Initializes a new instance of the StackPanel class.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public StackPanel ()
```

See Also

StackPanel Class
com.mindfusion.diagramming.components Namespace

StackPanel Methods

StackPanel.arrangeComponents Method

ContainerComponent.arrangeComponents override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void arrangeComponents (
    Rectangle2D.Float availableSpace,
    Graphics2D g2d
)
```

Parameters

availableSpace

g2d

See Also

StackPanel Members
StackPanel Class
com.mindfusion.diagramming.components Namespace

StackPanel.getDesiredSize Method

ContainerComponent.getDesiredSize override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public XDimension2D.Double getDesiredSize (
    XDimension2D.Double availableSize,
    Graphics2D g2d
)
```

Parameters

availableSize

g2d

Return Value

See Also

StackPanel Members
StackPanel Class
com.mindfusion.diagramming.components Namespace

StackPanel.getOrientation Method

Gets the orientation of the panel.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Orientation getOrientation ()
```

Return Value

A member of the ComponentBase.Orientation enumeration.

See Also

StackPanel Members
StackPanel Class
com.mindfusion.diagramming.components Namespace

StackPanel.getSpacing Method

Gets the distance between adjacent items in the panel.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public float getSpacing ()
```

Return Value

A floating point value specifying the distance in the current unit of measure.

See Also

StackPanel Members
StackPanel Class
com.mindfusion.diagramming.components Namespace

StackPanel.loadFromJson Method

Deserializes the component from a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the StackPanel data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

StackPanel Members
StackPanel Class
com.mindfusion.diagramming.components Namespace

StackPanel.loadFromXml Method

ContainerComponent.loadFromXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

StackPanel Members
StackPanel Class
com.mindfusion.diagramming.components Namespace

StackPanel.readExternal Method

ContainerComponent.readExternal override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

StackPanel Members
StackPanel Class
com.mindfusion.diagramming.components Namespace

StackPanel.saveToJson Method

Serializes the component into a JsonObject

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the StackPanel data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

StackPanel Members
StackPanel Class
com.mindfusion.diagramming.components Namespace

StackPanel.saveToXml Method

ContainerComponent.saveToXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

StackPanel Members
StackPanel Class
com.mindfusion.diagramming.components Namespace

StackPanel.setOrientation Method

Sets the orientation of the panel.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setOrientation (
    Orientation value
)
```

Parameters

value
A member of the ComponentBase.Orientation enumeration. The default is Vertical.

See Also

StackPanel Members
StackPanel Class
com.mindfusion.diagramming.components Namespace

StackPanel.setSpacing Method

Sets the distance between adjacent items in the panel.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setSpacing (
    float value
)
```

Parameters

value
A floating point value specifying the distance in the current unit of measure. The default is 0.

StackPanel Members
StackPanel Class
com.mindfusion.diagramming.components Namespace

StackPanel.writeExternal Method

ContainerComponent.writeExternal override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

`public void writeExternal (`
`  ObjectOutput out`
`)`

Parameters

out

TextComponent Members

Represents a component displaying static unformatted text.

The following tables list the members exposed by the TextComponent type.

Public Constructors

	Name	Description
	TextComponent	Initializes a new instance of the TextComponent class.

Protected Fields

	Name	Description

	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	arrangeComponents	Recursively arranges the child components, within the specified space and using the specified graphics for measurement purposes. (Inherited from ComponentBase.)
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	For internal use. (Inherited from ComponentBase.)
	draw	ComponentBase.draw override.
	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
	getBackground	Gets the brush used to fill the background of the component.
	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getChildCount	Gets the number of child components of this component. (Inherited from ComponentBase.)
	getCursor	Gets the cursor to display when the mouse is at the specified position. (Inherited from ComponentBase.)
	getDesiredSize	ComponentBase.getDesiredSize override.
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)
	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	getFont	Gets the font of the displayed text.
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel.

		(Inherited from ComponentBase.)
	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
	getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	getName	Gets the name of the component. (Inherited from ComponentBase.)
	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getText	Gets the text displayed by the component.
	getTextColor	Gets the color of the displayed text.
	getTextFormat	Gets the formatting of the displayed text.
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	(Inherited from ComponentBase.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)

onKeyUp	(Inherited from ComponentBase.)
onMouseMove	Overloaded. (Inherited from ComponentBase.)
onMouseUp	Overloaded. (Inherited from ComponentBase.)
onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
raiseValidated	(Inherited from ComponentBase.)
readExternal	ComponentBase.readExternal override.
removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
setBackground	Sets the brush used to fill the background of the component.
setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
setFont	Sets the font of the displayed text.
setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)

	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setText	Sets the text displayed by the component.
	setTextColor	Sets the color of the displayed text.
	setTextFormat	Sets the formatting of the displayed text.
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ComponentBase.writeExternal override.

Protected Methods

	Name	Description
	loadFromJson	Deserializes the component from a JsonObject.
	loadFromXml	ComponentBase.loadFromXml override.
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onMouseDown	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)

	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	Serializes the component into a JsonObject.
	saveToXml	ComponentBase.saveToXml override.
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)

TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent Methods

TextComponent.draw Method

ComponentBase.draw override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void draw (
    Graphics2D g2d,
    RenderOptions options
)
```

Parameters

g2d

options

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.getBackground Method

Gets the brush used to fill the background of the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getBackground ()
```

Return Value

An instance of a Brush-derived class.

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.getDesiredSize Method

ComponentBase.getDesiredSize override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public XDimension2D.Double getDesiredSize (
    XDimension2D.Double availableSize,
    Graphics2D g2d
)
```

Parameters

availableSize

g2d

Return Value

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.getFont Method

Gets the font of the displayed text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Font getFont ()
```

Return Value

A Font object. The default is Arial, 10.

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.getText Method

Gets the text displayed by the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public String getText ()
```

Return Value

A String value.

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.getTextColor Method

Gets the color of the displayed text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public Color getTextColor ()
```

Return Value

A Color object.

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.getTextFormat Method

Gets the formatting of the displayed text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public TextFormat getTextFormat ()
```

Return Value

A TextFormat object.

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.loadFromJson Method

Deserializes the component from a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the TextComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.loadFromXml Method

ComponentBase.loadFromXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.readExternal Method

ComponentBase.readExternal override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.saveToJson Method

Serializes the component into a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the TextComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

TextComponent.setBackground Method

Sets the brush used to fill the background of the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setBackground (
    Brush value
)
```

Parameters

value
An instance of a Brush-derived class. The default is null.

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.setFont Method

Sets the font of the displayed text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setFont (
    Font value
)
```

Parameters

value
A Font object. The default is Arial, 10.

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.setText Method

Sets the text displayed by the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setText (
    String value
)
```

Parameters

value
A String value.

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.setTextColor Method

Sets the color of the displayed text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setTextColor (
    Color value
)
```

Parameters

value
A Color object. The default is Black.

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.setTextFormat Method

Sets the formatting of the displayed text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java

public void setTextFormat (
    TextFormat value
)
```

Parameters

value
A TextFormat object.

See Also

TextComponent Members
TextComponent Class
com.mindfusion.diagramming.components Namespace

TextComponent.writeExternal Method

ComponentBase.writeExternal override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java

public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

TextLayout Members

Encapsulates the layouting information for the text in edit components.

The following tables list the members exposed by the TextLayout type.

Public Constructors

	Name	Description
	TextLayout	Initializes a new instance of the TextLayout class.

Public Methods

	Name	Description
	close	
	draw	
	getCharacterIndexFromPoint	Retrieves the character at the specified position.
	getCharBounds	Gets the bounding rectangle of the character with the specified index.
	getDesiredSize	
	getEndOfLine	Retrieves the index of the last character of the specified line.
	getFontHeight	Gets the height of the underlying font.
	getLineCount	Returns the number of lines in the layout.
	getLineFromCharacterIndex	Retrieves the line containing the character with the specified index.
	getRelativeCharacterIndex	Gets the index of the character, corresponding to the position of the specified character from the line above or the line below the line containing the character.
	getStartOfLine	Retrieves the index of the first character of the specified line.
	getText	
	getTextWrapping	

	invalidate	Invalidates the text layout. Subsequent calls to various layout methods will cause a new layout pass.
	setText	
	setTextWrapping

TextLayout.draw Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void draw (
    Graphics2D g2d,
    Font font,
    Color color,
    Rectangle2D.Float bounds,
    boolean drawSelection,
    int selectionStart,
    int selectionLength,
    Color selectionColor,
    boolean drawCaret,
    int firstLine
)
```

Parameters

g2d

font

color

bounds

drawSelection

selectionStart

selectionLength

selectionColor

drawCaret

firstLine

TextLayout.getCharacterIndexFromPoint Method

Retrieves the character at the specified position.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public int getCharacterIndexFromPoint (
    Rectangle2D.Float bounds,
    Point2D.Float position,
    int firstLine
)
```

Parameters

bounds

position

firstLine

Return Value

See Also

TextLayout Members
TextLayout Class
com.mindfusion.diagramming.components Namespace

TextLayout.getCharBounds Method

Gets the bounding rectangle of the character with the specified index.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Rectangle2D.Float getCharBounds (
    int characterIndex,
    Rectangle2D.Float bounds
)
```

Parameters

characterIndex

bounds

Return Value

TextLayout.getDesiredSize Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public XDimension2D.Double getDesiredSize (
    XDimension2D.Double availableSize,
    Graphics2D g2d
)
```

Parameters

availableSize

g2d

Return Value

See Also

TextLayout Members
TextLayout Class
com.mindfusion.diagramming.components Namespace

TextLayout.getEndOfLine Method

Retrieves the index of the last character of the specified line.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public int getEndOfLine (
    Rectangle2D.Float bounds,
    int lineIndex
)
```

Parameters

bounds

lineIndex

Return Value

See Also

TextLayout Members
TextLayout Class
com.mindfusion.diagramming.components Namespace

TextLayout.getFontHeight Method

Gets the height of the underlying font.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public float getFontHeight ()
```

Return Value

See Also

TextLayout Members
TextLayout Class
com.mindfusion.diagramming.components Namespace

TextLayout.getLineCount Method

Returns the number of lines in the layout.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public int getLineCount (
    Rectangle2D.Float bounds
)
```

Parameters

bounds

Return Value

See Also

TextLayout Members
TextLayout Class
com.mindfusion.diagramming.components Namespace

TextLayout.getLineFromCharacterIndex Method

Retrieves the line containing the character with the specified index.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public int getLineFromCharacterIndex (
    Rectangle2D.Float bounds,
    int characterIndex
)
```

Parameters

bounds

characterIndex

Return Value

See Also

TextLayout Members
TextLayout Class
com.mindfusion.diagramming.components Namespace

TextLayout.getRelativeCharacterIndex Method

Gets the index of the character, corresponding to the position of the specified character from the line above or the line below the line containing the character.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public int getRelativeCharacterIndex (
    Rectangle2D.Float bounds,
    int characterIndex,
    boolean up
)
```

Parameters

bounds

characterIndex

up

Return Value

See Also

TextLayout Members
TextLayout Class
com.mindfusion.diagramming.components Namespace

TextLayout.getStartOfLine Method

Retrieves the index of the first character of the specified line.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public int getStartOfLine (
    Rectangle2D.Float bounds,
    int lineIndex
)
```

Parameters

bounds

lineIndex

Return Value

```
public String getText ()
```

Return Value

See Also

TextLayout Members
TextLayout Class
com.mindfusion.diagramming.components Namespace

TextLayout.getTextWrapping Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public TextWrapping getTextWrapping ()
```

Return Value

See Also

TextLayout Members
TextLayout Class

TextLayout.invalidate Method

Invalidates the text layout. Subsequent calls to various layout methods will cause a new layout pass.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void invalidate ()
```

TextLayout Class
com.mindfusion.diagramming.components Namespace

TextLayout.setText Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setText (
    String value
)
```

Parameters

value

See Also

TextLayout.setTextWrapping Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setTextWrapping (
    TextWrapping value
)
```

Parameters

value

TextLayout Class
com.mindfusion.diagramming.components Namespace

TextWrapping Enumeration

Specifies the type of text wrapping.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java
`public enum TextWrapping`

Members

	Member name	Description
	Character	Indicates wrapping at the nearest character.
	None	Indicates that text wrapping is disabled.
	Word	Indicates wrapping at the nearest word.

ThumbComponent Members

Represents a thumb subcomponent in slider or similar components.

The following tables list the members exposed by the ThumbComponent type.

Public Constructors

	Name	Description
	ThumbComponent	Initializes a new instance of the ThumbComponent class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addDragEndedListener	
	addDraggedListener	
	addDragStartedListener	
	arrangeComponents	Recursively arranges the child components, within the specified space and using the specified graphics for measurement purposes. (Inherited from ComponentBase.)
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)

	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	ComponentBase.createOutlinePath override. (Inherited from ShapeComponent.)
	draw	ShapeComponent.draw override.
	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getBrush	Gets the brush used to fill the component. (Inherited from ShapeComponent.)
	getChildCount	Gets the number of child components of this component. (Inherited from ComponentBase.)
	getCursor	ComponentBase.getCursor override.
	getDesiredSize	Gets the desired size of this component in case the width and/or height have not been explicitly specified. (Inherited from ComponentBase.)
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)
	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
	getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)

	getIsOutline	Gets a value indicating whether this component defines the outline of its host. (Inherited from ShapeComponent.)
	getName	Gets the name of the component. (Inherited from ComponentBase.)
	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getPen	Gets the pen used to stroke the outline of the component. (Inherited from ShapeComponent.)
	getShape	Gets the Shape object defining the outline of the component. (Inherited from ShapeComponent.)
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	(Inherited from ComponentBase.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
	onKeyUp	(Inherited from ComponentBase.)
	onMouseDown	ComponentBase.onMouseDown override.
	onMouseMove	ComponentBase.onMouseMove override.
	onMouseUp	ComponentBase.onMouseUp override.
	onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	ComponentBase.readExternal override. (Inherited from ShapeComponent.)
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)

	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeDragEndedListener	
	removeDraggedListener	
	removeDragStartedListener	
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setBrush	Sets the brush used to fill the component. (Inherited from ShapeComponent.)
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setIsOutline	Sets a value indicating whether this component defines the outline of its host. (Inherited from ShapeComponent.)
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setParent	For internal use. (Inherited from ComponentBase.)

	setPen	Sets the pen used to stroke the outline of the component. (Inherited from ShapeComponent.)
	setShape	Sets the Shape object defining the outline of the component. (Inherited from ShapeComponent.)
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ComponentBase.writeExternal override. (Inherited from ShapeComponent.)

Protected Methods

	Name	Description
	createGeneralPath	Creates a GeneralPath object representing the shape. (Inherited from ShapeComponent.)
	fireOnDragEnded	
	fireOnDragged	
	fireOnDragStarted	
	loadFromJson	Deserializes the component from a JsonObject. (Inherited from ShapeComponent.)
	loadFromXml	ComponentBase.loadFromXml override. (Inherited from ShapeComponent.)
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)

	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	Serializes the component into a JsonObject. (Inherited from ShapeComponent.)
	saveToXml	ComponentBase.saveToXml override. (Inherited from ShapeComponent.)
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)

ThumbDragEvent Members

Provides data to the handlers of the ThumbComponent.Dragged event.

The following tables list the members exposed by the ThumbDragEvent type.

Public Constructors

	Name	Description
	ThumbDragEvent	Initializes a new instance of the ThumbDragEvent class.

Public Methods

	Name	Description
	getAmount	Gets the dragged amount.

See Also

ThumbDragEvent Class
com.mindfusion.diagramming.components Namespace

ThumbDragEvent Constructor

Initializes a new instance of the ThumbDragEvent class.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public ThumbDragEvent (
    float amount
)
```

Parameters

amount
The dragged amount.

See Also

ThumbDragEvent Class
com.mindfusion.diagramming.components Namespace

ThumbDragEvent Methods

ThumbDragEvent.getAmount Method

Gets the dragged amount.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public float getAmount ()
```

Return Value

See Also

ThumbDragEvent Members

TypeResolver Interface

Resolves types by their names.

Syntax

```
Java
public interface TypeResolver
```

See Also

TypeResolver Members
com.mindfusion.diagramming.components Namespace

TypeResolver Members

Resolves types by their names.

The following tables list the members exposed by the TypeResolver type.

Public Methods

	Name	Description
	resolveType	Returns the type corresponding to the specified name.

See Also

TypeResolver Methods

TypeResolver.resolveType Method

Returns the type corresponding to the specified name.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
Class<?> resolveType (
    String name
)
```

Parameters

name
The name or identifier of the type.

Return Value

The type corresponding to the specified name or identifier.

See Also

TypeResolver Members
TypeResolver Interface

ValueChangedEvent<T> Class

Provides data for value change event handlers. @param <T> The type of the value that is changing.

Syntax

Java

```
public class ValueChangedEvent<T>
```

Inheritance Hierarchy

java.lang.Object
com.mindfusion.diagramming.components.ValueChangedEvent(T)

See Also

ValueChangedEvent(T) Members
com.mindfusion.diagramming.components Namespace

ValueChangedEvent(T) Members

Provides data for value change event handlers. @param <T> The type of the value that is changing.

The following tables list the members exposed by the ValueChangedEvent(T) type.

Public Constructors

	Name	Description
	ValueChangedEvent	Overloaded.

Public Methods

	Name	Description
	getNewValue	Gets the new value.
	getOldValue	Gets the old value.

See Also

ValueChangedEvent<T> Class

ValueChangedEvent(T) Constructor

Overload List

Name	Description
ValueChangedEvent(T) ()	Initializes a new instance of the ValueChangedEvent class.
ValueChangedEvent(T) (T, T)	Initializes a new instance of the ValueChangedEvent class.

See Also

ValueChangedEvent<T> Class
com.mindfusion.diagramming.components Namespace

ValueChangedEvent(T) Constructor ()

Initializes a new instance of the ValueChangedEvent class.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java
`public ValueChangedEvent ()`

See Also

ValueChangedEvent(T) Constructor Overload List
ValueChangedEvent<T> Class
com.mindfusion.diagramming.components Namespace

ValueChangedEvent(T) Constructor (T, T)

Initializes a new instance of the ValueChangedEvent class.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public ValueChangedEvent (
    T oldValue,
    T newValue
)
```

Parameters

oldValue
The old value.

newValue
The new value.

See Also

ValueChangedEvent(T) Constructor Overload List

VerticalAlignment Class

Contains static constants that specify the vertical alignment of a component relative to its allocated space. Bottom - Indicates that the component should be bottom-aligned. Center - Indicates that the component should be centered. Stretch - Indicates that the component should be stretched vertically. Top - Indicates that the component should be top-aligned. @author Anton

Syntax

Java

```
public class VerticalAlignment
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.components.VerticalAlignment

XmlLoader.load Method (Document, Object)

Loads the component hierarchy from the specified XML stream and returns the root of this hierarchy.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public static ComponentBase load (
    Document document,
    Object target
)
```

Parameters

document
The XmlDocument to load from.

target
An object that is declaring the handlers for the events in the code and also used to evaluate expressions.

Return Value

The root of the loaded hierarchy.

com.mindfusion.diagramming.export Namespace

ExcelExporter Class

Exports MindFusion.Diagramming diagrams to Excel Open XML Format (XLSX) files.

Syntax

Java

```
public class ExcelExporter
```

Remarks

Diagrams are exported as Excel AutoShapes drawings. The export overload that takes a DiagramDocument parameter creates a sheet for each DiagramPage in the document. The export(Diagram) overload creates a single Excel sheet.

You must set the TemplatePath property before exporting to specify where the exporter should look for its template file.

Example

Java

```
ExcelExporter ex = new ExcelExporter();
ex.setTemplatePath(
    templatesFolder + "/ExcelTemplate.xlt");
ex.export(diagram, fileChooser.getSelectedFile().getAbsolutePath());
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.export.ExcelExporter

See Also

ExcelExporter Members
ExcelExporter Class
com.mindfusion.diagramming.export Namespace

ExcelExporter.getTemplatePath Method

Gets the full path to the 'ExcelTemplate.xlt' template file.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public String getTemplatePath ()
```

Return Value

A String containing the full path to the 'ExcelTemplate.xlt' template file.

See Also

ExcelExporter Members
ExcelExporter Class
com.mindfusion.diagramming.export Namespace

ExcelExporter.setTemplatePath Method

Sets the full path to the 'ExcelTemplate.xlt' template file.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public void setTemplatePath (
    String value
)
```

Parameters

value
A string specifying the full path to the 'ExcelTemplate.xlt' template file.

See Also

ExcelExporter Members
ExcelExporter Class
com.mindfusion.diagramming.export Namespace

PdfExporter Class

Exports JDiagram diagrams to Adobe Portable Document Format (PDF) files.

Syntax

Java

```
public class PdfExporter
```

Remarks

The Adobe Portable Document Format (PDF) is the most popular open format for representing textual and graphic information in resolution independent manner. In addition, PDF is a multiplatform format, viewable and printable on all popular operating systems. These features, along with its ability to describe complex documents that use a variety of graphics, images and fonts, make PDF a good choice when it comes to distributing your flowcharts and diagrams to others.

The **PdfExporter** class lets you create PDF files that represent JDiagram diagrams. In order to do that, create a **PdfExporter** instance and call its export method. If you need to set the page size and orientation, use the setPageSize, and setPageOrientation methods. To specify the page margins for all pages in the document, call the setMarginLeft, setMarginTop, etc. methods. setAutoScale lets you scale the diagram so that it fits in one or more PDF pages.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.export.PdfExporter

See Also

PdfExporter Members
com.mindfusion.diagramming.export Namespace

PdfExporter Members

Exports JDiagram diagrams to Adobe Portable Document Format (PDF) files.

The following tables list the members exposed by the PdfExporter type.

Public Constructors

	Name	Description
	PdfExporter	Initializes a new instance of the **PdfExporter** class.

Public Methods

	Name	Description
	export	Overloaded.
	getAutoScale	Gets a value indicating whether the diagram should be scaled to fit one or more pages of the PDF document.
	getDefaultCharset	
	getDisableTextClipping	Gets whether text clipping is disabled, as work-around for Adobe Reader V9+ issue when printing to some Postscript printers.
	getEnableGrid	Gets a value indicating whether the alignment grid is rendered.
	getHyperLinkStyle	

	getMarginBottom	Gets the bottom margin for the PDF pages, measured in Inches.
	getMarginLeft	Gets the left margin for the PDF pages, measured in Inches.
	getMarginRight	Gets the right margin for the PDF pages, measured in Inches.
	getMarginTop	Gets the top margin for the PDF pages, measured in Inches.
	getPageOrientation	Gets the orientation of the PDF pages.
	getPageSize	Gets the size of the PDF pages.
	getScale	Gets the scale of the PDF output relatively to the original on-screen size of the diagram.
	isAutoOrientation	Specifies whether the component should automatically choose the page orientation.
	setAutoOrientation	Specifies whether the component should automatically choose the page orientation.
	setAutoScale	Sets a value indicating whether the diagram should be scaled to fit one or more pages of the PDF document.
	setDefaultCharset	
	setDisableTextClipping	Sets whether text clipping is disabled, as work-around for Adobe Reader V9+ issue when printing to Postscript printers.
	setEnableGrid	Gets a value indicating whether the alignment grid is rendered.
	setHyperLinkStyle	
	setMarginBottom	Sets the bottom margin for the PDF pages, measured in Inches.
	setMarginLeft	Sets the left margin for the PDF pages, measured in Inches.
	setMarginRight	Sets the value of **right** margin of the destination PDF document.
	setMarginTop	Sets the value of **top** margin of the destination PDF document.
	setPageOrientation	Sets the orientation of the PDF pages.
	setPageSize	Sets the size of the PDF pages.
	setScale	Sets the scale of the PDF output relatively to the original on-screen size of the diagram.

PdfExporter Constructor

Initializes a new instance of the PdfExporter class.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java
`public PdfExporter ()`

See Also

PdfExporter Class
com.mindfusion.diagramming.export Namespace

PdfExporter Methods

PdfExporter.export Method

Overload List

Name	Description
PdfExporter.export (Diagram, String)	Creates a PDF file representing the specified JDiagram diagram.
PdfExporter.export (DiagramDocument, String)	Creates a PDF file representing the specified JDiagram document.

See Also

PdfExporter Members
PdfExporter Class
com.mindfusion.diagramming.export Namespace

PdfExporter.export Method (Diagram, String)

Creates a PDF file representing the specified JDiagram diagram.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public void export (
    Diagram diagram,
    String filePath
)
```

Parameters

diagram
A reference to the Diagram that will be exported.

filePath
The full path to the PDF file.

Remarks

By default, PdfExporter preserves the original scale of the diagram. If Bounds can not fit in a single page of size set by the setPageSize method, the exported diagram is divided into multiple pages. The AutoScale attribute allows scaling the diagram so that it exactly fits in one or more pages.

PdfExporter.getAutoScale Method

Gets a value indicating whether the diagram should be scaled to fit one or more pages of the PDF document.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public AutoScale getAutoScale ()
```

Return Value

A member of the AutoScale enumeration. The default is None.

Remarks

By default, the original scale of the diagram is preserved and the diagram is divided into multiple pages if needed. This property lets you scale the diagram so that it fits in one or more pages.

Gets the bottom margin for the PDF pages, measured in Inches.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

```
Java
public float getMarginBottom ()
```

Return Value

the value of **bottom** margin of the destination PDF document measured in **Inches**

See Also

PdfExporter Members
PdfExporter Class
com.mindfusion.diagramming.export Namespace

PdfExporter.getMarginLeft Method

Gets the left margin for the PDF pages, measured in Inches.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

```
Java
public float getMarginLeft ()
```

Return Value

See Also

PdfExporter Members
PdfExporter Class
com.mindfusion.diagramming.export Namespace

PdfExporter.getMarginRight Method

Gets the right margin for the PDF pages, measured in Inches.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

```
Java
public float getMarginRight ()
```

Return Value

the value of **rigth** margin of the destination PDF document measured in **Inches**

See Also

PdfExporter Members
PdfExporter Class
com.mindfusion.diagramming.export Namespace

PdfExporter.getMarginTop Method

Gets the top margin for the PDF pages, measured in Inches.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public float getMarginTop ()
```

Return Value

the value of **top** margin of the destination PDF document measured in **Inches**

See Also

PdfExporter Members
PdfExporter Class
com.mindfusion.diagramming.export Namespace

PdfExporter.getPageOrientation Method

Gets the orientation of the PDF pages.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public PageOrientation getPageOrientation ()
```

Return Value

A member of the PageOrientation enumeration. The default is **Portrait**.

See Also

PdfExporter Members
PdfExporter Class
com.mindfusion.diagramming.export Namespace

PdfExporter.getPageSize Method

Gets the size of the PDF pages.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

```
Java
public PageSizesEnum getPageSize ()
```

Return Value

A PageSizesEnum member. The default value is **Document**.

See Also

PdfExporter Members
PdfExporter Class
com.mindfusion.diagramming.export Namespace

PdfExporter.getScale Method

Gets the scale of the PDF output relatively to the original on-screen size of the diagram.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

```
Java
public float getScale ()
```

Return Value

A float value specifying the scale as percent of the original size. The default is 100.

Remarks

This value is used only if AutoScale is disabled.

PdfExporter.setAutoScale Method

Sets a value indicating whether the diagram should be scaled to fit one or more pages of the PDF document.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public void setAutoScale (
    AutoScale autoScale
)
```

Parameters

autoScale

A member of the AutoScale enumeration. The default is **None**.

Remarks

By default, the original scale of the diagram is preserved and the diagram is divided into multiple pages if needed. This property lets you scale the diagram so that it fits in one or more pages.

PdfExporter.setMarginBottom Method

Sets the bottom margin for the PDF pages, measured in Inches.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public void setMarginBottom (
    float marginBottom
)
```

Parameters

marginBottom
the value of bottom margin of the destination PDF document, measured in Inches.

See Also

PdfExporter Members
PdfExporter Class
com.mindfusion.diagramming.export Namespace

PdfExporter.setMarginLeft Method

Sets the left margin for the PDF pages, measured in Inches.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public void setMarginLeft (
    float marginLeft
)
```

Parameters

marginLeft
the value of left margin of the destination PDF document, measured in Inches.

See Also

PdfExporter Members
PdfExporter Class

PdfExporter.setMarginRight Method

Sets the value of **right** margin of the destination PDF document.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

```
Java
public void setMarginRight (
    float marginRight
)
```

Parameters

marginRigth
value of margin measured in **Inches**

See Also

PdfExporter Members
PdfExporter Class
com.mindfusion.diagramming.export Namespace

PdfExporter.setMarginTop Method

Sets the value of **top** margin of the destination PDF document.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

```
Java
public void setMarginTop (
    float marginTop
)
```

Parameters

marginTop
the value of top margin of the destination PDF document, measured in Inches.

PdfExporter.setPageOrientation Method

Sets the orientation of the PDF pages.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

```
Java
```

```
public void setPageOrientation (
    PageOrientation pageOrientation
)
```

Parameters

pageOrientation
A member of the PageOrientation enumeration. The default is **Portrait**.

PdfExporter.setPageSize Method

Sets the size of the PDF pages.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public void setPageSize (
    PageSizesEnum pageSize
)
```

Parameters

pageSize
A PageSizesEnum member. The default value is **Document**.

PdfExporter Members
PdfExporter Class
com.mindfusion.diagramming.export Namespace

PdfExporter.setScale Method

Sets the scale of the PDF output relatively to the original on-screen size of the diagram.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public void setScale (
    float scale
)
```

Parameters

scale
A float value specifying the scale as percent of the original size. The default is 100.

Remarks

This value is used only if AutoScale is disabled.

SvgExporter Class

Creates an SVG (Scalable Vector Graphics) drawing representing the content of a Diagram.

Syntax

Java
`public class SvgExporter`

Remarks

Scalable Vector Graphics is an XML-based graphics language that describes images with vector shapes, text, and embedded raster graphics. SVG drawings can be displayed in web pages, or edited / imported by vector graphics editing applications.

In order to create an SVG file from a Diagram, create an **SvgExporter** instance and call its export method, passing a **Diagram** object as parameter.

VisioExporter Class

Exports the contents of Diagram or DiagramDocument objects to Visio 2013 XML drawing files (*.vsdx).

Syntax

Java

```
public class VisioExporter
```

Remarks

This class allows exporting Visio 2003 XML Drawing files from JDiagram. ShapeNode objects are mapped to their closest Visio counterparts and DiagramLink instances are exported as Visio connectors of a similar style. In addition, most of the attributes of diagram items such as text, text formatting, fill and line colors and styles are preserved.

To function properly, the exporter object requires the *Visio2013.vxt* file to be present in the application's directory, or its location specified in TemplatePath. This file contains an XML template data used by the component to generate Visio documents.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.export.VisioExporter

See Also

VisioExporter Methods

VisioExporter.export Method

Overload List

Name	Description
VisioExporter.export (Diagram, String)	Creates a Visio .vsdx file representing the specified Diagram.
VisioExporter.export (DiagramDocument, String)	Creates a Visio .vsdx file representing the specified DiagramDocument.

See Also

VisioExporter Members
VisioExporter Class
com.mindfusion.diagramming.export Namespace

VisioExporter.export Method (Diagram, String)

Creates a Visio .vsdx file representing the specified Diagram.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public void export (
    Diagram diagram,
    String filePath
)
```

Parameters

diagram
A Diagram instance.

filePath
The full path to the exported Visio .vsdx file.

Remarks

The exported document contains a single page, as big as the scrollable diagram area set in Bounds.

To run properly, this method requires the *Visio2013.vxt* file to be present in the application's directory, or its full path to be assigned to TemplatePath. That file contains an XML template data used by the component to construct Visio documents.

See Also

export Method Overload List

VisioExporter.export Method (DiagramDocument, String)

Creates a Visio .vsdx file representing the specified DiagramDocument.

Namespace: com.mindfusion.diagramming.export
Package: com.mindfusion.diagramming.export

Syntax

Java

```
public void export (
    DiagramDocument doc,
    String filePath
)
```

Parameters

doc
A DiagramDocument object which represents a set of pages(diagrams)

filePath
The full path to the exported Visio .vsdx file.

Remarks

Each DiagramPage in the document is exported to an individual Visio page. The title of the Visio page is set to DiagramPage.Title.

DrawImporter Class

DrawImporter lets you import an OpenOffice Draw document into a Diagram or DiagramDocument object.

Syntax

```
Java
public class DrawImporter
```

Remarks

The **DrawImporter** class can import .odg files, created by the OpenOffice Draw vector graphics editor. In order to use it, you must import the com.mindfusion.diagramming.importers namespace.

Various overloads of the import method can be used to import the OpenOffice drawing into a DiagramDocument whose pages correspond to the Draw pages, or into a single Diagram whose content is merged from all imported pages.

DrawImporter supports shapes from the General and Flowchart shape palettes in Draw. For each node shape from the .odg file, the importer creates a ShapeNode object whose Shape, Text, Brush and Pen properties are set to values corresponding to the imported OpenOffice shape. For each connector shape, the importer creates a DiagramLink object whose Origin and Destination are set to the corresponding imported nodes, and whose ControlPoints reflect the geometry of the connector.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.importers.DrawImporter

VisioImporter Class

Imports Visio 2013 XML Drawing files (*.vsdx) into Diagram or DiagramDocument objects.

Syntax

Java
`public class VisioImporter`

Remarks

The **VisioImporter** class can import .vsdx files created by Visio 2013. In order to use it, you must import the com.mindfusion.diagramming.importers namespace.

Various overloads of the import method can be used to import the file into a DiagramDocument whose pages correspond to the Visio drawing pages, or into a single Diagram whose content is merged from all imported pages.

VisioImporter supports the basic flowchart and data flow Visio stencils. For each node shape from the .vsdx file, the importer creates a ShapeNode object whose Shape, Text, Brush and Pen properties are set to values corresponding to the imported Visio shape. For each connector shape, the importer creates a DiagramLink object whose Origin and Destination are set to the corresponding imported nodes, and whose ControlPoints reflect the geometry of the connector.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.importers.VisioImporter

Raised for each shape's XML element in the imported VSDX drawing to let you create a custom diagram item representing the Visio shape.

Namespace: com.mindfusion.diagramming.importers
Package: com.mindfusion.diagramming.importers

Syntax

Java

```
void importItem (
    ImportItemEvent e
)
```

Parameters

e
A ImportItemEvent instance providing information about the event.

AnnealLayout Methods

AnnealLayout.arrange Method

Applies the layout on the specified graph using the specified settings

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean arrange (
    Graph graph,
    AnnealLayoutInfo info
)
```

Parameters

graph

info

Return Value

See Also

AnnealLayout Members
AnnealLayout Class

AnnealLayoutInfo Members

The following tables list the members exposed by the AnnealLayoutInfo type.

Public Constructors

	Name	Description
	AnnealLayoutInfo	

Public Methods

	Name	Description
	getBoundaryFactor	Gets a value indicating how important the distance from nodes to the layout area boundaries is relatively to the other criteria considered by the algorithm.
	getCrossingEdgesCost	Gets a value specifying how important the low number of link crossings is relatively to the other criteria considered by the algorithm.
	getDistributionFactor	Gets a value indicating the importance of node distribution relatively to the other criteria considered by the algorithm.
	getEdgeLengthFactor	Gets a value specifying how important the short length of links is relatively to the other criteria considered by the algorithm.
	getIterationsPerStage	Gets how many node shift iterations to perform at each stage of the algorithm.
	getLayoutArea	Gets the size of the layout area.
	getNodeEdgeCrossingCost	Gets a value specifying how important the low number of crossings of links with edges is relatively to the other criteria considered by the algorithm.
	getNodeEdgeDistFactor	Gets a value specifying the importance of the distance between nodes and links relative to the other criteria considered by the algorithm.
	getPrecision	Gets the cost calculations precision.
	getRandomize	Gets a value indicating whether the nodes should be placed at random positions when the layout routine starts.
	getStages	Gets how many cooling stages the algorithm should simulate.
	getTemperature	Gets the initial temperature of the simulated annealing process.
	getTemperatureScale	Gets how much the simulated temperature is decreased at each stage of the algorithm.
	getWidthHeightRatio	Gets what width / height ratio the layout area should have.
	setBoundaryFactor	Sets a value indicating how important the distance from nodes to the layout area boundaries is relatively to the other criteria considered by the algorithm.
	setCrossingEdgesCost	Sets a value specifying how important the low number of link crossings is relatively to the other criteria considered by the algorithm.
	setDistributionFactor	Sets a value indicating the importance of node distribution relatively to the other criteria considered by the algorithm.

	setEdgeLengthFactor	Sets a value specifying how important the short length of links is relatively to the other criteria considered by the algorithm.
	setIterationsPerStage	Sets how many node shift iterations to perform at each stage of the algorithm.
	setLayoutArea	Sets the size of the layout area.
	setNodeEdgeCrossingCost	Sets a value specifying how important the low number of crossings of links with edges is relatively to the other criteria considered by the algorithm.
	setNodeEdgeDistFactor	Sets a value specifying the importance of the distance between nodes and links relative to the other criteria considered by the algorithm.
	setPrecision	Sets the cost calculations precision. 1 speicifes highest precision. Accepted values are between 0.9 and 1. The algorithm completes faster when running with a lower precision, but produces slightly worse results.
	setRandomize	Sets a value indicating whether the nodes should be placed at random positions when the layout routine starts.
	setStages	Sets how many cooling stages the algorithm should simulate.
	setTemperature	Sets the initial temperature of the simulated annealing process.
	setTemperatureScale	Sets how much the simulated temperature is decreased at each stage of the algorithm.
	setWidthHeightRatio	Sets what width / height ratio the layout area should have.

AnnealLayoutInfo Methods

AnnealLayoutInfo.getBoundaryFactor Method

Gets a value indicating how important the distance from nodes to the layout area boundaries is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public double getBoundaryFactor ()
```

Return Value

A multiplier applied to the node-to-boundary distance cost when evaluating the total cost of a graph configuration.

AnnealLayoutInfo.getLayoutArea Method

Gets the size of the layout area.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public Rectangle2D.Float getLayoutArea ()
```

Return Value

The layout area coordinates.

See Also

AnnealLayoutInfo Members

AnnealLayoutInfo.getNodeEdgeCrossingCost Method

Gets a value specifying how important the low number of crossings of links with edges is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public double getNodeEdgeCrossingCost ()
```

Return Value

A value added to the total cost of a graph configuration for each crossing of link and node.

See Also

AnnealLayoutInfo Members
AnnealLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

AnnealLayoutInfo.getNodeEdgeDistFactor Method

Gets a value specifying the importance of the distance between nodes and links relative to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`public double getNodeEdgeDistFactor ()`

Return Value

A multiplier applied to the node-to-link distance cost when evaluating the total cost of a graph configuration.

See Also

AnnealLayoutInfo Members
AnnealLayoutInfo Class

AnnealLayoutInfo.getStages Method

Gets how many cooling stages the algorithm should simulate.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public int getStages ()
```

Return Value

The number of cooling stages

See Also

AnnealLayoutInfo Members
AnnealLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

AnnealLayoutInfo.getTemperature Method

Gets the initial temperature of the simulated annealing process.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public double getTemperature ()
```

Return Value

A double value specifying the initial temperature of the simulated process.

See Also

AnnealLayoutInfo Members
AnnealLayoutInfo Class

AnnealLayoutInfo.getTemperatureScale Method

Gets how much the simulated temperature is decreased at each stage of the algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public double getTemperatureScale ()
```

Return Value

A multipler applied to the current temperature at the end of each cooling stage.

See Also

AnnealLayoutInfo Members
AnnealLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

AnnealLayoutInfo.getWidthHeightRatio Method

Gets what width / height ratio the layout area should have.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public double getWidthHeightRatio ()
```

Return Value

See Also

AnnealLayoutInfo Members
AnnealLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

AnnealLayoutInfo.setBoundaryFactor Method

Sets a value indicating how important the distance from nodes to the layout area boundaries is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setBoundaryFactor (
    double boundaryFactor
)
```

Parameters

boundaryFactor
A multiplier applied to the node-to-boundary distance cost when evaluating the total cost of a graph configuration. The default is 3000.

See Also

AnnealLayoutInfo Members
AnnealLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

AnnealLayoutInfo.setCrossingEdgesCost Method

Sets a value specifying how important the low number of link crossings is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setCrossingEdgesCost (
    double crossingEdgesCost
)
```

Parameters

crossingEdgesCost
A value added to the total cost of a graph configuration for each pair of crossing links. The default is 100000.

See Also

AnnealLayoutInfo Members
AnnealLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

AnnealLayoutInfo.setDistributionFactor Method

Sets a value indicating the importance of node distribution relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setDistributionFactor (
    double distributionFactor
)
```

Parameters

distributionFactor
A multiplier applied to the node distribution cost when evaluating the total cost of a graph configuration. The default is 40000.

See Also

AnnealLayoutInfo Members
AnnealLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

AnnealLayoutInfo.setEdgeLengthFactor Method

Sets a value specifying how important the short length of links is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setEdgeLengthFactor (
    double edgeLengthFactor
)
```

Parameters

edgeLengthFactor
A multiplier applied to the link length cost when evaluating the total cost of a graph configuration. The default is 0.25.

See Also

AnnealLayoutInfo Members
AnnealLayoutInfo Class

AnnealLayoutInfo.setIterationsPerStage Method

Sets how many node shift iterations to perform at each stage of the algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setIterationsPerStage (
    int iterationsPerStage
)
```

Parameters

iterationsPerStage
An integer value specifying the number of iterations. The default is 50

See Also

AnnealLayoutInfo Members

AnnealLayoutInfo.setNodeEdgeCrossingCost Method

Sets a value specifying how important the low number of crossings of links with edges is relatively to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setNodeEdgeCrossingCost (
    double nodeEdgeCrossingCost
)
```

Parameters

nodeEdgeCrossingCost
A value added to the total cost of a graph configuration for each crossing of link and node. The default is 100000.

See Also

AnnealLayoutInfo Members
AnnealLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

AnnealLayoutInfo.setNodeEdgeDistFactor Method

Sets a value specifying the importance of the distance between nodes and links relative to the other criteria considered by the algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setNodeEdgeDistFactor (
    double nodeEdgeDistFactor
)
```

Parameters

nodeEdgeDistFactor
A multiplier applied to the node-to-link distance cost when evaluating the total cost of a graph configuration. The default is 20000.

See Also

AnnealLayoutInfo Members
AnnealLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

AnnealLayoutInfo.setPrecision Method

Sets the cost calculations precision. 1 speicifes highest precision. Accepted values are between 0.9 and 1. The algorithm completes faster when running with a lower precision, but produces slightly worse results.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setPrecision (
    double precision
)
```

Parameters

precision

CircularLayoutInfo Members

The following tables list the members exposed by the CircularLayoutInfo type.

Public Constructors

	Name	Description
	CircularLayoutInfo	Initializes a new instance of the CircularLayoutInfo class.

Public Methods

	Name	Description
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged tree and the top-left point of the document bounds.
	getRadius	Gets the radius of the layout circle.
	getSiftingRounds	Gets the number of sifts to perform during the layout.
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged tree and the top-left point of the document bounds.
	setRadius	Sets the radius of the layout circle.
	setSiftingRounds	Sets the number of sifts to perform during the layout.

CircularLayoutInfo Methods

CircularLayoutInfo.getMargins Method

Gets the distance between the top-left corner of the smallest rectangle containing the arranged tree and the top-left point of the document bounds.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`public XDimension2D.Double getMargins ()`

Return Value

See Also

CircularLayoutInfo Members
CircularLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

CircularLayoutInfo.getRadius Method

Gets the radius of the layout circle.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public float getRadius ()
```

Return Value

A float value specifying the radius; the default is 60.

See Also

CircularLayoutInfo Members
CircularLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

CircularLayoutInfo.getSiftingRounds Method

Gets the number of sifts to perform during the layout.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public int getSiftingRounds ()
```

Return Value

An integer value specifying the number of sifting rounds; the default is 1.

See Also

CircularLayoutInfo Members

FractalLayout Class
com.mindfusion.diagramming.jlayout Namespace

FractalLayout Constructor

Initializes a new instance of the FractalLayout class.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public FractalLayout ()
```

See Also

FractalLayout Class
com.mindfusion.diagramming.jlayout Namespace

FractalLayout Methods

FractalLayout.arrange Method

Applies the layout to the specified graph.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public boolean arrange (
    Graph igraph
)
```

Parameters

igraph

Return Value

See Also

FractalLayout Members
FractalLayout Class
com.mindfusion.diagramming.jlayout Namespace

FractalLayout.getRoot Method

Gets the tree root.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public Node getRoot ()
```

Return Value

A Node specifying the root.

See Also

FractalLayout Members
FractalLayout Class
com.mindfusion.diagramming.jlayout Namespace

FractalLayout.setRoot Method

Sets the tree root.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setRoot (
    Node value
)
```

Parameters

value
A Node specifying the root.

Graph Members

The following tables list the members exposed by the Graph type.

Public Methods

	Name	Description
	getBounds	

	getDocRect	Gets the bounding rectangle of the document, containing the graph.
	getLinks	Gets a collection with all links in this graph.
	getNodes	Gets a collection with all nodes in this graph.
	isDirected	Gets a value indicating whether the direction of links in this graph should be considered, i.e. the graph is a 'directed graph'.

See Also

Graph Interface
com.mindfusion.diagramming.jlayout Namespace

Graph Methods

Graph.getBounds Method

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
Rectangle2D.Float getBounds (
    boolean includeLinks
)
```

Parameters

includeLinks

Return Value

See Also

Graph Members
Graph Interface
com.mindfusion.diagramming.jlayout Namespace

Graph.getDocRect Method

Gets the bounding rectangle of the document, containing the graph.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
Rectangle2D.Float getDocRect ()
```

Return Value

See Also

Graph Members
Graph Interface
com.mindfusion.diagramming.jlayout Namespace

Graph.getLinks Method

Gets a collection with all links in this graph.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`LinkList getLinks ()`

Return Value

See Also

Graph Members
Graph Interface
com.mindfusion.diagramming.jlayout Namespace

Graph.getNodes Method

Gets a collection with all nodes in this graph.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`NodeList getNodes ()`

Return Value

See Also

Graph Members
Graph Interface
com.mindfusion.diagramming.jlayout Namespace

Graph.isDirected Method

Gets a value indicating whether the direction of links in this graph should be considered, i.e. the graph is a 'directed graph'.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`boolean isDirected ()`

Return Value

See Also

Graph Members
Graph Interface
com.mindfusion.diagramming.jlayout Namespace

GraphBuilder Interface

Factory class used to create graphs.

Syntax

Java
`public interface GraphBuilder`

See Also

GraphBuilder Members
com.mindfusion.diagramming.jlayout Namespace

GraphBuilder Members

Factory class used to create graphs.

The following tables list the members exposed by the GraphBuilder type.

Public Methods

	Name	Description
	create	Creates new empty graph.

See Also

GraphBuilder Interface
com.mindfusion.diagramming.jlayout Namespace

GraphBuilder Methods

GraphBuilder.create Method

Creates new empty graph.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`Graph create ()`

Return Value

See Also

GraphBuilder Members
GraphBuilder Interface
com.mindfusion.diagramming.jlayout Namespace

GraphLibUtilities Class

Provides utility methods for operating with the MindFusion.Graphs library.

Syntax

Java
`public class GraphLibUtilities`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.jlayout.GraphLibUtilities

See Also

GraphLibUtilities Methods

GraphLibUtilities.graphFromIGraph Method

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static Graph graphFromIGraph (
    Graph igraph,
    HashMap<Vertex, Node> nodeMap,
    HashMap<Edge, Link> linkMap
)
```

Parameters

igraph

nodeMap

linkMap

Return Value

See Also

GraphLibUtilities Members
GraphLibUtilities Class
com.mindfusion.diagramming.jlayout Namespace

GraphLibUtilities.graphFromIGraphWithTables Method

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static Graph graphFromIGraphWithTables (
    Graph igraph,
    HashMap<Vertex, Node> nodeMap,
    HashMap<Edge, Link> linkMap
)
```

Parameters

igraph

nodeMap

linkMap

Return Value

HierarchicalLayout Class

Performs hierarchical layout on simple, connected, level-planar graphs. The hierarchical layout places vertices on predefined levels, such that if the source graph is level-planar it is guaranteed that all edges will have a single segment and will not intersect. A planar graph is considered level-planar if it is still possible to draw it without edge intersections when its vertices are positioned on predefined levels.

Syntax

Java

```
public class HierarchicalLayout
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.jlayout.HierarchicalLayout

See Also

HierarchicalLayout Members
com.mindfusion.diagramming.jlayout Namespace

HierarchicalLayout Members

Performs hierarchical layout on simple, connected, level-planar graphs. The hierarchical layout places vertices on predefined levels, such that if the source graph is level-planar it is guaranteed that all edges will have a single segment and will not intersect. A planar graph is considered level-planar if it is still possible to draw it without edge intersections when its vertices are positioned on predefined levels.

The following tables list the members exposed by the HierarchicalLayout type.

Public Constructors

	Name	Description
	HierarchicalLayout	Initializes a new instance of the **HierarchicalLayout** class.

Public Methods

	Name	Description
	arrange	Applies the layout to the specified graph using the specified settings.

HierarchicalLayout.arrange Method

Applies the layout to the specified graph using the specified settings.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean arrange (
    Graph igraph,
    HierarchicalLayoutInfo info
)
```

Parameters

igraph

info

Return Value

See Also

HierarchicalLayout Members
HierarchicalLayout Class
com.mindfusion.diagramming.jlayout Namespace

HierarchicalLayoutInfo Class

Contains settings for the HierarchicalLayout class.

Syntax

Java

```
public class HierarchicalLayoutInfo
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.jlayout.HierarchicalLayoutInfo

See Also

HierarchicalLayoutInfo Members
com.mindfusion.diagramming.jlayout Namespace

HierarchicalLayoutInfo Members

Contains settings for the HierarchicalLayout class.

The following tables list the members exposed by the HierarchicalLayoutInfo type.

Public Constructors

	Name	Description
	HierarchicalLayoutInfo	Initializes a new instance of the **HierarchicalLayoutInfo** class.

Public Methods

	Name	Description
	getLevelDistance	Gets the distance between adjacent levels in the hierarchical layout.
	getOrientation	Gets the orientation of the arranged graph.
	setLevelDistance	Sets the distance between adjacent levels in the hierarchical layout.
	setOrientation	Sets the orientation of the arranged graph.

See Also

HierarchicalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

HierarchicalLayoutInfo Constructor

Initializes a new instance of the HierarchicalLayoutInfo class.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`public HierarchicalLayoutInfo ()`

See Also

HierarchicalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

HierarchicalLayoutInfo Methods

HierarchicalLayoutInfo.getLevelDistance Method

Gets the distance between adjacent levels in the hierarchical layout.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public float getLevelDistance ()
```

Return Value

See Also

HierarchicalLayoutInfo Members
HierarchicalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

HierarchicalLayoutInfo.getOrientation Method

Gets the orientation of the arranged graph.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public Orientation getOrientation ()
```

Return Value

See Also

HierarchicalLayoutInfo Members
HierarchicalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

HierarchicalLayoutInfo.setLevelDistance Method

Sets the distance between adjacent levels in the hierarchical layout.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public void setLevelDistance (
    float value
)
```

Parameters

value

See Also

HierarchicalLayoutInfo Members
HierarchicalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

HierarchicalLayoutInfo.setOrientation Method

Sets the orientation of the arranged graph.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setOrientation (
    Orientation value
)
```

Parameters

value

See Also

HierarchicalLayoutInfo Members
HierarchicalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

HierarchicalLayoutTraits Enumeration

Indicates item traits specific to hierarchical layouts. Members of this enumeration can be used as keys in the DiagramItem.LayoutTraits hashtable.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public enum HierarchicalLayoutTraits
```

Members

	Member name	Description
	Level	The number associated with this key specifies the index of the level of the item in the level-planar graph.

See Also

LayerComparator Class

Syntax

Java
`public class LayerComparator implements Comparator<T>`

LayeredLayoutInfo Members

The following tables list the members exposed by the LayeredLayoutInfo type.

Public Constructors

	Name	Description
	LayeredLayoutInfo	Overloaded.

Public Methods

	Name	Description
	getDirection	
	getEnableCustomLayers	Gets a value indicating whether the layered layout will honor the LayeredLayoutTraits.Layer flags.
	getEndNode	
	getEnforceLinkFlow	Gets a value indicating whether the layout will force all links to go in the same direction. If the supplied graph has cycles, it will be made acyclic prior the layout. EnableCustomLayers and SplitLayers are ignored if this property is set to true.
	getIgnoreNodeSize	
	getLayerDistance	
	getLinksCompactFactor	

	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram
	getNodeDistance	
	getOrientation	
	getSplitLayers	
	getStartNode	
	getStatistics	Gets layout-specific information about the nodes and links participating in the layout.
	getStraightenLongLinks	
	getTimeLimit	
	setDirection	
	setEnableCustomLayers	Sets a value indicating whether the layered layout will honor the LayeredLayoutTraits.Layer flags.
	setEndNode	
	setEnforceLinkFlow	Sets a value indicating whether the layout will force all links to go in the same direction. If the supplied graph has cycles, it will be made acyclic prior the layout. EnableCustomLayers and SplitLayers are ignored if this property is set to true.
	setIgnoreNodeSize	
	setLayerDistance	
	setLinksCompactFactor	
	setMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram
	setNodeDistance	
	setOrientation	
	setSplitLayers	
	setStartNode	
	setStraightenLongLinks	
	setTimeLimit

LayeredLayoutStatistics Class

Encapsulates information about a layered layout which has already complete.

Syntax

Java

```
public class LayeredLayoutStatistics
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.jlayout.LayeredLayoutStatistics

See Also

LayeredLayoutStatistics Members

Encapsulates information about a layered layout which has already complete.

The following tables list the members exposed by the LayeredLayoutStatistics type.

Public Constructors

	Name	Description
	LayeredLayoutStatistics	Initializes a new instance of the **LayeredLayoutStatistics** class.

Public Methods

	Name	Description
	getLayerCount	Gets the total number of layers in the layout.
	getLinkLayerCount	Gets a mapping between links and the number of layers they run through.
	getNodeGridPositions	Gets a mapping between nodes and their assigned grid positions.
	getNodeLayerIndices	Gets a mapping between nodes and their assigned layers.

See Also

LayeredLayoutStatistics Class
com.mindfusion.diagramming.jlayout Namespace

LayeredLayoutStatistics Constructor

Initializes a new instance of the LayeredLayoutStatistics class.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`public LayeredLayoutStatistics ()`

See Also

LayeredLayoutStatistics Class

LayeredLayoutStatistics Methods

LayeredLayoutStatistics.getLayerCount Method

Gets the total number of layers in the layout.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public int getLayerCount ()
```

Return Value

See Also

LayeredLayoutStatistics Members
LayeredLayoutStatistics Class
com.mindfusion.diagramming.jlayout Namespace

LayeredLayoutStatistics.getLinkLayerCount Method

Gets a mapping between links and the number of layers they run through.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public Hashtable<Link, Integer> getLinkLayerCount ()
```

Return Value

See Also

LayeredLayoutStatistics Members
LayeredLayoutStatistics Class
com.mindfusion.diagramming.jlayout Namespace

LayeredLayoutStatistics.getNodeGridPositions Method

Gets a mapping between nodes and their assigned grid positions.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public Hashtable<Node, Double> getNodeGridPositions ()
```

Return Value

See Also

LayeredLayoutStatistics Members
LayeredLayoutStatistics Class
com.mindfusion.diagramming.jlayout Namespace

LayeredLayoutStatistics.getNodeLayerIndices Method

Gets a mapping between nodes and their assigned layers.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`public Hashtable<Node, Integer> getNodeLayerIndices ()`

Return Value

See Also

LayeredLayoutStatistics Members
LayeredLayoutStatistics Class
com.mindfusion.diagramming.jlayout Namespace

LayeredLayoutTraits Enumeration

Indicates item traits specific to layered layouts. Members of this enumeration can be used as keys in the DiagramItem.LayoutTraits hashtable.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`public enum LayeredLayoutTraits`

Members

	Member name	Description
	Layer	The number associated with this key specifies the index of the layer the layout should attempt to place the node to. Specifying a negative number indicates a layer starting from the last. For example, -1 would indicate the last layer, -2 - the layer before the last, and so on.

com.mindfusion.diagramming.jlayout Namespace

LayoutRules Constructor

Initializes a new instance of the LayoutRules class.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`public LayoutRules ()`

See Also

LayoutRules Methods

LayoutRules.addLayoutRule Method

Adds or sets a new rule, depending on if the rule with key - Key already exists or no;

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean addLayoutRule (
    Object Key,
    Object Value
)
```

Parameters

Key

Value

Return Value

See Also

LayoutRules Members
LayoutRules Class
com.mindfusion.diagramming.jlayout Namespace

LayoutRules.AddLayoutRule Method

Builds a key as a pair of the objects Object1 and Object2 and adds or sets a new rule, with this key anf value - Value.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean AddLayoutRule (
    Object Object1,
    Object Object2,
    Object Value
)
```

Parameters

Object1

Object2

Value

Return Value

See Also

LayoutRules Members
LayoutRules Class
com.mindfusion.diagramming.jlayout Namespace

LayoutRules.buildKey Method

Builds a key - object for the new rule, as a pair of two objects: obj1 and obj2

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public Object buildKey (
    Object obj1,
    Object obj2
)
```

Parameters

obj1

obj2

Return Value

See Also

LayoutRules Members
LayoutRules Class
com.mindfusion.diagramming.jlayout Namespace

LayoutRules.getLayoutRule Method

If there is rule with key - Key initializes - Value otherwise fails;

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean getLayoutRule (
    Object Key,
    ByRef<Object> Value
)
```

Parameters

Key

Value

Return Value

See Also

LayoutRules Members
LayoutRules Class
com.mindfusion.diagramming.jlayout Namespace

Link Interface

Syntax

Java
`public interface Link extends Routable`

See Also

Link Members
com.mindfusion.diagramming.jlayout Namespace

Link Members

The following tables list the members exposed by the Link type.

Public Methods

	Name	Description
	getDebugId	
	getDestination	Gets the destination Node for this link.
	getModified	Gets a value indicating whether the points of this link have been modified by the layouting algorithm.
	getOppositeNode	Returns the node at the opposite end of the link.
	getOrigin	Gets the origin Node for this link.
	getPoints	Gets the sequence of points defining this link.
	getRuntimeData	Gets custom data associated with this link.
	getTraits	Gets properties specific to each layout algorithm.
	getWeight	Gets the weight of the link.
	intersects	
	setModified	Sets a value indicating whether the points of this link have been modified by the layouting algorithm.
	setPoints	Overloaded.

	updatePoints	Invoked to update the link after its point sequence has been changed.

Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link Methods

Link.getDebugId Method

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`String getDebugId ()`

Return Value

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.getDestination Method

Gets the destination Node for this link.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`Node getDestination ()`

Return Value

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.getModified Method

Gets a value indicating whether the points of this link have been modified by the layouting algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
boolean getModified ()
```

Return Value

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.getOppositeNode Method

Returns the node at the opposite end of the link.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
Node getOppositeNode (
    Node aNode
)
```

Parameters

aNode
Specifies a node whose opposite node should be returned.

Return Value

The node opposite to the specified node.

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.getOrigin Method

Gets the origin Node for this link.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
Node getOrigin ()
```

Return Value

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.getPoints Method

Gets the sequence of points defining this link.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
PointList getPoints ()
```

Return Value

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.getRuntimeData Method

Gets custom data associated with this link.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
Hashtable<Object, Object> getRuntimeData ()
```

Return Value

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.getTraits Method

Gets properties specific to each layout algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
Hashtable<Object, Object> getTraits ()
```

Return Value

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.getWeight Method

Gets the weight of the link.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
float getWeight ()
```

Return Value

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.intersects Method

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
boolean intersects (
    Rectangle2D.Float rect
)
```

Parameters

rect

Return Value

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.setModified Method

Sets a value indicating whether the points of this link have been modified by the layouting algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
void setModified (
    boolean value
)
```

Parameters

value

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.setPoints Method

Overload List

Name	Description
Link.setPoints (ArrayList)	Invoked by some layouting algorithms to update the sequence of points which define the link.
Link.setPoints (PointList)	Sets the sequence of points defining this link.

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.setPoints Method (ArrayList<Point2D.Float>)

Invoked by some layouting algorithms to update the sequence of points which define the link.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
void setPoints (
    ArrayList<Point2D.Float> points
)
```

Parameters

points

See Also

setPoints Method Overload List
Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.setPoints Method (PointList)

Sets the sequence of points defining this link.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
void setPoints (
    PointList points
)
```

Parameters

points

See Also

setPoints Method Overload List
Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

Link.updatePoints Method

Invoked to update the link after its point sequence has been changed.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`void updatePoints ()`

See Also

Link Members
Link Interface
com.mindfusion.diagramming.jlayout Namespace

LinkList Class

Syntax

Java
`public class LinkList extends BaseList<E>`

Inheritance Hierarchy

java.lang.Object
  java.util.AbstractCollection(E)
    java.util.AbstractList(E)
      com.mindfusion.diagramming.jlayout.BaseList(E)
        com.mindfusion.diagramming.jlayout.LinkList

public LinkOperations ()
```

See Also

LinkOperations Class
com.mindfusion.diagramming.jlayout Namespace

LinkOperations Methods

LinkOperations.lagrangeInterpolation Method

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public static boolean lagrangeInterpolation (
    boolean xFlag,
    Point2D.Float sp,
    Point2D.Float ep,
    Point2D.Float xy,
    ByRef<Float> res
)
```

Parameters

xFlag

sp

ep

xy

res

Return Value

See Also

LinkOperations Members
LinkOperations Class

Node Members

The following tables list the members exposed by the Node type.

Public Methods

	Name	Description
	createVertex	Creates a Vertex of appropriate type to represent this node in a graph.
	getBounds	Gets or sets the bounding rectangle of the node.
	getCenter	Gets the geometric center of this node.
	getDebugId	
	getInLinks	Gets all incoming links.
	getMaster	Gets the master node in a graph with hierarchical relationships.
	getOutLinks	Gets all outgoing links.
	getRuntimeData	Gets custom data associated with this node.
	getSubordinates	Gets the subordinate nodes in a graph with hierarchical relationships.
	getTraits	Contains properties specific to each layout algorithm.
	getWeight	Gets the weight of the node.
	setBounds	Overloaded.
	setCenter	Sets the geometric center of this node.

See Also

Node Interface
com.mindfusion.diagramming.jlayout Namespace

Node Methods

Node.createVertex Method

Creates a Vertex of appropriate type to represent this node in a graph.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
Vertex createVertex ()
```

Return Value

An instance of the Vertex class.

See Also

Node Members
Node Interface
com.mindfusion.diagramming.jlayout Namespace

Node.getBounds Method

Gets or sets the bounding rectangle of the node.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
Rectangle2D.Float getBounds ()
```

Return Value

See Also

Node Members
Node Interface
com.mindfusion.diagramming.jlayout Namespace

Node.getCenter Method

Gets the geometric center of this node.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
Point2D.Float getCenter ()
```

Return Value

See Also

Node Members
Node Interface

Node.getDebugId Method

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
String getDebugId ()
```

Return Value

See Also

Node Members
Node Interface
com.mindfusion.diagramming.jlayout Namespace

Node.getInLinks Method

Gets all incoming links.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
LinkList getInLinks ()
```

Return Value

See Also

Node Members
Node Interface
com.mindfusion.diagramming.jlayout Namespace

Node.getMaster Method

Gets the master node in a graph with hierarchical relationships.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
Node getMaster ()
```

Return Value

See Also

Node Members
Node Interface
com.mindfusion.diagramming.jlayout Namespace

Node.getOutLinks Method

Gets all outgoing links.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`LinkList getOutLinks ()`

Return Value

See Also

Node Members
Node Interface
com.mindfusion.diagramming.jlayout Namespace

Node.getRuntimeData Method

Gets custom data associated with this node.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`Hashtable<Object, Object> getRuntimeData ()`

Return Value

See Also

Node Members
Node Interface
com.mindfusion.diagramming.jlayout Namespace

Node.getSubordinates Method

Gets the subordinate nodes in a graph with hierarchical relationships.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`NodeList getSubordinates ()`

Return Value

See Also

Node Members
Node Interface
com.mindfusion.diagramming.jlayout Namespace

Node.getTraits Method

Contains properties specific to each layout algorithm.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`Hashtable<Object, Object> getTraits ()`

Return Value

See Also

Node Members
Node Interface
com.mindfusion.diagramming.jlayout Namespace

Node.getWeight Method

Gets the weight of the node.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`float getWeight ()`

Return Value

See Also

Node Members
Node Interface

setBounds Method Overload List
Node Members
Node Interface
com.mindfusion.diagramming.jlayout Namespace

Node.setBounds Method (Rectangle2D, boolean)

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
void setBounds (
    Rectangle2D value,
    boolean updateSize
)
```

Parameters

value

updateSize

See Also

setBounds Method Overload List
Node Members
Node Interface
com.mindfusion.diagramming.jlayout Namespace

Node.setCenter Method

Sets the geometric center of this node.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
void setCenter (
    Point2D.Float value
)
```

Parameters

value

See Also

NodeOrderComparer2 Members
NodeOrderComparer2 Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayout Class

Performs one-way layout on a graph.

Syntax

Java

```
public class OneWayLayout
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.jlayout.OneWayLayout

See Also

OneWayLayout Members
com.mindfusion.diagramming.jlayout Namespace

OneWayLayout Members

Performs one-way layout on a graph.

The following tables list the members exposed by the OneWayLayout type.

Public Constructors

	Name	Description
	OneWayLayout	Initializes a new instance of the **OneWayLayout** class.

Public Methods

	Name	Description
	arrange	Applies the layout to the specified graph using the specified settings.

See Also

OneWayLayout Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayout Constructor

Initializes a new instance of the OneWayLayout class.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`public OneWayLayout ()`

See Also

OneWayLayout Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayout Methods

OneWayLayout.arrange Method

Applies the layout to the specified graph using the specified settings.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public boolean arrange (
    Graph igraph,
    OneWayLayoutInfo info
)
```

Parameters

igraph

info

Return Value

See Also

OneWayLayout Members
OneWayLayout Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayoutInfo Class

Contains settings for the OneWayLayout class.

Syntax

```
Java
public class OneWayLayoutInfo
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.jlayout.OneWayLayoutInfo

See Also

OneWayLayoutInfo Members
com.mindfusion.diagramming.jlayout Namespace

OneWayLayoutInfo Members

Contains settings for the OneWayLayout class.

The following tables list the members exposed by the OneWayLayoutInfo type.

Public Constructors

	Name	Description

	OneWayLayoutInfo	Initializes a new instance of the **OneWayLayoutInfo** class.

Public Methods

	Name	Description
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged graph and the top-left point of the document bounds.
	getNodeDistance	Gets the minimum spacing between adjacent nodes in the final layout.
	getOrientation	Gets the orientation of the arranged graph.
	getRoundedLinks	Gets a value indicating whether the layout will smooth link bends.
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged graph and the top-left point of the document bounds.
	setNodeDistance	Gets the minimum spacing between adjacent nodes in the final layout.
	setOrientation	Gets the orientation of the arranged graph.
	setRoundedLinks	Sets a value indicating whether the layout will smooth link bends.

OneWayLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayoutInfo Constructor

Initializes a new instance of the OneWayLayoutInfo class.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public OneWayLayoutInfo ()
```

See Also

OneWayLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayoutInfo Methods

OneWayLayoutInfo.getMargins Method

Gets the distance between the top-left corner of the smallest rectangle containing the arranged graph and the top-left point of the document bounds.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public XDimension2D.Double getMargins ()
```

Return Value

See Also

OneWayLayoutInfo Members
OneWayLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayoutInfo.getNodeDistance Method

Gets the minimum spacing between adjacent nodes in the final layout.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public float getNodeDistance ()
```

Return Value

See Also

OneWayLayoutInfo Members
OneWayLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayoutInfo.getOrientation Method

Gets the orientation of the arranged graph.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public Orientation getOrientation ()
```

Return Value

See Also

OneWayLayoutInfo Members
OneWayLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayoutInfo.getRoundedLinks Method

Gets a value indicating whether the layout will smooth link bends.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean getRoundedLinks ()
```

Return Value

See Also

OneWayLayoutInfo Members
OneWayLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayoutInfo.setMargins Method

Sets the distance between the top-left corner of the smallest rectangle containing the arranged graph and the top-left point of the document bounds.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setMargins (
    XDimension2D.Double value
)
```

Parameters

value

See Also

OneWayLayoutInfo Members
OneWayLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayoutInfo.setNodeDistance Method

Gets the minimum spacing between adjacent nodes in the final layout.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setNodeDistance (
    float value
)
```

Parameters

value

See Also

OneWayLayoutInfo Members
OneWayLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayoutInfo.setOrientation Method

Gets the orientation of the arranged graph.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setOrientation (
    Orientation value
)
```

Parameters

value

See Also

OneWayLayoutInfo Members
OneWayLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OneWayLayoutInfo.setRoundedLinks Method

Sets a value indicating whether the layout will smooth link bends.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

`public void setRoundedLinks (`
`    boolean value`
`)`

Parameters

value

OrthogonalBendLinks Methods

OrthogonalBendLinks.isBended Method

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static boolean isBended (
    boolean fixStartpts,
    Orientation startOrientation,
    Orientation endOrientation,
    Link outLink
)
```

Parameters

fixStartpts

startOrientation

endOrientation

outLink

Return Value

OrthogonalLayout Methods

OrthogonalLayout.arrange Method

Overload List

Name	Description
OrthogonalLayout.arrange (Graph, OrthogonalLayoutInfo)	Applies the layout to the specified graph using the specified settings.
OrthogonalLayout.arrange (Graph, OrthogonalLayoutInfo, LayoutProgress)	Applies the layout to the specified graph using the specified settings and progress callback delegate.

See Also

OrthogonalLayout Members
OrthogonalLayout Class
com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayout.arrange Method (Graph, OrthogonalLayoutInfo)

Applies the layout to the specified graph using the specified settings.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean arrange (
    Graph graph,
    OrthogonalLayoutInfo info
)
```

Parameters

graph

info

Return Value

See Also

arrange Method Overload List
OrthogonalLayout Members
OrthogonalLayout Class
com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayout.arrange Method (Graph, OrthogonalLayoutInfo, LayoutProgress)

Applies the layout to the specified graph using the specified settings and progress callback delegate.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean arrange (
    Graph igraph,
    OrthogonalLayoutInfo info,
    LayoutProgress progress
)
```

Parameters

igraph

info

progress

Return Value

OrthogonalLayoutInfo Members

The following tables list the members exposed by the OrthogonalLayoutInfo type.

Public Constructors

	Name	Description
	OrthogonalLayoutInfo	Initializes a new instance of the OrthogonalLayoutInfo class.

Public Methods

	Name	Description
	getDirected	Gets a value indicating whether the graph being laid out is directed.
	getMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged tree and the top-left point of the document bounds.
	getMinimizeLinkBends	
	getMinLaneSize	Gets or sets a value indicating the minimum size of a lane.
	getPadding	Gets a value indicating how much space to leave between nodes in adjacent lanes.
	getRefine	Gets or sets a value indicating whether to refine the layout.
	setDirected	Sets a value indicating whether the graph being laid out is directed.
	setMargins	
	setMinimizeLinkBends	Sets a value indicating whether the layout should attempt to minimize link bends.
	setMinLaneSize	Gets or sets a value indicating the minimum size of a lane.
	setPadding	Sets a value indicating how much space to leave between nodes in adjacent lanes.
	setRefine	Gets or sets a value indicating whether to refine the layout.

com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayoutInfo Methods

OrthogonalLayoutInfo.getDirected Method

Gets a value indicating whether the graph being laid out is directed.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public boolean getDirected ()
```

Return Value

See Also

OrthogonalLayoutInfo Members
OrthogonalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayoutInfo.getMargins Method

Sets the distance between the top-left corner of the smallest rectangle containing the arranged tree and the top-left point of the document bounds.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
```

Java

```
public XDimension2D.Double getMargins ()
```

Return Value

OrthogonalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayoutInfo.getMinimizeLinkBends Method

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean getMinimizeLinkBends ()
```

Return Value

Gets a value indicating whether the layout should attempt to minimize link bends.

See Also

OrthogonalLayoutInfo Members
OrthogonalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayoutInfo.getMinLaneSize Method

Gets or sets a value indicating the minimum size of a lane.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public float getMinLaneSize ()
```

Return Value

See Also

OrthogonalLayoutInfo Members
OrthogonalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayoutInfo.getPadding Method

Gets a value indicating how much space to leave between nodes in adjacent lanes.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public float getPadding ()
```

Return Value

See Also

OrthogonalLayoutInfo Members
OrthogonalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayoutInfo.getRefine Method

Gets or sets a value indicating whether to refine the layout.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean getRefine ()
```

Return Value

See Also

OrthogonalLayoutInfo Members
OrthogonalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayoutInfo.setDirected Method

Sets a value indicating whether the graph being laid out is directed.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setDirected (
    boolean directed
)
```

Parameters

directed

See Also

OrthogonalLayoutInfo Members
OrthogonalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayoutInfo.setMargins Method

Overload List

Name	Description
OrthogonalLayoutInfo.setMargins (XDimension2D.Double)	Sets the distance between the top-left corner of the smallest rectangle containing the arranged tree and the top-left point of the document bounds.

See Also

OrthogonalLayoutInfo Members
OrthogonalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayoutInfo.setMargins Method (XDimension2D.Double)

Sets the distance between the top-left corner of the smallest rectangle containing the arranged tree and the top-left point of the document bounds.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setMargins (
    XDimension2D.Double margins
)
```

Parameters

margins

See Also

OrthogonalLayoutInfo Members
OrthogonalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayoutInfo.setMinimizeLinkBends Method

Sets a value indicating whether the layout should attempt to minimize link bends.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setMinimizeLinkBends (
    boolean value
)
```

Parameters

value
true to minimize link bends, otherwise false. The default value is true.

See Also

OrthogonalLayoutInfo Members
OrthogonalLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

OrthogonalLayoutInfo.setMinLaneSize Method

Gets or sets a value indicating the minimum size of a lane.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setMinLaneSize (
    float value
)
```

Parameters

value

Pair Members

Represents a coupling between two arbitrary objects.

The following tables list the members exposed by the Pair type.

Public Constructors

	Name	Description

	Pair	Overloaded.

Public Methods

	Name	Description
	compareTo	Comparable.compareTo implementation.
	equals	Object.equals override.
	getFirstObject	Gets the first pair object.
	getPairElements	Gets the elements of the pair as an ArrayList.
	getSecondObject	Gets the second pair object.
	hashCode	Object.GetHashCode override.
	setFirstObject	Sets the first pair object.
	setSecondObject	Sets the second pair object.

Pair Methods

Pair.compareTo Method

Comparable.compareTo implementation.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public int compareTo (
    Pair pair
)
```

Parameters

pair

Return Value

See Also

Pair Members
Pair Class
com.mindfusion.diagramming.jlayout Namespace

Pair.equals Method

Object.equals override.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean equals (
    Object obj
)
```

Parameters

obj

Return Value

See Also

Pair Members
Pair Class
com.mindfusion.diagramming.jlayout Namespace

Pair.getFirstObject Method

Gets the first pair object.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public Object getFirstObject ()
```

Return Value

See Also

Pair Members
Pair Class
com.mindfusion.diagramming.jlayout Namespace

Pair.getPairElements Method

Gets the elements of the pair as an ArrayList.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public ArrayList<Object> getPairElements ()
```

Return Value

See Also

Pair Members
Pair Class
com.mindfusion.diagramming.jlayout Namespace

Pair.getSecondObject Method

Gets the second pair object.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public Object getSecondObject ()
```

Return Value

See Also

Pair Members
Pair Class
com.mindfusion.diagramming.jlayout Namespace

Pair.hashCode Method

Object.GetHashCode override.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public int hashCode ()
```

Return Value

See Also

Pair Members
Pair Class
com.mindfusion.diagramming.jlayout Namespace

Pair.setFirstObject Method

Sets the first pair object.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setFirstObject (
    Object value
)
```

Parameters

value

See Also

Pair Members
Pair Class
com.mindfusion.diagramming.jlayout Namespace

Pair.setSecondObject Method

Sets the second pair object.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setSecondObject (
    Object value
)
```

Parameters

value

See Also

Pair Members
Pair Class
com.mindfusion.diagramming.jlayout Namespace

Path Class

Syntax

Java
`public class Path`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.jlayout.Path

See Also

Path Members
com.mindfusion.diagramming.jlayout Namespace

Path Members

The following tables list the members exposed by the Path type.

Public Constructors

	Name	Description
	Path	Overloaded.

Public Methods

	Name	Description
	add	Overloaded.
	contains	Overloaded.
	getItems	Gets a list with all items (nodes and links) composing the path.
	getLength	Gets the length of the path.
	getLinks	Gets a list of all links composing the path.
	getNodes	Gets the list of all nodes connected by the path.
	getWeight	Gets the length of the path expressed as a sum of the weights of all nodes and links, composing the path.
	sameCycle	Determines whether the current path traverses the same nodes as the specified path in the same order, disregard which one is the starting node.

Path Constructor Overload List
Path Class
com.mindfusion.diagramming.jlayout Namespace

Path Methods

Path.add Method

Overload List

Name	Description
Path.add (Link, Node)	Append the node and the link to the path.
Path.add (Node)	Append the node to the path.

See Also

Path Members
Path Class
com.mindfusion.diagramming.jlayout Namespace

Path.add Method (Link, Node)

Append the node and the link to the path.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void add (
    Link link,
    Node node
)
```

Parameters

link

node

See Also

add Method Overload List
Path Members
Path Class
com.mindfusion.diagramming.jlayout Namespace

Path.add Method (Node)

Append the node to the path.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void add (
    Node node
)
```

Parameters

node

See Also

add Method Overload List
Path Members
Path Class
com.mindfusion.diagramming.jlayout Namespace

Path.contains Method

Overload List

Name	Description
Path.contains (Link)	Checks whether the specified link is a participant in the path.
Path.contains (Node)	Checks whether the specified node is a participant in the path.

See Also

Path Members
Path Class
com.mindfusion.diagramming.jlayout Namespace

Path.contains Method (Link)

Checks whether the specified link is a participant in the path.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean contains (
    Link link
```

```
)
```

Parameters

link

Return Value

See Also

contains Method Overload List
Path Members
Path Class
com.mindfusion.diagramming.jlayout Namespace

Path.contains Method (Node)

Checks whether the specified node is a participant in the path.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean contains (
    Node node
)
```

Parameters

node

Return Value

See Also

contains Method Overload List
Path Members
Path Class
com.mindfusion.diagramming.jlayout Namespace

Path.getItems Method

Gets a list with all items (nodes and links) composing the path.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public ArrayList<Object> getItems ()
```

Return Value

See Also

Path Members
Path Class
com.mindfusion.diagramming.jlayout Namespace

Path.getLength Method

Gets the length of the path.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public int getLength ()
```

Return Value

See Also

Path Members
Path Class
com.mindfusion.diagramming.jlayout Namespace

Path.getLinks Method

Gets a list of all links composing the path.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public LinkList getLinks ()
```

Return Value

See Also

Path Members
Path Class
com.mindfusion.diagramming.jlayout Namespace

Path.getNodes Method

Gets the list of all nodes connected by the path.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public NodeList getNodes ()
```

Return Value

See Also

Path Members
Path Class
com.mindfusion.diagramming.jlayout Namespace

Path.getWeight Method

Gets the length of the path expressed as a sum of the weights of all nodes and links, composing the path.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public float getWeight (
    boolean incNodes,
    boolean incLinks
)
```

Parameters

incNodes

incLinks

Return Value

See Also

Path Members
Path Class
com.mindfusion.diagramming.jlayout Namespace

Path.sameCycle Method

Determines whether the current path traverses the same nodes as the specified path in the same order, disregard which one is the starting node.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

```
Java
public boolean sameCycle (
    Path path
```

```
)
```

Parameters

path

Return Value

See Also

Path Members
Path Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder Class

Syntax

Java
`public class PathFinder`

Inheritance Hierarchy

java.lang.Object
com.mindfusion.diagramming.jlayout.PathFinder

See Also

PathFinder Members
com.mindfusion.diagramming.jlayout Namespace

PathFinder Members

The following tables list the members exposed by the PathFinder type.

Public Constructors

	Name	Description
	PathFinder	

Public Methods

	Name	Description
	findAllCycles	
	findAllPaths	Overloaded.
	findCycle	Overloaded.
	findLongestPath	Overloaded.

	findShortestPath	Overloaded.

public PathFinder ()
```

See Also

PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder Methods

PathFinder.findAllCycles Method

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static PathList findAllCycles (
    Graph graph
)
```

Parameters

graph

Return Value

See Also

PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findAllPaths Method

Overload List

Name	Description
PathFinder.findAllPaths (Graph, Node, Node)	Finds and returns all paths starting from node *from* and ending at node *to*. Returns empty collection if no path exists.
PathFinder.findAllPaths (Graph, Node, Node, int)	Finds and returns all paths starting from node *from* and ending at node *to*. Returns empty collection if no path exists.

See Also

PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findAllPaths Method (Graph, Node, Node)

Finds and returns all paths starting from node *from* and ending at node *to*. Returns empty collection if no path exists.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static PathList findAllPaths (
    Graph graph,
    Node from,
    Node to
)
```

Parameters

graph

from

to

Return Value

See Also

findAllPaths Method Overload List
PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findAllPaths Method (Graph, Node, Node, int)

Finds and returns all paths starting from node *from* and ending at node *to*. Returns empty collection if no path exists.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static PathList findAllPaths (
    Graph graph,
    Node from,
    Node to,
    int maxPaths
)
```

Parameters

graph

from

to

maxPaths

Return Value

See Also

findAllPaths Method Overload List
PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findCycle Method

Overload List

Name	Description
PathFinder.findCycle (Graph)	Detects whether there is a cycle in a graph.
PathFinder.findCycle (Graph, Node)	Detects whether the specified node participates in a cycle.

See Also

PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findCycle Method (Graph)

Detects whether there is a cycle in a graph.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static Path findCycle (
    Graph graph
)
```

Parameters

graph

Return Value

See Also

findCycle Method Overload List
PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findCycle Method (Graph, Node)

Detects whether the specified node participates in a cycle.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static Path findCycle (
    Graph graph,
    Node participant
)
```

Parameters

graph

participant

Return Value

See Also

findCycle Method Overload List
PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findLongestPath Method

Overload List

Name	Description
PathFinder.findLongestPath (Graph)	Finds the longest path in a graph. Returns null if path is not found.

PathFinder.findLongestPath (Graph, long)	Finds the longest path in the graph. The time limit specifies the maximum duration of the search process in milliseconds. Returns null if no path exists.
PathFinder.findLongestPath (Graph, Node, Node)	Finds the longest path between two nodes. Returns null if no path exists.

See Also

PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findLongestPath Method (Graph)

Finds the longest path in a graph. Returns null if path is not found.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static Path findLongestPath (
    Graph graph
)
```

Parameters

graph

Return Value

See Also

findLongestPath Method Overload List
PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findLongestPath Method (Graph, long)

Finds the longest path in the graph. The time limit specifies the maximum duration of the search process in milliseconds. Returns null if no path exists.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static Path findLongestPath (
    Graph graph,
    long timeLimit
)
```

Parameters

graph

timeLimit

Return Value

See Also

findLongestPath Method Overload List
PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findLongestPath Method (Graph, Node, Node)

Finds the longest path between two nodes. Returns null if no path exists.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static Path findLongestPath (
    Graph graph,
    Node from,
    Node to
)
```

Parameters

graph

from

to

Return Value

See Also

findLongestPath Method Overload List
PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findShortestPath Method

Overload List

Name	Description
PathFinder.findShortestPath (Graph, Node, Node)	Finds and returns the shortest path between *from* and *to*. Returns null if no path exists.

PathFinder.findShortestPath (Graph, Node, Node, boolean, boolean)	Finds and returns the shortest path between *from* and *to*, considering the weight of the nodes, the weight of the links or both.

See Also

PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findShortestPath Method (Graph, Node, Node)

Finds and returns the shortest path between *from* and *to*. Returns null if no path exists.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static Path findShortestPath (
    Graph graph,
    Node from,
    Node to
)
```

Parameters

graph

from

to

Return Value

See Also

findShortestPath Method Overload List
PathFinder Members
PathFinder Class
com.mindfusion.diagramming.jlayout Namespace

PathFinder.findShortestPath Method (Graph, Node, Node, boolean, boolean)

Finds and returns the shortest path between *from* and *to*, considering the weight of the nodes, the weight of the links or both.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public static Path findShortestPath (
    Graph graph,
    Node from,
    Node to,
    boolean useNodeWeights,
    boolean useLinkWeights
)
```

Parameters

graph

from

to

useNodeWeights

useLinkWeights

Return Value

See Also

findShortestPath Method Overload List

SpringLayoutTraits Enumeration

Indicates item traits specific to SpringLayout. Members of this enumeration can be used as keys in the DiagramItem.LayoutTraits hashtable.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public enum SpringLayoutTraits
```

Members

	Member name	Description
	Frozen	If the LayoutTraits value associated with a node through this key is **true**, SpringLayout considers the repulsion forces exerted by the node to other nodes, but ignores forces acting on the node and keeps it in place.

SwimlaneLayout Class

Performs layered layout on a graph.

Syntax

Java
`public class SwimlaneLayout`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.jlayout.SwimlaneLayout

See Also

SwimlaneLayout Members
com.mindfusion.diagramming.jlayout Namespace

SwimlaneLayout Members

Performs layered layout on a graph.

The following tables list the members exposed by the SwimlaneLayout type.

Public Constructors

	Name	Description
	SwimlaneLayout	Initializes a new instance of the **SwimlaneLayout** class.

Public Methods

	Name	Description
	arrange	Applies the layout to the specified graph using the specified settings.

See Also

SwimlaneLayout Class
com.mindfusion.diagramming.jlayout Namespace

SwimlaneLayout Constructor

Initializes a new instance of the SwimlaneLayout class.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public SwimlaneLayout ()
```

See Also

SwimlaneLayout Class
com.mindfusion.diagramming.jlayout Namespace

SwimlaneLayout Methods

SwimlaneLayout.arrange Method

Applies the layout to the specified graph using the specified settings.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public boolean arrange (
    Graph graph,
    GraphBuilder builder,
    SwimlaneLayoutInfo info
)
```

Parameters

graph

builder

info

Return Value

SwimlaneLayoutInfo Members

Contains settings for the SwimlaneLayout class.

The following tables list the members exposed by the SwimlaneLayoutInfo type.

Public Constructors

	Name	Description
	SwimlaneLayoutInfo	Initializes a new instance of the **SwimlaneLayoutInfo** class.

Public Methods

	Name	Description
	getCollapseEmptyLanes	Get a value indicating whether lanes without associated nodes will shrink to zero size. By default, empty lanes will have size equal to LaneDistance.
	getCompactNodes	Gets a value indicating whether the nodes within individual lanes are compacted.
	getDirection	Gets the direction of the arranged diagram.
	getKeepLaneSizes	Gets a value indicating whether the layout will attempt to preserve the original sizes of the lanes in the supplied grid.
	getLaneDistance	Gets the spacing between adjacent lanes in the final layout.
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds.
	getNodeDistance	Gets the spacing between adjacent nodes within a lane in the final layout.

	getOrientation	Gets the overall orientation of the arranged diagram.
	getSwimlaneGrid	Gets the object through which the swimlane grid can be manipulated by the layout.
	setCollapseEmptyLanes	Set a value indicating whether lanes without associated nodes will shrink to zero size. By default, empty lanes will have size equal to LaneDistance.
	setCompactNodes	Sets a value indicating whether the nodes within individual lanes are compacted.
	setDirection	Gets the direction of the arranged diagram.
	setKeepLaneSizes	Gets a value indicating whether the layout will attempt to preserve the original sizes of the lanes in the supplied grid.
	setLaneDistance	Sets the spacing between adjacent lanes in the final layout.
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds.
	setNodeDistance	Sets the spacing between adjacent nodes within a lane in the final layout.
	setOrientation	Sets the overall orientation of the arranged diagram.
	setSwimlaneGrid	Sets the object through which the swimlane grid can be manipulated by the layout.

SwimlaneLayoutInfo Members
SwimlaneLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

SwimlaneLayoutInfo.setNodeDistance Method

Sets the spacing between adjacent nodes within a lane in the final layout.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setNodeDistance (
    float value
)
```

Parameters

value

See Also

SwimlaneLayoutInfo Members
SwimlaneLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

SwimlaneLayoutInfo.setOrientation Method

Sets the overall orientation of the arranged diagram.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setOrientation (
    Orientation value
)
```

Parameters

value

See Also

SwimlaneLayoutInfo Members
SwimlaneLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

SwimlaneLayoutInfo.setSwimlaneGrid Method

Sets the object through which the swimlane grid can be manipulated by the layout.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setSwimlaneGrid (
    SwimlaneGrid value
)
```

Parameters

value

See Also

SwimlaneLayoutInfo Members
SwimlaneLayoutInfo Class

TreeLayoutBalance Enumeration

Specifies how to order child nodes in order to produce layouts with custom balance.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`public enum TreeLayoutBalance`

Members

	Member name	Description
	Custom	Indicates that the child order will be determined by a user-provided function.
	LeftHeavy	Indicates that the child nodes with most total children will be processed first, thus producing a left-heavy layout.
	Original	Indicates that the child order should not be changed.
	Reversed	Indicates that the child order should be reversed.
	RightHeavy	Indicates that the child nodes with least total children will be processed first, thus producing a right-heavy layout.

See Also

com.mindfusion.diagramming.jlayout Namespace

TreeLayoutDirection Enumeration

The members of this enumeration specify the overall direction of the layouts produced by the com.mindfusion.diagramming.TreeLayout class. These constants can be used as parameters of the com.mindfusion.diagramming.TreeLayout.setDirection method.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`public enum TreeLayoutDirection`

Members

	Member name	Description
	BottomToTop	Child nodes are laid out above their parent node.
	LeftToRight	Child nodes are laid out to the right of their parent node.
	RightToLeft	Child nodes are laid out to the left of their parent node.
	TopToBottom	Child nodes are laid out below their parent node.

TreeLayoutInfo Members

The following tables list the members exposed by the TreeLayoutInfo type.

Public Constructors

	Name	Description
	TreeLayoutInfo	Overloaded.

Public Methods

	Name	Description
	getBalance	Gets a value indicating the ordering of the child nodes in order to produce layouts with specific balance.
	getBalanceFunction	Gets the custom balancing function.
	getCompactAssistants	Gets a value indicating whether the "assistant" trait is regarded when performing the layout.
	getDirection	Gets or sets the layout direction.
	getEnableAssistants	Gets a value indicating whether the "assistant" trait is regarded when performing the layout.
	getKeepRootPosition	Gets or sets a flag, indicating whether the layout should preserve the position of the root node.
	getLevelDistance	Gets or sets the minimal distance between two adjacent tree levels.
	getNodeDistance	Gets or sets the minimal distance between two adjacent nodes in the same level.
	getStretchFactor	Gets or sets a value indicating the stretch factor in radial layouts.
	getXGap	Gets or sets the gap between the leftmost box and the left bound of the document.
	getYGap	Gets or sets the gap between the topmost box and the top bound of the document.
	setBalance	Sets a value indicating the ordering of the child nodes in order to produce layouts with specific balance.
	setBalanceFunction	Sets the custom balancing function.
	setCompactAssistants	Sets a value indicating whether the "assistant" trait is regarded when performing the layout.
	setDirection	
	setEnableAssistants	Sets a value indicating whether the "assistant" trait is regarded when performing the layout.
	setKeepRootPosition	
	setLevelDistance	
	setNodeDistance	
	setStretchFactor	
	setXGap	
	setYGap

com.mindfusion.diagramming.jlayout Namespace

TreeLayoutInfo.getNodeDistance Method

Gets or sets the minimal distance between two adjacent nodes in the same level.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public float getNodeDistance ()
```

Return Value

See Also

TreeLayoutInfo Members
TreeLayoutInfo Class

TreeLayoutInfo.getXGap Method

Gets or sets the gap between the leftmost box and the left bound of the document.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public float getXGap ()
```

Return Value

See Also

TreeLayoutInfo Members
TreeLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

TreeLayoutInfo.getYGap Method

Gets or sets the gap between the topmost box and the top bound of the document.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public float getYGap ()
```

Return Value

See Also

TreeLayoutInfo Members
TreeLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

TreeLayoutInfo.setBalance Method

Sets a value indicating the ordering of the child nodes in order to produce layouts with specific balance.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setBalance (
    TreeLayoutBalance value
)
```

Parameters

value
A member of the TreeLayoutBalance enumeration.

See Also

TreeLayoutInfo Members
TreeLayoutInfo Class
com.mindfusion.diagramming.jlayout Namespace

TreeLayoutInfo.setBalanceFunction Method

Sets the custom balancing function.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setBalanceFunction (
    Comparator<Node> value
)
```

Parameters

value

TreeLayoutInfo.setCompactAssistants Method

Sets a value indicating whether the "assistant" trait is regarded when performing the layout.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java

```
public void setCompactAssistants (
    boolean value
)
```

Parameters

value

See Also

TreeLayoutInfo Members

TreeLayoutTraits Enumeration

Indicates item traits specific to tree layouts. Members of this enumeration can be used as keys in the DiagramItem.LayoutTraits hashtable.

Namespace: com.mindfusion.diagramming.jlayout
Package: com.mindfusion.diagramming.jlayout

Syntax

Java
`public enum TreeLayoutTraits`

Members

	Member name	Description
	Assistant	If the LayoutTraits value associated with a node through this key is **true**, centered TreeLayout treats this node as an "assistant" during the arrangement. If the value is **false** or is not present, the node is treated as "subordinate". The associated value can also be of type AssistantType if it is required to specify the position of the assistant node relative to its parent. This value is considered when the EnableAssistants property of **TreeLayout** is set to **true**.

Contains settings for the TreeMapLayout class.

The following tables list the members exposed by the TreeMapLayoutInfo type.

Public Constructors

	Name	Description
	TreeMapLayoutInfo	Initializes a new instance of the **TreeMapLayoutInfo** class.

Public Methods

	Name	Description
	getContainerPadding	Gets the padding inside containers.
	getLayoutArea	Gets the rectangle in which the layout will try to arrange the nodes.
	getMinNodeSize	Gets the minimal size of an arranged node.
	getOrientation	Gets the overall orientation of the arranged diagram.
	getPadding	Gets the distance between adjacent nodes.
	getSquarify	Gets a value indicating whether the layout should attempt to keep the dimension ratio of the nodes closer to 1.

	setContainerPadding	Sets the padding inside containers.
	setLayoutArea	Sets the rectangle in which the layout will try to arrange the nodes.
	setMinNodeSize	Sets the minimal size of an arranged node.
	setOrientation	Sets the overall orientation of the arranged diagram.
	setPadding	Sets the distance between adjacent nodes.
	setSquarify	Sets a value indicating whether the layout should attempt to keep the dimension ratio of the nodes closer to 1.

Grid Class

Represents a lane grid.

Syntax

```
Java
public class Grid implements Externalizable
```

Remarks

The **Grid** class lets you define a background grid or table that can be used in Swimlane diagrams or Gantt charts. To activate the grid, set the EnableLanes property of the Diagram class to **true**.

Grids can include varying number of lanes, divided into child rows and columns whose intersections form cells. The grid can be resized by setting the ColumnCount and RowCount properties or by adding headers to the ColumnHeaders and RowHeaders collections. A column or row can be divided into child elements by adding to the SubHeaders collection of a Header, which lets you form a complex hierarchy of unlimited depth.

The intersection of rows and columns can be either a simple cell for bottommost elements in the lane hierarchy, or a group of cells for parent rows and columns. Cells or cell groups can be accessed via the get method, that lets you index cells either by their integer positions, or by their **Header** objects.

If the AllowResizeHeaders property of the **Grid** class is enabled, users can resize the grid columns and rows as desired. The LaneColumnResizeCursor and LaneRowResizeCursor properties of the DiagramView class specify the mouse cursor shown when resizing the lane column header or the lane row header. The CellBoundsChanged event is raised when lane cell bounds are resized.

The position of the grid and grid headers within the diagram document is defined by TopMargin and LeftMargin, which specify the grid offset relative to Bounds. HookHeaders enables lane headers to be anchored to the left or right side of the control's visible area. The sizes of headers at different levels in the lane hierarchy can be set in a single operation by using the RowHeadersWidths and ColumnHeadersHeights properties.

The appearance of the lanes grid can be customized further in the AlignCells property which specifies whether cells are aligned to each other, the HeadersOnTop property which specifies whether headers should appear on top of the z-order, and the TopLeftAreaStyle specifying the appearance of the grid's top left corner.

The **Grid** class provides many miscellaneous methods that can be used to find grid elements, for determining their bounds and for hit-testing.

Grid Members

Represents a lane grid.

The following tables list the members exposed by the Grid type.

Public Constructors

	Name	Description
	Grid	Overloaded.

Public Methods

	Name	Description
	addGridListener	

findColumn	Returns the first column header matching the specified caption.
findRow	Finds the first row whose header caption matches the specified string.
get	Overloaded.
getAllowResizeHeaders	Gets a value indicating whether users can resize the headers of the grid interactively.
getCellBounds	Returns the bounding rectangle of the specified cell.
getCellColumn	Returns the column index of the specified cell.
getCellFromPoint	Gets the cell located at the specified point.
getCellRow	Returns the row index of the specified cell.
getColumn	Returns the column header with the specified index from the bottommost column header level.
getColumnCount	Gets the number of columns in the grid.
getColumnHeaderBounds	Returns the bounding rectangle of all column headers.
getColumnHeaders	Gets the collection with the topmost column headers.
getColumnHeadersHeights	Gets an array with float values specifying the heights of individual column levels. If a value is non-positive or does not exist because the array has less arguments than the number of rows, then the height is calculated as the maximum height of the columns in that level.
getColumnIndex	Returns the 0-based index of the specified column. Only works for bottommost headers. If the specified column is a group header, returns -1.
getEnableStyledText	Gets a value indicating whether the text of the lane headers can contain formatting tags, such as <b>.
getHeaderBounds	Returns the bounding rectangle of the specified header.
getHeaderFromPoint	Overloaded.
getHeaderLevel	Gets the level of the specified header.
getheadersOnTop	Gets a value indicating whether lane headers appear at the top of the z-order above all other items.
getHookHeaders	Gets a value indicating whether headers will be anchored to the corresponding side (that is, the column header anchored to the top side and the row header anchored to the left side).
getLeftMargin	Gets the offset of the lane grid from the left side of the document bounds.
getMinHeaderSize	
getRow	Returns the row header with the specified index from the bottommost row header level.
getRowCount	Gets the number of rows in the grid.

getRowHeaderBounds	Returns the bounding rectangle of all row headers.
getRowHeaders	Gets the collection with the leftmost row headers.
getRowHeadersWidths	Gets an array with float values specifying the widths of individual row levels.
getRowIndex	Returns the 0-based index of the specified row. Only works for bottommost headers. If the specified row is a group header, returns -1;
getTopLeftAreaStyle	Gets the style of the area above all row headers and to the left of all column headers.
getTopLeftAreaText	Gets the text displayed in the top left area.
getTopLeftAreaTextColor	Gets the color of the text displayed in the top left area.
getTopLeftAreaTextFont	Gets the font used to display text in the top left area.
getTopLeftAreaTextFormat	Gets the format of the text displayed in the top left area.
getTopMargin	Gets the offset of the lane grid from the top side of the document bounds.
insertAfter	Inserts a new header after the specified header and returns a reference to it.
loadFromJson	Deserializes the lane grid from the specified JsonObject using the specified context.
loadFromXml	Deserializes the lane grid from the specified **Element** using the specified context.
raiseAppearanceChanged	
raiseCellBoundsChanged	
raiseHeaderAdded	
raiseHeaderResized	
raiseHeaderStartResizing	
readExternal	
removeGridListener	
renderFirst	Invoked in order to render the grid before any other diagram items are drawn.
renderLast	Invoked in order to render the grid after all other diagram items are drawn.
resizeColumnHeaderHeights	This method is for internal use only. Resizes the heights of all column headers from the specified level with the specified amount.
resizeRowHeaderWidths	This method is for internal use only. Resizes the widths of all row headers from the specified level with the specified amount.
saveToJson	Serializes the lane grid to the specified JsonObject using the specified context.

	saveToXml	Serializes the lane grid to the specified XmlElement using the specified context.
	setAllowResizeHeaders	Sets a value indicating whether users can resize the headers of the grid interactively.
	setColumnCount	Sets the number of columns in the grid.
	setColumnHeadersHeights	Sets an array with float values specifying the heights of individual column levels. If a value is non-positive or does not exist because the array has less arguments than the number of rows, then the height is calculated as the maximum height of the columns in that level.
	setEnableStyledText	Sets a value indicating whether the text of the lane headers can contain formatting tags, such as <b>.
	setHeadersOnTop	Sets a value indicating whether lane headers appear at the top of the z-order above all other items.
	setHookHeaders	Sets a value indicating whether headers will be anchored to the corresponding side (that is, the column header anchored to the top side and the row header anchored to the left side).
	setLeftMargin	Sets the offset of the lane grid from the left side of the document bounds.
	setMinHeaderSize	
	setParent	
	setRowCount	Sets the number of rows in the grid.
	setRowHeadersWidths	Sets an array with float values specifying the widths of individual row levels. If a value is non-positive or does not exist because the array has less arguments than the number of rows, then the width is calculated as the maximum width of the rows in that level.
	setTopLeftAreaStyle	Sets the style of the area above all row headers and to the left of all column headers.
	setTopLeftAreaText	Sets the text displayed in the top left area.
	setTopLeftAreaTextColor	Sets the color of the text displayed in the top left area.
	setTopLeftAreaTextFont	Sets the font used to display text in the top left area.
	setTopLeftAreaTextFormat	Sets the format of the text displayed in the top left area.
	setTopMargin	Sets the offset of the lane grid from the top side of the document bounds.
	writeExternal	

Protected Methods

	Name	Description
	columnHeaderAdded	Handles the HeaderAdded event on the master column header.

	columnHeaderHeightChanged	
	columnHeaderRemoved	
	columnHeaderSizeChanged	
	columnHeaderWidthChanged	
	headerSizeChanged	
	rowHeaderAdded	
	rowHeaderHeightChanged	
	rowHeaderRemoved	
	rowHeaderWidthChanged

Grid Methods

Grid.addGridListener Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void addGridListener (
    GridListener listener
)
```

Parameters

listener

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.columnHeaderAdded Method

Handles the HeaderAdded event on the master column header.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
protected void columnHeaderAdded (
    Header header
)
```

Parameters

header

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.columnHeaderHeightChanged Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
protected void columnHeaderHeightChanged (
    Header header,
    float oldValue
)
```

Parameters

header

oldValue

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.columnHeaderRemoved Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
protected void columnHeaderRemoved (
    Header header
)
```

Parameters

header

Grid.columnHeaderWidthChanged Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
protected void columnHeaderWidthChanged (
    Header header,
    float oldValue
)
```

Parameters

header

oldValue

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.findColumn Method

Returns the first column header matching the specified caption.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public Header findColumn (
    String title
)
```

Parameters

title
A string containing the header title to look for.

Return Value

Returns the first column Header that has the specified caption.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.findRow Method

Finds the first row whose header caption matches the specified string.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public Header findRow (
    String title
)
```

Parameters

title
A string containing the header title to look for.

Return Value

Returns the first row Header that has the specified caption.

com.mindfusion.diagramming.lanes Namespace

Grid.get Method

Overload List

Name	Description
Grid.get (Header, Header) Grid.get (int, int)	Gets the cell or the cluster of cells corresponding to the specified row and column.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.get Method (Header, Header)

Gets the cell or the cluster of cells corresponding to the specified row and column.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public ICell get (
    Header column,
    Header row
)
```

Parameters

column

row

Return Value

See Also

get Method Overload List
Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.get Method (int, int)

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public ICell get (
    int column,
    int row
)
```

Parameters

column

row

Return Value

See Also

get Method Overload List
Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getAllowResizeHeaders Method

Gets a value indicating whether users can resize the headers of the grid interactively.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public boolean getAllowResizeHeaders ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getCellBounds Method

Returns the bounding rectangle of the specified cell.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public Rectangle2D.Float getCellBounds (
    ICell cell
)
```

Parameters

cell
An ICell object representing a cell or a group of cells in the grid.

Return Value

A Rect instance representing the rectangle that bounds the specified cell or group of cells.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getCellColumn Method

Returns the column index of the specified cell.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public int getCellColumn (
    ICell cell
)
```

Parameters

cell
An ICell object representing a single cell in the grid.

Return Value

The index of the column that contains cell; -1 if cell is not found or refers to a group of cells.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getCellFromPoint Method

Gets the cell located at the specified point.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public ICell getCellFromPoint (
    Point2D point,
    Rectangle2D.Float cellBounds
)
```

Parameters

point
A Point instance specifying a point within the grid.

cellBounds
A Rect instance that receives the coordinates of the found cell.

Return Value

An ICell reference to the found cell, or **null** if there is no cell located at the specified point.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getCellRow Method

Returns the row index of the specified cell.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public int getCellRow (
    ICell cell
)
```

Parameters

cell
An ICell object representing a single cell in the grid.

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getColumn Method

Returns the column header with the specified index from the bottommost column header level.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public Header getColumn (
    int index
)
```

Parameters

index
An integer value specifying the column index.

Return Value

A Header object representing the column at the specified index.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getColumnCount Method

Gets the number of columns in the grid.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public int getColumnCount ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getColumnHeaderBounds Method

Returns the bounding rectangle of all column headers.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public Rectangle2D.Float getColumnHeaderBounds ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getColumnHeaders Method

Gets the collection with the topmost column headers.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public HeaderList getColumnHeaders ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getColumnHeadersHeights Method

Gets an array with float values specifying the heights of individual column levels. If a value is non-positive or does not exist because the array has less arguments than the number of rows, then the height is calculated as the maximum height of the columns in that level.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public float[] getColumnHeadersHeights ()
```

Return Value

See Also

Grid Members
Grid Class

Grid.getColumnIndex Method

Returns the 0-based index of the specified column. Only works for bottommost headers. If the specified column is a group header, returns -1.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public int getColumnIndex (
    Header column
)
```

Parameters

column
A Header instance that represents a grid column.

Return Value

The index of column, or -1 if the specified header represents a row or a group of child columns.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getEnableStyledText Method

Gets a value indicating whether the text of the lane headers can contain formatting tags, such as <b>.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public boolean getEnableStyledText ()
```

Return Value

{@code true} if JDiagram should process formatting tags when rendering header texts, otherwise {@code false}.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getHeaderBounds Method

Returns the bounding rectangle of the specified header.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public Rectangle2D.Float getHeaderBounds (
    Header header,
    boolean includeSubHeaders
)
```

Parameters

header
The Header object whose coordinates to return.

includeSubHeaders
true to include the coordinates of the child headers in the returned rectangle; otherwise, false.

Return Value

A **Rectangle2D.Float** that bounds the specified header, and optionally its child headers.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getHeaderFromPoint Method

Overload List

Name	Description
Grid.getHeaderFromPoint (Point2D, Rectangle2D, Point2D)	Gets the Header that is located at the specified point.
Grid.getHeaderFromPoint (Point2D, Rectangle2D.Float)	Gets the Header that is located at the specified point.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getHeaderFromPoint Method (Point2D, Rectangle2D, Point2D)

Gets the Header that is located at the specified point.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public Header getHeaderFromPoint (
    Point2D point,
    Rectangle2D headerBounds,
    Point2D scrollPosition
)
```

Parameters

point
A Point instance specifying a point within the grid.

headerBounds
A Rect instance that receives the coordinates of the found header.

scrollPosition
When the headers are hooked this parameter should provide information about the current scroll position in the view.

Return Value

The found Header object, or **null** if there is no header located at the specified point.

See Also

getHeaderFromPoint Method Overload List
Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getHeaderFromPoint Method (Point2D, Rectangle2D.Float)

Gets the Header that is located at the specified point.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public Header getHeaderFromPoint (
    Point2D point,
    Rectangle2D.Float headerBounds
)
```

Parameters

point
A Point instance specifying a point within the grid.

headerBounds
A Rect instance that receives the coordinates of the found header.

Return Value

The found Header object, or **null** if there is no header located at the specified point.

See Also

getHeaderFromPoint Method Overload List
Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getHeaderLevel Method

Gets the level of the specified header.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public int getHeaderLevel (
    Header header
)
```

Parameters

header

Return Value

This method is for internal use only.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getheadersOnTop Method

Gets a value indicating whether lane headers appear at the top of the z-order above all other items.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public boolean getheadersOnTop ()
```

Return Value

See Also

Grid Members
Grid Class

com.mindfusion.diagramming.lanes Namespace

Grid.getHookHeaders Method

Gets a value indicating whether headers will be anchored to the corresponding side (that is, the column header anchored to the top side and the row header anchored to the left side).

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public boolean getHookHeaders ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getLeftMargin Method

Gets the offset of the lane grid from the left side of the document bounds.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public float getLeftMargin ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getMinHeaderSize Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public float getMinHeaderSize ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getRow Method

Returns the row header with the specified index from the bottommost row header level.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public Header getRow (
    int index
)
```

Parameters

index
An integer value specifying the row index.

Return Value

A Header object representing the row at the specified index.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getRowCount Method

Gets the number of rows in the grid.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public int getRowCount ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getRowHeaderBounds Method

Returns the bounding rectangle of all row headers.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public Rectangle2D.Float getRowHeaderBounds ()
```

Return Value

A **Rectangle2D.Float** that bounds all row headers.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getRowHeaders Method

Gets the collection with the leftmost row headers.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public HeaderList getRowHeaders ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getRowHeadersWidths Method

Gets an array with float values specifying the widths of individual row levels.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public float[] getRowHeadersWidths ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getRowIndex Method

Returns the 0-based index of the specified row. Only works for bottommost headers. If the specified row is a group header, returns -1;

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public int getRowIndex (
    Header row
)
```

Parameters

row
A Header instance that represents a grid row.

Return Value

The index of row, or -1 if the specified header represents a column or a group of child rows.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getTopLeftAreaStyle Method

Gets the style of the area above all row headers and to the left of all column headers.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public Style getTopLeftAreaStyle ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getTopLeftAreaText Method

Gets the text displayed in the top left area.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public String getTopLeftAreaText ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getTopLeftAreaTextColor Method

Gets the color of the text displayed in the top left area.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public Color getTopLeftAreaTextColor ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getTopLeftAreaTextFont Method

Gets the font used to display text in the top left area.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public Font getTopLeftAreaTextFont ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getTopLeftAreaTextFormat Method

Gets the format of the text displayed in the top left area.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public TextFormat getTopLeftAreaTextFormat ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.getTopMargin Method

Gets the offset of the lane grid from the top side of the document bounds.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public float getTopMargin ()
```

Return Value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.headerSizeChanged Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
protected void headerSizeChanged ()
```

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.insertAfter Method

Inserts a new header after the specified header and returns a reference to it.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public Header insertAfter (
    Header header
)
```

Parameters

header
The header after which to insert the new header.

Return Value

A reference to the newly created header.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.loadFromJson Method

Deserializes the lane grid from the specified JsonObject using the specified context.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject

context
A JsonPersistContext

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.loadFromXml Method

Deserializes the lane grid from the specified **Element** using the specified context.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void loadFromXml (
    Element element,
    XmlPersistContext context
)
```

Parameters

element

context

See Also

com.mindfusion.diagramming.lanes Namespace

Grid.raiseHeaderAdded Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void raiseHeaderAdded (
    Header header
)
```

Parameters

header

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.raiseHeaderResized Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void raiseHeaderResized (
    Header header,
    boolean horizontal,
    boolean vertical
)
```

Parameters

header

horizontal

vertical

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.raiseHeaderStartResizing Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void raiseHeaderStartResizing (
    Header header,
    boolean horizontal,
    boolean vertical
)
```

Parameters

header

horizontal

vertical

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.readExternal Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.removeGridListener Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void removeGridListener (
    GridListener listener
)
```

Parameters

listener

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.renderFirst Method

Invoked in order to render the grid before any other diagram items are drawn.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void renderFirst (
    Graphics2D target,
    Rectangle2D viewport
)
```

Parameters

target

viewport

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.renderLast Method

Invoked in order to render the grid after all other diagram items are drawn.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void renderLast (
    Graphics2D target,
    Rectangle2D viewport
)
```

Parameters

target

viewport

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.resizeColumnHeaderHeights Method

This method is for internal use only. Resizes the heights of all column headers from the specified level with the specified amount.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void resizeColumnHeaderHeights (
    int level,
    float increase
)
```

Parameters

level

increase

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.resizeRowHeaderWidths Method

This method is for internal use only. Resizes the widths of all row headers from the specified level with the specified amount.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void resizeRowHeaderWidths (
    int level,
    float increase
)
```

Parameters

level

increase

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.rowHeaderAdded Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
protected void rowHeaderAdded (
    Header header
)
```

Parameters

header

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.rowHeaderHeightChanged Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
protected void rowHeaderHeightChanged (
    Header header,
    float oldValue
)
```

Parameters

header

oldValue

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.rowHeaderRemoved Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
protected void rowHeaderRemoved (
    Header header
)
```

Parameters

header

See Also

Grid.rowHeaderWidthChanged Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
protected void rowHeaderWidthChanged (
    Header header,
    float oldValue
)
```

Parameters

header

oldValue

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.saveToJson Method

Serializes the lane grid to the specified JsonObject using the specified context.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject

context
A JsonPersistContext

See Also

Grid Members
Grid Class

Grid.saveToXml Method

Serializes the lane grid to the specified XmlElement using the specified context.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void saveToXml (
    Element element,
    XmlPersistContext context
)
```

Parameters

element

context

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setAllowResizeHeaders Method

Sets a value indicating whether users can resize the headers of the grid interactively.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void setAllowResizeHeaders (
    boolean value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setColumnCount Method

Sets the number of columns in the grid.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void setColumnCount (
    int value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setColumnHeadersHeights Method

Sets an array with float values specifying the heights of individual column levels. If a value is non-positive or does not exist because the array has less arguments than the number of rows, then the height is calculated as the maximum height of the columns in that level.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void setColumnHeadersHeights (
    float[] value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setEnableStyledText Method

Sets a value indicating whether the text of the lane headers can contain formatting tags, such as <b>.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public void setEnableStyledText (
    boolean value
)
```

Parameters

value
{@code true} if JDiagram should process formatting tags when rendering header texts, otherwise {@code false}.

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setHeadersOnTop Method

Sets a value indicating whether lane headers appear at the top of the z-order above all other items.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public void setHeadersOnTop (
    boolean value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setHookHeaders Method

Sets a value indicating whether headers will be anchored to the corresponding side (that is, the column header anchored to the top side and the row header anchored to the left side).

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
```

```
public void setHookHeaders (
    boolean value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setLeftMargin Method

Sets the offset of the lane grid from the left side of the document bounds.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void setLeftMargin (
    float value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setMinHeaderSize Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void setMinHeaderSize (
    float value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setParent Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void setParent (
    Diagram parent
)
```

Parameters

parent

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setRowCount Method

Sets the number of rows in the grid.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void setRowCount (
    int value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setRowHeadersWidths Method

Sets an array with float values specifying the widths of individual row levels. If a value is non-positive or does not exist because the array has less arguments than the number of rows, then the width is calculated as the maximum width of the rows in that level.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void setRowHeadersWidths (
    float[] values
)
```

Parameters

values

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setTopLeftAreaStyle Method

Sets the style of the area above all row headers and to the left of all column headers.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void setTopLeftAreaStyle (
    Style value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setTopLeftAreaText Method

Sets the text displayed in the top left area.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public void setTopLeftAreaText (
    String value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setTopLeftAreaTextColor Method

Sets the color of the text displayed in the top left area.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public void setTopLeftAreaTextColor (
    Color value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setTopLeftAreaTextFont Method

Sets the font used to display text in the top left area.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public void setTopLeftAreaTextFont (
    Font value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setTopLeftAreaTextFormat Method

Sets the format of the text displayed in the top left area.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void setTopLeftAreaTextFormat (
    TextFormat value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.setTopMargin Method

Sets the offset of the lane grid from the top side of the document bounds.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void setTopMargin (
    float value
)
```

Parameters

value

See Also

Grid Members
Grid Class
com.mindfusion.diagramming.lanes Namespace

Grid.writeExternal Method

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

GridListener Members

The following tables list the members exposed by the GridListener type.

Public Methods

	Name	Description
	appearanceChanged	Raised when the appearance of any of the underlying cells or headers has changed (including when the size of the underlying headers or cells has changed).
	cellBoundsChanged	Raised when the bounding rectangle of a cell has been changed.
	headerAdded	Raised when a header has been inserted to the grid either interactively or through a call to the InsertBefore or InsertAfter methods.
	headerResized	Raised when the user finished resizing a header.
	headerStartResizing	Raises when the user starts resizing a header.
	invalidated	

See Also

GridListener Interface
com.mindfusion.diagramming.lanes Namespace

GridListener Methods

GridListener.appearanceChanged Method

Raised when the appearance of any of the underlying cells or headers has changed (including when the size of the underlying headers or cells has changed).

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
void appearanceChanged ()
```

See Also

GridListener Members
GridListener Interface
com.mindfusion.diagramming.lanes Namespace

GridListener.cellBoundsChanged Method

Raised when the bounding rectangle of a cell has been changed.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
void cellBoundsChanged (
    CellBoundsEvent e
)
```

Parameters

e

See Also

GridListener Members
GridListener Interface
com.mindfusion.diagramming.lanes Namespace

GridListener.headerAdded Method

Raised when a header has been inserted to the grid either interactively or through a call to the InsertBefore or InsertAfter methods.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
void headerAdded (
    HeaderEvent e
)
```

Parameters

e

See Also

GridListener Members
GridListener Interface
com.mindfusion.diagramming.lanes Namespace

GridListener.headerResized Method

Raised when the user finished resizing a header.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
void headerResized (
    HeaderResizeEvent e
)
```

Parameters

e

See Also

GridListener Members
GridListener Interface
com.mindfusion.diagramming.lanes Namespace

GridListener.headerStartResizing Method

Raises when the user starts resizing a header.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
void headerStartResizing (
    HeaderResizeEvent e
)
```

Parameters

e

Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
void invalidated ()
```

See Also

GridListener Members
GridListener Interface
com.mindfusion.diagramming.lanes Namespace

Header Class

Represents a header in a grid view.

Syntax

Java

```
public class Header implements Externalizable
```

Remarks

The **Header** class provides the properties to define and adjust headers in the lanes grid.

The size of a header can be set through the Height and Width properties. Note that the size of the rows and columns in the grid is controlled through the size of their headers. The SubHeaders property lets you add child rows or columns to the grid. The ResizeType property is used to specify how to resize child columns and rows when the topmost headers are resized. The possible values for the **ResizeType** property are defined in the ResizeType enumeration.

In order to specify the color, font or alignment of the header Title, set the TitleColor, TitleFont or TitleFormat properties.

Inheritance Hierarchy

java.lang.Object

See Also

Header Members

Represents a header in a grid view.

The following tables list the members exposed by the Header type.

Public Constructors

	Name	Description
	Header	Overloaded.

Public Methods

	Name	Description
	getHeight	
	getResizeType	
	getRotateTitle	
	getStyle	
	getSubHeaders	
	getTitle	
	getTitleColor	
	getTitleFont	
	getTitleFormat	
	getWidth	
	isColumnHeader	
	isRowHeader	
	loadFromXml	Loads the header from the specified **Element** using the specified context.
	readExternal	
	saveToXml	Saves the header to the specified XmlElement using the specified context.
	setHeight	
	setResizeType	
	setRotateTitle	
	setStyle	
	setTitle	
	setTitleColor	

	setTitleFont	
	setTitleFormat	
	setWidth	
	writeExternal	

Protected Methods

	Name	Description
	loadFromJson	Loads the header from the specified JsonObject using the specified context.
	saveToJson	Saves the header to the specified JsonObject using the specified context.

Header.loadFromJson Method

Loads the header from the specified JsonObject using the specified context.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj

context

See Also

Header Members
Header Class
com.mindfusion.diagramming.lanes Namespace

Header.loadFromXml Method

Loads the header from the specified **Element** using the specified context.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

```
Java
public void loadFromXml (
    Element element,
    XmlPersistContext context
)
```

Parameters

element

context

```
Java
```

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

Header Members
Header Class
com.mindfusion.diagramming.lanes Namespace

Header.saveToJson Method

Saves the header to the specified JsonObject using the specified context.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject

context
A JsonPersistContext

See Also

Header Members
Header Class
com.mindfusion.diagramming.lanes Namespace

Header.saveToXml Method

Saves the header to the specified XmlElement using the specified context.

Namespace: com.mindfusion.diagramming.lanes
Package: com.mindfusion.diagramming.lanes

Syntax

Java

```
public void saveToXml (
    Element element,
```

```
    XmlPersistContext context
)
```

Parameters

element

context

HeaderList Members

The following tables list the members exposed by the HeaderList type.

Public Constructors

	Name	Description
	HeaderList	

Protected Fields

	Name	Description
	list	(Inherited from BaseList.)
	listEvent	(Inherited from BaseList.)
	notifyParent	(Inherited from BaseList.)

Public Methods

	Name	Description
	add	Overloaded.
	clear	
	clone	
	contains	

	contains	Determines if this list contains the specified element. (Inherited from BaseList.)
	first	Gets the first element of this list. (Inherited from BaseList.)
	get	
	indexOf	
	last	Gets the last element of this list. (Inherited from BaseList.)
	readExternal	Loads the list's contents. (Inherited from BaseList.)
	remove	Overloaded.
	removeRange	Removes a range of elements from this list. (Inherited from BaseList.)
	set	Sets the element at the specified position in this list. (Inherited from BaseList.)
	set	
	size	Gets the number of elements in this list. (Inherited from BaseList.)
	writeExternal	Saves the list's contents. (Inherited from BaseList.)

Protected Methods

	Name	Description
	raiseAdding	Raises the adding event. (Inherited from BaseList.)
	raiseClearing	Raises the clearing event. (Inherited from BaseList.)
	raiseRemoving	Raises the removing event. (Inherited from BaseList.)

	DarkSlateBlue	Represents a brush that has an ARGB value of #FF483D8B.
	DarkSlateGray	Represents a brush that has an ARGB value of #FF2F4F4F.
	DarkTurquoise	Represents a brush that has an ARGB value of #FF00CED1.
	DarkViolet	Represents a brush that has an ARGB value of #FF9400D3.
	DeepPink	Represents a brush that has an ARGB value of #FFFF1493.
	DeepSkyBlue	Represents a brush that has an ARGB value of #FF00BFFF.
	DimGray	Represents a brush that has an ARGB value of #FF696969.
	DodgerBlue	Represents a brush that has an ARGB value of #FF1E90FF.
	Firebrick	Represents a brush that has an ARGB value of #FFB22222.
	FloralWhite	Represents a brush that has an ARGB value of #FFFFFAF0.
	ForestGreen	Represents a brush that has an ARGB value of #FF228B22.
	Fuchsia	Represents a brush that has an ARGB value of #FFFF00FF.
	Gainsboro	Represents a brush that has an ARGB value of #FFDCDCDC.
	GhostWhite	Represents a brush that has an ARGB value of #FFF8F8FF.
	Gold	Represents a brush that has an ARGB value of #FFFFD700.
	Goldenrod	Represents a brush that has an ARGB value of #FFDAA520.
	Gray	Represents a brush that has an ARGB value of #FF808080.
	Green	Represents a brush that has an ARGB value of #FF008000.
	GreenYellow	Represents a brush that has an ARGB value of #FFADFF2F.
	Honeydew	Represents a brush that has an ARGB value of #FFF0FFF0.
	HotPink	Represents a brush that has an ARGB value of #FFFF69B4.
	IndianRed	Represents a brush that has an ARGB value of #FFCD5C5C.
	Indigo	Represents a brush that has an ARGB value of #FF4B0082.
	Ivory	Represents a brush that has an ARGB value of #FFFFFFF0.

	Khaki	Represents a brush that has an ARGB value of #FFF0E68C.
	Lavender	Represents a brush that has an ARGB value of #FFE6E6FA.
	LavenderBlush	Represents a brush that has an ARGB value of #FFFFF0F5.
	LawnGreen	Represents a brush that has an ARGB value of #FF7CFC00.
	LemonChiffon	Represents a brush that has an ARGB value of #FFFFFACD.
	LightBlue	Represents a brush that has an ARGB value of #FFADD8E6.
	LightCoral	Represents a brush that has an ARGB value of #FFF08080.
	LightCyan	Represents a brush that has an ARGB value of #FFE0FFFF.
	LightGoldenrodYellow	Represents a brush that has an ARGB value of #FFFAFAD2.
	LightGray	Represents a brush that has an ARGB value of #FFD3D3D3.
	LightGreen	Represents a brush that has an ARGB value of #FF90EE90.
	LightPink	Represents a brush that has an ARGB value of #FFFFB6C1.
	LightSalmon	Represents a brush that has an ARGB value of #FFFFA07A.
	LightSeaGreen	Represents a brush that has an ARGB value of #FF20B2AA.
	LightSkyBlue	Represents a brush that has an ARGB value of #FF87CEFA.
	LightSlateGray	Represents a brush that has an ARGB value of #FF778899.
	LightSteelBlue	Represents a brush that has an ARGB value of #FFB0C4DE.
	LightYellow	Represents a brush that has an ARGB value of #FFFFFFE0.
	Lime	Represents a brush that has an ARGB value of #FF00FF00.
	LimeGreen	Represents a brush that has an ARGB value of #FF32CD32.
	Linen	Represents a brush that has an ARGB value of #FFFAF0E6.
	Magenta	Represents a brush that has an ARGB value of #FFFF00FF.
	Maroon	Represents a brush that has an ARGB value of #FF800000.
	MediumAquamarine	Represents a brush that has an ARGB value of #FF66CDAA.
	MediumBlue	Represents a brush that has an ARGB value of #FF0000CD.
	MediumOrchid	Represents a brush that has an ARGB value of #FFBA55D3.
	MediumPurple	Represents a brush that has an ARGB value of #FF9370DB.
	MediumSeaGreen	Represents a brush that has an ARGB value of #FF3CB371.
	MediumSlateBlue	Represents a brush that has an ARGB value of #FF7B68EE.
	MediumSpringGreen	Represents a brush that has an ARGB value of #FF00FA9A.
	MediumTurquoise	Represents a brush that has an ARGB value of #FF48D1CC.
	MediumVioletRed	Represents a brush that has an ARGB value of #FFC71585.
	MidnightBlue	Represents a brush that has an ARGB value of #FF191970.

	MintCream	Represents a brush that has an ARGB value of #FFF5FFFA.
	MistyRose	Represents a brush that has an ARGB value of #FFFFE4E1.
	Moccasin	Represents a brush that has an ARGB value of #FFFFE4B5.
	NavajoWhite	Represents a brush that has an ARGB value of #FFFFDEAD.
	Navy	Represents a brush that has an ARGB value of #FF000080.
	OldLace	Represents a brush that has an ARGB value of #FFFDF5E6.
	Olive	Represents a brush that has an ARGB value of #FF808000.
	OliveDrab	Represents a brush that has an ARGB value of #FF6B8E23.
	Orange	Represents a brush that has an ARGB value of #FFFFA500.
	OrangeRed	Represents a brush that has an ARGB value of #FFFF4500.
	Orchid	Represents a brush that has an ARGB value of #FFDA70D6.
	PaleGoldenrod	Represents a brush that has an ARGB value of #FFEEE8AA.
	PaleGreen	Represents a brush that has an ARGB value of #FF98FB98.
	PaleTurquoise	Represents a brush that has an ARGB value of #FFAFEEEE.
	PaleVioletRed	Represents a brush that has an ARGB value of #FFDB7093.
	PapayaWhip	Represents a brush that has an ARGB value of #FFFFEFD5.
	PeachPuff	Represents a brush that has an ARGB value of #FFFFDAB9.
	Peru	Represents a brush that has an ARGB value of #FFCD853F.
	Pink	Represents a brush that has an ARGB value of #FFFFC0CB.
	Plum	Represents a brush that has an ARGB value of #FFDDA0DD.
	PowderBlue	Represents a brush that has an ARGB value of #FFB0E0E6.
	Purple	Represents a brush that has an ARGB value of #FF800080.
	Red	Represents a brush that has an ARGB value of #FFFF0000.
	RosyBrown	Represents a brush that has an ARGB value of #FFBC8F8F.
	RoyalBlue	Represents a brush that has an ARGB value of #FF4169E1.
	SaddleBrown	Represents a brush that has an ARGB value of #FF8B4513.
	Salmon	Represents a brush that has an ARGB value of #FFFA8072.
	SandyBrown	Represents a brush that has an ARGB value of #FFF4A460.
	SeaGreen	Represents a brush that has an ARGB value of #FF2E8B57.
	SeaShell	Represents a brush that has an ARGB value of #FFFFF5EE.
	Sienna	Represents a brush that has an ARGB value of #FFA0522D.
	Silver	Represents a brush that has an ARGB value of #FFC0C0C0.
	SkyBlue	Represents a brush that has an ARGB value of #FF87CEEB.

	SlateBlue	Represents a brush that has an ARGB value of #FF6A5ACD.
	SlateGray	Represents a brush that has an ARGB value of #FF708090.
	Snow	Represents a brush that has an ARGB value of #FFFFFAFA.
	SpringGreen	Represents a brush that has an ARGB value of #FF00FF7F.
	SteelBlue	Represents a brush that has an ARGB value of #FF4682B4.
	Tan	Represents a brush that has an ARGB value of #FFD2B48C.
	Teal	Represents a brush that has an ARGB value of #FF008080.
	Thistle	Represents a brush that has an ARGB value of #FFD8BFD8.
	Tomato	Represents a brush that has an ARGB value of #FFFF6347.
	Transparent	Represents a fully transparent brush.
	Turquoise	Represents a brush that has an ARGB value of #FF40E0D0.
	Violet	Represents a brush that has an ARGB value of #FFEE82EE.
	Wheat	Represents a brush that has an ARGB value of #FFF5DEB3.
	White	Represents a brush that has an ARGB value of #FFFFFFFF.
	WhiteSmoke	Represents a brush that has an ARGB value of #FFF5F5F5.
	Yellow	Represents a brush that has an ARGB value of #FFFFFF00.
	YellowGreen	Represents a brush that has an ARGB value of #FF9ACD32.

DarkSlateGray	Represents a color that has an ARGB value of #FF2F4F4F.
DarkTurquoise	Represents a color that has an ARGB value of #FF00CED1.
DarkViolet	Represents a color that has an ARGB value of #FF9400D3.
DeepPink	Represents a color that has an ARGB value of #FFFF1493.
DeepSkyBlue	Represents a color that has an ARGB value of #FF00BFFF.
DimGray	Represents a color that has an ARGB value of #FF696969.
DodgerBlue	Represents a color that has an ARGB value of #FF1E90FF.
Empty	Represents an undefined color.
Firebrick	Represents a color that has an ARGB value of #FFB22222.
FloralWhite	Represents a color that has an ARGB value of #FFFFFAF0.
ForestGreen	Represents a color that has an ARGB value of #FF228B22.
Fuchsia	Represents a color that has an ARGB value of #FFFF00FF.
Gainsboro	Represents a color that has an ARGB value of #FFDCDCDC.
GhostWhite	Represents a color that has an ARGB value of #FFF8F8FF.
Gold	Represents a color that has an ARGB value of #FFFFD700.
Goldenrod	Represents a color that has an ARGB value of #FFDAA520.
Gray	Represents a color that has an ARGB value of #FF808080.

Green	Represents a color that has an ARGB value of #FF008000.
GreenYellow	Represents a color that has an ARGB value of #FFADFF2F.
Honeydew	Represents a color that has an ARGB value of #FFF0FFF0.
HotPink	Represents a color that has an ARGB value of #FFFF69B4.
IndianRed	Represents a color that has an ARGB value of #FFCD5C5C.
Indigo	Represents a color that has an ARGB value of #FF4B0082.
Ivory	Represents a color that has an ARGB value of #FFFFFFF0.
Khaki	Represents a color that has an ARGB value of #FFF0E68C.
Lavender	Represents a color that has an ARGB value of #FFE6E6FA.
LavenderBlush	Represents a color that has an ARGB value of #FFFFF0F5.
LawnGreen	Represents a color that has an ARGB value of #FF7CFC00.
LemonChiffon	Represents a color that has an ARGB value of #FFFFFACD.
LightBlue	Represents a color that has an ARGB value of #FFADD8E6.
LightCoral	Represents a color that has an ARGB value of #FFF08080.
LightCyan	Represents a color that has an ARGB value of #FFE0FFFF.
LightGoldenrodYellow	Represents a color that has an ARGB value of #FFFAFAD2.
LightGray	Represents a color that has an ARGB value of #FFD3D3D3.
LightGreen	Represents a color that has an ARGB value of #FF90EE90.
LightPink	Represents a color that has an ARGB value of #FFFFB6C1.
LightSalmon	Represents a color that has an ARGB value of #FFFFA07A.
LightSeaGreen	Represents a color that has an ARGB value of #FF20B2AA.
LightSkyBlue	Represents a color that has an ARGB value of #FF87CEFA.
LightSlateGray	Represents a color that has an ARGB value of #FF778899.
LightSteelBlue	Represents a color that has an ARGB value of #FFB0C4DE.
LightYellow	Represents a color that has an ARGB value of #FFFFFFE0.
Lime	Represents a color that has an ARGB value of #FF00FF00.
LimeGreen	Represents a color that has an ARGB value of #FF32CD32.
Linen	Represents a color that has an ARGB value of #FFFAF0E6.
Magenta	Represents a color that has an ARGB value of #FFFF00FF.
Maroon	Represents a color that has an ARGB value of #FF800000.
MediumAquamarine	Represents a color that has an ARGB value of #FF66CDAA.
MediumBlue	Represents a color that has an ARGB value of #FF0000CD.
MediumOrchid	Represents a color that has an ARGB value of #FFBA55D3.

	MediumPurple	Represents a color that has an ARGB value of #FF9370DB.
	MediumSeaGreen	Represents a color that has an ARGB value of #FF3CB371.
	MediumSlateBlue	Represents a color that has an ARGB value of #FF7B68EE.
	MediumSpringGreen	Represents a color that has an ARGB value of #FF00FA9A.
	MediumTurquoise	Represents a color that has an ARGB value of #FF48D1CC.
	MediumVioletRed	Represents a color that has an ARGB value of #FFC71585.
	MidnightBlue	Represents a color that has an ARGB value of #FF191970.
	MintCream	Represents a color that has an ARGB value of #FFF5FFFA.
	MistyRose	Represents a color that has an ARGB value of #FFFFE4E1.
	Moccasin	Represents a color that has an ARGB value of #FFFFE4B5.
	NavajoWhite	Represents a color that has an ARGB value of #FFFFDEAD.
	Navy	Represents a color that has an ARGB value of #FF000080.
	OldLace	Represents a color that has an ARGB value of #FFFDF5E6.
	Olive	Represents a color that has an ARGB value of #FF808000.
	OliveDrab	Represents a color that has an ARGB value of #FF6B8E23.
	Orange	Represents a color that has an ARGB value of #FFFFA500.
	OrangeRed	Represents a color that has an ARGB value of #FFFF4500.
	Orchid	Represents a color that has an ARGB value of #FFDA70D6.
	PaleGoldenrod	Represents a color that has an ARGB value of #FFEEE8AA.
	PaleGreen	Represents a color that has an ARGB value of #FF98FB98.
	PaleTurquoise	Represents a color that has an ARGB value of #FFAFEEEE.
	PaleVioletRed	Represents a color that has an ARGB value of #FFDB7093.
	PapayaWhip	Represents a color that has an ARGB value of #FFFFEFD5.
	PeachPuff	Represents a color that has an ARGB value of #FFFFDAB9.
	Peru	Represents a color that has an ARGB value of #FFCD853F.
	Pink	Represents a color that has an ARGB value of #FFFFC0CB.
	Plum	Represents a color that has an ARGB value of #FFDDA0DD.
	PowderBlue	Represents a color that has an ARGB value of #FFB0E0E6.
	Purple	Represents a color that has an ARGB value of #FF800080.
	Red	Represents a color that has an ARGB value of #FFFF0000.
	RosyBrown	Represents a color that has an ARGB value of #FFBC8F8F.
	RoyalBlue	Represents a color that has an ARGB value of #FF4169E1.
	SaddleBrown	Represents a color that has an ARGB value of #FF8B4513.

	Salmon	Represents a color that has an ARGB value of #FFFA8072.
	SandyBrown	Represents a color that has an ARGB value of #FFF4A460.
	SeaGreen	Represents a color that has an ARGB value of #FF2E8B57.
	SeaShell	Represents a color that has an ARGB value of #FFFFF5EE.
	Sienna	Represents a color that has an ARGB value of #FFA0522D.
	Silver	Represents a color that has an ARGB value of #FFC0C0C0.
	SkyBlue	Represents a color that has an ARGB value of #FF87CEEB.
	SlateBlue	Represents a color that has an ARGB value of #FF6A5ACD.
	SlateGray	Represents a color that has an ARGB value of #FF708090.
	Snow	Represents a color that has an ARGB value of #FFFFFAFA.
	SpringGreen	Represents a color that has an ARGB value of #FF00FF7F.
	SteelBlue	Represents a color that has an ARGB value of #FF4682B4.
	Tan	Represents a color that has an ARGB value of #FFD2B48C.
	Teal	Represents a color that has an ARGB value of #FF008080.
	Thistle	Represents a color that has an ARGB value of #FFD8BFD8.
	Tomato	Represents a color that has an ARGB value of #FFFF6347.
	Transparent	Represents a fully transparent color.
	Turquoise	Represents a color that has an ARGB value of #FF40E0D0.
	Violet	Represents a color that has an ARGB value of #FFEE82EE.
	Wheat	Represents a color that has an ARGB value of #FFF5DEB3.
	White	Represents a color that has an ARGB value of #FFFFFFFF.
	WhiteSmoke	Represents a color that has an ARGB value of #FFF5F5F5.
	Yellow	Represents a color that has an ARGB value of #FFFFFF00.
	YellowGreen	Represents a color that has an ARGB value of #FF9ACD32.

CombineMode Enumeration

Specifies how different clipping regions can be combined.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public enum CombineMode`

Members

	Member name	Description
	Complement	Specifies that the existing region is replaced by the result of the existing region being removed from the new region. Said differently, the existing region is excluded from the new region.
	Exclude	Specifies that the existing region is replaced by the result of the new region being removed from the existing region. Said differently, the new region is excluded from the existing region.
	Intersect	Two clipping regions are combined by taking their intersection.
	Replace	One clipping region is replaced by another.
	Union	Two clipping regions are combined by taking the union of both.
	Xor	Two clipping regions are combined by taking only the areas enclosed by one or the other region, but not both.

DashStyle Class

Represents the dash style of a contour.

Syntax

Java
`public class DashStyle implements Externalizable`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.drawing.DashStyle

See Also

DashStyle Members
com.mindfusion.drawing Namespace

DashStyle Members

Represents the dash style of a contour.

The following tables list the members exposed by the DashStyle type.

Public Constructors

	Name	Description
	DashStyle	Overloaded.

Public Fields

	Name	Description
	Dash	
	DashDot	
	DashDotDot	
	Dot	
	Solid	

Public Methods

	Name	Description
	clone	Creates a copy of the **DashStyle**.
	equals	
	fromId	
	getDashArray	Returns the array that defines the dash pattern.
	getDashPhase	Gets a value indicating the start offset into the dash pattern.

	getId	
	readExternal	Implements Externalizable.
	writeExternal	Implements Externalizable.

com.mindfusion.drawing Namespace

DashStyle Constructor (float[], float)

Initializes a new DashStyle instance.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

`public DashStyle (`
`  float[] dashArray,`
`  float dashPhase`
`)`

Parameters

dashArray
A float array containing dash lengths.

dashPhase
A float value specifying the start offset.

See Also

GradientBrush Constructor (Color, Color, int)

Initializes a new instance of the GradientBrush class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public GradientBrush (
    Color color1,
    Color color2,
    int angle
)
```

Parameters

color1
A Color object representing the start color of the gradient.

color2
A Color object representing the end color of the gradient.

angle
An integer value specifying the gradient orientation.

See Also

GradientBrush Constructor Overload List
GradientBrush Class
com.mindfusion.drawing Namespace

GradientBrush Constructor (float[], Color[], int)

Initializes a new instance of the GradientBrush class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public GradientBrush (
    float[] fractions,
    Color[] colors,
    int angle
)
```

Parameters

fractions
An array of float numbers specifying the positions of the colors along the gradient.

colors
An array of Color objects representing the colors of the gradient.

angle
An integer value specifying the gradient orientation.

Remarks

Instances of the GradientBrush class created using this constructor are currently not serialized.

GraphicsEx Interface
com.mindfusion.drawing Namespace

GraphicsUnit Enumeration

The members of this enumeration specify the unit of measure for graphic objects drawn by JDiagram.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public enum GraphicsUnit`

Members

	Member name	Description
	Centimeter	Specifies centimeters as the unit of measure.
	Display	Specifies 1/100 inch as the unit of measure.
	Document	Specifies the document unit (1/300 inch) as the unit of measure.
	Inch	Specifies the inch as the unit of measure.
	Millimeter	Specifies the millimeter as the unit of measure.
	Percent	Specifies percents as the unit of measure.
	Pixel	Specifies a device pixel as the unit of measure.
	Point	Specifies a printer's point (1/72 inch) as the unit of measure.
	World	
	WpfPoint	Specifies device-independent pixels (1/96 inch) as the unit of measure.

HatchStyle Enumeration

Represents hatch patterns available to HatchBrush objects.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public enum HatchStyle
```

Members

	Member name	Description
	BackwardDiagonal	A pattern of lines on a diagonal from upper right to lower left.
	Cross	Specifies horizontal and vertical lines that cross.
	DarkDownwardDiagonal	Specifies diagonal lines that slant to the right from top points to bottom points, are spaced 50 percent closer together than, and are twice the width of ForwardDiagonal.
	DarkHorizontal	Specifies horizontal lines that are spaced 50 percent closer together than Horizontal and are twice the width of Horizontal.
	DarkUpwardDiagonal	Specifies diagonal lines that slant to the left from top points to bottom points, are spaced 50 percent closer together than BackwardDiagonal, and are twice its width.
	DarkVertical	Specifies vertical lines that are spaced 50 percent closer together than Vertical and are twice its width.
	DashedDownwardDiagonal	Specifies dashed diagonal lines, that slant to the right from top points to bottom points.
	DashedHorizontal	Specifies dashed horizontal lines.
	DashedUpwardDiagonal	Specifies dashed diagonal lines, that slant to the left from top points to bottom points.
	DashedVertical	Specifies dashed vertical lines.
	DiagonalBrick	Specifies a hatch that has the appearance of layered bricks that slant to the left from top points to bottom points.
	DiagonalCross	A pattern of crisscross diagonal lines.
	Divot	Specifies a hatch that has the appearance of divots.
	DottedDiamond	Specifies forward diagonal and backward diagonal lines, each of which is composed of dots, that cross.

DottedGrid	Specifies horizontal and vertical lines, each of which is composed of dots, that cross.
ForwardDiagonal	A pattern of lines on a diagonal from upper left to lower right.
Horizontal	A pattern of horizontal lines.
HorizontalBrick	Specifies a hatch that has the appearance of horizontally layered bricks.
LargeCheckerBoard	Specifies a hatch that has the appearance of a checkerboard with squares that are twice the size of SmallCheckerBoard.
LargeConfetti	Specifies a hatch that has the appearance of confetti, and is composed of larger pieces than SmallConfetti.
LargeGrid	Specifies the hatch style Cross.
LightDownwardDiagonal	Specifies diagonal lines that slant to the right from top points to bottom points and are spaced 50 percent closer together than ForwardDiagonal, but are not antialiased.
LightHorizontal	Specifies horizontal lines that are spaced 50 percent closer together than Horizontal.
LightUpwardDiagonal	Specifies diagonal lines that slant to the left from top points to bottom points and are spaced 50 percent closer together than BackwardDiagonal.
LightVertical	Specifies vertical lines that are spaced 50 percent closer together than Vertical.
Max	Specifies hatch style SolidDiamond.
Min	Specifies hatch style Horizontal.
NarrowHorizontal	Specifies horizontal lines that are spaced 75 percent closer together than hatch style Horizontal.
NarrowVertical	Specifies vertical lines that are spaced 75 percent closer together than hatch style Vertical.
OutlinedDiamond	Specifies forward diagonal and backward diagonal lines that cross.
Percent05	Specifies a 5-percent hatch. The ratio of foreground color to background color is 5:100.
Percent10	Specifies a 10-percent hatch. The ratio of foreground color to background color is 10:100.
Percent20	Specifies a 20-percent hatch. The ratio of foreground color to background color is 20:100.
Percent25	Specifies a 25-percent hatch. The ratio of foreground color to background color is 25:100.
Percent30	Specifies a 30-percent hatch. The ratio of foreground color to background color is 30:100.
Percent40	Specifies a 40-percent hatch. The ratio of foreground color to background color is 40:100.

	Percent50	Specifies a 50-percent hatch. The ratio of foreground color to background color is 50:100.
	Percent60	Specifies a 60-percent hatch. The ratio of foreground color to background color is 60:100.
	Percent70	Specifies a 70-percent hatch. The ratio of foreground color to background color is 70:100.
	Percent75	Specifies a 75-percent hatch. The ratio of foreground color to background color is 75:100.
	Percent80	Specifies a 80-percent hatch. The ratio of foreground color to background color is 80:100.
	Percent90	Specifies a 90-percent hatch. The ratio of foreground color to background color is 90:100.
	Plaid	Specifies a hatch that has the appearance of a plaid material.
	Shingle	Specifies a hatch that has the appearance of diagonally layered shingles that slant to the right from top points to bottom points.
	SmallCheckerBoard	Specifies a hatch that has the appearance of a checkerboard.
	SmallConfetti	Specifies a hatch that has the appearance of confetti.
	SmallGrid	Specifies horizontal and vertical lines that cross and are spaced 50 percent closer together than hatch style Cross.
	SolidDiamond	Specifies a hatch that has the appearance of a checkerboard placed diagonally.
	Sphere	Specifies a hatch that has the appearance of spheres laid adjacent to one another.
	Trellis	Specifies a hatch that has the appearance of a trellis.
	Vertical	A pattern of vertical lines.
	Wave	Specifies horizontal lines that are composed of tildes.
	Weave	Specifies a hatch that has the appearance of a woven material.
	WideDownwardDiagonal	Specifies diagonal lines that slant to the right from top points to bottom points, have the same spacing as hatch style ForwardDiagonal, and are triple its width.
	WideUpwardDiagonal	Specifies diagonal lines that slant to the left from top points to bottom points, have the same spacing as hatch style BackwardDiagonal, and are triple its width.
	ZigZag	Specifies horizontal lines that are composed of zigzags.

ImageAlignment Enumeration

Specifies the alignment of an image.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public enum ImageAlignment`

Members

	Member name	Description
	Bottom	The image is aligned to the bottom side of the layout rectangle.
	Center	The image is centered within the layout rectangle.
	Fit	The image is stretched to fit in the layout rectangle, but its original ratio is preserved.
	Left	The image is aligned to the left side of the layout rectangle.
	None	Same as Center.
	Right	The image is aligned to the right side of the layout rectangle.
	Stretch	The image is stretched. Equal to (Left | Top | Right | Bottom).
	Tile	The image is tiled across the layout rectangle.
	Top	The image is aligned to the top side of the layout rectangle.

ImagePainter Methods

ImagePainter.draw Method

Overload List

Name	Description
ImagePainter.draw (Graphics2D, Image, Rectangle, EnumSet)	Draws the specified image in the target rectangle in the specified graphics using the specified image alignment.
ImagePainter.draw (Graphics2D, Image, Rectangle, EnumSet, int)	Draws the specified image in the target rectangle in the specified graphics using the specified image alignment and semi-transparency factor. The transparency ranges from 0 (invisible) to 255 (opaque).
ImagePainter.draw (Graphics2D, Image, Rectangle, ImageAlignment)	Draws the specified image in the target rectangle in the specified graphics using the specified image alignment.
ImagePainter.draw (Graphics2D, Image, Rectangle2D, EnumSet)	Draws the specified image in the target rectangle in the specified graphics using the specified image alignment.
ImagePainter.draw (Graphics2D, Image, Rectangle2D, EnumSet, int)	Draws the specified image in the target rectangle in the specified graphics using the specified image alignment and semi-transparency factor. The transparency ranges from 0 (invisible) to 255 (opaque).
ImagePainter.draw (Graphics2D, Image, Rectangle2D, ImageAlignment)	Draws the specified image in the target rectangle in the specified graphics using the specified image alignment.

ImagePainter.draw Method (Graphics2D, Image, Rectangle, EnumSet<ImageAlignment>)

Draws the specified image in the target rectangle in the specified graphics using the specified image alignment.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static void draw (
    Graphics2D g,
    Image image,
    Rectangle rect,
    EnumSet<ImageAlignment> align
)
```

Parameters

g

image

rect

align

Pen Members

A Pen specifies how the outline of an element should be stroked.

The following tables list the members exposed by the Pen type.

Public Constructors

	Name	Description
	Pen	Overloaded.

Public Methods

	Name	Description
	applyTo	Overloaded.
	clone	Creates a copy of this pen.
	getBrush	Gets the Brush of this pen.
	getCap	
	getColor	Gets the color of this pen.
	getDashStyle	Gets the dash style of this pen.
	getEffectiveWidth	Gets the effective width of the lines drawn with this pen once it has been applied to a Graphics2D object.
	getLineJoin	Gets the line join.
	getWidth	Gets the width of the lines drawn with this pen.
	readExternal	Implements Externalizable.
	setBrush	Gets a **Brush** of this pen.
	setCap	
	setColor	Sets the color of this pen.
	setDashStyle	Sets the dash style of this pen.
	setLineJoin	Sets the line join.
	setWidth	Sets what the width of the lines drawn with this pen should be.
	toColor	
	writeExternal	Implements Externalizable.

Pen Constructor (Brush, double)

Initializes a new instance of the Pen class. Instances of the Pen class created using this constructor are currently not serialised.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Pen (
    Brush brush,
    double width
)
```

Parameters

brush
A Brush object representing the pen color.

width
A double value representing the pen width.

See Also

Pen Constructor Overload List
Pen Class
com.mindfusion.drawing Namespace

Pen Constructor (Brush, double, DashStyle)

Initializes a new instance of the Pen class. Instances of the Pen class created using this constructor are currently not serialized.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Pen (
    Brush brush,
    double width,
    DashStyle dashStyle
)
```

Parameters

brush
A Brush object representing the pen color.

width
A double value representing the pen width.

dashStyle
A DashStyle object representing the pen's dash pattern.

See Also

Pen Constructor Overload List
Pen Class
com.mindfusion.drawing Namespace

Pen Constructor (Color)

Initializes a new instance of the Pen class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Pen (
    Color color
)
```

Parameters

color
A Color object representing the pen color.

Pen Constructor Overload List
Pen Class
com.mindfusion.drawing Namespace

Pen Constructor (Color, double)

Initializes a new instance of the Pen class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Pen (
    Color color,
    double width
)
```

Parameters

color
A Color object representing the pen color.

width
A double value representing the pen width.

See Also

Pen Constructor Overload List
Pen Class
com.mindfusion.drawing Namespace

Pen Constructor (Color, double, DashStyle)

Initializes a new instance of the Pen class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Pen (
    Color color,
    double width,
    DashStyle dashStyle
)
```

Parameters

color
A Color object representing the pen color.

width

A double value representing the pen width.

dashStyle
A DashStyle object representing the pen's dash pattern.

See Also

Pen Constructor Overload List
Pen Class
com.mindfusion.drawing Namespace

Pen Methods

Pen.applyTo Method

Overload List

Name	Description
Pen.applyTo (Graphics2D)	Sets the pen as the current pen for the specified Graphics2D object.
Pen.applyTo (Graphics2D, Rectangle2D)	Sets the pen as the current pen for the specified Graphics2D object.

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.applyTo Method (Graphics2D)

Sets the pen as the current pen for the specified Graphics2D object.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void applyTo (
    Graphics2D g
)
```

Parameters

g

See Also

applyTo Method Overload List
Pen Members

Pen.applyTo Method (Graphics2D, Rectangle2D)

Sets the pen as the current pen for the specified Graphics2D object.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void applyTo (
    Graphics2D g,
    Rectangle2D bounds
)
```

Parameters

g

bounds

See Also

applyTo Method Overload List
Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.clone Method

Creates a copy of this pen.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Pen clone ()
```

Return Value

The new Pen object.

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.getBrush Method

Gets the Brush of this pen.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

```
Java
public Brush getBrush ()
```

Return Value

A Brush object used to paint lines.

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.getCap Method

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

```
Java
public int getCap ()
```

Return Value

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.getColor Method

Gets the color of this pen.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

```
Java
public Color getColor ()
```

Return Value

A Color object representing the pen color.

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.getDashStyle Method

Gets the dash style of this pen.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public DashStyle getDashStyle ()
```

Return Value

A DashStyle object representing the pen's dash pattern.

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.getEffectiveWidth Method

Gets the effective width of the lines drawn with this pen once it has been applied to a Graphics2D object.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public double getEffectiveWidth (
    Graphics2D g2d
)
```

Parameters

g2d

Return Value

A double value representing the effective pen width.

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.getLineJoin Method

Gets the line join.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public int getLineJoin ()
```

Return Value

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.getWidth Method

Gets the width of the lines drawn with this pen.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public double getWidth ()
```

Return Value

A double value representing the pen width.

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.readExternal Method

Implements Externalizable.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.setBrush Method

Gets a Brush of this pen.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void setBrush (
    Brush value
)
```

Parameters

value
A Brush object used to paint lines.

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.setCap Method

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void setCap (
    int value
)
```

Parameters

value

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.setColor Method

Sets the color of this pen.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void setColor (
    Color value
)
```

Parameters

value
A Color object representing the pen color.

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.setDashStyle Method

Sets the dash style of this pen.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void setDashStyle (
    DashStyle value
)
```

Parameters

value
A DashStyle object representing the pen's dash pattern.

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.setLineJoin Method

Sets the line join.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void setLineJoin (
    int value
)
```

Parameters

value

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.setWidth Method

Sets what the width of the lines drawn with this pen should be.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void setWidth (
    double value
)
```

Parameters

value
A double value representing the pen width.

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.toColor Method

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Color toColor ()
```

Return Value

See Also

Pen Members
Pen Class
com.mindfusion.drawing Namespace

Pen.writeExternal Method

Implements Externalizable.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

The following tables list the members exposed by the Pens type.

Public Fields

	Name	Description
	AliceBlue	Represents a pen with the Colors.AliceBlue color.
	AntiqueWhite	Represents a pen with the Colors.AntiqueWhite color.
	Aqua	Represents a pen with the Colors.Aqua color.
	Aquamarine	Represents a pen with the Colors.Aquamarine color.
	Azure	Represents a pen with the Colors.Azure color.
	Beige	Represents a pen with the Colors.Beige color.
	Bisque	Represents a pen with the Colors.Bisque color.
	Black	Represents a pen with the Colors.Black color.
	BlanchedAlmond	Represents a pen with the Colors.BlanchedAlmond color.
	Blue	Represents a pen with the Colors.Blue color.
	BlueViolet	Represents a pen with the Colors.BlueViolet color.
	Brown	Represents a pen with the Colors.Brown color.
	BurlyWood	Represents a pen with the Colors.BurlyWood color.
	CadetBlue	Represents a pen with the Colors.CadetBlue color.
	Chartreuse	Represents a pen with the Colors.Chartreuse color.
	Chocolate	Represents a pen with the Colors.Chocolate color.
	Coral	Represents a pen with the Colors.Coral color.
	CornflowerBlue	Represents a pen with the Colors.CornflowerBlue color.
	Cornsilk	Represents a pen with the Colors.Cornsilk color.
	Crimson	Represents a pen with the Colors.Crimson color.
	Cyan	Represents a pen with the Colors.Cyan color.

	DarkBlue	Represents a pen with the Colors.DarkBlue color.
	DarkCyan	Represents a pen with the Colors.DarkCyan color.
	DarkGoldenrod	Represents a pen with the Colors.DarkGoldenrod color.
	DarkGray	Represents a pen with the Colors.DarkGray color.
	DarkGreen	Represents a pen with the Colors.DarkGreen color.
	DarkKhaki	Represents a pen with the Colors.DarkKhaki color.
	DarkMagenta	Represents a pen with the Colors.DarkMagenta color.
	DarkOliveGreen	Represents a pen with the Colors.DarkOliveGreen color.
	DarkOrange	Represents a pen with the Colors.DarkOrange color.
	DarkOrchid	Represents a pen with the Colors.DarkOrchid color.
	DarkRed	Represents a pen with the Colors.DarkRed color.
	DarkSalmon	Represents a pen with the Colors.DarkSalmon color.
	DarkSeaGreen	Represents a pen with the Colors.DarkSeaGreen color.
	DarkSlateBlue	Represents a pen with the Colors.DarkSlateBlue color.
	DarkSlateGray	Represents a pen with the Colors.DarkSlateGray color.
	DarkTurquoise	Represents a pen with the Colors.DarkTurquoise color.
	DarkViolet	Represents a pen with the Colors.DarkViolet color.
	DeepPink	Represents a pen with the Colors.DeepPink color.
	DeepSkyBlue	Represents a pen with the Colors.DeepSkyBlue color.
	DimGray	Represents a pen with the Colors.DimGray color.
	DodgerBlue	Represents a pen with the Colors.DodgerBlue color.
	Firebrick	Represents a pen with the Colors.Firebrick color.
	FloralWhite	Represents a pen with the Colors.FloralWhite color.
	ForestGreen	Represents a pen with the Colors.ForestGreen color.
	Fuchsia	Represents a pen with the Colors.Fuchsia color.
	Gainsboro	Represents a pen with the Colors.Gainsboro color.
	GhostWhite	Represents a pen with the Colors.GhostWhite color.
	Gold	Represents a pen with the Colors.Gold color.
	Goldenrod	Represents a pen with the Colors.Goldenrod color.
	Gray	Represents a pen with the Colors.Gray color.
	Green	Represents a pen with the Colors.Green color.
	GreenYellow	Represents a pen with the Colors.GreenYellow color.
	Honeydew	Represents a pen with the Colors.Honeydew color.

	HotPink	Represents a pen with the Colors.HotPink color.
	IndianRed	Represents a pen with the Colors.IndianRed color.
	Indigo	Represents a pen with the Colors.Indigo color.
	Ivory	Represents a pen with the Colors.Ivory color.
	Khaki	Represents a pen with the Colors.Khaki color.
	Lavender	Represents a pen with the Colors.Lavender color.
	LavenderBlush	Represents a pen with the Colors.LavenderBlush color.
	LawnGreen	Represents a pen with the Colors.LawnGreen color.
	LemonChiffon	Represents a pen with the Colors.LemonChiffon color.
	LightBlue	Represents a pen with the Colors.LightBlue color.
	LightCoral	Represents a pen with the Colors.LightCoral color.
	LightCyan	Represents a pen with the Colors.LightCyan color.
	LightGoldenrodYellow	Represents a pen with the Colors.LightGoldenrodYellow color.
	LightGray	Represents a pen with the Colors.LightGray color.
	LightGreen	Represents a pen with the Colors.LightGreen color.
	LightPink	Represents a pen with the Colors.LightPink color.
	LightSalmon	Represents a pen with the Colors.LightSalmon color.
	LightSeaGreen	Represents a pen with the Colors.LightSeaGreen color.
	LightSkyBlue	Represents a pen with the Colors.LightSkyBlue color.
	LightSlateGray	Represents a pen with the Colors.LightSlateGray color.
	LightSteelBlue	Represents a pen with the Colors.LightSteelBlue color.
	LightYellow	Represents a pen with the Colors.LightYellow color.
	Lime	Represents a pen with the Colors.Lime color.
	LimeGreen	Represents a pen with the Colors.LimeGreen color.
	Linen	Represents a pen with the Colors.Linen color.
	Magenta	Represents a pen with the Colors.Magenta color.
	Maroon	Represents a pen with the Colors.Maroon color.
	MediumAquamarine	Represents a pen with the Colors.MediumAquamarine color.
	MediumBlue	Represents a pen with the Colors.MediumBlue color.
	MediumOrchid	Represents a pen with the Colors.MediumOrchid color.
	MediumPurple	Represents a pen with the Colors.MediumPurple color.
	MediumSeaGreen	Represents a pen with the Colors.MediumSeaGreen color.

	MediumSlateBlue	Represents a pen with the Colors.MediumSlateBlue color.
	MediumSpringGreen	Represents a pen with the Colors.MediumSpringGreen color.
	MediumTurquoise	Represents a pen with the Colors.MediumTurquoise color.
	MediumVioletRed	Represents a pen with the Colors.MediumVioletRed color.
	MidnightBlue	Represents a pen with the Colors.MidnightBlue color.
	MintCream	Represents a pen with the Colors.MintCream color.
	MistyRose	Represents a pen with the Colors.MistyRose color.
	Moccasin	Represents a pen with the Colors.Moccasin color.
	NavajoWhite	Represents a pen with the Colors.NavajoWhite color.
	Navy	Represents a pen with the Colors.Navy color.
	OldLace	Represents a pen with the Colors.OldLace color.
	Olive	Represents a pen with the Colors.Olive color.
	OliveDrab	Represents a pen with the Colors.OliveDrab color.
	Orange	Represents a pen with the Colors.Orange color.
	OrangeRed	Represents a pen with the Colors.OrangeRed color.
	Orchid	Represents a pen with the Colors.Orchid color.
	PaleGoldenrod	Represents a pen with the Colors.PaleGoldenrod color.
	PaleGreen	Represents a pen with the Colors.PaleGreen color.
	PaleTurquoise	Represents a pen with the Colors.PaleTurquoise color.
	PaleVioletRed	Represents a pen with the Colors.PaleVioletRed color.
	PapayaWhip	Represents a pen with the Colors.PapayaWhip color.
	PeachPuff	Represents a pen with the Colors.PeachPuff color.
	Peru	Represents a pen with the Colors.Peru color.
	Pink	Represents a pen with the Colors.Pink color.
	Plum	Represents a pen with the Colors.Plum color.
	PowderBlue	Represents a pen with the Colors.PowderBlue color.
	Purple	Represents a pen with the Colors.Purple color.
	Red	Represents a pen with the Colors.Red color.
	RosyBrown	Represents a pen with the Colors.RosyBrown color.
	RoyalBlue	Represents a pen with the Colors.RoyalBlue color.
	SaddleBrown	Represents a pen with the Colors.SaddleBrown color.
	Salmon	Represents a pen with the Colors.Salmon color.
	SandyBrown	Represents a pen with the Colors.SandyBrown color.

	SeaGreen	Represents a pen with the Colors.SeaGreen color.
	SeaShell	Represents a pen with the Colors.SeaShell color.
	Sienna	Represents a pen with the Colors.Sienna color.
	Silver	Represents a pen with the Colors.Silver color.
	SkyBlue	Represents a pen with the Colors.SkyBlue color.
	SlateBlue	Represents a pen with the Colors.SlateBlue color.
	SlateGray	Represents a pen with the Colors.SlateGray color.
	Snow	Represents a pen with the Colors.Snow color.
	SpringGreen	Represents a pen with the Colors.SpringGreen color.
	SteelBlue	Represents a pen with the Colors.SteelBlue color.
	Tan	Represents a pen with the Colors.Tan color.
	Teal	Represents a pen with the Colors.Teal color.
	Thistle	Represents a pen with the Colors.Thistle color.
	Tomato	Represents a pen with the Colors.Tomato color.
	Transparent	Represents a pen with the Colors.Transparent color.
	Turquoise	Represents a pen with the Colors.Turquoise color.
	Violet	Represents a pen with the Colors.Violet color.
	Wheat	Represents a pen with the Colors.Wheat color.
	White	Represents a pen with the Colors.White color.
	WhiteSmoke	Represents a pen with the Colors.WhiteSmoke color.
	Yellow	Represents a pen with the Colors.Yellow color.
	YellowGreen	Represents a pen with the Colors.YellowGreen color.

Pens Class
com.mindfusion.drawing Namespace

Pens.Pink Field

Represents a pen with the Colors.Pink color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public static final Pen Pink`

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Plum Field

Represents a pen with the Colors.Plum color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public static final Pen Plum`

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.PowderBlue Field

Represents a pen with the Colors.PowderBlue color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public static final Pen PowderBlue`

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Purple Field

Represents a pen with the Colors.Purple color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

```
Java
public static final Pen Purple
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Red Field

Represents a pen with the Colors.Red color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

```
Java
public static final Pen Red
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.RosyBrown Field

Represents a pen with the Colors.RosyBrown color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

```
Java
public static final Pen RosyBrown
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.RoyalBlue Field

Represents a pen with the Colors.RoyalBlue color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen RoyalBlue
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.SaddleBrown Field

Represents a pen with the Colors.SaddleBrown color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen SaddleBrown
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Salmon Field

Represents a pen with the Colors.Salmon color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen Salmon
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.SandyBrown Field

Represents a pen with the Colors.SandyBrown color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen SandyBrown
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.SeaGreen Field

Represents a pen with the Colors.SeaGreen color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen SeaGreen
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.SeaShell Field

Represents a pen with the Colors.SeaShell color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen SeaShell
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Sienna Field

Represents a pen with the Colors.Sienna color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen Sienna
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Silver Field

Represents a pen with the Colors.Silver color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen Silver
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.SkyBlue Field

Represents a pen with the Colors.SkyBlue color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public static final Pen SkyBlue`

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.SlateBlue Field

Represents a pen with the Colors.SlateBlue color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public static final Pen SlateBlue`

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.SlateGray Field

Represents a pen with the Colors.SlateGray color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public static final Pen SlateGray`

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Snow Field

Represents a pen with the Colors.Snow color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

```
Java
public static final Pen Snow
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.SpringGreen Field

Represents a pen with the Colors.SpringGreen color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

```
Java
public static final Pen SpringGreen
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.SteelBlue Field

Represents a pen with the Colors.SteelBlue color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

```
Java
public static final Pen SteelBlue
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Tan Field

Represents a pen with the Colors.Tan color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public static final Pen Tan`

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Teal Field

Represents a pen with the Colors.Teal color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public static final Pen Teal`

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Thistle Field

Represents a pen with the Colors.Thistle color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public static final Pen Thistle`

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Tomato Field

Represents a pen with the Colors.Tomato color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen Tomato
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Transparent Field

Represents a pen with the Colors.Transparent color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen Transparent
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Turquoise Field

Represents a pen with the Colors.Turquoise color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen Turquoise
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Violet Field

Represents a pen with the Colors.Violet color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen Violet
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Wheat Field

Represents a pen with the Colors.Wheat color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen Wheat
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.White Field

Represents a pen with the Colors.White color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen White
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.WhiteSmoke Field

Represents a pen with the Colors.WhiteSmoke color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen WhiteSmoke
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.Yellow Field

Represents a pen with the Colors.Yellow color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public static final Pen Yellow
```

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

Pens.YellowGreen Field

Represents a pen with the Colors.YellowGreen color.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java
`public static final Pen YellowGreen`

See Also

Pens Members
Pens Class
com.mindfusion.drawing Namespace

PointList Class

A strongly-typed list of Point2D.Float objects.

Syntax

Java
`public class PointList extends BaseList<E> implements Cloneable`

Inheritance Hierarchy

java.lang.Object
  java.util.AbstractCollection(E)
    java.util.AbstractList(E)
      com.mindfusion.common.BaseList(E)
        com.mindfusion.drawing.PointList

See Also

PointList Members
com.mindfusion.drawing Namespace

PointList Members

A strongly-typed list of Point2D.Float objects.

The following tables list the members exposed by the PointList type.

Public Constructors

	Name	Description
	PointList	Overloaded.

Public Methods

	Name	Description
	add	Overloaded. (Inherited from BaseList.)
	addBaseListListener	Adds a BaseListListener to the list. (Inherited from BaseList.)
	clear	Removes all elements from the list. (Inherited from BaseList.)

clone	
first	Gets the first element of this list. (Inherited from BaseList.)
get	Returns the element at the specified position in the list. (Inherited from BaseList.)
getArray	
getCopy	
last	Gets the last element of this list. (Inherited from BaseList.)
readExternal	
remove	Overloaded. (Inherited from BaseList.)
removeBaseListListener	Removes the specified **BaseListListener** from the list. (Inherited from BaseList.)
set	Replaces the element at the specified position in this list with the specified element. (Inherited from BaseList.)
set	
size	Returns the number of elements in the list. (Inherited from BaseList.)
writeExternal

Polygon Members
com.mindfusion.drawing Namespace

Polygon Members

The following tables list the members exposed by the Polygon type.

Public Constructors

	Name	Description
	Polygon	Overloaded.

Public Methods

	Name	Description
	contains	Checks whether the specified point lies whithin the polygon.
	getBounds	Gets the smallest rectangle bounding the polygon.
	getPoints	Gets a collection of the polygon points.
	intersectLine	Calculates the intersections between the polygon and the line defined by the given points. The result is a list containing all points of intersection.
	intersectSegment	Overloaded.

See Also

Polygon Class
com.mindfusion.drawing Namespace

Polygon Constructor

Overload List

Name	Description
Polygon (List)	Builds new polygon object from a given points list.
Polygon (Rectangle2D)	Builds new polygon object from the specified rectangle.
Polygon (Rectangle2D.Float, int)	Build new polygon from ellipse. The ellipse is defined by the specified bounding rectangle. The second parameter specifies how close the polygon approximates the ellipse. Factor of 0 specifies simplest polygon, while factor 100 specifies the most complex polygon.

See Also

Polygon Class
com.mindfusion.drawing Namespace

Polygon Constructor (List<Point2D.Float>)

Builds new polygon object from a given points list.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Polygon (
    List<Point2D.Float> points
)
```

Parameters

points

See Also

Polygon Constructor Overload List
Polygon Class
com.mindfusion.drawing Namespace

Polygon Constructor (Rectangle2D)

Builds new polygon object from the specified rectangle.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Polygon (
    Rectangle2D rect
)
```

Parameters

rect

See Also

Polygon Constructor Overload List
Polygon Class
com.mindfusion.drawing Namespace

Polygon Constructor (Rectangle2D.Float, int)

Build new polygon from ellipse. The ellipse is defined by the specified bounding rectangle. The second parameter specifies how close the polygon approximates the ellipse. Factor of 0 specifies simplest polygon, while factor 100 specifies the most complex polygon.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Polygon (
    Rectangle2D.Float bounds,
    int factor
)
```

Parameters

bounds

factor

See Also

Polygon Constructor Overload List
Polygon Class
com.mindfusion.drawing Namespace

Polygon Methods

Polygon.contains Method

Checks whether the specified point lies whithin the polygon.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public boolean contains (
    Point2D.Float point
)
```

Parameters

point

Return Value

See Also

Polygon Members
Polygon Class
com.mindfusion.drawing Namespace

Polygon.getBounds Method

Gets the smallest rectangle bounding the polygon.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Rectangle2D.Float getBounds ()
```

Return Value

See Also

Polygon Members
Polygon Class
com.mindfusion.drawing Namespace

Polygon.getPoints Method

Gets a collection of the polygon points.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public PointList getPoints ()
```

Return Value

See Also

Polygon Members
Polygon Class
com.mindfusion.drawing Namespace

Polygon.intersectLine Method

Calculates the intersections between the polygon and the line defined by the given points. The result is a list containing all points of intersection.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public PointList intersectLine (
    Point2D.Float a,
    Point2D.Float b
)
```

Parameters

a

b

Return Value

See Also

Polygon Members
Polygon Class
com.mindfusion.drawing Namespace

Polygon.intersectSegment Method

Overload List

Name	Description
Polygon.intersectSegment (Line)	Calculates the intersections between the polygon and the given line segment. The result is a list containing all points of intersection.
Polygon.intersectSegment (Point2D.Float, Point2D.Float)	Calculates the intersections between the polygon and the line segment defined by the given points. The result is a list containing all points of intersection.

See Also

Polygon Members
Polygon Class
com.mindfusion.drawing Namespace

Polygon.intersectSegment Method (Line)

Calculates the intersections between the polygon and the given line segment. The result is a list containing all points of intersection.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public PointList intersectSegment (
    Line line
)
```

Parameters

line

Return Value

See Also

intersectSegment Method Overload List
Polygon Members
Polygon Class
com.mindfusion.drawing Namespace

Polygon.intersectSegment Method (Point2D.Float, Point2D.Float)

Calculates the intersections between the polygon and the line segment defined by the given points. The result is a list containing all points of intersection.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

```
Java
public PointList intersectSegment (
    Point2D.Float a,
    Point2D.Float b
)
```

Parameters

a

b

Return Value

RadialGradientBrush Members

The following tables list the members exposed by the RadialGradientBrush type.

Public Constructors

	Name	Description
	RadialGradientBrush	Overloaded.

Public Methods

	Name	Description
	applyTo	
	clone	Creates a clone of the brush.
	getCenterColor	Gets the center color.
	getColors	
	getFractions	
	getSurroundingColor	Gets the surrounding color.
	getX	Gets the relative x-coordinate of the center point.
	getY	Gets the relative y-coordinate of the center point.
	readExternal	Implements Externalizable.
	setCenterColor	Sets the center color.
	setColors	
	setFractions	
	setSurroundingColor	Sets the surrounding color.
	setX	Sets the relative x-coordinate of the center point.
	setY	Sets the relative y-coordinate of the center point.
	toColor	Returns a single color approximation of the brush.
	writeExternal	Implements Externalizable.

com.mindfusion.drawing Namespace

RadialGradientBrush Constructor ()

Initializes a new instance of the RadialGradientBrush class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public RadialGradientBrush ()
```

See Also

RadialGradientBrush Constructor Overload List
RadialGradientBrush Class
com.mindfusion.drawing Namespace

RadialGradientBrush Constructor (Color, Color)

Initializes a new instance of the RadialGradientBrush class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public RadialGradientBrush (
    Color centerColor,
    Color surroundingColor
)
```

Parameters

centerColor
A Color object representing the color at the center point.

surroundingColor
A Color object representing the surrounding color.

See Also

RadialGradientBrush Constructor Overload List
RadialGradientBrush Class
com.mindfusion.drawing Namespace

RadialGradientBrush Constructor (Color, Color, double, double)

Initializes a new instance of the RadialGradientBrush class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public RadialGradientBrush (
    Color centerColor,
    Color surroundingColor,
    double x,
    double y
)
```

Parameters

centerColor
A Color object representing the color at the center point.

surroundingColor
A Color object representing the surrounding color.

x
The relative x-coordinate of the center point. Value 0.5 indicates the middle of the destination rectangle.

y
The relative y-coordinate of the center point. Value 0.5 indicates the middle of the destination rectangle.

See Also

RadialGradientBrush Constructor Overload List
RadialGradientBrush Class
com.mindfusion.drawing Namespace

RadialGradientBrush Constructor (float[], Color[], double, double)

Initializes a new instance of the RadialGradientBrush class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public RadialGradientBrush (
    float[] fractions,
    Color[] colors,
    double x,
    double y
)
```

Parameters

fractions

An array of float numbers specifying the positions of the colors along the gradient.

colors
An array of Color objects representing the colors of the gradient.

x
The relative x-coordinate of the center point. Value 0.5 indicates the middle of the destination rectangle.

y
The relative y-coordinate of the center point. Value 0.5 indicates the middle of the destination rectangle.

Remarks

Instances of the RadialGradientBrush class created using this constructor are currently not serialized.

RadialGradientBrush Members
RadialGradientBrush Class
com.mindfusion.drawing Namespace

RadialGradientBrush.toColor Method

Returns a single color approximation of the brush.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Color toColor ()
```

Return Value

See Also

RadialGradientBrush Members
RadialGradientBrush Class
com.mindfusion.drawing Namespace

RadialGradientBrush.writeExternal Method

Implements Externalizable.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

See Also

SolidBrush Class

Represents a brush that paints the interior of objects with a single color.

Syntax

Java

```
public class SolidBrush extends Brush
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.drawing.Brush
    com.mindfusion.drawing.SolidBrush

See Also

SolidBrush Members
com.mindfusion.drawing Namespace

SolidBrush Members

Represents a brush that paints the interior of objects with a single color.

The following tables list the members exposed by the SolidBrush type.

Public Constructors

	Name	Description
	SolidBrush	Overloaded.

Public Methods

	Name	Description
	applyTo	
	clone	Create a copy of this brush.
	getColor	Gets the color that fills the interior of objects painted with this brush.
	readExternal	Implements Externalizable.
	setColor	Sets the color that fills the interior of objects painted with this brush.
	toColor	
	writeExternal	Implements Externalizable.

SolidBrush Constructor

Overload List

Name	Description
SolidBrush ()	Initializes a new instance of the SolidBrush class.
SolidBrush (Color)	Initializes a new instance of the **SolidBrush** class.
SolidBrush (String)	Initializes a new instance of the **SolidBrush** class.

See Also

SolidBrush Class
com.mindfusion.drawing Namespace

SolidBrush Constructor ()

Initializes a new instance of the SolidBrush class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public SolidBrush ()
```

See Also

SolidBrush Constructor Overload List
SolidBrush Class
com.mindfusion.drawing Namespace

SolidBrush Constructor (Color)

Initializes a new instance of the SolidBrush class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public SolidBrush (
    Color color
)
```

Parameters

color
A Color object representing the brush color.

See Also

SolidBrush Constructor Overload List
SolidBrush Class
com.mindfusion.drawing Namespace

SolidBrush Constructor (String)

Initializes a new instance of the SolidBrush class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public SolidBrush (
    String color
```

```
)
```

Parameters

color
A string specifying color hex code.

See Also

SolidBrush Constructor Overload List
SolidBrush Class
com.mindfusion.drawing Namespace

SolidBrush Methods

SolidBrush.applyTo Method

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void applyTo (
    Graphics2D g,
    Rectangle2D bounds
)
```

Parameters

g

bounds

See Also

SolidBrush Members
SolidBrush Class
com.mindfusion.drawing Namespace

SolidBrush.clone Method

Create a copy of this brush.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public SolidBrush clone ()
```

Return Value

The new SolidBrush object.

See Also

SolidBrush Members
SolidBrush Class
com.mindfusion.drawing Namespace

SolidBrush.getColor Method

Gets the color that fills the interior of objects painted with this brush.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Color getColor ()
```

Return Value

A Color object representing the brush color.

See Also

SolidBrush Members
SolidBrush Class
com.mindfusion.drawing Namespace

SolidBrush.readExternal Method

Implements Externalizable.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

SolidBrush Members
SolidBrush Class
com.mindfusion.drawing Namespace

SolidBrush.setColor Method

Sets the color that fills the interior of objects painted with this brush.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void setColor (
    Color value
)
```

Parameters

value
The new brush color.

See Also

SolidBrush Members
SolidBrush Class
com.mindfusion.drawing Namespace

SolidBrush.toColor Method

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Color toColor ()
```

Return Value

See Also

SolidBrush Members
SolidBrush Class
com.mindfusion.drawing Namespace

SolidBrush.writeExternal Method

Implements Externalizable.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

See Also

SolidBrush Members
SolidBrush Class

TextAlignment Enumeration

Specifies the alignment of text on the drawing surface.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public enum TextAlignment
```

Members

	Member name	Description
	BottomCenter	Text is vertically aligned at the bottom, and horizontally aligned at the center.
	BottomLeft	Text is vertically aligned at the bottom, and horizontally aligned on the left.
	BottomRight	Text is vertically aligned at the bottom, and horizontally aligned on the right.
	MiddleCenter	Text is vertically aligned in the middle, and horizontally aligned at the center.
	MiddleLeft	Text is vertically aligned in the middle, and horizontally aligned on the left.
	MiddleRight	Text is vertically aligned in the middle, and horizontally aligned on the right.
	NoWrap	The only flag that can be combines with any of the alignment flags. Specifies that the drawn text should not wrap when the text does not fit in a single line.
	TopCenter	Text is vertically aligned at the top, and horizontally aligned at the center.
	TopLeft	Text is vertically aligned at the top, and horizontally aligned on the left.

	TopRight	Text is vertically aligned at the top, and horizontally aligned on the right.

See Also

com.mindfusion.drawing Namespace

TextFormat Class

Specifies the format and alignment of text.

Syntax

Java
`public class TextFormat implements Cloneable`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.drawing.TextFormat

See Also

TextFormat Members
com.mindfusion.drawing Namespace

TextFormat Members

Specifies the format and alignment of text.

The following tables list the members exposed by the TextFormat type.

Public Constructors

	Name	Description
	TextFormat	Overloaded.

Public Methods

	Name	Description
	clone	Creates a copy of this **TextFormat**.
	drawText	
	equals	Object.equals override.
	getHorizontalAlign	Gets the horizontal text alignment.
	getNoWrap	Gets a value indicating whether automatic text wrapping is disabled.
	getRightToLeft	

	getVerticalAlign	Gets the vertical text alignment.
	getWrapAtCharacter	Gets a value indicating whether text can be wrapped to a new line at an arbitrary character, or only after a whole word.
	getWrapOverflowingSingleWordLines	Gets whether a single-word line should wrap when overflowing.
	setHorizontalAlign	Sets the horizontal text alignment.
	setNoWrap	Sets a value indicating whether automatic text wrapping is disabled.
	setRightToLeft	
	setVerticalAlign	Sets the vertical text alignment.
	setWrapAtCharacter	Sets a value indicating whether text can be wrapped to a new line at an arbitrary character, or only after a whole word.
	setWrapOverflowingSingleWordLines	Sets whether a single-word line should wrap when overflowing.

TextFormat Constructor

Overload List

Name	Description
TextFormat ()	Initializes a new instance of the TextFormat class.
TextFormat (Align, Align)	Initializes a new instance of the **TextFormat** class.

See Also

TextFormat Class
com.mindfusion.drawing Namespace

TextFormat Constructor ()

Initializes a new instance of the TextFormat class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public TextFormat ()
```

See Also

TextFormat Constructor Overload List
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat Constructor (Align, Align)

Initializes a new instance of the TextFormat class.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public TextFormat (
    Align horizontalAlign,
    Align verticalAlign
)
```

Parameters

horizontalAlign
One of the Align constants.

verticalAlign
One of the **Align** constants.

See Also

TextFormat Constructor Overload List
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat Methods

TextFormat.clone Method

Creates a copy of this TextFormat.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public TextFormat clone ()
```

Return Value

The new TextFormat object.

See Also

TextFormat Members
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat.drawText Method

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void drawText (
    String text,
    Graphics2D graphics,
    Font font,
    Rectangle2D bounds
)
```

Parameters

text

graphics

font

bounds

See Also

TextFormat Members
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat.equals Method

Object.equals override.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public boolean equals (
    TextFormat other
)
```

Parameters

other
The object to compare to this instance.

Return Value

true if the value parameter equals the value of this instance; otherwise, false.

See Also

TextFormat Members
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat.getHorizontalAlign Method

Gets the horizontal text alignment.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Align getHorizontalAlign ()
```

Return Value

A member of the Align enumeration.

See Also

TextFormat Members
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat.getNoWrap Method

Gets a value indicating whether automatic text wrapping is disabled.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public boolean getNoWrap ()
```

Return Value

true if text wrapping is disabled, otherwise false.

Remarks

If wrapping is enabled, the control automatically wraps the text to a new line when there is not enough space to fit it in one line. If automatic wrapping is disabled, the control wraps text only at new-line characters.

See Also

TextFormat Members
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat.getRightToLeft Method

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public boolean getRightToLeft ()
```

Return Value

See Also

TextFormat Members
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat.getVerticalAlign Method

Gets the vertical text alignment.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public Align getVerticalAlign ()
```

Return Value

A member of the Align enumeration.

See Also

TextFormat Members
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat.getWrapAtCharacter Method

Gets a value indicating whether text can be wrapped to a new line at an arbitrary character, or only after a whole word.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public boolean getWrapAtCharacter ()
```

Return Value

true if text can be wrapped at an arbitrary character, otherwise false.

See Also

TextFormat Members
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat.getWrapOverflowingSingleWordLines Method

Gets whether a single-word line should wrap when overflowing.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public boolean getWrapOverflowingSingleWordLines ()
```

Return Value

true if long word should wrap when it cannot fit on a line, or false if it should be drawn clipped.

See Also

TextFormat Members
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat.setHorizontalAlign Method

Sets the horizontal text alignment.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void setHorizontalAlign (
    Align value
)
```

Parameters

value
A member of the Align enumeration.

See Also

TextFormat Members
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat.setNoWrap Method

Sets a value indicating whether automatic text wrapping is disabled.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void setNoWrap (
    boolean wrap
)
```

Parameters

wrap
true to disable text wrapping, otherwise false.

Remarks

If wrapping is enabled, the control automatically wraps the text to a new line when there is not enough space to fit it in one line. If automatic wrapping is disabled, the control wraps text only at new-line characters.

```
public void setRightToLeft (
    boolean value
)
```

Parameters

value

See Also

TextFormat Members
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat.setVerticalAlign Method

Sets the vertical text alignment.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void setVerticalAlign (
    Align value
)
```

Parameters

value
A member of the Align enumeration.

See Also

TextFormat Members
TextFormat Class
com.mindfusion.drawing Namespace

TextFormat.setWrapAtCharacter Method

Sets a value indicating whether text can be wrapped to a new line at an arbitrary character, or only after a whole word.

Namespace: com.mindfusion.drawing
Package: com.mindfusion.drawing

Syntax

Java

```
public void setWrapAtCharacter (
    boolean value
)
```

Parameters

value
true if text can be wrapped at an arbitrary character, otherwise false.

See Also

TextFormat Members
TextFormat Class

	allPairShortestPaths	Overloaded. (Inherited from Graph.)
	assignTreeLevels	(Inherited from Graph.)
	bestTreeRoot	(Inherited from Graph.)
	coarsen	(Inherited from Graph.)
	containsRepeatedEdges	(Inherited from Graph.)
	contractEdge	(Inherited from Graph.)
	convertToStGraph	Overloaded. (Inherited from Graph.)
	convertToStGraphVirtualEnds	The input should be biconnected undirected graph. The output is directed acyclic ST graph. (Inherited from Graph.)
	createReverseMaps	(Inherited from Graph.)
	cutVertices	Overloaded.
	depthFirstSearch	Overloaded. (Inherited from Graph.)
	directFromRoot	
	eliminateIntermediateSourcesAndSinks	(Inherited from Graph.)
	embedOnSameFace	(Inherited from Graph.)
	father	(Inherited from Graph.)
	findPendantCut	
	findPlanarSubgraph	(Inherited from Graph.)
	findPlanarSubgraphByBookEmbedding	(Inherited from Graph.)
	findPlanarSubgraphBySimpleEdgeInsertion	(Inherited from Graph.)
	findShortestPath	Overloaded. (Inherited from Graph.)
	findShortestWeightedPath	Overloaded. (Inherited from Graph.)
	getBiconnectedComponents	Overloaded. (Inherited from Graph.)

	getBlock	
	getBlocks	
	getCanonicalOrder	(Inherited from Graph.)
	getCnode	
	getConnectedComponents	(Inherited from Graph.)
	getConnectedComponentsQuickFind	(Inherited from Graph.)
	getConnectedComponentsQuickUnion	(Inherited from Graph.)
	getCutvertex	
	getDualGraph	Overloaded. (Inherited from Graph.)
	getEdgeConnectedComponents	(Inherited from Graph.)
	getEdges	(Inherited from Graph.)
	getLayers	(Inherited from Graph.)
	getLevelPlanarEmbedding	Must be called on a proper hierarchical graph. (Inherited from Graph.)
	getOutsideVertex	Overloaded.
	getPlanarEmbedding	(Inherited from Graph.)
	getRoot	
	getStNumbering	Overloaded. (Inherited from Graph.)
	getTreeChildren	(Inherited from Graph.)
	getVertices	(Inherited from Graph.)
	getWeightedTopologicalNumbering	Overloaded. (Inherited from Graph.)
	isAcyclic	(Inherited from Graph.)
	isBnode	
	isCnode	
	isPendant	
	isPlanar	(Inherited from Graph.)
	isProperHierarchical	Must be called on a simple hierarchical graph. (Inherited from Graph.)
	isTree	(Inherited from Graph.)
	load	(Inherited from Graph.)
	loadMappings	(Inherited from Graph.)
	makeAcyclic	Must be called on a simple connected graph. (Inherited from Graph.)
	makeBiconnected	(Inherited from Graph.)

	makeBimodal	(Inherited from Graph.)
	makeProperHierarchical	Replaces long links with a sequence of virtual nodes and links that connect adjacent levels. Must be called on a simple hierarchical graph. (Inherited from Graph.)
	makeStPlanar	(Inherited from Graph.)
	maximalMatching	(Inherited from Graph.)
	maxWeightedCliqueOfTransitiveDAG	Must be called on a transitive DAG. (Inherited from Graph.)
	minCostPathOrNegativeCycle	(Inherited from Graph.)
	optimalTopologicalNumbering	Overloaded. (Inherited from Graph.)
	partition	(Inherited from Graph.)
	partitionTree	(Inherited from Graph.)
	planarize	Overloaded. (Inherited from Graph.)
	planarMakeBiconnected	Must be called on a planar graph. (Inherited from Graph.)
	removeAllEdges	(Inherited from Graph.)
	removeBnode	
	removeCnode	
	removeEdge	(Inherited from Graph.)
	removeVertex	(Inherited from Graph.)
	reorderTopologically	(Inherited from Graph.)
S	reverse	(Inherited from Graph.)
	save	(Inherited from Graph.)
	saveMappings	(Inherited from Graph.)
	setNewParent	
	splitToMaxDegree	Overloaded. (Inherited from Graph.)
	topologicalSort	(Inherited from Graph.)
	toString	(Inherited from Graph.)
	triangulate	Overloaded. (Inherited from Graph.)

	vertices	(Inherited from Graph.)

Public Methods

	Name	Description
	addEdge	Overloaded. (Inherited from Graph.)
	addVertex	Overloaded. (Inherited from Graph.)
	addVertexAndOutEdges	(Inherited from Graph.)
	allPairShortestPaths	Overloaded. (Inherited from Graph.)
	assignTreeLevels	(Inherited from Graph.)
	bestTreeRoot	(Inherited from Graph.)
	cacheIncidentFace	
	coarsen	(Inherited from Graph.)
	containsRepeatedEdges	(Inherited from Graph.)
	contractEdge	(Inherited from Graph.)
	convertToStGraph	Overloaded. (Inherited from Graph.)
	convertToStGraphVirtualEnds	The input should be biconnected undirected graph. The output is directed acyclic ST graph. (Inherited from Graph.)
	createReverseMaps	(Inherited from Graph.)
	depthFirstSearch	Overloaded. (Inherited from Graph.)
	eliminateIntermediateSourcesAndSinks	(Inherited from Graph.)
	embedOnSameFace	(Inherited from Graph.)
	father	(Inherited from Graph.)
	findPlanarSubgraph	(Inherited from Graph.)
	findPlanarSubgraphByBookEmbedding	(Inherited from Graph.)

	findPlanarSubgraphBySimpleEdgeInsertion	(Inherited from Graph.)
	findShortestPath	Overloaded. (Inherited from Graph.)
	findShortestWeightedPath	Overloaded. (Inherited from Graph.)
	getBiconnectedComponents	Overloaded. (Inherited from Graph.)
	getCanonicalOrder	(Inherited from Graph.)
	getCommonEdge	
	getCommonEdgeMinWeight	
	getConnectedComponents	(Inherited from Graph.)
	getConnectedComponentsQuickFind	(Inherited from Graph.)
	getConnectedComponentsQuickUnion	(Inherited from Graph.)
	getDualGraph	Overloaded. (Inherited from Graph.)
	getEdgeConnectedComponents	(Inherited from Graph.)
	getEdges	(Inherited from Graph.)
	getEmbedding	
	getFaces	
	getFaceVertices	
	getIncidentFaces	Gets a set of faces whose boundary contains the specified vertex.
	getLayers	(Inherited from Graph.)
	getLevelPlanarEmbedding	Must be called on a proper hierarchical graph. (Inherited from Graph.)
	getOriginalEdge	
	getPlanarEmbedding	(Inherited from Graph.)
	getStNumbering	Overloaded. (Inherited from Graph.)
	getTreeChildren	(Inherited from Graph.)
	getVertices	(Inherited from Graph.)
	getVertices	
	getWeightedTopologicalNumbering	Overloaded. (Inherited from Graph.)
	isAcyclic	(Inherited from Graph.)
	isPlanar	(Inherited from Graph.)
	isProperHierarchical	Must be called on a simple hierarchical graph. (Inherited from Graph.)
	isTree	(Inherited from Graph.)
	load	(Inherited from Graph.)

	loadMappings	(Inherited from Graph.)
	makeAcyclic	Must be called on a simple connected graph. (Inherited from Graph.)
	makeBiconnected	(Inherited from Graph.)
	makeBimodal	(Inherited from Graph.)
	makeProperHierarchical	Replaces long links with a sequence of virtual nodes and links that connect adjacent levels. Must be called on a simple hierarchical graph. (Inherited from Graph.)
	makeStPlanar	(Inherited from Graph.)
	maximalMatching	(Inherited from Graph.)
	maxWeightedCliqueOfTransitiveDAG	Must be called on a transitive DAG. (Inherited from Graph.)
	minCostPathOrNegativeCycle	(Inherited from Graph.)
	optimalTopologicalNumbering	Overloaded. (Inherited from Graph.)
	partition	(Inherited from Graph.)
	partitionTree	(Inherited from Graph.)
	planarize	Overloaded. (Inherited from Graph.)
	planarMakeBiconnected	Must be called on a planar graph. (Inherited from Graph.)
	removeAllEdges	(Inherited from Graph.)
	removeEdge	(Inherited from Graph.)
	removeVertex	(Inherited from Graph.)
	reorderTopologically	(Inherited from Graph.)
S	reverse	(Inherited from Graph.)
	save	(Inherited from Graph.)
	saveMappings	(Inherited from Graph.)
	splitExternalFace	
	splitToMaxDegree	Overloaded. (Inherited from Graph.)
	topologicalSort	(Inherited from Graph.)
	toString	
	triangulate	Overloaded. (Inherited from Graph.)

DualGraph Members
DualGraph Class
com.mindfusion.graphs Namespace

DualGraph.getIncidentFaces Method

Gets a set of faces whose boundary contains the specified vertex.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Face> getIncidentFaces (
    Vertex v
)
```

Parameters

v
A vertex in the original graph.

Return Value

A set of faces whose boundary contains v.

Edge.getCapacity Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public int getCapacity ()
```

Return Value

See Also

Edge Members
Edge Class
com.mindfusion.graphs Namespace

Edge.getCommonVertex Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Vertex getCommonVertex (
    Edge edge
)
```

Parameters

edge

Return Value

See Also

Edge Members
Edge Class
com.mindfusion.graphs Namespace

Edge.getCost Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public int getCost ()
```

Return Value

See Also

Edge Members
Edge Class
com.mindfusion.graphs Namespace

Edge.getDestination Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public Vertex getDestination ()`

Return Value

See Also

Edge Members
Edge Class
com.mindfusion.graphs Namespace

Edge.getEnds Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public Vertex[] getEnds ()`

Return Value

See Also

Edge Members
Edge Class

Edge.getIsLoop Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public boolean getIsLoop ()`

Return Value

See Also

Edge Members
Edge Class
com.mindfusion.graphs Namespace

Edge.getLowerFlowBound Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public int getLowerFlowBound ()`

Return Value

See Also

Edge Members
Edge Class
com.mindfusion.graphs Namespace

Edge.getOrigin Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Vertex getOrigin ()
```

Return Value

See Also

Edge Members
Edge Class
com.mindfusion.graphs Namespace

Edge.getOtherEnd Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Vertex getOtherEnd (
    Vertex vertex
)
```

Parameters

vertex

Return Value

See Also

Edge Members
Edge Class
com.mindfusion.graphs Namespace

Edge.getResidualCapacity Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public int getResidualCapacity ()
```

Return Value

See Also

Edge Members
Edge Class

Edge.getWeight Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public float getWeight ()
```

Return Value

com.mindfusion.graphs Namespace

Edge.incidentWith Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public boolean incidentWith (
    Vertex vertex
)
```

Parameters

vertex

Return Value

See Also

Edge Members
Edge Class
com.mindfusion.graphs Namespace

Edge.joins Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public boolean joins (
    Vertex node1,
    Vertex node2
)
```

Parameters

node1

node2

Return Value

See Also

Edge Members
Edge Class
com.mindfusion.graphs Namespace

Edge.orientFrom Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void orientFrom (
    Vertex vertex
)
```

Parameters

vertex

See Also

Edge Members
Edge Class
com.mindfusion.graphs Namespace

Edge.orientTo Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void orientTo (
    Vertex vertex
)
```

Parameters

vertex

See Also

Edge Members

FractalDrawing Class

A tree drawing algorithm that places child nodes symmetrically around their parent node. Nodes at the lowest level are arranged directly in a circle around their parent. At the upper level, the already arranged nodes form branches that are arranged in a circle around the new parent node. The algorithm is recursively repeated till the highest level is reached.

Syntax

```
Java
public class FractalDrawing
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.graphs.FractalDrawing

See Also

	father	
	findPlanarSubgraph	
	findPlanarSubgraphByBookEmbedding	
	findPlanarSubgraphBySimpleEdgeInsertion	
	findShortestPath	Overloaded.
	findShortestWeightedPath	Overloaded.

	getBiconnectedComponents	Overloaded.
	getCanonicalOrder	
	getConnectedComponents	
	getConnectedComponentsQuickFind	
	getConnectedComponentsQuickUnion	
	getDualGraph	Overloaded.
	getEdgeConnectedComponents	
	getEdges	
	getLayers	
	getLevelPlanarEmbedding	Must be called on a proper hierarchical graph.
	getPlanarEmbedding	
	getStNumbering	Overloaded.
	getTreeChildren	
	getVertices	
	getWeightedTopologicalNumbering	Overloaded.
	isAcyclic	
	isPlanar	
	isProperHierarchical	Must be called on a simple hierarchical graph.
	isTree	
	load	
	loadMappings	
	makeAcyclic	Must be called on a simple connected graph.
	makeBiconnected	
	makeBimodal	
	makeProperHierarchical	Replaces long links with a sequence of virtual nodes and links that connect adjacent levels. Must be called on a simple hierarchical graph.
	makeStPlanar	
	maximalMatching	
	maxWeightedCliqueOfTransitiveDAG	Must be called on a transitive DAG.
	minCostPathOrNegativeCycle	
	optimalTopologicalNumbering	Overloaded.
	partition	
	partitionTree	

	planarize	Overloaded.
	planarMakeBiconnected	Must be called on a planar graph.
	removeAllEdges	
	removeEdge	
	removeVertex	
	reorderTopologically	
S	reverse	
	save	
	saveMappings	
	splitToMaxDegree	Overloaded.
	topologicalSort	
	toString	
	triangulate	Overloaded.

Graph Constructor (Graph, boolean)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph (
    Graph graph,
    boolean saveMapping
)
```

Parameters

graph

saveMapping

See Also

Graph Constructor Overload List
Graph Class
com.mindfusion.graphs Namespace

Graph Constructor (Graph, Collection<Edge>, boolean, boolean)

Create a subgraph copy induced by the specified edge subset.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph (
    Graph graph,
    Collection<Edge> edgeSubset,
    boolean allVertices,
    boolean saveMapping
)
```

Parameters

graph

edgeSubset

allVertices

saveMapping

See Also

Graph Constructor Overload List
Graph Class
com.mindfusion.graphs Namespace

Graph Constructor (Graph, Collection<Vertex>, boolean)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph (
    Graph graph,
    Collection<Vertex> vertexSubset,
    boolean saveMapping
)
```

Parameters

graph

vertexSubset

saveMapping

allPairShortestPaths Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.assignTreeLevels Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<ArrayList<Vertex>> assignTreeLevels (
    Vertex root,
    HashMap<Vertex, Integer> vertexLevelMap,
    HashMap<Vertex, Float> branchWeights
)
```

Parameters

root

vertexLevelMap

branchWeights

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.bestTreeRoot Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Vertex bestTreeRoot ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.coarsen Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void coarsen (
    int maxSize,
    boolean strict,
    Stack<Graph> graphs,
    Stack<HashMap<Vertex, Edge>> contractionMaps
)
```

Parameters

maxSize

strict

graphs

contractionMaps

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.containsRepeatedEdges Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public boolean containsRepeatedEdges ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.contractEdge Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Vertex contractEdge (
    Edge edge
)
```

Parameters

edge

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.convertToStGraph Method

Overload List

Name	Description
Graph.convertToStGraph ()	
Graph.convertToStGraph (Vertex)	The input should be biconnected undirected graph. The output is directed acyclic ST graph.

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.convertToStGraph Method ()

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public ArrayList<Edge> convertToStGraph ()`

Return Value

See Also

convertToStGraph Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.convertToStGraph Method (Vertex)

The input should be biconnected undirected graph. The output is directed acyclic ST graph.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

`public ArrayList<Edge> convertToStGraph (`
`  Vertex sink`
`)`

Parameters

sink

Return Value

See Also

convertToStGraph Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.convertToStGraphVirtualEnds Method

The input should be biconnected undirected graph. The output is directed acyclic ST graph.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public StConversion convertToStGraphVirtualEnds ()`

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.createReverseMaps Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public void createReverseMaps ()`

See Also

Graph Members

com.mindfusion.graphs Namespace

Graph.depthFirstSearch Method

Overload List

Name	Description
Graph.depthFirstSearch ()	

Graph.depthFirstSearch (Vertex)	

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.depthFirstSearch Method ()

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void depthFirstSearch ()
```

See Also

depthFirstSearch Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.depthFirstSearch Method (Vertex)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void depthFirstSearch (
    Vertex start
)
```

Parameters

start

See Also

depthFirstSearch Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.eliminateIntermediateSourcesAndSinks Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

```
Java
public void eliminateIntermediateSourcesAndSinks (
    HierarchicalEmbedding embedding,
    Set<Edge> addedEdges
)
```

Parameters

embedding

addedEdges

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.embedOnSameFace Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

```
Java
public Embedding embedOnSameFace (
    Collection<Vertex> faceVertices
)
```

Parameters

faceVertices

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.father Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Vertex father (
    Vertex vertex
)
```

Parameters

vertex

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.findPlanarSubgraph Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph findPlanarSubgraph (
    Set<Edge> edgesToDelete,
    Collection<Edge> crossingConstrainedEdges
)
```

Parameters

edgesToDelete

crossingConstrainedEdges

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.findPlanarSubgraphByBookEmbedding Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph findPlanarSubgraphByBookEmbedding (
    Set<Edge> edgesToDelete,
```

```
    Collection<Edge> crossingConstrainedEdges
)
```

Parameters

edgesToDelete

crossingConstrainedEdges

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.findPlanarSubgraphBySimpleEdgeInsertion Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph findPlanarSubgraphBySimpleEdgeInsertion (
    Set<Edge> edgesToDelete
)
```

Parameters

edgesToDelete

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.findShortestPath Method

Overload List

Name	Description
Graph.findShortestPath (Set, Set)	
Graph.findShortestPath (Vertex, Set)	
Graph.findShortestPath (Vertex, Vertex)	

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.findShortestPath Method (Set<Vertex>, Set<Vertex>)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Vertex> findShortestPath (
    Set<Vertex> originSet,
    Set<Vertex> destSet
)
```

Parameters

originSet

destSet

Return Value

See Also

findShortestPath Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.findShortestPath Method (Vertex, Set<Vertex>)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Vertex> findShortestPath (
    Vertex v1,
    Set<Vertex> destSet
)
```

Parameters

v1

destSet

Return Value

See Also

findShortestPath Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.findShortestPath Method (Vertex, Vertex)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Vertex> findShortestPath (
    Vertex v1,
    Vertex v2
)
```

Parameters

v1

v2

Return Value

Graph Class
com.mindfusion.graphs Namespace

Graph.findShortestWeightedPath Method (Set<Vertex>, Set<Vertex>)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Vertex> findShortestWeightedPath (
    Set<Vertex> originSet,
    Set<Vertex> destSet
)
```

Parameters

originSet

destSet

Return Value

See Also

findShortestWeightedPath Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.findShortestWeightedPath Method (Vertex, Set<Vertex>, ByRef<Double>)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Vertex> findShortestWeightedPath (
    Vertex origin,
    Set<Vertex> destSet,
    ByRef<Double> minWeigth
)
```

Parameters

origin

destSet

minWeigth

Return Value

See Also

findShortestWeightedPath Method Overload List
Graph Members

Graph Class

Graph.getBiconnectedComponents Method (boolean)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph[] getBiconnectedComponents (
    boolean saveMapping
)
```

Parameters

saveMapping

Return Value

See Also

getBiconnectedComponents Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getBiconnectedComponents Method (boolean, ComponentBlocksHandler)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph[] getBiconnectedComponents (
    boolean saveMapping,
    ComponentBlocksHandler blocksHandler
)
```

Parameters

saveMapping

blocksHandler

Return Value

See Also

getBiconnectedComponents Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getCanonicalOrder Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Vertex> getCanonicalOrder ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getConnectedComponents Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph[] getConnectedComponents ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getConnectedComponentsQuickFind Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public Graph[] getConnectedComponentsQuickFind ()`

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getConnectedComponentsQuickUnion Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public Graph[] getConnectedComponentsQuickUnion ()`

Return Value

See Also

Graph Members

Graph.getDualGraph Method

Overload List

Name	Description
Graph.getDualGraph (boolean)	
Graph.getDualGraph (Embedding, Vertex, Vertex)	

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getDualGraph Method (boolean)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public DualGraph getDualGraph (
    boolean cacheIncidentFaces
)
```

Parameters

cacheIncidentFaces

Return Value

See Also

getDualGraph Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getDualGraph Method (Embedding, Vertex, Vertex)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public DualGraph getDualGraph (
    Embedding embedding,
    Vertex s,
    Vertex t
)
```

Parameters

embedding

s

t

Return Value

See Also

getDualGraph Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getEdgeConnectedComponents Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph[] getEdgeConnectedComponents ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getEdges Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Edge> getEdges ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getLayers Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<ArrayList<Vertex>> getLayers ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getLevelPlanarEmbedding Method

Must be called on a proper hierarchical graph.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public HierarchicalEmbedding getLevelPlanarEmbedding (
    boolean planarize,
    Set<Edge> removedEdges
)
```

Parameters

planarize

removedEdges

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getPlanarEmbedding Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Embedding getPlanarEmbedding ()
```

Return Value

See Also

Graph.getStNumbering Method

Overload List

Name	Description
Graph.getStNumbering ()	
Graph.getStNumbering (Vertex)	Algorithm from the paper "Computing an st-numbering" by Shimon Even and Robert Endre Tarjan. Running time is O(V + E). This method must be called on a biconnected graph.

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getStNumbering Method ()

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public ArrayList<Vertex> getStNumbering ()`

Return Value

See Also

getStNumbering Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getStNumbering Method (Vertex)

Algorithm from the paper "Computing an st-numbering" by Shimon Even and Robert Endre Tarjan. Running time is O(V + E). This method must be called on a biconnected graph.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Vertex> getStNumbering (
    Vertex sink
)
```

Parameters

sink

Return Value

See Also

getStNumbering Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getTreeChildren Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Vertex> getTreeChildren (
    Vertex node,
    HashMap<Vertex, Integer> vertexLevelMap
)
```

Parameters

node

vertexLevelMap

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getVertices Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Vertex> getVertices ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getWeightedTopologicalNumbering Method

Overload List

Name	Description
Graph.getWeightedTopologicalNumbering ()	
Graph.getWeightedTopologicalNumbering (int[], float)	
Graph.getWeightedTopologicalNumbering (float)	

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getWeightedTopologicalNumbering Method ()

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public float[] getWeightedTopologicalNumbering ()`

Return Value

See Also

getWeightedTopologicalNumbering Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getWeightedTopologicalNumbering Method (int[], float)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public float[] getWeightedTopologicalNumbering (
    int[] tsort,
    float minNumber
)
```

Parameters

tsort

minNumber

Return Value

See Also

getWeightedTopologicalNumbering Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.getWeightedTopologicalNumbering Method (float)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public float[] getWeightedTopologicalNumbering (
    float minNumber
)
```

Parameters

minNumber

Return Value

See Also

getWeightedTopologicalNumbering Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.isAcyclic Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public boolean isAcyclic ()`

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.isPlanar Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public boolean isPlanar ()`

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.isProperHierarchical Method

Must be called on a simple hierarchical graph.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public boolean isProperHierarchical ()`

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.isTree Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

```
Java
public boolean isTree ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.load Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

```
Java
public void load (
    String fileName
)
```

Parameters

fileName

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.loadMappings Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void loadMappings (
    String fileName,
    Graph original
)
```

Parameters

fileName

original

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.makeAcyclic Method

Must be called on a simple connected graph.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Edge> makeAcyclic ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.makeBiconnected Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Edge> makeBiconnected ()
```

Return Value

See Also

Graph Members
Graph Class

Graph.makeBimodal Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public BimodalSplit makeBimodal ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.makeProperHierarchical Method

Replaces long links with a sequence of virtual nodes and links that connect adjacent levels. Must be called on a simple hierarchical graph.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public HashMap<Edge, ArrayList<Edge>> makeProperHierarchical ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.makeStPlanar Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public StPlanarization makeStPlanar ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.maximalMatching Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public ArrayList<Edge> maximalMatching ()`

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.maxWeightedCliqueOfTransitiveDAG Method

Must be called on a transitive DAG.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public ArrayList<Vertex> maxWeightedCliqueOfTransitiveDAG ()`

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.minCostPathOrNegativeCycle Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

`public ArrayList<Edge> minCostPathOrNegativeCycle (`
`  Vertex start,`
`  Vertex end`
`)`

Parameters

start

end

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.optimalTopologicalNumbering Method

Overload List

Name	Description
Graph.optimalTopologicalNumbering ()	
Graph.optimalTopologicalNumbering (int[])	

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.optimalTopologicalNumbering Method ()

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public int[] optimalTopologicalNumbering ()`

Return Value

See Also

optimalTopologicalNumbering Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.optimalTopologicalNumbering Method (int[])

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public int[] optimalTopologicalNumbering (
    int[] tsort
)
```

Parameters

tsort

Return Value

See Also

optimalTopologicalNumbering Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.partition Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Set<Set<Vertex>> partition (
    int numPartitions,
    int coarseGraphSize,
    double tolerance
)
```

Parameters

numPartitions

coarseGraphSize

tolerance

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.partitionTree Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Set<Set<Vertex>> partitionTree (
    int subsetSize
)
```

Parameters

subsetSize

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.planarize Method

Overload List

Name	Description
Graph.planarize (HashMap>)	
Graph.planarize (HashMap>, Collection)	

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.planarize Method (HashMap<Edge, ArrayList<Edge>>)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph planarize (
    HashMap<Edge, ArrayList<Edge>> edgeToDummyEdgesMap
)
```

Parameters

edgeToDummyEdgesMap

Return Value

See Also

planarize Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.planarize Method (HashMap<Edge, ArrayList<Edge>>, Collection<Edge>)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph planarize (
    HashMap<Edge, ArrayList<Edge>> edgeToDummyEdgesMap,
    Collection<Edge> crossingConstrainedEdges
)
```

Parameters

edgeToDummyEdgesMap

crossingConstrainedEdges

Return Value

See Also

planarize Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.planarMakeBiconnected Method

Must be called on a planar graph.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Edge> planarMakeBiconnected ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.removeAllEdges Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void removeAllEdges ()
```

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.removeEdge Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void removeEdge (
    Edge e
)
```

Parameters

e

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.removeVertex Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void removeVertex (
    Vertex v
)
```

Parameters

v

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.reorderTopologically Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void reorderTopologically ()
```

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.reverse Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public static void reverse (
    int[] b
)
```

Parameters

b

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.save Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void save (
    String fileName
)
```

Parameters

fileName

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.saveMappings Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void saveMappings (
    String fileName,
    Graph original
)
```

Parameters

fileName

original

See Also

Graph.splitToMaxDegree Method

Overload List

Name	Description
Graph.splitToMaxDegree (int)	
Graph.splitToMaxDegree (int, Embedding)	
Graph.splitToMaxDegree (Vertex, int)	
Graph.splitToMaxDegree (Vertex, int, Embedding)	

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.splitToMaxDegree Method (int)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public HashMap<Vertex, Graph> splitToMaxDegree (
    int maxDegree
)
```

Parameters

maxDegree

Return Value

splitToMaxDegree Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.splitToMaxDegree Method (Vertex, int)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Graph splitToMaxDegree (
    Vertex vertex,
    int maxDegree
)
```

Parameters

vertex

maxDegree

Return Value

See Also

splitToMaxDegree Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.splitToMaxDegree Method (Vertex, int, Embedding)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

```
Java
public Graph splitToMaxDegree (
    Vertex vertex,
    int maxDegree,
    Embedding embedding
)
```

Parameters

vertex

maxDegree

embedding

Return Value

See Also

splitToMaxDegree Method Overload List
Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.topologicalSort Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

```
Java
public int[] topologicalSort ()
```

Return Value

See Also

Graph Members
Graph Class
com.mindfusion.graphs Namespace

Graph.toString Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public String toString ()`

Return Value

IntervalGraph Members

The following tables list the members exposed by the IntervalGraph type.

Public Constructors

	Name	Description
	IntervalGraph	

Public Fields

	Name	Description
	edgeCopyToOrigMap	(Inherited from Graph.)
	edgeOrigToCopyMap	(Inherited from Graph.)
	searchOrder	(Inherited from Graph.)
	vertexCopyToOrigMap	(Inherited from Graph.)
	vertexOrigToCopyMap	(Inherited from Graph.)

Protected Fields

	Name	Description

	edges	(Inherited from Graph.)
	vertices	(Inherited from Graph.)

Public Methods

	Name	Description
	addEdge	Overloaded. (Inherited from Graph.)
	addVertex	Overloaded. (Inherited from Graph.)
	addVertexAndOutEdges	(Inherited from Graph.)
	allPairShortestPaths	Overloaded. (Inherited from Graph.)
	assignTreeLevels	(Inherited from Graph.)
	bestTreeRoot	(Inherited from Graph.)
	coarsen	(Inherited from Graph.)
	containsRepeatedEdges	(Inherited from Graph.)
	contractEdge	(Inherited from Graph.)
	convertToStGraph	Overloaded. (Inherited from Graph.)
	convertToStGraphVirtualEnds	The input should be biconnected undirected graph. The output is directed acyclic ST graph. (Inherited from Graph.)
	createReverseMaps	(Inherited from Graph.)
	depthFirstSearch	Overloaded. (Inherited from Graph.)
	eliminateIntermediateSourcesAndSinks	(Inherited from Graph.)
	embedOnSameFace	(Inherited from Graph.)
	father	(Inherited from Graph.)
	findPlanarSubgraph	(Inherited from Graph.)
	findPlanarSubgraphByBookEmbedding	(Inherited from Graph.)
	findPlanarSubgraphBySimpleEdgeInsertion	(Inherited from Graph.)
	findShortestPath	Overloaded. (Inherited from Graph.)
	findShortestWeightedPath	Overloaded. (Inherited from Graph.)
	getBiconnectedComponents	Overloaded. (Inherited from Graph.)
	getCanonicalOrder	(Inherited from Graph.)
	getConnectedComponents	(Inherited from Graph.)
	getConnectedComponentsQuickFind	(Inherited from Graph.)
	getConnectedComponentsQuickUnion	(Inherited from Graph.)
	getDualGraph	Overloaded. (Inherited from Graph.)

	getEdgeConnectedComponents	(Inherited from Graph.)
	getEdges	(Inherited from Graph.)
	getIntervals	
	getLayers	(Inherited from Graph.)
	getLevelPlanarEmbedding	Must be called on a proper hierarchical graph. (Inherited from Graph.)
	getPlanarEmbedding	(Inherited from Graph.)
	getStNumbering	Overloaded. (Inherited from Graph.)
	getTreeChildren	(Inherited from Graph.)
	getVertices	(Inherited from Graph.)
	getWeightedTopologicalNumbering	Overloaded. (Inherited from Graph.)
	isAcyclic	(Inherited from Graph.)
	isPlanar	(Inherited from Graph.)
	isProperHierarchical	Must be called on a simple hierarchical graph. (Inherited from Graph.)
	isTree	(Inherited from Graph.)
	load	(Inherited from Graph.)
	loadMappings	(Inherited from Graph.)
	makeAcyclic	Must be called on a simple connected graph. (Inherited from Graph.)
	makeBiconnected	(Inherited from Graph.)
	makeBimodal	(Inherited from Graph.)
	makeProperHierarchical	Replaces long links with a sequence of virtual nodes and links that connect adjacent levels. Must be called on a simple hierarchical graph. (Inherited from Graph.)
	makeStPlanar	(Inherited from Graph.)
	maximalMatching	(Inherited from Graph.)
	maxWeightedCliqueOfTransitiveDAG	Must be called on a transitive DAG. (Inherited from Graph.)
	maxWeightedIndependentSet	
	minCostPathOrNegativeCycle	(Inherited from Graph.)
	optimalTopologicalNumbering	Overloaded. (Inherited from Graph.)
	partition	(Inherited from Graph.)
	partitionTree	(Inherited from Graph.)
	planarize	Overloaded. (Inherited from Graph.)

	planarMakeBiconnected	Must be called on a planar graph. (Inherited from Graph.)
	removeAllEdges	(Inherited from Graph.)
	removeEdge	(Inherited from Graph.)
	removeVertex	(Inherited from Graph.)
	reorderTopologically	(Inherited from Graph.)
S	reverse	(Inherited from Graph.)
	save	(Inherited from Graph.)
	saveMappings	(Inherited from Graph.)
	splitToMaxDegree	Overloaded. (Inherited from Graph.)
	topologicalSort	(Inherited from Graph.)
	toString	(Inherited from Graph.)
	triangulate	Overloaded. (Inherited from Graph.)

OrthogonalRepresentation Members

The following tables list the members exposed by the OrthogonalRepresentation type.

Public Constructors

	Name	Description
	OrthogonalRepresentation	

Public Methods

	Name	Description
	edgesFromShape	
	getFaceShapes	
	nextShape	
	setFaceShapes	
	shapeOfEdge	
	splitEdge	

See Also

OrthogonalRepresentation Class
com.mindfusion.graphs Namespace

OrthogonalRepresentation Constructor

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public OrthogonalRepresentation ()
```

See Also

OrthogonalRepresentation Class

OrthogonalRepresentation Methods

OrthogonalRepresentation.edgesFromShape Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Edge> edgesFromShape (
    Face face
)
```

Parameters

face

Return Value

See Also

OrthogonalRepresentation Members
OrthogonalRepresentation Class
com.mindfusion.graphs Namespace

OrthogonalRepresentation.getFaceShapes Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public HashMap<Face, ArrayList<EdgeShape>> getFaceShapes ()
```

Return Value

See Also

OrthogonalRepresentation Members
OrthogonalRepresentation Class
com.mindfusion.graphs Namespace

OrthogonalRepresentation.nextShape Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public EdgeShape nextShape (
    Face face,
    Edge edge
)
```

Parameters

face

edge

Return Value

See Also

OrthogonalRepresentation Members
OrthogonalRepresentation Class
com.mindfusion.graphs Namespace

OrthogonalRepresentation.setFaceShapes Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void setFaceShapes (
    HashMap<Face, ArrayList<EdgeShape>> value
)
```

Parameters

value

See Also

OrthogonalRepresentation Members
OrthogonalRepresentation Class
com.mindfusion.graphs Namespace

OrthogonalRepresentation.shapeOfEdge Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public EdgeShape shapeOfEdge (
    Face face,
    Edge edge
)
```

Parameters

face

edge

Return Value

See Also

OrthogonalRepresentation Members
OrthogonalRepresentation Class
com.mindfusion.graphs Namespace

OrthogonalRepresentation.splitEdge Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void splitEdge (
    Face face,
    Edge edge,
    Edge segment1,
    Edge segment2
)
```

Parameters

face

edge

segment1

segment2

OverlapGraph Members

The following tables list the members exposed by the OverlapGraph type.

Public Constructors

	Name	Description
	OverlapGraph	

Public Fields

	Name	Description
	edgeCopyToOrigMap	(Inherited from Graph.)
	edgeOrigToCopyMap	(Inherited from Graph.)
	searchOrder	(Inherited from Graph.)
	vertexCopyToOrigMap	(Inherited from Graph.)
	vertexOrigToCopyMap	(Inherited from Graph.)

Protected Fields

	Name	Description
	edges	(Inherited from Graph.)
	vertices	(Inherited from Graph.)

Public Methods

	Name	Description
	addEdge	Overloaded. (Inherited from Graph.)
	addVertex	Overloaded. (Inherited from Graph.)
	addVertexAndOutEdges	(Inherited from Graph.)
	allPairShortestPaths	Overloaded. (Inherited from Graph.)
	assignTreeLevels	(Inherited from Graph.)
	bestTreeRoot	(Inherited from Graph.)
	coarsen	(Inherited from Graph.)
	containsRepeatedEdges	(Inherited from Graph.)
	contractEdge	(Inherited from Graph.)
	convertToStGraph	Overloaded. (Inherited from Graph.)
	convertToStGraphVirtualEnds	The input should be biconnected undirected graph. The output is directed acyclic ST graph. (Inherited from Graph.)
	createReverseMaps	(Inherited from Graph.)
	depthFirstSearch	Overloaded. (Inherited from Graph.)
	eliminateIntermediateSourcesAndSinks	(Inherited from Graph.)
	embedOnSameFace	(Inherited from Graph.)
	father	(Inherited from Graph.)
	findPlanarSubgraph	(Inherited from Graph.)
	findPlanarSubgraphByBookEmbedding	(Inherited from Graph.)
	findPlanarSubgraphBySimpleEdgeInsertion	(Inherited from Graph.)
	findShortestPath	Overloaded. (Inherited from Graph.)
	findShortestWeightedPath	Overloaded. (Inherited from Graph.)
	getBiconnectedComponents	Overloaded. (Inherited from Graph.)
	getCanonicalOrder	(Inherited from Graph.)
	getConnectedComponents	(Inherited from Graph.)
	getConnectedComponentsQuickFind	(Inherited from Graph.)
	getConnectedComponentsQuickUnion	(Inherited from Graph.)

	getDualGraph	Overloaded. (Inherited from Graph.)
	getEdgeConnectedComponents	(Inherited from Graph.)
	getEdges	(Inherited from Graph.)
	getLayers	(Inherited from Graph.)
	getLevelPlanarEmbedding	Must be called on a proper hierarchical graph. (Inherited from Graph.)
	getPlanarEmbedding	(Inherited from Graph.)
	getStNumbering	Overloaded. (Inherited from Graph.)
	getTreeChildren	(Inherited from Graph.)
	getVertices	(Inherited from Graph.)
	getWeightedTopologicalNumbering	Overloaded. (Inherited from Graph.)
	isAcyclic	(Inherited from Graph.)
	isPlanar	(Inherited from Graph.)
	isProperHierarchical	Must be called on a simple hierarchical graph. (Inherited from Graph.)
	isTree	(Inherited from Graph.)
	load	(Inherited from Graph.)
	loadMappings	(Inherited from Graph.)
	makeAcyclic	Must be called on a simple connected graph. (Inherited from Graph.)
	makeBiconnected	(Inherited from Graph.)
	makeBimodal	(Inherited from Graph.)
	makeProperHierarchical	Replaces long links with a sequence of virtual nodes and links that connect adjacent levels. Must be called on a simple hierarchical graph. (Inherited from Graph.)
	makeStPlanar	(Inherited from Graph.)
	maximalMatching	(Inherited from Graph.)
	maxIndependentSet	
	maxWeightedCliqueOfTransitiveDAG	Must be called on a transitive DAG. (Inherited from Graph.)
	minCostPathOrNegativeCycle	(Inherited from Graph.)
	optimalTopologicalNumbering	Overloaded. (Inherited from Graph.)
	partition	(Inherited from Graph.)
	partitionTree	(Inherited from Graph.)
	planarize	Overloaded. (Inherited from Graph.)

	planarMakeBiconnected	Must be called on a planar graph. (Inherited from Graph.)
	removeAllEdges	(Inherited from Graph.)
	removeEdge	(Inherited from Graph.)
	removeVertex	(Inherited from Graph.)
	reorderTopologically	(Inherited from Graph.)
S	reverse	(Inherited from Graph.)
	save	(Inherited from Graph.)
	saveMappings	(Inherited from Graph.)
	splitToMaxDegree	Overloaded. (Inherited from Graph.)
	topologicalSort	(Inherited from Graph.)
	toString	(Inherited from Graph.)
	triangulate	Overloaded. (Inherited from Graph.)

Name	Description
PolylineDrawing (Graph)	Construct orthogonal drawing of a connected graph.
PolylineDrawing (Graph, StEmbedding)	Construct orthogonal drawing of a connected graph.

See Also

PolylineDrawing Class
com.mindfusion.graphs Namespace

PolylineDrawing Constructor (Graph)

Construct orthogonal drawing of a connected graph.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public PolylineDrawing (
    Graph graph
)
```

Parameters

graph
A Graph instance.

See Also

PolylineDrawing Constructor Overload List
PolylineDrawing Class
com.mindfusion.graphs Namespace

PolylineDrawing Constructor (Graph, StEmbedding)

Construct orthogonal drawing of a connected graph.

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public PolylineDrawing (
    Graph stGraph,
    StEmbedding stEmbedding
)
```

Parameters

stGraph

stEmbedding

See Also

PolylineDrawing Constructor Overload List
PolylineDrawing Class
com.mindfusion.graphs Namespace

PolylineDrawing Methods

PolylineDrawing.getEdgePoints Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

Representation.right Method (Edge)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
protected Face right (
    Edge e
)
```

Parameters

e

Return Value

See Also

right Method Overload List
Representation Members
Representation Class
com.mindfusion.graphs Namespace

Representation.right Method (Vertex)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
protected Face right (
    Vertex v
)
```

Parameters

v

Return Value

See Also

right Method Overload List
Representation Members
Representation Class
com.mindfusion.graphs Namespace

Representation.rightmostOutgoing Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Edge rightmostOutgoing (
    Vertex v
)
```

Parameters

v

Return Value

See Also

Representation Members
Representation Class
com.mindfusion.graphs Namespace

Set<T> Class

Syntax

Java

```
public class Set<T> extends HashMap<K, V> implements Iterable<T>, Cloneable
```

Inheritance Hierarchy

Set(T) Constructor ()

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public Set ()`

See Also

Set(T) Constructor Overload List
Set<T> Class
com.mindfusion.graphs Namespace

Set(T) Constructor (Iterable<T>)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

`public Set (`
`  Iterable<T> elements`
`)`

Parameters

elements

See Also

Set(T) Constructor Overload List
Set<T> Class
com.mindfusion.graphs Namespace

Set(T) Methods

Set(T).add Method

Overload List

Name	Description
Set(T).add (Collection) Set(T).add (T)	

See Also

Set(T) Members
Set<T> Class
com.mindfusion.graphs Namespace

Set(T).add Method (Collection<T>)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void add (
    Collection<T> subset
)
```

Parameters

subset

See Also

add Method Overload List
Set(T) Members
Set<T> Class
com.mindfusion.graphs Namespace

Set(T).add Method (T)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void add (
    T element
)
```

Parameters

element

See Also

add Method Overload List
Set(T) Members
Set<T> Class
com.mindfusion.graphs Namespace

Set(T).clone Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Vertex Constructor (Vertex)

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Vertex (
    Vertex prototype
)
```

Parameters

prototype

See Also

Vertex Constructor Overload List
Vertex Class
com.mindfusion.graphs Namespace

Vertex Methods

Vertex.adjacentTo Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public boolean adjacentTo (
    Vertex vertex
)
```

Parameters

vertex

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.edgeTo Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Edge edgeTo (
    Vertex vertex
)
```

Parameters

vertex

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.getBalance Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

```
Java
public int getBalance ()
```

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.getCommonEdge Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

```
Java
public Edge getCommonEdge (
    Vertex vertex
)
```

Parameters

vertex

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.getData Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

```
Java
public Object getData ()
```

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.getDegree Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public int getDegree ()`

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.getEdges Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public ArrayList<Edge> getEdges ()`

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.getInEdges Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Edge> getInEdges ()
```

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.getNeighbors Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Vertex> getNeighbors ()
```

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.getOutEdges Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public ArrayList<Edge> getOutEdges ()
```

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.getTraits Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public Hashtable<Object, Object> getTraits ()`

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.getWeight Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public float getWeight ()`

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.highestUpEdge Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public Edge highestUpEdge ()`

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.incidentWith Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public boolean incidentWith (
    Edge edge
)
```

Parameters

edge

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.lowestDownEdge Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public Edge lowestDownEdge ()
```

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.removeEdge Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

```
Java
public void removeEdge (
    Edge edge
)
```

Parameters

edge

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.removeInEdge Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

```
Java
public void removeInEdge (
    Edge edge
)
```

Parameters

edge

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.setBalance Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

```
Java
public void setBalance (
    int value
)
```

Parameters

value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.setData Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void setData (
    Object value
)
```

Parameters

value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.setWeight Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java

```
public void setWeight (
    float value
)
```

Parameters

value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

Vertex.toString Method

Namespace: com.mindfusion.graphs
Package: com.mindfusion.graphs

Syntax

Java
`public String toString ()`

Return Value

See Also

Vertex Members
Vertex Class
com.mindfusion.graphs Namespace

VertexExchangeGraph Class

Syntax

Java
`public class VertexExchangeGraph extends Graph`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.graphs.Graph
    com.mindfusion.graphs.VertexExchangeGraph

See Also

VertexExchangeGraph Members
com.mindfusion.graphs Namespace

VertexExchangeGraph Members

The following tables list the members exposed by the VertexExchangeGraph type.

Public Constructors

	Name	Description
	VertexExchangeGraph	

Public Fields

	Name	Description

	edgeCopyToOrigMap	(Inherited from Graph.)
	edgeOrigToCopyMap	(Inherited from Graph.)
	searchOrder	(Inherited from Graph.)
	vertexCopyToOrigMap	(Inherited from Graph.)
	vertexOrigToCopyMap	(Inherited from Graph.)

Protected Fields

	Name	Description
	edges	(Inherited from Graph.)
	vertices	(Inherited from Graph.)

Public Methods

	Name	Description
	addEdge	Overloaded. (Inherited from Graph.)
	addVertex	Overloaded. (Inherited from Graph.)
	addVertexAndOutEdges	(Inherited from Graph.)
	allPairShortestPaths	Overloaded. (Inherited from Graph.)
	assignTreeLevels	(Inherited from Graph.)
	bestTreeRoot	(Inherited from Graph.)
	coarsen	(Inherited from Graph.)
	containsRepeatedEdges	(Inherited from Graph.)
	contractEdge	(Inherited from Graph.)
	convertToStGraph	Overloaded. (Inherited from Graph.)
	convertToStGraphVirtualEnds	The input should be biconnected undirected graph. The output is directed acyclic ST graph. (Inherited from Graph.)
	createReverseMaps	(Inherited from Graph.)
	depthFirstSearch	Overloaded. (Inherited from Graph.)
	eliminateIntermediateSourcesAndSinks	(Inherited from Graph.)
	embedOnSameFace	(Inherited from Graph.)
	father	(Inherited from Graph.)
	findPlanarEmbedding	
	findPlanarSubgraph	(Inherited from Graph.)
	findPlanarSubgraphByBookEmbedding	(Inherited from Graph.)

	findPlanarSubgraphBySimpleEdgeInsertion	(Inherited from Graph.)
	findShortestPath	Overloaded. (Inherited from Graph.)
	findShortestWeightedPath	Overloaded. (Inherited from Graph.)
	getBiconnectedComponents	Overloaded. (Inherited from Graph.)
	getCanonicalOrder	(Inherited from Graph.)
	getColumns	
	getConnectedComponents	(Inherited from Graph.)
	getConnectedComponentsQuickFind	(Inherited from Graph.)
	getConnectedComponentsQuickUnion	(Inherited from Graph.)
	getDualGraph	Overloaded. (Inherited from Graph.)
	getEdgeConnectedComponents	(Inherited from Graph.)
	getEdges	(Inherited from Graph.)
	getLayers	(Inherited from Graph.)
	getLevelPlanarEmbedding	Must be called on a proper hierarchical graph. (Inherited from Graph.)
	getPlanarEmbedding	(Inherited from Graph.)
	getRows	
	getStNumbering	Overloaded. (Inherited from Graph.)
	getTreeChildren	(Inherited from Graph.)
	getVertices	(Inherited from Graph.)
	getWeightedTopologicalNumbering	Overloaded. (Inherited from Graph.)
	isAcyclic	(Inherited from Graph.)
	isPlanar	(Inherited from Graph.)
	isProperHierarchical	Must be called on a simple hierarchical graph. (Inherited from Graph.)
	isTree	(Inherited from Graph.)
	load	(Inherited from Graph.)
	loadMappings	(Inherited from Graph.)
	makeAcyclic	Must be called on a simple connected graph. (Inherited from Graph.)
	makeBiconnected	(Inherited from Graph.)
	makeBimodal	(Inherited from Graph.)
	makeProperHierarchical	Replaces long links with a sequence of virtual nodes and links that connect adjacent levels. Must be called on a simple hierarchical graph. (Inherited from Graph.)

	makeStPlanar	(Inherited from Graph.)
	maximalMatching	(Inherited from Graph.)
	maxWeightedCliqueOfTransitiveDAG	Must be called on a transitive DAG. (Inherited from Graph.)
	minCostPathOrNegativeCycle	(Inherited from Graph.)
	optimalTopologicalNumbering	Overloaded. (Inherited from Graph.)
	partition	(Inherited from Graph.)
	partitionTree	(Inherited from Graph.)
	planarize	Overloaded. (Inherited from Graph.)
	planarMakeBiconnected	Must be called on a planar graph. (Inherited from Graph.)
	removeAllEdges	(Inherited from Graph.)
	removeEdge	(Inherited from Graph.)
	removeVertex	(Inherited from Graph.)
	reorderTopologically	(Inherited from Graph.)
S	reverse	(Inherited from Graph.)
	save	(Inherited from Graph.)
	saveMappings	(Inherited from Graph.)
	setLabels	
	splitToMaxDegree	Overloaded. (Inherited from Graph.)
	topologicalSort	(Inherited from Graph.)
	toString	(Inherited from Graph.)
	triangulate	Overloaded. (Inherited from Graph.)
	vertexAt

Globals.setDocument Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static void setDocument (
    PdfDocument document
)
```

Parameters

document

See Also

Globals Members
Globals Class
com.mindfusion.pdf Namespace

Globals.setDocumentRect Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static void setDocumentRect (
    Rectangle2D rect
)
```

Parameters

rect

See Also

Globals Members
Globals Class
com.mindfusion.pdf Namespace

Globals.setGraphics Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static void setGraphics (
    PdfGraphics2D graphics
)
```

Parameters

graphics

See Also

Globals Members

com.mindfusion.pdf Namespace

Globals.setId Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static void setId (
    long value
)
```

Parameters

value

See Also

Globals Members
Globals Class
com.mindfusion.pdf Namespace

Globals.setInitialRect Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static void setInitialRect (
    Rectangle2D rect
)
```

Parameters

rect

See Also

Globals Members
Globals Class
com.mindfusion.pdf Namespace

Globals.setLayoutRect Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static void setLayoutRect (
    Rectangle2D rect
)
```

Parameters

rect

See Also

Globals Members
Globals Class

Globals.setTextScale Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static void setTextScale (
    float unitScale
)
```

Parameters

unitScale

See Also

Globals Members
Globals Class
com.mindfusion.pdf Namespace

Globals.setUnitScale Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static void setUnitScale (
    float unitScale
)
```

Parameters

unitScale

See Also

INotify<T> Interface

Syntax

Java

```
public interface INotify<T>
```

Inheritors

com.mindfusion.pdf.PdfObject

See Also

INotify(T) Members
com.mindfusion.pdf Namespace

INotify(T) Members

The following tables list the members exposed by the INotify(T) type.

Public Methods

	Name	Description

	OnAdded	
	OnChanged	

See Also

INotify<T> Interface
com.mindfusion.pdf Namespace

INotify(T) Methods

INotify(T).OnAdded Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
void OnAdded (
    int index
)
```

Parameters

index

See Also

INotify(T) Members
INotify<T> Interface
com.mindfusion.pdf Namespace

INotify(T).OnChanged Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
void OnChanged (
    int index,
    T oldValue,
    T newValue
)
```

Parameters

index

oldValue

newValue

See Also

INotify(T) Members
INotify<T> Interface
com.mindfusion.pdf Namespace

IPdfSaver Interface

Syntax

Java
`public interface IPdfSaver`

Inheritors

com.mindfusion.pdf.PdfObject

PdfGraphics2D Constructor (Rectangle2D, GraphicsUnit)

Constructs new instance of the PdfGraphics2D object

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public PdfGraphics2D (
    Rectangle2D rect,
    GraphicsUnit gUnit
)
```

Parameters

rect
Drawing area measured in diagram unit

gUnit
Measure unit of the diagram

See Also

PdfGraphics2D.translate Method (double, double)

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public void translate (
    double tx,
    double ty
)
```

Parameters

tx

ty

PdfGraphicsState Members

The following tables list the members exposed by the PdfGraphicsState type.

Public Constructors

	Name	Description
	PdfGraphicsState	

Protected Fields

	Name	Description
	currentRotation	(Inherited from PdfObject.)
	currentTransform	(Inherited from PdfObject.)
	id	(Inherited from PdfObject.)
	offset	(Inherited from PdfObject.)
	page	(Inherited from PdfObject.)
	parent	(Inherited from PdfObject.)
	pdfType	(Inherited from PdfObject.)
	size	(Inherited from PdfObject.)

Public Methods

	Name	Description
	compare	(Inherited from PdfObject.)
	compareTo	(Inherited from PdfObject.)
	getCollectionId	(Inherited from PdfObject.)
	getCurrentRotation	(Inherited from PdfObject.)
	getCurrentTransform	(Inherited from PdfObject.)
	getDocument	private PdfDocument document = null; public PdfDocument getDocument() { return isRoot() ? document : page.getDocument(); } (Inherited from PdfObject.)
	getId	(Inherited from PdfObject.)
	getName	(Inherited from PdfObject.)
	getObjectFooter	(Inherited from PdfObject.)
	getObjectHeader	(Inherited from PdfObject.)
	getOffset	(Inherited from PdfObject.)
	getPage	(Inherited from PdfObject.)
	getParent	(Inherited from PdfObject.)
	getParentPath	
	getPdfType	(Inherited from PdfObject.)
	getSize	(Inherited from PdfObject.)
	isParentless	(Inherited from PdfObject.)
	isRoot	(Inherited from PdfObject.)
	OnAdded	(Inherited from PdfObject.)
	OnChanged	(Inherited from PdfObject.)
	registerObject	(Inherited from PdfObject.)
	Save	(Inherited from PdfObject.)
	setCollectionId	(Inherited from PdfObject.)
	setParent	(Inherited from PdfObject.)

Protected Methods

	Name	Description
	getContent	

See Also

Tools.Arc2Path Method (int, int, int, int, float, float)

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static GeneralPath Arc2Path (
    int x,
    int y,
    int width,
    int heigth,
    float startAngle,
    float sweepAngle
)
```

Parameters

x

y

width

heigth

startAngle

sweepAngle

Return Value

See Also

com.mindfusion.pdf Namespace

Tools.GetPaintType Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static PaintType GetPaintType (
    Paint p
)
```

Parameters

p

Return Value

See Also

Tools Members
Tools Class
com.mindfusion.pdf Namespace

Tools.Image2Bytes Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static byte[] Image2Bytes (
    Image img
)
```

Parameters

img

Return Value

See Also

Tools Members
Tools Class
com.mindfusion.pdf Namespace

Tools.isAlphaApplicable Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static boolean isAlphaApplicable (
    Image img
)
```

Parameters

img

Return Value

See Also

Tools Members
Tools Class
com.mindfusion.pdf Namespace

Tools.isClosed Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static boolean isClosed (
    GeneralPath p
)
```

Parameters

p

Return Value

See Also

Tools Members
Tools Class
com.mindfusion.pdf Namespace

Tools.isEven Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

Java

```
public static boolean isEven (
    int x
)
```

Parameters

x

Return Value

See Also

Tools Members
Tools Class
com.mindfusion.pdf Namespace

Tools.IsNumber Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

```
Java
public static boolean IsNumber (
    Object value
)
```

Parameters

value

Return Value

See Also

Tools Members
Tools Class
com.mindfusion.pdf Namespace

Tools.IsUnicodeString Method

Namespace: com.mindfusion.pdf
Package: com.mindfusion.pdf

Syntax

```
Java
public static boolean IsUnicodeString (
    String value
)
```

Parameters

value

Return Value

ByteCode Members

The following tables list the members exposed by the ByteCode type.

Public Constructors

	Name	Description
	ByteCode	Initializes a new instance of the **ByteCode** class from the specified parse tree root.

Public Methods

	Name	Description
	evaluate	Evaluates the byte code in the specified context.
	get	Gets the element at the specified position within the code.
	getIdentifiers	Gets the list with all identifiers within the code. There is no guarantee that this list will contain unique entries, thus, if an identifier is encountered several times in the initial sequence, it will appear several times in the returned list.
	getLength	Gets the number of elements in the code.

See Also

ByteCode Class
com.mindfusion.scripting Namespace

ByteCode Constructor

Initializes a new instance of the ByteCode class from the specified parse tree root.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public ByteCode (
    ParseTreeNode root
)
```

Parameters

root

See Also

ByteCode Class
com.mindfusion.scripting Namespace

ByteCode Methods

ByteCode.evaluate Method

Evaluates the byte code in the specified context.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public Object evaluate (
    EvaluationContext context
)
```

Parameters

context

Return Value

See Also

ByteCode Members
ByteCode Class
com.mindfusion.scripting Namespace

ByteCode.get Method

Gets the element at the specified position within the code.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

```
Java
public Object get (
    int index
)
```

Parameters

index

Return Value

See Also

ByteCode Members
ByteCode Class
com.mindfusion.scripting Namespace

ByteCode.getIdentifiers Method

Gets the list with all identifiers within the code. There is no guarantee that this list will contain unique entries, thus, if an identifier is encountered several times in the initial sequence, it will appear several times in the returned list.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

```
Java
public String[] getIdentifiers ()
```

Return Value

See Also

ByteCode Members
ByteCode Class
com.mindfusion.scripting Namespace

ByteCode.getLength Method

Gets the number of elements in the code.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

```
Java
```

```
public int getLength ()
```

Return Value

See Also

Compiler Class
com.mindfusion.scripting Namespace

Compiler.compile Method (String)

Returns a ByteCode object corresponding to the specified source code. The returned byte code can be subsequently evaluated by calling its ByteCode.evaluate method.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public static ByteCode compile (
    String source
)
```

Parameters

source
The script to compile.

Return Value

The compiled script.

See Also

compile Method Overload List
Compiler Members
Compiler Class
com.mindfusion.scripting Namespace

Compiler.compile Method (String, boolean)

Returns a ByteCode object corresponding to the specified source code. The returned byte code can be subsequently evaluated by calling its ByteCode.evaluate method.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public static ByteCode compile (
    String source,
    boolean normalize
)
```

Parameters

source
The script to compile.

normalize
true to encase source in square brackets if it is not encased already; otherwise, false.

Return Value

The compiled script.

EvaluateFunctionEventObject Class

Raised when a function cannot be resolved by the EvaluationContext to allow clients to evaluate it.

Syntax

Java
`public class EvaluateFunctionEventObject extends EventObject`

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.scripting.EvaluateFunctionEventObject

See Also

EvaluateFunctionEventObject Members
com.mindfusion.scripting Namespace

EvaluateFunctionEventObject Members

Raised when a function cannot be resolved by the EvaluationContext to allow clients to evaluate it.

The following tables list the members exposed by the EvaluateFunctionEventObject type.

Public Constructors

	Name	Description
	EvaluateFunctionEventObject	Initializes a new instance of the **EvaluateFunctionEventObject** class.

Public Methods

	Name	Description
	getArguments	Gets the list of the function's arguments.
	getIsEvaluated	Gets a value indicating whether the function has been evaluated.
	getName	Gets the name of the function to evaluate.
	getParam	Gets the user-defined object set to the SimpleEvaluationContext.getDispatchFunctionParam.
	getResult	Gets the result of the function evaluation. An attempt to get this value before it was set results in an exception.
	setResult	Gets the result of the function evaluation.

See Also

EvaluateFunctionEventObject Class
com.mindfusion.scripting Namespace

EvaluateFunctionEventObject Constructor

Initializes a new instance of the EvaluateFunctionEventObject class.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

```
Java
public EvaluateFunctionEventObject (
    Object source,
    String name,
    Object[] arguments,
    Object param
)
```

Parameters

source
The object on which the Event initially occurred.

name
The name of the function.

arguments
The list of arguments to pass to the function.

param
A reference to a user-defined object, related to the event.

See Also

EvaluateFunctionEventObject Class
com.mindfusion.scripting Namespace

EvaluateFunctionEventObject Methods

EvaluateFunctionEventObject.getArguments Method

Gets the list of the function's arguments.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

```
Java
public Object[] getArguments ()
```

Return Value

See Also

EvaluateFunctionEventObject Members
EvaluateFunctionEventObject Class
com.mindfusion.scripting Namespace

EvaluateFunctionEventObject.getIsEvaluated Method

Gets a value indicating whether the function has been evaluated.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java
`public boolean getIsEvaluated ()`

Return Value

See Also

EvaluateFunctionEventObject Members
EvaluateFunctionEventObject Class
com.mindfusion.scripting Namespace

EvaluateFunctionEventObject.getName Method

Gets the name of the function to evaluate.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java
`public String getName ()`

Return Value

See Also

EvaluateFunctionEventObject Members
EvaluateFunctionEventObject Class
com.mindfusion.scripting Namespace

EvaluateFunctionEventObject.getParam Method

Gets the user-defined object set to the SimpleEvaluationContext.getDispatchFunctionParam.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java
`public Object getParam ()`

Return Value

See Also

EvaluateFunctionEventObject Members
EvaluateFunctionEventObject Class
com.mindfusion.scripting Namespace

EvaluateFunctionEventObject.getResult Method

Gets the result of the function evaluation. An attempt to get this value before it was set results in an exception.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public Object getResult ()
```

Return Value

See Also

EvaluateFunctionEventObject Members
EvaluateFunctionEventObject Class
com.mindfusion.scripting Namespace

EvaluateFunctionEventObject.setResult Method

Gets the result of the function evaluation.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public void setResult (
    Object value
)
```

Parameters

value

See Also

com.mindfusion.scripting Namespace

EvaluationContext Members

The following tables list the members exposed by the EvaluationContext type.

Public Methods

	Name	Description
	assignIdentifier	Assigns a value to the identifier with the specified name. If the identifier is not defined it is automatically defined.
	assignValue	Assigns the specified value to the property represented by the specified descriptor.
	createMemberInfo	Overloaded.
	evaluateIdentifier	Evaluates the identifier with the specified name.
	format	Formats the specified value according to the specified format.
	invokeFunction	Invokes the function with the specified name.
	isTargetProperty	Returns whether the underlying object exposes a public property with the specified name.

See Also

EvaluationContext Interface

EvaluationContext Methods

EvaluationContext.assignIdentifier Method

Assigns a value to the identifier with the specified name. If the identifier is not defined it is automatically defined.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

```
Java
void assignIdentifier (
    String name,
    Object value
)
```

Parameters

name
The identifier to assign.

value
The new value.

See Also

EvaluationContext Members
EvaluationContext Interface
com.mindfusion.scripting Namespace

EvaluationContext.assignValue Method

Assigns the specified value to the property represented by the specified descriptor.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

```
Java
Object assignValue (
    MemberInfo info,
    Object value
)
```

Parameters

info

value

Return Value

See Also

EvaluationContext Members
EvaluationContext Interface
com.mindfusion.scripting Namespace

EvaluationContext.createMemberInfo Method

Overload List

Name	Description
EvaluationContext.createMemberInfo (MemberInfo, String)	Creates a MemberInfo object representing a property with the specified name on the object represented by the specified **MemberInfo**.
EvaluationContext.createMemberInfo (String, String)	Creates a **MemberInfo** object representing a property with the specified name on the specified object.

See Also

EvaluationContext Members
EvaluationContext Interface
com.mindfusion.scripting Namespace

EvaluationContext.createMemberInfo Method (MemberInfo, String)

Creates a MemberInfo object representing a property with the specified name on the object represented by the specified **MemberInfo**.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
MemberInfo createMemberInfo (
    MemberInfo info,
    String propertyName
)
```

Parameters

info

propertyName

Return Value

See Also

createMemberInfo Method Overload List
EvaluationContext Members
EvaluationContext Interface
com.mindfusion.scripting Namespace

EvaluationContext.createMemberInfo Method (String, String)

Creates a MemberInfo object representing a property with the specified name on the specified object.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
MemberInfo createMemberInfo (
    String objectName,
    String propertyName
)
```

Parameters

objectName

propertyName

Return Value

See Also

createMemberInfo Method Overload List
EvaluationContext Members
EvaluationContext Interface
com.mindfusion.scripting Namespace

EvaluationContext.evaluateIdentifier Method

Evaluates the identifier with the specified name.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
Object evaluateIdentifier (
    String name
)
```

Parameters

name
The identifier to evaluate.

Return Value

The result of the evaluation.

See Also

EvaluationContext Members
EvaluationContext Interface
com.mindfusion.scripting Namespace

EvaluationContext.format Method

Formats the specified value according to the specified format.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
String format (
    Object value,
    NumberFormat format
)
```

Parameters

value
The value to format.

format
The **NumberFormat** to use when performing the formatting.

Return Value

The string representing the value formatted according to the specified format.

See Also

EvaluationContext Members
EvaluationContext Interface
com.mindfusion.scripting Namespace

EvaluationContext.invokeFunction Method

Invokes the function with the specified name.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
Object invokeFunction (
    String name,
    Object[] p
)
```

Parameters

name
The name of the function to invoke.

p
The list of arguments of the function.

Return Value

The result of the invocation.

See Also

EvaluationContext Members
EvaluationContext Interface
com.mindfusion.scripting Namespace

EvaluationContext.isTargetProperty Method

Returns whether the underlying object exposes a public property with the specified name.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
boolean isTargetProperty (
    String propertyName
)
```

Parameters

propertyName

Return Value

See Also

EvaluationContext Members
EvaluationContext Interface
com.mindfusion.scripting Namespace

MemberInfo Class

Encapsulates the information required to identify a specific member of a particular object.

Syntax

Java

```
public class MemberInfo
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.scripting.MemberInfo

See Also

MemberInfo Members
com.mindfusion.scripting Namespace

MemberInfo Members

Encapsulates the information required to identify a specific member of a particular object.

The following tables list the members exposed by the MemberInfo type.

Public Constructors

	Name	Description
	MemberInfo	Overloaded.

Public Methods

	Name	Description
	getValue	Gets the value of the represented property.
	setValue	Sets the value of the represented property.

See Also

MemberInfo Class
com.mindfusion.scripting Namespace

MemberInfo Constructor

Overload List

Name	Description
MemberInfo (MemberInfo, String)	Initializes a new instance of the MemberInfo class with the object identified by the property defined by the specified MemberInfo and the property with the specified name.
MemberInfo (Object, String)	Initializes a new instance of the **MemberInfo** class for the specified object and the property with the specified name.

See Also

MemberInfo Class
com.mindfusion.scripting Namespace

MemberInfo Constructor (MemberInfo, String)

Initializes a new instance of the MemberInfo class with the object identified by the property defined by the specified MemberInfo and the property with the specified name.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public MemberInfo (
    MemberInfo info,
    String propertyName
)
```

Parameters

info

propertyName

See Also

MemberInfo Constructor Overload List
MemberInfo Class
com.mindfusion.scripting Namespace

MemberInfo Constructor (Object, String)

Initializes a new instance of the MemberInfo class for the specified object and the property with the specified name.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public MemberInfo (
    Object o,
    String propertyName
)
```

Parameters

o

propertyName

See Also

MemberInfo Constructor Overload List
MemberInfo Class
com.mindfusion.scripting Namespace

MemberInfo Methods

MemberInfo.getValue Method

Gets the value of the represented property.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public Object getValue ()
```

Return Value

See Also

MemberInfo Members
MemberInfo Class
com.mindfusion.scripting Namespace

MemberInfo.setValue Method

Sets the value of the represented property.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public void setValue (
    Object value
)
```

Parameters

value

See Also

MemberInfo Members
MemberInfo Class
com.mindfusion.scripting Namespace

SimpleEvaluationContext Class

Provides a basic implementation of the EvaluationContext interface.

Syntax

Java

```
public class SimpleEvaluationContext implements EvaluationContext
```

Inheritance Hierarchy

java.lang.Object
com.mindfusion.scripting.SimpleEvaluationContext

See Also

SimpleEvaluationContext Members
com.mindfusion.scripting Namespace

SimpleEvaluationContext Members

Provides a basic implementation of the EvaluationContext interface.

The following tables list the members exposed by the SimpleEvaluationContext type.

Public Constructors

	Name	Description
	SimpleEvaluationContext	Initializes a new instance of the **SimpleEvaluationContext** class for the specified object.

Public Methods

	Name	Description
	addListener	Registers listener so that it will receive events from the context.
	assignIdentifier	EvaluationContext.assignIdentifier implementation.
	assignValue	Assigns the specified value to the property represented by the specified descriptor.
	createMemberInfo	Overloaded.
	evaluateIdentifier	EvaluationContext.evaluateIdentifier implementation.
	format	EvaluationContext.format implementation.
	getDispatchFunctionParam	Gets a user-defined object passed to the DispatchFunctionCall event.
	getLocalVars	
	invokeFunction	EvaluationContext.invokeFunction implementation.
	isTargetProperty	Returns whether the underlying object exposes a public property with the specified name.
	removeListener	Unregisters listener so that it will no longer receive events from the context.
	setDispatchFunctionParam	Sets a user-defined object passed to the DispatchFunctionCall event.

See Also

SimpleEvaluationContext Class
com.mindfusion.scripting Namespace

SimpleEvaluationContext Constructor

Initializes a new instance of the SimpleEvaluationContext class for the specified object.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public SimpleEvaluationContext (
    Object target
)
```

Parameters

target

See Also

SimpleEvaluationContext Class
com.mindfusion.scripting Namespace

SimpleEvaluationContext Methods

SimpleEvaluationContext.addListener Method

Registers listener so that it will receive events from the context.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public void addListener (
    SimpleEvaluationContextListener listener
)
```

Parameters

listener

See Also

SimpleEvaluationContext Members
SimpleEvaluationContext Class
com.mindfusion.scripting Namespace

SimpleEvaluationContext.assignIdentifier Method

EvaluationContext.assignIdentifier implementation.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public void assignIdentifier (
    String name,
    Object value
)
```

Parameters

name

value

See Also

SimpleEvaluationContext Members
SimpleEvaluationContext Class
com.mindfusion.scripting Namespace

SimpleEvaluationContext.assignValue Method

Assigns the specified value to the property represented by the specified descriptor.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public Object assignValue (
    MemberInfo info,
    Object value
)
```

Parameters

info

value

Return Value

See Also

SimpleEvaluationContext Members
SimpleEvaluationContext Class

SimpleEvaluationContext.evaluateIdentifier Method

EvaluationContext.evaluateIdentifier implementation.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public Object evaluateIdentifier (
    String name
)
```

Parameters

name

Return Value

See Also

SimpleEvaluationContext Members
SimpleEvaluationContext Class
com.mindfusion.scripting Namespace

SimpleEvaluationContext.format Method

EvaluationContext.format implementation.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public String format (
    Object value,
    NumberFormat format
)
```

Parameters

value

format

Return Value

See Also

SimpleEvaluationContext Members
SimpleEvaluationContext Class
com.mindfusion.scripting Namespace

SimpleEvaluationContext.getDispatchFunctionParam Method

Gets a user-defined object passed to the DispatchFunctionCall event.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public Object getDispatchFunctionParam ()
```

Return Value

See Also

SimpleEvaluationContext Members
SimpleEvaluationContext Class
com.mindfusion.scripting Namespace

SimpleEvaluationContext.getLocalVars Method

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

```
public HashMap<String, Object> getLocalVars ()
```

Return Value

See Also

SimpleEvaluationContext Members
SimpleEvaluationContext Class
com.mindfusion.scripting Namespace

SimpleEvaluationContext.invokeFunction Method

EvaluationContext.invokeFunction implementation.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public Object invokeFunction (
    String name,
    Object[] p
)
```

Parameters

name

p

Return Value

See Also

SimpleEvaluationContext Members
SimpleEvaluationContext Class
com.mindfusion.scripting Namespace

SimpleEvaluationContext.isTargetProperty Method

Returns whether the underlying object exposes a public property with the specified name.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public boolean isTargetProperty (
    String propertyName
)
```

Parameters

propertyName

Return Value

See Also

SimpleEvaluationContext Members
SimpleEvaluationContext Class
com.mindfusion.scripting Namespace

SimpleEvaluationContext.removeListener Method

Unregisters listener so that it will no longer receive events from the context.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public void removeListener (
    SimpleEvaluationContextListener listener
)
```

Parameters

listener

See Also

SimpleEvaluationContext Members
SimpleEvaluationContext Class
com.mindfusion.scripting Namespace

SimpleEvaluationContext.setDispatchFunctionParam Method

Sets a user-defined object passed to the DispatchFunctionCall event.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
public void setDispatchFunctionParam (
    Object value
)
```

Parameters

value

SimpleEvaluationContext Members
SimpleEvaluationContext Class
com.mindfusion.scripting Namespace

SimpleEvaluationContextListener Interface

Defines events raised by the SimpleEvaluationContext class.

Syntax

Java

```
public interface SimpleEvaluationContextListener extends EventListener
```

See Also

SimpleEvaluationContextListener Members
com.mindfusion.scripting Namespace

SimpleEvaluationContextListener Members

Defines events raised by the SimpleEvaluationContext class.

The following tables list the members exposed by the SimpleEvaluationContextListener type.

Public Methods

	Name	Description
	dispatchFunctionCall	Raised when a function name cannot be recognized one of the built-in functions, to allow clients to evaluate the function call.

See Also

SimpleEvaluationContextListener Interface
com.mindfusion.scripting Namespace

SimpleEvaluationContextListener Methods

SimpleEvaluationContextListener.dispatchFunctionCall Method

Raised when a function name cannot be recognized one of the built-in functions, to allow clients to evaluate the function call.

Namespace: com.mindfusion.scripting
Package: com.mindfusion.scripting

Syntax

Java

```
void dispatchFunctionCall (
    EvaluateFunctionEventObject e
)
```

Parameters

e

Globals.getSW Method

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

```
Java
public static double getSW ()
```

Return Value

See Also

Globals Members
Globals Class
com.mindfusion.svg Namespace

Globals.getSWS Method

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java
`public static String getSWS ()`

Return Value

See Also

Globals Members
Globals Class
com.mindfusion.svg Namespace

Globals.getTransform Method

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java
`public static AffineTransform getTransform ()`

Return Value

See Also

Globals Members
Globals Class
com.mindfusion.svg Namespace

Globals.isCustomStroke Method

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java
`public static boolean isCustomStroke ()`

Return Value

See Also

Globals Members
Globals Class
com.mindfusion.svg Namespace

Globals.isReady Method

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

```
Java
public static boolean isReady ()
```

Return Value

See Also

Globals Members
Globals Class
com.mindfusion.svg Namespace

Globals.isTransformed Method

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

```
Java
public static boolean isTransformed ()
```

Return Value

See Also

Globals Members
Globals Class
com.mindfusion.svg Namespace

Globals.newImage Method

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

```
Java
public static String newImage (
    Image img
```

```
)
```

Parameters

img

Return Value

See Also

Globals Members
Globals Class
com.mindfusion.svg Namespace

Globals.nextId Method

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

```
Java
public static long nextId ()
```

Return Value

See Also

Globals Members
Globals Class
com.mindfusion.svg Namespace

Globals.resetId Method

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

```
Java
public static void resetId ()
```

See Also

Globals Members

SvgContent Class

Represents the content of an SVG drawing.

Syntax

Java
`public class SvgContent`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.svg.SvgContent

See Also

SvgContent Members
com.mindfusion.svg Namespace

SvgContent Members

Represents the content of an SVG drawing.

The following tables list the members exposed by the SvgContent type.

Public Constructors

	Name	Description
	SvgContent	Initializes a new instance of the SvgContent class.

Public Methods

	Name	Description
	draw	Draws the SVG content on specified Graphics2D.
S	fromFile	Loads SVG from the specified file.
S	fromStream	Loads SVG from the specified stream.
	getBounds	Gets the bounding rectangle that fits SVG elements.

	getConcaveHull	Gets the concave hull of SVG elements' coordinates.
	getConvexHull	Gets the convex hull of SVG elements' coordinates.
	getFileUrl	Gets the URI of SVG file this object was loaded from.
	getSvgElement	Returns the root XML Element. Intended to be used only for reading.
	loadImage	Overloaded.
	parse	Overloaded.

See Also

SvgContent Class
com.mindfusion.svg Namespace

SvgContent Constructor

Initializes a new instance of the SvgContent class.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public SvgContent ()
```

See Also

SvgContent Class
com.mindfusion.svg Namespace

SvgContent Methods

SvgContent.draw Method

Draws the SVG content on specified Graphics2D.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public void draw (
    Graphics2D graphics,
    Rectangle2D bounds
)
```

Parameters

graphics

A Graphics2D instance.

bounds
The target rectangle.

See Also

SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.fromFile Method

Loads SVG from the specified file.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public static SvgContent fromFile (
    String fileName
)
```

Parameters

fileName
A string containing file path.

Return Value

An SvgContent instance representing the SVG drawing, or **null** if I/O or parsing errors occurred.

See Also

SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.fromStream Method

Loads SVG from the specified stream.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public static SvgContent fromStream (
    InputStream stream
)
```

Parameters

stream
A **java.io.InputStream** instance.

Return Value

An SvgContent instance representing the SVG drawing, or **null** if I/O or parsing errors occurred.

See Also

SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.getBounds Method

Gets the bounding rectangle that fits SVG elements.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public Rectangle2D getBounds ()
```

Return Value

A Rectangle2D instance.

See Also

SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.getConcaveHull Method

Gets the concave hull of SVG elements' coordinates.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public Point2D[] getConcaveHull ()
```

Return Value

An array of Point2D objects representing the concave hull.

See Also

SvgContent Members
SvgContent Class

SvgContent.getConvexHull Method

Gets the convex hull of SVG elements' coordinates.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

```
Java
public Point2D[] getConvexHull ()
```

Return Value

An array of Point2D objects representing the convex hull.

See Also

SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.getFileUrl Method

Gets the URI of SVG file this object was loaded from.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

```
Java
public String getFileUrl ()
```

Return Value

A string containing the file URI.

See Also

SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.getSvgElement Method

Returns the root XML Element. Intended to be used only for reading.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java
`public Element getSvgElement ()`

Return Value

An XML Element.

See Also

SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.loadImage Method

Overload List

Name	Description
SvgContent.loadImage (Document, Rectangle2D)	Returns a java.awt.Image representation of the SVG drawing.
SvgContent.loadImage (String, Rectangle2D)	Returns a java.awt.Image representation of the SVG drawing.

See Also

SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.loadImage Method (Document, Rectangle2D)

Returns a java.awt.Image representation of the SVG drawing.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public Image loadImage (
    Document document,
    Rectangle2D bounds
)
```

Parameters

document
An XML Document containing SVG markup.

bounds
A Rectangle2D specifying the image size.

Return Value

A java.awt.Image instance.

See Also

loadImage Method Overload List
SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.loadImage Method (String, Rectangle2D)

Returns a java.awt.Image representation of the SVG drawing.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public Image loadImage (
    String fileName,
    Rectangle2D bounds
)
```

Parameters

fileName
A string containing the path of an SVG file.

bounds
A Rectangle2D specifying the image size.

Return Value

A java.awt.Image instance.

See Also

loadImage Method Overload List
SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.parse Method

Overload List

Name	Description
SvgContent.parse (Document)	Parses the content of specified XML document.
SvgContent.parse (Document, boolean)	Parses the content of specified XML document.
SvgContent.parse (NodeList)	Parses the content of specified XML elements.

SvgContent.parse (String)	Parses the content of specified SVG file.
SvgContent.parse (String, boolean)	Parses the content of specified SVG file.

See Also

SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.parse Method (Document)

Parses the content of specified XML document.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public void parse (
    Document document
)
```

Parameters

document
An org.w3c.dom.Document instance.

See Also

parse Method Overload List
SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.parse Method (Document, boolean)

Parses the content of specified XML document.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public void parse (
    Document document,
    boolean splitGroups
)
```

Parameters

document
An org.w3c.dom.Document instance.

splitGroups
true to treat top-level group elements as pages, or false otherwise.

See Also

parse Method Overload List
SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.parse Method (NodeList)

Parses the content of specified XML elements.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public void parse (
    NodeList xmlElements
)
```

Parameters

xmlElements
An org.w3c.dom.NodeList instance.

See Also

parse Method Overload List
SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.parse Method (String)

Parses the content of specified SVG file.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public void parse (
    String fileName
)
```

Parameters

fileName
A string containing the path of an SVG file.

See Also

parse Method Overload List
SvgContent Members
SvgContent Class
com.mindfusion.svg Namespace

SvgContent.parse Method (String, boolean)

Parses the content of specified SVG file.

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public void parse (
    String fileName,
    boolean splitGroups
)
```

Parameters

fileName
A string containing the path of an SVG file.

splitGroups
true to treat top-level group elements as pages, or false otherwise.

SvgGraphics2D Constructor

Constructs new instance of the SvgGraphics2D object

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

Java

```
public SvgGraphics2D (
    Rectangle2D rect,
    String FileName,
    GraphicsUnit gUnit
)
```

Parameters

rect
Drawing area measured in diagram unit

FileName
Fully qualified path of the *Portable Document Format* file to be generated

gUnit
Measure unit of the diagram

SvgGraphics2D.setGZipOutput Method

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

```
Java
public void setGZipOutput (
    boolean GZipOutput
)
```

Parameters

GZipOutput
must be 'true' if gzipped output **(.svgz)** is allowed. Default: true

See Also

SvgGraphics2D.setInlineImages Method

Namespace: com.mindfusion.svg
Package: com.mindfusion.svg

Syntax

```
Java
public void setInlineImages (
    boolean inlineImages
)
```

Parameters

inlineImages
'true' if the images reused in the svg produced as embedded **base64** strings. 'false' if the images are produced as external files. Default: false

Table of Predefined Shapes

Shape	Identifier	Common Uses
	Actor	A user An actor in use case model
	Alternative	An alternative in SDL An extraction in flowcharts Storage in quality management

	Arrow1	Use as desired
	Arrow2	Use as desired
	Arrow3	Transportation in quality management A reference point
	Arrow4	Use as desired
	Arrow5	Use as desired
	Arrow6	Use as desired
	Arrow7	A signal Electronic transmission of data
	Arrow8	Use as desired
	Arrow9	Use as desired
	BeginLoop	Begin of a loop
	BpmnComplex	BPMN Gateways: Complex Decision/Merge
	BpmnDataBasedXor	BPMN Gateways: Data-Based Exclusive Decision/Merge (XOR)
	BpmnEndCancel	BPMN Events: Cancel (End)
	BpmnEndCompensation	BPMN Events: Compensation (End)
	BpmnEndError	BPMN Events: Error (End)
	BpmnEndLink	BPMN Events: Link (End)

	BpmnEndMessage	BPMN Events: Message (End)
	BpmnEndMultiple	BPMN Events: Multiple (End)
	BpmnEndTerminate	BPMN Events: Terminate (End)
	BpmnEventBasedXor	BPMN Gateways: Event-Based Exclusive Decision/Merge (XOR)
	BpmnInclusive	BPMN Gateways: Inclusive Decision/Merge (OR)
	BpmnIntermediateCancel	BPMN Events: Cancel (Intermediate)
	BpmnIntermediateCompensation	BPMN Events: Compensation (Intermediate)
	BpmnIntermediateError	BPMN Events: Error (Intermediate)
	BpmnIntermediateLink	BPMN Events: Link (Intermediate)
	BpmnIntermediateMessage	BPMN Events: Message (Intermediate)
	BpmnIntermediateMultiple	BPMN Events: Multiple (Intermediate)
	BpmnIntermediateRule	BPMN Events: Rule (Intermediate)
	BpmnIntermediateTimer	BPMN Events: Timer (Intermediate)
	BpmnParallelFork	BPMN Gateways: Parallel Fork/Join (AND)
	BpmnStartLink	BPMN Events: Link (Start)

	BpmnStartMessage	BPMN Events: Message (Start)
	BpmnStartMultiple	BPMN Events: Multiple (Start)
	BpmnStartRule	BPMN Events: Rule (Start)
	BpmnStartTimer	BPMN Events: Timer (Start)
	Cloud	Object instance in data flow diagrams
	Collate	A collation in flowcharts
	ConeDown	Use as desired
	ConeUp	Use as desired
	ConnectedIssues	Connected issues in quality management
	CreateRequest	Request to create in SDL
	Cross	Use as desired
	Cube	Use as desired
	Cylinder	Use as desired
	Database	A database in flowcharts
	DataTransmition	Electronic transmission of data
	DDelay	Use as desired

	Decagon	Use as desired
	Decision	Decision in flowcharts A comparison in flowcharts Relationship in data flow diagrams
	Decision2	A decision in SDL
	Delay	A delay in process diagrams
	DInDelay	Use as desired
	DirectAccessStorage	A direct access storage
	DiskStorage	Data stored on disk in flowcharts
	Display	Data that is displayed for human use
	DividedEvent	An event
	DividedProcess	A process or document in flowcharts Entity in data flow diagrams
	Document	A document
	Donut	Use as desired
	DOutDelay	Use as desired
	Ellipse	A cross-reference within the same page of a flowchart Process in data flow diagrams State in data flow diagrams A continuation of the flowchart in SDL An use case Operation in quality management
	EndLoop	End of a loop
	ExternalOrganization	An external organization

	ExternalProcess	An external process
	File	A file
	FramedRectangle	Use as desired
	Gate	A gateway
	Heart	Use as desired
	Heptagon	Use as desired
	Hourglass	Use as desired
	Input	Data that is input by manual means
	InternalStorage	An internal storage
	Interrupt	An interrupt
	Interrupt2	An interrupt
	IsoProcess	Iso9000 process
	Junction	A summing junction A return in SDL
	Lightning	Use as desired
	LinedDocument	A document in flowcharts
	ManualOperation	Operation performed by a human

	Merge	A merger in flowcharts Inbound goods in quality management Non-electronic file Stop state in data flow diagrams
	MessageFromUser	A message from user side in SDL
	MessageToUser	A message to user side in SDL
	Microform	A microform
	MicroformProcessing	A microform processing
	MicroformRecording	A microform recording
	MultiDocument	A multiple document in flowcharts
	MultiProc	A multiple process or document in flowcharts
	Octagon	Use as desired
	OfflineStorage	An offline storage
	OffpageConnection	A cross-reference to another page of a flowchart
	OffpageReference	A cross-reference to another page of a flowchart A foreign module
	Or	An 'or' statement
	Pentagon	Use as desired
	Plaque	Use as desired
	PrimitiveFromCall	A primitive from call control in SDL

	PrimitiveToCall	A primitive to call control in SDL
	Procedure	Procedure in SDL
	Process	A process or document in flowcharts A file or data storage
	Prysm	Use as desired
	PunchedCard	A punched card
	PyramidDown	Use as desired
	PyramidUp	Use as desired
	Rectangle	A metric operation 'External interactor' in data flow diagrams Inspection in quality management
	RightTriangle	Use as desired
	RoundRect	A process or item in flowcharts An event An issue in quality management
	RSave	Input or output data in flowcharts
	Save	A save in SDL Input or output data in flowcharts
	Sort	A sort operation
	Sphere	Use as desired
	Star	Use as desired
	Star4Pointed	Use as desired
	Star5Pointed	Use as desired

	Star6Pointed	Use as desired
	Star7Pointed	Use as desired
	Star16Pointed	Use as desired
	Star24Pointed	Use as desired
	Star32Pointed	Use as desired
	Start	Start of a program flow A starting point in SDL
	Tape	Sequentially accessible data
	Terminator	Start or end of a program flow
	TransmittalTape	A transmittal tape
	Trapezoid	Use as desired

Licensing

There are no separate trial and licensed builds of JAR archives for MindFusion components. When you purchase a license, you can find the license key for this component listed on the Keys & Downloads page at MindFusion's customer portal. Pass this license key to the DiagramView.setLicenseKey method to disable the component's evaluation mode and stop displaying trial messages. **setLicenseKey** is a static method and you need to call it just once from application's initialization code.

Using AI Assistants

Modern software development is increasingly assisted by Large Language Model (LLM) agents. To help these tools understand MindFusion API and generate accurate code, we provide a unified LLM-friendly documentation index, following https://llmstxt.org/ proposal. The llms.txt for MindFusion Diagramming Toolkit for Java Swing is located here:

https://mindfusion.dev/docs/java-swing/diagramming/llms.txt

How to use with your AI Assistant

Point your agent to https://mindfusion.dev/docs/java-swing/diagramming/llms.txt, or download a local copy for it to read from the project's repository. If you are working with smaller context-window size, you might have to split the file into sections or copy portions from it into individual prompts.

For initial integration of the toolkit into your project, loading the MinApp, Controls, and/or Tutorial sample projects into the assistant's context should help too.

The llms.txt structure

We have divided llms.txt into two main sections, corresponding to the Overview and Reference parts of this documentation:

- High-Level Guides and Overviews (Inlined) - Contains the full content of all conceptual overviews, tutorials, and architectural guidelines in a single, continuous stream. This allows the AI to gain a coherent mental model of the library without needing to crawl separate files.
- API Class Reference (Linked) - Lists the consolidated class/type reference documents in the *Markdown* folder. This enables the agent to dynamically lazy-load individual class references on demand only when you ask about specific classes.

Context-Window performance

For a complete export of this library's documentation at the time of writing this, the primary index file is approximately 500 KB (equivalent to 120,000 to 130,000 tokens). Here is how this scales across popular AI architectures:

- Large-Context Models with 2M tokens: The entire index takes up less than 6% of the context window. The agent can ingest and retain the entire high-level documentation suite for long-duration conversations with virtually zero context decay.
- Standard-Context Models with 200k tokens: Ingesting the index could take up approximately 65% of the context window. For these models, we recommend using individual sections from the inlined Guides / Overview topics for architectural orientation, copy-pasting them on-demand to preserve space for your active code.

Technical Support

Detailed information about everything connected with software products offered by MindFusion - online documentation, demos, information about forthcoming products can be found at https://mindfusion.dev. The site is updated every day, so make sure you visit it regularly to catch up with the newest from us.

Apart from that, MindFusion employs a dedicated and technically proficient support team. This guarantees that all your questions and inquiries will be answered in quick and professional manner. They can be reached by e-mail at mailto:support@mindfusion.eu or by phone at +359 889 199 729.

You can post a question on the JDiagram discussion board here:

https://mindfusion.dev/Forum/YaBB.pl?board=jdiag_disc

or visit our help desk site:

https://mindfusion.dev/HelpDesk/index.php

We will be happy to hear any suggestions and recommendations you might have regarding JDiagram. We take in account the opinion of every single person who has shown interest in our products.

MindFusion Products

MindFusion offers various programming components for different platforms. Below is a list of our products with links to their sections on our website as well link to download a trial version. Clients that have already purchased a product use an increasing discount for each subsequent one.
