NodeHandleType adjustmentHandle
)
```

Parameters

mousePosition
Specifies the mouse position.

adjustmentHandle

The adjustment handle used to modify the node.

DiagramNode.saveToJson Method

Saves the node as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

Remarks

This method is invoked when an item is being serialized into a JSON-format diagram file.

DiagramNode.setAnchorPattern Method

Sets the anchor points to which link end points are aligned when links connect to this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAnchorPattern (
    AnchorPattern value
)
```

Parameters

value
An AnchorPattern object that definesthe anchor points for this node.

Remarks

If this property is not set for a ShapeNode, the control will use the points defined in the node's associated Shape.

com.mindfusion.diagramming Namespace

DiagramNode.setBounds Method (Rectangle2D, boolean, boolean)

Sets the location and size of this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBounds (
    Rectangle2D rect,
    boolean updateGroups,
    boolean updateLinks
)
```

Parameters

rect
A Rectangle2D specifying the node position.

updateGroups
Specifies whether the position of child nodes attached to this one should be updated too.

updateLinks
Specifies whether the position of links connected to this node should be updated too.

See Also

setBounds Method Overload List

DiagramNode.setBoundsDirect Method

For internal use.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBoundsDirect (
    Rectangle2D rc
)
```

Parameters

rc

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.setConstraints Method

Sets constraints to the node size and movement direction. The constraints are applied when a user modifies the node interactively. They are not checked when the position of a node is set programmatically.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setConstraints (
    NodeConstraints value
)
```

Parameters

value
A NodeConstraints object.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.setEnabledHandles Method

Sets a combination of NodeHandleType members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnabledHandles (
    EnumSet<NodeHandleType> value
)
```

Parameters

value
A set of NodeHandleType members.

Remarks

Disabling some selection handles allows restricting the types of modifications that users can perform on a node. Each manipulation handle can be enabled or disabled by adding or removing its corresponding enum element from the set.

For example, to make a node resizable only horizontally, set this property to a combination of the Move, **ResizeMiddleLeft** and **ResizeMiddleRight** flags. That will disable all manipulation handles, except the left and right ones, which allow horizontal resizing, and the central one allowing movement of the node.

ModificationStart Property
ShowDisabledHandles Property

DiagramNode.setExpandable Method

Sets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setExpandable (
    boolean value
)
```

Parameters

value

true if the tree branch that starts from this node can be expanded or collapsed by users, otherwise **false**.

Remarks

This property is useful mostly when nodes form a tree-like hierarchical structure. If it is enabled, a small [±] button is drawn beside the node. Clicking that button either shows or hides all children of this node in the tree. It depends on the diagram's ExpandOnIncoming property which items connected to a node are considered its children. The tree expansion continues recursively down the child nodes if the RecursiveExpand property is enabled.

The appearance of the collapse / expand icon can be customized by setting Renderers.ExpandIconRenderer.

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.setExpanded Method

Expands or collapses the tree branch that starts from a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setExpanded (
    boolean value
)
```

Parameters

value
true if the tree branch that starts from this node should be expanded, otherwise **false**.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.setExpandedFlag Method

Changes the "expanded" flag without actually expanding or collapsing the tree branch that starts from a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setExpandedFlag (
    boolean expanded
)
```

Parameters

expanded
The new value of the flag.

DiagramNode.setHandlesStyle Method

Sets a value indicating how the node adjustment handles behave and what do they look like.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHandlesStyle (
    HandlesStyle value
)
```

Parameters

value
A member of the HandlesStyle enumeration.

Remarks

Specifies how node selection status is indicated visually. In addition, this property defines how manipulation of the node can be done, that is, how to move it, resize it or link it to other nodes. You can assign any of the HandlesStyle enum elements to this property.

DiagramNode.setObstacle Method

Sets a value indicating whether the link routing algorithm should consider this node an obstacle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setObstacle (
    boolean value
)
```

Parameters

value
true if auto-routed links should go around this node, otherwise **false**.

DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.setReflexive Method

Invoked to let a node set the shape of a reflexive link connected to it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void setReflexive (
    DiagramLink link
)
```

Parameters

link
Reference to the link.

DiagramNode.setRotationAngle Method

Sets the rotation angle of a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setRotationAngle (
    float value
)
```

Parameters

value
A float value specifying the node rotation angle.

DiagramNode.shouldRenderAnchors Method

Determines whether the node should render its anchor points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected boolean shouldRenderAnchors (
    RenderOptions options
)
```

Parameters

options

Return Value

DiagramNode.startCreate Method

DiagramItem.startCreate override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void startCreate (
    Point2D org
)
```

Parameters

org
The initial mouse position.

See Also

DiagramNode Members
DiagramNode Class
com.mindfusion.diagramming Namespace

DiagramNode.startModify Method

DiagramItem.startModify override. Invoked when the user starts modifying this node interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void startModify (
    Point2D org,
    AdjustmentHandle handle,
    InteractionState ist
)
```

Parameters

org
The initial mouse position.

handle
The adjustment handle used to modify this item.

ist
An InteractionState object containing more information about the current state of the operation.

DiagramNode.updateCreate Method

DiagramItem.updateCreate override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void updateCreate (
    Point2D current
)
```

Parameters

current
The current mouse position.

DiagramNode.updateModify Method

DiagramItem.updateModify override. Invoked during interactive modification of this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void updateModify (
    Point2D current,
    InteractionState ist
)
```

Parameters

current
The current mouse position.

ist
An InteractionState object containing more information about the current state of the operation.

DiagramNode.writeExternal Method

Implements Externalizable.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

DiagramNodeList Class

A strongly typed list of DiagramNode objects.

Syntax

Java

```
public class DiagramNodeList extends BaseList<E> implements Cloneable
```

Inheritance Hierarchy

java.lang.Object
  java.util.AbstractCollection(E)
    java.util.AbstractList(E)
      com.mindfusion.diagramming.BaseList(E)
        com.mindfusion.diagramming.DiagramNodeList

DiagramNodeList Members

A strongly typed list of DiagramNode objects.

The following tables list the members exposed by the DiagramNodeList type.

Public Constructors

	Name	Description
	DiagramNodeList	

Protected Fields

	Name	Description
	list	(Inherited from BaseList.)
	listEvent	(Inherited from BaseList.)
	notifyParent	(Inherited from BaseList.)

Public Methods

	Name	Description
	add	Adds a new element to the list. (Inherited from BaseList.)
	clear	Removes all elements from the list. (Inherited from BaseList.)
	clone	
	contains	Determines if this list contains the specified element. (Inherited from BaseList.)
	first	Gets the first element of this list. (Inherited from BaseList.)
	get	Gets the element at the specified position in this list. (Inherited from BaseList.)
	last	Gets the last element of this list. (Inherited from BaseList.)
	readExternal	Loads the list's contents. (Inherited from BaseList.)
	remove	Overloaded. (Inherited from BaseList.)
	removeRange	Removes a range of elements from this list. (Inherited from BaseList.)
	set	Sets the element at the specified position in this list. (Inherited from BaseList.)
	size	Gets the number of elements in this list. (Inherited from BaseList.)
	writeExternal	Saves the list's contents. (Inherited from BaseList.)

Protected Methods

	Name	Description
	raiseAdding	Raises the adding event. (Inherited from BaseList.)
	raiseClearing	Raises the clearing event. (Inherited from BaseList.)
	raiseRemoving	Raises the removing event. (Inherited from BaseList.)

DiagramNodeProperties Class

Stores the values of DiagramNode properties during undo / redo operations. If you need to implement undo support for the additional properties defined by a class derived from **DiagramNode**, do so by deriving from DiagramNodeProperties and overriding the DiagramNode.saveProperties, DiagramNode.restoreProperties, and DiagramNode.createProperties methods.

Syntax

Java

```
public class DiagramNodeProperties extends DiagramItemProperties
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DiagramItemProperties
    com.mindfusion.diagramming.DiagramNodeProperties
      com.mindfusion.diagramming.ContainerNodeProperties
      com.mindfusion.diagramming.ControlNodeProperties
      com.mindfusion.diagramming.ShapeNodeProperties
      com.mindfusion.diagramming.TableNodeProperties

DiagramNodeStyle Members

Represents a reusable set of properties that define the appearance of diagram nodes.

The following tables list the members exposed by the DiagramNodeStyle type.

Protected Constructors

	Name	Description
	DiagramNodeStyle	Initializes a new instance of the **DiagramNodeStyle** class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from Style.)
	getBrush	Gets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	getEffects	Gets a list of the effects applied to the node.
	getFontFamily	Gets the font family of the item text. (Inherited from DiagramItemStyle.)
	getFontSize	Gets the font size of the item text. (Inherited from DiagramItemStyle.)
	getFontStyle	Gets the font style of the item text. (Inherited from DiagramItemStyle.)
	getFontUnit	Gets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	getShadowBrush	Gets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	getStroke	Gets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	getStrokeThickness	Gets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
	readExternal	**Externalizable.readExternal** implementation. (Inherited from Style.)
S	registerType	Associates a type with an alias. The alias is used when saving and loading objects of the specified type during style serialization and deserialization. (Inherited from Style.)
	removePropertyChangeListener	(Inherited from Style.)
	setBrush	Sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	setFontFamily	Sets the font family of the item text. (Inherited from DiagramItemStyle.)

	setFontSize	Sets the font size of the item text. (Inherited from DiagramItemStyle.)
	setFontStyle	Sets the font style of the item text. (Inherited from DiagramItemStyle.)
	setFontUnit	Sets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	setShadowBrush	Sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	setStroke	Sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	setStrokeThickness	Sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
	writeExternal	**Externalizable.writeExternal** implementation. (Inherited from Style.)

Protected Methods

	Name	Description
	getValue	Gets the value of the specified property. (Inherited from Style.)
	isPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	loadFromJson	Loads the style content from a JsonObject.
	loadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	registerProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	saveToJson	Saves the style content into a JsonObject.
	saveToXml	Saves the style content into an XML element. (Inherited from Style.)
	setValue	Sets the value of the specified property. (Inherited from Style.)
	unsetValue	Clears the value of the specified property. (Inherited from Style.)

DiagramNodeStyle Methods

DiagramNodeStyle.getEffects Method

Gets a list of the effects applied to the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public List<NodeEffect> getEffects ()
```

Return Value

A list of NodeEffect objects.

See Also

DiagramNodeStyle Members
DiagramNodeStyle Class
com.mindfusion.diagramming Namespace

DiagramNodeStyle.loadFromJson Method

Loads the style content from a JsonObject.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
```

```
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the style's data.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

DiagramNodeStyle Members
DiagramNodeStyle Class
com.mindfusion.diagramming Namespace

DiagramNodeStyle.saveToJson Method

Saves the style content into a JsonObject.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject the style's data should be stored into.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

com.mindfusion.diagramming Namespace

DiagramPage Members

Represents a single page in a DiagramDocument object.

The following tables list the members exposed by the DiagramPage type.

Public Constructors

	Name	Description
	DiagramPage	Initializes a new instance of the **DiagramPage** class.

Public Methods

	Name	Description
	addDiagramListener	Registers listener so that it will receive events when users create, modify or delete diagram items. (Inherited from Diagram.)
	addPropertyChangeListener	
	alignPointToGrid	Aligns a point to the alignment grid. (Inherited from Diagram.)
	arrange	Arranges the diagram using the specified graph layout algorithm. (Inherited from Diagram.)
	arrangeLinkLabels	Rearranges link labels whose AutoArrange property is enabled. (Inherited from Diagram.)
	changeUnit	Sets new MeasureUnit value and scales the coordinates of diagram items so that their absolute size remains unchanged. (Inherited from Diagram.)
	clearAll	Deletes all items from the diagram. (Inherited from Diagram.)
	copySelection	Creates a copy of the currently selected objects and groups. (Inherited from Diagram.)
	createImage	Overloaded. Creates a bitmap image representing the diagram contents. (Inherited from Diagram.)

	createItem	Implements the IItemFactory interface. (Inherited from Diagram.)
	createStyledText	Creates a styled text object for the specified text string. (Inherited from Diagram.)
	createThemeFromDefaults	Creates a Theme object representing the default properties of the diagram. This method is only for compatibility with files saved with versions earlier than 4.0. (Inherited from Diagram.)
	destroyGroup	Destroys the specified group. The group items are not deleted, unless its setAutoDeleteItems method is calles. (Inherited from Diagram.)
	draw	Renders the diagram on the specified **Graphics2D** object. (Inherited from Diagram.)
	drawAlignmentGuides	Draws the current alignment guides. (Inherited from Diagram.)
	drawLayer	Renders all items of a layer to the specified graphics. (Inherited from Diagram.)
	drawString	(Inherited from Diagram.)
	drawStyledText	(Inherited from Diagram.)
	drawTextObject	(Inherited from Diagram.)
	enumByReverseZ	Overloaded. Hit-tests diagram items in reverse Z order. (Inherited from Diagram.)
	enumTopLevelByReverseZ	Overloaded. Hit-tests diagram top-level items in reverse Z order. (Inherited from Diagram.)
	executeCommand	Executes a command and saves it in the undo/redo history. (Inherited from Diagram.)
	findGroup	Finds the group that has the specified tag. (Inherited from Diagram.)
	findLink	Finds the link that has the specified tag. (Inherited from Diagram.)
	findLinkById	Finds the link that has the specified id value. (Inherited from Diagram.)
	findNode	Finds the node that has the specified tag. (Inherited from Diagram.)
	findNodeById	Finds the node that has the specified id value. (Inherited from Diagram.)
	getActiveItem	Gets the active item. (Inherited from Diagram.)
	getActiveItemHandlesStyle	Gets the visual style of the manipulation handles displayed around the active item. (Inherited from Diagram.)
	getActiveLayer	Gets the zero-based index of the active layer. (Inherited from Diagram.)
	getAdjustmentHandlesSize	Gets the size of selection handles. (Inherited from Diagram.)

	getAlignmentGuidePen	Gets the pen used to draw alignment guides. (Inherited from Diagram.)
	getAlignToGrid	Gets a value indicating whether items are aligned to the alignment grid while users draw them. (Inherited from Diagram.)
	getAllowLinksRepeat	Gets a value indicating whether users are allowed to draw more than one links between the same nodes. (Inherited from Diagram.)
	getAllowMultipleResize	Gets whether multiple selected nodes can be resized simultaneously. (Inherited from Diagram.)
	getAllowSelfLoops	Gets whether users are allowed to draw reflexive links. (Inherited from Diagram.)
	getAllowSplitLinks	Gets whether link segments can be added and removed interactively. (Inherited from Diagram.)
	getAllowUnanchoredLinks	Gets a value indicating whether users are allowed to attach links to nodes that do not have any anchor points. (Inherited from Diagram.)
	getAllowUnconnectedLinks	Gets a value indicating whether users are allowed to draw unconnected links. (Inherited from Diagram.)
	getAutoAlignDistance	Gets the maximal horizontal or vertical distance at which a node aligns to the borders of other nodes. (Inherited from Diagram.)
	getAutoAlignNodes	Gets whether nodes should automatically align to the borders of other nodes during user interaction. (Inherited from Diagram.)
	getAutoCloseDistance	Gets the maximum distance between first and last points of a FreeFormNode for which the node's outline is closed automatically. (Inherited from Diagram.)
	getAutoDeleteLinks	Gets whether links are deleted automatically when their Origin or Destination is deleted. (Inherited from Diagram.)
	getAutoResize	Gets a value specifying whether the document scrollable area is resized automatically when users draw items near the edges of the diagram. (Inherited from Diagram.)
	getAutoSnapDistance	Specifies the maximum distance at which links auto-snap to nodes. (Inherited from Diagram.)
	getAutoSnapLinks	Gets the default value for the AutoSnapToNode property of new links. (Inherited from Diagram.)
	getBackBrush	Gets the diagram's background brush. (Inherited from Diagram.)
	getBackgroundImage	Gets the background image. (Inherited from Diagram.)
	getBackgroundImageAlign	Gets how the background image is positioned relatively to the scrollable area of the diagram. (Inherited from Diagram.)
	getBackgroundImageUrl	Gets the URL of the background image. (Inherited from Diagram.)

	getBookmarks	Gets a collection of all saved bookmarks / areas of interest defined in this diagram. (Inherited from Diagram.)
	getBounds	Gets the bounds of the scrollable area of the diagram. (Inherited from Diagram.)
	getBoundsPen	Gets the pen with which the diagram bounds are drawn. (Inherited from Diagram.)
	getCellCustomDraw	Gets the default type of custom painting applied to cells of new tables. (Inherited from Diagram.)
	getCellFrameStyle	Gets the default style of the cell frames of new tables. (Inherited from Diagram.)
	getClsidTable	Gets the table of registered item identifiers. (Inherited from Diagram.)
	getContainerCaption	Gets the default value for the Caption attribute of containers. (Inherited from Diagram.)
	getContainerCaptionHeight	Gets the default value for the CaptionHeight attribute of containers. (Inherited from Diagram.)
	getContainerHighlightPen	Gets the default value for the HighlightPen attribute of containers. (Inherited from Diagram.)
	getContainerMargin	Gets the default value for the Margin attribute of containers. (Inherited from Diagram.)
	getContainerMinimumSize	Gets the default value for the MinimumSize attribute of containers. (Inherited from Diagram.)
	getContainerNodeStyle	Gets the theme-level style for container nodes. (Inherited from Diagram.)
	getContainersFoldable	Gets the default value for the Foldable attribute of containers. (Inherited from Diagram.)
	getContentBounds	Returns the smallest rectangle that bounds all diagram items. (Inherited from Diagram.)
	getCrossingRadius	Gets the radius of the shapes drawn at link crossing points. (Inherited from Diagram.)
	getDefaultControlType	Gets the type of components that will be hosted by default in newly created ControlNode objects. (Inherited from Diagram.)
	getDefaultShape	Gets the default shape of nodes. (Inherited from Diagram.)
	getDiagramLinkStyle	Gets the theme-level style for diagram links. (Inherited from Diagram.)
	getDiagramListeners	Gets the list of currently registered event listeners. (Inherited from Diagram.)
	getDiagramStyle	Gets the theme-level style for the diagram. (Inherited from Diagram.)
	getDirty	Indicates whether the diagram has changed since the last save. (Inherited from Diagram.)

	getDisabledHandlesStyle	Gets the visual style of disabled manipulation handles. (Inherited from Diagram.)
	getDummy	(Inherited from Diagram.)
	getDynamicLinks	Gets a value indicating whether links automatically update their end points positions so that they will always point towards the node centers. (Inherited from Diagram.)
	getEffectiveBackBrush	Gets the currently effective background brush of the diagram. This property returns the BackBrush if it is not null, or the brush from the associated style or theme otherwise. (Inherited from Diagram.)
	getEnableLanes	Gets whether lanes are enabled. (Inherited from Diagram.)
	getEnableSpatialIndex	Gets whether to index item positions for faster hit-testing and viewport clipping queries. (Inherited from Diagram.)
	getEnableStyledText	Gets a value indicating whether new nodes display richly formatted text. (Inherited from Diagram.)
	getExpandButtonAction	Gets what should happen when a user clicks the +/- button that is displayed near expandable nodes. (Inherited from Diagram.)
	getExpandButtonPosition	Gets where expand/collapse buttons are located relatively to their nodes. (Inherited from Diagram.)
	getExpandOnIncoming	Gets which direction of links is considered the tree direction when expanding or collapsing diagram branches. (Inherited from Diagram.)
	getFactory	Gets a Factory instance that lets you add programmatically new items to the diagram. (Inherited from Diagram.)
	getFocusedComponent	Gets the component within this diagram which is currently holding the input focus. (Inherited from Diagram.)
	getFocusedManipulator	Gets the manipulator currently holding the input focus. (Inherited from Diagram.)
	getFoldedContainerSize	Gets the size of folded containers. (Inherited from Diagram.)
	getFont	Gets the default font for new diagram items. (Inherited from Diagram.)
S	getFormatBeingLoaded	Returns the file format id of the file currently being loaded. (Inherited from Diagram.)
	getFreeFormAttractDistance	Gets the radius around dragged free-form adjustment handle in which other points of **FreeFormNode** are modified too. (Inherited from Diagram.)
	getFreeFormTargets	Gets an array of Shape objects used to replace **FreeFormNode** instances with ShapeNode ones when Behavior is set to LinkFreeShapes or DrawFreeShapes. (Inherited from Diagram.)
	getGridColor	Gets the color of the alignment grid. (Inherited from Diagram.)

	getGridOffsetX	Gets the horizontal offset of the first point of the alignment grid. (Inherited from Diagram.)
	getGridOffsetY	Gets the vertical offset of the first point of the alignment grid. (Inherited from Diagram.)
	getGridSizeX	Gets the horizontal distance between grid points. (Inherited from Diagram.)
	getGridSizeY	Gets the vertical distance between grid points. (Inherited from Diagram.)
	getGridStyle	Gets the appearance style of the alignment grid. (Inherited from Diagram.)
	getGroups	Gets a collection of all groups in the diagram. (Inherited from Diagram.)
	getHitTestPriority	Gets a value indicating the order in which items are hit-tested. (Inherited from Diagram.)
	getHoverDelay	Gets the time in milliseconds that mouse pointer should remain stationary before reporting hover events. (Inherited from Diagram.)
	getIcon	Gets an image associated with the page.
	getIconUrl	Gets the URL of the image associated with the page.
	getImageDpiX	Specifies the default resolution of images. (Inherited from Diagram.)
	getImageDpiY	(Inherited from Diagram.)
	getInteraction	Gets an InteractionState instance representing the current action being carried out by the user. (Inherited from Diagram.)
	getItemAt	Overloaded. (Inherited from Diagram.)
	getItems	Gets a collection of all items in the diagram. (Inherited from Diagram.)
	getLaneGrid	Gets the Grid instance that represents the lane grid. (Inherited from Diagram.)
	getLayers	Gets a list of the layers in the current diagram. (Inherited from Diagram.)
	getLinkAt	Overloaded. (Inherited from Diagram.)
	getLinkBaseShape	Gets the default shape displayed at the origin of new links. (Inherited from Diagram.)
	getLinkBaseShapeSize	Gets the default size of the shape displayed at the origin of new links. (Inherited from Diagram.)
	getLinkBranchIndicator	(Inherited from Diagram.)
	getLinkBrush	Gets the default brush assigned to new links. (Inherited from Diagram.)
	getLinkCascadeOrientation	Gets the default orientation of the first segments of cascading links. (Inherited from Diagram.)

	getLinkCrossings	Gets what shapes are drawn at link crossing points. (Inherited from Diagram.)
	getLinkCustomDraw	Gets the default type of custom painting done on links. (Inherited from Diagram.)
	getLinkEndsMovable	Gets a value indicating that users are allowed to move the end points of a link after the link is created. (Inherited from Diagram.)
	getLinkHandlesStyle	Gets the default style of link selection handles. (Inherited from Diagram.)
	getLinkHeadShape	Gets the default shape displayed as head of new links. (Inherited from Diagram.)
	getLinkHeadShapeSize	Gets the default size of the shape displayed as arrowhead of new links. (Inherited from Diagram.)
	getLinkIntermediateShape	Gets the default shape displayed at the middle of links segments. (Inherited from Diagram.)
	getLinkIntermediateShapeSize	Gets the default size of the shape displayed at the middle of links segments. (Inherited from Diagram.)
	getLinkPen	Gets the default pen assigned to new links. (Inherited from Diagram.)
	getLinkRouter	Gets the component used to find paths for auto-routed links when diagram nodes are added or their positions change. (Inherited from Diagram.)
	getLinks	Gets a collection of all links in the diagram. (Inherited from Diagram.)
	getLinksAt	Returns the links that contain the specified point. (Inherited from Diagram.)
	getLinkSegments	Gets the default number of link segments. (Inherited from Diagram.)
	getLinkShape	Gets the default shape of links. (Inherited from Diagram.)
	getLinksRetainForm	Gets a value indicating whether new links are set to maintain their shapes while the nodes they connect are moved around. (Inherited from Diagram.)
	getLinkText	Gets the default text assigned to new links. (Inherited from Diagram.)
	getLinkTextStyle	Gets the default placement and orientation of links' text. (Inherited from Diagram.)
	getMeasureUnit	Gets the current unit of measure. (Inherited from Diagram.)
	getMergeThreshold	Gets the maximum distance between adjacent control points of a link at which the respective segments can be merged. (Inherited from Diagram.)
	getNearestNode	Returns the nearest node whose bounding rectangle is intersected by the circle, defined by origin point and radius. (Inherited from Diagram.)
	getNodeAt	Overloaded. (Inherited from Diagram.)

	getNodeEffects	Gets a collection with all effects applied to the nodes of this diagram. (Inherited from Diagram.)
	getNodes	Gets a collection of all nodes in the diagram. (Inherited from Diagram.)
	getNodesAt	Returns the nodes that contain the specified point. (Inherited from Diagram.)
	getNodesExpandable	Gets whether the tree branches that start from new nodes are expandable by default. (Inherited from Diagram.)
	getRecursiveExpand	Gets whether tree branches are expanded recursively. (Inherited from Diagram.)
	getRenderOptions	(Inherited from Diagram.)
	getRestrictItemsToBounds	Gets a value indicating whether users are allowed to move items outside the currently defined document bounds. (Inherited from Diagram.)
	getRoundedLinks	Gets if the joins between segments of Polyline and Cascading links should be rounded. (Inherited from Diagram.)
	getRoundedLinksRadius	Gets the radius of arc joins of rounded links' segments. (Inherited from Diagram.)
	getRouteLinks	Gets a value indicating whether links should avoid nodes by going the shortest path from their origin to their destination without crossing any other nodes. (Inherited from Diagram.)
	getRoutingOptions	Gets a RoutingOptions instance that lets you set various attributes of link routing algorithms. (Inherited from Diagram.)
	getSelectAfterCreate	Gets a value indicating whether newly created items are selected automatically. (Inherited from Diagram.)
	getSelectedItemHandlesStyle	Gets the visual style of the manipulation handles displayed around selected items. (Inherited from Diagram.)
	getSelection	Gets a Selection instance representing the current selection. (Inherited from Diagram.)
	getSelectionOnTop	Gets a value indicating whether selected items are drawn on top of the non-selected ones. (Inherited from Diagram.)
	getShadowBrush	Gets .the default brush used to paint the shadows cast by diagram items. (Inherited from Diagram.)
	getShadowOffsetX	Gets the default horizontal distance between shadows and the items that cast them. (Inherited from Diagram.)
	getShadowOffsetY	Gets the default vertical distance between shadows and the items that cast them. (Inherited from Diagram.)
	getShadowsStyle	Gets the style of shadows. (Inherited from Diagram.)
	getShapeBrush	Gets the default brush assigned to new nodes. (Inherited from Diagram.)
	getShapeCustomDraw	Gets whether new nodes should be custom drawn and what type of custom drawing will be performed on them.

		(Inherited from Diagram.)
	getShapeHandlesStyle	Gets the default value for the HandlesStyle property of new shape nodes. (Inherited from Diagram.)
	getShapeNodeStyle	Gets the theme-level style for shape nodes. (Inherited from Diagram.)
	getShapeOrientation	Gets the default shape definition orientation angle assigned to new nodes. (Inherited from Diagram.)
	getShapePen	Gets the default pen assigned to new nodes. (Inherited from Diagram.)
	getShapeText	Gets the default text assigned to new nodes. (Inherited from Diagram.)
	getShowAnchors	Gets a value indicating whether anchor points should be shown on screen. (Inherited from Diagram.)
	getShowDisabledHandles	Gets whether disabled manipulation handles are displayed. (Inherited from Diagram.)
	getShowGrid	Gets a value indicating whether the alignment grid is displayed. (Inherited from Diagram.)
	getShowHandlesOnDrag	Gets whether selection handles of objects under the pointer are displayed while another object is being modified. (Inherited from Diagram.)
	getSnapToAnchor	Gets a value indicating when links should snap to anchor points. (Inherited from Diagram.)
	getStyle	Gets the style associated with the diagram. (Inherited from Diagram.)
	getSvgNodeStyle	Gets the theme-level style for SVG nodes. (Inherited from Diagram.)
	getTableBrush	Gets the default brush assigned to new tables. (Inherited from Diagram.)
	getTableCaption	Gets the default caption text assigned to new tables. (Inherited from Diagram.)
	getTableCaptionHeight	Gets the default height of the caption bar of new tables. (Inherited from Diagram.)
	getTableColumnCount	Gets how many columns new tables have by default. (Inherited from Diagram.)
	getTableColumnWidth	Gets the default width of the columns of new tables. (Inherited from Diagram.)
	getTableConnectionStyle	Gets how users are allowed to link tables to each other - as integral entities, by rows, or both. (Inherited from Diagram.)
	getTableCustomDraw	Gets the default type of custom painting applied to new tables. (Inherited from Diagram.)
	getTableHandlesStyle	Gets the default style of table selection handles. (Inherited from Diagram.)

	getTableNodeStyle	Gets the theme-level style for table nodes. (Inherited from Diagram.)
	getTablePen	Gets the default pen assigned to new tables. (Inherited from Diagram.)
	getTableRowCount	Gets how many rows new tables have by default. (Inherited from Diagram.)
	getTableRowHeight	Gets the default height of the row of new tables. (Inherited from Diagram.)
	getTableShape	Gets the default value of the Shape property of new tables. (Inherited from Diagram.)
	getTablesScrollable	Gets a value indicating whether users are allowed to scroll new tables. (Inherited from Diagram.)
	getTag	Gets the custom data associated with this diagram. (Inherited from Diagram.)
	getTextColor	Gets the default text color that is assigned to new items. (Inherited from Diagram.)
	getTextFormat	Gets the default format and alignment of the text of new items. (Inherited from Diagram.)
	getTheme	Gets the theme associated with the diagram. (Inherited from Diagram.)
	getTitle	Gets the page title.
	getTitleColor	Gets the color of the title when the title is displayed.
	getToolTip	Gets the tooltip text. (Inherited from Diagram.)
	getTreeViewNodeStyle	Gets the theme-level style for tree view nodes. (Inherited from Diagram.)
	getTypeTable	Gets the table of registered item types. (Inherited from Diagram.)
	getUndoManager	Gets the diagram's UndoManager. (Inherited from Diagram.)
	getValidityChecks	(Inherited from Diagram.)
	handleKeyDown	Propagates keyboard input to interested manipulators and components. (Inherited from Diagram.)
	handleKeyPress	Propagates keyboard input to interested manipulators. (Inherited from Diagram.)
	handleKeyUp	Propagates keyboard input to interested components. (Inherited from Diagram.)
	handlePointerMove	Propagates mouse input to interested manipulators. (Inherited from Diagram.)
	hitTestComponents	(Inherited from Diagram.)
	hitTestLabels	Returns the item label located at specified position. (Inherited from Diagram.)

	imageToDoc	Transforms points from the image coordinate space to the document coordinate space. (Inherited from Diagram.)
	imageToDocX	Converts from image coordinates to document coordinates. (Inherited from Diagram.)
	imageToDocY	Converts from image coordinates to document coordinates. (Inherited from Diagram.)
	imageUpdate	(Inherited from Diagram.)
	init	Returns a DiagramBuilder object used to configure this Diagram instance. (Inherited from Diagram.)
S	isClassRegistered	(Inherited from Diagram.)
S	isClientClassRegistered	(Inherited from Diagram.)
	isItemInteractive	Checks if the specified item can be modified interactively. (Inherited from Diagram.)
	isItemLocked	Checks if the specified item is locked. (Inherited from Diagram.)
	isItemVisible	Checks if the specified item is currently visible. (Inherited from Diagram.)
	items	Iterates over diagram items of the desired type (Inherited from Diagram.)
	loadFromJson	Overloaded. (Inherited from Diagram.)
	loadFromJsonString	Loads the diagram from a JSON-formatted string. (Inherited from Diagram.)
	loadFromString	Decodes diagram contents from a string previously created by saveToString. (Inherited from Diagram.)
	loadFromXml	Overloaded. (Inherited from Diagram.)
	measureString	Measures a text taking into consideration the current affine transform of the diagram. (Inherited from Diagram.)
	pasteSelection	Adds the specified items and groups to the specified diagram document. (Inherited from Diagram.)
	raiseActionRedone	Raises the actionRedone event. (Inherited from Diagram.)
	raiseActionUndone	Raises the actionUndone event. (Inherited from Diagram.)
	raiseCellTextEdited	Raises the DiagramListener.cellTextEdited event. (Inherited from Diagram.)
	raiseCellTextEditing	Raises the cellTextEditing event to validate entering in-place editing mode. (Inherited from Diagram.)
	raiseClicked	Overloaded. (Inherited from Diagram.)
	raiseDeleting	Raises the appropriate *Deleting (linkDeleting or nodeDeleting) event. (Inherited from Diagram.)
	raiseDoubleClicked	Overloaded. (Inherited from Diagram.)
	raiseLinkTextEdited	Raises the linkTextEdited event. (Inherited from Diagram.)

	raiseLinkTextEditing	Raises the linkTextEditing event to validate entering in-place editing mode. (Inherited from Diagram.)
	raiseNodeTextEdited	Raises the nodeTextEdited event. (Inherited from Diagram.)
	raiseNodeTextEditing	Raises the nodeTextEditing event to validate entering inplace edit mode. (Inherited from Diagram.)
	raiseTreeCollapsed	Raises the treeCollapsed event. (Inherited from Diagram.)
	raiseTreeExpanded	Raises the treeExpanded event. (Inherited from Diagram.)
	raiseTreeItemTextEdited	Raises the DiagramListener.treeItemTextEdited event. (Inherited from Diagram.)
	raiseViewRemoved	Raises the DiagramListener.viewRemoved event. (Inherited from Diagram.)
S	registerClass	Overloaded. (Inherited from Diagram.)
S	registerItemClass	Overloaded. (Inherited from Diagram.)
	removeDiagramListener	Unregisters listener so that it will no longer receive diagram events. (Inherited from Diagram.)
	removePropertyChangeListener	
	repaint	Overloaded. (Inherited from Diagram.)
	resizeToFitItems	Overloaded. (Inherited from Diagram.)
	resumeLinkRouter	Called when the control ends a batch update operation that might affect many links. (Inherited from Diagram.)
	routeAllLinks	Overloaded. (Inherited from Diagram.)
	saveTo	Overloaded. (Inherited from Diagram.)
	saveToJson	Overloaded. (Inherited from Diagram.)
	saveToJsonString	Saves the diagram to a JSON-formatted string. (Inherited from Diagram.)
	saveToString	Overloaded. Saves the diagram contents into a string. (Inherited from Diagram.)
	saveToXml	Overloaded. (Inherited from Diagram.)
	setActiveItem	Sets the active item. (Inherited from Diagram.)
	setActiveLayer	Sets the zero-based index of the active layer. (Inherited from Diagram.)
	setAdjustmentHandlesSize	Sets the size of selection handles. (Inherited from Diagram.)
	setAlignmentGuidePen	Sets the pen used to draw alignment guides. (Inherited from Diagram.)
	setAlignToGrid	Sets a value indicating whether items should be aligned to the alignment grid while users draw them. (Inherited from Diagram.)
	setAllowLinksRepeat	Sets a value indicating whether users are allowed to draw more than one links between the same nodes. (Inherited

		from Diagram.)
	setAllowMultipleResize	Sets whether multiple selected nodes can be resized simultaneously. (Inherited from Diagram.)
	setAllowSelfLoops	Sets whether users are allowed to draw reflexive links. (Inherited from Diagram.)
	setAllowSplitLinks	Sets whether link segments can be added and removed interactively. (Inherited from Diagram.)
	setAllowUnanchoredLinks	Sets a value indicating whether users are allowed to attach links to nodes that do not have any anchor points. (Inherited from Diagram.)
	setAllowUnconnectedLinks	Sets a value indicating whether users are allowed to draw unconnected links. (Inherited from Diagram.)
	setAutoAlignDistance	Sets the maximal horizontal or vertical distance at which a node aligns to the borders of other nodes. (Inherited from Diagram.)
	setAutoAlignNodes	Sets whether nodes should automatically align to the borders of other nodes during user interaction. (Inherited from Diagram.)
	setAutoCloseDistance	Sets the maximum distance between first and last points of a **FreeFormNode** for which the node's outline is closed automatically. (Inherited from Diagram.)
	setAutoDeleteLinks	Sets whether links are deleted automatically when their **Origin** or **Destination** is deleted. (Inherited from Diagram.)
	setAutoResize	Sets a value specifying whether the document scrollable area should be resized automatically when users draw items near the edges of the diagram. (Inherited from Diagram.)
	setAutoSnapDistance	Specifies the maximum distance at which links auto-snap to nodes. (Inherited from Diagram.)
	setAutoSnapLinks	Sets the default value for the **AutoSnapToNode** property of new links. (Inherited from Diagram.)
	setBackBrush	Sets the diagram's background brush. (Inherited from Diagram.)
	setBackgroundImage	Overloaded. (Inherited from Diagram.)
	setBackgroundImageAlign	Sets how the background image should be positioned relatively to the scrollable area of the diagram. (Inherited from Diagram.)
	setBackgroundImageUrl	Sets the URL of the background image. (Inherited from Diagram.)
	setBounds	Overloaded. (Inherited from Diagram.)
	setBoundsPen	Sets the pen with which document bounds are drawn. (Inherited from Diagram.)
	setCellCustomDraw	Sets the default type of custom painting applied to cells of new tables. (Inherited from Diagram.)

	setCellFrameStyle	Sets the default style of the cell frames of new tables. (Inherited from Diagram.)
	setContainerCaption	Sets the default value for the caption of containers. (Inherited from Diagram.)
	setContainerCaptionHeight	Sets the default value for the caption height of containers. (Inherited from Diagram.)
	setContainerHighlightPen	Sets the default value for the HighlightPen of containers. (Inherited from Diagram.)
	setContainerMargin	Sets the default value for the Margin attribute of containers. (Inherited from Diagram.)
	setContainerMinimumSize	Sets the default value for the minimum size of containers. (Inherited from Diagram.)
	setContainersFoldable	Sets the default value for the Foldable property of containers. (Inherited from Diagram.)
	setCrossingRadius	Sets the radius of the shapes drawn at link crossing points. (Inherited from Diagram.)
	setDefaultControlType	Sets the type of components that will be hosted by default in newly created **ControlNode** objects. (Inherited from Diagram.)
	setDefaultShape	Sets the default shape that should be assigned to new nodes. The shape of individual nodes can be set by calling their ShapeNode.setShape method. (Inherited from Diagram.)
	setDirty	Overloaded. Lets you set or clear the diagram's modification flag. (Inherited from Diagram.)
	setDynamicLinks	Sets a value indicating whether links should automatically update their end points positions so that they will always point towards the node centers. (Inherited from Diagram.)
	setEnableLanes	Sets whether lanes are enabled. (Inherited from Diagram.)
	setEnableSpatialIndex	Sets whether to index item positions for faster hit-testing and viewport clipping queries. (Inherited from Diagram.)
	setEnableStyledText	Sets a value indicating whether newly created nodes should display richly formatted text. (Inherited from Diagram.)
	setExpandButtonAction	Sets what should happen when a user clicks the +/- button that is displayed near expandable nodes. (Inherited from Diagram.)
	setExpandButtonPosition	Sets where expand/collapse buttons are located relatively to their nodes. (Inherited from Diagram.)
	setExpandOnIncoming	Sets which direction of links is considered the tree direction when expanding or collapsing diagram branches. (Inherited from Diagram.)
	setFocusedComponent	Sets the component within this diagram which is currently holding the input focus. (Inherited from Diagram.)

	setFocusedManipulator	Sets the manipulator currently holding the input focus. (Inherited from Diagram.)
	setFoldedContainerSize	Sets the size of folded containers. (Inherited from Diagram.)
	setFont	Sets the default font for new diagram items. (Inherited from Diagram.)
	setFreeFormAttractDistance	Sets the radius around dragged free-form adjustment handle in which other points of **FreeFormNode** are modified too. (Inherited from Diagram.)
	setFreeFormTargets	Sets an array of **Shape** objects used to replace **FreeFormNode** instances with **ShapeNode** ones when Behavior is set to LinkFreeShapes or DrawFreeShapes. (Inherited from Diagram.)
	setGridColor	Sets the color of the alignment grid. (Inherited from Diagram.)
	setGridOffsetX	Sets the horizontal offset of the first point of the alignment grid. (Inherited from Diagram.)
	setGridOffsetY	Sets the vertical offset of the first point of the alignment grid. (Inherited from Diagram.)
	setGridSizeX	Sets the horizontal distance between grid points. (Inherited from Diagram.)
	setGridSizeY	Sets the vertical distance between grid points. (Inherited from Diagram.)
	setGridStyle	Sets the appearance style of the alignment grid. (Inherited from Diagram.)
	setHitTestPriority	Sets a value indicating the order in which items are hit-tested. (Inherited from Diagram.)
	setHoverDelay	Sets the time in milliseconds that mouse pointer should remain stationary before reporting hover events. (Inherited from Diagram.)
	setIcon	Sets an image associated with the page.
	setIconUrl	Sets the URL of the image associated with the page.
	setImageDpiX	Sets the default resolution of images. (Inherited from Diagram.)
	setImageDpiY	(Inherited from Diagram.)
	setLinkBaseShape	Sets what shape should be displayed at the origin of new links. (Inherited from Diagram.)
	setLinkBaseShapeSize	Sets the default size of the shape displayed at the origin of new links. (Inherited from Diagram.)
	setLinkBranchIndicator	(Inherited from Diagram.)
	setLinkBrush	Sets the default brush that should be assigned to new links. (Inherited from Diagram.)

	setLinkCascadeOrientation	Sets the default orientation of the first segments of cascading links. (Inherited from Diagram.)
	setLinkCrossings	Sets what shapes should be drawn at the points where links cross. (Inherited from Diagram.)
	setLinkCustomDraw	Sets the default type of custom painting done on links. (Inherited from Diagram.)
	setLinkEndsMovable	Sets a value indicating users are allowed to move the end points of a link after the link is created. (Inherited from Diagram.)
	setLinkHandlesStyle	Sets the style of selection handles that should be assigned to new links. (Inherited from Diagram.)
	setLinkHeadShape	Sets what shape should be displayed as arrowhead of new links. (Inherited from Diagram.)
	setLinkHeadShapeSize	Sets the default size of the shape displayed as arrowhead of new links. (Inherited from Diagram.)
	setLinkIntermediateShape	Sets what shape should be displayed at the middle of links segments. (Inherited from Diagram.)
	setLinkIntermediateShapeSize	Sets the default size of the shape displayed at the middle of links segments. (Inherited from Diagram.)
	setLinkPen	Sets the default pen that should be assigned to new links. (Inherited from Diagram.)
	setLinkRouter	Sets the component used to find paths for auto-routed links when diagram nodes are added or their positions change. (Inherited from Diagram.)
	setLinkSegments	Sets the default number of link segments. (Inherited from Diagram.)
	setLinkShape	Sets the style that should be assigned to new links. (Inherited from Diagram.)
	setLinksRetainForm	Sets a value indicating whether new links are set to maintain their shapes while the nodes they connect are moved around. (Inherited from Diagram.)
	setLinkText	Sets the default text that should be assigned to new links. (Inherited from Diagram.)
	setLinkTextStyle	Sets the default placement and orientation of the links labels. (Inherited from Diagram.)
	setMeasureUnit	Sets the units for measuring of lengths and sizes. (Inherited from Diagram.)
	setMergeThreshold	Sets the maximum distance between adjacent control points of a link at which the respective segments can be merged. (Inherited from Diagram.)
	setNodesExpandable	Sets whether the tree branches that start from new nodes should be expandable by default. (Inherited from Diagram.)
	setRecursiveExpand	Sets whether tree branches should be expanded recursively. (Inherited from Diagram.)

	setRestrictItemsToBounds	Sets a value indicating whether users are allowed to move items outside the currently define document bounds. (Inherited from Diagram.)
	setRoundedLinks	Sets if the joins between segments of Polyline and Cascading links should be rounded. (Inherited from Diagram.)
	setRoundedLinksRadius	Sets the radius of arc joins of rounded links' segments. (Inherited from Diagram.)
	setRouteLinks	Sets a value indicating whether links should avoid nodes by going the shortest path from their origin to their destination without crossing any other nodes. (Inherited from Diagram.)
	setSelectAfterCreate	Sets a value indicating whether newly created items should be selected automatically. (Inherited from Diagram.)
	setSelectionOnTop	Sets a value indicating whether selected items should be drawn on top of the non-selected ones. (Inherited from Diagram.)
	setShadowBrush	Sets the default brush used to paint the shadows cast by diagram items. (Inherited from Diagram.)
	setShadowOffset	Sets the distance at which shadows are offset from the items that cast them. (Inherited from Diagram.)
	setShadowOffsetX	Sets the default horizontal distance between shadows and the items that cast them. (Inherited from Diagram.)
	setShadowOffsetY	Sets the default vertical distance between shadows and the items that cast them. (Inherited from Diagram.)
	setShadowsStyle	Sets the style of shadows. (Inherited from Diagram.)
	setShapeBrush	Sets the default brush that should be assigned to new nodes. (Inherited from Diagram.)
	setShapeCustomDraw	Sets whether new nodes should be custom drawn and what type of custom drawing will be performed on them. (Inherited from Diagram.)
	setShapeHandlesStyle	Sets the default value for the HandlesStyle property of new shape nodes. (Inherited from Diagram.)
	setShapeOrientation	Sets the default shape definition orientation angle assigned to new nodes. (Inherited from Diagram.)
	setShapePen	Sets the default pen that should be assigned to new nodes. (Inherited from Diagram.)
	setShapeText	Sets the default text to new nodes. (Inherited from Diagram.)
	setShowAnchors	Sets a value indicating whether anchor points should be shown on screen. (Inherited from Diagram.)
	setShowDisabledHandles	Sets whether disabled manipulation handles will be displayed. (Inherited from Diagram.)
	setShowGrid	Sets a value indicating whether the alignment grid is displayed. (Inherited from Diagram.)

	setShowHandlesOnDrag	Sets whether selection handles of objects under the pointer are displayed while another object is being modified. (Inherited from Diagram.)
	setSnapToAnchor	Sets a value indicating when links should snap to anchor points. (Inherited from Diagram.)
	setStyle	Sets the style associated with the diagram. (Inherited from Diagram.)
	setTableBrush	Sets the default brush that is assigned to new tables. (Inherited from Diagram.)
	setTableCaption	Sets the default caption text that should be assigned to new tables. (Inherited from Diagram.)
	setTableCaptionHeight	Sets the default height of the caption bar of new tables. (Inherited from Diagram.)
	setTableColumnCount	Sets how many columns should be allocated to new tables. (Inherited from Diagram.)
	setTableColumnWidth	Sets the default width of columns in newly created tables. (Inherited from Diagram.)
	setTableConnectionStyle	Sets how users are allowed to link tables to each other - as integral entities, by rows, or both. (Inherited from Diagram.)
	setTableCustomDraw	Sets the default type of custom painting applied to new tables. (Inherited from Diagram.)
	setTableHandlesStyle	Sets the style of selection handles that should be assigned to new tables. (Inherited from Diagram.)
	setTablePen	Sets the default pen that should be assigned to new tables. (Inherited from Diagram.)
	setTableRowCount	Sets how many rows should be allocated to new tables. (Inherited from Diagram.)
	setTableRowHeight	Sets the default height of rows in newly created tables. (Inherited from Diagram.)
	setTableShape	Sets the default value of the **Shape** property of new tables. (Inherited from Diagram.)
	setTablesScrollable	Sets a value indicating whether users are allowed to scroll new tables. (Inherited from Diagram.)
	setTag	Associates a custom data with this diagram. (Inherited from Diagram.)
	setTextColor	Sets the default text color to be assigned to new items. (Inherited from Diagram.)
	setTextFormat	Sets the default format and alignment of the text of new items. (Inherited from Diagram.)
	setTheme	Sets the theme associated with the diagram. (Inherited from Diagram.)
	setTitle	Sets the page title.

	setTitleColor	Gets the color of the title when the title is displayed.
	setToolTip	Sets the tooltip text that is displayed when the pointer hovers over an unoccupied area of the diagram. (Inherited from Diagram.)
	setValidityChecks	(Inherited from Diagram.)
	suspendLinkRouter	Called when the control starts a batch update operation that might affect many links. The diagram collects links specified through route and routeAllLinks calls and defers finding their paths to when **resumeLinkRouter** is called. (Inherited from Diagram.)
	updateRuntimeIndices	Assigns consecutive values to the RuntimeIndex property of items. (Inherited from Diagram.)
	with	Returns a DiagramBuilder object used to configure and create new Diagram instances. (Inherited from Diagram.)

Protected Methods

	Name	Description
	getValue	Gets the effective value of the style property with the specified name. (Inherited from Diagram.)

DiagramPageValidationEvent Members

Contains the arguments passed to handlers of DiagramPage validation events. @author Meppy

The following tables list the members exposed by the DiagramPageValidationEvent type.

Public Constructors

	Name	Description
	DiagramPageValidationEvent	Initializes a new instance of the **DiagramPageValidationEvent** class.

Public Methods

	Name	Description
	getCancel	Gets a value indicating whether to cancel the current operation.
	getDiagramPage	Gets the DiagramPage related to the event. (Inherited from DiagramPageEvent.)
	setCancel	Gets a value indicating whether to cancel the current operation. Set this property to {@code true} to prevent the user from completing the operation.

DiagramPageValidationEvent Class
com.mindfusion.diagramming Namespace

DiagramPageValidationEvent Constructor

Initializes a new instance of the DiagramPageValidationEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramPageValidationEvent (
    Object source,
    DiagramPage diagramPage
)
```

Parameters

source
The object on which the event initially occurred.

diagramPage
The DiagramPage related to the event.

DiagramPageValidationEvent Methods

DiagramPageValidationEvent.getCancel Method

Gets a value indicating whether to cancel the current operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getCancel ()
```

Return Value

DiagramPageValidationEvent.setCancel Method

Gets a value indicating whether to cancel the current operation. Set this property to {@code true} to prevent the user from completing the operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setCancel (
    boolean value
)
```

Parameters

value

DiagramStyle Members

Represents a reusable set of properties that define the appearance of diagrams.

The following tables list the members exposed by the DiagramStyle type.

Public Constructors

	Name	Description
	DiagramStyle	Initializes a new instance of the **DiagramStyle** class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from Style.)
	getBackBrush	Gets the brush used for painting the diagram background.
	getBrush	Gets the brush used to fill the interior of items.
	getFontFamily	Gets the font family of the item texts.
	getFontSize	Gets the font size of the item texts.
	getFontStyle	Gets the font style of the item texts.
	getFontUnit	Gets the measure unit used to specify font size.
	getNodeEffects	Gets a list with all effects applied to the nodes of this diagram.
	getShadowBrush	Gets the brush used to paint the shadow of the items.
	getStroke	Gets the brush used to paint the outline of the items.
	getStrokeThickness	Gets the thickness of the items' outline, expressed in the current units of measure.
	getTextBrush	Gets the brush used to paint texts inside the items.
	readExternal	**Externalizable.readExternal** implementation. (Inherited from Style.)
S	registerType	Associates a type with an alias. The alias is used when saving and loading objects of the specified type during style serialization and deserialization. (Inherited from Style.)
	removePropertyChangeListener	(Inherited from Style.)
	setBackBrush	Sets the brush used for painting the diagram background.
	setBrush	Sets the brush used to fill the interior of items.
	setFontFamily	Sets the font family of the item texts.
	setFontSize	Sets the font size of the item texts.
	setFontStyle	Gets the font style of the item texts.
	setFontUnit	Sets the measure unit used to specify font size.
	setShadowBrush	Sets the brush used to paint the shadow of the items.
	setStroke	Sets the brush used to paint the outline of the items.
	setStrokeThickness	Sets the thickness of the items' outline, expressed in the current units of measure.
	setTextBrush	Sets the brush used to paint texts inside the items.
	writeExternal	**Externalizable.writeExternal** implementation. (Inherited from Style.)

Protected Methods

	Name	Description

	getValue	Gets the value of the specified property. (Inherited from Style.)
	isPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	loadFromJson	Loads the style content from a JSON object.
	loadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	registerProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	saveToJson	Saves the style content into a JsonObject.
	saveToXml	Saves the style content into an XML element. (Inherited from Style.)
	setValue	Sets the value of the specified property. (Inherited from Style.)
	unsetValue	Clears the value of the specified property. (Inherited from Style.)

DiagramStyle.getFontStyle Method

Gets the font style of the item texts.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getFontStyle ()
```

Return Value

A combination of the style constants defined in the **Font** class.

See Also

DiagramStyle.getFontUnit Method

Gets the measure unit used to specify font size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public GraphicsUnit getFontUnit ()
```

Return Value

A member of the GraphicsUnit enumeration.

setFontUnit Method
getFontSize Method

DiagramStyle.getNodeEffects Method

Gets a list with all effects applied to the nodes of this diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public List<NodeEffect> getNodeEffects ()
```

Return Value

A list of NodeEffect objects.

DiagramStyle.getStrokeThickness Method

Gets the thickness of the items' outline, expressed in the current units of measure.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public double getStrokeThickness ()
```

Return Value

A **double** value specifying the stroke thickness.

See Also

DiagramStyle Members

DiagramStyle Members
DiagramStyle Class
com.mindfusion.diagramming Namespace

DiagramStyle.loadFromJson Method

Loads the style content from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the style's data.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

DiagramStyle Members
DiagramStyle Class
com.mindfusion.diagramming Namespace

DiagramStyle.saveToJson Method

Saves the style content into a JsonObject.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject the style's data should be stored into.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

DiagramStyle.setBackBrush Method

Sets the brush used for painting the diagram background.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBackBrush (
    Brush value
)
```

Parameters

value
A Brush instance.

See Also

DiagramStyle Members
DiagramStyle Class
com.mindfusion.diagramming Namespace

DiagramStyle.setFontSize Method

Sets the font size of the item texts.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFontSize (
    float value
)
```

Parameters

value
A **float** value specifying the font size.

See Also

DiagramStyle Members
DiagramStyle Class
com.mindfusion.diagramming Namespace

DiagramStyle.setFontStyle Method

Gets the font style of the item texts.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFontStyle (
    int value
)
```

Parameters

value
A combination of the style constants defined in the **Font** class.

See Also

DiagramStyle Members
DiagramStyle Class

DiagramStyle.setFontUnit Method

Sets the measure unit used to specify font size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFontUnit (
    GraphicsUnit value
)
```

Parameters

value
A member of the GraphicsUnit enumeration.

See Also

DiagramStyle Members
DiagramStyle Class

DiagramStyle.setShadowBrush Method

Sets the brush used to paint the shadow of the items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShadowBrush (
    Brush value
)
```

Parameters

value
A Brush instance.

See Also

DiagramStyle Members
DiagramStyle Class
com.mindfusion.diagramming Namespace

DiagramStyle.setStroke Method

Sets the brush used to paint the outline of the items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setStroke (
    Brush value
)
```

Parameters

value
A Brush instance.

See Also

DiagramStyle Members
DiagramStyle Class
com.mindfusion.diagramming Namespace

DiagramStyle.setStrokeThickness Method

Sets the thickness of the items' outline, expressed in the current units of measure.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setStrokeThickness (
    double value
)
```

Parameters

value
A **double** value specifying the stroke thickness.

DiagramView Members

DiagramView is a Swing component that displays the content of a Diagram object.

The following tables list the members exposed by the **DiagramView** type.

Public Constructors

	Name	Description
	DiagramView	Overloaded.

Public Methods

	Name	Description
	adoptHostedControls	Adopts controls hosted in other views and moves them to this view.

	ancestorAdded	Implements **AncestorListener**. Call the base method if you inherit the **Diagram** class and need to override this method.
	ancestorMoved	Implements **AncestorListener**. Call the base method if you inherit the **Diagram** class and need to override this method.
	ancestorRemoved	Implements **AncestorListener**. Call the base method if you inherit the **Diagram** class and need to override this method.
	beginEdit	Overloaded.
	bringIntoView	Overloaded. Scrolls the view to make the specified item or rectangular area visible.
	cancelDrag	Cancels the modification of the selected items.
	copyToClipboard	Overloaded.
	cutToClipboard	Overloaded.
	deviceToDoc	Overloaded.
	disableInteractionBuffer	For internal use.
	docToDevice	Overloaded.
	dragEnter	
	dragExit	
	dragOver	
	drop	
	dropActionChanged	
	endEdit	Exits in-place editing mode and either accepts or rejects the changes made to the item's text.
	getAllowInplaceEdit	Gets a value indicating whether users are allowed to edit the text of diagram items.
	getAllowLinkCursor	Gets the cursor shown when the currently drawn link can be attached to the item at the current mouse pointer location.
	getAntiAlias	Gets the current anti-aliasing mode for non text objects.
	getAutoScroll	Gets a value indicating whether the diagram will scroll automatically when the pointer is dragged towards the edge of the view.
	getBehavior	Gets a value indicating how the control responds to users actions.
	getCounterDiagonalResizeCursor	Gets the cursor shown when dragging from the current mouse pointer location would start resizing an item along its secondary diagonal.
	getCustomBehavior	Gets custom behavior object specifying how the control responds to mouse input.

	getCustomLinkType	Gets a custom type of DiagramLink-derived objects that will be created when the users starts drawing with the mouse.
	getCustomNodeType	Gets the type of a DiagramNode-derived class whose instance should be created when a user starts drawing.
	getDelKeyAction	Gets a value that specifies what action should be carried out when the user hits the Del key.
	getDiagonalResizeCursor	Gets the cursor shown when dragging from the current mouse pointer location would start resizing an item along its main diagonal.
	getDiagram	Gets the diagram displayed by this view.
	getDisallowCursor	Gets the cursor shown when an item cannot be created at the current mouse pointer location.
	getDisallowLinkCursor	Gets the cursor shown when the currently created link cannot be attached to the item at the current mouse pointer location.
	getDragIndicatorOpacity	Gets the opacity of ghost image displayed during drag-and-drop from NodeListView.
	getDragThreshold	Gets the minimum distance the pointer should be dragged, measured in pixels, that would cause a drag event instead of click.
	getDrawLinkCursor	Gets the cursor shown when a link can be drawn from the current mouse pointer location.
	getEditTextCursor	Gets the mouse cursor shown to the user when the mouse is positioned over an edit component.
	getFont	
	getGlassPane	For internal use.
	getHorizontalDropAlignment	Gets the horizontal placement of nodes created by drag-and-drop operations, relatively to mouse cursor.
	getHorizontalResizeCursor	Gets the cursor shown when dragging from the current mouse pointer location would start resizing an item horizontally.
	getInplaceEditAcceptOnEnter	Gets a value indicating whether pressing the ENTER key ends in-place editing and accepts changes.
	getInplaceEditCancelOnEsc	Gets a value indicating whether pressing the ESC key ends in-place editing and cancels changes.
	getInplaceEditFont	Gets the font used to display text in the in-place editing text control.
	getLaneColumnResizeCursor	Gets the mouse cursor shown to the user when dragging would resize a lane column header.
	getLaneRowResizeCursor	Gets the mouse cursor shown to the user when dragging would resize a lane row header.
	getMagnifierEnabled	Gets a value indicating whether the magnifier tool is currently enabled.

	getMagnifierFactor	Gets the zoom factor of the magnifier tool.
	getMagnifierFrameColor	Gets the color of the magnifier frame.
	getMagnifierFrameThickness	Gets the thickness of the magnifier frame, expressed in pixels.
	getMagnifierHeight	Gets the height of the magnifier tool, expressed in pixels.
	getMagnifierSecondaryFrameColor	Gets the secondary color of the magnifier frame.
	getMagnifierShading	Gets a value indicating whether to enhance the effect of a magnifier lense by using a gradient shading.
	getMagnifierShape	Gets the shape of the magnifier tool.
	getMagnifierWidth	Gets the width of the magnifier tool, expressed in pixels.
	getMiddleButtonActions	Gets what actions are performed via the middle mouse button.
	getModificationStart	Gets a value indicating how users can start modifying items in the diagram.
	getModifierKeyActions	Gets an object that allows changing the function of keyboard modifier keys such as CTRL and ALT.
	getMoveCursor	Gets the cursor shown when the item under the mouse pointer can be modified.
	getPanCursor	Gets the cursor shown when panning the diagram view.
	getPointerCursor	Gets the mouse cursor shown when no modification is performed.
	getPreferredScrollableViewportSize	Provides support for scrolling when the diagram in placed inside a scroll pane.
	getPreferredSize	Returns the size of the diagram in pixels, based on the currently set document size and zoom level.
	getPrintOptions	Returns a PrintOptions instance that allows customizing various aspects of printing and print-preview.
	getRightButtonActions	Gets what actions are performed via the right mouse button.
	getRotateCursor	Gets the cursor shown when dragging from the current mouse pointer location would start rotating a box.
	getScrollableBlockIncrement	Provides support for scrolling when the diagram in placed inside a scroll pane.
	getScrollableTracksViewportHeight	Provides support for scrolling when the diagram in placed inside a scroll pane.
	getScrollableTracksViewportWidth	Provides support for scrolling when the diagram in placed inside a scroll pane.
	getScrollableUnitIncrement	Provides support for scrolling when the diagram in placed inside a scroll pane.
	getScrollX	Gets the horizontal scroll position.
	getScrollY	Gets the vertical scroll position.

	getScrollZoneSize	Gets the size of the auto scroll zone near the edges of the control.
	getShowToolTips	Gets a value indicating whether an item's ToolTip is shown when the pointer hovers over the item.
	getTextAntiAlias	Gets the current anti-aliasing mode for text.
	getToolTipText	Returns the string to be used as the tooltip for event.
	getTrackPointedItem	Gets a value indicating whether the control will raise mouse hover events.
	getVerticalDropAlignment	Gets the vertical placement of nodes created by drag-and-drop operations, relatively to mouse cursor.
	getVerticalResizeCursor	Gets the cursor shown when dragging from the current mouse pointer location would start resizing an item vertically.
	getXmlClipboard	Gets a value that specifies whether XML serialization will be used when saving/loading the selection to/from clipboard.
	getZoomFactor	Gets the current zoom level.
	loadFrom	Overloaded.
	loadFromJson	Overloaded.
	loadFromJsonString	Loads the specified JSON data.
	loadFromString	Loads the diagram contents from a string.
	lostOwnership	
	pasteFromClipboard	Overloaded.
	print	Overloaded.
	printPreview	Overloaded.
	recreateCacheImage	Recreates the off-screen cache bitmap used for fast drawing while modifying items.
	repaint	Overloaded.
	resumeRepaint	Resumes repainting the control after a suspendRepaint call.
	saveTo	Overloaded.
	saveToJson	Overloaded.
	saveToJsonString	Serializes the DiagramView's data to JSON.
	saveToString	Overloaded.
	saveToXml	Overloaded.
	scrollTo	Scrolls the diagram to the specified position. The **Diagram** component must be contained within a JScrollPane in order to use this method.

	setAllowInplaceEdit	Sets a value indicating whether users are allowed to edit the text of diagram items.
	setAllowLinkCursor	Sets the cursor shown when the currently drawn link can be attached to the item at the current mouse pointer location.
	setAntiAlias	Sets the current anti-aliasing mode for non text objects.
	setAutoScroll	Sets a value indicating whether the diagram should scroll automatically when the pointer is dragged towards the edge of the view.
	setBehavior	Sets a value indicating how the control should respond to users actions.
	setCounterDiagonalResizeCursor	Sets the cursor shown when dragging from the current mouse pointer location would start resizing an item along its secondary diagonal.
	setCustomBehavior	Sets a custom behavior object specifying how the control responds to mouse input.
	setCustomLinkType	Sets a custom type of **DiagramLink**-derived objects that will be created when the users starts drawing with the mouse.
	setCustomNodeType	Sets the type of a DiagramNode-derived class whose instance should be created when a user starts drawing.
	setDelKeyAction	Sets a value that specifies what action should be carried out when the user hits the Del key.
	setDiagonalResizeCursor	Sets the cursor shown when dragging from the current mouse pointer location would start resizing an item along its main diagonal.
	setDiagram	Sets the diagram displayed by this view.
	setDisallowCursor	Sets the cursor shown when an item cannot be created at the current mouse pointer location.
	setDisallowLinkCursor	Sets the cursor shown when the currently created link can be attached to the item at the current mouse pointer location.
	setDragIndicatorOpacity	Sets the opacity of ghost image displayed during drag-and-drop from **NodeListView**.
	setDragThreshold	Sets the minimum distance the pointer should be dragged, measured in pixels, that would cause a drag event instead of click.
	setDrawLinkCursor	Sets the cursor shown when a link can be drawn from the current mouse pointer location.
	setEditTextCursor	Gets the mouse cursor shown to the user when the mouse is positioned over an edit component.
	setHorizontalDropAlignment	Sets the horizontal placement of nodes created by drag-and-drop operations, relatively to mouse cursor.

	setHorizontalResizeCursor	Sets the cursor shown when dragging from the current mouse pointer location would start resizing an item horizontally.
	setInplaceEditAcceptOnEnter	Sets a value indicating whether pressing the ENTER key ends in-place editing and accepts changes.
	setInplaceEditCancelOnEsc	Sets a value indicating whether pressing the ESC key ends in-place editing and cancels changes.
	setInplaceEditFont	Sets the font used to display text in the in-place editing text control.
	setLaneColumnResizeCursor	Sets the mouse cursor shown to the user when dragging would resize a lane column header.
	setLaneRowResizeCursor	Sets the mouse cursor shown to the user when dragging would resize a lane row header.
	setLicenseKey	Sets the component's license key string, disabling evaluation mode.
	setMagnifierEnabled	Sets a value indicating whether the magnifier tool is currently enabled.
	setMagnifierFactor	Gets the zoom factor of the magnifier tool.
	setMagnifierFrameColor	Sets the color of the magnifier frame.
	setMagnifierFrameThickness	Sets the thickness of the magnifier frame, expressed in pixels.
	setMagnifierHeight	Sets the height of the magnifier tool, expressed in pixels.
	setMagnifierSecondaryFrameColor	Sets the secondary color of the magnifier frame.
	setMagnifierShading	Sets a value indicating whether to enhance the effect of a magnifier lense by using a gradient shading.
	setMagnifierShape	Sets the shape of the magnifier tool.
	setMagnifierWidth	Sets the width of the magnifier tool, expressed in pixels.
	setMiddleButtonActions	Sets what actions are performed via the middle mouse button.
	setModificationStart	Sets a value indicating how users can start modifying items in the diagram.
	setMoveCursor	Sets the cursor shown when the item under the mouse pointer can be modified.
	setPanCursor	Sets the cursor shown when panning the diagram view
	setPointerCursor	Sets the mouse cursor that should be shown when no modification is performed.
	setRightButtonActions	Sets what actions are performed via the right mouse button.
	setRotateCursor	Sets the cursor shown when dragging from the current mouse pointer location would start rotating a box.
	setScrollX	Sets the horizontal scroll position. The **Diagram** component must be contained within a JScrollPane in

		order to use this method.
	setScrollY	Sets the vertical scroll position. The **Diagram** component must be contained within a JScrollPane in order to use this method.
	setScrollZoneSize	Sets the size of the auto scroll zone near the edges of the control.
	setShowToolTips	Sets a value indicating whether an item's **ToolTip** is shown when the pointer hovers over the item.
	setTextAntiAlias	Sets the current anti-aliasing mode for text.
	setTrackPointedItem	Sets a value indicating whether the control should raise mouse hover events.
	setVerticalDropAlignment	Sets the vertical placement of nodes created by drag-and-drop operations, relatively to mouse cursor.
	setVerticalResizeCursor	Sets the cursor shown when dragging from the current mouse pointer location would start resizing an item vertically.
	setXmlClipboard	Sets a value that specifies whether XML serialization will be used when saving/loading the selection to/from clipboard.
	setZoomFactor	Sets the zoom level.
	startInteraction	Starts the specified interactive operation. Subsequent pointer movements will modify or create the item specified through the InteractionState instance.
	suspendRepaint	Stops repainting the control. This is useful when using the JDiagram API from JavaScript, where the control would be repainted after each script line executes.
S	toJson	Serializes the DiagramView's data to JSON.
	zoomToFit	Overloaded.
	zoomToRect	Overloaded.

DiagramView Constructor

Overload List

Name	Description
DiagramView ()	Initializes a new instance of the DiagramView class.
DiagramView (Diagram)	Initializes a new instance of the **DiagramView** class.

See Also

DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView Constructor ()

Initializes a new instance of the DiagramView class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramView ()
```

See Also

DiagramView Constructor Overload List
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView Constructor (Diagram)

Initializes a new instance of the DiagramView class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramView (
    Diagram diagram
)
```

Parameters

diagram

See Also

DiagramView Constructor Overload List
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView Methods

DiagramView.adoptHostedControls Method

Adopts controls hosted in other views and moves them to this view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void adoptHostedControls (
    boolean onlyUnparented
)
```

Parameters

onlyUnparented
true if only controls that currently do not have a parent view are adopted; **false** to adopt all controls.

Remarks

This method is useful when displaying ControlNode objects in multiple views. For example, you might want to invoke it when a view becomes the topmost window in a MDI application.

DiagramView.beginEdit Method (DiagramItem, InplaceEditable, Point2D)

Enters inplace-edit mode, letting the user edit the text of the specified item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void beginEdit (
    DiagramItem diagItem,
    InplaceEditable item,
    Point2D mousePosition
)
```

Parameters

diagItem

item

The diagram item or table's cell whose text should be edited.

mousePosition

DiagramView.bringIntoView Method

Scrolls the view to make the specified item or rectangular area visible.

Overload List

Name	Description
DiagramView.bringIntoView (DiagramItem)	Scrolls the viewport so that the specified item will be visible. This works only when the diagram is contained within a JScrollPane.
DiagramView.bringIntoView (Rectangle2D)	Scrolls the view to make the specified rectangular area visible.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.bringIntoView Method (DiagramItem)

Scrolls the viewport so that the specified item will be visible. This works only when the diagram is contained within a JScrollPane.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void bringIntoView (
    DiagramItem item
)
```

Parameters

item
The DiagramItem to bring into view.

See Also

DiagramView.copyToClipboard Method

Overload List

Name	Description
DiagramView.copyToClipboard ()	Copies the current selection of items to the system clipboard.
DiagramView.copyToClipboard (boolean)	Copies the current selection of items to the system clipboard.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.copyToClipboard Method ()

Copies the current selection of items to the system clipboard.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean copyToClipboard ()
```

Return Value

true if items were successfully copied; otherwise, **false**.

Remarks

Call this method when writing message handler for the Copy command from the Edit menu of your application. MindFusion.Diagramming does not provide keyboard interface for clipboard operations, so you might assign a CTRL+C shortcut to this command.

See Also

copyToClipboard Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.copyToClipboard Method (boolean)

Copies the current selection of items to the system clipboard.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean copyToClipboard (
    boolean groups
)
```

Parameters

groups
true to copy item groups; otherwise, false.

Return Value

true if items were successfully copied; otherwise, **false**.

Remarks

Call this method when writing message handler for the Copy command from the Edit menu of your application. MindFusion.Diagramming does not provide keyboard interface for clipboard operations, so you might assign a CTRL+C shortcut to this command.

DiagramView.cutToClipboard Method

Overload List

Name	Description
DiagramView.cutToClipboard ()	Cuts the currently selected items to the system clipboard.
DiagramView.cutToClipboard (boolean)	Cuts the currently selected items to the system clipboard.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.cutToClipboard Method ()

Cuts the currently selected items to the system clipboard.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public boolean cutToClipboard ()`

Return Value

true if items are successfully copied to clipboard; otherwise, **false**.

Remarks

Call this method when writing message handler for the Cut command from the Edit menu of your application. MindFusion.Diagramming does not provide keyboard interface for clipboard operations, so you might assign a CTRL+X shortcut to this command.

The method deletes all selected items after copying them to clipboard. That operation can be undone in the sense that deleted items are restored by calling UndoManager.undo; however the clipboard data is not restored and the items remain in the clipboard available for further pasting.

com.mindfusion.diagramming Namespace

DiagramView.cutToClipboard Method (boolean)

Cuts the currently selected items to the system clipboard.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean cutToClipboard (
    boolean groups
)
```

Parameters

groups
true to cut item groups; otherwise, false.

Return Value

true if items are successfully copied to clipboard; otherwise, **false**.

Remarks

Call this method when writing message handler for the Cut command from the Edit menu of your application. MindFusion.Diagramming does not provide keyboard interface for clipboard operations, so you might assign a CTRL+X shortcut to this command.

The method deletes all selected items after copying them to clipboard. That operation can be undone in the sense that deleted items are restored by calling UndoManager.undo; however the clipboard data is not restored and the items remain in the clipboard available for further pasting.

DiagramView.deviceToDoc Method (int, int)

Transforms points from the device coordinate space to the document coordinate space.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Point2D.Float deviceToDoc (
    int x,
    int y
)
```

Parameters

x

y

Return Value

A **Point2D.Float** object, which represents the document coordinates of device point (x, y).

See Also

deviceToDoc Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.deviceToDoc Method (Point)

Transforms points from the device coordinate space to the document coordinate space.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Point2D.Float deviceToDoc (
    Point devPoint
```

```
)
```

Parameters

devPoint
An instance of the Point object, whose coordinates should be transformed and returned.

Return Value

A Point2D.Float object, which represents the document coordinates of devPoint.

See Also

com.mindfusion.diagramming Namespace

DiagramView.endEdit Method

Exits in-place editing mode and either accepts or rejects the changes made to the item's text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void endEdit (
    boolean accept
)
```

Parameters

accept
true to accept changes made to text; **false** to reject them.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getAllowInplaceEdit Method

Gets a value indicating whether users are allowed to edit the text of diagram items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAllowInplaceEdit ()
```

Return Value

true if users are allowed to edit the text of diagram items, otherwise **false**.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getAllowLinkCursor Method

Gets the cursor shown when the currently drawn link can be attached to the item at the current mouse pointer location.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Cursor getAllowLinkCursor ()
```

Return Value

A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getAntiAlias Method

Gets the current anti-aliasing mode for non text objects.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public SmoothingMode getAntiAlias ()
```

Return Value

A SmoothingMode object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getAutoScroll Method

Gets a value indicating whether the diagram will scroll automatically when the pointer is dragged towards the edge of the view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAutoScroll ()
```

Return Value

true if the diagram will scroll automatically, otherwise **false**.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getBehavior Method

Gets a value indicating how the control responds to users actions.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Behavior getBehavior ()
```

Return Value

A member of the Behavior enumeration. The default is **LinkShapes**.

Remarks

The property specifies how the control responds to user actions with the mouse. The default value, LinkShapes, facilitates drawing of flowchart diagrams. **LinkTables** makes JDiagram create table nodes and links while the user draws with the mouse, allowing creation of entity-relationship or class-hierarchy diagrams.

Modes such as **Modify**, **PanAndModify**, **MoveNodes**, **SelectOnly** allow users to interact with existing items, but not draw new ones on the canvas. Note that controls such as NodeListView and ShapeListBox can be used to create new nodes regardless of DiagramView's current behavior mode.

There are several more values that can be assigned to the property, that make the control draw specific types of items, for example only shape nodes, only control hosts, only links, and so on. These are useful when implementing the ability to select specific drawing tools in applications.

DiagramView.getCustomBehavior Method

Gets custom behavior object specifying how the control responds to mouse input.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public BehaviorBase getCustomBehavior ()
```

Return Value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getCustomLinkType Method

Gets a custom type of DiagramLink-derived objects that will be created when the users starts drawing with the mouse.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Class<? extends DiagramLink> getCustomLinkType ()
```

Return Value

The custom link class.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getCustomNodeType Method

Gets the type of a DiagramNode-derived class whose instance should be created when a user starts drawing.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Class<? extends DiagramNode> getCustomNodeType ()
```

Return Value

the custom node object.

See Also

DiagramView Members
DiagramView Class

DiagramView.getDragIndicatorOpacity Method

Gets the opacity of ghost image displayed during drag-and-drop from NodeListView.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getDragIndicatorOpacity ()
```

Return Value

A value in 0 - 1 range specifying opacity. The default is **0.4**.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getDragThreshold Method

Gets the minimum distance the pointer should be dragged, measured in pixels, that would cause a drag event instead of click.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getDragThreshold ()
```

Return Value

The minimal distance to move the pointer before starting a drag operation.

See Also

DiagramView Members

DiagramView.getHorizontalDropAlignment Method

Gets the horizontal placement of nodes created by drag-and-drop operations, relatively to mouse cursor.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public HorizontalAlignment getHorizontalDropAlignment ()
```

Return Value

A member of the HorizontalAlignment enumeration.

Remarks

This property lets you center the new node or align specified edge to the mouse pointer position when drag-and-drop ends.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getHorizontalResizeCursor Method

Gets the cursor shown when dragging from the current mouse pointer location would start resizing an item horizontally.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Cursor getHorizontalResizeCursor ()
```

Return Value

A **java.awt.Cursor** object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Cursor getLaneRowResizeCursor ()
```

Return Value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getMagnifierEnabled Method

Gets a value indicating whether the magnifier tool is currently enabled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getMagnifierEnabled ()
```

Return Value

Remarks

The magnifier tool can be alternatively enabled on-demand through a modifier key or a mouse button.

See Also

DiagramView Members
DiagramView Class

DiagramView.getMagnifierFactor Method

Gets the zoom factor of the magnifier tool.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getMagnifierFactor ()
```

Return Value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getMagnifierFrameColor Method

Gets the color of the magnifier frame.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Color getMagnifierFrameColor ()
```

Return Value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getMagnifierFrameThickness Method

Gets the thickness of the magnifier frame, expressed in pixels.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getMagnifierFrameThickness ()
```

Return Value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getMagnifierHeight Method

Gets the height of the magnifier tool, expressed in pixels.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getMagnifierHeight ()
```

Return Value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getMagnifierSecondaryFrameColor Method

Gets the secondary color of the magnifier frame.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Color getMagnifierSecondaryFrameColor ()
```

Return Value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getMagnifierShading Method

Gets a value indicating whether to enhance the effect of a magnifier lense by using a gradient shading.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public boolean getMagnifierShading ()`

Return Value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getMagnifierShape Method

Gets the shape of the magnifier tool.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public Shape getMagnifierShape ()`

Return Value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getMagnifierWidth Method

Gets the width of the magnifier tool, expressed in pixels.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public int getMagnifierWidth ()`

Return Value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getMiddleButtonActions Method

Gets what actions are performed via the middle mouse button.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public EnumSet<MouseButtonAction> getMiddleButtonActions ()
```

Return Value

An enumset of MouseButtonAction values.

Remarks

This property allows the following actions to be assigned to the middle mouse button: panning the diagram view, canceling the current drawing operation, or starting a multiple selection operation.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace
getRightButtonActions Method

DiagramView.getModificationStart Method

Gets a value indicating how users can start modifying items in the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ModificationStart getModificationStart ()
```

Return Value

A member of the ModificationStart enumeration.

See Also

DiagramView Members
DiagramView Class

DiagramView.getModifierKeyActions Method

Gets an object that allows changing the function of keyboard modifier keys such as CTRL and ALT.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ModifierKeyActions getModifierKeyActions ()
```

Return Value

An instance of the ModifierKeyActions class.

Remarks

Use the Alt, Control and Shift properties of this ModifierKeyActions instance to specify the functions of the ALT, CTRL and SHIFT keys. These properties can be set to values of the ModifierKeyAction enumeration.

DiagramView.getMoveCursor Method

Gets the cursor shown when the item under the mouse pointer can be modified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Cursor getMoveCursor ()
```

Return Value

A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getPanCursor Method

Gets the cursor shown when panning the diagram view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Cursor getPanCursor ()
```

Return Value

A java.awt.Cursor object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getPointerCursor Method

Gets the mouse cursor shown when no modification is performed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Cursor getPointerCursor ()
```

Return Value

A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getPreferredScrollableViewportSize Method

Provides support for scrolling when the diagram in placed inside a scroll pane.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension getPreferredScrollableViewportSize ()
```

Return Value

A **Dimension** object representing the preferred size.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getPreferredSize Method

Returns the size of the diagram in pixels, based on the currently set document size and zoom level.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension getPreferredSize ()
```

Return Value

A **Dimension** object representing the preferred size.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getPrintOptions Method

Returns a PrintOptions instance that allows customizing various aspects of printing and print-preview.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public PrintOptions getPrintOptions ()
```

Return Value

A PrintOptions object.

See Also

DiagramView Members
DiagramView Class

DiagramView.getRightButtonActions Method

Gets what actions are performed via the right mouse button.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public EnumSet<MouseButtonAction> getRightButtonActions ()
```

Return Value

An enumset of MouseButtonAction values.

Remarks

This property allows the following actions to be assigned to the right mouse button: panning the diagram view, canceling the current drawing operation, or starting a multiple selection operation.

See Also

DiagramView.getRotateCursor Method

Gets the cursor shown when dragging from the current mouse pointer location would start rotating a box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Cursor getRotateCursor ()
```

Return Value

A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getScrollableBlockIncrement Method

Provides support for scrolling when the diagram in placed inside a scroll pane.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getScrollableBlockIncrement (
    Rectangle visibleRect,
    int orientation,
    int direction
)
```

Parameters

visibleRect

orientation

direction

Return Value

The "block" increment for scrolling in the specified direction.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getScrollableTracksViewportHeight Method

Provides support for scrolling when the diagram in placed inside a scroll pane.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getScrollableTracksViewportHeight ()
```

Return Value

false

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getScrollableTracksViewportWidth Method

Provides support for scrolling when the diagram in placed inside a scroll pane.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getScrollableTracksViewportWidth ()
```

Return Value

false

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getScrollableUnitIncrement Method

Provides support for scrolling when the diagram in placed inside a scroll pane.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getScrollableUnitIncrement (
    Rectangle visibleRect,
    int orientation,
    int direction
)
```

Parameters

visibleRect

orientation

direction

Return Value

The "unit" increment for scrolling in the specified direction.

See Also

DiagramView Members

DiagramView.getScrollX Method

Gets the horizontal scroll position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getScrollX ()
```

Return Value

A float value specifying the current horizontal scroll position.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getScrollY Method

Gets the vertical scroll position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getScrollY ()
```

Return Value

A float value specifying the current vertical scroll position.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getScrollZoneSize Method

Gets the size of the auto scroll zone near the edges of the control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getScrollZoneSize ()
```

Return Value

An integer value specifying the scroll zone size.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace
getAutoScroll Method

DiagramView.getShowToolTips Method

Gets a value indicating whether an item's ToolTip is shown when the pointer hovers over the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getShowToolTips ()
```

Return Value

true if tooltips are shown for the diagramitems that have them, otherwise **false**.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getTextAntiAlias Method

Gets the current anti-aliasing mode for text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SmoothingMode getTextAntiAlias ()
```

Return Value

A member of the SmoothingMode enumeration.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getToolTipText Method

Returns the string to be used as the tooltip for event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getToolTipText (
    MouseEvent event
)
```

Parameters

event

Return Value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getTrackPointedItem Method

Gets a value indicating whether the control will raise mouse hover events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getTrackPointedItem ()
```

Return Value

true if mouse hover events are raised when the pointer enters or leaves the boundaries of an item, or **false** otherwise.

linkPointerEnter Event
linkPointerLeave Event
linkHovered Event

DiagramView.getVerticalDropAlignment Method

Gets the vertical placement of nodes created by drag-and-drop operations, relatively to mouse cursor.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public VerticalAlignment getVerticalDropAlignment ()
```

Return Value

A member of the VerticalAlignment enumeration.

Remarks

This property lets you center the new node or align specified edge to the mouse pointer position when drag-and-drop ends.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getVerticalResizeCursor Method

Gets the cursor shown when dragging from the current mouse pointer location would start resizing an item vertically.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Cursor getVerticalResizeCursor ()
```

Return Value

A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.getXmlClipboard Method

Gets a value that specifies whether XML serialization will be used when saving/loading the selection to/from clipboard.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public boolean getXmlClipboard ()`

Return Value

true if XML serialization will be used; otherwise **false**.

See Also

DiagramView Members

DiagramView.loadFrom Method

Overload List

Name	Description
DiagramView.loadFrom (InputStream)	Loads the diagram contents from a stream.

DiagramView.loadFrom (String)	Loads the diagram contents from a file.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.loadFrom Method (InputStream)

Loads the diagram contents from a stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFrom (
    InputStream in
)
```

Parameters

in
A **java.io.InputStream** from which to load the diagram contents.

See Also

loadFrom Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.loadFrom Method (String)

Loads the diagram contents from a file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFrom (
    String fileName
)
```

Parameters

fileName
The name of the file from which the diagram contents should be loaded.

See Also

loadFrom Method Overload List

com.mindfusion.diagramming Namespace

DiagramView.loadFromJson Method

Overload List

Name	Description
DiagramView.loadFromJson (InputStream)	Loads the diagram from a JSON stream.
DiagramView.loadFromJson (String)	Loads the diagram from a JSON file.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.loadFromJson Method (InputStream)

Loads the diagram from a JSON stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromJson (
    InputStream stream
)
```

Parameters

stream
A **java.io.InputStream** instance from which to load diagram data in JSON format.

See Also

loadFromJson Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace
saveToJson Method

DiagramView.loadFromJson Method (String)

Loads the diagram from a JSON file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void loadFromJson (
    String fileName
)
```

Parameters

fileName
A string specifying the file name or full path.

See Also

loadFromJson Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace
saveToJson Method

DiagramView.loadFromJsonString Method

Loads the specified JSON data.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void loadFromJsonString (
    String json
)
```

Parameters

json
The JSON string

See Also

DiagramView Class
com.mindfusion.diagramming Namespace
saveToJsonString Method

DiagramView.loadFromString Method

Loads the diagram contents from a string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

`public void loadFromString (`
`  String chartData`
`)`

Parameters

chartData
A **String** from which to load the diagram contents.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.loadFromXml Method

Overload List

Name	Description
DiagramView.loadFromXml (Document, boolean)	Loads the contents of the XML diagram document.
DiagramView.loadFromXml (InputSource)	Loads the contents of the XML diagram document.
DiagramView.loadFromXml (InputStream)	Loads the contents of the XML diagram document.
DiagramView.loadFromXml (String)	Loads the contents of the XML diagram document.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.loadFromXml Method (Document, boolean)

Loads the contents of the XML diagram document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public void loadFromXml (` `  Document document,`

```
    boolean freeProcessedXml
)
```

Parameters

document
A DOM **Document** object from which to load the diagram data.

freeProcessedXml

See Also

loadFromXml Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.loadFromXml Method (InputSource)

Loads the contents of the XML diagram document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    InputSource source
)
```

Parameters

source
An **InputSource** where the XML markup should be read from.

See Also

loadFromXml Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.loadFromXml Method (InputStream)

Loads the contents of the XML diagram document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    InputStream stream
)
```

Parameters

stream
A **java.io.InputStream** where the XML markup should be read from.

See Also

loadFromXml Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.loadFromXml Method (String)

Loads the contents of the XML diagram document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    String fileName
)
```

Parameters

fileName
The name of the XML file the data should be read from.

See Also

loadFromXml Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.lostOwnership Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void lostOwnership (
    Clipboard arg0,
    Transferable arg1
)
```

Parameters

arg0

arg1

See Also

DiagramView.pasteFromClipboard Method

Overload List

Name	Description
DiagramView.pasteFromClipboard (float, float)	Pastes diagram items from the system clipboard.
DiagramView.pasteFromClipboard (float, float, boolean)	Pastes diagram items from the system clipboard.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.pasteFromClipboard Method (float, float)

Pastes diagram items from the system clipboard.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean pasteFromClipboard (
    float dx,
    float dy
)
```

Parameters

dx
Horizontal offset of pasted items from their original positions.

dy
Vertical offset of pasted items from their original positions.

Return Value

Remarks

If MindFusion.Diagramming items are available in the clipboard, this method clones them and adds them to the current diagram. Non-zero dx / dy offset is useful when pasting items several times consecutively, so the pasted items don't overlay the original ones completely.

See Also

pasteFromClipboard Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.pasteFromClipboard Method (float, float, boolean)

Pastes diagram items from the system clipboard.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean pasteFromClipboard (
    float dx,
    float dy,
    boolean unconnectedLinks
)
```

Parameters

dx
Horizontal offset of pasted items from their original positions.

dy
Vertical offset of pasted items from their original positions.

unconnectedLinks
true to allow pasting links whose origin or destination node has not been copied; otherwise, **false**. Default is **false**.

Return Value

Remarks

If MindFusion.Diagramming items are available in the clipboard, this method clones them and adds them to the current diagram. Non-zero dx / dy offset is useful when pasting items several times consecutively, so the pasted items don't overlay the original ones completely.

DiagramView.print Method (Graphics, PageFormat, int)

Implements the Printable interface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int print (
    Graphics graphics,
    PageFormat pageFormat,
    int pageIndex
)
```

Parameters

graphics

pageFormat
The size and orientation of each page to be printed.

pageIndex

Return Value

See Also

print Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.print Method (PageFormat, String)

Prints the current diagram using the specified page format.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void print (
    PageFormat pageFormat,
    String printer
)
```

Parameters

pageFormat

The size and orientation of each page to be printed.

printer
Specifies the destination printer.

DiagramView.saveTo Method

Overload List

Name	Description
DiagramView.saveTo (OutputStream)	Saves the diagram contents into a stream.
DiagramView.saveTo (String)	Saves the diagram contents into a file.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.saveTo Method (OutputStream)

Saves the diagram contents into a stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveTo (
    OutputStream out
)
```

Parameters

out
A **java.io.OutputStream** where the diagram contents should be saved.

See Also

saveTo Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.saveTo Method (String)

Saves the diagram contents into a file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveTo (
    String fileName
)
```

Parameters

fileName
The name of the file into which the diagram contents should be saved.

See Also

saveTo Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.saveToJson Method

Overload List

Name	Description
DiagramView.saveToJson (OutputStream)	Saves the diagram into a JSON stream.
DiagramView.saveToJson (String)	Saves the diagram into a JSON file.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.saveToJson Method (OutputStream)

Saves the diagram into a JSON stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToJson (
    OutputStream stream
)
```

Parameters

stream
A **java.io.OutputStream** instance to which to write the diagram data in JSON format.

Remarks

This method adds view state information (scroll position, zoom level, Behavior property value) to the JSON dictionary created by the Diagram object's saveToJson method.

See Also

saveToJson Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace
loadFromJson Method

DiagramView.saveToJson Method (String)

Saves the diagram into a JSON file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToJson (
    String fileName
)
```

Parameters

fileName
A string specifying the file name or full path.

Remarks

This method adds view state information (scroll position, zoom level, Behavior property value) to the JSON dictionary created by the Diagram object's saveToJson method.

See Also

saveToJson Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace
loadFromJson Method

DiagramView.saveToJsonString Method

Serializes the DiagramView's data to JSON.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public String saveToJsonString ()`

Return Value

The JSON string.

Remarks

This method adds view state information (scroll position, zoom level, Behavior property value) to the JSON dictionary created by the Diagram object's saveToJsonString method.

DiagramView.saveToString Method

Overload List

Name	Description
DiagramView.saveToString ()	Saves the diagram contents into a string.
DiagramView.saveToString (SaveToStringFormat, boolean)	Saves the diagram contents into a string.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.saveToString Method ()

Saves the diagram contents into a string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String saveToString ()
```

Return Value

A **String** containing the base64 encoded diagram contents.

See Also

saveToString Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.saveToString Method (SaveToStringFormat, boolean)

Saves the diagram contents into a string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String saveToString (
    SaveToStringFormat format,
    boolean includeUnalteredProperties
)
```

Parameters

format
A member of the SaveToStringFormat enumeration that indicates the desired serialized string format.

includeUnalteredProperties
true to serialize all properties; **false** to serialize only properties different from their default value.

Return Value

A String containing the serialized diagram.

See Also

saveToString Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.saveToXml Method

Overload List

Name	Description
DiagramView.saveToXml (Document)	Saves the diagram to the specified XML document.
DiagramView.saveToXml (Document, boolean)	Saves the diagram to the specified XML document.
DiagramView.saveToXml (OutputStream, boolean)	Saves the diagram to the specified XML document.
DiagramView.saveToXml (String)	Saves the diagram to the specified XML document.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.saveToXml Method (Document)

Saves the diagram to the specified XML document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    Document document
)
```

Parameters

document
A DOM **Document** object where the diagram should be saved.

See Also

saveToXml Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.saveToXml Method (Document, boolean)

Saves the diagram to the specified XML document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    Document document,
    boolean includeUnalteredProperties
)
```

Parameters

document
A DOM **Document** object where the diagram should be saved.

includeUnalteredProperties

See Also

saveToXml Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.saveToXml Method (OutputStream, boolean)

Saves the diagram to the specified XML document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    OutputStream stream,
    boolean includeUnalteredProperties
)
```

Parameters

stream
A **java.io.OutputStream** where the XML markup should be serialized.

includeUnalteredProperties

See Also

saveToXml Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.saveToXml Method (String)

Saves the diagram to the specified XML document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    String fileName
)
```

Parameters

fileName
The full path and name of the disk file where the diagram should be saved.

See Also

saveToXml Method Overload List
DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.scrollTo Method

Scrolls the diagram to the specified position. The Diagram component must be contained within a JScrollPane in order to use this method.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void scrollTo (
    float x,
    float y
)
```

Parameters

x
A float value specifying the horizontal scroll position.

y
A float value specifying the vertical scroll position.

See Also

DiagramView Members

com.mindfusion.diagramming Namespace
setScrollX Method
setScrollY Method

bringIntoView Method
zoomToRect Method

DiagramView.setAllowInplaceEdit Method

Sets a value indicating whether users are allowed to edit the text of diagram items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowInplaceEdit (
    boolean value
)
```

Parameters

value
true if users are allowed to edit the text of diagram items, otherwise **false**.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setAllowLinkCursor Method

Sets the cursor shown when the currently drawn link can be attached to the item at the current mouse pointer location.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowLinkCursor (
    Cursor value
)
```

Parameters

value
A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setAntiAlias Method

Sets the current anti-aliasing mode for non text objects.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAntiAlias (
    SmoothingMode antiAlias
)
```

Parameters

antiAlias
A SmoothingMode object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setAutoScroll Method

Sets a value indicating whether the diagram should scroll automatically when the pointer is dragged towards the edge of the view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoScroll (
    boolean value
)
```

Parameters

value
true if the diagram should scroll automatically, otherwise **false**.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setBehavior Method

Sets a value indicating how the control should respond to users actions.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setBehavior (
    Behavior value
)
```

Parameters

value
A member of the Behavior enumeration.

Remarks

The property specifies how the control responds to user actions with the mouse. The default value, LinkShapes, facilitates drawing of flowchart diagrams. **LinkTables** makes JDiagram create table nodes and links while the user draws with the mouse, allowing creation of entity-relationship or class-hierarchy diagrams.

Modes such as **Modify**, **PanAndModify**, **MoveNodes**, **SelectOnly** allow users to interact with existing items, but not draw new ones on the canvas. Note that controls such as NodeListView and ShapeListBox can be used to create new nodes regardless of DiagramView's current behavior mode.

There are several more values that can be assigned to the property, that make the control draw specific types of items, for example only shape nodes, only control hosts, only links, and so on. These are useful when implementing the ability to select specific drawing tools in applications.

com.mindfusion.diagramming Namespace

DiagramView.setCounterDiagonalResizeCursor Method

Sets the cursor shown when dragging from the current mouse pointer location would start resizing an item along its secondary diagonal.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setCounterDiagonalResizeCursor (
    Cursor value
)
```

Parameters

value
A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setCustomBehavior Method

Sets a custom behavior object specifying how the control responds to mouse input.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCustomBehavior (
    BehaviorBase value
)
```

Parameters

value
A BehaviorBase value.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setCustomLinkType Method

Sets a custom type of DiagramLink-derived objects that will be created when the users starts drawing with the mouse.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCustomLinkType (
    Class<? extends DiagramLink> value
)
```

Parameters

value
The custom link class.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setCustomNodeType Method

Sets the type of a DiagramNode-derived class whose instance should be created when a user starts drawing.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCustomNodeType (
    Class<? extends DiagramNode> value
)
```

Parameters

value

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setDelKeyAction Method

Sets a value that specifies what action should be carried out when the user hits the Del key.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDelKeyAction (
    DelKeyAction delKeyAction
)
```

Parameters

delKeyAction
A member of the DelKeyAction enumeration.

linkDeleting Event
AutoDeleteLinks Property

DiagramView.setDiagonalResizeCursor Method

Sets the cursor shown when dragging from the current mouse pointer location would start resizing an item along its main diagonal.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDiagonalResizeCursor (
    Cursor value
)
```

Parameters

value
A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setDiagram Method

Sets the diagram displayed by this view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDiagram (
    Diagram value
)
```

Parameters

value
A Diagram object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setDisallowCursor Method

Sets the cursor shown when an item cannot be created at the current mouse pointer location.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setDisallowCursor (
    Cursor value
)
```

Parameters

value
A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class

DiagramView.setDisallowLinkCursor Method

Sets the cursor shown when the currently created link can be attached to the item at the current mouse pointer location.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setDisallowLinkCursor (
    Cursor value
)
```

Parameters

value
A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setDragIndicatorOpacity Method

Sets the opacity of ghost image displayed during drag-and-drop from NodeListView.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDragIndicatorOpacity (
    float value
)
```

Parameters

value
A value in 0 - 1 range specifying opacity.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setDragThreshold Method

Sets the minimum distance the pointer should be dragged, measured in pixels, that would cause a drag event instead of click.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDragThreshold (
    int dragThreshold
)
```

Parameters

dragThreshold
The minimal distance to move the pointer before starting a drag operation.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setDrawLinkCursor Method

Sets the cursor shown when a link can be drawn from the current mouse pointer location.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDrawLinkCursor (
    Cursor value
)
```

Parameters

value
A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setEditTextCursor Method

Gets the mouse cursor shown to the user when the mouse is positioned over an edit component.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEditTextCursor (
    Cursor value
)
```

Parameters

value
A java.awt.Cursor object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setHorizontalDropAlignment Method

Sets the horizontal placement of nodes created by drag-and-drop operations, relatively to mouse cursor.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHorizontalDropAlignment (
    HorizontalAlignment value
)
```

Parameters

value
A member of the HorizontalAlignment enumeration.

Remarks

This property lets you center the new node or align specified edge to the mouse pointer position when drag-and-drop ends.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setHorizontalResizeCursor Method

Sets the cursor shown when dragging from the current mouse pointer location would start resizing an item horizontally.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHorizontalResizeCursor (
    Cursor value
)
```

Parameters

value
A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class

DiagramView.setInplaceEditAcceptOnEnter Method

Sets a value indicating whether pressing the ENTER key ends in-place editing and accepts changes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setInplaceEditAcceptOnEnter (
    boolean inplaceEditAcceptOnEnter
)
```

Parameters

inplaceEditAcceptOnEnter

true if ENTER ends in-place editing, otherwise **false.**

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setInplaceEditCancelOnEsc Method

Sets a value indicating whether pressing the ESC key ends in-place editing and cancels changes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setInplaceEditCancelOnEsc (
    boolean inplaceEditCancelOnEsc
)
```

Parameters

inplaceEditCancelOnEsc

true if ESC ends in-place editing, otherwise **false**.

See Also

DiagramView Members

DiagramView.setInplaceEditFont Method

Sets the font used to display text in the in-place editing text control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setInplaceEditFont (
    Font value
)
```

Parameters

value

A **java.awt.Font** object representing the font of the in-place editing control.

DiagramView.setMagnifierEnabled Method

Sets a value indicating whether the magnifier tool is currently enabled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMagnifierEnabled (
    boolean value
)
```

Parameters

value

Remarks

The magnifier tool can be alternatively enabled on-demand through a modifier key or a mouse button.

See Also

DiagramView Members
DiagramView Class

DiagramView.setMagnifierFrameColor Method

Sets the color of the magnifier frame.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMagnifierFrameColor (
    Color value
)
```

Parameters

value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setMagnifierFrameThickness Method

Sets the thickness of the magnifier frame, expressed in pixels.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMagnifierFrameThickness (
    int value
)
```

Parameters

value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setMagnifierHeight Method

Sets the height of the magnifier tool, expressed in pixels.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMagnifierHeight (
    int value
)
```

Parameters

value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setMagnifierSecondaryFrameColor Method

Sets the secondary color of the magnifier frame.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMagnifierSecondaryFrameColor (
    Color value
)
```

Parameters

value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setMagnifierShading Method

Sets a value indicating whether to enhance the effect of a magnifier lense by using a gradient shading.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMagnifierShading (
    boolean value
)
```

Parameters

value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setMagnifierShape Method

Sets the shape of the magnifier tool.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMagnifierShape (
    Shape value
)
```

Parameters

value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setMagnifierWidth Method

Sets the width of the magnifier tool, expressed in pixels.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMagnifierWidth (
    int value
)
```

Parameters

value

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setMiddleButtonActions Method

Sets what actions are performed via the middle mouse button.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMiddleButtonActions (
    EnumSet<MouseButtonAction> value
)
```

Parameters

value
An enumset of MouseButtonAction values.

Remarks

This property allows the following actions to be assigned to the middle mouse button: panning the diagram view, canceling the current drawing operation, or starting a multiple selection operation.

See Also

DiagramView.setModificationStart Method

Sets a value indicating how users can start modifying items in the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setModificationStart (
    ModificationStart value
)
```

Parameters

value
A member of the ModificationStart enumeration.

See Also

DiagramView Members
DiagramView Class

DiagramView.setMoveCursor Method

Sets the cursor shown when the item under the mouse pointer can be modified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMoveCursor (
    Cursor value
)
```

Parameters

value
A **java.awt.Cursor** object.

See Also

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setPanCursor Method

Sets the cursor shown when panning the diagram view

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setPanCursor (
    Cursor value
)
```

Parameters

value
A java.awt.Cursor object.

See Also

DiagramView Members
DiagramView Class

DiagramView.setRightButtonActions Method

Sets what actions are performed via the right mouse button.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRightButtonActions (
    EnumSet<MouseButtonAction> value
)
```

Parameters

value
An enumset of MouseButtonAction values.

Remarks

This property allows the following actions to be assigned to the right mouse button: panning the diagram view, canceling the current drawing operation, or starting a multiple selection operation.

DiagramView.setScrollZoneSize Method

Sets the size of the auto scroll zone near the edges of the control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setScrollZoneSize (
    int value
)
```

Parameters

value
An integer value specifying the scroll zone size.

setAutoScroll Method

DiagramView.setShowToolTips Method

Sets a value indicating whether an item's ToolTip is shown when the pointer hovers over the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setShowToolTips (
    boolean value
)
```

Parameters

value
true if tooltips are shown for the diagram items that have them, otherwise **false**.

DiagramView.setTextAntiAlias Method

Sets the current anti-aliasing mode for text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTextAntiAlias (
    SmoothingMode antiAlias
)
```

Parameters

antiAlias
A member of the SmoothingMode enumeration.

DiagramView.setTrackPointedItem Method

Sets a value indicating whether the control should raise mouse hover events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTrackPointedItem (
    boolean value
)
```

Parameters

value
true if mouse hover events should be raised when the pointer enters or leaves the boundaries of an item, or **false** otherwise.

linkHovered Event

DiagramView.setVerticalDropAlignment Method

Sets the vertical placement of nodes created by drag-and-drop operations, relatively to mouse cursor.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setVerticalDropAlignment (
    VerticalAlignment value
)
```

Parameters

value
A member of the VerticalAlignment enumeration.

Remarks

This property lets you center the new node or align specified edge to the mouse pointer position when drag-and-drop ends.

DiagramView.setVerticalResizeCursor Method

Sets the cursor shown when dragging from the current mouse pointer location would start resizing an item vertically.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setVerticalResizeCursor (
    Cursor value
)
```

Parameters

value
A **java.awt.Cursor** object.

DiagramView Members
DiagramView Class
com.mindfusion.diagramming Namespace

DiagramView.setXmlClipboard Method

Sets a value that specifies whether XML serialization will be used when saving/loading the selection to/from clipboard.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setXmlClipboard (
    boolean xmlClipboard
)
```

Parameters

xmlClipboard
true if XML serialization will be used; otherwise **false**.

DiagramView.setZoomFactor Method

Sets the zoom level.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setZoomFactor (
    float value
)
```

Parameters

value
A float value specifying the zoom factor as percents of the original view size.

com.mindfusion.diagramming Namespace
zoomToRect Method

DiagramView.startInteraction Method

Starts the specified interactive operation. Subsequent pointer movements will modify or create the item specified through the InteractionState instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void startInteraction (
    InteractionState interactionState,
    Point2D.Float point
)
```

Parameters

interactionState

point

DiagramView.suspendRepaint Method

Stops repainting the control. This is useful when using the JDiagram API from JavaScript, where the control would be repainted after each script line executes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void suspendRepaint ()
```

Remarks

The DiagramView is repainted automatically when properties of DiagramItems change. Call this method to stop repainting the view, and resumeRepaint to start repainting again.

DiagramView.toJson Method

Serializes the DiagramView's data to JSON.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static String toJson (
    DiagramView view
)
```

Parameters

view
A DiagramView Object

Return Value

The JSON string.

scrollTo Method
setZoomFactor Method

DiagramView.zoomToRect Method (Rectangle2D, boolean)

Zooms and scrolls the view to fit the specified document rectangle in the viewport.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void zoomToRect (
    Rectangle2D rect,
    boolean centered
)
```

Parameters

rect
A **Rectangle2D** instance specifying the desired viewport's position and size.

centered
true to center the rectangle in viewport, or **false** to align it to top-left corner.

DirectionConstraint Enumeration

The members of these enumeration specify in what direction to constrain the movement of a node. These constants can be used as parameters of the setMoveDirection method of the NodeConstraints class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public enum DirectionConstraint
```

Members

	Member name	Description
	Horizontal	Users are allowed to move the node horizontally.
	None	Specifies no restrictions.
	Vertical	Users are allowed to move the node vertically.

DisconnectLinkCmd Members

Disconnects links from a deleted node.

The following tables list the members exposed by the DisconnectLinkCmd type.

Public Constructors

	Name	Description
	DisconnectLinkCmd	Initializes a new instance of the **DisconnectLinkCmd** class.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)
	execute	Carries out the command's action.
	getLink	Gets a reference to the modified link.
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	This method is called by the UndoManager when redoing actions.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	This method is called by the **UndoManager** when undoing actions.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related. (Inherited from Command.)
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

DisconnectLinkCmd Methods

DisconnectLinkCmd.execute Method

Carries out the command's action.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void execute (
    boolean undoEnabled
)
```

Parameters

undoEnabled
true if the undo manager is enabled at this time, or **false** otherwise.

DocumentView Members

Represents an extended DiagramView for DiagramDocument objects.

The following tables list the members exposed by the DocumentView type.

Public Constructors

	Name	Description
	DocumentView	Initializes a new instance of the **DocumentView** class.

Public Methods

	Name	Description
	adoptHostedControls	Adopts controls hosted in other views and moves them to this view. (Inherited from DiagramView.)
	ancestorAdded	Implements **AncestorListener**. Call the base method if you inherit the Diagram class and need to override this method. (Inherited from DiagramView.)
	ancestorMoved	Implements **AncestorListener**. Call the base method if you inherit the **Diagram** class and need to override this

		method. (Inherited from DiagramView.)
	ancestorRemoved	Implements **AncestorListener**. Call the base method if you inherit the **Diagram** class and need to override this method. (Inherited from DiagramView.)
	beginEdit	Overloaded. (Inherited from DiagramView.)
	bringIntoView	Overloaded. Scrolls the view to make the specified item or rectangular area visible. (Inherited from DiagramView.)
	cancelDrag	Cancels the modification of the selected items. (Inherited from DiagramView.)
	copyToClipboard	Overloaded. (Inherited from DiagramView.)
	cutToClipboard	Overloaded. (Inherited from DiagramView.)
	deviceToDoc	Overloaded. (Inherited from DiagramView.)
	disableInteractionBuffer	For internal use. (Inherited from DiagramView.)
	docToDevice	Overloaded. (Inherited from DiagramView.)
	dragEnter	(Inherited from DiagramView.)
	dragExit	(Inherited from DiagramView.)
	dragOver	(Inherited from DiagramView.)
	drop	(Inherited from DiagramView.)
	dropActionChanged	(Inherited from DiagramView.)
	endEdit	Exits in-place editing mode and either accepts or rejects the changes made to the item's text. (Inherited from DiagramView.)
	getAllowInplaceEdit	Gets a value indicating whether users are allowed to edit the text of diagram items. (Inherited from DiagramView.)
	getAllowLinkCursor	Gets the cursor shown when the currently drawn link can be attached to the item at the current mouse pointer location. (Inherited from DiagramView.)
	getAntiAlias	Gets the current anti-aliasing mode for non text objects. (Inherited from DiagramView.)
	getAutoScroll	Gets a value indicating whether the diagram will scroll automatically when the pointer is dragged towards the edge of the view. (Inherited from DiagramView.)
	getBehavior	Gets a value indicating how the control responds to users actions. (Inherited from DiagramView.)
	getCounterDiagonalResizeCursor	Gets the cursor shown when dragging from the current mouse pointer location would start resizing an item along its secondary diagonal. (Inherited from DiagramView.)
	getCurrentPage	Gets the currently active page.
	getCustomBehavior	Gets custom behavior object specifying how the control responds to mouse input. (Inherited from DiagramView.)
	getCustomLinkType	Gets a custom type of DiagramLink-derived objects that will be created when the users starts drawing with the

		mouse. (Inherited from DiagramView.)
	getCustomNodeType	Gets the type of a DiagramNode-derived class whose instance should be created when a user starts drawing. (Inherited from DiagramView.)
	getDelKeyAction	Gets a value that specifies what action should be carried out when the user hits the Del key. (Inherited from DiagramView.)
	getDiagonalResizeCursor	Gets the cursor shown when dragging from the current mouse pointer location would start resizing an item along its main diagonal. (Inherited from DiagramView.)
	getDiagram	Gets the diagram displayed by this view. (Inherited from DiagramView.)
	getDisallowCursor	Gets the cursor shown when an item cannot be created at the current mouse pointer location. (Inherited from DiagramView.)
	getDisallowLinkCursor	Gets the cursor shown when the currently created link cannot be attached to the item at the current mouse pointer location. (Inherited from DiagramView.)
	getDocument	Gets the displayed diagram document.
	getDragIndicatorOpacity	Gets the opacity of ghost image displayed during drag-and-drop from NodeListView. (Inherited from DiagramView.)
	getDragThreshold	Gets the minimum distance the pointer should be dragged, measured in pixels, that would cause a drag event instead of click. (Inherited from DiagramView.)
	getDrawLinkCursor	Gets the cursor shown when a link can be drawn from the current mouse pointer location. (Inherited from DiagramView.)
	getEditTextCursor	Gets the mouse cursor shown to the user when the mouse is positioned over an edit component. (Inherited from DiagramView.)
	getFont	(Inherited from DiagramView.)
	getGlassPane	For internal use. (Inherited from DiagramView.)
	getHorizontalDropAlignment	Gets the horizontal placement of nodes created by drag-and-drop operations, relatively to mouse cursor. (Inherited from DiagramView.)
	getHorizontalResizeCursor	Gets the cursor shown when dragging from the current mouse pointer location would start resizing an item horizontally. (Inherited from DiagramView.)
	getInplaceEditAcceptOnEnter	Gets a value indicating whether pressing the ENTER key ends in-place editing and accepts changes. (Inherited from DiagramView.)
	getInplaceEditCancelOnEsc	Gets a value indicating whether pressing the ESC key ends in-place editing and cancels changes. (Inherited from DiagramView.)

	getInplaceEditFont	Gets the font used to display text in the in-place editing text control. (Inherited from DiagramView.)
	getLaneColumnResizeCursor	Gets the mouse cursor shown to the user when dragging would resize a lane column header. (Inherited from DiagramView.)
	getLaneRowResizeCursor	Gets the mouse cursor shown to the user when dragging would resize a lane row header. (Inherited from DiagramView.)
	getMagnifierEnabled	Gets a value indicating whether the magnifier tool is currently enabled. (Inherited from DiagramView.)
	getMagnifierFactor	Gets the zoom factor of the magnifier tool. (Inherited from DiagramView.)
	getMagnifierFrameColor	Gets the color of the magnifier frame. (Inherited from DiagramView.)
	getMagnifierFrameThickness	Gets the thickness of the magnifier frame, expressed in pixels. (Inherited from DiagramView.)
	getMagnifierHeight	Gets the height of the magnifier tool, expressed in pixels. (Inherited from DiagramView.)
	getMagnifierSecondaryFrameColor	Gets the secondary color of the magnifier frame. (Inherited from DiagramView.)
	getMagnifierShading	Gets a value indicating whether to enhance the effect of a magnifier lense by using a gradient shading. (Inherited from DiagramView.)
	getMagnifierShape	Gets the shape of the magnifier tool. (Inherited from DiagramView.)
	getMagnifierWidth	Gets the width of the magnifier tool, expressed in pixels. (Inherited from DiagramView.)
	getMiddleButtonActions	Gets what actions are performed via the middle mouse button. (Inherited from DiagramView.)
	getModificationStart	Gets a value indicating how users can start modifying items in the diagram. (Inherited from DiagramView.)
	getModifierKeyActions	Gets an object that allows changing the function of keyboard modifier keys such as CTRL and ALT. (Inherited from DiagramView.)
	getMoveCursor	Gets the cursor shown when the item under the mouse pointer can be modified. (Inherited from DiagramView.)
	getPanCursor	Gets the cursor shown when panning the diagram view. (Inherited from DiagramView.)
	getPointerCursor	Gets the mouse cursor shown when no modification is performed. (Inherited from DiagramView.)
	getPreferredScrollableViewportSize	Provides support for scrolling when the diagram in placed inside a scroll pane. (Inherited from DiagramView.)
	getPreferredSize	Returns the size of the diagram in pixels, based on the currently set document size and zoom level. (Inherited from DiagramView.)

	getPrintOptions	Returns a PrintOptions instance that allows customizing various aspects of printing and print-preview. (Inherited from DiagramView.)
	getRightButtonActions	Gets what actions are performed via the right mouse button. (Inherited from DiagramView.)
	getRotateCursor	Gets the cursor shown when dragging from the current mouse pointer location would start rotating a box. (Inherited from DiagramView.)
	getScrollableBlockIncrement	Provides support for scrolling when the diagram in placed inside a scroll pane. (Inherited from DiagramView.)
	getScrollableTracksViewportHeight	Provides support for scrolling when the diagram in placed inside a scroll pane. (Inherited from DiagramView.)
	getScrollableTracksViewportWidth	Provides support for scrolling when the diagram in placed inside a scroll pane. (Inherited from DiagramView.)
	getScrollableUnitIncrement	Provides support for scrolling when the diagram in placed inside a scroll pane. (Inherited from DiagramView.)
	getScrollX	Gets the horizontal scroll position. (Inherited from DiagramView.)
	getScrollY	Gets the vertical scroll position. (Inherited from DiagramView.)
	getScrollZoneSize	Gets the size of the auto scroll zone near the edges of the control. (Inherited from DiagramView.)
	getShowToolTips	Gets a value indicating whether an item's ToolTip is shown when the pointer hovers over the item. (Inherited from DiagramView.)
	getTextAntiAlias	Gets the current anti-aliasing mode for text. (Inherited from DiagramView.)
	getToolTipText	Returns the string to be used as the tooltip for event. (Inherited from DiagramView.)
	getTrackPointedItem	Gets a value indicating whether the control will raise mouse hover events. (Inherited from DiagramView.)
	getVerticalDropAlignment	Gets the vertical placement of nodes created by drag-and-drop operations, relatively to mouse cursor. (Inherited from DiagramView.)
	getVerticalResizeCursor	Gets the cursor shown when dragging from the current mouse pointer location would start resizing an item vertically. (Inherited from DiagramView.)
	getXmlClipboard	Gets a value that specifies whether XML serialization will be used when saving/loading the selection to/from clipboard. (Inherited from DiagramView.)
	getZoomFactor	Gets the current zoom level. (Inherited from DiagramView.)
	loadFrom	Loads the document from the specified stream.
	loadFromJson	Overloaded. (Inherited from DiagramView.)

	loadFromJsonString	Loads the specified JSON data. (Inherited from DiagramView.)
	loadFromString	Loads the diagram contents from a string. (Inherited from DiagramView.)
	loadFromXml	Loads the diagram document from the specified XML Document.
	lostOwnership	(Inherited from DiagramView.)
	pasteFromClipboard	Overloaded. (Inherited from DiagramView.)
	print	Overloaded. (Inherited from DiagramView.)
	printPreview	Overloaded. (Inherited from DiagramView.)
	recreateCacheImage	Recreates the off-screen cache bitmap used for fast drawing while modifying items. (Inherited from DiagramView.)
	repaint	Overloaded. (Inherited from DiagramView.)
	resumeRepaint	Resumes repainting the control after a suspendRepaint call. (Inherited from DiagramView.)
	saveTo	Saves the document into the specified stream.
	saveToJson	Overloaded. (Inherited from DiagramView.)
	saveToJsonString	Serializes the DiagramView's data to JSON. (Inherited from DiagramView.)
	saveToString	Overloaded. (Inherited from DiagramView.)
	saveToXml	Saves the diagram document into the specified XML Document.
	scrollTo	Scrolls the diagram to the specified position. The **Diagram** component must be contained within a JScrollPane in order to use this method. (Inherited from DiagramView.)
	setAllowInplaceEdit	Sets a value indicating whether users are allowed to edit the text of diagram items. (Inherited from DiagramView.)
	setAllowLinkCursor	Sets the cursor shown when the currently drawn link can be attached to the item at the current mouse pointer location. (Inherited from DiagramView.)
	setAntiAlias	Sets the current anti-aliasing mode for non text objects. (Inherited from DiagramView.)
	setAutoScroll	Sets a value indicating whether the diagram should scroll automatically when the pointer is dragged towards the edge of the view. (Inherited from DiagramView.)
	setBehavior	Sets a value indicating how the control should respond to users actions. (Inherited from DiagramView.)
	setCounterDiagonalResizeCursor	Sets the cursor shown when dragging from the current mouse pointer location would start resizing an item along its secondary diagonal. (Inherited from DiagramView.)

	setCurrentPage	Sets the currently active page.
	setCustomBehavior	Sets a custom behavior object specifying how the control responds to mouse input. (Inherited from DiagramView.)
	setCustomLinkType	Sets a custom type of **DiagramLink**-derived objects that will be created when the users starts drawing with the mouse. (Inherited from DiagramView.)
	setCustomNodeType	Sets the type of a DiagramNode-derived class whose instance should be created when a user starts drawing. (Inherited from DiagramView.)
	setDelKeyAction	Sets a value that specifies what action should be carried out when the user hits the Del key. (Inherited from DiagramView.)
	setDiagonalResizeCursor	Sets the cursor shown when dragging from the current mouse pointer location would start resizing an item along its main diagonal. (Inherited from DiagramView.)
	setDiagram	Sets the diagram displayed by this view. (Inherited from DiagramView.)
	setDisallowCursor	Sets the cursor shown when an item cannot be created at the current mouse pointer location. (Inherited from DiagramView.)
	setDisallowLinkCursor	Sets the cursor shown when the currently created link can be attached to the item at the current mouse pointer location. (Inherited from DiagramView.)
	setDocument	Sets the displayed diagram document.
	setDragIndicatorOpacity	Sets the opacity of ghost image displayed during drag-and-drop from **NodeListView**. (Inherited from DiagramView.)
	setDragThreshold	Sets the minimum distance the pointer should be dragged, measured in pixels, that would cause a drag event instead of click. (Inherited from DiagramView.)
	setDrawLinkCursor	Sets the cursor shown when a link can be drawn from the current mouse pointer location. (Inherited from DiagramView.)
	setEditTextCursor	Gets the mouse cursor shown to the user when the mouse is positioned over an edit component. (Inherited from DiagramView.)
	setHorizontalDropAlignment	Sets the horizontal placement of nodes created by drag-and-drop operations, relatively to mouse cursor. (Inherited from DiagramView.)
	setHorizontalResizeCursor	Sets the cursor shown when dragging from the current mouse pointer location would start resizing an item horizontally. (Inherited from DiagramView.)
	setInplaceEditAcceptOnEnter	Sets a value indicating whether pressing the ENTER key ends in-place editing and accepts changes. (Inherited from DiagramView.)
	setInplaceEditCancelOnEsc	Sets a value indicating whether pressing the ESC key ends in-place editing and cancels changes. (Inherited from

		DiagramView.)
	setInplaceEditFont	Sets the font used to display text in the in-place editing text control. (Inherited from DiagramView.)
	setLaneColumnResizeCursor	Sets the mouse cursor shown to the user when dragging would resize a lane column header. (Inherited from DiagramView.)
	setLaneRowResizeCursor	Sets the mouse cursor shown to the user when dragging would resize a lane row header. (Inherited from DiagramView.)
	setLicenseKey	Sets the component's license key string, disabling evaluation mode. (Inherited from DiagramView.)
	setMagnifierEnabled	Sets a value indicating whether the magnifier tool is currently enabled. (Inherited from DiagramView.)
	setMagnifierFactor	Gets the zoom factor of the magnifier tool. (Inherited from DiagramView.)
	setMagnifierFrameColor	Sets the color of the magnifier frame. (Inherited from DiagramView.)
	setMagnifierFrameThickness	Sets the thickness of the magnifier frame, expressed in pixels. (Inherited from DiagramView.)
	setMagnifierHeight	Sets the height of the magnifier tool, expressed in pixels. (Inherited from DiagramView.)
	setMagnifierSecondaryFrameColor	Sets the secondary color of the magnifier frame. (Inherited from DiagramView.)
	setMagnifierShading	Sets a value indicating whether to enhance the effect of a magnifier lense by using a gradient shading. (Inherited from DiagramView.)
	setMagnifierShape	Sets the shape of the magnifier tool. (Inherited from DiagramView.)
	setMagnifierWidth	Sets the width of the magnifier tool, expressed in pixels. (Inherited from DiagramView.)
	setMiddleButtonActions	Sets what actions are performed via the middle mouse button. (Inherited from DiagramView.)
	setModificationStart	Sets a value indicating how users can start modifying items in the diagram. (Inherited from DiagramView.)
	setMoveCursor	Sets the cursor shown when the item under the mouse pointer can be modified. (Inherited from DiagramView.)
	setPanCursor	Sets the cursor shown when panning the diagram view (Inherited from DiagramView.)
	setPointerCursor	Sets the mouse cursor that should be shown when no modification is performed. (Inherited from DiagramView.)
	setRightButtonActions	Sets what actions are performed via the right mouse button. (Inherited from DiagramView.)
	setRotateCursor	Sets the cursor shown when dragging from the current mouse pointer location would start rotating a box. (Inherited from DiagramView.)

	setScrollX	Sets the horizontal scroll position. The **Diagram** component must be contained within a JScrollPane in order to use this method. (Inherited from DiagramView.)
	setScrollY	Sets the vertical scroll position. The **Diagram** component must be contained within a JScrollPane in order to use this method. (Inherited from DiagramView.)
	setScrollZoneSize	Sets the size of the auto scroll zone near the edges of the control. (Inherited from DiagramView.)
	setShowToolTips	Sets a value indicating whether an item's **ToolTip** is shown when the pointer hovers over the item. (Inherited from DiagramView.)
	setTextAntiAlias	Sets the current anti-aliasing mode for text. (Inherited from DiagramView.)
	setTrackPointedItem	Sets a value indicating whether the control should raise mouse hover events. (Inherited from DiagramView.)
	setVerticalDropAlignment	Sets the vertical placement of nodes created by drag-and-drop operations, relatively to mouse cursor. (Inherited from DiagramView.)
	setVerticalResizeCursor	Sets the cursor shown when dragging from the current mouse pointer location would start resizing an item vertically. (Inherited from DiagramView.)
	setXmlClipboard	Sets a value that specifies whether XML serialization will be used when saving/loading the selection to/from clipboard. (Inherited from DiagramView.)
	setZoomFactor	Sets the zoom level. (Inherited from DiagramView.)
	startInteraction	Starts the specified interactive operation. Subsequent pointer movements will modify or create the item specified through the InteractionState instance. (Inherited from DiagramView.)
	suspendRepaint	Stops repainting the control. This is useful when using the JDiagram API from JavaScript, where the control would be repainted after each script line executes. (Inherited from DiagramView.)
	toJson	Serializes the DiagramView's data to JSON. (Inherited from DiagramView.)
	zoomToFit	Overloaded. (Inherited from DiagramView.)
	zoomToRect	Overloaded. (Inherited from DiagramView.)

Protected Methods

	Name	Description
	paintComponent	(Inherited from DiagramView.)
	processKeyEvent	(Inherited from DiagramView.)

com.mindfusion.diagramming Namespace

DocumentView Methods

DocumentView.getCurrentPage Method

Gets the currently active page.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramPage getCurrentPage ()
```

Return Value

The current DiagramPage object.

See Also

DocumentView Members
DocumentView Class
com.mindfusion.diagramming Namespace

DocumentView.getDocument Method

Gets the displayed diagram document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramDocument getDocument ()
```

Return Value

A DiagramDocument instance.

See Also

DocumentView Members
DocumentView Class
com.mindfusion.diagramming Namespace

DocumentView.loadFrom Method

Loads the document from the specified stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFrom (
    InputStream stream
)
```

Parameters

stream
A **java.io.InputStream** instance.

See Also

DocumentView Members
DocumentView Class
com.mindfusion.diagramming Namespace

DocumentView.loadFromXml Method

Loads the diagram document from the specified XML Document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    Document document,
    boolean freeProcessedXml
)
```

Parameters

document

freeProcessedXml

See Also

DocumentView Members
DocumentView Class
com.mindfusion.diagramming Namespace

DocumentView.saveTo Method

Saves the document into the specified stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveTo (
    OutputStream stream
)
```

Parameters

stream

A **java.io.OutputStream** instance.

See Also

DocumentView Members
DocumentView Class
com.mindfusion.diagramming Namespace

DocumentView.saveToXml Method

Saves the diagram document into the specified XML Document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    Document document,
    boolean includeUnalteredProperties
)
```

Parameters

document

includeUnalteredProperties

See Also

DocumentView Members
DocumentView Class
com.mindfusion.diagramming Namespace

DocumentView.setCurrentPage Method

Sets the currently active page.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCurrentPage (
    DiagramPage value
)
```

Parameters

value

See Also

DocumentView Members
DocumentView Class
com.mindfusion.diagramming Namespace

DocumentView.setDocument Method

Sets the displayed diagram document.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDocument (
    DiagramDocument value
)
```

Parameters

value
A DiagramDocument instance.

DraggedItem Class

Class used to hold a DiagramItem reference during drag and drop.

Syntax

Java

```
public class DraggedItem
```

Inheritance Hierarchy

java.lang.Object
com.mindfusion.diagramming.DraggedItem

See Also

DraggedItem Members
com.mindfusion.diagramming Namespace

DraggedItem Members

Class used to hold a DiagramItem reference during drag and drop.

The following tables list the members exposed by the DraggedItem type.

Public Constructors

	Name	Description
	DraggedItem	Overloaded.

Public Methods

	Name	Description
	getAutoConnectDistance	Gets the maximum distance within which a link will attempt to auto-connect to a nearby node.
	getAutoConnectLinks	Gets a value indicating whether links should be automatically connected to nearby nodes when dropped.
	getItem	Gets the item that holds the dragged DiagramItem.
	getLabel	Gets the text displayed for the item.
	getNode	Gets the node that holds the dragged DiagramNode.
	getSize	Get the size of the item.
	setAutoConnectDistance	Sets the maximum distance within which a link will attempt to auto-connect to a nearby node.
	setAutoConnectLinks	Sets a value indicating whether links should be automatically connected to nearby nodes when dropped.
	setItem	Sets the item that holds the dragged DiagramItem.
	setLabel	Sets the text displayed for the item.
	setNode	Sets the node that holds the dragged DiagramNode.
	setSize	Set the size of the item.

See Also

DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem Constructor

Overload List

Name	Description
DraggedItem (DiagramNode, Dimension2D)	Initializes a new instance of the DraggedNode class.
DraggedItem (DiagramNode, Dimension2D, String)	Initializes a new instance of the DraggedNode class.

See Also

DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem Constructor (DiagramNode, Dimension2D)

Initializes a new instance of the DraggedNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DraggedItem (
    DiagramNode node,
    Dimension2D size
)
```

Parameters

node
The dragged DiagramNode.

size
The size of the node.

See Also

DraggedItem Constructor Overload List
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem Constructor (DiagramNode, Dimension2D, String)

Initializes a new instance of the DraggedNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DraggedItem (
    DiagramNode node,
    Dimension2D size,
    String label
)
```

Parameters

node
The dragged DiagramNode.

size
The size of the node.

label
The text to be displayed for the node.

See Also

DraggedItem Constructor Overload List
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem Methods

DraggedItem.getAutoConnectDistance Method

Gets the maximum distance within which a link will attempt to auto-connect to a nearby node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getAutoConnectDistance ()
```

Return Value

The auto-connect distance.

See Also

DraggedItem Members
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem.getAutoConnectLinks Method

Gets a value indicating whether links should be automatically connected to nearby nodes when dropped.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAutoConnectLinks ()
```

Return Value

true to auto-connect links, otherwise false.

See Also

DraggedItem Members
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem.getItem Method

Gets the item that holds the dragged DiagramItem.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem getItem ()
```

Return Value

See Also

DraggedItem Members
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem.getLabel Method

Gets the text displayed for the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getLabel ()
```

Return Value

See Also

DraggedItem Members
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem.getNode Method

Gets the node that holds the dragged DiagramNode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode getNode ()
```

Return Value

See Also

DraggedItem Members
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem.getSize Method

Get the size of the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension2D getSize ()
```

Return Value

See Also

DraggedItem Members
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem.setAutoConnectDistance Method

Sets the maximum distance within which a link will attempt to auto-connect to a nearby node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoConnectDistance (
    float value
)
```

Parameters

value
The auto-connect distance.

See Also

DraggedItem Members
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem.setAutoConnectLinks Method

Sets a value indicating whether links should be automatically connected to nearby nodes when dropped.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoConnectLinks (
    boolean value
)
```

Parameters

value
true to auto-connect links, otherwise false.

See Also

DraggedItem Members
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem.setItem Method

Sets the item that holds the dragged DiagramItem.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setItem (
    DiagramItem value
)
```

Parameters

value

See Also

DraggedItem Members
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem.setLabel Method

Sets the text displayed for the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLabel (
    String value
)
```

Parameters

value

See Also

DraggedItem Members
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem.setNode Method

Sets the node that holds the dragged DiagramNode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setNode (
    DiagramNode value
)
```

Parameters

value

See Also

DraggedItem Members
DraggedItem Class
com.mindfusion.diagramming Namespace

DraggedItem.setSize Method

Set the size of the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSize (
    Dimension2D value
)
```

Parameters

value

DraggedItemTransferable Members

Implements drag-and-drop transfers from ItemListView.

The following tables list the members exposed by the DraggedItemTransferable type.

Public Constructors

	Name	Description

	DraggedItemTransferable	Initializes a new instance of the DraggedItemTransferable class.

Public Methods

	Name	Description
	getTransferData	Implements Transferable.getTransferData.
	getTransferDataFlavors	Implements Transferable.getTransferDataFlavors.
	isDataFlavorSupported	Implements Transferable.isDataFlavorSupported.

See Also

DraggedItemTransferable Class
com.mindfusion.diagramming Namespace

DraggedItemTransferable Constructor

Initializes a new instance of the DraggedItemTransferable class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DraggedItemTransferable (
    DraggedItem item
)
```

Parameters

item
A representation of the DiagramItem to transfer.

See Also

DraggedItemTransferable Class
com.mindfusion.diagramming Namespace

DraggedItemTransferable Methods

DraggedItemTransferable.getTransferData Method

Implements Transferable.getTransferData.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object getTransferData (
    DataFlavor flavor
)
```

Parameters

flavor

Return Value

See Also

DraggedItemTransferable Members
DraggedItemTransferable Class
com.mindfusion.diagramming Namespace

DraggedItemTransferable.getTransferDataFlavors Method

Implements Transferable.getTransferDataFlavors.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DataFlavor[] getTransferDataFlavors ()
```

Return Value

See Also

DraggedItemTransferable Members
DraggedItemTransferable Class
com.mindfusion.diagramming Namespace

DraggedItemTransferable.isDataFlavorSupported Method

Implements Transferable.isDataFlavorSupported.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean isDataFlavorSupported (
    DataFlavor flavor
)
```

Parameters

flavor

Return Value

DraggedShape Class

Class that holds shape id and size during drag and drop operation.

Syntax

Java
`public class DraggedShape implements Serializable`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DraggedShape

See Also

DraggedShape Members
com.mindfusion.diagramming Namespace

DraggedShape Members

Class that holds shape id and size during drag and drop operation.

The following tables list the members exposed by the DraggedShape type.

Public Constructors

	Name	Description
	DraggedShape	

Public Methods

	Name	Description
	getDefaultShapeHeight	
	getDefaultShapeWidth	
	getId	

See Also

DraggedShape Class
com.mindfusion.diagramming Namespace

DraggedShape Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DraggedShape (
    String id,
    float defaultShapeWidth,
    float defaultShapeHeight
)
```

Parameters

id

defaultShapeWidth

defaultShapeHeight

See Also

DraggedShape Class
com.mindfusion.diagramming Namespace

DraggedShape Methods

DraggedShape.getDefaultShapeHeight Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getDefaultShapeHeight ()
```

Return Value

See Also

DraggedShape Members
DraggedShape Class
com.mindfusion.diagramming Namespace

DraggedShape.getDefaultShapeWidth Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getDefaultShapeWidth ()
```

Return Value

See Also

DraggedShape Members
DraggedShape Class
com.mindfusion.diagramming Namespace

DraggedShape.getId Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public String getId ()
```

Return Value

See Also

DraggedShape Members
DraggedShape Class

DrawAnchorPointEvent Class

Contains the arguments passed to the DrawAnchorPoint event handlers.

Syntax

```
Java
public class DrawAnchorPointEvent extends EventObject
```

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.diagramming.DrawAnchorPointEvent

See Also

DrawAnchorPointEvent Members
com.mindfusion.diagramming Namespace

DrawAnchorPointEvent Members

Contains the arguments passed to the DrawAnchorPoint event handlers.

The following tables list the members exposed by the DrawAnchorPointEvent type.

Public Constructors

	Name	Description
	DrawAnchorPointEvent	Initializes a new instance of the DrawAnchorPointEvent class.

Public Methods

	Name	Description
	getAnchorIndex	Gets the index of the anchor point within its containing pattern.
	getAnchorPattern	Gets the anchor pattern containing the anchor point being drawn.
	getGraphics	Gets a **Graphics2D** object whose methods should be used to draw the anchor point mark.
	getLocation	Gets the location of the anchor point being drawn.
	getNode	Gets the node whose anchor point is being drawn.

See Also

DrawAnchorPointEvent Class
com.mindfusion.diagramming Namespace

DrawAnchorPointEvent Constructor

Initializes a new instance of the DrawAnchorPointEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DrawAnchorPointEvent (
    Object source,
    Graphics2D graphics,
    Point2D location,
    DiagramNode node,
    AnchorPattern anchorPattern,
    int anchorIndex
)
```

Parameters

source
The source of the event.

graphics

The **Graphics2D** object that represents the target of the drawing operation.

location
The position of the anchor point, expressed in document coordinates.

node
The DiagramNode related to the event.

anchorPattern
The AnchorPattern object whose point is being drawn.

anchorIndex
The zero-based index of the anchor point being drawn within its anchor pattern.

See Also

DrawAnchorPointEvent Class
com.mindfusion.diagramming Namespace

DrawAnchorPointEvent Methods

DrawAnchorPointEvent.getAnchorIndex Method

Gets the index of the anchor point within its containing pattern.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getAnchorIndex ()
```

Return Value

An integer value specifying the zero-based index of the anchor point within its AnchorPattern.

See Also

DrawAnchorPointEvent Members
DrawAnchorPointEvent Class
com.mindfusion.diagramming Namespace

DrawAnchorPointEvent.getAnchorPattern Method

Gets the anchor pattern containing the anchor point being drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public AnchorPattern getAnchorPattern ()
```

Return Value

An instance of the AnchorPattern class.

See Also

DrawAnchorPointEvent Members
DrawAnchorPointEvent Class
com.mindfusion.diagramming Namespace

DrawAnchorPointEvent.getGraphics Method

Gets a **Graphics2D** object whose methods should be used to draw the anchor point mark.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Graphics2D getGraphics ()
```

Return Value

A **Graphics2D** instance.

See Also

DrawAnchorPointEvent Members
DrawAnchorPointEvent Class
com.mindfusion.diagramming Namespace

DrawAnchorPointEvent.getLocation Method

Gets the location of the anchor point being drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Point2D getLocation ()
```

Return Value

A **Point2D** specifying the location of the anchor point.

See Also

DrawAnchorPointEvent Members
DrawAnchorPointEvent Class
com.mindfusion.diagramming Namespace

DrawAnchorPointEvent.getNode Method

Gets the node whose anchor point is being drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public DiagramNode getNode ()`

Return Value

An instance of the DiagramNode class.

See Also

DrawAnchorPointEvent Members
DrawAnchorPointEvent Class
com.mindfusion.diagramming Namespace

DrawCellEvent Class

Contains the arguments passed to the DrawCell event handlers.

Syntax

Java
`public class DrawCellEvent extends EventObject`

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.diagramming.DrawCellEvent

See Also

DrawCellEvent Members
com.mindfusion.diagramming Namespace

DrawCellEvent Members

Contains the arguments passed to the DrawCell event handlers.

The following tables list the members exposed by the DrawCellEvent type.

Public Constructors

	Name	Description
	DrawCellEvent	

Public Methods

	Name	Description
	getBounds	Gets the bounding rectangle of the cell being drawn.
	getCell	Gets the cell that should be custom drawn.
	getColumn	Gets the index of the table's column that contains Cell.
	getGraphics	A **Graphics2D** object whose methods should be used to draw the cell.
	getRow	Gets the index of the table's row that contains Cell.
	getTable	Get the table that contains Cell.

See Also

DrawCellEvent Class
com.mindfusion.diagramming Namespace

DrawCellEvent Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DrawCellEvent (
    Object source,
    Graphics2D graphics,
    TableNode table,
    int column,
    int row,
    Rectangle2D bounds
)
```

Parameters

source

graphics

table

column

row

bounds

See Also

DrawCellEvent Class
com.mindfusion.diagramming Namespace

DrawCellEvent Methods

DrawCellEvent.getBounds Method

Gets the bounding rectangle of the cell being drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Rectangle2D getBounds ()
```

Return Value

A **Rectangle2D** specifying the bounding rectangle of the cell.

See Also

DrawCellEvent Members
DrawCellEvent Class
com.mindfusion.diagramming Namespace

DrawCellEvent.getCell Method

Gets the cell that should be custom drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Cell getCell ()
```

Return Value

An instance of the cell class.

See Also

DrawCellEvent Members
DrawCellEvent Class
com.mindfusion.diagramming Namespace

DrawCellEvent.getColumn Method

Gets the index of the table's column that contains Cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getColumn ()
```

Return Value

An integer value specifying the zero-based index of the column.

See Also

DrawCellEvent Members
DrawCellEvent Class
com.mindfusion.diagramming Namespace

DrawCellEvent.getGraphics Method

A **Graphics2D** object whose methods should be used to draw the cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Graphics2D getGraphics ()
```

Return Value

An instance of a class implementing the **Graphics2D** interface.

See Also

DrawCellEvent Members
DrawCellEvent Class
com.mindfusion.diagramming Namespace

DrawCellEvent.getRow Method

Gets the index of the table's row that contains Cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getRow ()
```

Return Value

An integer value specifying the zero-based index of the row.

See Also

DrawCellEvent Members
DrawCellEvent Class
com.mindfusion.diagramming Namespace

DrawCellEvent.getTable Method

Get the table that contains Cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public TableNode getTable ()
```

Return Value

An instance of the TableNode class

See Also

DrawCellEvent Members
DrawCellEvent Class
com.mindfusion.diagramming Namespace

DrawContainersBehavior Class

Implements the Behavior.DrawContainers behavior.

Syntax

```
Java
public class DrawContainersBehavior extends DrawNodesBehavior
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.Interaction
    com.mindfusion.diagramming.BehaviorBase
      com.mindfusion.diagramming.DrawNodesBehavior
        com.mindfusion.diagramming.DrawContainersBehavior

See Also

DrawContainersBehavior Members
com.mindfusion.diagramming Namespace

DrawContainersBehavior Members

Implements the Behavior.DrawContainers behavior.

The following tables list the members exposed by the DrawContainersBehavior type.

Public Constructors

	Name	Description
	DrawContainersBehavior	Initializes a new instance of the DrawContainersBehavior class.

Protected Fields

	Name	Description
	currentCursor	(Inherited from BehaviorBase.)
	diagramView	(Inherited from BehaviorBase.)

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events. (Inherited from BehaviorBase.)
	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves. (Inherited from BehaviorBase.)
	pointerOver	Invoked when the mouse moves. (Inherited from BehaviorBase.)
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events. (Inherited from BehaviorBase.)

Protected Methods

	Name	Description
	createLink	(Inherited from BehaviorBase.)
	createNode	
	getDiagram	(Inherited from BehaviorBase.)
	getDiagramView	(Inherited from BehaviorBase.)
	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state. (Inherited from BehaviorBase.)
	setMouseCursor	BehaviorBase.setMouseCursor override. (Inherited from DrawNodesBehavior.)
	startDraw	(Inherited from DrawNodesBehavior.)
	startDrawCommon	(Inherited from BehaviorBase.)

DrawControlsBehavior Members

Implements the Behavior.DrawControls behavior.

The following tables list the members exposed by the DrawControlsBehavior type.

Public Constructors

	Name	Description
	DrawControlsBehavior	Initializes a new instance of the DrawControlsBehavior class.

Protected Fields

	Name	Description
	currentCursor	(Inherited from BehaviorBase.)
	diagramView	(Inherited from BehaviorBase.)

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events. (Inherited from BehaviorBase.)
	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves. (Inherited from BehaviorBase.)
	pointerOver	Invoked when the mouse moves. (Inherited from BehaviorBase.)
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events. (Inherited from BehaviorBase.)

Protected Methods

	Name	Description
	createLink	(Inherited from BehaviorBase.)
	createNode	DrawNodesBehavior.createNode override.
	getDiagram	(Inherited from BehaviorBase.)
	getDiagramView	(Inherited from BehaviorBase.)
	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state. (Inherited from BehaviorBase.)
	setMouseCursor	BehaviorBase.setMouseCursor override. (Inherited from DrawNodesBehavior.)
	startDraw	(Inherited from DrawNodesBehavior.)
	startDrawCommon	(Inherited from BehaviorBase.)

DrawFreeFormsBehavior Members

This class is used when Behavior is set to DrawFreeForms or DrawFreeShapes.

The following tables list the members exposed by the DrawFreeFormsBehavior type.

Public Constructors

	Name	Description
	DrawFreeFormsBehavior	Initializes a new instance of the **DrawFreeFormsBehavior** class.

Protected Fields

	Name	Description
	currentCursor	(Inherited from BehaviorBase.)
	diagramView	(Inherited from BehaviorBase.)

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events. (Inherited from BehaviorBase.)
	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves. (Inherited from BehaviorBase.)
	pointerOver	Invoked when the mouse moves. (Inherited from BehaviorBase.)
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events. (Inherited from BehaviorBase.)

Protected Methods

	Name	Description
	createLink	(Inherited from BehaviorBase.)
	createNode	DrawNodesBehavior.createNode override.
	getDiagram	(Inherited from BehaviorBase.)
	getDiagramView	(Inherited from BehaviorBase.)
	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state. (Inherited from BehaviorBase.)
	setMouseCursor	BehaviorBase.setMouseCursor override. (Inherited from DrawNodesBehavior.)
	startDraw	(Inherited from DrawNodesBehavior.)
	startDrawCommon	(Inherited from BehaviorBase.)

DrawFreeFormsBehavior Class
com.mindfusion.diagramming Namespace

DrawFreeFormsBehavior Constructor

Initializes a new instance of the DrawFreeFormsBehavior class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DrawFreeFormsBehavior (
    DiagramView diagramView,
    boolean convertToShape
)
```

Parameters

diagramView
The DiagramView this behavior will be associated with.

convertToShape
true to convert the FreeFormNode to a ShapeNode once user finishes drawing it, or **false** otherwise.

See Also

DrawFreeFormsBehavior Class
com.mindfusion.diagramming Namespace

DrawFreeFormsBehavior Methods

DrawFreeFormsBehavior.createNode Method

DrawNodesBehavior.createNode override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected DiagramNode createNode ()
```

Return Value

An instance of the FreeFormNode class.

See Also

DrawFreeFormsBehavior Members

DrawItemEvent Members

Contains information passed to the custom-draw events defined in DiagramListener.

The following tables list the members exposed by the DrawItemEvent type.

Public Constructors

	Name	Description
	DrawItemEvent	Initializes a new **DrawItemEvent** instance.

Public Methods

	Name	Description
	getGraphics	Gets a reference to the destination graphics object.
	getItem	Gets a reference to the item related to the event.

See Also

DrawItemEvent Class
com.mindfusion.diagramming Namespace

DrawItemEvent Constructor

Initializes a new DrawItemEvent instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DrawItemEvent (
    Object source,
    Graphics2D graphics,
    DiagramItem item
)
```

Parameters

source
The sender of this event.

graphics
The destination graphics surface.

item
The item that should be drawn.

See Also

DrawItemEvent Class
com.mindfusion.diagramming Namespace

DrawItemEvent Methods

DrawItemEvent.getGraphics Method

Gets a reference to the destination graphics object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Graphics2D getGraphics ()
```

Return Value

A reference to a **Graphics2D** object through which the custom drawing should be performed.

See Also

DrawItemEvent Members
DrawItemEvent Class
com.mindfusion.diagramming Namespace

DrawItemEvent.getItem Method

Gets a reference to the item related to the event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem getItem ()
```

Return Value

A reference to an DiagramItem -derived object.

See Also

DrawItemEvent Members
DrawItemEvent Class
com.mindfusion.diagramming Namespace

DrawLinkEvent Class

Contains the arguments passed to the drawLink event handlers.

Syntax

Java
`public class DrawLinkEvent extends EventObject`

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.diagramming.DrawLinkEvent

See Also

DrawLinkEvent Members
com.mindfusion.diagramming Namespace

DrawLinkEvent Members

Contains the arguments passed to the drawLink event handlers.

The following tables list the members exposed by the DrawLinkEvent type.

Public Constructors

	Name	Description
	DrawLinkEvent	

Public Methods

	Name	Description
	getGraphics	Gets a **Graphics2D** object whose methods should be used to draw the link.
	getLink	Gets the DiagramLink object that should be custom drawn.
	getPoints	Gets a collection of the link's control points.
	getShadow	Gets a value indicating whether the event is raised to draw the link's shadow.

See Also

DrawLinkEvent Class
com.mindfusion.diagramming Namespace

DrawLinkEvent Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DrawLinkEvent (
    Object source,
    Graphics2D graphics,
    DiagramLink link,
    boolean shadow,
    PointList points
)
```

Parameters

source

graphics

link

shadow

points

See Also

DrawLinkEvent Class
com.mindfusion.diagramming Namespace

DrawLinkEvent Methods

DrawLinkEvent.getGraphics Method

Gets a **Graphics2D** object whose methods should be used to draw the link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Graphics2D getGraphics ()
```

Return Value

A **Graphics2D** instance.

See Also

DrawLinkEvent Members
DrawLinkEvent Class
com.mindfusion.diagramming Namespace

DrawLinkEvent.getLink Method

Gets the DiagramLink object that should be custom drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramLink getLink ()
```

Return Value

An instance of the DiagramLink class.

See Also

DrawLinkEvent Members
DrawLinkEvent Class
com.mindfusion.diagramming Namespace

DrawLinkEvent.getPoints Method

Gets a collection of the link's control points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public PointList getPoints ()
```

Return Value

An instance of the PointList class.

See Also

DrawLinkEvent Members
DrawLinkEvent Class
com.mindfusion.diagramming Namespace

DrawLinkEvent.getShadow Method

Gets a value indicating whether the event is raised to draw the link's shadow.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public boolean getShadow ()`

Return Value

true if now drawing the link's shadow; otherwise, false.

See Also

DrawLinkEvent Members
DrawLinkEvent Class
com.mindfusion.diagramming Namespace

DrawLinksBehavior Class

Implements the Behavior.DrawLinks behavior.

Syntax

Java
`public class DrawLinksBehavior extends BehaviorBase`

DrawLinksBehavior Members

Implements the Behavior.DrawLinks behavior.

The following tables list the members exposed by the DrawLinksBehavior type.

Public Constructors

	Name	Description
	DrawLinksBehavior	Initializes a new instance of the DrawLinksBehavior class.

Protected Fields

	Name	Description

	currentCursor	(Inherited from BehaviorBase.)
	diagramView	(Inherited from BehaviorBase.)

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events. (Inherited from BehaviorBase.)
	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves. (Inherited from BehaviorBase.)
	pointerOver	Invoked when the mouse moves. (Inherited from BehaviorBase.)
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events. (Inherited from BehaviorBase.)

Protected Methods

	Name	Description
	createLink	(Inherited from BehaviorBase.)
	getDiagram	(Inherited from BehaviorBase.)
	getDiagramView	(Inherited from BehaviorBase.)
	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state. (Inherited from BehaviorBase.)
	setMouseCursor	BehaviorBase.setMouseCursor override.
	startDraw	
	startDrawCommon	(Inherited from BehaviorBase.)

DrawLinksBehavior Class
com.mindfusion.diagramming Namespace

DrawLinksBehavior Constructor

Initializes a new instance of the DrawLinksBehavior class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DrawLinksBehavior (
    DiagramView diagramView
)
```

Parameters

diagramView
A DiagramView instance.

See Also

DrawLinksBehavior Class
com.mindfusion.diagramming Namespace

DrawLinksBehavior Methods

DrawLinksBehavior.setMouseCursor Method

BehaviorBase.setMouseCursor override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected CursorHint setMouseCursor (
    Point2D point,
    ByRef<Boolean> startInteraction
)
```

Parameters

point
A Point2D instance that specifies the position of the mouse cursor.

startInteraction
true if the user is going to create, delete, modify or select a DiagramItem; **false** if mouse behavior is not considered; in this case the mouse pointer is set to a default cursor according to the background LaneGrid.

Return Value

A member of the CursorHint enumeration.

See Also

DrawLinksBehavior Members
DrawLinksBehavior Class
com.mindfusion.diagramming Namespace

DrawLinksBehavior.startDraw Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected InteractionState startDraw (
    Point2D point,
    MouseEvent e
)
```

Parameters

point

e

Return Value

DrawNodeEvent Members

Contains the arguments passed to the drawNode event handlers.

The following tables list the members exposed by the DrawNodeEvent type.

Public Constructors

	Name	Description
	DrawNodeEvent	

Public Methods

	Name	Description
	getBounds	Gets the bounding rectangle of the node being drawn.
	getGraphics	Gets a **Graphics2D** object whose methods should be used to draw the node.
	getNode	Gets the DiagramNode object that should be custom drawn.
	getShadow	Gets a value indicating whether the event is raised to draw the node's shadow.

See Also

DrawNodeEvent Class
com.mindfusion.diagramming Namespace

DrawNodeEvent Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DrawNodeEvent (
    Object source,
    Graphics2D graphics,
    DiagramNode node,
    boolean shadow,
    Rectangle2D bounds
)
```

Parameters

source

graphics

node

shadow

bounds

See Also

DrawNodeEvent Class
com.mindfusion.diagramming Namespace

DrawNodeEvent Methods

DrawNodeEvent.getBounds Method

Gets the bounding rectangle of the node being drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Rectangle2D getBounds ()
```

Return Value

A **Rectangle2D** specifying the bounding rectangle of the node.

See Also

DrawNodeEvent Members
DrawNodeEvent Class
com.mindfusion.diagramming Namespace

DrawNodeEvent.getGraphics Method

Gets a **Graphics2D** object whose methods should be used to draw the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Graphics2D getGraphics ()
```

Return Value

A **Graphics2D** instance.

See Also

DrawNodeEvent Members
DrawNodeEvent Class
com.mindfusion.diagramming Namespace

DrawNodeEvent.getNode Method

Gets the DiagramNode object that should be custom drawn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramNode getNode ()
```

Return Value

An instance of the DiagramNode class.

See Also

DrawNodeEvent Members
DrawNodeEvent Class
com.mindfusion.diagramming Namespace

DrawNodeEvent.getShadow Method

Gets a value indicating whether the event is raised to draw the node's shadow.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getShadow ()
```

Return Value

true if now drawing the node's shadow; otherwise, **false**.

DrawShapesBehavior Members

Implements the Behavior.DrawShapes behavior.

The following tables list the members exposed by the DrawShapesBehavior type.

Public Constructors

	Name	Description
	DrawShapesBehavior	Initializes a new instance of the DrawShapesBehavior class.

Protected Fields

	Name	Description
	currentCursor	(Inherited from BehaviorBase.)
	diagramView	(Inherited from BehaviorBase.)

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events. (Inherited from BehaviorBase.)
	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves. (Inherited from BehaviorBase.)
	pointerOver	Invoked when the mouse moves. (Inherited from BehaviorBase.)
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events. (Inherited from BehaviorBase.)

Protected Methods

	Name	Description
	createLink	(Inherited from BehaviorBase.)
	createNode	
	getDiagram	(Inherited from BehaviorBase.)
	getDiagramView	(Inherited from BehaviorBase.)
	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state. (Inherited from BehaviorBase.)
	setMouseCursor	BehaviorBase.setMouseCursor override. (Inherited from DrawNodesBehavior.)
	startDraw	(Inherited from DrawNodesBehavior.)
	startDrawCommon	(Inherited from BehaviorBase.)

DrawTablesBehavior Members

Implements the Behavior.DrawTables behavior.

The following tables list the members exposed by the DrawTablesBehavior type.

Public Constructors

	Name	Description
	DrawTablesBehavior	Initializes a new instance of the DrawTablesBehavior class.

Protected Fields

	Name	Description
	currentCursor	(Inherited from BehaviorBase.)
	diagramView	(Inherited from BehaviorBase.)

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events. (Inherited from BehaviorBase.)
	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves. (Inherited from BehaviorBase.)
	pointerOver	Invoked when the mouse moves. (Inherited from BehaviorBase.)
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events. (Inherited from BehaviorBase.)

Protected Methods

	Name	Description
	createLink	(Inherited from BehaviorBase.)
	createNode	
	getDiagram	(Inherited from BehaviorBase.)
	getDiagramView	(Inherited from BehaviorBase.)
	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state. (Inherited from BehaviorBase.)
	setMouseCursor	BehaviorBase.setMouseCursor override. (Inherited from DrawNodesBehavior.)
	startDraw	(Inherited from DrawNodesBehavior.)
	startDrawCommon	(Inherited from BehaviorBase.)

	cycleDetected	(Inherited from DiagramItem.)
	cycleProtect	(Inherited from DiagramItem.)
	enabledHandles	(Inherited from DiagramNode.)
	handlesStyle	(Inherited from DiagramNode.)
	incomingLinks	(Inherited from DiagramNode.)
	masterGroup	(Inherited from DiagramNode.)
	modifyDX	(Inherited from DiagramItem.)
	modifyDY	(Inherited from DiagramItem.)
	modifyHandle	(Inherited from DiagramItem.)
	modifying	(Inherited from DiagramItem.)
	obstacle	(Inherited from DiagramNode.)
	outgoingLinks	(Inherited from DiagramNode.)
	pen	(Inherited from DiagramItem.)
	ptEnd	(Inherited from DiagramItem.)
	ptMdfLast	(Inherited from DiagramItem.)
	ptOrg	(Inherited from DiagramItem.)
	ptSavedEnd	(Inherited from DiagramItem.)
	ptSavedOrg	(Inherited from DiagramItem.)
	savedBounds	(Inherited from DiagramNode.)
	subordinateGroup	(Inherited from DiagramItem.)

Public Methods

	Name	Description
	addLabel	Overloaded. (Inherited from DiagramNode.)
	as	Down-casts the item to specified type. (Inherited from DiagramItem.)
	attachTo	Overloaded. (Inherited from DiagramNode.)
	clone	Creates a copy of this item. (Inherited from DiagramItem.)
	containsPoint	
	createConnectionPoint	
	detach	Detaches a node from its master group. (Inherited from DiagramNode.)
	getAllIncomingLinks	Gets a collection of all links entering this node. (Inherited from DiagramNode.)
	getAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	getAllOutgoingLinks	Gets a collection of all links going out of this node. (Inherited from DiagramNode.)
	getAllowIncomingLinks	Gets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	getAllowOutgoingLinks	Gets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	getAnchorPattern	Gets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	getBounds	Gets the node location and size. (Inherited from DiagramNode.)
	getBrush	Gets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	getCenter	Returns the center point of this node. (Inherited from DiagramNode.)
	getConstraints	Gets the movement and size constraints applied to a node. (Inherited from DiagramNode.)
	getContainer	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	getEffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style. (Inherited from DiagramItem.)

	getEffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style. (Inherited from DiagramItem.)
	getEffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	getEffects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	getEnabledHandles	Gets a combination of NodeHandleType members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	getExpandable	Gets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	getExpanded	Gets a value indicating whether the tree branch that starts from a node is expanded or collapsed. (Inherited from DiagramNode.)
	getFont	Gets the font used to draw the text of an item. (Inherited from DiagramItem.)
	getHandlesStyle	Gets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	getHyperLink	Gets the hyperlink associated with an item. (Inherited from DiagramItem.)
	getId	Gets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	getIncomingLinks	Gets the links coming into a node. (Inherited from DiagramNode.)
	getIntersection	
	getLabels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms. (Inherited from DiagramItem.)
	getLocalCenter	(Inherited from DiagramNode.)

	getLocked	Gets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	getMasterGroup	Gets the hierarchical group in which this node is a subordinate item. (Inherited from DiagramNode.)
	getMasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	getNearestBorderPoint	DiagramNode.getNearestBorderPoint override.
	getObstacle	Gets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	getOpacity	Gets the opacity of this item. (Inherited from DiagramItem.)
	getOutgoingLinks	Gets the links going out from a node. (Inherited from DiagramNode.)
	getParent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	getPen	Gets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	getPrintable	Gets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
S	getRotatedBounds	Gets the bounding rectangle of this node, when it is rotated at the specified angle around the specified pivot. (Inherited from DiagramNode.)
	getRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	getRuntimeIndex	For internal use. (Inherited from DiagramItem.)
	getSelected	Gets a value indicating whether this item is selected. (Inherited from DiagramItem.)
	getShadowBrush	Gets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getStyle	Gets the style associated with the item. (Inherited from DiagramItem.)
	getSubordinateGroup	Gets the group of subordinated items attached to this one. (Inherited from DiagramItem.)
	getTag	Gets user-defined data assigned to an item. (Inherited from DiagramItem.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	getTextPadding	Gets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)

	getToolTip	Gets the tooltip text displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	getVisible	Gets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	getWeight	Gets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	getZIndex	Gets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	hasSubordinates	Checks whether there are any nodes attached to this item. (Inherited from DiagramItem.)
	hitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	hitTestHandle	DiagramItem.hitTestHandle override.
	labelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	moveTo	Moves a node to the specified location. (Inherited from DiagramNode.)
S	nodesIntersect	Determines whether two nodes intersect. (Inherited from DiagramNode.)
	onDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	onDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	onDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	readExternal	Implements Externalizable. (Inherited from DiagramNode.)
	removeLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	resize	Sets the size of a node. (Inherited from DiagramNode.)
	setAllowIncomingLinks	Sets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	setAllowOutgoingLinks	Sets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	setAnchorPattern	Sets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	setBounds	Overloaded. (Inherited from DiagramNode.)
	setBoundsDirect	For internal use. (Inherited from DiagramNode.)

	setBrush	Sets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	setConstraints	Sets constraints to the node size and movement direction. The constraints are applied when a user modifies the node interactively. They are not checked when the position of a node is set programmatically. (Inherited from DiagramNode.)
	setEnabledHandles	Sets a combination of **NodeHandleType** members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	setExpandable	Sets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	setExpanded	Expands or collapses the tree branch that starts from a node. (Inherited from DiagramNode.)
	setExpandedFlag	Changes the "expanded" flag without actually expanding or collapsing the tree branch that starts from a node. (Inherited from DiagramNode.)
	setFont	Sets the font used to draw the text of an item. (Inherited from DiagramItem.)
	setHandlesStyle	Sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	setHyperLink	Sets the hyperlink associated with an item. (Inherited from DiagramItem.)
	setId	Assigns user-defined identifier to this item. (Inherited from DiagramItem.)
	setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	setLocked	Sets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	setObstacle	Sets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	setOpacity	Sets the opacity of this item. (Inherited from DiagramItem.)
	setPen	Sets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	setPrintable	Sets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	setRotationAngle	Sets the rotation angle of a node. (Inherited from DiagramNode.)

	setSelected	Selects or deselects an item. (Inherited from DiagramItem.)
	setShadowBrush	Sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setStyle	Sets the style associated with the item. (Inherited from DiagramItem.)
	setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event. (Inherited from DiagramItem.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	setTextPadding	Sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	setVisible	Sets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	setWeight	Sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	setZIndex	Sets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	writeExternal	Implements Externalizable. (Inherited from DiagramNode.)
	zBottom	Moves an item to the bottom of the Z order. (Inherited from DiagramItem.)
	zLevelDown	Moves an item down in the Z order. (Inherited from DiagramItem.)
	zLevelUp	Moves an item up in the Z order. (Inherited from DiagramItem.)
	zTop	Moves an item to the top of the Z order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	allowCreate	DiagramItem.allowCreate override. (Inherited from DiagramNode.)
	allowModify	(Inherited from DiagramNode.)
	allowModifyImpl	(Inherited from DiagramNode.)

	cancelModify	DiagramItem.cancelModify override. Invoked when the interactive modification of this node has been canceled. (Inherited from DiagramNode.)
	completeCreate	DiagramItem.completeCreate override. (Inherited from DiagramNode.)
	completeModify	(Inherited from DiagramNode.)
	constraintsInfringed	(Inherited from DiagramNode.)
	createProperties	DiagramItem.createProperties override. (Inherited from DiagramNode.)
	createState	DiagramItem.createState override. (Inherited from DiagramNode.)
	draw	
	drawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	drawShadow	
	drawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	getLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getLocalBoundsD	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getMeasureUnit	(Inherited from DiagramItem.)
	getRepaintRect	DiagramItem.getRepaintRect override. (Inherited from DiagramNode.)
	getValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	groupContains	(Inherited from DiagramNode.)
	loadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
	loadFromXml	(Inherited from DiagramNode.)
	move	(Inherited from DiagramNode.)
	onAdd	Called when an item is added to a Diagram, either by the user, programmatically or by undo / redo. (Inherited from DiagramItem.)
	onChangeFont	(Inherited from DiagramItem.)
	onChangeTextPadding	(Inherited from DiagramItem.)
	onChildModified	Called when a group child node has been modified. Override this method if you need to know when a node from the **SubordinateGroup** is modified. (Inherited from DiagramItem.)

	onClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	onDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	onLoad	Called when this item is loaded from a file. (Inherited from DiagramItem.)
	onMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	onModify	Called when an item is modified (Inherited from DiagramNode.)
	onRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or by undo / redo. (Inherited from DiagramNode.)
	onRotationAngleChanged	Called when the node's rotation angle changes. (Inherited from DiagramNode.)
	onStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	onStyleFontChanged	Invoked when font property values of an associated style change. (Inherited from DiagramItem.)
	onUpdateBounds	
	parentConstraintsInfringed	(Inherited from DiagramNode.)
	putExpandable	(Inherited from DiagramNode.)
	putSelected	(Inherited from DiagramItem.)
	rectFromPoints	(Inherited from DiagramNode.)
	repaint	Overloaded. (Inherited from DiagramItem.)
	resizeToFitImage	(Inherited from DiagramNode.)
	restoreProperties	DiagramItem.restoreProperties override. (Inherited from DiagramNode.)
	restoreState	DiagramItem.restoreState override. (Inherited from DiagramNode.)
	saveProperties	DiagramItem.saveProperties override. (Inherited from DiagramNode.)
	saveState	DiagramItem.saveState override. (Inherited from DiagramNode.)
	saveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	saveToXml	(Inherited from DiagramNode.)
	scaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	setDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)

	setReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	shouldRender	Determines whether the item is rendered in the current context. (Inherited from DiagramItem.)
	shouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	startCreate	DiagramItem.startCreate override. (Inherited from DiagramNode.)
	startModify	DiagramItem.startModify override. Invoked when the user starts modifying this node interactively. (Inherited from DiagramNode.)
	updateCreate	DiagramItem.updateCreate override. (Inherited from DiagramNode.)
	updateLinkPositions	(Inherited from DiagramNode.)
	updateModify	DiagramItem.updateModify override. Invoked during interactive modification of this node. (Inherited from DiagramNode.)

EditCellTextEvent Members

Contains the arguments passed to the cellTextEdited event handlers.

The following tables list the members exposed by the EditCellTextEvent type.

Public Constructors

	Name	Description
	EditCellTextEvent	Initializes a new instance of the EditCellTextEvent class.

Public Methods

	Name	Description
	getCell	Gets the cell whose text has been edited.
	getColumn	Gets the index of the table's column that contains the Cell object.
	getNewText	Gets the text that has just been entered by the user.
	getOldText	Gets the text that had been displayed in the cell before the user edited it.
	getRow	Gets the index of the table's row that contains the **Cell** object.

EditCellTextEvent Class
com.mindfusion.diagramming Namespace

EditCellTextEvent Constructor

Initializes a new instance of the EditCellTextEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public EditCellTextEvent (
    Object source,
    Cell cell,
    string oldText,
```

```
    string newText,
    int column,
    int row
)
```

Parameters

source
The source of the event.

cell
The cell related to the event.

oldText
The old text of the cell.

newText
The new text of the cell.

column
The zero-based index of the table column related to the event.

row
The zero-based index of the table row related to the event.

EditNodeTextEvent Constructor

Initializes a new instance of the EditNodeTextEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public EditNodeTextEvent (
    Object source,
    DiagramNode node,
    string oldText,
    string newText
)
```

Parameters

source
The source of the event.

node
The DiagramNode related to the event.

oldText
The old text of the node.

newText
The new text of the node.

EditTextCmd Members

Changes the text of a DiagramItem.

The following tables list the members exposed by the EditTextCmd type.

Public Constructors

	Name	Description
	EditTextCmd	Initializes a new instance of the EditTextCmd class.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)
	execute	Carries out the command action.

	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	Redoes the command action.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	Undoes the command.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related. (Inherited from Command.)
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

EffectPhase Enumeration

The members of this enumeration specify the rendering phase during which an effect application is requested.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum EffectPhase
```

Members

	Member name	Description
	AfterFill	Indicates that the **NodeEffect.apply** method is invoked after the target node is filled.
	AfterOutline	Indicates that the **NodeEffect.apply** method is invoked after the target node is stroked.
	BeforeFill	Indicates that the **NodeEffect.apply** method is invoked before the target node is filled.

ElementTemplate Methods

ElementTemplate.getColor Method

Gets the color of this element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Color getColor ()
```

Return Value

A **java.awt.Color** instance.

Remarks

If this value is **null**, the element is drawn using the color assigned to the ShapeNode's Pen.

ExpandButtonAction Enumeration

The members of this enumeration specify what action is triggered by the +/- buttons that are displayed near expandable nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum ExpandButtonAction`

Members

	Member name	Description
	ExpandTreeBranch	Expands or collapses the children of a node in a tree-like diagram and raises the treeExpanded or treeCollapsed event.
	RaiseEvents	Raises the expandButtonClicked event.

See Also

com.mindfusion.diagramming Namespace

ExpandButtonPosition Enumeration

The members of this enumeration specify possible locations for expand/collapse buttons.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum ExpandButtonPosition`

Members

	Member name	Description
	OuterBottom	Place expand/collapse buttons at the bottom side of their nodes.
	OuterLeft	Place expand/collapse buttons at the left-hand side of their nodes.
	OuterLowerLeft	Place expand/collapse buttons at the lower-left corner of their nodes.
	OuterLowerRight	Place expand/collapse buttons at the lower-right corner of their nodes.
	OuterRight	Place expand/collapse buttons at the right-hand side of their nodes.
	OuterTop	Place expand/collapse buttons at the top side of their nodes.
	OuterUpperLeft	Place expand/collapse buttons at the upper-left corner of their nodes.
	OuterUpperRight	Place expand/collapse buttons at the upper-right corner of their nodes.

ExpandHeaderRowCmd Members

Implements undo and redo of collapsing or expanding the header row of a table section.

The following tables list the members exposed by the ExpandHeaderRowCmd type.

Public Constructors

	Name	Description
	ExpandHeaderRowCmd	Initializes a new **ExpandHeaderRowCmd** instance.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)
	execute	This method is called internally by JDiagram when performing the action.
	getRowIndex	Gets the index of the header row that defines which rows are collapsed or defined.
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTable	Gets the table whose rows are expanded or collapsed by this command.
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	This method is called by the UndoManager when redoing actions.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	This method is called by the **UndoManager** when undoing actions.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related. (Inherited from Command.)
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)
