ExpandHeaderRowCmd Constructor

Initializes a new ExpandHeaderRowCmd instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ExpandHeaderRowCmd (
    TableNode table,
    int rowIndex
)
```

Parameters

table
The TableNode whose rows are expanded or collapsedthrough this command.

rowIndex
The index of the header row that defines the tablesection to be expanded or collapsed.

ExpandHeaderRowCmd Class
com.mindfusion.diagramming Namespace

ExpandHeaderRowCmd Methods

ExpandHeaderRowCmd.execute Method

This method is called internally by JDiagram when performing the action.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void execute (
    boolean undoEnabled
)
```

Parameters

undoEnabled
true if the undo manager is enabled at this time, otherwise **false**.

ExpandHeaderRowCmd Members
ExpandHeaderRowCmd Class
com.mindfusion.diagramming Namespace

ExpandHeaderRowCmd.getRowIndex Method

Gets the index of the header row that defines which rows are collapsed or defined.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getRowIndex ()
```

Return Value

An integer value specifying the header row index.

ExpandHeaderRowCmd Members
ExpandHeaderRowCmd Class
com.mindfusion.diagramming Namespace

ExpandHeaderRowCmd.getTable Method

Gets the table whose rows are expanded or collapsed by this command.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public TableNode getTable ()
```

Return Value

A TableNode object.

ExpandIconRenderer Class

Draws expand and collapse buttons of Expandable nodes.

Syntax

Java

```
public class ExpandIconRenderer
```

Remarks

You can assign an instance of this class to Renderers.ExpandIconRenderer to override the default appearance of collapse / expand icons.

Inheritance Hierarchy

java.lang.Object
com.mindfusion.diagramming.ExpandIconRenderer

See Also

ExpandIconRenderer Members

ExpandIconRenderer Constructor

Overload List

Name	Description
ExpandIconRenderer (Image, Image)	Initializes a new instance of the ExpandIconRenderer class that renders collapse / expand icons provided as bitmaps.
ExpandIconRenderer (RenderCallback)	Initializes a new instance of the **ExpandIconRenderer** class.
ExpandIconRenderer (SvgContent, SvgContent)	Initializes a new instance of the **ExpandIconRenderer** class that renders collapse / expand icons provided as SVG drawings.

See Also

ExpandIconRenderer Class
com.mindfusion.diagramming Namespace

ExpandIconRenderer Constructor (Image, Image)

Initializes a new instance of the ExpandIconRenderer class that renders collapse / expand icons provided as bitmaps.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ExpandIconRenderer (
    Image collapseIcon,
    Image expandIcon
)
```

Parameters

collapseIcon
A **java.awt.Image** representing the collapse icon.

expandIcon
A **java.awt.Image** representing the expand icon.

See Also

ExpandIconRenderer Constructor Overload List
ExpandIconRenderer Class
com.mindfusion.diagramming Namespace

ExpandIconRenderer Constructor (RenderCallback<DiagramNode>)

Initializes a new instance of the ExpandIconRenderer class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ExpandIconRenderer (
    RenderCallback<DiagramNode> renderCallback
)
```

Parameters

renderCallback
A callback function that draws the icon using Graphics2D API.

See Also

ExpandIconRenderer Constructor Overload List
ExpandIconRenderer Class
com.mindfusion.diagramming Namespace

ExpandIconRenderer Constructor (SvgContent, SvgContent)

Initializes a new instance of the ExpandIconRenderer class that renders collapse / expand icons provided as SVG drawings.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ExpandIconRenderer (
    SvgContent collapseIcon,
    SvgContent expandIcon
)
```

Parameters

collapseIcon
An SvgContent representing the collapse icon.

expandIcon
An **SvgContent** representing the expand icon.

See Also

ExpandIconRenderer Constructor Overload List
ExpandIconRenderer Class
com.mindfusion.diagramming Namespace

ExpandIconRenderer Methods

ExpandIconRenderer.getSize Method

Gets a float value specifying icon size in diagram's MeasureUnit.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Float getSize ()
```

Return Value

A **Float** value that lets you override the icon size. The default value is **null**.

Remarks

If this property is not set, icons are rendered using default unit-independent size.

See Also

ExpandIconRenderer Members

com.mindfusion.diagramming Namespace

ExpandIconRenderer.setSize Method

Sets a float value specifying icon size in diagram's MeasureUnit.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSize (
    Float value
)
```

Parameters

value
A **Float** value that lets you override the icon size. The default value is **null**.

Remarks

If this property is not set, icons are rendered using default unit-independent size.

ExpandItemCmd Members

Implements expanding/collapsing branched of items in a tree.

The following tables list the members exposed by the ExpandItemCmd type.

Public Constructors

	Name	Description
	ExpandItemCmd	Initializes a new **ExpandItemCmd** instance.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)

	execute	This method is called internally by JDiagram when performing the action.
	getItem	Gets the root of the tree branch related to this command.
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	This method is called by the UndoManager when redoing actions.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	This method is called by the **UndoManager** when undoing actions.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related. (Inherited from Command.)
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

ExpandTreeViewItemCmd Class
com.mindfusion.diagramming Namespace

ExpandTreeViewItemCmd Constructor

Initializes a new instance of the ExpandTreeViewItemCmd class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ExpandTreeViewItemCmd (
    TreeViewNode node,
    TreeViewItem item
)
```

Parameters

node
The parent TreeViewNode.

item
The TreeViewItem that has been collapsed or expanded.

See Also

ExpandTreeViewItemCmd Class
com.mindfusion.diagramming Namespace

ExpandTreeViewItemCmd Methods

ExpandTreeViewItemCmd.execute Method

Command.execute override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void execute (
    boolean undoEnabled
)
```

Parameters

undoEnabled
Specifies whether undo/redo is enabled. If undo is disabled, the command won't be saved in undo history and will never be called to undo or redo itself. In such case you might choose to skip some housekeeping operations such as saving state variables for later undo/redo.

Factory Members

Provides shortcut methods for creating and adding instances of the standard item types. Call the class methods through the Diagram.getFactory property of the Diagram class.

The following tables list the members exposed by the Factory type.

Public Constructors

	Name	Description
	Factory	Initializes a new instance of the **Factory** class over the specified **Diagram**.

Public Methods

	Name	Description
	createContainerNode	Overloaded.
	createDiagramLink	Overloaded.
	createGroup	Creates a new hierarchical Group with the specified main item.
	createShapeNode	Overloaded. Creates a new ShapeNode instance and adds it to the Nodes collection of the underlying diagram.
	createSvgNode	Overloaded.

	createTableNode	Overloaded. Creates a new TableNode instance and adds it to the Nodes collection of the underlying diagram.
	createTreeViewNode	Overloaded.

Factory Constructor

Initializes a new instance of the Factory class over the specified Diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Factory (
    Diagram diagram
)
```

Parameters

diagram
The Diagram object for which to create the new factory.

See Also

Factory Class
com.mindfusion.diagramming Namespace

Factory Methods

Factory.createContainerNode Method

Overload List

Name	Description
Factory.createContainerNode (double, double, double, double)	Creates a new ContainerNode instance at the specified position with the specified size.
Factory.createContainerNode (double, double, double, double, boolean)	Creates a new **ContainerNode** instance at the specified location with the specified size, optionally foldable.
Factory.createContainerNode (Point2D, Dimension2D)	Creates a new **ContainerNode** instance at the specified location with the specified size.
Factory.createContainerNode (Point2D, Dimension2D, boolean)	Creates a new **ContainerNode** instance at the specified location with the specified size, optionally foldable.

Factory.createContainerNode (Rectangle2D)	Creates a new **ContainerNode** instance with the specified dimensions.
Factory.createContainerNode (Rectangle2D, boolean)	Creates a new **ContainerNode** instance with the specified dimensions, optionally foldable, and adds it to the Nodes collection of the underlying diagram.

See Also

Factory Members
Factory Class
com.mindfusion.diagramming Namespace

Factory.createContainerNode Method (double, double, double, double)

Creates a new ContainerNode instance at the specified position with the specified size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ContainerNode createContainerNode (
    double x,
    double y,
    double width,
    double height
)
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

Return Value

The newly created ContainerNode instance.

Remarks

The method creates a container node at the position specified by x and y. The size of the node is set by *width* and *height*. For further customization of the node, use the methods of the ContainerNode class.

See Also

createContainerNode Method Overload List
Factory Members

Factory.createContainerNode Method (double, double, double, double, boolean)

Creates a new ContainerNode instance at the specified location with the specified size, optionally foldable.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ContainerNode createContainerNode (
    double x,
    double y,
    double width,
    double height,
    boolean foldable
)
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

foldable
true if the container can be folded; otherwise, **false**.

Return Value

The newly created ContainerNode instance.

Remarks

The method creates a container node at the position specified by x and y. The size of the container is set by *width* and *height*. The parameter *foldable* specifies whether the container node is initially foldable. For further customization of the node, use the methods of the ContainerNode class.

Factory.createContainerNode Method (Point2D, Dimension2D)

Creates a new ContainerNode instance at the specified location with the specified size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ContainerNode createContainerNode (
    Point2D location,
    Dimension2D size
)
```

Parameters

location
The position of the new node.

size
The size of the new node.

Return Value

The newly created ContainerNode instance.

Remarks

The method creates a container node at the position specified by *location*. The size of the node is set by *size*. For further customization of the node, use the methods of the ContainerNode class.

Factory.createContainerNode Method (Point2D, Dimension2D, boolean)

Creates a new ContainerNode instance at the specified location with the specified size, optionally foldable.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ContainerNode createContainerNode (
    Point2D location,
    Dimension2D size,
    boolean foldable
)
```

Parameters

location
The position of the new node.

size
The size of the new node.

foldable
true if the container can be folded; otherwise, **false**.

Return Value

The newly created ContainerNode instance.

Remarks

The method creates a container node at the position specified by *location*. The size of the container is set by *size*. The parameter *foldable* specifies whether the container node is initially foldable. For further customization of the node, use the methods of the ContainerNode class.

Factory.createContainerNode Method (Rectangle2D)

Creates a new ContainerNode instance with the specified dimensions.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ContainerNode createContainerNode (
    Rectangle2D bounds
)
```

Parameters

bounds
The bounding rectangle of the new node.

Return Value

The newly created ContainerNode instance.

Remarks

The method creates a container node with dimensions specified by *bounds*.

Factory.createContainerNode Method (Rectangle2D, boolean)

Creates a new ContainerNode instance with the specified dimensions, optionally foldable, and adds it to the Nodes collection of the underlying diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ContainerNode createContainerNode (
    Rectangle2D bounds,
    boolean foldable
)
```

Parameters

bounds
The bounding rectangle of the new node.

foldable
true if the container can be folded; otherwise, **false**.

Return Value

The newly created ContainerNode instance.

Remarks

The method creates a container node with the position and size specified by *bounds*. The parameter foldable specifies whether the container node is initially *foldable*.

Factory.createDiagramLink Method

Overload List

Name	Description
Factory.createDiagramLink (DiagramNode, DiagramNode)	Creates a new DiagramLink instance between the specified nodes and adds it to the Links collection of the underlying diagram. The method creates a link connecting the nodes specified by origin and destination.
Factory.createDiagramLink (DiagramNode, Point2D)	Creates a new **DiagramLink** instance between the specified node and the specified point, and adds it to the Links collection of the underlying diagram.

Factory.createDiagramLink (DiagramNode, TableNode, int)	Creates a new **DiagramLink** instance between the specified nodes and the specified table, and adds it to the Links collection of the underlying diagram.
Factory.createDiagramLink (Point2D, DiagramNode)	Creates a new **DiagramLink** instance between the specified point and the specified node, and adds it to the Links collection of the underlying diagram.
Factory.createDiagramLink (Point2D, Point2D)	Creates a new **DiagramLink** instance between the specified points and adds it to the Links collection of the underlying diagram.
Factory.createDiagramLink (ShapeNode, int, ShapeNode, int)	Creates a new **DiagramLink** instance between the specified nodes and adds it to the Links collection of the underlying diagram.
Factory.createDiagramLink (TableNode, int, DiagramNode)	Creates a new **DiagramLink** instance between the specified table and the specified node, and adds it to the Links collection of the underlying diagram.
Factory.createDiagramLink (TableNode, int, TableNode, int)	Creates a new **DiagramLink** instance between the specified tables and adds it to the Links collection of the underlying diagram.
Factory.createDiagramLink (TableNode, TableNode)	Creates a new **DiagramLink** instance between the specified tables and adds it to the Links collection of the underlying diagram.
Factory.createDiagramLink (TreeViewNode, TreeViewItem, TreeViewNode, TreeViewItem)	Creates a new **DiagramLink** instance between the specified tree items and adds it to the Diagram.getLinks collection of the underlying diagram.

Factory.createDiagramLink Method (DiagramNode, DiagramNode)

Creates a new DiagramLink instance between the specified nodes and adds it to the Links collection of the underlying diagram. The method creates a link connecting the nodes specified by origin and destination.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink createDiagramLink (
    DiagramNode origin,
    DiagramNode destination
)
```

Parameters

origin
The origin node.

destination

The destination node.

Return Value

The newly created DiagramLink instance.

Factory.createDiagramLink Method (DiagramNode, Point2D)

Creates a new DiagramLink instance between the specified node and the specified point, and adds it to the Links collection of the underlying diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink createDiagramLink (
    DiagramNode origin,
    Point2D destination
)
```

Parameters

origin
The origin node.

destination
The destination point.

Return Value

The newly created DiagramLink instance.

Remarks

The method creates a link connecting the node specified by *origin* and the point specified by *destination*. For further customization of the link, use the methods of the DiagramLink class.

Creates a new DiagramLink instance between the specified nodes and the specified table, and adds it to the Links collection of the underlying diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink createDiagramLink (
    DiagramNode origin,
    TableNode destination,
    int destRow
)
```

Parameters

origin
The origin node.

destination
The destination node.

destRow
The zero-based index of the destination table row of the new link.

Return Value

The newly created DiagramLink instance.

Remarks

The method creates a link connecting the node specified by *origin* and the table specified by *destination*. For further customization of the link, use the methods of the DiagramLink class.

Factory.createDiagramLink Method (ShapeNode, int, ShapeNode, int)

Creates a new DiagramLink instance between the specified nodes and adds it to the Links collection of the underlying diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink createDiagramLink (
    ShapeNode origin,
    int originAnchor,
    ShapeNode destination,
    int destAnchor
)
```

Parameters

origin
The origin node.

originAnchor
The index of an anchor point within the origin node's AnchorPattern.

destination
The destination node.

destAnchor
The index of an anchor point within the destination node's **AnchorPattern**.

Return Value

The newly created DiagramLink instance.

Remarks

The method creates a link connecting the shape nodes specified by origin and destination. For further customization of the link, use the methods of the DiagramLink class.

Creates a new DiagramLink instance between the specified tables and adds it to the Links collection of the underlying diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink createDiagramLink (
    TableNode origin,
    int originRow,
    TableNode destination,
    int destRow
)
```

Parameters

origin
The origin node.

originRow
The zero-based index of the origin table row of the new link.

destination
The destination node.

destRow
The zero-based index of the destination table row of the new link.

Return Value

The newly created DiagramLink instance.

Remarks

The method creates a link connecting the tables specified by *origin* and *destination*. For further customization of the link, use the methods of the DiagramLink class.

Factory.createDiagramLink Method (TableNode, TableNode)

Creates a new DiagramLink instance between the specified tables and adds it to the Links collection of the underlying diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink createDiagramLink (
    TableNode origin,
    TableNode destination
)
```

Parameters

origin
The origin node.

destination
The destination node.

Return Value

The newly created DiagramLink instance.

Remarks

The method creates a link connecting the tables specified by origin and destination. For further customization of the link, use the methods of the DiagramLink class.

Factory.createDiagramLink Method (TreeViewNode, TreeViewItem, TreeViewNode, TreeViewItem)

Creates a new DiagramLink instance between the specified tree items and adds it to the Diagram.getLinks collection of the underlying diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink createDiagramLink (
    TreeViewNode origin,
    TreeViewItem originItem,
    TreeViewNode destination,
    TreeViewItem destinationItem
)
```

Parameters

origin
The origin node.

originItem
The origin item.

destination
The destination node.

destinationItem
The destination item.

Return Value

The newly created DiagramLink instance.

See Also

createDiagramLink Method Overload List
Factory Members
Factory Class
com.mindfusion.diagramming Namespace

Factory.createGroup Method

Creates a new hierarchical Group with the specified main item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Group createGroup (
    DiagramItem mainItem
)
```

Parameters

mainItem
The DiagramItem around which the group would be built.

Return Value

The newly created Group instance.

Remarks

Use this method to create an hierarchical group of items. Attach subordinated items through the various Group members.

Factory.createShapeNode Method

Creates a new ShapeNode instance and adds it to the Nodes collection of the underlying diagram.

Overload List

Name	Description
Factory.createShapeNode (double, double, double, double)	Creates a new **ShapeNode** instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram.
Factory.createShapeNode (double, double, double, double, Shape)	Creates a new **ShapeNode** instance with the specified dimensions and shape.
Factory.createShapeNode (Point2D, Dimension2D)	Creates a new **ShapeNode** instance at the specified position with the specified size.
Factory.createShapeNode (Point2D, Dimension2D, Shape)	Creates a new **ShapeNode** instance at the specified position with the specified size and shape.
Factory.createShapeNode (Rectangle2D)	Creates a new **ShapeNode** instance with the specified dimensions.
Factory.createShapeNode (Rectangle2D, Shape)	Creates a new **ShapeNode** instance with the specified dimensions and shape.

Factory.createShapeNode Method (double, double, double, double)

Creates a new ShapeNode instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ShapeNode createShapeNode (
    double x,
    double y,
    double width,
    double height
)
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

Return Value

The newly created ShapeNode instance.

Remarks

The method creates a shape node at the position specified by x and y. The size of the node is set by *width* and *height*. For further customization of the node, use the methods of the ShapeNode class.

Factory.createShapeNode Method (double, double, double, double, Shape)

Creates a new ShapeNode instance with the specified dimensions and shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ShapeNode createShapeNode (
    double x,
```

```
    double y,
    double width,
    double height,
    Shape shape
)
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

shape
The shape of the new node.

Return Value

The newly created ShapeNode instance.

Remarks

The method creates a shape node at the position specified by x and y. The size of the node is set by *width* and *height*. The shape of the new node is specified by *shape*. For further customization of the node, use the methods of the ShapeNode class.

Syntax

Java

```
public ShapeNode createShapeNode (
    Point2D location,
    Dimension2D size
)
```

Parameters

location
The position of the new node.

size
The size of the new node.

Return Value

The newly created ShapeNode instance.

Remarks

The method creates a shape node at the position specified by *location*. The size of the node is set by *size*. For further customization of the node, use the methods of the ShapeNode class.

Factory.createSvgNode Method

Overload List

Name	Description
Factory.createSvgNode (double, double, double, double)	Creates a new SvgNode instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram. The method creates a svg node at the position specified by x and y. The size of the node is set by width and height.
Factory.createSvgNode (double, double, double, double, String)	Creates a new **SvgNode** instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram. The method creates a svg node at the position specified by x and y. The size of the node is set by width and height.
Factory.createSvgNode (double, double, double, double, SvgContent)	Creates a new **SvgNode** instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram. The method creates a svg node at the position specified by x and y. The size of the node is set by width and height.
Factory.createSvgNode (Point2D, Dimension2D)	Creates a new **SvgNode** instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram. The method creates a svg node at the position specified by location. The size of the node is set by size.
Factory.createSvgNode (Point2D, Dimension2D, String)	Creates a new **SvgNode** instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram. The method creates a svg node at the position specified by location. The size of the node is set by size.
Factory.createSvgNode (Point2D, Dimension2D, SvgContent)	Creates a new **SvgNode** instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram. The method creates a svg node at

	the position specified by location. The size of the node is set by size.
Factory.createSvgNode (Rectangle2D)	Creates a new **SvgNode** instance with the specified dimensions and adds it to the Nodes collection of the underlying diagram. The method creates a svg node with dimensions specified by bounds.
Factory.createSvgNode (Rectangle2D, String)	Creates a new **SvgNode** instance with the specified dimensions and adds it to the Nodes collection of the underlying diagram. The method creates a svg node with dimensions specified by bounds.
Factory.createSvgNode (Rectangle2D, SvgContent)	Creates a new **SvgNode** instance with the specified dimensions and adds it to the Nodes collection of the underlying diagram. The method creates a svg node with dimensions specified by bounds.

Creates a new SvgNode instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram. The method creates a svg node at the position specified by x and y. The size of the node is set by width and height.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SvgNode createSvgNode (
    double x,
    double y,
    double width,
    double height
)
```

Parameters

x
The x-coordinate of the upper-left corner of the new node

y
The y-coordinate of the upper-left cornet of the new node

width
The width of the new node

height
The height of the new node

Return Value

The newly created SvgNode instance

Factory.createSvgNode Method (double, double, double, double, SvgContent)

Creates a new SvgNode instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram. The method creates a svg node at the position specified by x and y. The size of the node is set by width and height.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SvgNode createSvgNode (
    double x,
    double y,
    double width,
    double height,
    SvgContent svgContent
)
```

Parameters

x
The x-coordinate of the upper-left corner of the new node

y
The y-coordinate of the upper-left cornet of the new node

width
The width of the new node

height
The height of the new node

svgContent
The SvgContent instance representing the SVG drawing rendered in SvgNode

Return Value

The newly created **SvgNode** instance

Creates a new TableNode instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram. The method creates a table node at the position specified by x and y. The size of the node is set by width and height.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TableNode createTableNode (
    double x,
    double y,
    double width,
    double height
)
```

Parameters

x
The x-coordinate of the upper-left corner of the new table.

y
The y-coordinate of the upper-left corner of the new table.

width
The width of the new table.

height
The height of the new table.

Return Value

The newly created TableNode instance.

Remarks

The method creates a table node at the position specified by x and y. The size of the node is set by *width* and *height*.

Factory.createTableNode Method (double, double, double, double, int, int)

Creates a new TableNode instance at the specified position with the specified size and the specified number of columns and rows, and adds it to the Nodes collection of the underlying diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TableNode createTableNode (
    double x,
    double y,
    double width,
    double height,
    int columns,
    int rows
)
```

Parameters

x
The x-coordinate of the upper-left corner of the new table.

y
The y-coordinate of the upper-left corner of the new table.

width
The width of the new table.

height
The height of the new table.

columns
The initial number of columns in the table.

rows
The initial number of rows in the table.

Return Value

The newly created TableNode instance.

Remarks

The method creates a table node at the position specified by x and y. The size of the node is set by *width* and *height*. The initial number of columns and rows in the table is specified by *columns* and *rows* respectively.

FlowchartLayout Class

FlowchartLayout can be used to arrange flowcharts representing program source code.

Syntax

Java
`public class FlowchartLayout extends AbstractLayout`

Remarks

The algorithm recognizes program code -like patterns in the graph, such as loops, sequences and if/switch branchings, and arranges them recursively. **FlowchartLayout** could be used to arrange other types of graphs as well, though with some restrictions. For example it treats all back links as loops in the code, and expects that they are nested - loop links starting closer to the stop node should end closer to the start node. Another similar restriction is that there shouldn't be any cross-links that connect different branches of a decision sub-graph.

FlowchartLayout Members

FlowchartLayout can be used to arrange flowcharts representing program source code.

The following tables list the members exposed by the **FlowchartLayout** type.

Public Constructors

	Name	Description
	FlowchartLayout	Initializes a new instance of the **FlowchartLayout** class.

Public Methods

	Name	Description
	arrange	Applies the layout on the specified subset of items from the specified Diagram instance.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getBranchPadding	Gets how much space to leave between adjacent decision branches in the flowchart.
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getIgnoreRepeatingLinks	Gets a value indicating whether to ignore repeating links.

	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	getLinkPadding	Gets how much space to leave between adjacent back links designating nested loops.
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getNodeDistance	Gets the distance between consecutive nodes in the flowchart.
	getOrientation	Gets the overall orientation of the arranged diagram.
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	getSplitGraph	Gets a value indicating whether unconnected subgraphs should be laid out independently from each other. If this property is set to true, each independent graph in the diagram is laid out in its own layout area. Otherwise all subgraphs are arranged in the same layout area.
	init	Returns a FlowchartLayoutBuilder object used to configure this FlowchartLayout instance.
	removeMidleSegmentPoint	(Inherited from AbstractLayout.)
	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setBranchPadding	Sets how much space to leave between adjacent decision branches in the flowchart.
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setIgnoreRepeatingLinks	Sets a value indicating whether to ignore repeating links.
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)

	setLinkPadding	Sets how much space to leave between adjacent back links designating nested loops.
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setNodeDistance	Sets the distance between consecutive nodes in the flowchart.
	setOrientation	Sets the overall orientation of the arranged diagram.
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
	setSplitGraph	Sets a value indicating whether unconnected subgraphs should be laid out independently from each other. If this property is set to true, each independent graph in the diagram is laid out in its own layout area. Otherwise all subgraphs are arranged in the same layout area.
S	with	Returns a FlowchartLayoutBuilder object used to configure and create new FlowchartLayout instances.

FlowchartLayout Methods

FlowchartLayout.arrange Method

Applies the layout on the specified subset of items from the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram
The Diagram to arrange.

items
Specifies a subset of diagram items to arrange.

Return Value

true if the diagram has been arranged successfully; otherwise, false.

FoldContainerCmd Members

Undoable command that implements folding and unfolding of container nodes.

The following tables list the members exposed by the FoldContainerCmd type.

Public Constructors

	Name	Description
	FoldContainerCmd	Initializes a new instance of the **FoldContainerCmd** class.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)
	execute	Carries out the command action.
	getContainer	Gets the table associated with the command.
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	Redoes the command action.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	Undoes the command.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related. (Inherited from Command.)
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

Public Constructors

	Name	Description
	Folder	Initializes a new instance of the **Folder** class.

Protected Fields

	Name	Description
	item	(Inherited from Manipulator.)

Public Methods

	Name	Description
	addToRepaintRect	Manipulator.AddToRepaintRect override.
	cancel	Called when the manipulator should cancel the current manipulation. (Inherited from Manipulator.)
	draw	Manipulator.draw override.
	drawsInLocalCoordinates	Returns whether the manipulator object draws in local or global coordinates. (Inherited from Manipulator.)
	getItem	(Inherited from Manipulator.)
	hitTest	Manipulator.hitTest override.
	needsPointerMessages	Returns whether the manipulator object needs to track mouse events. (Inherited from Manipulator.)
	onClick	Manipulator.onClick override.
	onGotFocus	Called when the manipulator receives input focus. (Inherited from Manipulator.)
	onLostFocus	Called when the manipulator loses the input focus. (Inherited from Manipulator.)
	onPointerDown	Called when the left mouse button is pressed while the pointer is over this manipulator. (Inherited from Manipulator.)
	onPointerMove	Called when the mouse is moved while this manipulator tracks the mouse events. (Inherited from Manipulator.)
	onPointerUp	Called when the left mouse button is released while this manipulator tracks the mouse events. (Inherited from Manipulator.)

	setMouseCursor	(Inherited from Manipulator.)
	supportClipping	Manipulator.SupportClipping override.

FractalLayout Class

A tree layout algorithm that places child nodes symmetrically around their parent node.

Syntax

Java

```
public class FractalLayout extends AbstractLayout
```

Remarks

Nodes at the lowest level are arranged directly in a circle around their parent. At the upper level, the already arranged nodes form branches that are arranged in a circle around the new parent node. The algorithm is recursively repeated till the highest level is reached. If nodes in the tree have uniform number of children, the end result has fractal-like appearance (subsets of the graph look like scaled-down copies of the whole graph).

You can choose which node should be displayed at the center of the topmost circle by setting the Root property. If it is not specified, the algorithm automatically selects a root that leads to more balanced distribution of nodes.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.AbstractLayout

com.mindfusion.diagramming.FractalLayout

FractalLayout Members

A tree layout algorithm that places child nodes symmetrically around their parent node.

The following tables list the members exposed by the FractalLayout type.

Public Constructors

	Name	Description
	FractalLayout	Initializes a new instance of the FractalLayout class.

Public Methods

	Name	Description
	arrange	Applies the layout on the specified subset of items from the specified Diagram instance.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	getRoot	Gets the tree root.
	init	Returns a FractalLayoutBuilder object used to configure this FractalLayout instance.

	removeMidleSegmentPoint	(Inherited from AbstractLayout.)
	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
	setRoot	Sets the tree root.
	with	Returns a FractalLayoutBuilder object used to configure and create new FractalLayout instances.

Syntax

Java

```
public int getPointIndex ()
```

Return Value

An integer index of modified outline point.

FreeFormHandle.setPointIndex Method

Sets the index of a point from FreeFormNode.Points collection that is being modified through this handle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setPointIndex (
    int pointIndex
)
```

Parameters

pointIndex
An integer index of modified outline point.

FreeFormNode Class

A **FreeFormNode** collects all points from users' mouse or touch input and displays them as node's outline.

Syntax

Java

```
public class FreeFormNode extends DiagramNode implements InplaceEditable
```

Remarks

To let users draw free-form nodes interactively, set Behavior to DrawFreeForms or LinkFreeForms. Use the Points property of **FreeFormNode** to get or set outline points programmatically. If the Closed property is set, the node is drawn as a closed shape and its interior filled, or otherwise the node is drawn as a polyline. If the distance between first and last points drawn by user is shorter than AutoCloseDistance, the node's Closed property is automatically set to **true**. **AutoCloseDistance** default value is Float.MAX_VALUE, so free-form nodes are always closed.

FreeFormNode Members

A FreeFormNode collects all points from users' mouse or touch input and displays them as node's outline.

The following tables list the members exposed by the **FreeFormNode** type.

Public Constructors

	Name	Description
	FreeFormNode	Overloaded.

Protected Fields

	Name	Description
	allowIncomingLinks	(Inherited from DiagramNode.)
	allowOutgoingLinks	(Inherited from DiagramNode.)
	anchorPattern	(Inherited from DiagramNode.)
	AV_Cancel	(Inherited from DiagramNode.)
	AV_EndModIncoming	(Inherited from DiagramNode.)
	AV_EndModOutgoing	(Inherited from DiagramNode.)
	AV_StartModIncoming	(Inherited from DiagramNode.)
	AV_StartModOutgoing	(Inherited from DiagramNode.)
	AV_UpdateIncoming	(Inherited from DiagramNode.)
	AV_UpdateOutgoing	(Inherited from DiagramNode.)
	AV_UpdIntscIncoming	(Inherited from DiagramNode.)
	AV_UpdIntscOutgoing	(Inherited from DiagramNode.)
	AV_UpdPosIncoming	(Inherited from DiagramNode.)
	AV_UpdPosOutgoing	(Inherited from DiagramNode.)
	bounds	(Inherited from DiagramNode.)
	brush	(Inherited from DiagramItem.)
	cycleDetected	(Inherited from DiagramItem.)
	cycleProtect	(Inherited from DiagramItem.)

	enabledHandles	(Inherited from DiagramNode.)
	handlesStyle	(Inherited from DiagramNode.)
	incomingLinks	(Inherited from DiagramNode.)
	masterGroup	(Inherited from DiagramNode.)
	modifyDX	(Inherited from DiagramItem.)
	modifyDY	(Inherited from DiagramItem.)
	modifyHandle	(Inherited from DiagramItem.)
	modifying	(Inherited from DiagramItem.)
	obstacle	(Inherited from DiagramNode.)
	outgoingLinks	(Inherited from DiagramNode.)
	pen	(Inherited from DiagramItem.)
	ptEnd	(Inherited from DiagramItem.)
	ptMdfLast	(Inherited from DiagramItem.)
	ptOrg	(Inherited from DiagramItem.)
	ptSavedEnd	(Inherited from DiagramItem.)
	ptSavedOrg	(Inherited from DiagramItem.)
	savedBounds	(Inherited from DiagramNode.)
	subordinateGroup	(Inherited from DiagramItem.)

Public Methods

	Name	Description
	addLabel	Overloaded. (Inherited from DiagramNode.)
	as	Down-casts the item to specified type. (Inherited from DiagramItem.)
	attachTo	Overloaded. (Inherited from DiagramNode.)
	clone	Creates a copy of this item. (Inherited from DiagramItem.)
	containsPoint	Overloaded.
	detach	Detaches a node from its master group. (Inherited from DiagramNode.)
	getAllIncomingLinks	Gets a collection of all links entering this node. (Inherited from DiagramNode.)
	getAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	getAllOutgoingLinks	Gets a collection of all links going out of this node. (Inherited from DiagramNode.)

	getAllowIncomingLinks	Gets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	getAllowOutgoingLinks	Gets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	getAnchorPattern	Gets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	getBounds	Gets the node location and size. (Inherited from DiagramNode.)
	getBrush	Gets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	getCenter	Returns the center point of this node. (Inherited from DiagramNode.)
	getClosed	Gets if the node's shape is closed.
	getConstraints	Gets the movement and size constraints applied to a node. (Inherited from DiagramNode.)
	getContainer	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	getEditRect	Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).
	getEffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style. (Inherited from DiagramItem.)
	getEffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style. (Inherited from DiagramItem.)
	getEffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	getEffects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	getEnabledHandles	Gets a combination of NodeHandleType members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)

	getExpandable	Gets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	getExpanded	Gets a value indicating whether the tree branch that starts from a node is expanded or collapsed. (Inherited from DiagramNode.)
	getFont	Gets the font used to draw the text of an item. (Inherited from DiagramItem.)
	getHandlesStyle	Gets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	getHyperLink	Gets the hyperlink associated with an item. (Inherited from DiagramItem.)
	getId	Gets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	getIncomingLinks	Gets the links coming into a node. (Inherited from DiagramNode.)
	getLabels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms. (Inherited from DiagramItem.)
	getLocalCenter	(Inherited from DiagramNode.)
	getLocked	Gets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	getMasterGroup	Gets the hierarchical group in which this node is a subordinate item. (Inherited from DiagramNode.)
	getMasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	getNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getObstacle	Gets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	getOpacity	Gets the opacity of this item. (Inherited from DiagramItem.)
	getOutgoingLinks	Gets the links going out from a node. (Inherited from DiagramNode.)
	getParent	Gets the diagram that contains this item. (Inherited from DiagramItem.)

	getPen	Gets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	getPoints	Gets the node's outline points.
	getPrintable	Gets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
S	getRotatedBounds	Gets the bounding rectangle of this node, when it is rotated at the specified angle around the specified pivot. (Inherited from DiagramNode.)
	getRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	getRuntimeIndex	For internal use. (Inherited from DiagramItem.)
	getSelected	Gets a value indicating whether this item is selected. (Inherited from DiagramItem.)
	getShadowBrush	Gets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getStyle	Gets the style associated with the item. (Inherited from DiagramItem.)
	getSubordinateGroup	Gets the group of subordinated items attached to this one. (Inherited from DiagramItem.)
	getTag	Gets user-defined data assigned to an item. (Inherited from DiagramItem.)
	getText	Gets the text displayed inside this node.
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	getTextPadding	Gets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	getTextToEdit	Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when this node is edited in-place.
	getToolTip	Gets the tooltip text displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	getVisible	Gets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	getWeight	Gets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	getZIndex	Gets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	hasSubordinates	Checks whether there are any nodes attached to this item. (Inherited from DiagramItem.)

	hitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	hitTestHandle	DiagramNode.hitTestHandle override. Determines whether a selection handle of this node is located at the specified point.
	init	Returns a FreeFormNodeBuilder object used to configure this FreeFormNode instance.
	labelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	moveTo	Moves a node to the specified location. (Inherited from DiagramNode.)
	nodesIntersect	Determines whether two nodes intersect. (Inherited from DiagramNode.)
	onDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	onDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	onDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	readExternal	DiagramNode.readExternal override.
	removeLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	resize	Sets the size of a node. (Inherited from DiagramNode.)
	setAllowIncomingLinks	Sets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	setAllowOutgoingLinks	Sets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	setAnchorPattern	Sets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	setBounds	Overloaded. (Inherited from DiagramNode.)
	setBoundsDirect	For internal use. (Inherited from DiagramNode.)
	setBrush	Sets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	setClosed	Sets if the node's shape is closed.
	setConstraints	Sets constraints to the node size and movement direction. The constraints are applied when a user modifies the node interactively. They are not checked when the position of a node is set programmatically. (Inherited from DiagramNode.)

	setEditedText	Implements InplaceEditable.setEditedText. Assigns the edited text to this node after in-place edit operation completes successfully.
	setEnabledHandles	Sets a combination of **NodeHandleType** members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	setExpandable	Sets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	setExpanded	Expands or collapses the tree branch that starts from a node. (Inherited from DiagramNode.)
	setExpandedFlag	Changes the "expanded" flag without actually expanding or collapsing the tree branch that starts from a node. (Inherited from DiagramNode.)
	setFont	Sets the font used to draw the text of an item. (Inherited from DiagramItem.)
	setHandlesStyle	Sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	setHyperLink	Sets the hyperlink associated with an item. (Inherited from DiagramItem.)
	setId	Assigns user-defined identifier to this item. (Inherited from DiagramItem.)
	setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	setLocked	Sets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	setObstacle	Sets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	setOpacity	Sets the opacity of this item. (Inherited from DiagramItem.)
	setPen	Sets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	setPoints	Sets the node's outline points.
	setPrintable	Sets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	setRotationAngle	Sets the rotation angle of a node. (Inherited from DiagramNode.)
	setSelected	Selects or deselects an item. (Inherited from DiagramItem.)

	setShadowBrush	Sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setStyle	Sets the style associated with the item. (Inherited from DiagramItem.)
	setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event. (Inherited from DiagramItem.)
	setText	Sets the text label displayed inside this node.
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	setTextPadding	Sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	setVisible	Sets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	setWeight	Sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	setZIndex	Sets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	updateFromPoints	Updates the node's internal state after its points have changed.
	with	Returns a FreeFormNodeBuilder object used to configure and create new FreeFormNode instances.
	writeExternal	DiagramNode.writeExternal override.
	zBottom	Moves an item to the bottom of the Z order. (Inherited from DiagramItem.)
	zLevelDown	Moves an item down in the Z order. (Inherited from DiagramItem.)
	zLevelUp	Moves an item up in the Z order. (Inherited from DiagramItem.)
	zTop	Moves an item to the top of the Z order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description

	allowCreate	DiagramNode.allowCreate override.
	allowModify	(Inherited from DiagramNode.)
	allowModifyImpl	(Inherited from DiagramNode.)
	cancelModify	DiagramItem.cancelModify override. Invoked when the interactive modification of this node has been canceled.
	completeCreate	DiagramNode.completeCreate override.
	completeModify	(Inherited from DiagramNode.)
	constraintsInfringed	(Inherited from DiagramNode.)
	createConnectionPoint	(Inherited from DiagramNode.)
	createProperties	DiagramNode.createProperties override.
	createState	DiagramNode.createState override.
	draw	DiagramNode.draw override. Draws this node on the specified Graphics2D surface.
	drawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	drawShadow	DiagramNode.drawShadow override. Draws the node's shadow on the specified Graphics2D surface.
	drawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	getLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getLocalBoundsD	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getMeasureUnit	(Inherited from DiagramItem.)
	getRepaintRect	DiagramItem.getRepaintRect override. (Inherited from DiagramNode.)
	getValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	groupContains	(Inherited from DiagramNode.)
	loadFromJson	Loads the node from a JSON object.
	loadFromXml	Loads the item content from an XML element.
	move	(Inherited from DiagramNode.)
	onAdd	Called when an item is added to a Diagram, either by the user, programmatically or by undo / redo. (Inherited from DiagramItem.)
	onChangeFont	(Inherited from DiagramItem.)
	onChangeTextPadding	(Inherited from DiagramItem.)

	onChildModified	Called when a group child node has been modified. Override this method if you need to know when a node from the **SubordinateGroup** is modified. (Inherited from DiagramItem.)
	onClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	onDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	onLoad	Called when this item is loaded from a file. (Inherited from DiagramItem.)
	onMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	onModify	Called when an item is modified (Inherited from DiagramNode.)
	onRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or by undo / redo. (Inherited from DiagramNode.)
	onRotationAngleChanged	Called when the node's rotation angle changes. (Inherited from DiagramNode.)
	onRotationAngleChanged	**DiagramNode.onRotationAngleChanged** override.
	onStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	onStyleFontChanged	Invoked when font property values of an associated style change. (Inherited from DiagramItem.)
	onUpdateBounds	DiagramNode.onUpdateBounds override. Invoked when the bounding rectangle of this node has changed.
	parentConstraintsInfringed	(Inherited from DiagramNode.)
	putExpandable	(Inherited from DiagramNode.)
	putSelected	(Inherited from DiagramItem.)
	rectFromPoints	(Inherited from DiagramNode.)
	repaint	Overloaded. (Inherited from DiagramItem.)
	resizeToFitImage	(Inherited from DiagramNode.)
	restoreProperties	DiagramNode.restoreProperties override.
	restoreState	DiagramNode.restoreState override.
	saveProperties	DiagramNode.saveProperties override.
	saveState	DiagramNode.saveState override.
	saveToJson	Saves the node as a JSON object.
	saveToXml	Saves the item content into an XML element.
	scaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)

	setDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	setReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	shouldRender	Determines whether the item is rendered in the current context. (Inherited from DiagramItem.)
	shouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	startCreate	DiagramItem.startCreate override.
	startModify	DiagramNode.startModify override. Invoked when the user starts modifying this node interactively.
	updateCreate	DiagramNode.updateCreate override.
	updateLinkPositions	(Inherited from DiagramNode.)
	updateModify	DiagramNode.updateModify override. Invoked during interactive modification of this node.

FreeFormNode Constructor

Overload List

Name	Description
FreeFormNode ()	Initializes a new instance of the FreeFormNode class.
FreeFormNode (Diagram)	Initializes a new instance of the **FreeFormNode** class.
FreeFormNode (FreeFormNode)	Initializes a new instance of the **FreeFormNode** class using the specified node as a prototype.

See Also

FreeFormNode Constructor ()

Initializes a new instance of the FreeFormNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public FreeFormNode ()
```

See Also

FreeFormNode Constructor Overload List
FreeFormNode Class
com.mindfusion.diagramming Namespace

FreeFormNode Constructor (Diagram)

Initializes a new instance of the FreeFormNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public FreeFormNode (
    Diagram parent
)
```

Parameters

parent
The Diagram from which to obtain default values for the node properties.

See Also

FreeFormNode Constructor Overload List
FreeFormNode Class
com.mindfusion.diagramming Namespace

FreeFormNode Constructor (FreeFormNode)

Initializes a new instance of the FreeFormNode class using the specified node as a prototype.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public FreeFormNode (
    FreeFormNode prototype
)
```

Parameters

prototype
The node to use as a prototype. The properties of the new node are initialized from the property values of this node.

com.mindfusion.diagramming Namespace

FreeFormNode Methods

FreeFormNode.allowCreate Method

DiagramNode.allowCreate override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected boolean allowCreate (
    Point2D current,
    InteractionState ist
)
```

Parameters

current
The current mouse position.

ist
An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the creation of this item, or **false** otherwise.

FreeFormNode.cancelModify Method

DiagramItem.cancelModify override. Invoked when the interactive modification of this node has been canceled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void cancelModify (
    InteractionState ist
)
```

Parameters

ist
An InteractionState object containing more information about the current state of the operation.

FreeFormNode.completeCreate Method

DiagramNode.completeCreate override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void completeCreate (
    Point2D end
)
```

Parameters

end
The final mouse position.

FreeFormNode.containsPoint Method (Point2D)

DiagramNode.containsPoint override. Checks whether this node contains the specified point. This method is called during hit-testing to determine if the pointer is over the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean containsPoint (
    Point2D point
)
```

Parameters

point
The point to check.

Return Value

true it this node contains the specified point, or **false** otherwise.

See Also

containsPoint Method Overload List
FreeFormNode Members
FreeFormNode Class
com.mindfusion.diagramming Namespace

FreeFormNode.containsPoint Method (Point2D, float)

DiagramNode.containsPoint override. Checks whether this node contains the specified point. This method is called during hit-testing to determine if the pointer is over the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean containsPoint (
    Point2D point,
    float threshold
)
```

Parameters

point
The point to check.

threshold

Specifies the size of the area around the node outlines where the point is still considered inside.

Return Value

true it this node contains the specified point, or **false** otherwise.

FreeFormNode.draw Method

DiagramNode.draw override. Draws this node on the specified Graphics2D surface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void draw (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g
A Graphics2D instance.

options
Provides options for the drawing operation.

FreeFormNode.drawShadow Method

DiagramNode.drawShadow override. Draws the node's shadow on the specified Graphics2D surface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void drawShadow (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g
A Graphics2D instance.

options
Provides options for the drawing operation.

FreeFormNode.getClosed Method

Gets if the node's shape is closed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getClosed ()
```

Return Value

true if the node should be drawn as a closed polygon and filled, or **false** otherwise.

Remarks

This property is set automatically if the distance between start and end points is smaller than AutoCloseDistance when the user finishes drawing the node.

FreeFormNode.getEditRect Method

Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getEditRect (
    DiagramItem item,
    Point2D mousePosition
)
```

Parameters

item
A reference to this node.

mousePosition
A Point2D instance specifying the current pointer position.

Return Value

A Rectangle2D specifying where the edit box should be placed.

FreeFormNode.getPoints Method

Gets the node's outline points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ArrayList<Point2D.Float> getPoints ()
```

Return Value

An ArrayList<Rectangle2D.Float> instance.

FreeFormNode Class
com.mindfusion.diagramming Namespace

FreeFormNode.getTextToEdit Method

Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when this node is edited in-place.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getTextToEdit ()
```

Return Value

A String that represents the initial contents of the in-place edit box.

FreeFormNode Class
com.mindfusion.diagramming Namespace

FreeFormNode.hitTestHandle Method

DiagramNode.hitTestHandle override. Determines whether a selection handle of this node is located at the specified point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AdjustmentHandle hitTestHandle (
    Point2D point
)
```

Parameters

point
A Point2D instance specifying the location where to look for adjustment handles.

Return Value

Returns a NodeAdjustmentHandle or FreeFormHandle representing the adjustment handle found at the specified location, or **null** if there is none.

FreeFormNode Class
com.mindfusion.diagramming Namespace

FreeFormNode.init Method

Returns a FreeFormNodeBuilder object used to configure this FreeFormNode instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public FreeFormNodeBuilder init ()
```

Return Value

A **FreeFormNodeBuilder** instance.

FreeFormNode Class
com.mindfusion.diagramming Namespace

FreeFormNode.loadFromJson Method

Loads the node from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

FreeFormNode.loadFromXml Method

Loads the item content from an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Xml Element containing the item's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

FreeFormNode.onRotationAngleChanged Method

DiagramNode.onRotationAngleChanged override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onRotationAngleChanged (
    double oldAngle
)
```

Parameters

oldAngle

FreeFormNode.onUpdateBounds Method

DiagramNode.onUpdateBounds override. Invoked when the bounding rectangle of this node has changed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onUpdateBounds (
    Rectangle2D oldBounds
)
```

Parameters

oldBounds

FreeFormNode.readExternal Method

DiagramNode.readExternal override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

FreeFormNode.restoreProperties Method

DiagramNode.restoreProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void restoreProperties (
    DiagramItemProperties props
)
```

Parameters

props
A DiagramItemProperties instance.

FreeFormNode.restoreState Method

DiagramNode.restoreState override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void restoreState (
    DiagramItemState state
)
```

Parameters

state
A DiagramItemState instance.

FreeFormNode.saveProperties Method

DiagramNode.saveProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveProperties (
    DiagramItemProperties props
)
```

Parameters

props
A DiagramItemProperties instance.

FreeFormNode.saveState Method

DiagramNode.saveState override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveState (
    DiagramItemState state
)
```

Parameters

state
A DiagramItemState instance.

See Also

FreeFormNode Members
FreeFormNode Class
com.mindfusion.diagramming Namespace

FreeFormNode.saveToJson Method

Saves the node as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

FreeFormNode Members
FreeFormNode Class
com.mindfusion.diagramming Namespace

FreeFormNode.saveToXml Method

Saves the item content into an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Xml Element the item's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

FreeFormNode Members
FreeFormNode Class
com.mindfusion.diagramming Namespace

FreeFormNode.setClosed Method

Sets if the node's shape is closed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setClosed (
    boolean value
)
```

Parameters

value
true if the node should be drawn as a closed polygon and filled, or **false** otherwise.

Remarks

This property is set automatically if the distance between start and end points is smaller than AutoCloseDistance when the user finishes drawing the node.

FreeFormNode.setEditedText Method

Implements InplaceEditable.setEditedText. Assigns the edited text to this node after in-place edit operation completes successfully.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEditedText (
    String newText
)
```

Parameters

newText
The new text of this node.

See Also

FreeFormNode Members
FreeFormNode Class
com.mindfusion.diagramming Namespace

FreeFormNode.setPoints Method

Sets the node's outline points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setPoints (
    ArrayList<Point2D.Float> value
)
```

Parameters

value
An ArrayList<Point2D.Float> instance.

FreeFormNode.setText Method

Sets the text label displayed inside this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setText (
    String value
)
```

Parameters

value
A String containing the label text.

FreeFormNode.startCreate Method

DiagramItem.startCreate override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void startCreate (
    Point2D org
)
```

Parameters

org
The initial mouse position.

See Also

FreeFormNode Members
FreeFormNode Class
com.mindfusion.diagramming Namespace

FreeFormNode.startModify Method

DiagramNode.startModify override. Invoked when the user starts modifying this node interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void startModify (
    Point2D org,
    AdjustmentHandle handle,
    InteractionState ist
)
```

Parameters

org
The initial mouse position.

handle
The adjustment handle used to modify this item.

ist
An InteractionState object containing more information about the current state of the operation.

FreeFormNode.updateCreate Method

DiagramNode.updateCreate override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void updateCreate (
    Point2D current
)
```

Parameters

current
The current position of the mouse pointer.

FreeFormNode.updateModify Method

DiagramNode.updateModify override. Invoked during interactive modification of this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void updateModify (
    Point2D current,
    InteractionState ist
)
```

Parameters

current
The current mouse position.

ist
An InteractionState object containing more information about the current state of the operation.

FreeFormNodeStyle Members

Represents a reusable set of properties that define the appearance of free-form nodes.

The following tables list the members exposed by the FreeFormNodeStyle type.

Public Constructors

	Name	Description
	FreeFormNodeStyle	Initializes a new instance of the **FreeFormNodeStyle** class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from Style.)
	getBrush	Gets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	getEffects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	getFontFamily	Gets the font family of the item text. (Inherited from DiagramItemStyle.)
	getFontSize	Gets the font size of the item text. (Inherited from DiagramItemStyle.)
	getFontStyle	Gets the font style of the item text. (Inherited from DiagramItemStyle.)
	getFontUnit	Gets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	getShadowBrush	Gets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	getStroke	Gets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	getStrokeThickness	Gets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
	init	Returns a FreeFormNodeStyleBuilder object used to configure this FreeFormNodeStyle instance.
	readExternal	**Externalizable.readExternal** implementation. (Inherited from Style.)

	registerType	Associates a type with an alias. The alias is used when saving and loading objects of the specified type during style serialization and deserialization. (Inherited from Style.)
	removePropertyChangeListener	(Inherited from Style.)
	setBrush	Sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	setFontFamily	Sets the font family of the item text. (Inherited from DiagramItemStyle.)
	setFontSize	Sets the font size of the item text. (Inherited from DiagramItemStyle.)
	setFontStyle	Sets the font style of the item text. (Inherited from DiagramItemStyle.)
	setFontUnit	Sets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	setShadowBrush	Sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	setStroke	Sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	setStrokeThickness	Sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
	with	Returns a FreeFormNodeStyleBuilder object used to configure and create new FreeFormNodeStyle instances.
	writeExternal	**Externalizable.writeExternal** implementation. (Inherited from Style.)

Protected Methods

	Name	Description
	getValue	Gets the value of the specified property. (Inherited from Style.)
	isPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	loadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	loadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	registerProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	saveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)

	saveToXml	Saves the style content into an XML element. (Inherited from Style.)
	setValue	Sets the value of the specified property. (Inherited from Style.)
	unsetValue	Clears the value of the specified property. (Inherited from Style.)

GlassEffect Members

Represents a glass-like visual effect. This effect can be applied to the nodes in a Diagram by adding an instance of this class to the Diagram.getNodeEffects collection.

The following tables list the members exposed by the GlassEffect type.

Public Constructors

	Name	Description
	GlassEffect	Initializes a new instance of the **GlassEffect** class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from NodeEffect.)
	clone	NodeEffect.clone override.
	getGlowColor	Gets the color of the glow portion of the effect.
	getReflectionColor	Gets the color of the reflection portion of the effect.
	getType	Gets the type of the glass effect.
	getUsePenAsGlow	Gets a value indicating whether the glow portion of the effect should be painted with the Pen color of the respective node.
	readExternal	NodeEffect.readExternal override.
	removePropertyChangeListener	(Inherited from NodeEffect.)
	setGlowColor	Sets the color of the glow portion of the effect.
	setReflectionColor	Sets the color of the reflection portion of the effect.
	setType	Sets the type of the glass effect.
	setUsePenAsGlow	Sets a value indicating whether the glow portion of the effect should be painted with the Pen color of the respective node.
	writeExternal	NodeEffect.writeExternal override.

GlassEffectType Enumeration

The members of this enumeration specify the type of a GlassEffect node effect.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public enum GlassEffectType
```

Members

	Member name	Description
	Type1	Indicates a glass effect with soft radial glow at the bottom and a sharp reflection at the top.
	Type2	Indicates a glass effect with linear glow at the bottom and sharp reflection at the top.
	Type3	Indicates a glass effect with radial glow at the bottom and smooth reflection and emphasized outline at the top.
	Type4	Indicates a glass effect with sharp reflection at the top and soft glow at the left and right sides.

Granularity Enumeration

The members of this enumeration specify the granularity of the obstacles map generated by QuickRouter.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum Granularity`

Members

	Member name	Description
	CoarseGrained	Merge map tiles if possible to create a coarse-grained map. The fewer tiles in the map lead to faster path-finding.
	FineGrained	Reserved for future use.
	Normal	Use the map tiles found by the initial division algorithm.

GridLayout Members

Implements a grid graph layout algorithm. GridLayout arranges diagram nodes in a grid, keeping connected nodes close together. The algorithm strives to achieve a small number of link crossings. It is based on an iterative process whose initial steps shuffle the grid nodes randomly. That can lead to very different results each time the algorithm is run.

The following tables list the members exposed by the **GridLayout** type.

Public Constructors

	Name	Description
	GridLayout	Initializes a new instance of the **GridLayout** class.

Public Methods

	Name	Description
	arrange	Arranges the specified diagram.
	getAnchoring	Gets a value indicating how links will be aligned to the anchor points of tree nodes.
	getEndNode	Gets the node that should be placed at the bottom right corner of the grid.
	getGridSize	Gets the desired distance between adjacent grid points.
	getIterations	Gets the number of iterations that the layout algorithm should run.
	getKeepGroupLayout	Gets a value specifying whether the relative position of nodes within groups should be kept intact.
	getRandomSeed	Gets the randomization seed used for generating random node positions.
	getStartNode	Gets the node that should be placed at the upper left corner of the grid.
	getXGap	Gets a value indicating how much horizontal space should be left between the document boundaries and the graph.
	getYGap	Gets a value indicating how much vertical space should be left between the document boundaries and the graph.
	init	Returns a GridLayoutBuilder object used to configure this GridLayout instance.
	setAnchoring	Sets a value indicating how links should be aligned to the anchor points of tree nodes.
	setEndNode	Sets the node that should be placed at the bottom right corner of the grid.
	setGridSize	Sets the desired distance between adjacent grid points.
	setIterations	Sets the number of iterations that the layout algorithm should run.

	setKeepGroupLayout	Sets a value specifying whether the relative position of nodes within groups should be kept intact.
	setRandomSeed	Sets the randomization seed used for generating random node positions.
	setStartNode	Sets the node that should be placed at the upper left corner of the grid.
	setXGap	Sets a value indicating how much horizontal space should be left between the document boundaries and the graph.
	setYGap	Sets a value indicating how much vertical space should be left between the document boundaries and the graph.
S	with	Returns a GridLayoutBuilder object used to configure and create new GridLayout instances.

GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout Constructor

Initializes a new instance of the GridLayout class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public GridLayout ()
```

See Also

GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout Methods

GridLayout.arrange Method

Arranges the specified diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram chart
)
```

Parameters

chart
The Diagram to arrange.

Return Value

true

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.getAnchoring Method

Gets a value indicating how links will be aligned to the anchor points of tree nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Anchoring getAnchoring ()
```

Return Value

A member of the Anchoring enumeration.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.getEndNode Method

Gets the node that should be placed at the bottom right corner of the grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode getEndNode ()
```

Return Value

Reference to the end DiagramNode.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.getGridSize Method

Gets the desired distance between adjacent grid points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getGridSize ()
```

Return Value

A float value specifying the distance between adjacent grid points.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.getIterations Method

Gets the number of iterations that the layout algorithm should run.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getIterations ()
```

Return Value

An integer value specifying the number of iterations.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.getKeepGroupLayout Method

Gets a value specifying whether the relative position of nodes within groups should be kept intact.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getKeepGroupLayout ()
```

Return Value

true if the relative position of nodes withingroups should be preserved, otherwise **false**.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.getRandomSeed Method

Gets the randomization seed used for generating random node positions.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getRandomSeed ()
```

Return Value

An integer value specifying the randomization seed.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.getStartNode Method

Gets the node that should be placed at the upper left corner of the grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramNode getStartNode ()
```

Return Value

Reference to the start DiagramNode.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.getXGap Method

Gets a value indicating how much horizontal space should be left between the document boundaries and the graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getXGap ()
```

Return Value

A float value specifying the horizontal offset from theleft document border.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.getYGap Method

Gets a value indicating how much vertical space should be left between the document boundaries and the graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getYGap ()
```

Return Value

A float value specifying the vertical offset from thetop document border.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.init Method

Returns a GridLayoutBuilder object used to configure this GridLayout instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public GridLayoutBuilder init ()
```

Return Value

A **GridLayoutBuilder** instance.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.setAnchoring Method

Sets a value indicating how links should be aligned to the anchor points of tree nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAnchoring (
    Anchoring value
)
```

Parameters

value
A member of the Anchoring enumeration.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.setEndNode Method

Sets the node that should be placed at the bottom right corner of the grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setEndNode (
    DiagramNode value
)
```

Parameters

value
A DiagramNode object representing the grid end node.

Remarks

If you set the end node, you should also call the setStartNode method to specify the start node. GridLayout usually produces better layouts if you do not specify start and end nodes; in such a case the algorithm automatically selects suitable nodes.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.setGridSize Method

Sets the desired distance between adjacent grid points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setGridSize (
    float value
)
```

Parameters

value
A float value specifying the distance between adjacent grid points.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.setIterations Method

Sets the number of iterations that the layout algorithm should run.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIterations (
    int value
)
```

Parameters

value
An integer value specifying the number of iterations.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.setKeepGroupLayout Method

Sets a value specifying whether the relative position of nodes within groups should be kept intact.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setKeepGroupLayout (
    boolean value
)
```

Parameters

value
true if the relative position of nodes withingroups should be preserved, otherwise **false**.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.setRandomSeed Method

Sets the randomization seed used for generating random node positions.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRandomSeed (
    int value
)
```

Parameters

value
An integer value specifying the randomization seed.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.setStartNode Method

Sets the node that should be placed at the upper left corner of the grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setStartNode (
    DiagramNode value
)
```

Parameters

value
A DiagramNode object representing the grid start node.

Remarks

If you set the start node, you should also call the setEndNode method to specify the end node. GridLayout usually produces better layouts if you do not specify start and end nodes; in such a case the algorithm automatically selects suitable nodes.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.setXGap Method

Sets a value indicating how much horizontal space should be left between the document boundaries and the graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setXGap (
    float value
)
```

Parameters

value
A float value specifying the horizontal offset from theleft document border.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.setYGap Method

Sets a value indicating how much vertical space should be left between the document boundaries and the graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setYGap (
    float value
)
```

Parameters

value
A float value specifying the vertical offset from thetop document border.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridLayout.with Method

Returns a GridLayoutBuilder object used to configure and create new GridLayout instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static GridLayoutBuilder with ()
```

Return Value

A **GridLayoutBuilder** instance.

See Also

GridLayout Members
GridLayout Class
com.mindfusion.diagramming Namespace

GridRouter Class

Implements a link routing algorithm that uses a grid to represent the free and occupied regions in the diagram.

Syntax

Java
`public class GridRouter implements LinkRouter`

Remarks

To use this class for link routing, assign its instance to the LinkRouter property of the Diagram class. It is based on heuristic algorithm whose parameters can be customized via RoutingOptions.

Inheritance Hierarchy

java.lang.Object
com.mindfusion.diagramming.GridRouter

See Also

GridRouter Members
com.mindfusion.diagramming Namespace

GridRouter Members

Implements a link routing algorithm that uses a grid to represent the free and occupied regions in the diagram.

The following tables list the members exposed by the GridRouter type.

Public Constructors

	Name	Description
	GridRouter	

Public Methods

	Name	Description
	getDiagram	Gets the Diagram whose links will be routed.
	routeLink	Implements LinkRouter.routeLink.

	routeLinks	Implements LinkRouter.routeLinks.
	setDiagram	Sets the Diagram whose links will be routed.

See Also

GridRouter Class
com.mindfusion.diagramming Namespace

GridRouter Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public GridRouter ()
```

See Also

GridRouter Class
com.mindfusion.diagramming Namespace

GridRouter Methods

GridRouter.getDiagram Method

Gets the Diagram whose links will be routed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Diagram getDiagram ()
```

Return Value

A Diagram instance.

See Also

GridRouter Members
GridRouter Class
com.mindfusion.diagramming Namespace

GridRouter.routeLink Method

Implements LinkRouter.routeLink.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean routeLink (
    DiagramLink link,
    ConnectionPoint originConnection,
    ConnectionPoint destinationConnection,
    boolean nowCreating
)
```

Parameters

link
The DiagramLink to route.

originConnection
Represents connection to Origin node, potentially different from link's stored connection when modifying first control point.

destinationConnection
Represents connection to Destination node, potentially different from link's stored connection when modifying last control point.

nowCreating
Indicates whether link is currently being created.

Return Value

true if a path has been found successfully, otherwise false.

See Also

GridRouter Members
GridRouter Class
com.mindfusion.diagramming Namespace

GridRouter.routeLinks Method

Implements LinkRouter.routeLinks.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkList routeLinks (
    DiagramLinkList links
)
```

Parameters

links
A list of DiagramLink objects that should be routed.

Return Value

A list of links that were not routed successfully.

See Also

GridRouter Members
GridRouter Class
com.mindfusion.diagramming Namespace

GridRouter.setDiagram Method

Sets the Diagram whose links will be routed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDiagram (
    Diagram value
)
```

Parameters

value
A Diagram instance.

See Also

GridRouter Members
GridRouter Class
com.mindfusion.diagramming Namespace

GridStyle Enumeration

The members of this enumeration specify how the alignment grid should be drawn on the screen. Its elements can be used as arguments of the setGridStyle method of the Diagram class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum GridStyle
```

Members

	Member name	Description
	Lines	The grid is drawn as a series of crossing horizontal and vertical lines.
	Points	The alignment grid is drawn as a matrix of points.

com.mindfusion.diagramming Namespace

Group Class

Represents an hierarchical group of items. One of the items is considered the master item, the rest are subordinated items that follow the master one when it is modified.

Syntax

Java
`public class Group implements Externalizable`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.Group

See Also

Group Members
com.mindfusion.diagramming Namespace

Group Members

Represents an hierarchical group of items. One of the items is considered the master item, the rest are subordinated items that follow the master one when it is modified.

The following tables list the members exposed by the Group type.

Public Constructors

	Name	Description
	Group	Overloaded.

Public Methods

	Name	Description
	attachProportional	Adds a node to the group.
	attachToCorner	Adds a node to the group.
	attachToLinkPoint	Adds a node to the group.
	attachToLinkSegment	Adds a node to the group.
	attachToLongestHSegment	Adds a node to the group, maintaining its relative positions to master link's longest horizontal segment.
	attachToSideMiddle	Attaches a node to the group, so that it will follow the middle point of another node's side.

	detach	Removes a node from the group.
	getAttachedNodes	Gets a list of the subordinated nodes in this group.
	getAutoDeleteItems	Gets a value indicating whether the subordinated items in this group will be deleted automatically when the group is destroyed.
	getExpandable	Gets a value indicating whether expansion of a tree branch that contains the master item of a group will propagate through its attached items.
	getFollowMasterContainment	
	getFollowMasterRotation	Gets a value indicating whether the attached items in a group follow the rotation of the group's master item.
	getMainItem	Gets the master item of this group.
	getTag	Gets the custom data object assigned to this group.
	getVisible	Gets a value indicating whether this group is visible.
	readExternal	Implements Externalizable.
	setAutoDeleteItems	Sets a value indicating whether the subordinated items in this group should be deleted automatically when the group is destroyed.
	setExpandable	Sets a value indicating whether expansion of a tree branch that contains the master item of a group should propagate through its attached items.
	setFollowMasterContainment	
	setFollowMasterRotation	Sets a value indicating whether the attached items in a group should follow the rotation of the group's master item.
	setTag	Assigns a custom data object to this group. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event.
	setVisible	Shows or hides all items in the group.
	writeExternal	Implements Externalizable.

Group Constructor (Group)

Initializes a new instance of the Group class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Group (
    Group prototype
)
```

Parameters

prototype
A Group instance whose attributes are copied to this group.

See Also

Group Constructor Overload List
Group Class
com.mindfusion.diagramming Namespace

Group Methods

Group.attachProportional Method

Adds a node to the group.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean attachProportional (
    DiagramNode node,
    float left,
    float top,
    float right,
    float bottom
)
```

Parameters

node
The DiagramNode to attach.

left
A float percent value specifying to what X position in themaster node to attach the left side of this node.

top
A float percent value specifying to what Y position in themaster node to attach the top side of this node.

right
A float percent value specifying to what X position in themaster node to attach the right side of this node.

bottom
A float percent value specifying to what Y position in themaster node to attach the bottom side of this node.

Return Value

true if the node is attached successfully,otherwise false.

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.attachToCorner Method

Adds a node to the group.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean attachToCorner (
    DiagramNode node,
    int corner
)
```

Parameters

node
The DiagramNode to attach.

corner
The corner to attach to.

Return Value

true if the node is attached successfully,otherwise false.

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.attachToLinkPoint Method

Adds a node to the group.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean attachToLinkPoint (
    DiagramNode node,
    int point
)
```

Parameters

node
The DiagramNode to attach.

point
Index of the link control point to attach to.

Return Value

true if the node is attached successfully,otherwise **false**.

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.attachToLinkSegment Method

Adds a node to the group.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean attachToLinkSegment (
    DiagramNode node,
    int segment
)
```

Parameters

node
The DiagramNode to attach.

segment
The link segment to attach to.

Return Value

true if the node is attached successfully, otherwise **false**.

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.attachToLongestHSegment Method

Adds a node to the group, maintaining its relative positions to master link's longest horizontal segment.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean attachToLongestHSegment (
    DiagramNode node
)
```

Parameters

node
The DiagramNode to attach.

Return Value

true if the node is attached successfully, otherwise **false**.

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.attachToSideMiddle Method

Attaches a node to the group, so that it will follow the middle point of another node's side.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean attachToSideMiddle (
    DiagramNode node,
    int side
)
```

Parameters

node
The DiagramNode to attach.

side
The side to attach to.

Return Value

true if the node is attached successfully, otherwise **false**.

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.detach Method

Removes a node from the group.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean detach (
    DiagramNode node
)
```

Parameters

node
The DiagramNode that should be detached.

Return Value

true if the node is detached, otherwise **false**.

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.getAttachedNodes Method

Gets a list of the subordinated nodes in this group.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNodeList getAttachedNodes ()
```

Return Value

An DiagramNodeList containing the nodes attached to this group.

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.getAutoDeleteItems Method

Gets a value indicating whether the subordinated items in this group will be deleted automatically when the group is destroyed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAutoDeleteItems ()
```

Return Value

true if the items will be deleted automatically,otherwise **false**.

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.getExpandable Method

Gets a value indicating whether expansion of a tree branch that contains the master item of a group will propagate through its attached items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getExpandable ()
```

Return Value

true if tree expansion propagates throughthis group, otherwise **false**.

```

Return Value

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.getFollowMasterRotation Method

Gets a value indicating whether the attached items in a group follow the rotation of the group's master item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public GroupRotation getFollowMasterRotation ()
```

Return Value

A member of the GroupRotation enumeration. The default is **IgnoreRotation**.

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.getMainItem Method

Gets the master item of this group.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramItem getMainItem ()
```

Return Value

A reference to the master DiagramItem.

See Also

Group Members
Group Class

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.setAutoDeleteItems Method

Sets a value indicating whether the subordinated items in this group should be deleted automatically when the group is destroyed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoDeleteItems (
    boolean value
)
```

Parameters

value
true if the items should be deleted automatically,otherwise **false**.

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.setExpandable Method

Sets a value indicating whether expansion of a tree branch that contains the master item of a group should propagate through its attached items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setExpandable (
    boolean value
)
```

Parameters

value
true if tree expansion should propagate throughthis group, otherwise **false**.

```
public void setFollowMasterContainment (
    boolean value
)
```

Parameters

value

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.setFollowMasterRotation Method

Sets a value indicating whether the attached items in a group should follow the rotation of the group's master item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFollowMasterRotation (
    GroupRotation value
)
```

Parameters

value
A member of the GroupRotation enumeration.

See Also

Group Members
Group Class
com.mindfusion.diagramming Namespace

Group.setTag Method

Assigns a custom data object to this group. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTag (
    Object value
)
```

Parameters

value

An Object containing custom data.

GroupAttachCmd Members

Represents an action that attaches an item to a group.

The following tables list the members exposed by the GroupAttachCmd type.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)
	execute	Overloaded.
	getGroup	Gets the group related to this command.
	getItem	Gets the item related to this command.
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	This method is called by the UndoManager when redoing actions. (Inherited from Command.)
	setTitle	Sets the command title. (Inherited from Command.)
	undo	This method is called by the **UndoManager** when undoing actions.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related. (Inherited from Command.)
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

GroupAttachCmd.execute Method ()

Attaches the item to the group.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public void execute ()`

See Also

execute Method Overload List
GroupAttachCmd Members

GroupAttachCmd.execute Method (boolean)

This method is called internally by JDiagram when attaching items to groups.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void execute (
    boolean undoEnabled
)
```

Parameters

undoEnabled
true if the undo manager is enabledat this time, otherwise **false**.

See Also

execute Method Overload List
GroupAttachCmd Members
GroupAttachCmd Class
com.mindfusion.diagramming Namespace

GroupAttachCmd.getGroup Method

Gets the group related to this command.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Group getGroup ()
```

Return Value

A Group instance.

See Also

GroupAttachCmd Members

GroupDetachCmd Members

Represents an action that detaches an item from a group.

The following tables list the members exposed by the GroupDetachCmd type.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)
	execute	Overloaded.
	getGroup	Gets the group related to this command.
	getItem	Gets the item related to this command.
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	This method is called by the UndoManager when redoing actions. (Inherited from Command.)
	setTitle	Sets the command title. (Inherited from Command.)
	undo	This method is called by the **UndoManager** when undoing actions.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related. (Inherited from Command.)
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

GroupEvent Members

Contains the arguments passed to handlers of group-related events, such as groupDestroyed.

The following tables list the members exposed by the GroupEvent type.

Public Constructors

	Name	Description
	GroupEvent	Represents methods that will handle general group-related events.

Public Methods

	Name	Description
	getGroup	Gets the group for which the event was raised.
	getIndex	Gets an integer index related to the event.

See Also

GroupEvent Class
com.mindfusion.diagramming Namespace

GroupEvent Constructor

Represents methods that will handle general group-related events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public GroupEvent (
    Object source,
    Group group
)
```

Parameters

source
The source of the event.

group
The Group for which the event is raised.

See Also

GroupEvent Class
com.mindfusion.diagramming Namespace

GroupEvent Methods

GroupEvent.getGroup Method

Gets the group for which the event was raised.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Group getGroup ()
```

Return Value

An instance of the Group class.

See Also

GroupEvent Members
GroupEvent Class
com.mindfusion.diagramming Namespace

GroupEvent.getIndex Method

Gets an integer index related to the event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getIndex ()
```

Return Value

An integer value.

See Also

GroupList Class

A strongly typed list of Group objects.

Syntax

Java

```
public class GroupList extends BaseList<E>
```

Inheritance Hierarchy

java.lang.Object
  java.util.AbstractCollection(E)
    java.util.AbstractList(E)
      com.mindfusion.diagramming.BaseList(E)
        com.mindfusion.diagramming.GroupList

See Also

GroupList Members
com.mindfusion.diagramming Namespace

GroupList Members

A strongly typed list of Group objects.

The following tables list the members exposed by the GroupList type.

Public Constructors

	Name	Description
	GroupList	

Protected Fields

	Name	Description
	list	(Inherited from BaseList.)
	listEvent	(Inherited from BaseList.)
	notifyParent	(Inherited from BaseList.)

Public Methods

	Name	Description
	add	Adds a new element to the list. (Inherited from BaseList.)
	clear	Removes all elements from the list. (Inherited from BaseList.)
	contains	Determines if this list contains the specified element. (Inherited from BaseList.)
	first	Gets the first element of this list. (Inherited from BaseList.)
	get	Gets the element at the specified position in this list. (Inherited from BaseList.)
	last	Gets the last element of this list. (Inherited from BaseList.)
	readExternal	Loads the list's contents. (Inherited from BaseList.)
	remove	Overloaded. (Inherited from BaseList.)
	removeRange	Removes a range of elements from this list. (Inherited from BaseList.)
	set	Sets the element at the specified position in this list. (Inherited from BaseList.)
	size	Gets the number of elements in this list. (Inherited from BaseList.)
	writeExternal	Saves the list's contents. (Inherited from BaseList.)

Protected Methods

	Name	Description
	raiseAdding	Raises the adding event. (Inherited from BaseList.)

	raiseClearing	Raises the clearing event. (Inherited from BaseList.)
	raiseRemoving	Raises the removing event. (Inherited from BaseList.)

com.mindfusion.diagramming Namespace

GroupRotation Enumeration

The members of this enumeration indicate how rotation of a group's master node affects the nodes attached to that group.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum GroupRotation`

Members

	Member name	Description
	FerrisWheel	Attached nodes are moved to a position corresponding to the master node's rotation angle, but they are node rotated.
	IgnoreRotation	Attached nodes ignore the rotation angle applied to the master node.
	RotateChildren	Attached nodes are rotated by the RotationAngle of the group's master node and around its center.

See Also

HandlesStyle Enumeration

The members of this enumeration specify the appearance and functionality of the manipulation handles displayed around a selected node. They can be used as parameters of the setHandlesStyle method of the DiagramNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum HandlesStyle`

Members

	Member name	Description
	Custom	JDiagram raises the drawHandles and hitTestSelHandles events to let your application perform custom drawing and hit testing of selection handles.
	DashFrame	If selected, a node is drawn with a dashed frame around it. The frame enables resizing the node. The center of the node allows moving it and the edge area enables creating links.
	EasyMove	Any point of the interior of a node enables moving the node, except a small area in the center that allows creating links. This works best after calling DiagramView.setModificationStart specifying AutoHandles as argument.
	HatchFrame	If selected, the object is drawn with hatched frame around it. Modifications can be done as with DashFrame.
	HatchHandles	If selected, a node is drawn with both hatched frame and modification handles. The frame enable moving the node, and the handles enable resizing. Links are created from any point of the interior.
	HatchHandles2	Looks like HatchHandles, but allows moving the node from its interior region. Links are created from the points near the edge.
	HatchHandles3	Behaves like HatchHandles2, but paints the selection frame using a denser brush pattern.
	Invisible	There is no visible difference between selected and unselected node.
	InvisibleMove	There aren't any selection handles displayed. The selected node can only be moved, but not resized.
	MoveOnly	If a node is selected, it can only be moved. This works best after calling **DiagramView.setModificationStart** specifying **AutoHandles** as argument.

	RoundAndSquare	Corner resize handles are round, remaining handles are square.
	RoundAndSquare2	Corner resize handles are round, remaining handles are square. In addition, there is a dashed frame drawn around selected nodes.
	SquareHandles	If selected, the node is drawn with square modification handles around it.
	SquareHandles2	Square resize handles are drawn around a selected node. There isn't a move- handle in the center as with the SquareHandles style, but nodes can be moved by dragging their interior or caption areas. Links can be created by drawing from near the edges of a node.

HandlesVisualStyle Members

Defines the Pen and Brush objects used to draw items' adjustment handles.

The following tables list the members exposed by the HandlesVisualStyle type.

Public Constructors

	Name	Description
	HandlesVisualStyle	Initializes a new instance of the HandlesVisualStyle class.

Public Methods

	Name	Description
	getControlPointBrush	Gets a Brush used to fill the interior of shape control points.
	getDashBackground	Gets a Brush used to draw dash frame background.
	getDashPen	Gets a Pen used to draw dashed selection frames.
	getHandleBrush	Gets a Brush used to fill the interior of selection handles.
	getHandlePen	Gets a Pen used to draw the border of selection handles.
	getHatchBrush	Gets a Brush used to draw hatch frames.
	getPatternBrush	Gets a Brush used to draw selection frames for the MoveOnly style.
	getRotationHandleBrush	Gets a Brush used to fill the interior of the rotation handle.
	loadFromXml	Loads the style from XML.
	readExternal	
	saveToXml	Saves the style to XML.
	setControlPointBrush	Sets a Brush used to fill the interior of shape control points.
	setDashBackground	Sets a Brush used to draw dash frame background.
	setDashPen	Sets a Pen used to draw dashed selection frames.
	setHandleBrush	Sets a Brush used to fill the interior of selection handles.
	setHandlePen	Sets a Pen used to draw the border of selection handles.
	setHatchBrush	Sets a Brush used to draw hatch frames.
	setPatternBrush	Sets a Brush used to draw selection frames for the MoveOnly style.
	setRotationHandleBrush	Sets a Brush used to fill the interior of the rotation handle.
	writeExternal

HandlesVisualStyle.loadFromXml Method

Loads the style from XML.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    String elementName,
    String colorElementName,
    Element parentElement,
    XmlPersistContext context
)
```

Parameters

elementName
The name of the element that describes the style.

colorElementName
The name of an element that contains a fallback color.

parentElement
The parent XML element.

context
An <@link XmlPersistContext} object providing contextual information about the serialization process and some helper serialization methods.

HandlesVisualStyle.saveToXml Method

Saves the style to XML.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    String elementName,
    Element parentElement,
    XmlPersistContext context
)
```

Parameters

elementName
The name of the element that describes the style.

parentElement
The parent XML element.

context
An <@link XmlPersistContext} object providing contextual information about the serialization process and some helper serialization methods.

HierarchicalLayout Class

Performs hierarchical layout on simple, connected, level-planar graphs.

Syntax

Java

```
public class HierarchicalLayout extends AbstractLayout
```

Remarks

HierarchicalLayout places nodes on user-defined levels, such that if the source graph is level-planar, all links are guaranteed to have a single segment and will not intersect. A graph is considered level-planar if it is possible to draw it without link intersections when its nodes are positioned on predefined levels. The layout method requires that for each node LayoutTraits contains a HierarchicalLayoutTraits.Level entry specifying the level, and no two connected nodes must be on the same level.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.AbstractLayout
    com.mindfusion.diagramming.HierarchicalLayout

See Also

HierarchicalLayout Members
com.mindfusion.diagramming Namespace

HierarchicalLayout Members

Performs hierarchical layout on simple, connected, level-planar graphs.

The following tables list the members exposed by the HierarchicalLayout type.

Public Constructors

	Name	Description
	HierarchicalLayout	Initializes a new instance of the **HierarchicalLayout** class.

Public Methods

	Name	Description
	arrange	Applies the layout on the specified subset of items from the specified Diagram instance.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	getLevelDistance	Gets the distance between adjacent levels in the hierarchical layout.
	getLinkBendFactor	Gets the bending factor of links.
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getOrientation	Gets a the orientation of the arranged graph.
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	init	Returns a HierarchicalLayoutBuilder object used to configure this HierarchicalLayout instance.
S	removeMidleSegmentPoint	(Inherited from AbstractLayout.)

	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	setLevelDistance	Sets the distance between adjacent levels in the hierarchical layout.
	setLinkBendFactor	Sets the bending factor of links. A value of 1 indicates that the links should not bend. A value less than 1 indicates that the links should bend towards the geometric center of the graph. A value greater than 1 indicates that the links should bend outwards.
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setOrientation	Sets a the orientation of the arranged graph.
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
S	with	Returns a HierarchicalLayoutBuilder object used to configure and create new HierarchicalLayout instances.

HierarchicalLayout Methods

HierarchicalLayout.arrange Method

Applies the layout on the specified subset of items from the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram
The Diagram that should be arranged.

items
A collection of nodes and links from diagram that define the subgraph to arrange.

Return Value

This method always returns true.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public HierarchicalLayoutBuilder init ()
```

Return Value

A **HierarchicalLayoutBuilder** instance.

See Also

HierarchicalLayout Members
HierarchicalLayout Class
com.mindfusion.diagramming Namespace

HierarchicalLayout.setLevelDistance Method

Sets the distance between adjacent levels in the hierarchical layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLevelDistance (
    float value
)
```

Parameters

value

See Also

HierarchicalLayout Members
HierarchicalLayout Class
com.mindfusion.diagramming Namespace

HierarchicalLayout.setLinkBendFactor Method

Sets the bending factor of links. A value of 1 indicates that the links should not bend. A value less than 1 indicates that the links should bend towards the geometric center of the graph. A value greater than 1 indicates that the links should bend outwards.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkBendFactor (
    float value
)
```

Parameters

value

See Also

HierarchicalLayout Members
HierarchicalLayout Class
com.mindfusion.diagramming Namespace

HierarchicalLayout.setOrientation Method

Sets a the orientation of the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setOrientation (
    Orientation value
)
```

Parameters

value
A member of the Orientation enumeration.

See Also

HierarchicalLayout Members
HierarchicalLayout Class
com.mindfusion.diagramming Namespace

HierarchicalLayout.with Method

Returns a HierarchicalLayoutBuilder object used to configure and create new HierarchicalLayout instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static HierarchicalLayoutBuilder with ()
```

Return Value

A **HierarchicalLayoutBuilder** instance.

See Also

HierarchicalLayout Members
HierarchicalLayout Class
com.mindfusion.diagramming Namespace

HitTestEvent Class

Contains the arguments passed to custom hit-testing event handlers.

Syntax

Java
`public class HitTestEvent extends EventObject`

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.diagramming.HitTestEvent

See Also

HitTestEvent Members
com.mindfusion.diagramming Namespace

HitTestEvent Members

Contains the arguments passed to custom hit-testing event handlers.

The following tables list the members exposed by the HitTestEvent type.

Public Constructors

	Name	Description
	HitTestEvent	Initializes a new instance of the **HitTestEvent** class.

Public Methods

	Name	Description
	getHitResult	Gets the adjustment handle that has been hit.
	getItem	Gets the item whose adjustment handles are being hit-tested.
	getPointerPosition	Gets the current cursor position, expressed in document coordinates.
	setHitResult	Sets the adjustment handle that has been hit.

See Also

HitTestEvent Class
com.mindfusion.diagramming Namespace

HitTestEvent Constructor

Initializes a new instance of the HitTestEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public HitTestEvent (
    Object source,
    DiagramItem item,
    Point2D pointerPosition
)
```

Parameters

source
The event source.

item
The DiagramItem related to the event.

mousePosition
The cursor location at the time the event is raised, expressed in document coordinates.

See Also

HitTestEvent Class
com.mindfusion.diagramming Namespace

HitTestEvent Methods

HitTestEvent.getHitResult Method

Gets the adjustment handle that has been hit.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AdjustmentHandle getHitResult ()
```

Return Value

An AdjustmentHandle instance representing the handle, or **null** if there is no handle located at the specified position.

See Also

HitTestEvent Members
HitTestEvent Class
com.mindfusion.diagramming Namespace

HitTestEvent.getItem Method

Gets the item whose adjustment handles are being hit-tested.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public DiagramItem getItem ()
```

Return Value

A DiagramItem instance.

See Also

HitTestEvent Members
HitTestEvent Class
com.mindfusion.diagramming Namespace

HitTestEvent.getPointerPosition Method

Gets the current cursor position, expressed in document coordinates.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public Point2D getPointerPosition ()
```

Return Value

See Also

HitTestEvent Members
HitTestEvent Class
com.mindfusion.diagramming Namespace

HitTestEvent.setHitResult Method

Sets the adjustment handle that has been hit.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void setHitResult (
    AdjustmentHandle hitResult
```

```
)
```

Parameters

hitResult
An AdjustmentHandle instance representing the handle, or **null** if there is no handle located at the specified position.

See Also

HitTestEvent Members
HitTestEvent Class
com.mindfusion.diagramming Namespace

HitTestPriority Enumeration

The members of this enumeration specify the order of item hit testing. They can be used as arguments to the setHitTestPriority method.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum HitTestPriority`

Members

	Member name	Description
	NodesBeforeLinks	Test nodes first, then links.
	ZOrder	Test items in decreasing Z order, independently of their types.

See Also

com.mindfusion.diagramming Namespace

HtmlBuilder Class

Provides helper methods for building HTML image maps.

Syntax

Java
`public class HtmlBuilder`

Inheritance Hierarchy

java.lang.Object
com.mindfusion.diagramming.HtmlBuilder

See Also

HtmlBuilder Members
com.mindfusion.diagramming Namespace

HtmlBuilder Members

Provides helper methods for building HTML image maps.

The following tables list the members exposed by the HtmlBuilder type.

Public Constructors

	Name	Description
	HtmlBuilder	Initializes a new HtmlBuilder instance.

Public Methods

	Name	Description
	createImageHtml	Exports a diagram image file and generates the code for an html page that displays that file along with the html image map that corresponds to the diagram.
	createImageMap	Creates an HTML image map.
	createUseMapAttr	Creates a USEMAP attribute for the specified image map.
	getAreasForTableCells	Gets a value indicating whether image map AREA elements will be created for tables' cells.
	getExpandBtnHyperLink	Gets a hyperlink assigned to the AREA elements created for expand/collapse buttons.
	getLinkTarget	Gets the name of the target frame where hyperlinks should be opened.
	getScale	
	setAreasForTableCells	Sets a value indicating whether image map AREA elements should be created for tables' cells.
	setExpandBtnHyperLink	Sets a hyperlink that should be assigned to the AREA elements created for expand/collapse buttons.
	setLinkTarget	Sets the name of the target frame where hyperlinks should be opened.
	setScale	

See Also

HtmlBuilder Class
com.mindfusion.diagramming Namespace

HtmlBuilder Constructor

Initializes a new HtmlBuilder instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public HtmlBuilder (
    Diagram diagram
)
```

Parameters

diagram
The Diagram whose contents should be exported to HTML.

See Also

HtmlBuilder Class
com.mindfusion.diagramming Namespace

HtmlBuilder Methods

HtmlBuilder.createImageHtml Method

Exports a diagram image file and generates the code for an html page that displays that file along with the html image map that corresponds to the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String createImageHtml (
    String htmlFileName,
    String htmlTitle,
    String imgLocalPath,
    String imgURL,
    String imgFormat
)
```

Parameters

htmlFileName
The name of the html file that should be created.

htmlTitle
The title of the HTML page.

imgLocalPath
The name of the exported image file.

imgURL
The URL of the image file.

imgFormat
The format of the exported image.

Return Value

A String object containing the HTML code.

See Also

HtmlBuilder Members
HtmlBuilder Class
com.mindfusion.diagramming Namespace

HtmlBuilder.createImageMap Method

Creates an HTML image map.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String createImageMap (
    String mapName
)
```

Parameters

mapName
A **String** containing the map element ID.

Return Value

A **String** object containing the image map tags.

See Also

HtmlBuilder Members
HtmlBuilder Class
com.mindfusion.diagramming Namespace

HtmlBuilder.createUseMapAttr Method

Creates a USEMAP attribute for the specified image map.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String createUseMapAttr (
    String mapID
)
```

Parameters

mapID
A String containing the map element ID.

Return Value

A String object containing the USEMAP code.

See Also

HtmlBuilder Members
HtmlBuilder Class
com.mindfusion.diagramming Namespace

HtmlBuilder.getAreasForTableCells Method

Gets a value indicating whether image map AREA elements will be created for tables' cells.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAreasForTableCells ()
```

Return Value

true if cell areas will be created, otherwise **false**.

See Also

HtmlBuilder Members
HtmlBuilder Class
com.mindfusion.diagramming Namespace

HtmlBuilder.getExpandBtnHyperLink Method

Gets a hyperlink assigned to the AREA elements created for expand/collapse buttons.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getExpandBtnHyperLink ()
```

Return Value

A String object containing the hyperlink.

See Also

HtmlBuilder Members
HtmlBuilder Class
com.mindfusion.diagramming Namespace

HtmlBuilder.getLinkTarget Method

Gets the name of the target frame where hyperlinks should be opened.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public String getLinkTarget ()
```

Return Value

A String object containing the target frame name.

See Also

HtmlBuilder Members
HtmlBuilder Class
com.mindfusion.diagramming Namespace

HtmlBuilder.getScale Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getScale ()
```

Return Value

See Also

HtmlBuilder Members
HtmlBuilder Class
com.mindfusion.diagramming Namespace

HtmlBuilder.setAreasForTableCells Method

Sets a value indicating whether image map AREA elements should be created for tables' cells.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setAreasForTableCells (
    boolean value
)
```

Parameters

value
true if cell areas should be created, otherwise **false**.

See Also

HtmlBuilder Members
HtmlBuilder Class
com.mindfusion.diagramming Namespace

HtmlBuilder.setExpandBtnHyperLink Method

Sets a hyperlink that should be assigned to the AREA elements created for expand/collapse buttons.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setExpandBtnHyperLink (
    String value
)
```

Parameters

value
A String object containing the hyperlink.

See Also

HtmlBuilder Members
HtmlBuilder Class
com.mindfusion.diagramming Namespace

HtmlBuilder.setLinkTarget Method

Sets the name of the target frame where hyperlinks should be opened.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setLinkTarget (
    String value
)
```

Parameters

value
A String containing the name of the target frame.

See Also

HtmlBuilder Members
HtmlBuilder Class
com.mindfusion.diagramming Namespace

HtmlBuilder.setScale Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setScale (
    float scale
)
```

Parameters

scale

See Also

HtmlBuilder Members
HtmlBuilder Class
com.mindfusion.diagramming Namespace

HyperLinkStyle Enumeration

Specifies how various export components should treat the HyperLink property of items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum HyperLinkStyle
```

Members

	Member name	Description
	None	Do not generate hyperlinks.
	Shape	Generate hyperlinks that correspond to the item's shape.

	Text	Generate hyperlinks for the text bounding rectangle.

See Also

com.mindfusion.diagramming Namespace

IItemFactory Interface

Defines an interface for constructing objects from their XML elements.

Syntax

Java
`public interface IItemFactory`

Inheritors

com.mindfusion.diagramming.Diagram

See Also

IItemFactory Members
com.mindfusion.diagramming Namespace

IItemFactory Members

Defines an interface for constructing objects from their XML elements.

The following tables list the members exposed by the IItemFactory type.

Public Methods

	Name	Description
	createItem	
	getClsidTable	
	getTypeTable	

See Also

IItemFactory Interface
com.mindfusion.diagramming Namespace

IItemFactory Methods

IItemFactory.createItem Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
Object createItem (
    String itemClass
)
```

Parameters

itemClass

Return Value

See Also

IItemFactory Members
IItemFactory Interface
com.mindfusion.diagramming Namespace

IItemFactory.getClsidTable Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
HashMap<String, ClassDescriptor> getClsidTable ()
```

Return Value

See Also

IItemFactory Members
IItemFactory Interface
com.mindfusion.diagramming Namespace

IItemFactory.getTypeTable Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
HashMap<Class<?>, ClassDescriptor> getTypeTable ()
```

Return Value

See Also

ImageAlign Enumeration

The members of this enumeration specify the position and size of the image displayed inside a node. These constants can be used as parameters of the setImageAlign method of the ShapeNode and TableNode classes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum ImageAlign
```

Members

	Member name	Description
	BottomCenter	The image is aligned to the bottom-center point of the node.
	BottomLeft	The image is aligned to the bottom-left corner of the node.
	BottomRight	The image is aligned to the bottom-right corner of the node.
	Center	The image is centered.
	Fit	The image is resized to fit the node, preserving its original x/y ratio.
	FitBottom	The image is resized to fit the size of the object and aligned to bottom side.
	FitLeft	The image is resized to fit the size of the object and aligned to left side.
	FitRight	The image is resized to fit the size of the object and aligned to right side.
	FitTop	The image is resized to fit the size of the object and aligned to top side.
	MiddleLeft	The image is aligned to the middle-left point of the node.
	MiddleRight	The image is aligned to the middle-right point of the node.
	Stretch	The image is stretched to fill the node.
	Tile	The image is tiled across the node area.
	TopCenter	The image is aligned to the top-center point of the node.
	TopLeft	The image is aligned to the top-left corner of the node.
	TopRight	The image is aligned to the top-right corner of the node.

InplaceEditable Members
com.mindfusion.diagramming Namespace

InplaceEditable Members

Represents an in-place editable object.

The following tables list the members exposed by the InplaceEditable type.

Public Methods

	Name	Description
	getEditRect	Returns the rectangle where the in-place edit text box should appear (in document coordinates).
	getTextToEdit	Returns the text of the object which will be displayed initially when the object is in-place edited.
	setEditedText	Sets the edited text to the object after the in-place editing operation has been completed successfully.

See Also

InplaceEditable Interface
com.mindfusion.diagramming Namespace

InplaceEditable Methods

InplaceEditable.getEditRect Method

Returns the rectangle where the in-place edit text box should appear (in document coordinates).

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

Rectangle2D getEditRect (
    DiagramItem item,
    Point2D mousePosition
)
```

Parameters

item
The DiagramItem whose text will be edited or that contains the edited component.

mousePosition
A **Point2D** instance specifying the current pointer position.

Return Value

A **Rectangle2D** specifying where the edit box should be placed.

See Also

InplaceEditable Members
InplaceEditable Interface
com.mindfusion.diagramming Namespace

InplaceEditable.getTextToEdit Method

Returns the text of the object which will be displayed initially when the object is in-place edited.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

String getTextToEdit ()
```

Return Value

A string value that represents the initial contents of the in-place editing box.

See Also

InplaceEditable Members
InplaceEditable Interface
com.mindfusion.diagramming Namespace

InplaceEditable.setEditedText Method

Sets the edited text to the object after the in-place editing operation has been completed successfully.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void setEditedText (
    String newText
)
```

Parameters

newText
The new text of the in-place edited object.

See Also

InplaceEditable Members
InplaceEditable Interface

InPlaceEditEvent Members

The event is raised when leaving in-place editing mode.

The following tables list the members exposed by the InPlaceEditEvent type.

Public Constructors

	Name	Description
	InPlaceEditEvent	Initializes a new instance of the **InPlaceEditEvent** class.

Public Methods

	Name	Description
	getBounds	
	getEditControl	Gets the control used to edit the item's text.
	getItem	Gets an instance of the InplaceEditable class.
	setBounds	
	setEditControl	Sets the control used to edit the item's text.
	setItem	Sets the **InplaceEditable** instance.

See Also

InPlaceEditEvent Class
com.mindfusion.diagramming Namespace

InPlaceEditEvent Constructor

Initializes a new instance of the InPlaceEditEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public InPlaceEditEvent (
    Object source,
    InplaceEditable item,
    JComponent editControl
)
```

Parameters

source
The node or table cell whose text has been edited.

item
An InplaceEditable instance that contains the event data.

editControl
The used to edit the item.

See Also

InPlaceEditEvent Class
com.mindfusion.diagramming Namespace

InPlaceEditEvent Methods

InPlaceEditEvent.getBounds Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Rectangle2D getBounds ()
```

Return Value

See Also

InPlaceEditEvent Members
InPlaceEditEvent Class
com.mindfusion.diagramming Namespace

InPlaceEditEvent.getEditControl Method

Gets the control used to edit the item's text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public JComponent getEditControl ()
```

Return Value

The component that lets users edit item's text.

See Also

InPlaceEditEvent Members
InPlaceEditEvent Class
com.mindfusion.diagramming Namespace

InPlaceEditEvent.getItem Method

Gets an instance of the InplaceEditable class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public InplaceEditable getItem ()
```

Return Value

An instance of the InplaceEditable class.

See Also

InPlaceEditEvent Members
InPlaceEditEvent Class
com.mindfusion.diagramming Namespace

InPlaceEditEvent.setEditControl Method

Sets the control used to edit the item's text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEditControl (
    JComponent value
)
```

Parameters

value
The component that lets users edit item's text.

See Also

InPlaceEditEvent Members
InPlaceEditEvent Class
com.mindfusion.diagramming Namespace

InPlaceEditEvent.setItem Method

Sets the InplaceEditable instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setItem (
    InplaceEditable item
)
```

Parameters

item
Sets an InplaceEditable object.

Interaction Members

Tracks pointer messages to implement user interaction with the diagram.

The following tables list the members exposed by the Interaction type.

Protected Constructors

	Name	Description
	Interaction	Initializes a new instance of the **Interaction** class.

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled.
	pointerDown	Invoked in response to system pointer down events.
	pointerMove	Invoked when the pointer moves.
	pointerOver	Invoked in response to system pointer over events.
	pointerUp	Invoked in response to system pointer up events.

Protected Methods

	Name	Description
	getDiagramView	Gets a reference to the DiagramView control this interaction is associated with.

See Also

Interaction Class
com.mindfusion.diagramming Namespace

Interaction Constructor

Initializes a new instance of the Interaction class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Interaction (
    DiagramView diagramView
)
```

Parameters

diagramView
A DiagramView where the interaction takes place.

See Also

Interaction Class
com.mindfusion.diagramming Namespace

Interaction Methods

Interaction.cancelDrag Method

Invoked when the operation should be canceled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public void cancelDrag ()`

See Also

Interaction Members
Interaction Class
com.mindfusion.diagramming Namespace

Interaction.getDiagramView Method

Gets a reference to the DiagramView control this interaction is associated with.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`protected DiagramView getDiagramView ()`

Return Value

See Also

Interaction Members
Interaction Class
com.mindfusion.diagramming Namespace

Interaction.pointerDown Method

Invoked in response to system pointer down events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void pointerDown (
    Point pointerPosition,
    MouseEvent e
)
```

Parameters

mousePosition
A Point instance that specifies the mouse pointer position.

e
The corresponding system **MouseEvent** object.

See Also

Interaction Members
Interaction Class
com.mindfusion.diagramming Namespace

Interaction.pointerMove Method

Invoked when the pointer moves.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void pointerMove (
    Point pointerPosition,
    MouseEvent e
)
```

Parameters

mousePosition
A Point instance that specifies the mouse pointer position.

e
The corresponding system **MouseEvent** object.

See Also

Interaction Members
Interaction Class
com.mindfusion.diagramming Namespace

Interaction.pointerOver Method

Invoked in response to system pointer over events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void pointerOver (
    Point pointerPosition,
    MouseEvent e
)
```

Parameters

mousePosition
A Point instance that specifies the mouse pointer position.

e
The corresponding system **MouseEvent** object.

See Also

Interaction Members
Interaction Class
com.mindfusion.diagramming Namespace

Interaction.pointerUp Method

Invoked in response to system pointer up events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void pointerUp (
    Point pointerPosition,
    MouseEvent e
)
```

Parameters

mousePosition
A Point instance that specifies the mouse pointer position.

e
The corresponding system **MouseEvent** object.

Interaction Members
Interaction Class
com.mindfusion.diagramming Namespace

InteractionState Class

Encapsulates the current state of user interaction with the control.

Syntax

Java
`public class InteractionState`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.InteractionState

See Also

InteractionState Members
com.mindfusion.diagramming Namespace

InteractionState Members

Encapsulates the current state of user interaction with the control.

The following tables list the members exposed by the InteractionState type.

Public Constructors

	Name	Description
	InteractionState	Initializes a new **InteractionState** instance.

Public Methods

	Name	Description
	getAction	Gets a value indicating what action is currently being performed.
	getAdjustmentHandle	Gets the adjustment handle being dragged by the user.
	getCurrentItem	Gets the item being created or modified.
	getDiagram	Gets the current Diagram instance.
	getInvalidRect	Gets the area that should be repainted.
	getLinkTarget	Gets the current target node when a link is being modified.
	getOriginalStates	
	getPointerMoved	Gets a value indicating whether the mouse pointer has moved since the user pressed down the mouse button
	getSkipSavingState	Gets a value indicating whether diagram items should skip storing their state for subsequent cancel.
	getStartPoint	Gets the coordinates of the point where the modification has started.
	setLinkTarget	Sets the current target node when a link is being modified
	setOriginalStates	

	setPointerMoved	Sets a value indicating whether the mouse pointer has moved since the user pressed down the mouse button

See Also

InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState Constructor

Initializes a new InteractionState instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public InteractionState (
    DiagramItem currentItem,
    AdjustmentHandle adjustmentHandle,
    Action action
)
```

Parameters

currentItem
The DiagramItem to be created or modified.

adjustmentHandle
The selection handle to be dragged with the mouse, defines what kind of modification to perform.

action
A member of the Action enumeration, specifying what kind of action to perform.

See Also

InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState Methods

InteractionState.getAction Method

Gets a value indicating what action is currently being performed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Action getAction ()
```

Return Value

A member of the Action enumeration.

See Also

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState.getAdjustmentHandle Method

Gets the adjustment handle being dragged by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AdjustmentHandle getAdjustmentHandle ()
```

Return Value

An AdjustmentHandle instance representing the dragged handle.

See Also

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState.getCurrentItem Method

Gets the item being created or modified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem getCurrentItem ()
```

Return Value

See Also

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState.getDiagram Method

Gets the current Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Diagram getDiagram ()
```

Return Value

An instance of the Diagram class.

See Also

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState.getInvalidRect Method

Gets the area that should be repainted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Rectangle2D getInvalidRect ()
```

Return Value

A **Rectangle2D** specifying a rectangular region of the diagram that should be repainted.

See Also

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState.getLinkTarget Method

Gets the current target node when a link is being modified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramNode getLinkTarget ()
```

Return Value

A DiagramNode that the currently modified DiagramLink should connect to if the interaction completes at the current pointer position.

See Also

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState.getOriginalStates Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Map<DiagramItem, DiagramItemState> getOriginalStates ()
```

Return Value

See Also

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState.getPointerMoved Method

Gets a value indicating whether the mouse pointer has moved since the user pressed down the mouse button

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getPointerMoved ()
```

Return Value

true if the pointer has moved; otherwise, **false**.

See Also

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState.getSkipSavingState Method

Gets a value indicating whether diagram items should skip storing their state for subsequent cancel.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getSkipSavingState ()
```

Return Value

See Also

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState.getStartPoint Method

Gets the coordinates of the point where the modification has started.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Point2D.Float getStartPoint ()
```

Return Value

A **Point2D.Float** object specifying the start point coordinates.

See Also

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState.setLinkTarget Method

Sets the current target node when a link is being modified

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkTarget (
    DiagramNode value
```

```
)
```

Parameters

value
A DiagramNode that the currently modified DiagramLink should connect to if the interaction completes at the current pointer position.

See Also

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState.setOriginalStates Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setOriginalStates (
    Map<DiagramItem, DiagramItemState> value
)
```

Parameters

value

See Also

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

InteractionState.setPointerMoved Method

Sets a value indicating whether the mouse pointer has moved since the user pressed down the mouse button

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setPointerMoved (
    boolean value
)
```

Parameters

value

true if the pointer has moved; otherwise, **false.**

InteractionState Members
InteractionState Class
com.mindfusion.diagramming Namespace

ItemEvent Class

Contains information passed to the events defined in DiagramListener.

Syntax

Java
`public class ItemEvent extends EventObject`

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.diagramming.ItemEvent

See Also

ItemEvent Members
com.mindfusion.diagramming Namespace

ItemEvent Members

Contains information passed to the events defined in DiagramListener.

The following tables list the members exposed by the ItemEvent type.

Public Constructors

	Name	Description
	ItemEvent	Initializes a new **ItemEvent** instance.

Public Methods

	Name	Description
	getItem	Gets a reference to the item related to the event.

See Also

ItemEvent Class
com.mindfusion.diagramming Namespace

ItemEvent Constructor

Initializes a new ItemEvent instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ItemEvent (
    Object source,
    DiagramItem item
)
```

Parameters

source
The sender of this event.

item
The DiagramItem related to the event.

See Also

ItemEvent Class
com.mindfusion.diagramming Namespace

ItemEvent Methods

ItemEvent.getItem Method

Gets a reference to the item related to the event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem getItem ()
```

Return Value

A reference to an DiagramItem -derived object.

See Also

ItemEvent Members
ItemEvent Class
com.mindfusion.diagramming Namespace

ItemLabel Class

The base class for node and link labels.

Syntax

Java

```
public abstract class ItemLabel
    implements InplaceEditable
```

Remarks

This class represents supplementary labels displayed by an item, in addition to its main Text property. Call the addLabel method to create a label, and customize it through various members of type-specific LinkLabel and NodeLabel classes.

A label can also display a **java.awt.Image** bitmap assigned to the Image property. This lets you draw multiple icons per node, or along a link's geometry.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.ItemLabel
    com.mindfusion.diagramming.LinkLabel
    com.mindfusion.diagramming.NodeLabel

See Also

ItemLabel Members
com.mindfusion.diagramming Namespace

ItemLabel Members

The base class for node and link labels.

The following tables list the members exposed by the ItemLabel type.

Public Constructors

	Name	Description
	ItemLabel	Overloaded. Initializes a new instance of the **ItemLabel** class.

Public Methods

	Name	Description
	cancel	Called when drag operation is canceled.
	getBrush	Gets the brush used to draw the label's background.
	getContentPadding	Gets the distance between Image and Text when both are specified.
	getEditRect	Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in

		document coordinates).
	getEnableWrap	Gets whether the text should wrap to multiple lines.
	getFont	Gets the font of the label's text.
	getHorizontalAlign	Gets label's horizontal alignment relative to the pin point.
	getHorizontalOffset	Gets label's horizontal offset from its pin point.
	getImage	Gets the image displayed by this label.
	getImageAlign	Gets the alignment of label's image relative to text.
	getImageSize	Gets a size that overrides the native image size.
	getImageUrl	Gets a URL used to load an image into this label.
	getIndex	Gets the index of an edge or point this label is relative to.
	getLocked	Gets a value indicating whether users are allowed to edit this label.
	getMargin	Gets the text margins size.
	getMaxWidth	Gets the maximal width that when reached should cause text to wrap to a new line.
	getText	Gets the label's text.
	getTextColor	Gets the color of the label's text.
	getTextToEdit	Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when this label is edited in-place.
	getVerticalAlign	Gets label's vertical alignment relative to the pin point.
	getVerticalOffset	Gets label's vertical offset from its pin point.
	onPointerDown	Called when the left mouse button is pressed while the pointer is over this label.
	onPointerMove	Called when the mouse is moved while this label tracks the mouse events.
	onPointerUp	Called when the left mouse button is released while this label tracks the mouse events.
	setBrush	Sets the brush used to draw the label's background.
	setContentPadding	Sets the distance between **Image** and **Text** when both are specified.
	setEditedText	Implements InplaceEditable.setEditedText. Assigns the edited text to the label after in-place edit operation completes successfully
	setEnableWrap	Sets whether the text should wrap to multiple lines.
	setFont	Sets the font of the label's text.
	setHorizontalAlign	Sets label's horizontal alignment relative to the pin point.
	setHorizontalOffset	Sets label's horizontal offset from its pin point.

	setImage	Sets the image displayed by this label.
	setImageAlign	Sets the alignment of label's image relative to text.
	setImageSize	Sets a size that overrides the native image size.
	setImageUrl	Sets a URL used to load an image into this label.
	setIndex	Sets the index of an edge or point this label is relative to.
	setLocked	Sets a value indicating whether users are allowed to edit this label.
	setMargin	Sets the text margins size.
	setMaxWidth	Sets the maximal width that when reached should cause text to wrap to a new line.
	setMouseCursor	Indicates what cursor to display for interactive labels.
	setText	Sets the label's text.
	setTextColor	Sets the color of the label's text.
	setVerticalAlign	Sets label's vertical alignment relative to the pin point.
	setVerticalOffset	Sets label's vertical offset from its pin point.

Protected Methods

	Name	Description
	draw	Draws this label on the specified **Graphics2D** surface.
	getItem	Returns the DiagramItem that displays this label.
	getLayoutRect	Gets the label's layout rectangle calculated from text length, font and alignment.
	loadFromJson	Loads the label from a JSON object.
	loadFromXml	Loads the label from the specified XML element.
	saveToJson	Saves the label as a JSON object.
	saveToXml	Saves the label into the specified XML element.

ItemLabel Constructor

Initializes a new instance of the ItemLabel class.

Overload List

Name	Description

ItemLabel ()	Used during deserialization.
ItemLabel (DiagramItem)	Initializes a new instance of the **ItemLabel** class.

See Also

ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel Constructor ()

Used during deserialization.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ItemLabel ()
```

See Also

ItemLabel Constructor Overload List
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel Constructor (DiagramItem)

Initializes a new instance of the ItemLabel class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ItemLabel (
    DiagramItem item
)
```

Parameters

item
The DiagramItem that displays the label.

See Also

ItemLabel Constructor Overload List
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel Methods

ItemLabel.cancel Method

Called when drag operation is canceled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void cancel ()
```

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.draw Method

Draws this label on the specified **Graphics2D** surface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void draw (
    Graphics2D graphics
)
```

Parameters

graphics
A **java.awt.Graphics2D** instance.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getBrush Method

Gets the brush used to draw the label's background.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getBrush ()
```

Return Value

A Brush used to paint the label's background. The default value is **null**.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getContentPadding Method

Gets the distance between Image and Text when both are specified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Float getContentPadding ()
```

Return Value

A **Float** value specifying padding distance. The default value is **null**.

Remarks

If this property is not set, distance is set to 1mm independent of current measure unit.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getEditRect Method

Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getEditRect (
    DiagramItem item,
    Point2D mousePosition
)
```

Parameters

item
The DiagramItem whose label's text will be edited.

mousePosition
A **java.awt.geom.Point2D** instance specifying the current pointer position.

Return Value

A **java.awt.geom.Rectangle2D** specifying where the edit box should be placed.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getEnableWrap Method

Gets whether the text should wrap to multiple lines.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getEnableWrap ()
```

Return Value

true if text wrapping is enabled, or **false** otherwise.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getFont Method

Gets the font of the label's text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Font getFont ()
```

Return Value

A **java.awt.Font** object representing the text font.

Remarks

This property can be **null**, in which case the label will use the Font of its parent item.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getHorizontalAlign Method

Gets label's horizontal alignment relative to the pin point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Align getHorizontalAlign ()
```

Return Value

A member of the Align enumeration. The default is **Center**.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getHorizontalOffset Method

Gets label's horizontal offset from its pin point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getHorizontalOffset ()
```

Return Value

A **float** value specifying horizontal offset.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getImage Method

Gets the image displayed by this label.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Image getImage ()
```

Return Value

A **java.awt.Image** object.

Remarks

If a label displays both image and text, the image position relative to text depends on the ImageAlign property.

If the label is only intended to display an icon image and no text, you could also set its Locked property to prevent users from entering text.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getImageAlign Method

Gets the alignment of label's image relative to text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ImageAlign getImageAlign ()
```

Return Value

A member of the ImageAlign enumeration.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace
Image Property
Text Property

ItemLabel.getImageSize Method

Gets a size that overrides the native image size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension2D getImageSize ()
```

Return Value

A **Dimension2D** instance.

Remarks

By default, Image is rendered using bitmap's intrinsic size. Set this value to increase or reduce the size of the rendered image.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getImageUrl Method

Gets a URL used to load an image into this label.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getImageUrl ()
```

Return Value

a String containing the URL.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace
Image Property

ItemLabel.getIndex Method

Gets the index of an edge or point this label is relative to.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getIndex ()
```

Return Value

An integer index.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getItem Method

Returns the DiagramItem that displays this label.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected DiagramItem getItem ()
```

Return Value

A DiagramItem instance.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getLayoutRect Method

Gets the label's layout rectangle calculated from text length, font and alignment.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected Rectangle2D getLayoutRect ()
```

Return Value

A **java.awt.geom.Rectangle2D** specifying the label's layout rectangle.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getLocked Method

Gets a value indicating whether users are allowed to edit this label.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getLocked ()
```

Return Value

true to prevent users from editing this label, or **false** otherwise.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getMargin Method

Gets the text margins size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Thickness getMargin ()
```

Return Value

A Thickness instance specifying the size of text margins.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getMaxWidth Method

Gets the maximal width that when reached should cause text to wrap to a new line.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getMaxWidth ()
```

Return Value

A **float** value specifying the maximal label width.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getText Method

Gets the label's text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getText ()
```

Return Value

A String containing the label's text.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getTextColor Method

Gets the color of the label's text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Color getTextColor ()
```

Return Value

A **java.awt.Color** object representing the text color.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getTextToEdit Method

Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when this label is edited in-place.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getTextToEdit ()
```

Return Value

A String that represents the initial contents of the in-place edit box.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getVerticalAlign Method

Gets label's vertical alignment relative to the pin point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Align getVerticalAlign ()
```

Return Value

A member of the Align enumeration. The default is **Center**.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.getVerticalOffset Method

Gets label's vertical offset from its pin point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getVerticalOffset ()
```

Return Value

A **float** value specifying vertical offset.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.loadFromJson Method

Loads the label from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the label's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.loadFromXml Method

Loads the label from the specified XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An **org.w3c.dom.Element** instance.

context
An XmlPersistContext instance.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.onPointerDown Method

Called when the left mouse button is pressed while the pointer is over this label.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void onPointerDown (
    Point2D mousePosition
)
```

Parameters

mousePosition
A **java.awt.geom.Point2D** instance that specifies the current mouse position.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.onPointerMove Method

Called when the mouse is moved while this label tracks the mouse events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void onPointerMove (
    Point2D mousePosition
)
```

Parameters

mousePosition
A **java.awt.geom.Point2D** instance that specifies the current mouse position.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.onPointerUp Method

Called when the left mouse button is released while this label tracks the mouse events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void onPointerUp (
    Point2D mousePosition
)
```

Parameters

mousePosition
A **java.awt.geom.Point2D** instance that specifies the current mouse position.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.saveToJson Method

Saves the label as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.saveToXml Method

Saves the label into the specified XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An **org.w3c.dom.Element** instance.

context
An XmlPersistContext instance.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setBrush Method

Sets the brush used to draw the label's background.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void setBrush (
    Brush value
)
```

Parameters

value
A Brush used to paint the label's background.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setContentPadding Method

Sets the distance between Image and Text when both are specified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void setContentPadding (
    Float value
)
```

Parameters

value
A **Float** value specifying padding distance. The default value is **null**.

Remarks

If this property is not set, distance is set to 1mm independent of current measure unit.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setEditedText Method

Implements InplaceEditable.setEditedText. Assigns the edited text to the label after in-place edit operation completes successfully

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setEditedText (
    String newText
)
```

Parameters

newText
The new text of this label.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setEnableWrap Method

Sets whether the text should wrap to multiple lines.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setEnableWrap (
    boolean enableWrap
)
```

Parameters

enableWrap
true to enable text wrapping, or **false** otherwise.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setFont Method

Sets the font of the label's text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFont (
    Font value
)
```

Parameters

value
A **java.awt.Font** object representing the text font.

Remarks

This property can be **null**, in which case the label will use the Font of its parent item.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setHorizontalAlign Method

Sets label's horizontal alignment relative to the pin point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHorizontalAlign (
    Align align
)
```

Parameters

align
A member of the Align enumeration.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setHorizontalOffset Method

Sets label's horizontal offset from its pin point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHorizontalOffset (
    float value
)
```

Parameters

value
A **float** value specifying horizontal offset.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setImage Method

Sets the image displayed by this label.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImage (
    Image value
)
```

Parameters

value
A **java.awt.Image** object.

Remarks

If a label displays both image and text, the image position relative to text depends on the ImageAlign property.

If the label is only intended to display an icon image and no text, you could also set its Locked property to prevent users from entering text.

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setImageAlign Method

Sets the alignment of label's image relative to text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImageAlign (
    ImageAlign value
)
```

Parameters

value
A member of the ImageAlign enumeration.

ItemLabel Class
com.mindfusion.diagramming Namespace
Image Property
Text Property

ItemLabel.setImageSize Method

Sets a size that overrides the native image size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImageSize (
    Dimension2D value
)
```

Parameters

value
A Dimension2D instance.

Remarks

By default, Image is rendered using bitmap's intrinsic size. Set this value to increase or reduce the size of the rendered image.

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setImageUrl Method

Sets a URL used to load an image into this label.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImageUrl (
    String value
)
```

Parameters

value
A String containing the URL

Image Property

ItemLabel.setIndex Method

Sets the index of an edge or point this label is relative to.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIndex (
    int value
)
```

Parameters

value
An integer index.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setLocked Method

Sets a value indicating whether users are allowed to edit this label.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLocked (
    boolean value
)
```

Parameters

value
true to prevent users from editing this label, or **false** otherwise.

See Also

ItemLabel Members

ItemLabel.setMargin Method

Sets the text margins size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMargin (
    Thickness margin
)
```

Parameters

margin
A Thickness instance specifying the size of text margins.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setMaxWidth Method

Sets the maximal width that when reached should cause text to wrap to a new line.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMaxWidth (
    float maxWidth
)
```

Parameters

maxWidth
A **float** value specifying the maximal label width.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setMouseCursor Method

Indicates what cursor to display for interactive labels.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CursorHint setMouseCursor (
    Point2D point
)
```

Parameters

point
Specifies mouse pointer position.

Return Value

A member of the CursorHint enumeration.

ItemLabel.setText Method

Sets the label's text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setText (
    String text
)
```

Parameters

text
A String containing the label's text.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setTextColor Method

Sets the color of the label's text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTextColor (
    Color value
)
```

Parameters

value
A **java.awt.Color** object representing the text color.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setVerticalAlign Method

Sets label's vertical alignment relative to the pin point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setVerticalAlign (
    Align align
)
```

Parameters

align
A member of the Align enumeration.

See Also

ItemLabel Members
ItemLabel Class
com.mindfusion.diagramming Namespace

ItemLabel.setVerticalOffset Method

Sets label's vertical offset from its pin point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setVerticalOffset (
    float value
)
```

Parameters

value
A **float** value specifying vertical offset.

ItemListEvent Members

Provides data for the events that are raised by an ItemListView.

The following tables list the members exposed by the ItemListEvent type.

Public Constructors

	Name	Description
	ItemListEvent	Initializes a new instance of the **ItemListEvent** class.

Public Methods

	Name	Description
	getIndex	Gets the index of the item.
	getItem	Gets the item that the event is related to.

See Also

ItemListEvent Class
com.mindfusion.diagramming Namespace

ItemListEvent Constructor

Initializes a new instance of the ItemListEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ItemListEvent (
    Object source,
    DiagramItem item,
    int index
)
```

Parameters

source
The ItemListView that raised the event.

item
The DiagramItem that the event is related to.

index
The index of the item.

See Also

ItemListEvent Class
com.mindfusion.diagramming Namespace

ItemListEvent Methods

ItemListEvent.getIndex Method

Gets the index of the item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getIndex ()
```

Return Value

An integer value specifying the item's index.

See Also

ItemListEvent Members
ItemListEvent Class
com.mindfusion.diagramming Namespace

ItemListEvent.getItem Method

Gets the item that the event is related to.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramItem getItem ()
```

Return Value

A DiagramItem instance.

See Also

ItemListEvent Members
ItemListEvent Class
com.mindfusion.diagramming Namespace

ItemListView Class

A list view control that hosts DiagramItems and supports drag-and-drop to DiagramView.

Syntax

```
Java
public class ItemListView extends JList<E>
```

Remarks

The **ItemListView** control provides a list of diagram items that can be dragged and dropped onto a DiagramView to create new item instances.

Item Management

Items can be added to the list by calling the addItem method and removed using removeItemAt. To clear the entire list, use the clearItems method. The control supports displaying both DiagramNode and DiagramLink objects, superseding the legacy NodeListView which was limited to nodes.

Drag-and-Drop Behavior

When an item is dragged from the list and dropped onto a diagram, the control creates a new instance by calling the source item's clone method. If you are using custom item subclasses, ensure you override the **clone** method to correctly copy all custom property values.
The dimensions of the newly created item are determined by the NewInstanceSize property. If this property is not set, the item's original size is used.

Automatic Connections

The control supports an auto-connect feature enabled via the AutoConnectLinks property. When active:

- Links: Dropping a link near existing nodes (within the range specified by AutoConnectDistance) will automatically connect the link's ends to those nodes.
- Nodes: Dropping a node near the unconnected end of an existing link will automatically attach that link to the new node.

Inheritance Hierarchy

java.lang.Object
  java.awt.Component
    java.awt.Container
      javax.swing.JComponent
        javax.swing.JList(E)

Palette Class

ItemListView Members

A list view control that hosts DiagramItems and supports drag-and-drop to DiagramView.

The following tables list the members exposed by the ItemListView type.

Public Constructors

	Name	Description
	ItemListView	Initializes a new instance of the **ItemListView** class.

Public Methods

	Name	Description

	addItem	Overloaded.
	addItemListViewListener	Registers listener so that it will receive events when users select or delete items from the list.
	addItems	Overloaded.
	clearItems	Removes all items from the list view.
	getAllowRemove	Gets a value indicating whether to allow deletion of list items by pressing Del.
	getAutoConnectDistance	Gets the maximum distance within which a link will attempt to auto-connect to a nearby node.
	getAutoConnectLinks	Gets a value indicating whether links should be automatically connected to nearby nodes when dropped from the ItemListView.
	getIconMargin	Gets the horizontal and vertical margins around the items.
	getIconSize	Gets the size of the items displayed in the list.
	getItemAt	Gets the item at the specified position.
	getItemsCount	Gets the number of items in the list view.
	getMeasureUnit	Gets the unit of measure used when drawing items.
	getNewInstanceSize	Gets the default size with which items dragged onto a diagram will be created.
	getShowLabels	Gets a value indicating whether to show text labels along with icons for each list item.
	insertItem	Overloaded.
	removeItemAt	Removes the item at the specified position.
	removeItemListViewListener	Unregisters listener so that it will no longer receive ItemListView events.
	setAllowRemove	Sets a value indicating whether to allow deletion of list items by pressing Del.
	setAutoConnectDistance	Sets the maximum distance within which a link will attempt to auto-connect to a nearby node.
	setAutoConnectLinks	Sets a value indicating whether links should be automatically connected to nearby nodes when dropped from the ItemListView.
	setIconMargin	Sets the horizontal and vertical margins around the items.
	setIconSize	Sets the size of the items displayed in the list.
	setMeasureUnit	Sets the unit of measure used when drawing items.
	setNewInstanceSize	Sets the default size with which items dragged onto a diagram will be created.
	setShowLabels	Sets a value specifying whether to show text labels along with icons for each list item.

Protected Methods

	Name	Description
	onComponentResized	
	onItemRemoved	
	onItemSelected	Overloaded.
	onKeyPressed

com.mindfusion.diagramming Namespace
removeItemAt Method

ItemListView.addItem Method (DiagramItem, String)

Adds a new item to the end of the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addItem (
    DiagramItem item,
    String label
)
```

Parameters

item
The item to add.

label
The text to be displayed for the item.

See Also

addItem Method Overload List
ItemListView Members
ItemListView Class

ItemListView.addItemListViewListener Method

Registers listener so that it will receive events when users select or delete items from the list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addItemListViewListener (
    ItemListViewListener listener
)
```

Parameters

listener
An object implementing the ItemListViewListener interface.

See Also

ItemListView.addItems Method (DiagramItem[], String[])

Adds the specified items to the end of the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void addItems (
    DiagramItem[] items,
    String[] labels
)
```

Parameters

items
The array of items to add.

labels
The array of texts to be displayed for the items.

See Also

addItems Method Overload List
ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.addItems Method (DiagramItemList)

Adds the specified items to the end of the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void addItems (
    DiagramItemList items
)
```

Parameters

items
The collection of items to add.

See Also

addItems Method Overload List
ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.addItems Method (DiagramItemList, String[])

Adds the specified items to the end of the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void addItems (
    DiagramItemList items,
    String[] labels
)
```

Parameters

items
The collection of items to add.

labels
The array of texts to be displayed for the items.

See Also

addItems Method Overload List
ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.clearItems Method

Removes all items from the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void clearItems ()
```

See Also

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.getAutoConnectDistance Method

Gets the maximum distance within which a link will attempt to auto-connect to a nearby node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getAutoConnectDistance ()
```

Return Value

The auto-connect distance.

See Also

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.getAutoConnectLinks Method

Gets a value indicating whether links should be automatically connected to nearby nodes when dropped from the ItemListView.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAutoConnectLinks ()
```

Return Value

true to auto-connect links, or **false** otherwise.

com.mindfusion.diagramming Namespace

ItemListView.getIconMargin Method

Gets the horizontal and vertical margins around the items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Dimension getIconMargin ()
```

Return Value

A Dimension instance specifying the icon margins.

See Also

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.getIconSize Method

Gets the size of the items displayed in the list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Dimension getIconSize ()
```

Return Value

A Dimension instance specifying the item size.

See Also

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.getItemAt Method

Gets the item at the specified position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramItem getItemAt (
    int index
)
```

Parameters

index
An integer value specifying the item's index in the list.

Return Value

The DiagramItem at the specified position.

See Also

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.getItemsCount Method

Gets the number of items in the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getItemsCount ()
```

Return Value

Returns the number of items in this list view.

See Also

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.getMeasureUnit Method

Gets the unit of measure used when drawing items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public GraphicsUnit getMeasureUnit ()
```

Return Value

A member of the GraphicsUnit enumeration.

See Also

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.getNewInstanceSize Method

Gets the default size with which items dragged onto a diagram will be created.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension2D getNewInstanceSize ()
```

Return Value

A Dimension2D instance specifying the size of created items.

See Also

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.getShowLabels Method

Gets a value indicating whether to show text labels along with icons for each list item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getShowLabels ()
```

Return Value

true if labels are shown.

)
```

Parameters

e

See Also

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.removeItemAt Method

Removes the item at the specified position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeItemAt (
    int index
)
```

Parameters

index
The zero-based index of the item to remove.

See Also

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.removeItemListViewListener Method

Unregisters listener so that it will no longer receive ItemListView events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeItemListViewListener (
    ItemListViewListener listener
)
```

Parameters

listener
An object implementing the ItemListViewListener interface.

See Also

ItemListView Members
ItemListView Class

itemRemoved Event

ItemListView.setAutoConnectDistance Method

Sets the maximum distance within which a link will attempt to auto-connect to a nearby node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoConnectDistance (
    float value
)
```

Parameters

value
The auto-connect distance.

Remarks

This value is applied when AutoConnectLinks is enabled. If a link is dropped within specified distance from an existing node, or if a node is dropped near unconnected link, the node is set as Origin or Destination of the link.

See Also

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.setAutoConnectLinks Method

Sets a value indicating whether links should be automatically connected to nearby nodes when dropped from the ItemListView.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setAutoConnectLinks (
    boolean value
)
```

Parameters

value
true to auto-connect links, otherwise false.

Remarks

If a link is dropped within AutoConnectDistance from an existing node, or if a node is dropped near unconnected link, the node is set as Origin or Destination of the link.

Sets the horizontal and vertical margins around the items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setIconMargin (
    Dimension value
)
```

Parameters

value
A Dimension instance specifying the icon margins.

See Also

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.setIconSize Method

Sets the size of the items displayed in the list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIconSize (
    Dimension value
)
```

Parameters

value
A Dimension instance specifying the item size.

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.setNewInstanceSize Method

Sets the default size with which items dragged onto a diagram will be created.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setNewInstanceSize (
    Dimension2D value
)
```

Parameters

value
A Dimension2D instance specifying the size of created items.

Remarks

The copy created from an item dragged from the list view is resized to this size.

ItemListView Members
ItemListView Class
com.mindfusion.diagramming Namespace

ItemListView.setShowLabels Method

Sets a value specifying whether to show text labels along with icons for each list item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShowLabels (
    boolean value
)
```

Parameters

value
true if text labels must be shown, or **false** otherwise.

ItemListView Class
com.mindfusion.diagramming Namespace

ItemListViewAdapter Class

Provides empty implementations for the methods defined in the ItemListViewListener interface. This lets you override only the handlers for the events you are interested in, instead of implementing all methods of **ItemListViewListener**.

Syntax

Java

```
public class ItemListViewAdapter implements ItemListViewListener
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.ItemListViewAdapter

See Also

ItemListViewAdapter Members
com.mindfusion.diagramming Namespace

ItemListViewAdapter Members

Provides empty implementations for the methods defined in the ItemListViewListener interface. This lets you override only the handlers for the events you are interested in, instead of implementing all methods of **ItemListViewListener**.

The following tables list the members exposed by the ItemListViewAdapter type.

Public Constructors

	Name	Description
	ItemListViewAdapter	

Public Methods

	Name	Description
	itemRemoved	Raised when the user removes an item from the list view.
	itemSelected	Raised when the user selects an item in the list view.

See Also

ItemListViewAdapter Class
com.mindfusion.diagramming Namespace

ItemListViewAdapter Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public ItemListViewAdapter ()`

See Also

ItemListViewAdapter Methods

ItemListViewAdapter.itemRemoved Method

Raised when the user removes an item from the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void itemRemoved (
    ItemListEvent e
)
```

Parameters

e

See Also

ItemListViewAdapter Members
ItemListViewAdapter Class
com.mindfusion.diagramming Namespace

ItemListViewAdapter.itemSelected Method

Raised when the user selects an item in the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void itemSelected (
    ItemListEvent e
)
```

Parameters

e

See Also

ItemListViewAdapter Members
ItemListViewAdapter Class
com.mindfusion.diagramming Namespace

ItemListViewListener Interface

Defines the events that can be raised by an ItemListView.

Syntax

Java
`public interface ItemListViewListener extends EventListener`

Inheritors

com.mindfusion.diagramming.ItemListViewAdapter

See Also

ItemListViewListener Members
com.mindfusion.diagramming Namespace

ItemListViewListener Members

Defines the events that can be raised by an ItemListView.

The following tables list the members exposed by the ItemListViewListener type.

Public Methods

	Name	Description
	itemRemoved	Raised when the user removes an item from the list view.
	itemSelected	Raised when the user selects an item in the list view.

See Also

ItemListViewListener Interface
com.mindfusion.diagramming Namespace

ItemListViewListener Methods

ItemListViewListener.itemRemoved Method

Raised when the user removes an item from the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

`void itemRemoved (`
`  ItemListEvent e`
`)`

Parameters

e
An ItemListEvent object providing information about the event.

See Also

ItemListViewListener Members
ItemListViewListener Interface
com.mindfusion.diagramming Namespace

ItemListViewListener.itemSelected Method

Raised when the user selects an item in the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void itemSelected (
    ItemListEvent e
)
```

Parameters

e
An ItemListEvent object providing information about the event.

See Also

ItemListViewListener Members

com.mindfusion.diagramming Namespace

ItemTransferHandler Methods

ItemTransferHandler.createTransferable Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected Transferable createTransferable (
    JComponent c
)
```

Parameters

c

Return Value

See Also

ItemTransferHandler Members
ItemTransferHandler Class
com.mindfusion.diagramming Namespace

ItemTransferHandler.getSourceActions Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getSourceActions (
    JComponent c
)
```

Parameters

c

Return Value

JsonPersistContext Members

The following tables list the members exposed by the JsonPersistContext type.

Public Constructors

	Name	Description
	JsonPersistContext	Overloaded.

Public Fields

	Name	Description
	LatestFormat	

Protected Fields

	Name	Description
	brushes	(Inherited from JsonContext.)
	inplaceImages	(Inherited from JsonContext.)
	inplaceResources	(Inherited from JsonContext.)

Public Methods

	Name	Description
	getDiagram	
	getFileVersion	
	getItemProperties	
	loadItem	Reads a diagram item from the specified JsonObject.
	parse	Deserializes the specified JSON formatted string to a JsonObject. (Inherited from JsonContext.)
	readAnchorPattern	Reads an AnchorPattern object.

	readBrush	Overloaded. (Inherited from JsonContext.)
	readBrushColor	Reads a Brush object with the specified color. (Inherited from JsonContext.)
	readBrushes	Reads all brushes. (Inherited from JsonContext.)
	readColor	Overloaded. (Inherited from JsonContext.)
	readComposite	Reads the properties of a CompositeNode, which are marked with the AutoJson attribute.
	readEffect	Reads a NodeEffect object.
	readEnum	Reads an enum value. (Inherited from JsonContext.)
S	readFile	Reads json file (Inherited from JsonContext.)
	readFont	
	readImage	Reads an Image object. (Inherited from JsonContext.)
	readImages	Reads all images. (Inherited from JsonContext.)
	readItemId	Reads an item reference.
	readObject	(Inherited from JsonContext.)
	readPen	Overloaded. (Inherited from JsonContext.)
	readPointF	Reads a **Point2D.Float** object. (Inherited from JsonContext.)
	readPointString	Reads a list of points. (Inherited from JsonContext.)
	readRectangleF	Reads a Rectangle2D.Float object. (Inherited from JsonContext.)
	readShape	Reads a Shape object.
	readSizeF	read the SizeF object (Inherited from JsonContext.)
	readStringFormat	Reads a StringFormat object. (Inherited from JsonContext.)
	readStyle	Reads a Style object.
	readSvg	Read SVG object.
	readTag	Reads the specified tag for the specified object. Tags are read similarly to arbitrary objects except that the client of the diagram is given a chance to perform custom deserialization through event handling.
	readTheme	Reads a Theme object.
	readThickness	Reads a Thickness object.
	saveItem	Saves the specified diagram item to a JsonObject.
	serialize	Serializes the specified JsonObject to a JSON formatted string. (Inherited from JsonContext.)
	setItemProperties	
	writeAnchorPattern	Writes an AnchorPattern object.

	writeBrush	Writes a MindFusion.Drawing.Brush object. (Inherited from JsonContext.)
	writeBrushColor	Writes the color of the specified brush. (Inherited from JsonContext.)
	writeBrushes	Writes all currently accumulated brushes. (Inherited from JsonContext.)
	writeColor	Writes a Color object. (Inherited from JsonContext.)
	writeComposite	Writes the properties of a CompositeNode, which are marked with the AutoJson attribute.
	writeEffect	Writes a NodeEffect object.
	writeEnum	Writes an enum value. (Inherited from JsonContext.)
S	writeFile	Writes serialized json to file. (Inherited from JsonContext.)
	writeFont	
	writeImage	Writes an Image object. (Inherited from JsonContext.)
	writeImages	Writes all currently accumulated images. (Inherited from JsonContext.)
	writeItemId	Writes a reference to the specified item.
	writeItemType	
	writeObject	(Inherited from JsonContext.)
	writePen	Writes a MindFusion.Drawing.Pen object. (Inherited from JsonContext.)
	writePointF	Writes a PointF object. (Inherited from JsonContext.)
	writePointString	Writes a Point string. (Inherited from JsonContext.)
	writeRectangleF	Writes a RectangleF object. (Inherited from JsonContext.)
	writeShape	Writes a Shape object.
	writeSizeF	Writes a sizeF object (Inherited from JsonContext.)
	writeStringFormat	Writes a StringFormat object. (Inherited from JsonContext.)
	writeStyle	Writes a Style object.
	writeSvg	
	writeTag	Writes the specified tag of the specified object. Tags are written similarly to arbitrary objects except that the client of the diagram is given a chance to perform custom serialization through event handling.
	writeTheme	Writes a Theme object.
	writeThickness	Writes a Thickness object.

Protected Methods

	Name	Description

	Base64Decode	(Inherited from JsonContext.)
	base64Encode	(Inherited from JsonContext.)
	toCamelCase	(Inherited from JsonContext.)
	toPascalCase	(Inherited from JsonContext.)

JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext Fields

JsonPersistContext.LatestFormat Field

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public static int LatestFormat`

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext Constructor

Overload List

Name	Description
JsonPersistContext (Diagram, int)	Contains methods that can help serialize and deserialize MindFusion.Diagramming items to and from JSON.
JsonPersistContext (Diagram, int, boolean)	Initializes a new instance of the JsonPersistContext class.

See Also

JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext Constructor (Diagram, int)

Contains methods that can help serialize and deserialize MindFusion.Diagramming items to and from JSON.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public JsonPersistContext (
    Diagram diagram,
    int fileVersion
)
```

Parameters

diagram
A Diagram that will be serialized and deserialized

fileVersion
Specifies the current file format number.

See Also

JsonPersistContext Constructor Overload List
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext Constructor (Diagram, int, boolean)

Initializes a new instance of the JsonPersistContext class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public JsonPersistContext (
    Diagram diagram,
    int fileVersion,
    boolean trackItems
)
```

Parameters

diagram
The Diagram that will be serialized or deserialized.

fileVersion
Specifies the current file format number.

trackItems
true to track shared item instances by their identifier, or false otherwise.

JsonPersistContext Constructor Overload List
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext Methods

JsonPersistContext.getDiagram Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public Diagram getDiagram ()`

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.getFileVersion Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public int getFileVersion ()`

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.getItemProperties Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public Map<DiagramItem, Map<Object, Object>> getItemProperties ()`

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.loadItem Method

Reads a diagram item from the specified JsonObject.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem loadItem (
    JsonObject obj
)
```

Parameters

obj

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.readAnchorPattern Method

Reads an AnchorPattern object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnchorPattern readAnchorPattern (
    JsonValue value
)
```

Parameters

value
A JsonValue

Return Value

A AnchorPattern Object

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.readComposite Method

Reads the properties of a CompositeNode, which are marked with the AutoJson attribute.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readComposite (
    JsonObject obj,
    CompositeNode node
)
```

Parameters

obj
A JsonObject containing deserialized data

node
A ComposideNode

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.readEffect Method

Reads a NodeEffect object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeEffect readEffect (
    JsonValue value
)
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.readFont Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Font readFont (
    JsonObject obj,
    Font defaultFont
)
```

Parameters

obj
A JsonObject containing Font Details

defaultFont
A default Font Object to return in case JsonObject == null

Return Value

Font

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.readItemId Method

Reads an item reference.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem readItemId (
    JsonValue value
)
```

Parameters

value
A JsonValue

Return Value

DiagramItem

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.readShape Method

Reads a Shape object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Shape readShape (
    JsonValue value
)
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.readStyle Method

Reads a Style object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readStyle (
    JsonValue value,
    Style style
)
```

Parameters

value

style

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.readSvg Method

Read SVG object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SvgContent readSvg (
    JsonValue value
)
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.readTag Method

Reads the specified tag for the specified object. Tags are read similarly to arbitrary objects except that the client of the diagram is given a chance to perform custom deserialization through event handling.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object readTag (
    Object item,
    JsonValue tagValue,
    String propertyName
)
```

Parameters

item
item

tagValue
JsonValue

propertyName
A name

Return Value

tag Object

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.readTheme Method

Reads a Theme object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Theme readTheme (
    JsonValue value
)
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.readThickness Method

Reads a Thickness object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Thickness readThickness (
    JsonValue value
)
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.saveItem Method

Saves the specified diagram item to a JsonObject.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonObject saveItem (
    DiagramItem item
)
```

Parameters

item
A DiagramItem

Return Value

A JsonObject

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.setItemProperties Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setItemProperties (
    Map<DiagramItem, Map<Object, Object>> itemProperties
)
```

Parameters

itemProperties

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.writeAnchorPattern Method

Writes an AnchorPattern object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonValue writeAnchorPattern (
    AnchorPattern anchorPattern
)
```

Parameters

anchorPattern
A AnchorPattern

Return Value

A JsonValue

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.writeComposite Method

Writes the properties of a CompositeNode, which are marked with the AutoJson attribute.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void writeComposite (
    JsonObject obj,
    CompositeNode node
)
```

Parameters

obj
A JsonObject where AutoJson data is stored.

node
A ComposideNode

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.writeEffect Method

Writes a NodeEffect object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonValue writeEffect (
    NodeEffect effect
)
```

Parameters

effect
NodeEffect

Return Value

JsonValue

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.writeFont Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonObject writeFont (
    Font font
)
```

Parameters

font

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.writeItemId Method

Writes a reference to the specified item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonValue writeItemId (
    DiagramItem item
)
```

Parameters

item
A DiagramItem

Return Value

A JsonValue

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.writeItemType Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonValue writeItemType (
    Class itemType
)
```

Parameters

itemType

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class

JsonPersistContext.writeShape Method

Writes a Shape object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonValue writeShape (
    Shape shape
)
```

Parameters

shape
A Shape

Return Value

A JsonValue

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.writeStyle Method

Writes a Style object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonValue writeStyle (
    Style style
)
```

Parameters

style
A Style Object

Return Value

A JsonValue

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.writeSvg Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonValue writeSvg (
    SvgContent content
)
```

Parameters

content
An svg content object to write

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.writeTag Method

Writes the specified tag of the specified object. Tags are written similarly to arbitrary objects except that the client of the diagram is given a chance to perform custom serialization through event handling.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonValue writeTag (
    Object item,
    Object tagValue,
    String propertyName
)
```

Parameters

item

tagValue

propertyName

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.writeTheme Method

Writes a Theme object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonObject writeTheme (
    Theme theme
)
```

Parameters

theme
A Theme object to write

Return Value

A JsonObject

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonPersistContext.writeThickness Method

Writes a Thickness object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonObject writeThickness (
    Thickness thickness
)
```

Parameters

thickness
A Thickness containing values to write

Return Value

a JsonObject

See Also

JsonPersistContext Members
JsonPersistContext Class
com.mindfusion.diagramming Namespace

JsonSerializeTagEvent Class

Contains the arguments passed to the JsonSerializeTag and JsonDeserializeTag event handlers.

Syntax

Java
`public class JsonSerializeTagEvent extends EventObject`

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.diagramming.JsonSerializeTagEvent

See Also

JsonSerializeTagEvent Members
com.mindfusion.diagramming Namespace

JsonSerializeTagEvent Members

Contains the arguments passed to the JsonSerializeTag and JsonDeserializeTag event handlers.

The following tables list the members exposed by the JsonSerializeTagEvent type.

Public Constructors

	Name	Description
	JsonSerializeTagEvent	Initializes a new instance of the JsonSerializeTagArgs class. Constructs a prototypical Event.

Public Methods

	Name	Description
	getContext	Gets a context object that can help you write and read various values.
	getObject	Gets the object being serialized or deserialized.
	getPropertyName	Gets the name of the property being serialized.
	getRepresentation	Gets the JsonObject, representing the tag object

	getTag	Gets the tag object being serialized or deserialized.
	isHandled	Gets a value indicating whether the event is handled.
	setHandled	Sets a value indicating whether the event is handled. Always set this flag to true if you perform custom tag serialization.
	setRepresentation	Sets the JsonObject, representing the tag object
	setTag	Sets the tag object being serialized or deserialized.

com.mindfusion.diagramming Namespace

JsonSerializeTagEvent Constructor

Initializes a new instance of the JsonSerializeTagArgs class. Constructs a prototypical Event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonSerializeTagEvent (
    Object source,
    Object item,
    Object tag,
    String propertyName,
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

source
The object on which the Event initially occurred.

item

tag

propertyName

obj

context

See Also

JsonSerializeTagEvent Class
com.mindfusion.diagramming Namespace

JsonSerializeTagEvent Methods

JsonSerializeTagEvent.getContext Method

Gets a context object that can help you write and read various values.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonPersistContext getContext ()
```

Return Value

JsonPersistContext object

See Also

JsonSerializeTagEvent Members
JsonSerializeTagEvent Class
com.mindfusion.diagramming Namespace

JsonSerializeTagEvent.getObject Method

Gets the object being serialized or deserialized.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object getObject ()
```

Return Value

See Also

JsonSerializeTagEvent Members
JsonSerializeTagEvent Class
com.mindfusion.diagramming Namespace

JsonSerializeTagEvent.getPropertyName Method

Gets the name of the property being serialized.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getPropertyName ()
```

Return Value

A property name

See Also

JsonSerializeTagEvent Members
JsonSerializeTagEvent Class
com.mindfusion.diagramming Namespace

JsonSerializeTagEvent.getRepresentation Method

Gets the JsonObject, representing the tag object

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public JsonObject getRepresentation ()
```

Return Value

JsonObject serialized or deserialized.

See Also

JsonSerializeTagEvent Members
JsonSerializeTagEvent Class
com.mindfusion.diagramming Namespace

JsonSerializeTagEvent.getTag Method

Gets the tag object being serialized or deserialized.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object getTag ()
```

Return Value

An object representing the tag value being serialized or deserialized.

See Also

JsonSerializeTagEvent Members
JsonSerializeTagEvent Class
com.mindfusion.diagramming Namespace

JsonSerializeTagEvent.isHandled Method

Gets a value indicating whether the event is handled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean isHandled ()
```

Return Value

true/false

See Also

JsonSerializeTagEvent Members
JsonSerializeTagEvent Class
com.mindfusion.diagramming Namespace

JsonSerializeTagEvent.setHandled Method

Sets a value indicating whether the event is handled. Always set this flag to true if you perform custom tag serialization.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHandled (
    boolean handled
)
```

Parameters

handled
boolean

Layer Members

The Layer class represents a layer in the diagram. The visibility, z order and lock status of items in a layer can be controlled via properties of the respective Layer object.

The following tables list the members exposed by the Layer type.

Public Constructors

	Name	Description
	Layer	

Public Methods

	Name	Description
	addPropertyChangeListener	Registers listener so that it will receive events when the properties of this layer change.
	getLocked	Gets a value indicating whether the layer is locked. Items associated with locked layers cannot be modified interactively, regardless of their own DiagramItem.getLocked property.
	getTitle	Gets a title associated with the layer.
	getVisible	Gets a value indicating whether the layer is visible. Items associated with hidden layers are not displayed, regardless of their own DiagramItem.getVisible property.

	getZIndex	Gets the z-index of the layer.
	readExternal	Implements Externalizable.
	removePropertyChangeListener	Unregisters listener so that it will no longer receive layer events.
	setLocked	Sets a value indicating whether the layer is locked. Items associated with locked layers cannot be modified interactively, regardless of their own **DiagramItem.getLocked** property.
	setTitle	Sets a title associated with the layer.
	setVisible	Sets a value indicating whether the layer is visible. Items associated with hidden layers are not displayed, regardless of their own **DiagramItem.getVisible** property.
	setZIndex	Sets the z-index of the layer.
	writeExternal	Implements Externalizable.

LayeredLayout Class

Implements a layered graph layout algorithm.

Syntax

Java

```
public class LayeredLayout implements Layout
```

Remarks

This algorithm assigns diagram nodes to distinct horizontal or vertical layers. While arranging the layers, the layout routine seeks to meet the following criteria:

- connected nodes must be placed close together;
- links must flow in one direction if possible;
- links must cross as few layers as possible;
- links must not cross other links;

To apply this layout to a diagram, create a **LayeredLayout** instance, set its members and invoke the arrange method.

The final appearance of arranged graphs depends mostly on the Orientation and Direction properties which define the overall orientation of the layout. The LayerDistance and NodeDistance properties specify how much space to leave between adjacent layers and adjacent nodes in a layer.

The performance of **LayeredLayout** is dependent on the number of links in the diagram. At its first stage, the algorithm looks for the longest sequence of links in the graph and builds the node layers along it. That stage can be the most time consuming if there are a lot of links in a graph, so there is the TimeLimit property provided to control how much time the layout routine is allowed to spend on path-finding. Next, if there are layers much longer than the other ones and SplitLayers is enabled, nodes from these layers are moved to new ones so the graph width is uniformly distributed.

The layout routine continues by shuffling nodes and link points across their layers, so the criteria mentioned above are approximated. Finally, link ends are aligned to anchor points if Anchoring is enabled and the distance between outermost links is decreased as set in LinksCompactFactor.

The layered graph layout algorithm produces best results if it can place link ends at arbitrary positions over nodes' outlines, that is, when using the Ignore value. If your application logic requires links to be always attached to anchor points, use the other two values. In such cases Reassign would yield better results.

LayeredLayout Members

Implements a layered graph layout algorithm.

The following tables list the members exposed by the LayeredLayout type.

Public Constructors

	Name	Description
	LayeredLayout	Overloaded.

Public Methods

	Name	Description
	arrange	Arranges the specified flowchart.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getDirection	Gets a value indicating in what direction the links in the arranged diagram should go.
	getEnableCustomLayers	Gets a value indicating whether to indicating whether the layered layout will honor the LayeredLayoutTraits.Layer flags.
	getEndNode	Gets the node that should be placed in the last layer of the arranged graph.
	getEnforceLinkFlow	Gets a value indicating whether to attempt to force all links to go in the same direction. If the graph being arrange has cycles, some of the links will still go backward. EnableCustomLayers and SplitLayers are ignored if this property is set to true.
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getIgnoreNodeSize	Gets a value indicating whether the distance between adjacent nodes in the final layout should be independent of the nodes' size.
	getKeepGroupLayout	Gets a value specifying whether the relative position of nodes within groups should be kept intact.
	getLayerDistance	Gets the desired distance between adjacent layers.
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)

	getLinksCompactFactor	Gets a value indicating how much to compact the outermost links.
	getLinkType	Gets the appearance of the links in the final layout.
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getNodeDistance	Gets the desired distance between adjacent nodes on the same layer.
	getOrientation	Gets a value indicating what the overall orientation of the arranged diagram should be.
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	getSplitLayers	Gets a value indicating whether layers that are much wider than the other layers should be split.
	getStartNode	Gets the node that should be placed in the first layer of the arranged graph.
	getStatistics	Gets layout-specific information about the nodes and links participating in the layout.
	getStraightenLongLinks	Gets whether the layout algorithm should strive to straigten links that cross more than one layer of the graph.
	getTimeLimit	Gets the time-out value set for the path-finding part of the layered layout algorithm.
	getXGap	Gets a value indicating how much horizontal space should be left between the document boundaries and the graph.
	getYGap	Gets a value indicating how much vertical space should be left between the document boundaries and the graph.
	init	Returns a LayeredLayoutBuilder object used to configure this LayeredLayout instance.
S	removeMidleSegmentPoint	(Inherited from AbstractLayout.)
	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setDirection	Sets a value indicating in what direction the links in the arranged diagram should go.
	setEnableCustomLayers	Sets a value indicating whether to indicating whether the layered layout will honor the LayeredLayoutTraits.Layer flags.
	setEndNode	Sets the node that should be placed in the last layer of the arranged graph. This value is honored only if a start node is specified too.
	setEnforceLinkFlow	Sets a value indicating whether to attempt to force all links to go in the same direction. If the graph being arrange has

		cycles, some of the links will still go backward. EnableCustomLayers and SplitLayers are ignored if this property is set to true.
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setIgnoreNodeSize	Sets a value indicating whether the distance between adjacent nodes in the final layout should be independent of the nodes' size.
	setKeepGroupLayout	Sets a value specifying whether the relative position of nodes within groups should be kept intact.
	setLayerDistance	Sets the desired distance between adjacent layers.
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	setLinksCompactFactor	Sets a value indicating how much to compact the outermost links.
	setLinkType	Sets the appearance of the links in the final layout.
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setNodeDistance	Sets the desired distance between adjacent nodes on the same layer.
	setOrientation	Sets a value indicating what the overall orientation of the arranged diagram should be.
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
	setSplitLayers	Sets a value indicating whether layers that are much wider than the other layers should be split.
	setStartNode	Sets the node that should be placed in the first layer of the arranged graph.
	setStraightenLongLinks	Sets whether the layout algorithm should strive to straigten links that cross more than one layer of the graph.
	setTimeLimit	Sets a time-out value for the path-finding part of the layered layout algorithm.
	setXGap	Sets a value indicating how much horizontal space should be left between the document boundaries and the graph.
	setYGap	Sets a value indicating how much vertical space should be left between the document boundaries and the graph.

	with	Returns a LayeredLayoutBuilder object used to configure and create new LayeredLayout instances.

```
public LayeredLayout (
    Orientation orientation,
    float layerDistance,
    float nodeDistance,
    float xGap,
    float yGap
)
```

Parameters

orientation
One of the com.mindfusion.diagramming.jlayout.Orientation constants.

layerDistance
A float value specifying the desired distancebetween adjacent layers.

nodeDistance
A float value specifying the desired distancebetween adjacent nodes.

xGap
A float value specifying the horizontal offset from theleft document border.

yGap
A float value specifying the vertical offset from thetop document border.

LayeredLayout Methods

LayeredLayout.arrange Method

Arranges the specified flowchart.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram
The Diagram to arrange.

items

Return Value

true

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getDirection Method

Gets a value indicating in what direction the links in the arranged diagram should go.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Direction getDirection ()
```

Return Value

A member of the Direction enumeration.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getEnableCustomLayers Method

Gets a value indicating whether to indicating whether the layered layout will honor the LayeredLayoutTraits.Layer flags.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getEnableCustomLayers ()
```

Return Value

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getEndNode Method

Gets the node that should be placed in the last layer of the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramNode getEndNode ()
```

Return Value

Reference to the end DiagramNode.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getEnforceLinkFlow Method

Gets a value indicating whether to attempt to force all links to go in the same direction. If the graph being arrange has cycles, some of the links will still go backward. EnableCustomLayers and SplitLayers are ignored if this property is set to true.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getEnforceLinkFlow ()
```

Return Value

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getIgnoreNodeSize Method

Gets a value indicating whether the distance between adjacent nodes in the final layout should be independent of the nodes' size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getIgnoreNodeSize ()
```

Return Value

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getKeepGroupLayout Method

Gets a value specifying whether the relative position of nodes within groups should be kept intact.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getKeepGroupLayout ()
```

Return Value

true if the relative position of nodes within groups should be preserved, otherwise **false**.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getLayerDistance Method

Gets the desired distance between adjacent layers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getLayerDistance ()
```

Return Value

A float value specifying the distance between adjacent layers.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getLinksCompactFactor Method

Gets a value indicating how much to compact the outermost links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getLinksCompactFactor ()
```

Return Value

A float multiplier applied to the distance between outermost links.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getLinkType Method

Gets the appearance of the links in the final layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LayeredLayoutLinkType getLinkType ()
```

Return Value

A member of the LayeredLayoutLinkType enumeration.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getNodeDistance Method

Gets the desired distance between adjacent nodes on the same layer.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getNodeDistance ()
```

Return Value

A float value specifying the distance between adjacent nodes.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getOrientation Method

Gets a value indicating what the overall orientation of the arranged diagram should be.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Orientation getOrientation ()
```

Return Value

A member of the Orientation enumeration.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getSplitLayers Method

Gets a value indicating whether layers that are much wider than the other layers should be split.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getSplitLayers ()
```

Return Value

true if long layers will be split, otherwise **false**.

See Also

LayeredLayout Members
LayeredLayout Class

LayeredLayout.getStartNode Method

Gets the node that should be placed in the first layer of the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramNode getStartNode ()
```

Return Value

Reference to the start DiagramNode.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getStatistics Method

Gets layout-specific information about the nodes and links participating in the layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public LayeredLayoutStatistics getStatistics ()
```

Return Value

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getStraightenLongLinks Method

Gets whether the layout algorithm should strive to straigten links that cross more than one layer of the graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getStraightenLongLinks ()
```

Return Value

true to straighten long links; otherwise **false**. The default value is **false**.

Remarks

If this property is enabled, links that cross multiple layers have at most two bends. Because of the additional horizontal alignment contraints, the arranged graph osually occupies a larger area than when not using **StraightenLongLinks**.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getTimeLimit Method

Gets the time-out value set for the path-finding part of the layered layout algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public long getTimeLimit ()
```

Return Value

An integer value specifying the maximum time in milliseconds the path-finding algorithm can run.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getXGap Method

Gets a value indicating how much horizontal space should be left between the document boundaries and the graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getXGap ()
```

Return Value

A float value specifying the horizontal offset from theleft document border.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.getYGap Method

Gets a value indicating how much vertical space should be left between the document boundaries and the graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public float getYGap ()`

Return Value

A float value specifying the vertical offset from thetop document border.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.init Method

Returns a LayeredLayoutBuilder object used to configure this LayeredLayout instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public LayeredLayoutBuilder init ()`

Return Value

A **LayeredLayoutBuilder** instance.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setDirection Method

Sets a value indicating in what direction the links in the arranged diagram should go.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDirection (
    Direction value
)
```

Parameters

value
A member of the Direction enumeration.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setEnableCustomLayers Method

Sets a value indicating whether to indicating whether the layered layout will honor the LayeredLayoutTraits.Layer flags.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableCustomLayers (
    boolean value
)
```

Parameters

value

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setEndNode Method

Sets the node that should be placed in the last layer of the arranged graph. This value is honored only if a start node is specified too.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void setEndNode (
    DiagramNode value
)
```

Parameters

value
A DiagramNode object representing the end node.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace
getEndNode Method
setStartNode Method

LayeredLayout.setEnforceLinkFlow Method

Sets a value indicating whether to attempt to force all links to go in the same direction. If the graph being arrange has cycles, some of the links will still go backward. EnableCustomLayers and SplitLayers are ignored if this property is set to true.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void setEnforceLinkFlow (
    boolean value
)
```

Parameters

value

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setIgnoreNodeSize Method

Sets a value indicating whether the distance between adjacent nodes in the final layout should be independent of the nodes' size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setIgnoreNodeSize (
    boolean value
)
```

Parameters

value

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setKeepGroupLayout Method

Sets a value specifying whether the relative position of nodes within groups should be kept intact.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setKeepGroupLayout (
    boolean value
)
```

Parameters

value
true if the relative position of nodes within groups should be preserved, otherwise **false**.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setLayerDistance Method

Sets the desired distance between adjacent layers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public void setLayerDistance (
    float value
)
```

Parameters

value
A float value specifying the distance between adjacent layers.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setLinksCompactFactor Method

Sets a value indicating how much to compact the outermost links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinksCompactFactor (
    float value
)
```

Parameters

value
A float multiplier applied to the distance between outermost links.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setLinkType Method

Sets the appearance of the links in the final layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkType (
    LayeredLayoutLinkType value
)
```

Parameters

value
A member of the LayeredLayoutLinkType enumeration.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setNodeDistance Method

Sets the desired distance between adjacent nodes on the same layer.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setNodeDistance (
    float value
)
```

Parameters

value
A float value specifying the distance between adjacent nodes.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setOrientation Method

Sets a value indicating what the overall orientation of the arranged diagram should be.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setOrientation (
    Orientation value
)
```

Parameters

value
A member of the Orientation enumeration.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setSplitLayers Method

Sets a value indicating whether layers that are much wider than the other layers should be split.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSplitLayers (
    boolean value
)
```

Parameters

value
true if long layers should be split, otherwise **false**.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setStartNode Method

Sets the node that should be placed in the first layer of the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setStartNode (
    DiagramNode value
)
```

Parameters

value
A DiagramNode object representing the start node.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace
getStartNode Method
setEndNode Method

LayeredLayout.setStraightenLongLinks Method

Sets whether the layout algorithm should strive to straigten links that cross more than one layer of the graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setStraightenLongLinks (
    boolean value
)
```

Parameters

value
true to straighten long links; otherwise **false**. The default value is **false**.

Remarks

If this property is enabled, links that cross multiple layers have at most two bends. Because of the additional horizontal alignment contraints, the arranged graph osually occupies a larger area than when not using **StraightenLongLinks**.

LayeredLayout.setTimeLimit Method

Sets a time-out value for the path-finding part of the layered layout algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTimeLimit (
    long value
)
```

Parameters

value
An integer value specifying the maximum time in milliseconds the path-finding algorithm can run.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setXGap Method

Sets a value indicating how much horizontal space should be left between the document boundaries and the graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setXGap (
    float value
)
```

Parameters

value
A **float** value specifying the horizontal offset from the left document border.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.setYGap Method

Sets a value indicating how much vertical space should be left between the document boundaries and the graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setYGap (
    float value
)
```

Parameters

value
A **float** value specifying the vertical offset from the top document border.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayout.with Method

Returns a LayeredLayoutBuilder object used to configure and create new LayeredLayout instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public static LayeredLayoutBuilder with ()`

Return Value

A **LayeredLayoutBuilder** instance.

See Also

LayeredLayout Members
LayeredLayout Class
com.mindfusion.diagramming Namespace

LayeredLayoutLinkType Enumeration

Specifies the style of the links after they are laid out.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum LayeredLayoutLinkType`

Members

	Member name	Description
	Cascading	Indicates cascading links.
	Straight	Indicates straight links.

See Also

com.mindfusion.diagramming Namespace

LayeredLayoutStatistics Class

Encapsulates information about a layered layout which has already complete.

Syntax

Java
`public class LayeredLayoutStatistics`

Inheritance Hierarchy

java.lang.Object
com.mindfusion.diagramming.LayeredLayoutStatistics

See Also

LayeredLayoutStatistics Members
com.mindfusion.diagramming Namespace

LayeredLayoutStatistics Members

Encapsulates information about a layered layout which has already complete.

The following tables list the members exposed by the LayeredLayoutStatistics type.

Public Methods

	Name	Description
	getLayerCount	Gets the total number of layers in the layout. If more than one subgraph is laid out, this property returns the number of layers in the last subgraph.
	getLinkLayerCount	Gets a mapping between links and the number of layers they run through.
	getNodeGridPositions	Gets a mapping between nodes and their assigned grid positions.
	getNodeLayerIndices	Gets a mapping between nodes and their assigned layers.

See Also

LayeredLayoutStatistics Class
com.mindfusion.diagramming Namespace

LayeredLayoutStatistics Methods

LayeredLayoutStatistics.getLayerCount Method

Gets the total number of layers in the layout. If more than one subgraph is laid out, this property returns the number of layers in the last subgraph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public int getLayerCount ()`

Return Value

See Also

LayeredLayoutStatistics Members
LayeredLayoutStatistics Class
com.mindfusion.diagramming Namespace

LayeredLayoutStatistics.getLinkLayerCount Method

Gets a mapping between links and the number of layers they run through.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Hashtable<DiagramLink, Integer> getLinkLayerCount ()
```

Return Value

See Also

LayeredLayoutStatistics Members
LayeredLayoutStatistics Class
com.mindfusion.diagramming Namespace

LayeredLayoutStatistics.getNodeGridPositions Method

Gets a mapping between nodes and their assigned grid positions.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Hashtable<DiagramNode, Double> getNodeGridPositions ()
```

Return Value

See Also

LayeredLayoutStatistics Members
LayeredLayoutStatistics Class
com.mindfusion.diagramming Namespace

LayeredLayoutStatistics.getNodeLayerIndices Method

Gets a mapping between nodes and their assigned layers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public Hashtable<DiagramNode, Integer> getNodeLayerIndices ()`

Return Value

See Also

LayeredLayoutStatistics Members

LayerListView Class

Provides user interface for changing layer attributes.

Syntax

Java
`public class LayerListView extends JPanel`

Inheritance Hierarchy

java.lang.Object
  java.awt.Component
    java.awt.Container
      javax.swing.JComponent
        javax.swing.JPanel
          com.mindfusion.diagramming.LayerListView

See Also

LayerListView Members
com.mindfusion.diagramming Namespace

LayerListView Members

Provides user interface for changing layer attributes.

The following tables list the members exposed by the LayerListView type.

Public Constructors

	Name	Description
	LayerListView	Initializes a new instance of the LayerListView class.

Public Methods

	Name	Description
	addLayerListViewListener	Registers listener so that it will receive events when users select, add or remove layers from the list.

	getActiveButtonTooltip	Gets the tooltip for the 'Active Layer' button in each item.
	getAddLayerButtonTooltip	Gets the tooltip for the 'Add Layer' button.
	getAllowTitleEdit	Gets a value indicating whether layer titles can be in-place edited.
	getDiagram	Gets the diagram this control is associated with.
	getDisplayText	Gets a value indicating whether to paint the text of items in the overview.
	getImages	Gets the image list used to draw icons for visibility and lock status.
	getItemColor	Gets the color with which items' background is painted.
	getItemHeight	Gets the height of the list items.
	getItems	Gets a list of layer items shown in this control.
	getLockedButtonTooltip	Gets the tooltip for the 'Locked' button in each item.
	getOverviewWidth	Gets the width of the layer overview.
	getRemoveLayerButtonTooltip	Gets the tooltip for the 'Remove Layer' button.
	getSelectedColor	Gets the color with which selected items' background is painted.
	getShowTooltips	Gets a value indicating whether to display tooltips.
	getVisibleButtonTooltip	Gets the tooltip for the 'Visible' button in each item.
	removeLayerListViewListener	Unregisters listener so that it will no longer receive LayerListView events.
	setActiveButtonTooltip	Sets the tooltip for the 'Active Layer' button in each item.
	setAddLayerButtonTooltip	Sets the tooltip for the 'Add Layer' button.
	setAllowTitleEdit	Sets a value indicating whether layer titles can be in-place edited.
	setDiagram	Sets the diagram this control is associated with.
	setDisplayText	Sets a value indicating whether to paint the text of items in the overview.
	setImages	Gets the image list used to draw icons for visibility and lock status.
	setItemColor	Sets the color with which items' background is painted.
	setItemHeight	Sets the height of the items.
	setLockedButtonTooltip	Sets the tooltip for the 'Locked' button in each item.
	setOverviewWidth	Sets the width of the layer overview.
	setRemoveLayerButtonTooltip	Sets the tooltip for the 'Remove Layer' button.
	setSelectedColor	Sets the color with which selected items' background is painted.

	setShowTooltips	Sets a value indicating whether to display tooltips.
	setVisibleButtonTooltip	Gets the tooltip for the 'Visible' button in each item.

LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView Constructor

Initializes a new instance of the LayerListView class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LayerListView ()
```

See Also

LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView Methods

LayerListView.addLayerListViewListener Method

Registers listener so that it will receive events when users select, add or remove layers from the list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addLayerListViewListener (
    LayerListViewListener listener
)
```

Parameters

listener
An object implementing the LayerListViewListener interface.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getActiveButtonTooltip Method

Gets the tooltip for the 'Active Layer' button in each item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getActiveButtonTooltip ()
```

Return Value

A String specifying the tooltip of the Active Layer button.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getAddLayerButtonTooltip Method

Gets the tooltip for the 'Add Layer' button.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getAddLayerButtonTooltip ()
```

Return Value

A String specifying the tooltip of the Add Layer button.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getAllowTitleEdit Method

Gets a value indicating whether layer titles can be in-place edited.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowTitleEdit ()
```

Return Value

true to allow editing the layers titles, otherwise false.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getDiagram Method

Gets the diagram this control is associated with.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Diagram getDiagram ()
```

Return Value

A Diagram instance.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getDisplayText Method

Gets a value indicating whether to paint the text of items in the overview.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getDisplayText ()
```

Return Value

true to display items' text, otherwise false.

See Also

LayerListView Members
LayerListView Class

LayerListView.getImages Method

Gets the image list used to draw icons for visibility and lock status.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public List<Image> getImages ()
```

Return Value

A List of Image objects.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getItemColor Method

Gets the color with which items' background is painted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Color getItemColor ()
```

Return Value

The Color of items when not selected.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getItemHeight Method

Gets the height of the list items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getItemHeight ()
```

Return Value

An integer value specifying the items height.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getItems Method

Gets a list of layer items shown in this control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ExtendedArrayList<LayerListViewItem> getItems ()
```

Return Value

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getLockedButtonTooltip Method

Gets the tooltip for the 'Locked' button in each item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public String getLockedButtonTooltip ()
```

Return Value

A String specifying the tooltip of the Locked button.

See Also

LayerListView Members
LayerListView Class

LayerListView.getOverviewWidth Method

Gets the width of the layer overview.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getOverviewWidth ()
```

Return Value

An integer value specifying the width of the layers' overview area.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getRemoveLayerButtonTooltip Method

Gets the tooltip for the 'Remove Layer' button.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getRemoveLayerButtonTooltip ()
```

Return Value

A String specifying the tooltip of the Remove Layer button.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getSelectedColor Method

Gets the color with which selected items' background is painted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Color getSelectedColor ()
```

Return Value

The Color of selected items.

LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getShowTooltips Method

Gets a value indicating whether to display tooltips.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getShowTooltips ()
```

Return Value

true to show tooltips, otherwise false.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.getVisibleButtonTooltip Method

Gets the tooltip for the 'Visible' button in each item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getVisibleButtonTooltip ()
```

Return Value

A String specifying the tooltip of the Visible button.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.removeLayerListViewListener Method

Unregisters listener so that it will no longer receive LayerListView events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeLayerListViewListener (
    LayerListViewListener listener
)
```

Parameters

listener
An object implementing the LayerListViewListener interface.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setActiveButtonTooltip Method

Sets the tooltip for the 'Active Layer' button in each item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setActiveButtonTooltip (
    String value
)
```

Parameters

value
A String specifying the tooltip of the Active Layer button.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setAddLayerButtonTooltip Method

Sets the tooltip for the 'Add Layer' button.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAddLayerButtonTooltip (
    String value
)
```

Parameters

value
A String specifying the tooltip of the Add Layer button.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setAllowTitleEdit Method

Sets a value indicating whether layer titles can be in-place edited.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowTitleEdit (
    boolean value
)
```

Parameters

value
true to allow editing the layers titles, otherwise false.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setDiagram Method

Sets the diagram this control is associated with.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setDiagram (
    Diagram value
)
```

Parameters

value
A Diagram instance.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setDisplayText Method

Sets a value indicating whether to paint the text of items in the overview.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setDisplayText (
    boolean value
)
```

Parameters

value
true to display items' text, otherwise false.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setImages Method

Gets the image list used to draw icons for visibility and lock status.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public void setImages (
    List<Image> value
)
```

Parameters

value
A List of Image objects.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setItemColor Method

Sets the color with which items' background is painted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setItemColor (
    Color value
)
```

Parameters

value
The Color of items when not selected.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setItemHeight Method

Sets the height of the items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setItemHeight (
    int value
)
```

Parameters

value
An integer value specifying the items height.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setLockedButtonTooltip Method

Sets the tooltip for the 'Locked' button in each item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLockedButtonTooltip (
    String value
)
```

Parameters

value
A String specifying the tooltip of the Locked button.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setOverviewWidth Method

Sets the width of the layer overview.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setOverviewWidth (
    int value
)
```

Parameters

value
An integer value specifying the width of the layers' overview area.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setRemoveLayerButtonTooltip Method

Sets the tooltip for the 'Remove Layer' button.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRemoveLayerButtonTooltip (
    String value
)
```

Parameters

value
A String specifying the tooltip of the Remove Layer button.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setSelectedColor Method

Sets the color with which selected items' background is painted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSelectedColor (
    Color value
)
```

Parameters

value
The Color of selected items.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setShowTooltips Method

Sets a value indicating whether to display tooltips.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShowTooltips (
    boolean value
)
```

Parameters

value
true to show tooltips, otherwise false.

See Also

LayerListView Members
LayerListView Class
com.mindfusion.diagramming Namespace

LayerListView.setVisibleButtonTooltip Method

Gets the tooltip for the 'Visible' button in each item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setVisibleButtonTooltip (
    String value
)
```

Parameters

value
A String specifying the tooltip of the Visible button.

LayerListViewAdapter Class

Provides empty implementations for the methods defined in the LayerListViewListener interface. This lets you override only the handlers for the events you are interested in, instead of implementing all methods of LayerListViewListener.

Syntax

Java
`public class LayerListViewAdapter implements LayerListViewListener`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.LayerListViewAdapter

See Also

LayerListViewAdapter Members
com.mindfusion.diagramming Namespace

LayerListViewAdapter Members

Provides empty implementations for the methods defined in the LayerListViewListener interface. This lets you override only the handlers for the events you are interested in, instead of implementing all methods of LayerListViewListener.

The following tables list the members exposed by the LayerListViewAdapter type.

Public Constructors

	Name	Description
	LayerListViewAdapter	

Public Methods

	Name	Description
	addButtonClick	Raised when the user clicks the control's add button.
	removeButtonClick	Raised when the user clicks the control's remove button.
	selectedItemChanged	Raised when the control's selected item has changed.

See Also

LayerListViewAdapter Class
com.mindfusion.diagramming Namespace

LayerListViewAdapter Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LayerListViewAdapter ()
```

See Also

LayerListViewAdapter Class
com.mindfusion.diagramming Namespace

LayerListViewAdapter Methods

LayerListViewAdapter.addButtonClick Method

Raised when the user clicks the control's add button.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addButtonClick (
    ValidationEvent e
)
```

Parameters

e

See Also

LayerListViewAdapter Members
LayerListViewAdapter Class
com.mindfusion.diagramming Namespace

LayerListViewAdapter.removeButtonClick Method

Raised when the user clicks the control's remove button.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeButtonClick (
    ValidationEvent e
)
```

Parameters

e

See Also

LayerListViewAdapter Members
LayerListViewAdapter Class
com.mindfusion.diagramming Namespace

LayerListViewAdapter.selectedItemChanged Method

Raised when the control's selected item has changed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void selectedItemChanged (
    ListSelectionEvent e
)
```

Parameters

e

See Also

LayerListViewAdapter Members
LayerListViewAdapter Class
com.mindfusion.diagramming Namespace

LayerListViewItem Class

Represents an item within a LayerListView control.

Syntax

Java

```
public class LayerListViewItem extends JComponent implements IDrawer
```

Inheritance Hierarchy

java.lang.Object
  java.awt.Component
    java.awt.Container
      javax.swing.JComponent
        com.mindfusion.diagramming.LayerListViewItem

See Also

LayerListViewItem Members
com.mindfusion.diagramming Namespace

LayerListViewItem Members

Represents an item within a LayerListView control.

The following tables list the members exposed by the LayerListViewItem type.

Public Constructors

	Name	Description
	LayerListViewItem	Initializes a new instance of the LayerListViewItem class.

Public Methods

	Name	Description
	getIndex	Gets the index of this item.
	getLayer	Gets the layer object represented by this item.
	onPaintComponent	Called when a control host pane is repainted.

Protected Methods

	Name	Description
	paintComponent	
	processKeyEvent	

See Also

LayerListViewItem Class
com.mindfusion.diagramming Namespace

LayerListViewItem Constructor

Initializes a new instance of the LayerListViewItem class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LayerListViewItem (
    LayerListView parent,
    Layer layer
)
```

Parameters

parent
The parent control of this item.

layer
The layer represented by this item.

See Also

LayerListViewItem Class
com.mindfusion.diagramming Namespace

LayerListViewItem Methods

LayerListViewItem.getIndex Method

Gets the index of this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getIndex ()
```

Return Value

See Also

LayerListViewItem Members
LayerListViewItem Class
com.mindfusion.diagramming Namespace

LayerListViewItem.getLayer Method

Gets the layer object represented by this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Layer getLayer ()
```

Return Value

See Also

LayerListViewItem Members
LayerListViewItem Class
com.mindfusion.diagramming Namespace

LayerListViewItem.onPaintComponent Method

Called when a control host pane is repainted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void onPaintComponent (
    Graphics graphics
)
```

Parameters

graphics

See Also

LayerListViewItem Members
LayerListViewItem Class
com.mindfusion.diagramming Namespace

LayerListViewItem.paintComponent Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void paintComponent (
    Graphics graphics
)
```

Parameters

graphics

See Also

LayerListViewItem Members
LayerListViewItem Class
com.mindfusion.diagramming Namespace

LayerListViewItem.processKeyEvent Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void processKeyEvent (
    KeyEvent e
)
```

Parameters

e

See Also

LayerListViewItem Members
LayerListViewItem Class
com.mindfusion.diagramming Namespace

LayerListViewListener Interface

Defines the events that can be raised by LayerListView.

Syntax

Java
`public interface LayerListViewListener extends EventListener`

Inheritors

com.mindfusion.diagramming.LayerListViewAdapter

See Also

LayerListViewListener Members
com.mindfusion.diagramming Namespace

LayerListViewListener Members

Defines the events that can be raised by LayerListView.

The following tables list the members exposed by the LayerListViewListener type.

Public Methods

	Name	Description
	addButtonClick	Raised when the user clicks the control's add button.
	removeButtonClick	Raised when the user clicks the control's remove button.
	selectedItemChanged	Raised when the control's selected item has changed.

See Also

LayerListViewListener Interface
com.mindfusion.diagramming Namespace

LayerListViewListener Methods

LayerListViewListener.addButtonClick Method

Raised when the user clicks the control's add button.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
void addButtonClick (
    ValidationEvent e
)
```

Parameters

e
A ValidationEvent object providing information about the event.

See Also

LayerListViewListener Members
LayerListViewListener Interface
com.mindfusion.diagramming Namespace

LayerListViewListener.removeButtonClick Method

Raised when the user clicks the control's remove button.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
void removeButtonClick (
    ValidationEvent e
)
```

Parameters

e
A ValidationEvent object providing information about the event.

See Also

LayerListViewListener Members
LayerListViewListener Interface
com.mindfusion.diagramming Namespace

LayerListViewListener.selectedItemChanged Method

Raised when the control's selected item has changed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void selectedItemChanged (
    ListSelectionEvent e
)
```

Parameters

e
A ListSelectionEvent object providing information about the event.

See Also

LayerListViewListener Members
LayerListViewListener Interface

Layout Interface

Defines the interface of automatic graph layout classes.

Syntax

Java

```
public interface Layout
```

Inheritors

com.mindfusion.diagramming.AnnealLayout
com.mindfusion.diagramming.GridLayout
com.mindfusion.diagramming.SpringLayout
com.mindfusion.diagramming.TreeLayout

See Also

Layout Members
com.mindfusion.diagramming Namespace

Layout Members

Defines the interface of automatic graph layout classes.

The following tables list the members exposed by the Layout type.

Public Methods

	Name	Description
	arrange	

See Also

Layout Interface
com.mindfusion.diagramming Namespace

Layout Methods

Layout.arrange Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
boolean arrange (
    Diagram diagram
)
```

Parameters

diagram

Return Value

See Also

Layout Members
Layout Interface
com.mindfusion.diagramming Namespace

LayoutLink Interface

Defines a callback method called for links during layout.

Syntax

Java

```
public interface LayoutLink
```

See Also

LayoutLink Members
com.mindfusion.diagramming Namespace

LayoutLink Members

Defines a callback method called for links during layout.

The following tables list the members exposed by the LayoutLink type.

Public Methods

	Name	Description
	layout	

See Also

LayoutLink Interface
com.mindfusion.diagramming Namespace

LayoutLink Methods

LayoutLink.layout Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void layout (
    DiagramLink link
)
```

Parameters

link

See Also

LayoutLink Members
LayoutLink Interface
com.mindfusion.diagramming Namespace

LayoutNode Interface

Defines a callback method called for nodes during layout.

Syntax

Java

```
public interface LayoutNode
```

See Also

LayoutNode Members
com.mindfusion.diagramming Namespace

LayoutNode Members

Defines a callback method called for nodes during layout.

The following tables list the members exposed by the LayoutNode type.

Public Methods

	Name	Description
	layout	

See Also

LayoutNode Interface
com.mindfusion.diagramming Namespace

LayoutNode Methods

LayoutNode.layout Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void layout (
    DiagramNode node,
    Rectangle2D.Float oldBounds
)
```

Parameters

node

oldBounds

See Also

LayoutNode Members
LayoutNode Interface
com.mindfusion.diagramming Namespace

LayoutProgress Interface

Defines a callback method that notifies about layout progress.

Syntax

Java

```
public interface LayoutProgress
```

See Also

LayoutProgress Members

Defines a callback method that notifies about layout progress.

The following tables list the members exposed by the LayoutProgress type.

Public Methods

	Name	Description
	update	

See Also

LayoutProgress Interface
com.mindfusion.diagramming Namespace

LayoutProgress Methods

LayoutProgress.update Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void update (
    int current,
    int total
)
```

Parameters

current

total

See Also

LayoutProgress Members
LayoutProgress Interface
com.mindfusion.diagramming Namespace

LegacySupport Class

Implements deserialization of objects saved with JDiagram 1.x versions.

Syntax

Java
`public class LegacySupport`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.LegacySupport

See Also

LegacySupport Members
com.mindfusion.diagramming Namespace

LegacySupport Members

Implements deserialization of objects saved with JDiagram 1.x versions.

The following tables list the members exposed by the LegacySupport type.

Public Constructors

	Name	Description
	LegacySupport	

See Also

LegacySupport Class
com.mindfusion.diagramming Namespace

LegacySupport Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public LegacySupport ()`

See Also

LegacySupport Class
com.mindfusion.diagramming Namespace

LegacySupportStream Class

Implements deserialization of objects saved with JDiagram 1.x versions.

Syntax

Java
`public class LegacySupportStream extends ObjectInputStream`

Inheritance Hierarchy

java.lang.Object
  java.io.InputStream
    java.io.ObjectInputStream
      com.mindfusion.diagramming.LegacySupportStream

See Also

LegacySupportStream Members
com.mindfusion.diagramming Namespace

LegacySupportStream Members

Implements deserialization of objects saved with JDiagram 1.x versions.

The following tables list the members exposed by the LegacySupportStream type.

Public Constructors

	Name	Description
	LegacySupportStream	

Protected Methods

	Name	Description
	readClassDescriptor	

See Also

LegacySupportStream Class
com.mindfusion.diagramming Namespace

LegacySupportStream Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LegacySupportStream (
    InputStream in
)
```

Parameters

in

See Also

LegacySupportStream Class
com.mindfusion.diagramming Namespace

LegacySupportStream Methods

LegacySupportStream.readClassDescriptor Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`protected ObjectStreamClass readClassDescriptor ()`

Return Value

See Also

LegacySupportStream Members
LegacySupportStream Class
com.mindfusion.diagramming Namespace

LineTemplate Class

Represents a straight line segment in a Shape definition.

Syntax

Java
`public class LineTemplate extends ElementTemplate`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.ElementTemplate
    com.mindfusion.diagramming.LineTemplate

See Also

LineTemplate Members
com.mindfusion.diagramming Namespace

LineTemplate Members

Represents a straight line segment in a Shape definition.

The following tables list the members exposed by the LineTemplate type.

Public Constructors

	Name	Description
	LineTemplate	Overloaded.

Public Methods

	Name	Description
	getColor	Gets the color of this element. (Inherited from ElementTemplate.)
	getDashStyle	(Inherited from ElementTemplate.)
	getWidth	(Inherited from ElementTemplate.)
	setColor	(Inherited from ElementTemplate.)
	setDashStyle	(Inherited from ElementTemplate.)
	setWidth	(Inherited from ElementTemplate.)
	toDOM	

Protected Methods

	Name	Description
	getElementPen	Gets a pen used to render the element. If no pen properties are explicitly specified for this element, returns the pen passed as an argument. (Inherited from ElementTemplate.)

See Also

LineTemplate Class
com.mindfusion.diagramming Namespace

LineTemplate Constructor

Overload List

Name	Description
LineTemplate (float, float, float, float)	Initializes a new LineTemplate instance with the specified coordinates of the segment end points.
LineTemplate (float, float, float, float, Color, DashStyle, float)	Initializes a new LineTemplate instance with the specified coordinates of the segment end points.

See Also

LineTemplate Class
com.mindfusion.diagramming Namespace

LineTemplate Constructor (float, float, float, float)

Initializes a new LineTemplate instance with the specified coordinates of the segment end points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LineTemplate (
    float x1,
    float y1,
    float x2,
    float y2
)
```

Parameters

x1
Horizontal position of the first point specified aspercents of the box width.

y1
Vertical position of the first point specified aspercents of the box height.

x2
Horizontal position of the second point specified aspercents of the box width.

y2
Vertical position of the second point specified aspercents of the box height.

See Also

LineTemplate Constructor Overload List
LineTemplate Class
com.mindfusion.diagramming Namespace

LineTemplate Constructor (float, float, float, float, Color, DashStyle, float)

Initializes a new LineTemplate instance with the specified coordinates of the segment end points.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LineTemplate (
    float x1,
    float y1,
    float x2,
    float y2,
    Color color,
    DashStyle dashStyle,
    float width
)
```

Parameters

x1

Horizontal position of the first point specified aspercents of the box width.

y1
Vertical position of the first point specified aspercents of the box height.

x2
Horizontal position of the second point specified aspercents of the box width.

y2
Vertical position of the second point specified aspercents of the box height.

color
The color of this segment.

dashStyle
The dash style of this segment.

width
The width of this segment.

LinkAdjustmentHandle Class

Represents an adjustment handle used to modify the position of a link's control point.

Syntax

Java
`public class LinkAdjustmentHandle extends AdjustmentHandle`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.AdjustmentHandle
    com.mindfusion.diagramming.LinkAdjustmentHandle

See Also

LinkAdjustmentHandle Members
com.mindfusion.diagramming Namespace

LinkAdjustmentHandle Members

Represents an adjustment handle used to modify the position of a link's control point.

The following tables list the members exposed by the LinkAdjustmentHandle type.

Public Constructors

	Name	Description
	LinkAdjustmentHandle	Initializes a new instance of the **LinkAdjustmentHandle** class.

Public Methods

	Name	Description
	getPointIndex	Gets the index of a link's control point that will be adjusted by this handle.
	setPointIndex	Sets the index of a link's control point that will be adjusted by this handle.

See Also

LinkAdjustmentHandle Class
com.mindfusion.diagramming Namespace

LinkAdjustmentHandle Constructor

Initializes a new instance of the LinkAdjustmentHandle class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkAdjustmentHandle (
    int pointIndex
)
```

Parameters

pointIndex
An integer value specifying the index of a link's control point that will be adjusted by this handle.

See Also

LinkAdjustmentHandle Class
com.mindfusion.diagramming Namespace

LinkAdjustmentHandle Methods

LinkAdjustmentHandle.getPointIndex Method

Gets the index of a link's control point that will be adjusted by this handle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getPointIndex ()
```

Return Value

An integer index of modified control point.

See Also

LinkAdjustmentHandle Members
LinkAdjustmentHandle Class
com.mindfusion.diagramming Namespace

LinkAdjustmentHandle.setPointIndex Method

Sets the index of a link's control point that will be adjusted by this handle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setPointIndex (
    int pointIndex
)
```

Parameters

pointIndex
An integer index of modified control point.

LinkAdjustmentHandle Members
LinkAdjustmentHandle Class
com.mindfusion.diagramming Namespace

LinkContainersBehavior Class

Implements the Behavior.LinkContainers behavior.

Syntax

Java
`public class LinkContainersBehavior extends LinkNodesBehavior`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.Interaction
    com.mindfusion.diagramming.BehaviorBase
      com.mindfusion.diagramming.LinkNodesBehavior
        com.mindfusion.diagramming.LinkContainersBehavior

See Also

LinkContainersBehavior Members
com.mindfusion.diagramming Namespace

LinkContainersBehavior Members

Implements the Behavior.LinkContainers behavior.

The following tables list the members exposed by the LinkContainersBehavior type.

Public Constructors

	Name	Description
	LinkContainersBehavior	Initializes a new instance of the LinkContainersBehavior class.

Protected Fields

	Name	Description
	currentCursor	(Inherited from BehaviorBase.)
	diagramView	(Inherited from BehaviorBase.)

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events. (Inherited from BehaviorBase.)
	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves. (Inherited from BehaviorBase.)
	pointerOver	Invoked when the mouse moves. (Inherited from BehaviorBase.)
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events. (Inherited from BehaviorBase.)

Protected Methods

	Name	Description
	createLink	(Inherited from BehaviorBase.)
	createNode	
	getDiagram	(Inherited from BehaviorBase.)
	getDiagramView	(Inherited from BehaviorBase.)
	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state. (Inherited from BehaviorBase.)
	setMouseCursor	BehaviorBase.setMouseCursor override. (Inherited from LinkNodesBehavior.)
	startDraw	(Inherited from LinkNodesBehavior.)
	startDrawCommon	(Inherited from BehaviorBase.)

See Also

LinkContainersBehavior Class
com.mindfusion.diagramming Namespace

LinkContainersBehavior Constructor

Initializes a new instance of the LinkContainersBehavior class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected LinkContainersBehavior (
    DiagramView diagramView
)
```

Parameters

diagramView
A DiagramView instance.

See Also

LinkContainersBehavior Class
com.mindfusion.diagramming Namespace

LinkContainersBehavior Methods

LinkContainersBehavior.createNode Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`protected DiagramNode createNode ()`

Return Value

See Also

LinkContainersBehavior Members
LinkContainersBehavior Class

LinkControlsBehavior Members

Implements the Behavior.LinkControls behavior.

The following tables list the members exposed by the LinkControlsBehavior type.

Public Constructors

	Name	Description
	LinkControlsBehavior	Initializes a new instance of the LinkControlsBehavior class.

Protected Fields

	Name	Description
	currentCursor	(Inherited from BehaviorBase.)
	diagramView	(Inherited from BehaviorBase.)

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events. (Inherited from BehaviorBase.)
	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves. (Inherited from BehaviorBase.)
	pointerOver	Invoked when the mouse moves. (Inherited from BehaviorBase.)
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events. (Inherited from BehaviorBase.)

Protected Methods

	Name	Description
	createLink	(Inherited from BehaviorBase.)
	createNode	LinkNodesBehavior.createNode override.
	getDiagram	(Inherited from BehaviorBase.)
	getDiagramView	(Inherited from BehaviorBase.)
	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state. (Inherited from BehaviorBase.)
	setMouseCursor	BehaviorBase.setMouseCursor override. (Inherited from LinkNodesBehavior.)
	startDraw	(Inherited from LinkNodesBehavior.)
	startDrawCommon	(Inherited from BehaviorBase.)

LinkControlsBehavior Class
com.mindfusion.diagramming Namespace

LinkControlsBehavior Constructor

Initializes a new instance of the LinkControlsBehavior class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkControlsBehavior (
    DiagramView diagramView
)
```

Parameters

diagramView
The DiagramView this behavior will be associated with.

See Also

LinkControlsBehavior Class
com.mindfusion.diagramming Namespace

LinkControlsBehavior Methods

LinkControlsBehavior.createNode Method

LinkNodesBehavior.createNode override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DiagramNode createNode ()
```

Return Value

A ControlNode instance.

LinkControlsBehavior Members
LinkControlsBehavior Class
com.mindfusion.diagramming Namespace

LinkCrossings Enumeration

The members of this enumeration specify how the points where links cross should be drawn on the screen. It is used as parameter of the setLinkCrossings method.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum LinkCrossings`

Members

	Member name	Description
	Arcs	Draw arcs above the intersection points.
	Cut	Break off the link segments at the intersection points.
	Straight	Draw straight lines.

LinkEvent Members

Contains the arguments passed to handlers of link related events.

The following tables list the members exposed by the LinkEvent type.

Public Constructors

	Name	Description
	LinkEvent	Overloaded.

Public Methods

	Name	Description
	getAdjustmentHandle	Gets the adjustment handle being moved by the user.
	getLabel	Gets a LinkLabel related to this event.
	getLink	Gets the link for which the event raised.
	getMouseButton	Gets which mouse button has been pressed.
	getPointerPosition	Gets the current pointer position.
	setAdjustmentHandle	Sets the adjustment handle being moved by the user.
	setPointerPosition	Sets the current pointer position.

LinkEvent Constructor (Object, DiagramLink)

Initializes a new LinkEvent instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkEvent (
    Object source,
    DiagramLink link
)
```

Parameters

source
The sender of this event.

link
A LinkEvent that contains the event data.

See Also

LinkEvent Constructor Overload List

com.mindfusion.diagramming Namespace

LinkEvent Constructor (Object, DiagramLink, int, Point2D)

Initializes a new instance of the LinkEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkEvent (
    Object source,
    DiagramLink link,
    int mouseButton,
    Point2D pointerPosition
)
```

Parameters

source

link
The DiagramLink related to the event.

mouseButton
One of the **MouseEvent** button constants.

mousePosition
The position of the mouse cursor, in document coordinates.

LinkEvent Constructor (Object, DiagramLink, Point2D, int)

Initializes a new instance of the LinkEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkEvent (
    Object source,
    DiagramLink link,
    Point2D pointerPosition,
    int adjustmentHandle
)
```

Parameters

source

link

The DiagramLink related to the event.

mousePosition

The position of the mouse cursor, in document coordinates.

adjustmentHandle

An integer index of the adjustment handle used to modify an item.

See Also

LinkEvent Constructor Overload List
LinkEvent Class
com.mindfusion.diagramming Namespace

LinkEvent Methods

LinkEvent.getAdjustmentHandle Method

Gets the adjustment handle being moved by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getAdjustmentHandle ()
```

Return Value

An integer value that represents the index of the link's control point being moved.

LinkEvent Members
LinkEvent Class

LinkEvent.getLabel Method

Gets a LinkLabel related to this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkLabel getLabel ()
```

Return Value

A LinkLabel instance.

Remarks

At this time, label is reported by click and text edit events.

LinkEvent.setPointerPosition Method

Sets the current pointer position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setPointerPosition (
    Point2D pointerPosition
)
```

Parameters

mousePosition
A Point2D object specifying the current mouse position.

LinkFreeFormsBehavior Members

This class is used when Behavior is set to LinkFreeForms or LinkFreeShapes.

The following tables list the members exposed by the LinkFreeFormsBehavior type.

Public Constructors

	Name	Description
	LinkFreeFormsBehavior	Initializes a new instance of the **LinkFreeFormsBehavior** class.

Protected Fields

	Name	Description
	currentCursor	(Inherited from BehaviorBase.)
	diagramView	(Inherited from BehaviorBase.)

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events. (Inherited from BehaviorBase.)
	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves. (Inherited from BehaviorBase.)
	pointerOver	Invoked when the mouse moves. (Inherited from BehaviorBase.)
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events. (Inherited from BehaviorBase.)

Protected Methods

	Name	Description
	createLink	(Inherited from BehaviorBase.)
	createNode	LinkNodesBehavior.createNode override.
	getDiagram	(Inherited from BehaviorBase.)
	getDiagramView	(Inherited from BehaviorBase.)

	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state. (Inherited from BehaviorBase.)
	setMouseCursor	BehaviorBase.setMouseCursor override. (Inherited from LinkNodesBehavior.)
	startDraw	(Inherited from LinkNodesBehavior.)
	startDrawCommon	(Inherited from BehaviorBase.)

LinkFreeFormsBehavior Class
com.mindfusion.diagramming Namespace

LinkFreeFormsBehavior Constructor

Initializes a new instance of the LinkFreeFormsBehavior class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkFreeFormsBehavior (
    DiagramView diagramView,
    boolean convertToShape
)
```

Parameters

diagramView
The DiagramView this behavior will be associated with.

convertToShape
true to convert the FreeFormNode to a ShapeNode once user finishes drawing it, or **false** otherwise.

LinkFreeFormsBehavior Class
com.mindfusion.diagramming Namespace

LinkFreeFormsBehavior Methods

LinkFreeFormsBehavior.createNode Method

LinkNodesBehavior.createNode override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DiagramNode createNode ()
```

Return Value

An instance of the FreeFormNode class.

See Also

LinkFreeFormsBehavior Members
LinkFreeFormsBehavior Class
com.mindfusion.diagramming Namespace

LinkLabel Class

Represents a label displayed by a DiagramLink. New labels can be added to a link by calling the DiagramLink.addLabel method.

Syntax

Java

```
public class LinkLabel
    extends ItemLabel
    implements Externalizable
```

Remarks

Each label can be associated with a specific segment or control point of the link, or it can be placed at a specific position along the link's length. To set a label's position, call one of the setSegmentPosition, setControlPointPosition or setLinkLengthPosition methods.

The alignment of text can be set via setHorizontalAlign and setVerticalAlign. Text can automatically wrap to new line if it exceeds a specified width. To enable that, call setEnableWrap and setMaxWidth.

By default, labels are rendered using the link's text color and font. Call setTextColor and setFont to specify distinct color and font for the label's text.

A label can also display a **java.awt.Image** bitmap assigned to the Image property. This lets you draw icons along a link's geometry. If a label contains both image and text, their relative position can be set using the ImageAlign property.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.ItemLabel
    com.mindfusion.diagramming.LinkLabel

LinkLabel Members
com.mindfusion.diagramming Namespace

LinkLabel Members

Represents a label displayed by a DiagramLink. New labels can be added to a link by calling the DiagramLink.addLabel method.

The following tables list the members exposed by the LinkLabel type.

Public Constructors

	Name	Description
	LinkLabel	Overloaded.

Public Methods

	Name	Description
	cancel	Called when drag operation is canceled. (Inherited from ItemLabel.)
	clone	Creates a clone of this label.
	getAutoArrange	Gets a value indicating whether the label can be auto arranged.
	getBrush	Gets the brush used to draw the label's background.
	getContentPadding	Gets the distance between Image and Text when both are specified. (Inherited from ItemLabel.)
	getEditRect	Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).
	getEnableWrap	Gets whether the text should wrap to multiple lines.
	getFont	Gets the font of the link's label text.
	getHorizontalAlign	Gets the horizontal alignment of the text within the label's layout rectangle.
	getHorizontalOffset	Gets label's horizontal offset from its pin point. (Inherited from ItemLabel.)
	getImage	Gets the image displayed by this label. (Inherited from ItemLabel.)
	getImageAlign	Gets the alignment of label's image relative to text. (Inherited from ItemLabel.)
	getImageSize	Gets a size that overrides the native image size. (Inherited from ItemLabel.)
	getImageUrl	Gets a URL used to load an image into this label. (Inherited from ItemLabel.)
	getIndex	Gets the index of the segment or control point this label is relative to.
	getLengthFactor	Gets label's position along link's length when the RelativeTo property is set to LinkLength.
	getLocked	Gets a value indicating whether users are allowed to edit this label. (Inherited from ItemLabel.)
	getMargin	Gets the text margins size.

	getMaxWidth	Gets the maximal width that when reached should cause text to wrap to a new line.
	getRelativeTo	Gets the label's relative positioning.
	getText	Gets the label's text.
	getTextColor	Gets the color of the link's label text.
	getTextToEdit	Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when this label is edited in-place.
	getVerticalAlign	Gets the vertical alignment of the text relatively to the label's position.
	getVerticalOffset	Gets label's vertical offset from its pin point. (Inherited from ItemLabel.)
	onPointerDown	Called when the left mouse button is pressed while the pointer is over this label. (Inherited from ItemLabel.)
	onPointerMove	Called when the mouse is moved while this label tracks the mouse events. (Inherited from ItemLabel.)
	onPointerUp	Called when the left mouse button is released while this label tracks the mouse events. (Inherited from ItemLabel.)
	readExternal	Loads the label from the specified binary stream.
	setAutoArrange	Sets a value indicating whether the label can be auto arranged.
	setBrush	Sets the brush used to draw the label's background.
	setContentPadding	Sets the distance between **Image** and **Text** when both are specified. (Inherited from ItemLabel.)
	setControlPointPosition	Positions this label relatively to the specified control point.
	setEditedText	Implements InplaceEditable.setEditedText. Assigns the edited text to the label after in-place edit operation completes successfully
	setEnableWrap	Sets whether the text should wrap to multiple lines.
	setFont	Sets the font of the link's label.
	setHorizontalAlign	Sets the horizontal alignment of the text within the label's layout rectangle.
	setHorizontalOffset	Sets label's horizontal offset from its pin point. (Inherited from ItemLabel.)
	setImage	Sets the image displayed by this label. (Inherited from ItemLabel.)
	setImageAlign	Sets the alignment of label's image relative to text. (Inherited from ItemLabel.)
	setImageSize	Sets a size that overrides the native image size. (Inherited from ItemLabel.)
	setImageUrl	Sets a URL used to load an image into this label. (Inherited from ItemLabel.)

	setIndex	Sets the index of the segment or control point this label is relative to.
	setLengthFactor	Sets label's position along link's length when the **RelativeTo** property is set to **LinkLength**.
	setLinkLengthPosition	Positions this label relatively to the link length.
	setLocked	Sets a value indicating whether users are allowed to edit this label. (Inherited from ItemLabel.)
	setMargin	Sets the text margins size.
	setMaxWidth	Sets the maximal width that when reached should cause text to wrap to a new line.
	setMouseCursor	Indicates what cursor to display for interactive labels. (Inherited from ItemLabel.)
	setRelativeTo	Sets the label's relative positioning.
	setSegmentPosition	Positions this label relatively to the specified link segment.
	setText	Sets the label's text.
	setTextColor	Sets the color of the link's label.
	setVerticalAlign	Sets the vertical alignment of the text relatively to the label's position.
	setVerticalOffset	Sets label's vertical offset from its pin point. (Inherited from ItemLabel.)
	writeExternal	Saves the label into the specified binary stream.

Protected Methods

	Name	Description
	draw	Draws this label on the specified **Graphics2D** surface.
	getItem	Returns the DiagramItem that displays this label. (Inherited from ItemLabel.)
	getLayoutRect	Gets the label's layout rectangle calculated from text length, font and alignment.
	getLink	Returns the **DiagramLink** that displays this label.
	loadFromJson	Loads the label from a JSON object.
	loadFromXml	Loads the label from the specified XML element.
	pointAlongLength	Overloaded.
	saveToJson	Saves the label as a JSON object.
	saveToXml	Saves the label into the specified XML element.

LinkLabel Constructor (DiagramLink)

Initializes a new instance of the LinkLabel class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkLabel (
    DiagramLink link
)
```

Parameters

link
The DiagramLink that displays the label.

See Also

LinkLabel Constructor Overload List
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel Constructor (DiagramLink, String)

Initializes a new instance of the LinkLabel class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkLabel (
    DiagramLink link,
    String text
)
```

Parameters

link
The DiagramLink that displays the label.

text
The label's text.

LinkLabel Methods

LinkLabel.clone Method

Creates a clone of this label.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkLabel clone ()
```

Return Value

A new LinkLabel instance that is an exact copy of this label.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.draw Method

Draws this label on the specified **Graphics2D** surface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void draw (
    Graphics2D graphics
)
```

Parameters

graphics
A **Graphics2D** instance.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getAutoArrange Method

Gets a value indicating whether the label can be auto arranged.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAutoArrange ()
```

Return Value

A boolean indicating whether the label can be auto arranged.

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getBrush Method

Gets the brush used to draw the label's background.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getBrush ()
```

Return Value

A Brush instance specifying the background brush.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getEditRect Method

Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getEditRect (
    DiagramItem item,
    Point2D mousePosition
)
```

Parameters

item
The DiagramLink whose label's text will be edited.

mousePosition
A **Point2D** instance specifying the current pointer position.

Return Value

A **Rectangle2D** specifying where the edit box should be placed.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getEnableWrap Method

Gets whether the text should wrap to multiple lines.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getEnableWrap ()
```

Return Value

true if text wrapping is enabled; otherwise, **false**.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getFont Method

Gets the font of the link's label text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Font getFont ()
```

Return Value

A **Font** object representing the text font. The default value is **null**.

Remarks

The label's text is rendered using the link's font if this value is **null**.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getHorizontalAlign Method

Gets the horizontal alignment of the text within the label's layout rectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Align getHorizontalAlign ()
```

Return Value

A member of the Align enumeration. The default is **Center**.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getIndex Method

Gets the index of the segment or control point this label is relative to.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getIndex ()
```

Return Value

The integer index of a link's segment or control point.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getLayoutRect Method

Gets the label's layout rectangle calculated from text length, font and alignment.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected Rectangle2D getLayoutRect ()
```

Return Value

A **Rectangle2D** instance specifying the region in which to render the link's text.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getLengthFactor Method

Gets label's position along link's length when the RelativeTo property is set to LinkLength.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getLengthFactor ()
```

Return Value

A **float** value specifying label's position. The default is **0.5**.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace
setLinkLengthPosition Method

LinkLabel.getLink Method

Returns the DiagramLink that displays this label.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DiagramLink getLink ()
```

Return Value

A DiagramLink instance.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getMargin Method

Gets the text margins size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Thickness getMargin ()
```

Return Value

A Thickness instance specifying the size of text margins.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getMaxWidth Method

Gets the maximal width that when reached should cause text to wrap to a new line.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getMaxWidth ()
```

Return Value

A float value specifying the maximal label width.

See Also

LinkLabel Members

com.mindfusion.diagramming Namespace

LinkLabel.getRelativeTo Method

Gets the label's relative positioning.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public RelativeToLink getRelativeTo ()
```

Return Value

A member of the RelativeToLink enumeration. The default value is **LinkLength**.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getText Method

Gets the label's text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getText ()
```

Return Value

A String containing the label's text.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getTextColor Method

Gets the color of the link's label text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Color getTextColor ()
```

Return Value

A **Color** object representing the text color. The default value is **null**.

Remarks

The label's text is rendered using the link's text color if this value is **null**.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getTextToEdit Method

Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when this label is edited in-place.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getTextToEdit ()
```

Return Value

The label's text.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.getVerticalAlign Method

Gets the vertical alignment of the text relatively to the label's position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Align getVerticalAlign ()
```

Return Value

A member of the Align enumeration. The default value is **Far**.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.loadFromJson Method

Loads the label from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the label's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.loadFromXml Method

Loads the label from the specified XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Element instance.

context
An XmlPersistContext instance.

LinkLabel.pointAlongLength Method

Overload List

Name	Description
LinkLabel.pointAlongLength (float)	
LinkLabel.pointAlongLength (float, PointList)	Returns a point lying on a polyline that is positioned at a relative position along the polyline's length.

See Also

LinkLabel.pointAlongLength Method (float)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Point2D.Float pointAlongLength (
    float lengthFactor
)
```

Parameters

lengthFactor

Return Value

See Also

pointAlongLength Method Overload List

LinkLabel.pointAlongLength Method (float, PointList)

Returns a point lying on a polyline that is positioned at a relative position along the polyline's length.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Point2D.Float pointAlongLength (
    float lengthFactor,
    PointList segments
)
```

Parameters

lengthFactor
A value from 0 to 1 specifying a portion of link's length.

segments
A list of points specifying the polyline segments.

Return Value

A **Point2D.Float** instance.

pointAlongLength Method Overload List
LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.readExternal Method

Loads the label from the specified binary stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in
An **ObjectInput** stream from which to read the label's data.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.saveToJson Method

Saves the label as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.saveToXml Method

Saves the label into the specified XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Element instance.

context
An XmlPersistContext instance.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.setAutoArrange Method

Sets a value indicating whether the label can be auto arranged.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAutoArrange (
    boolean value
)
```

Parameters

value
A boolean indicating whether the label can be auto arranged.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.setBrush Method

Sets the brush used to draw the label's background.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBrush (
    Brush value
)
```

Parameters

value
A Brush instance specifying the background brush.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.setControlPointPosition Method

Positions this label relatively to the specified control point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setControlPointPosition (
    int controlPoint,
    float dx,
    float dy
)
```

Parameters

controlPoint
The control point index.

dx
Horizontal offset from the point.

dy
Vertical offset from the point.

com.mindfusion.diagramming Namespace

LinkLabel.setEditedText Method

Implements InplaceEditable.setEditedText. Assigns the edited text to the label after in-place edit operation completes successfully

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setEditedText (
    String newText
)
```

Parameters

newText
The new text for this label.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.setEnableWrap Method

Sets whether the text should wrap to multiple lines.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setEnableWrap (
    boolean enableWrap
)
```

Parameters

enableWrap
true to enable text wrapping; otherwise, **false**.

See Also

LinkLabel Members
LinkLabel Class

LinkLabel.setFont Method

Sets the font of the link's label.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setFont (
    Font value
)
```

Parameters

value
A **Font** object representing the text font.

Remarks

The label's text is rendered using the link's font if this value is **null**.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.setHorizontalAlign Method

Sets the horizontal alignment of the text within the label's layout rectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setHorizontalAlign (
    Align align
)
```

Parameters

align
A member of the Align enumeration.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.setIndex Method

Sets the index of the segment or control point this label is relative to.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setIndex (
    int value
)
```

Parameters

value
The integer index of a link's segment or control point.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.setLengthFactor Method

Sets label's position along link's length when the RelativeTo property is set to LinkLength.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLengthFactor (
    float value
)
```

Parameters

value
A **float** value specifying label's position.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace
setLinkLengthPosition Method

LinkLabel.setLinkLengthPosition Method

Positions this label relatively to the link length.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkLengthPosition (
    float lengthFactor
)
```

Parameters

lengthFactor
A value between 0 and 1 specifying the position of the label relatively to the link's length.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.setMargin Method

Sets the text margins size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMargin (
    Thickness margin
)
```

Parameters

margin
A Thickness instance specifying the size of text margins.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.setMaxWidth Method

Sets the maximal width that when reached should cause text to wrap to a new line.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMaxWidth (
    float maxWidth
)
```

Parameters

maxWidth
A float value specifying the maximal label width.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.setRelativeTo Method

Sets the label's relative positioning.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRelativeTo (
    RelativeToLink value
)
```

Parameters

value
A member of the RelativeToLink enumeration.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.setSegmentPosition Method

Positions this label relatively to the specified link segment.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSegmentPosition (
    int segment,
    float dx,
    float dy
)
```

Parameters

segment
The segment index.

dx
Horizontal offset from the segment center.

dy
Vertical offset from the segment center.

LinkLabel.setText Method

Sets the label's text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setText (
    String text
)
```

Parameters

text
A String containing the label's text.

See Also

LinkLabel Members
LinkLabel Class
com.mindfusion.diagramming Namespace

LinkLabel.setTextColor Method

Sets the color of the link's label.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTextColor (
    Color value
)
```

Parameters

value
A **Color** object representing the text color.

Remarks

The label's text is rendered using the link's text color if this value is **null**.

LinkLabel.setVerticalAlign Method

Sets the vertical alignment of the text relatively to the label's position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setVerticalAlign (
    Align align
)
```

Parameters

align
A member of the Align enumeration.

See Also

LinkLabel Members
LinkLabel Class

LinkLabel.writeExternal Method

Saves the label into the specified binary stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out
An **ObjectOutput** stream into which to save the label's data.

LinkNodesBehavior Class

The base class for behavior types that allow drawing both nodes and links.

Syntax

Java

```
public abstract class LinkNodesBehavior extends BehaviorBase
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.Interaction
    com.mindfusion.diagramming.BehaviorBase
      com.mindfusion.diagramming.LinkNodesBehavior
        com.mindfusion.diagramming.LinkContainersBehavior
        com.mindfusion.diagramming.LinkControlsBehavior
        com.mindfusion.diagramming.LinkFreeFormsBehavior
        com.mindfusion.diagramming.LinkShapesBehavior
        com.mindfusion.diagramming.LinkTablesBehavior
        com.mindfusion.diagramming.LinkTreeViewsBehavior

See Also

LinkNodesBehavior Members

The base class for behavior types that allow drawing both nodes and links.

The following tables list the members exposed by the LinkNodesBehavior type.

Protected Constructors

	Name	Description
	LinkNodesBehavior	Initializes a new instance of the LinkNodesBehavior class.

Protected Fields

	Name	Description
	currentCursor	(Inherited from BehaviorBase.)
	diagramView	(Inherited from BehaviorBase.)

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events. (Inherited from BehaviorBase.)
	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves. (Inherited from BehaviorBase.)
	pointerOver	Invoked when the mouse moves. (Inherited from BehaviorBase.)
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events. (Inherited from BehaviorBase.)

Protected Methods

	Name	Description
	createLink	(Inherited from BehaviorBase.)
	createNode	
	getDiagram	(Inherited from BehaviorBase.)
	getDiagramView	(Inherited from BehaviorBase.)
	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state. (Inherited from BehaviorBase.)
	setMouseCursor	BehaviorBase.setMouseCursor override.

	startDraw	
	startDrawCommon	(Inherited from BehaviorBase.)

LinkNodesBehavior Constructor

Initializes a new instance of the LinkNodesBehavior class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected LinkNodesBehavior (
    DiagramView diagramView
)
```

Parameters

diagramView
A DiagramView instance.

See Also

LinkNodesBehavior Class
com.mindfusion.diagramming Namespace

LinkNodesBehavior Methods

LinkNodesBehavior.createNode Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected abstract DiagramNode createNode ()
```

Return Value

See Also

LinkNodesBehavior.setMouseCursor Method

BehaviorBase.setMouseCursor override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected CursorHint setMouseCursor (
    Point2D point,
    ByRef<Boolean> startInteraction
)
```

Parameters

point
A Point2D instance that specifies the position of the mouse cursor.

startInteraction
true if the user is going to create, delete, modify or select a DiagramItem; **false** if mouse behavior is not considered; in this case the mouse pointer is set to a default cursor according to the background LaneGrid.

Return Value

A member of the CursorHint enumeration.

LinkRouter Members

Defines methods that should be implemented by a link-router component. The control calls them when a new link path should be set in response to changes in the diagram, such as adding or modifying nodes.

The following tables list the members exposed by the LinkRouter type.

Public Methods

	Name	Description
	routeLink	Called when a single link must be routed.
	routeLinks	Called when more than one links must be routed.
	setDiagram	Sets the diagram this router is associated with.

See Also

LinkRouter Interface
com.mindfusion.diagramming Namespace

LinkRouter Methods

LinkRouter.routeLink Method

Called when a single link must be routed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
boolean routeLink (
    DiagramLink link,
    ConnectionPoint originConnection,
    ConnectionPoint destinationConnection,
    boolean nowCreating
)
```

Parameters

link
A DiagramLink object representing the link.

originConnection
Represents connection to Origin node, potentially different from link's stored connection when modifying first control point.

destinationConnection
Represents connection to Destination node, potentially different from link's stored connection when modifying last control point.

nowCreating
Indicates whether link is currently being created.

Return Value

true if a path has been found, otherwise **false**.

See Also

LinkRouter Members
LinkRouter Interface
com.mindfusion.diagramming Namespace

LinkRouter.routeLinks Method

Called when more than one links must be routed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
DiagramLinkList routeLinks (
    DiagramLinkList links
)
```

Parameters

links
A DiagramLinkList containing the links that should be routed.

Return Value

A list of links that were not routed successfully.

See Also

LinkRouter Members
LinkRouter Interface
com.mindfusion.diagramming Namespace

LinkRouter.setDiagram Method

Sets the diagram this router is associated with.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void setDiagram (
    Diagram value
)
```

Parameters

value
A Diagram instance.

See Also

LinkRouter Interface
com.mindfusion.diagramming Namespace

LinkShape Enumeration

The members of this enumeration specify the geometry of link segments and how the segments are related to each other. The enumeration elements can be used as parameters of the setShape method of the DiagramLink class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum LinkShape
```

Members

	Member name	Description
	Bezier	The link segments are Bezier curves. Each two adjacent segments share a control point. The joins between segments are always kept smooth.
	Cascading	The link consists of straight line segments. All segments are either horizontal or vertical, where each two adjacent segments are orthogonal one to the other.
	Polyline	The link consists of straight line segments.
	Spline	The segments of a link are curves forming an interpolating spline that passes through all control points.

LinkShapeEvent Members

Contains the arguments passed to the SetSelfLoopShape event handler.

The following tables list the members exposed by the LinkShapeEvent type.

Public Constructors

	Name	Description
	LinkShapeEvent	Initializes a new instance of the LinkShapeEvent class.

Public Methods

	Name	Description
	getAdjustmentHandle	Gets the adjustment handle being moved by the user. (Inherited from LinkEvent.)
	getHandled	Gets if the event handler has set a custom loop shape.
	getLabel	Gets a LinkLabel related to this event. (Inherited from LinkEvent.)
	getLink	Gets the link for which the event raised. (Inherited from LinkEvent.)
	getMouseButton	Gets which mouse button has been pressed. (Inherited from LinkEvent.)
	getPointerPosition	Gets the current pointer position. (Inherited from LinkEvent.)
	setAdjustmentHandle	Sets the adjustment handle being moved by the user. (Inherited from LinkEvent.)
	setHandled	Sets if the event handler has set a custom loop shape.
	setPointerPosition	Sets the current pointer position. (Inherited from LinkEvent.)

LinkShapeEvent Constructor

Initializes a new instance of the LinkShapeEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkShapeEvent (
    Object source,
    DiagramLink link
)
```

Parameters

source

link

The DiagramLink that becomes a self-loop.

See Also

LinkShapeEvent Class
com.mindfusion.diagramming Namespace

LinkShapeEvent Methods

LinkShapeEvent.getHandled Method

Gets if the event handler has set a custom loop shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getHandled ()
```

Return Value

See Also

LinkShapeEvent Members
LinkShapeEvent Class
com.mindfusion.diagramming Namespace

LinkShapeEvent.setHandled Method

Sets if the event handler has set a custom loop shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHandled (
    boolean handled
)
```

Parameters

handled

LinkTextStyle Enumeration

The members of this enumeration specify where the label of a link is placed and how it is oriented relatively to the link segments. These constants can be used as parameters of the setTextStyle method of the DiagramLink class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum LinkTextStyle`

Members

	Member name	Description

	Center	The text is displayed horizontally above the middle link segment or control point, depending on whether there are an odd or even number of segments.
	Follow	The label text starts from the first point of the link and follows the path defined by the link segments. This style is useful for displaying long text.
	OverLongestSegment	The text follows the longest link segment and is displayed centered at the segment's middle point.
	Rotate	The text is displayed rotated at the same angle as the segment where the text is placed. A long enough segment from the middle link segments is chosen for that purpose.

LinkTreeViewsBehavior Class
com.mindfusion.diagramming Namespace

LinkTreeViewsBehavior Constructor

Initializes a new instance of the LinkTreeViewsBehavior class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public LinkTreeViewsBehavior (
    DiagramView diagramView
)
```

Parameters

diagramView
The DiagramView this behavior will be associated with.

See Also

LinkTreeViewsBehavior Class
com.mindfusion.diagramming Namespace

LinkTreeViewsBehavior Methods

LinkTreeViewsBehavior.createNode Method

An instance of the DiagramNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected DiagramNode createNode ()
```

Return Value

See Also

LinkTreeViewsBehavior Members
LinkTreeViewsBehavior Class
com.mindfusion.diagramming Namespace

LinkValidationEvent Class

Contains the arguments passed to handlers of link validation events.

Syntax

```
Java
public class LinkValidationEvent extends LinkEvent
```

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.diagramming.LinkEvent
      com.mindfusion.diagramming.LinkValidationEvent

See Also

LinkValidationEvent Members

LinkValidationEvent Members

Contains the arguments passed to handlers of link validation events.

The following tables list the members exposed by the LinkValidationEvent type.

Public Constructors

	Name	Description
	LinkValidationEvent	Overloaded.

Public Methods

	Name	Description
	cancelDrag	Cancels the creation or modification of the link.
	getAdjustmentHandle	Gets the adjustment handle being moved by the user. (Inherited from LinkEvent.)
	getAnchorIndex	Gets the anchor point related to a link validation event.
	getCancel	Gets a value indicating whether to cancel the current operation.
	getChangingDestination	Gets a value indicating whether the user modifies the link's destination end point.
	getChangingOrigin	Gets a value indicating whether the user modifies the link's origin end point.
	getDestination	Gets the node that will become the link's destination if the event is validated.
	getLabel	Gets a LinkLabel related to this event. (Inherited from LinkEvent.)
	getLink	Gets the link for which the event raised. (Inherited from LinkEvent.)
	getMouseButton	Gets which mouse button has been pressed. (Inherited from LinkEvent.)
	getNode	Gets the node to which the link will be connected.
	getNodeElement	Gets the node's element to which the link will be connected.
	getOrigin	Gets the node that would become the link's origin if the event is validated.

	getPointerPosition	Gets the current pointer position. (Inherited from LinkEvent.)
	getSelectionRectangle	Gets the current selection rectangle.
	getTableRow	Gets the table row related to a link validation event.
	setAdjustmentHandle	Sets the adjustment handle being moved by the user. (Inherited from LinkEvent.)
	setCancel	Sets a value indicating whether to cancel the current operation.
	setPointerPosition	Sets the current pointer position. (Inherited from LinkEvent.)

LinkValidationEvent Constructor

Overload List

Name	Description
LinkValidationEvent (Object, DiagramLink)	Represents methods that will handle link validation events.
LinkValidationEvent (Object, DiagramLink, Point2D, int, DiagramNode, int, int)	
LinkValidationEvent (Object, DiagramLink, Rectangle2D)	

See Also

LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent Constructor (Object, DiagramLink)

Represents methods that will handle link validation events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkValidationEvent (
    Object source,
    DiagramLink link
)
```

Parameters

source
The source of the validation event.

link
A LinkValidationEvent that contains the event data.

See Also

LinkValidationEvent Constructor Overload List
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent Constructor (Object, DiagramLink, Point2D, int, DiagramNode, int, int)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public LinkValidationEvent (
    Object source,
    DiagramLink link,
    Point2D mousePosition,
    int adjustmentHandle,
    DiagramNode node,
    int anchorIndex,
    int tableRow
)
```

Parameters

source

link

mousePosition

adjustmentHandle

node

anchorIndex

tableRow

LinkValidationEvent Constructor Overload List
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent Constructor (Object, DiagramLink, Rectangle2D)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public LinkValidationEvent (
    Object source,
    DiagramLink link,
    Rectangle2D selectionRectangle
)
```

Parameters

source

link

selectionRectangle

See Also

LinkValidationEvent Constructor Overload List
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent Methods

LinkValidationEvent.cancelDrag Method

Cancels the creation or modification of the link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void cancelDrag ()
```

See Also

LinkValidationEvent Members
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent.getAnchorIndex Method

Gets the anchor point related to a link validation event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getAnchorIndex ()
```

Return Value

An integer value specifying the index of an anchor point within an AnchorPattern.

See Also

LinkValidationEvent Members
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent.getCancel Method

Gets a value indicating whether to cancel the current operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getCancel ()
```

Return Value

true to cancel the operation; **false** to approve it.

See Also

LinkValidationEvent Members
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent.getChangingDestination Method

Gets a value indicating whether the user modifies the link's destination end point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getChangingDestination ()
```

Return Value

true if the user is changing the destination point; otherwise, **false**.

See Also

LinkValidationEvent Members
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent.getChangingOrigin Method

Gets a value indicating whether the user modifies the link's origin end point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getChangingOrigin ()
```

Return Value

true if the user is changing the origin point; otherwise, **false**.

See Also

LinkValidationEvent Members
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent.getDestination Method

Gets the node that will become the link's destination if the event is validated.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode getDestination ()
```

Return Value

An instance of the DiagramNode class.

See Also

LinkValidationEvent Members
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent.getNode Method

Gets the node to which the link will be connected.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode getNode ()
```

Return Value

An instance of the DiagramNode class.

See Also

LinkValidationEvent Members
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent.getNodeElement Method

Gets the node's element to which the link will be connected.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object getNodeElement ()
```

Return Value

The element of a compound node to which the link will connect.

Remarks

This property could refer to a TreeViewItem if the link connects to a TreeViewNode, or a Row if the link connects to a TableNode.

See Also

LinkValidationEvent Members
LinkValidationEvent Class
com.mindfusion.diagramming Namespace
Node Property

LinkValidationEvent.getOrigin Method

Gets the node that would become the link's origin if the event is validated.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode getOrigin ()
```

Return Value

An instance of the DiagramNode class.

See Also

LinkValidationEvent Members
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent.getSelectionRectangle Method

Gets the current selection rectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getSelectionRectangle ()
```

Return Value

A **Rectangle2D** instance representing the selection rectangle.

See Also

LinkValidationEvent Members
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent.getTableRow Method

Gets the table row related to a link validation event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getTableRow ()
```

Return Value

An integer value specifying the zero-based index of a TableNode's row.

See Also

LinkValidationEvent Members
LinkValidationEvent Class
com.mindfusion.diagramming Namespace

LinkValidationEvent.setCancel Method

Sets a value indicating whether to cancel the current operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCancel (
    boolean cancel
)
```

Parameters

cancel

true to cancel the operation; **false** to approve it.

See Also

LinkValidationEvent Members
LinkValidationEvent Class

Manipulator Members

The base class for interactive widgets displayed in diagram items.

The following tables list the members exposed by the Manipulator type.

Public Constructors

	Name	Description
	Manipulator	

Protected Fields

	Name	Description
	item	

Public Methods

	Name	Description
	cancel	Called when the manipulator should cancel the current manipulation.
	drawsInLocalCoordinates	Returns whether the manipulator object draws in local or global coordinates.
	getItem	
	needsPointerMessages	Returns whether the manipulator object needs to track mouse events.
	onGotFocus	Called when the manipulator receives input focus.
	onLostFocus	Called when the manipulator loses the input focus.
	onPointerDown	Called when the left mouse button is pressed while the pointer is over this manipulator.
	onPointerMove	Called when the mouse is moved while this manipulator tracks the mouse events.
	onPointerUp	Called when the left mouse button is released while this manipulator tracks the mouse events.
	setMouseCursor	

See Also

Manipulator Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Manipulator (
    DiagramItem item
)
```

Parameters

item

See Also

Manipulator Class
com.mindfusion.diagramming Namespace

Manipulator Methods

Manipulator.cancel Method

Called when the manipulator should cancel the current manipulation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void cancel ()
```

See Also

Manipulator Members
Manipulator Class
com.mindfusion.diagramming Namespace

Manipulator.drawsInLocalCoordinates Method

Returns whether the manipulator object draws in local or global coordinates.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean drawsInLocalCoordinates ()
```

Return Value

true if drawn in local coordinates, otherwise, false.

See Also

Manipulator Members
Manipulator Class
com.mindfusion.diagramming Namespace

Manipulator.getItem Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```

Return Value

See Also

Manipulator Members
Manipulator Class
com.mindfusion.diagramming Namespace

Manipulator.needsPointerMessages Method

Returns whether the manipulator object needs to track mouse events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean needsPointerMessages (
    Point2D point
)
```

Parameters

point

Return Value

true to track mouse events; otherwise, **false**.

See Also

Manipulator Members
Manipulator Class
com.mindfusion.diagramming Namespace

Manipulator.onGotFocus Method

Called when the manipulator receives input focus.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void onGotFocus ()
```

See Also

Manipulator Members
Manipulator Class
com.mindfusion.diagramming Namespace

Manipulator.onLostFocus Method

Called when the manipulator loses the input focus.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void onLostFocus ()
```

See Also

Manipulator Members
Manipulator Class
com.mindfusion.diagramming Namespace

Manipulator.onPointerDown Method

Called when the left mouse button is pressed while the pointer is over this manipulator.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void onPointerDown (
    Point2D pointerPosition
)
```

Parameters

mousePosition
A Point2D instance that specifies the current mouse position.

See Also

Manipulator Members
Manipulator Class
com.mindfusion.diagramming Namespace

Manipulator.onPointerMove Method

Called when the mouse is moved while this manipulator tracks the mouse events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void onPointerMove (
    Point2D pointerPosition
)
```

Parameters

mousePosition
A Point2D instance that specifies the current mouse position.

See Also

Manipulator Members
Manipulator Class
com.mindfusion.diagramming Namespace

Manipulator.onPointerUp Method

Called when the left mouse button is released while this manipulator tracks the mouse events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void onPointerUp (
    Point2D pointerPosition
)
```

Parameters

mousePosition
A Point2D instance that specifies the current mouse position.

See Also

Manipulator Members
Manipulator Class
com.mindfusion.diagramming Namespace

Manipulator.setMouseCursor Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CursorHint setMouseCursor (
    Point2D mousePosition
)
```

Parameters

mousePosition

Return Value

See Also

Manipulator Members
Manipulator Class
com.mindfusion.diagramming Namespace

MarkStyle Enumeration

The members of this enumeration specify what marks should be drawn where the anchor points of a node are located. They can be used as parameters of the constructors and the setMarkStyle method of the AnchorPoint class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum MarkStyle
```

Members

	Member name	Description
	Circle	Draw a circle at the anchor point location.
	Cross	Draw a cross at the anchor point location.
	Custom	Custom-draw the anchor point.
	None	No visual indication for the anchor point.
	Rectangle	Draw a rectangle at the anchor point location.
	X	Draw an X at the anchor point location.

See Also

com.mindfusion.diagramming Namespace

MeasureUnit Class

Specifies units of measure.

Syntax

Java
`public class MeasureUnit`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.MeasureUnit

See Also

MeasureUnit Members

MeasureUnit Members

Specifies units of measure.

The following tables list the members exposed by the MeasureUnit type.

Public Constructors

	Name	Description
	MeasureUnit	Overloaded.

Public Fields

	Name	Description
	Centimeter	
	Document	Specifies document units (1/300 inch) as the unit of measure.
	Inch	Specifies inches as the unit of measure.
	Millimeter	Specifies millimeters as the unit of measure.
	Percent	Specifies percents as the unit of measure.
	Pixel	Specifies device pixels as the unit of measure.
	Point	Specifies printer's points (1/72 inch) as the unit of measure.
	WpfPoint	Specifies device-independent pixels (1/96 inch) as the unit of measure.

Public Methods

	Name	Description
	convert	Overloaded.
	equals	**Object.equals** override.
	fromGraphicsUnit	Returns the measure unit corresponding to the specified graphics unit.
	fromId	Overloaded.
	getAmount	Gets the unit's amount.
	getId	Gets the unit identifier.
	getName	Gets the name of the unit.
	hashCode	**Object.hashCode** override.
	op_Equality	Compares two **MeasureUnit** objects for equality.
	op_Inequality	Compares two **MeasureUnit** objects for inequality.
	toString	**Object.toString** override.

com.mindfusion.diagramming Namespace

MeasureUnit Constructor (String, double)

Initializes a new instance of the MeasureUnit class with the specified amount.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public MeasureUnit (
    String name,
    double unitsPerInch
)
```

Parameters

name
The name of the new unit.

unitsPerInch
The amount of the new unit that is equal to one inch.

See Also

MeasureUnit Constructor Overload List
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit Constructor (String, double, int)

Initializes a new instance of the MeasureUnit class with the specified amount.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public MeasureUnit (
    String name,
    double unitsPerInch,
    int standardDivisions
)
```

Parameters

name
The name of the new unit.

unitsPerInch
The amount of the new unit that is equal to one inch.

standardDivisions
The number of divisions of the new unit.

See Also

MeasureUnit Constructor Overload List
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit Constructor (String, MeasureUnit, double)

Initializes a new instance of the MeasureUnit class with the specified unit of measure as a base.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public MeasureUnit (
    String name,
    MeasureUnit baseUnit,
    double scale
)
```

Parameters

name
The name of the new unit.

baseUnit
The base of the new unit.

scale
The scale of the new unit, relatively to the base.

See Also

MeasureUnit Constructor Overload List
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit Constructor (String, MeasureUnit, double, int)

Initializes a new instance of the MeasureUnit class with the specified unit of measure as a base.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public MeasureUnit (
    String name,
    MeasureUnit baseUnit,
    double scale,
    int standardDivisions
)
```

Parameters

name
The name of the new unit.

baseUnit
The base of the new unit.

scale
The scale of the new unit, relatively to the base.

standardDivisions
The number of divisions of the new unit.

MeasureUnit Methods

MeasureUnit.convert Method

Overload List

Name	Description
MeasureUnit.convert (double, MeasureUnit, DiagramView)	Converts the specified value from this unit to the specified unit.
MeasureUnit.convert (Point2D, MeasureUnit, DiagramView)	Converts the specified point from this unit to the specified unit.
MeasureUnit.convert (Rectangle2D, MeasureUnit, DiagramView)	Converts the specified rectangle from this unit to the specified unit.

See Also

MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.convert Method (double, MeasureUnit, DiagramView)

Converts the specified value from this unit to the specified unit.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public double convert (
    double value,
    MeasureUnit targetUnit,
    DiagramView view
)
```

Parameters

value
The value to convert, expressed in the current measure unit.

targetUnit
The target measure unit.

view
A parameter that is used when converting to special units (such as percents).

Return Value

The converted value.

See Also

convert Method Overload List
MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.convert Method (Point2D, MeasureUnit, DiagramView)

Converts the specified point from this unit to the specified unit.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Point2D convert (
    Point2D p,
    MeasureUnit targetUnit,
    DiagramView view
)
```

Parameters

p
The point to convert, expressed in the current measure unit.

targetUnit
The target measure unit.

view
A parameter that is used when converting to special units (such as percents).

Return Value

The converted point.

See Also

convert Method Overload List
MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.convert Method (Rectangle2D, MeasureUnit, DiagramView)

Converts the specified rectangle from this unit to the specified unit.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D convert (
    Rectangle2D r,
    MeasureUnit targetUnit,
    DiagramView view
)
```

Parameters

r
The rectangle to convert, expressed in the current measure unit.

targetUnit
The target measure unit.

view
A parameter that is used when converting to special units (such as percents).

Return Value

The converted rectangle.

See Also

convert Method Overload List
MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.equals Method

Object.equals override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean equals (
    Object obj
)
```

Parameters

obj
The object to compare with the current unit.

Return Value

true if the specified object is the same as or is equal to the current unit; otherwise, **false**.

See Also

MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.fromGraphicsUnit Method

Returns the measure unit corresponding to the specified graphics unit.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static MeasureUnit fromGraphicsUnit (
    GraphicsUnit unit
)
```

Parameters

unit
One of the GraphicsUnit values.

Return Value

The built-in MeasureUnit corresponding to the specified graphics unit. If *unit* is World, this method returns **null**. If *unit* is Display, this method returns Pixel.

See Also

MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.fromId Method

Overload List

Name	Description

MeasureUnit.fromId (GraphicsUnit)	Returns a MeasureUnit from its integer identifier.
MeasureUnit.fromId (int)	

See Also

MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.fromId Method (GraphicsUnit)

Returns a MeasureUnit from its integer identifier.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static MeasureUnit fromId (
    GraphicsUnit id
)
```

Parameters

id
The identifier of one of the built-in measure units.

Return Value

The built-in MeasureUnit corresponding to the specified identifier.

See Also

fromId Method Overload List
MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.fromId Method (int)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static MeasureUnit fromId (
    int id
)
```

Parameters

id

Return Value

See Also

fromId Method Overload List
MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.getAmount Method

Gets the unit's amount.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public double getAmount ()`

Return Value

See Also

MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.getId Method

Gets the unit identifier.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public int getId ()`

Return Value

Remarks

This property returns -1 for custom MeasureUnit objects.

MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.getName Method

Gets the name of the unit.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getName ()
```

Return Value

See Also

MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.hashCode Method

Object.hashCode override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int hashCode ()
```

Return Value

A hash code for the current unit.

See Also

MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.op_Equality Method

Compares two MeasureUnit objects for equality.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static boolean op_Equality (
    MeasureUnit a,
    MeasureUnit b
)
```

Parameters

a

The first MeasureUnit to compare.

b

The second **MeasureUnit** to compare.

Return Value

{@code true} if the specified arguments are equal; otherwise, {@code false}.

See Also

MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.op_Inequality Method

Compares two MeasureUnit objects for inequality.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static boolean op_Inequality (
    MeasureUnit a,
    MeasureUnit b
)
```

Parameters

a

The first MeasureUnit to compare.

b

The second **MeasureUnit** to compare.

Return Value

{@code true} if the specified arguments are not equal; otherwise, {@code false}.

See Also

MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

MeasureUnit.toString Method

Object.toString override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public String toString ()`

Return Value

The name of the unit.

See Also

MeasureUnit Members
MeasureUnit Class
com.mindfusion.diagramming Namespace

ModificationStart Enumeration

The members of this enumeration specify how users can start modifying an item. They can be used as parameters of the setModificationStart method of the Diagram class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum ModificationStart`

Members

	Member name	Description
	AutoHandles	Modification handles appear automatically around the item that is under the mouse pointer. Users can start modifying items by simply pointing at them and dragging.
	SelectedOnly	Users must first select an item in order to modify it.

See Also

com.mindfusion.diagramming Namespace

ModifierKeyAction Enumeration

Defines the actions that can be assigned to a modifier key such as CTRL or ALT.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum ModifierKeyAction`

Members

	Member name	Description
	ExtendSelection	Similar to Select, but does not deselect currently selected items when they are outside of a newly drawn lasso rectangle.
	Magnify	Magnifies the diagram objects under the mouse while the modifier key is pressed down.
	None	Specifies that a modifier key does not have any specific function assigned to it.
	OverrideBehavior	While the modifier key is pressed down, dragging the mouse starts creating a new item or drawing a selection rectangle instead of modifying a selected item. Otherwise, dragging the mouse could start modification of the selected item.
	Pan	Pan the view if the mouse is dragged while the modifier key is pressed down.
	Select	Start drawing a selection rectangle if the mouse is dragged while a modifier key is pressed down. Toggle the selection if an item is clicked while the key is down.
	Zoom	Start drawing a zoom-lasso if the mouse is dragged while respective modifier key is pressed down.

Remarks

The values from this enumeration can be assigned to the members of the diagram view's ModifierKeyActions.

See Also

com.mindfusion.diagramming Namespace

ModifierKeyActions Class

Maps keyboard modifier keys to special actions in MindFusion.Diagramming, such as panning and drawing selection rectangle.

Syntax

Java
`public class ModifierKeyActions`

Remarks

The ModifierKeyActions property of DiagramView returns an object of this type, letting you specify the modifier key functions for each **DiagramView** instance.

Assign member of the ModifierKeyAction enumeration to the Alt, Control and Shift properties to specify what function is assigned to the ALT, CTRL and SHIFT keys.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.ModifierKeyActions

See Also

ModifierKeyActions Members
com.mindfusion.diagramming Namespace

ModifierKeyActions Members

Maps keyboard modifier keys to special actions in MindFusion.Diagramming, such as panning and drawing selection rectangle.

The following tables list the members exposed by the ModifierKeyActions type.

Public Methods

	Name	Description
	getAlt	Gets what action is triggered by the ALT key.
	getControl	Gets what action is triggered by the CTRL key.
	getShift	Gets what action is triggered by the SHIFT key.
	setAlt	Sets what action is triggered by the ALT key.
	setControl	Sets what action is triggered by the CTRL key.
	setShift	Sets what action is triggered by the SHIFT key.

See Also

ModifierKeyActions Class
com.mindfusion.diagramming Namespace

ModifierKeyActions Methods

ModifierKeyActions.getAlt Method

Gets what action is triggered by the ALT key.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ModifierKeyAction getAlt ()
```

Return Value

A member of the ModifierKeyAction enumeration. The default is **Pan**.

Remarks

The value of this property specifies what happens when a user holds down the ALT key and drags the mouse. The default value Pan makes the control enter pan mode, letting the user scroll the diagram contents by dragging it with the mouse.

See Also

ModifierKeyActions Members
ModifierKeyActions Class
com.mindfusion.diagramming Namespace

ModifierKeyActions.getControl Method

Gets what action is triggered by the CTRL key.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ModifierKeyAction getControl ()
```

Return Value

A member of the ModifierKeyAction enumeration. The default is **Select**.

Remarks

The value of this property specifies what happens when a user holds down the CTRL key and drags the mouse. The default value Select makes the control enter selection mode, letting the user draw a lasso rectangle around diagram items in order to select them.

See Also

ModifierKeyActions Members
ModifierKeyActions Class
com.mindfusion.diagramming Namespace

ModifierKeyActions.getShift Method

Gets what action is triggered by the SHIFT key.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ModifierKeyAction getShift ()
```

Return Value

A member of the ModifierKeyAction enumeration. The default is **OverrideBehavior**.

Remarks

The value of this property specifies what happens when a user holds down the SHIFT key and drags the mouse. The default value OverrideBehavior makes the control ignore item's selection handles, thus not allowing modifying a selected item but starts the creation of a new item.

See Also

ModifierKeyActions Members
ModifierKeyActions Class
com.mindfusion.diagramming Namespace

ModifierKeyActions.setAlt Method

Sets what action is triggered by the ALT key.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAlt (
    ModifierKeyAction value
)
```

Parameters

value
A member of the ModifierKeyAction enumeration.

Remarks

The value of this property specifies what happens when a user holds down the ALT key and drags the mouse. The default value Pan makes the control enter pan mode, letting the user scroll the diagram contents by dragging it with the mouse.

See Also

ModifierKeyActions Members
ModifierKeyActions Class
com.mindfusion.diagramming Namespace

ModifierKeyActions.setControl Method

Sets what action is triggered by the CTRL key.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setControl (
    ModifierKeyAction value
)
```

Parameters

value
A member of the ModifierKeyAction enumeration.

Remarks

The value of this property specifies what happens when a user holds down the CTRL key and drags the mouse. The default value Select makes the control enter selection mode, letting the user draw a lasso rectangle around diagram items in order to select them.

See Also

ModifierKeyActions Members
ModifierKeyActions Class
com.mindfusion.diagramming Namespace

ModifierKeyActions.setShift Method

Sets what action is triggered by the SHIFT key.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShift (
    ModifierKeyAction value
)
```

Parameters

value
A member of the ModifierKeyAction enumeration.

Remarks

The value of this property specifies what happens when a user holds down the SHIFT key and drags the mouse. The default value OverrideBehavior makes the control ignore item's selection handles, thus not allowing modifying a selected item but starts the creation of a new item.

ModifyBehavior Class

Implements the Behavior.Modify behavior.

Syntax

```
Java
public class ModifyBehavior extends BehaviorBase
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.Interaction
    com.mindfusion.diagramming.BehaviorBase
      com.mindfusion.diagramming.ModifyBehavior

See Also

ModifyBehavior Members
com.mindfusion.diagramming Namespace

ModifyBehavior Members

Implements the Behavior.Modify behavior.

The following tables list the members exposed by the ModifyBehavior type.

Public Constructors

	Name	Description
	ModifyBehavior	Initializes a new instance of the ModifyBehavior class.

Protected Fields

	Name	Description
	currentCursor	(Inherited from BehaviorBase.)
	diagramView	(Inherited from BehaviorBase.)

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events. (Inherited from BehaviorBase.)

	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves. (Inherited from BehaviorBase.)
	pointerOver	Invoked when the mouse moves. (Inherited from BehaviorBase.)
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events. (Inherited from BehaviorBase.)

Protected Methods

	Name	Description
	createLink	(Inherited from BehaviorBase.)
	getDiagram	(Inherited from BehaviorBase.)
	getDiagramView	(Inherited from BehaviorBase.)
	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state. (Inherited from BehaviorBase.)
	setMouseCursor	BehaviorBase.setMouseCursor override.
	startDraw	
	startDrawCommon	(Inherited from BehaviorBase.)

See Also

ModifyBehavior Class
com.mindfusion.diagramming Namespace

ModifyBehavior Constructor

Initializes a new instance of the ModifyBehavior class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected ModifyBehavior (
    DiagramView diagramView
)
```

Parameters

diagramView
A DiagramView instance.

See Also

ModifyBehavior Class
com.mindfusion.diagramming Namespace

ModifyBehavior Methods

ModifyBehavior.setMouseCursor Method

BehaviorBase.setMouseCursor override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected CursorHint setMouseCursor (
    Point2D point,
    ByRef<Boolean> startInteraction
)
```

Parameters

point
A Point2D instance that specifies the position of the mouse cursor.

startInteraction
true if the user is going to create, delete, modify or select a DiagramItem; **false** if mouse behavior is not considered; in this case the mouse pointer is set to a default cursor according to the background LaneGrid.

Return Value

A member of the CursorHint enumeration.

See Also

ModifyBehavior Members
ModifyBehavior Class

ModifyItemCmd Members

Represents an action that changes the size or position of a diagram item.

The following tables list the members exposed by the ModifyItemCmd type.

Public Constructors

	Name	Description
	ModifyItemCmd	Initializes a new instance of the **ModifyItemCmd** class.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)
	execute	This method is called internally by JDiagram when saving item position and size for later undo/redo.
	getItem	Gets a reference to the modified item.
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)

	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	This method is called by the UndoManager when redoing actions.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	This method is called by the **UndoManager** when undoing actions.

Protected Methods

	Name	Description
	adopt	
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

ModifyItemCmd Class
com.mindfusion.diagramming Namespace

ModifyItemCmd Constructor

Initializes a new instance of the ModifyItemCmd class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ModifyItemCmd (
    DiagramItem item
)
```

Parameters

item
The item whose modification is represented by this command.

See Also

ModifyItemCmd Class
com.mindfusion.diagramming Namespace

ModifyItemCmd Methods

ModifyItemCmd.adopt Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

protected boolean adopt (
    Command command
)
```

Parameters

command

Return Value

ModifyItemCmd Members
ModifyItemCmd Class
com.mindfusion.diagramming Namespace

ModifyItemCmd.execute Method

This method is called internally by JDiagram when saving item position and size for later undo/redo.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void execute (
    boolean undoEnabled
)
```

Parameters

undoEnabled
true if the undo manager is enabled at this time, otherwise **false**.

See Also

ModifyItemCmd Members

MouseButtonAction Enumeration

Specifies what actions can be associated with the middle and right mouse buttons.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum MouseButtonAction`

Members

	Member name	Description
	Cancel	Cancels the current drawing operation.
	Draw	Draw new items or modify existing items.
	Magnify	Magnifies the items under the mouse while the button is pressed down.
	Pan	Pans the view if the mouse is dragged while the button is pressed down.
	Select	Starts a multiple selection operation.
	Zoom	Draw a zoom-lasso if the mouse is dragged with specified button pressed down.

See Also

com.mindfusion.diagramming Namespace

MouseInputMode Enumeration

The members of this enumeration specify specify how to process mouse actions done over a ControlNode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum MouseInputMode`

Members

	Member name	Description
	HandledByBoth	Mouse events are sent to both the diagram view and the hosted control.
	HandledByDiagram	Mouse input is processed by the DiagramView.
	HandledByHostedControl	Mouse input is processed by the hosted control.

See Also

MoveNodesBehavior Class

This class is used when the view's Behavior is set to MoveNodes.

Syntax

Java

```
public class MoveNodesBehavior
    extends BehaviorBase
```

Inheritance Hierarchy

MoveNodesBehavior Members

This class is used when the view's Behavior is set to MoveNodes.

The following tables list the members exposed by the MoveNodesBehavior type.

Public Constructors

	Name	Description
	MoveNodesBehavior	Initializes a new instance of the MoveNodesBehavior class.

Protected Fields

	Name	Description
	currentCursor	(Inherited from BehaviorBase.)
	diagramView	(Inherited from BehaviorBase.)

Public Methods

	Name	Description
	cancelDrag	Invoked when the operation should be canceled. (Inherited from Interaction.)
	pointerDown	Interaction.pointerDown override. Invoked in response to system pointer down events. (Inherited from BehaviorBase.)

	pointerMove	Interaction.pointerMove override. Invoked when the pointer moves. (Inherited from BehaviorBase.)
	pointerOver	Invoked when the mouse moves. (Inherited from BehaviorBase.)
	pointerUp	Interaction.pointerUp override. Invoked in response to system pointer up events. (Inherited from BehaviorBase.)

Protected Methods

	Name	Description
	createLink	(Inherited from BehaviorBase.)
	getDiagram	(Inherited from BehaviorBase.)
	getDiagramView	(Inherited from BehaviorBase.)
	setModfCursor	Updates the current cursor according to the specified cursor position and diagram state. (Inherited from BehaviorBase.)
	setMouseCursor	
	startDraw	
	startDrawCommon	(Inherited from BehaviorBase.)

NodeAdjustmentHandle Members

Represents an adjustment handle used to move, resize or rotate a node.

The following tables list the members exposed by the NodeAdjustmentHandle type.

Public Constructors

	Name	Description
	NodeAdjustmentHandle	Initializes a new instance of the **NodeAdjustmentHandle** class.

Public Methods

	Name	Description
	getHandleType	Gets the type of this adjustment handle.
	setHandleType	Sets the type of this adjustment handle.

See Also

NodeAdjustmentHandle Class
com.mindfusion.diagramming Namespace

NodeAdjustmentHandle Constructor

Initializes a new instance of the NodeAdjustmentHandle class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeAdjustmentHandle (
    NodeHandleType handleType
)
```

Parameters

handleType
A member of the NodeHandleType enumeration identifying the handle type.

See Also

NodeAdjustmentHandle Class
com.mindfusion.diagramming Namespace

NodeAdjustmentHandle Methods

NodeAdjustmentHandle.getHandleType Method

Gets the type of this adjustment handle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeHandleType getHandleType ()
```

Return Value

A member of the NodeHandleType enumeration.

See Also

NodeConstraints Class

Represents the movement and size constraints that can be applied to a node.

Syntax

Java

```
public class NodeConstraints implements Externalizable
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.NodeConstraints

See Also

NodeConstraints Members
com.mindfusion.diagramming Namespace

NodeConstraints Members

Represents the movement and size constraints that can be applied to a node.

The following tables list the members exposed by the NodeConstraints type.

Public Constructors

	Name	Description
	NodeConstraints	Initializes a new **NodeConstraints** instance.

Public Methods

	Name	Description
	clone	Creates a copy of this **NodeConstraints** instance.
	getDisableMirroring	Gets a value indicating whether the user can drag a side of the node past its opposite side, so that they switch positions.
	getKeepInsideDiagram	Gets a value indicating whether a node must always stay inside the boundaries of the diagram that contains it.
	getKeepInsideParent	Gets a value indicating whether a node must always stay in the boundaries of its group master node.
	getKeepRatio	Gets a value indicating whether the initial width/height ratio of a node must be preserved.
	getMaxHeight	Gets the largest allowed height for the node.
	getMaxWidth	Gets the largest allowed width for the node.
	getMinHeight	Gets the smallest allowed height for the node.
	getMinWidth	Gets the smallest allowed width for the node.
	getMoveDirection	Gets a value indicating the movement direction constraint.
	loadFromXml	Loads the label from the specified XML element.
	readExternal	Implements Externalizable.
	saveToXml	Saves the label into the specified XML element.

	setDisableMirroring	Sets a value indicating whether the user can drag a side of the node past its opposite side, so that they switch positions.
	setKeepInsideDiagram	Sets a value indicating whether a node must always stay inside the boundaries of the diagram that contains it.
	setKeepInsideParent	Sets a value indicating whether a node must always stay in the boundaries of its group master node.
	setKeepRatio	Sets a value indicating whether the initial width/height ratio of a node must be preserved.
	setMaxHeight	Sets the largest allowed height for the node.
	setMaxWidth	Sets the largest allowed width for the node.
	setMinHeight	Sets the smallest allowed height for the node.
	setMinWidth	Sets the smallest allowed width for the node.
	setMoveDirection	Sets a value indicating the movement direction constraint.
	writeExternal	Implements Externalizable.

NodeConstraints Members
NodeConstraints Class
com.mindfusion.diagramming Namespace

NodeConstraints.getMinWidth Method

Gets the smallest allowed width for the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getMinWidth ()
```

Return Value

A float value specifying the minimal node width.

See Also

NodeConstraints Members
NodeConstraints Class
com.mindfusion.diagramming Namespace

NodeConstraints.getMoveDirection Method

Gets a value indicating the movement direction constraint.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DirectionConstraint getMoveDirection ()
```

Return Value

A member of the DirectionConstraint enumeration.

See Also

NodeConstraints Members
NodeConstraints Class
com.mindfusion.diagramming Namespace

NodeConstraints.loadFromXml Method

Loads the label from the specified XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Element instance.

context
A XmlPersistContext instance.

See Also

NodeConstraints Members
NodeConstraints Class
com.mindfusion.diagramming Namespace

NodeConstraints.readExternal Method

Implements Externalizable.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

NodeConstraints Members
NodeConstraints Class
com.mindfusion.diagramming Namespace

NodeConstraints.saveToXml Method

Saves the label into the specified XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Element instance.

context
An XmlPersistContext instance.

See Also

NodeConstraints Members
NodeConstraints Class
com.mindfusion.diagramming Namespace

NodeConstraints.setDisableMirroring Method

Sets a value indicating whether the user can drag a side of the node past its opposite side, so that they switch positions.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDisableMirroring (
    boolean value
)
```

Parameters

value
Indicates whether the user can drag a side of the node past its opposite side, so that they switch positions.

See Also

NodeConstraints.setKeepInsideDiagram Method

Sets a value indicating whether a node must always stay inside the boundaries of the diagram that contains it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setKeepInsideDiagram (
    boolean value
)
```

Parameters

value
Indicates whether a node should always stay inside the boundaries of the diagram that contains it.

See Also

NodeConstraints Members
NodeConstraints Class
com.mindfusion.diagramming Namespace

NodeConstraints.setKeepInsideParent Method

Sets a value indicating whether a node must always stay in the boundaries of its group master node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setKeepInsideParent (
    boolean value
)
```

Parameters

value
Indicates whether a node should always stay in the boundaries of its group master node.

Remarks

This property lets you restrict nodes attached to another node by the attachTo method, and also the children of a ContainerNode, so that users cannot move the attached nodes out of the bounds of their parent.

See Also

NodeConstraints Members
NodeConstraints Class
com.mindfusion.diagramming Namespace
getKeepInsideParent Method

NodeConstraints.setKeepRatio Method

Sets a value indicating whether the initial width/height ratio of a node must be preserved.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setKeepRatio (
    boolean value
)
```

Parameters

value
Indicates whether the initial width/height ratio of a node should be preserved.

Remarks

If you enable this property in an initialization-event handler, the node will have an aspect ratio of 1:1. For example in order to let users draw perfect square or circle shapes, set **KeepRatio** to **true** in the initializeNode handler.

NodeConstraints.setMaxHeight Method

Sets the largest allowed height for the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMaxHeight (
    float value
)
```

Parameters

value
A float value specifying the maximal node height.

NodeEvent Members

Contains the arguments passed to handlers of node-related events, such as nodeCreated and nodeModified.

The following tables list the members exposed by the NodeEvent type.

Public Constructors

	Name	Description
	NodeEvent	Overloaded.

Public Methods

	Name	Description
	getAdjustmentHandle	Gets the adjustment handle being moved by the user.
	getLabel	Gets a NodeLabel related to this event.
	getMouseButton	Gets which mouse button has been pressed.
	getNode	Gets the node for which the event was raised.
	getNodeHandleType	Gets the type of adjustment handle moved by the user.
	getPointerPosition	Gets the current pointer position.
	setAdjustmentHandle	Sets the adjustment handle being moved by the user.
	setPointerPosition	Sets the current pointer position.

NodeEvent Constructor (Object, DiagramNode)

Represents methods that will handle general node related events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeEvent (
    Object source,
    DiagramNode node
)
```

Parameters

source
The source of the event.

node
The DiagramNode related to the event.

See Also

NodeEvent Constructor Overload List
NodeEvent Class
com.mindfusion.diagramming Namespace

NodeEvent Constructor (Object, DiagramNode, int, Point2D)

Initializes a new instance of the NodeEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeEvent (
    Object source,
    DiagramNode node,
    int mouseButton,
    Point2D mousePosition
)
```

Parameters

source
The source of the event.

node
The DiagramNode related to the event.

mouseButton
One of the **MouseEvent** button constants.

mousePosition
The mouse position related to this event.

See Also

NodeEvent Constructor Overload List
NodeEvent Class
com.mindfusion.diagramming Namespace

NodeEvent Constructor (Object, DiagramNode, Point2D, AdjustmentHandle)

Initializes a new instance of the NodeEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeEvent (
    Object source,
    DiagramNode node,
    Point2D mousePosition,
    AdjustmentHandle adjustmentHandle
)
```

Parameters

source
The source of the event.

node
The DiagramNode related to the event.

mousePosition
The mouse location related to this event.

adjustmentHandle
An instance of the AdjustmentHandle class.

See Also

NodeEvent Constructor Overload List
NodeEvent Class
com.mindfusion.diagramming Namespace

NodeEvent Methods

NodeEvent.getAdjustmentHandle Method

Gets the adjustment handle being moved by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AdjustmentHandle getAdjustmentHandle ()
```

Return Value

An instance of the AdjustmentHandle class.

See Also

NodeEvent Members
NodeEvent Class
com.mindfusion.diagramming Namespace

NodeEvent.getLabel Method

Gets a NodeLabel related to this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeLabel getLabel ()
```

Return Value

A NodeLabel instance.

Remarks

At this time, label is reported by click and text edit events.

See Also

NodeEvent Members
NodeEvent Class
com.mindfusion.diagramming Namespace

NodeEvent.getMouseButton Method

Gets which mouse button has been pressed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getMouseButton ()
```

Return Value

the currently pressed mouse button.

See Also

NodeEvent Members
NodeEvent Class
com.mindfusion.diagramming Namespace

NodeEvent.getNode Method

Gets the node for which the event was raised.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode getNode ()
```

Return Value

An instance of the DiagramNode class.

See Also

NodeEvent Members
NodeEvent Class
com.mindfusion.diagramming Namespace

NodeEvent.getNodeHandleType Method

Gets the type of adjustment handle moved by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public NodeHandleType getNodeHandleType ()
```

Return Value

A member of the NodeHandleType enumeration.

Remarks

This method returns **null** if the event's AdjustmentHandle is a FreeFormHandle.

See Also

NodeEvent Members
NodeEvent Class
com.mindfusion.diagramming Namespace

NodeEvent.getPointerPosition Method

Gets the current pointer position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public Point2D getPointerPosition ()
```

Return Value

A **Point2D** object specifying the current mouse position.

NodeEvent Members
NodeEvent Class
com.mindfusion.diagramming Namespace

NodeEvent.setAdjustmentHandle Method

Sets the adjustment handle being moved by the user.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setAdjustmentHandle (
    AdjustmentHandle adjustmentHandle
)
```

Parameters

adjustmentHandle
An instance of the AdjustmentHandle class.

See Also

NodeEvent Members
NodeEvent Class
com.mindfusion.diagramming Namespace

NodeEvent.setPointerPosition Method

Sets the current pointer position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setPointerPosition (
    Point2D pointerPosition
)
```

Parameters

mousePosition
A Point2D object specifying the current mouse position.

NodeHandleType Enumeration

Identifies the types of selection handles of a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public enum NodeHandleType
```

Members

	Member name	Description
	Move	A central selection handle that can be used to move the node.
	ResizeBottomCenter	A bottom-center handle that can be used to resize the node vertically.
	ResizeBottomLeft	A bottom-left handle that can be used to resize the node.
	ResizeBottomRight	A bottom-right handle that can be used to resize the node.
	ResizeMiddleLeft	A middle-left handle that can be used to resize the node horizontally.
	ResizeMiddleRight	A middle-right handle that can be used to resize the node horizontally.
	ResizeTopCenter	A top-center handle that can be used to resize the node vertically.
	ResizeTopLeft	A top-left handle that can be used to resize the node.
	ResizeTopRight	A top-right handle that can be used to resize the node.
	Rotate	A rotation handle that can be used to rotate the node.

com.mindfusion.diagramming Namespace

NodeLabel Class

Represents a label displayed by a DiagramNode. New labels can be added to a node by calling the addLabel method.

Syntax

Java

```
public class NodeLabel extends ItemLabel implements Externalizable
```

Remarks

The position of a label is determined by where it is pinned relative to node's bounding box, and offset from the pin point, as set using setCornerPosition, setEdgePosition and setCenterPosition methods. In addition, the HorizontalAlign and VerticalAlign properties specify whether the label is centered on its pin point or aligned to it.

Apart from Text, a label can also display **java.awt.Image** bitmap assigned to the Image property. This lets you draw multiple icons inside a node. If a label contains both image and text, their relative position can be set using the ImageAlign property.

You can let users arrange labels manually by setting the Behavior property of DiagramView to MoveLabels.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.ItemLabel
    com.mindfusion.diagramming.NodeLabel

LinkLabel Class

NodeLabel Members

Represents a label displayed by a DiagramNode. New labels can be added to a node by calling the addLabel method.

The following tables list the members exposed by the NodeLabel type.

Public Constructors

	Name	Description
	NodeLabel	Overloaded. Initializes a new instance of the **NodeLabel** class.

Public Methods

	Name	Description
	cancel	Called when drag operation is canceled. (Inherited from ItemLabel.)
	clone	Creates a clone of this label.
	getBrush	Gets the brush used to draw the label's background. (Inherited from ItemLabel.)
	getContentPadding	Gets the distance between Image and Text when both are specified. (Inherited from ItemLabel.)
	getEditRect	Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates). (Inherited from ItemLabel.)
	getEnableWrap	Gets whether the text should wrap to multiple lines. (Inherited from ItemLabel.)
	getFont	Gets the font of the label's text. (Inherited from ItemLabel.)
	getHorizontalAlign	Gets label's horizontal alignment relative to the pin point. (Inherited from ItemLabel.)
	getHorizontalOffset	Gets label's horizontal offset from its pin point. (Inherited from ItemLabel.)
	getImage	Gets the image displayed by this label. (Inherited from ItemLabel.)

	getImageAlign	Gets the alignment of label's image relative to text. (Inherited from ItemLabel.)
	getImageSize	Gets a size that overrides the native image size. (Inherited from ItemLabel.)
	getImageUrl	Gets a URL used to load an image into this label. (Inherited from ItemLabel.)
	getIndex	Gets the index of an edge or point this label is relative to. (Inherited from ItemLabel.)
	getLocked	Gets a value indicating whether users are allowed to edit this label. (Inherited from ItemLabel.)
	getMargin	Gets the text margins size. (Inherited from ItemLabel.)
	getMaxWidth	Gets the maximal width that when reached should cause text to wrap to a new line. (Inherited from ItemLabel.)
	getRelativeTo	Gets the label's relative positioning.
	getText	Gets the label's text. (Inherited from ItemLabel.)
	getTextColor	Gets the color of the label's text. (Inherited from ItemLabel.)
	getTextToEdit	Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when this label is edited in-place. (Inherited from ItemLabel.)
	getVerticalAlign	Gets label's vertical alignment relative to the pin point. (Inherited from ItemLabel.)
	getVerticalOffset	Gets label's vertical offset from its pin point. (Inherited from ItemLabel.)
	onPointerDown	Called when the left mouse button is pressed while the pointer is over this label. (Inherited from ItemLabel.)
	onPointerMove	Called when the mouse is moved while this label tracks the mouse events. (Inherited from ItemLabel.)
	onPointerUp	Called when the left mouse button is released while this label tracks the mouse events. (Inherited from ItemLabel.)
	readExternal	Loads the label from the specified binary stream.
	setBrush	Sets the brush used to draw the label's background. (Inherited from ItemLabel.)
	setCenterPosition	Positions this label relatively to the node center.
	setContentPadding	Sets the distance between **Image** and **Text** when both are specified. (Inherited from ItemLabel.)
	setCornerPosition	Positions this label relatively to the specified corner point.
	setEdgePosition	Positions this label relatively to the specified node edge.
	setEditedText	Implements InplaceEditable.setEditedText. Assigns the edited text to the label after in-place edit operation completes successfully (Inherited from ItemLabel.)
	setEnableWrap	Sets whether the text should wrap to multiple lines. (Inherited from ItemLabel.)

	setFont	Sets the font of the label's text. (Inherited from ItemLabel.)
	setHorizontalAlign	Sets label's horizontal alignment relative to the pin point. (Inherited from ItemLabel.)
	setHorizontalOffset	Sets label's horizontal offset from its pin point. (Inherited from ItemLabel.)
	setImage	Sets the image displayed by this label. (Inherited from ItemLabel.)
	setImageAlign	Sets the alignment of label's image relative to text. (Inherited from ItemLabel.)
	setImageSize	Sets a size that overrides the native image size. (Inherited from ItemLabel.)
	setImageUrl	Sets a URL used to load an image into this label. (Inherited from ItemLabel.)
	setIndex	Sets the index of an edge or point this label is relative to. (Inherited from ItemLabel.)
	setLocked	Sets a value indicating whether users are allowed to edit this label. (Inherited from ItemLabel.)
	setMargin	Sets the text margins size. (Inherited from ItemLabel.)
	setMaxWidth	Sets the maximal width that when reached should cause text to wrap to a new line. (Inherited from ItemLabel.)
	setMouseCursor	Indicates what cursor to display for interactive labels. (Inherited from ItemLabel.)
	setRelativeTo	Sets the label's relative positioning.
	setText	Sets the label's text. (Inherited from ItemLabel.)
	setTextColor	Sets the color of the label's text. (Inherited from ItemLabel.)
	setVerticalAlign	Sets label's vertical alignment relative to the pin point. (Inherited from ItemLabel.)
	setVerticalOffset	Sets label's vertical offset from its pin point. (Inherited from ItemLabel.)
	writeExternal	Saves the label into the specified binary stream.

Protected Methods

	Name	Description
	draw	Draws this label on the specified **Graphics2D** surface. (Inherited from ItemLabel.)
	getItem	Returns the DiagramItem that displays this label. (Inherited from ItemLabel.)
	getLayoutRect	Gets the label's layout rectangle calculated from text length, font and alignment. (Inherited from ItemLabel.)
	getNode	Returns the **DiagramNode** that displays this label.

	loadFromJson	Loads the label from a JSON object.
	loadFromXml	Loads the label from the specified XML element.
	saveToJson	Saves the label as a JSON object.
	saveToXml	Saves the label into the specified XML element.

NodeLabel.loadFromJson Method

Loads the label from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the label's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

NodeLabel.loadFromXml Method

Loads the label from the specified XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

An **org.w3c.dom.Element** instance.

context
An XmlPersistContext instance.

See Also

NodeLabel Members
NodeLabel Class
com.mindfusion.diagramming Namespace

NodeLabel.readExternal Method

Loads the label from the specified binary stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in
A **java.io.ObjectInput** instance.

See Also

NodeLabel Members

NodeLabel.saveToJson Method

Saves the label as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

Saves the label into the specified XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

An **org.w3c.dom.Element** instance.

context

An XmlPersistContext instance.

See Also

NodeLabel Members
NodeLabel Class
com.mindfusion.diagramming Namespace

NodeLabel.setCenterPosition Method

Positions this label relatively to the node center.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCenterPosition (
    float dx,
    float dy
)
```

Parameters

dx

Horizontal offset from the center point.

dy
Vertical offset from the center point.

Remarks

This method sets the node's center as label's pin point and assigns specified offsets to HorizontalOffset and VerticalOffset properties.

See Also

NodeLabel Members
NodeLabel Class
com.mindfusion.diagramming Namespace

NodeLabel.setCornerPosition Method

Positions this label relatively to the specified corner point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCornerPosition (
    int cornerPoint,
    float dx,
    float dy
)
```

Parameters

cornerPoint
The corner point index.

dx
Horizontal offset from the point.

dy
Vertical offset from the point.

Remarks

This method sets node's corner as label's pin point and assigns specified offsets to HorizontalOffset and VerticalOffset properties. The *cornerPoint* index starts counting from top-left corner in clockwise direction:

- 0 desigates top-left corner;
- 1 desigates top-right corner;
- 2 desigates bottom-right corner;
- 3 desigates bottom-left corner;

NodeLabel.setEdgePosition Method

Positions this label relatively to the specified node edge.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEdgePosition (
    int edge,
    float dx,
    float dy
)
```

Parameters

edge
The edge index.

dx
Horizontal offset from the edge center.

dy
Vertical offset from the edge center.

NodeLabel Members
NodeLabel Class
com.mindfusion.diagramming Namespace

NodeLabel.setRelativeTo Method

Sets the label's relative positioning.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRelativeTo (
    RelativeToNode value
)
```

Parameters

value
A member of the RelativeToNode enumeration.

See Also

NodeLabel Members
NodeLabel Class
com.mindfusion.diagramming Namespace

NodeLabel.writeExternal Method

Saves the label into the specified binary stream.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out
A **java.io.ObjectOutput** instance.

NodeListEvent Class
com.mindfusion.diagramming Namespace

NodeListEvent Constructor

Overload List

Name	Description
NodeListEvent (DiagramNode)	Initializes a new instance of the NodeListEvent class.
NodeListEvent (DiagramNode, int)	Initializes a new instance of the NodeListEvent class.

See Also

NodeListEvent Class
com.mindfusion.diagramming Namespace

NodeListEvent Constructor (DiagramNode)

Initializes a new instance of the NodeListEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeListEvent (
    DiagramNode node
)
```

Parameters

node

The node related to the event.

See Also

NodeListEvent Constructor Overload List
NodeListEvent Class
com.mindfusion.diagramming Namespace

NodeListEvent Constructor (DiagramNode, int)

Initializes a new instance of the NodeListEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeListEvent (
    DiagramNode node,
    int index
)
```

Parameters

node
The node related to the event.

index
The zero-based index of the node within its containing collection.

NodeListEvent Class
com.mindfusion.diagramming Namespace

NodeListView Class

Represents a list control containing DiagramNode objects. Nodes from the list can be dragged to a Diagram canvas to create new nodes.

Syntax

Java

```
public class NodeListView
    extends JList<DraggedItem>
```

Remarks

Obsolete

This component has been superseded by ItemListView, which can also display DiagramLink objects.

Inheritance Hierarchy

java.lang.Object
  java.awt.Component
    java.awt.Container
      javax.swing.JComponent
        javax.swing.JList(E)

NodeListView Members

Represents a list control containing DiagramNode objects. Nodes from the list can be dragged to a Diagram canvas to create new nodes.

The following tables list the members exposed by the NodeListView type.

Public Constructors

	Name	Description
	NodeListView	Initializes a new instance of the NodeListView class.

Public Methods

	Name	Description
	addNode	Overloaded.
	addNodeListViewListener	Registers listener so that it will receive events when users select or delete nodes from the list.
	addNodes	Overloaded.
	clearNodes	Removes all nodes from the list view.
	getAllowRemove	Gets a value indicating whether to allow deletion of list nodes by pressing Del.

	getDefaultNodeSize	Gets the default size with which nodes dragged onto a diagram will be created.
	getIconMargin	Gets the horizontal and vertical margins around the nodes.
	getIconSize	Gets the size of the nodes displayed in the list.
	getMeasureUnit	Gets the unit of measure used when drawing nodes.
	getNodeAt	Gets the node at the specified position.
	getNodesCount	Gets the number of nodes in the list view.
	getShowLabels	Gets a value indicating whether to show text labels along with icons for each list item.
	insertNode	Overloaded.
	removeNodeAt	Removes the node at the specified position.
	removeNodeListViewListener	Unregisters listener so that it will no longer receive NodeListView events.
	setAllowRemove	Sets a value indicating whether to allow deletion of list nodes by pressing Del.
	setDefaultNodeSize	Sets the default size with which nodes dragged onto a diagram will be created.
	setIconMargin	Sets the horizontal and vertical margins around the nodes.
	setIconSize	Sets the size of the nodes displayed in the list.
	setMeasureUnit	Sets the unit of measure used when drawing nodes.
	setShowLabels	Sets a value specifying whether to show text labels along with icons for each list item.

Protected Methods

	Name	Description
	onComponentResized	
	onItemSelected	
	onKeyPressed	
	onMousePressed	
	onNodeRemoved	
	onNodeSelected	
	updateComponentResize

NodeListView Methods

NodeListView.addNode Method

Overload List

Name	Description
NodeListView.addNode (DiagramNode)	Adds a new node to the end of the list view.
NodeListView.addNode (DiagramNode, String)	Adds a new node to the end of the list view.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.addNode Method (DiagramNode)

Adds a new node to the end of the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

`public void addNode (`
`  DiagramNode node`
`)`

Parameters

node

The node to add.

See Also

addNode Method Overload List
NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.addNode Method (DiagramNode, String)

Adds a new node to the end of the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addNode (
    DiagramNode node,
    String label
)
```

Parameters

node
The node to add.

label
The text to be displayed for the node.

See Also

addNode Method Overload List
NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.addNodeListViewListener Method

Registers listener so that it will receive events when users select or delete nodes from the list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addNodeListViewListener (
    NodeListViewListener listener
)
```

Parameters

listener

An object implementing the NodeListViewListener interface.

See Also

NodeListView Members

NodeListView.addNodes Method (DiagramNode[], String[])

Adds the specified nodes to the end of the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addNodes (
    DiagramNode[] nodes,
    String[] labels
)
```

Parameters

nodes
The array of nodes to add.

labels
The array of texts to be displayed for the nodes.

See Also

addNodes Method Overload List
NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.addNodes Method (DiagramNodeList)

Adds the specified nodes to the end of the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addNodes (
    DiagramNodeList nodes
)
```

Parameters

nodes
The collection of nodes to add.

See Also

addNodes Method Overload List
NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.addNodes Method (DiagramNodeList, String[])

Adds the specified nodes to the end of the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addNodes (
    DiagramNodeList nodes,
    String[] labels
)
```

Parameters

nodes
The collection of nodes to add.

labels
The array of texts to be displayed for the nodes.

See Also

addNodes Method Overload List
NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.clearNodes Method

Removes all nodes from the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void clearNodes ()
```

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.getAllowRemove Method

Gets a value indicating whether to allow deletion of list nodes by pressing Del.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getAllowRemove ()
```

Return Value

true to allow node deletion, otherwise false.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.getDefaultNodeSize Method

Gets the default size with which nodes dragged onto a diagram will be created.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension2D getDefaultNodeSize ()
```

Return Value

A Dimension2D instance specifying the size of created nodes.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.getIconMargin Method

Gets the horizontal and vertical margins around the nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension getIconMargin ()
```

Return Value

A Dimension instance specifying the icon margins.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.getIconSize Method

Gets the size of the nodes displayed in the list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension getIconSize ()
```

Return Value

A Dimension instance specifying the node size.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.getMeasureUnit Method

Gets the unit of measure used when drawing nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public GraphicsUnit getMeasureUnit ()
```

Return Value

A member of the GraphicsUnit enumeration.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.getNodeAt Method

Gets the node at the specified position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNode getNodeAt (
    int index
)
```

Parameters

index
An integer value specifying the node's index in the list.

Return Value

The DiagramNode at the specified position.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.getNodesCount Method

Gets the number of nodes in the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public int getNodesCount ()`

Return Value

Returns the number of nodes in this list view.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.getShowLabels Method

Gets a value indicating whether to show text labels along with icons for each list item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public boolean getShowLabels ()`

Return Value

true if labels are shown.

See Also

NodeListView Members
NodeListView Class

NodeListView.insertNode Method

Overload List

Name	Description
NodeListView.insertNode (int, DiagramNode)	Inserts the node at the specified position.

NodeListView.insertNode (int, DiagramNode, String)	Inserts the node at the specified position.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.insertNode Method (int, DiagramNode)

Inserts the node at the specified position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void insertNode (
    int index,
    DiagramNode node
)
```

Parameters

index
The zero-based index at which the node should be inserted.

node
The node to insert.

See Also

insertNode Method Overload List
NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.insertNode Method (int, DiagramNode, String)

Inserts the node at the specified position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void insertNode (
    int index,
    DiagramNode node,
    String label
)
```

Parameters

index
The zero-based index at which the node should be inserted.

node
The node to insert. The text to be displayed for the node.

label
The text to be displayed for the node.

)
```

Parameters

e

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.removeNodeAt Method

Removes the node at the specified position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeNodeAt (
    int index
)
```

Parameters

index
The zero-based index of the node to remove.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.removeNodeListViewListener Method

Unregisters listener so that it will no longer receive NodeListView events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeNodeListViewListener (
    NodeListViewListener listener
)
```

Parameters

listener
An object implementing the NodeListViewListener interface.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.setAllowRemove Method

Sets a value indicating whether to allow deletion of list nodes by pressing Del.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowRemove (
    boolean value
)
```

Parameters

value
true to allow node deletion, otherwise false.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.setDefaultNodeSize Method

Sets the default size with which nodes dragged onto a diagram will be created.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDefaultNodeSize (
    Dimension2D value
)
```

Parameters

value
A Dimension2D instance specifying the size of created nodes.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.setIconMargin Method

Sets the horizontal and vertical margins around the nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIconMargin (
    Dimension value
)
```

Parameters

value
A Dimension instance specifying the icon margins.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.setIconSize Method

Sets the size of the nodes displayed in the list.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIconSize (
    Dimension value
)
```

Parameters

value
A Dimension instance specifying the node size.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.setMeasureUnit Method

Sets the unit of measure used when drawing nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMeasureUnit (
    GraphicsUnit value
)
```

Parameters

value
A member of the GraphicsUnit enumeration.

See Also

NodeListView Members
NodeListView Class
com.mindfusion.diagramming Namespace

NodeListView.setShowLabels Method

Sets a value specifying whether to show text labels along with icons for each list item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setShowLabels (
    boolean value
)
```

Parameters

value
true if text labels must be shown, otherwise false.

NodeListViewListener Methods

NodeListViewListener.nodeRemoved Method

Raised when the user removes a node from the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void nodeRemoved (
    NodeListEvent e
)
```

Parameters

e
A NodeListEvent object providing information about the event.

See Also

NodeListViewListener Members
NodeListViewListener Interface
com.mindfusion.diagramming Namespace

NodeListViewListener.nodeSelected Method

Raised when the user selects a node in the list view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

void nodeSelected (
    NodeListEvent e
)
```

Parameters

e
A NodeListEvent object providing information about the event.

NodeValidationEvent Members

Contains the arguments passed to handlers of node validation events.

The following tables list the members exposed by the NodeValidationEvent type.

Public Constructors

	Name	Description
	NodeValidationEvent	Overloaded.

Public Fields

	Name	Description
	label	

Public Methods

	Name	Description
	cancelDrag	Cancels the creation or modification of the node.
	getAdjustmentHandle	Gets the adjustment handle being moved by the user. (Inherited from NodeEvent.)
	getCancel	Gets a value indicating whether to cancel the current operation.
	getLabel	Gets a NodeLabel related to this event.
	getMouseButton	Gets which mouse button has been pressed. (Inherited from NodeEvent.)
	getNode	Gets the node for which the event was raised. (Inherited from NodeEvent.)
	getNodeHandleType	Gets the type of adjustment handle moved by the user. (Inherited from NodeEvent.)
	getPointerPosition	Gets the current pointer position. (Inherited from NodeEvent.)
	getSelectionRectangle	Gets the current selection rectangle.
	setAdjustmentHandle	Sets the adjustment handle being moved by the user. (Inherited from NodeEvent.)

	setCancel	Sets a value indicating whether to cancel the current operation.
	setPointerPosition	Sets the current pointer position. (Inherited from NodeEvent.)

NodeValidationEvent Constructor (Object, DiagramNode)

Represents methods that will handle node validation events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeValidationEvent (
    Object source,
    DiagramNode node
)
```

Parameters

source
The source of the event.

node
A DiagramNode instance.

See Also

NodeValidationEvent Constructor Overload List
NodeValidationEvent Class
com.mindfusion.diagramming Namespace

NodeValidationEvent Constructor (Object, DiagramNode, Point2D, AdjustmentHandle)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeValidationEvent (
    Object source,
    DiagramNode node,
    Point2D mousePosition,
    AdjustmentHandle adjustmentHandle
)
```

Parameters

source

node

mousePosition

adjustmentHandle
An instance of the AdjustmentHandle class.

NodeValidationEvent.getLabel Method

Gets a NodeLabel related to this event.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public NodeLabel getLabel ()
```

Return Value

A NodeLabel instance.

Remarks

This property is set when events are raised for supplementary node labels, e.g. nodeTextEditing firing when user tries to edit a label.

OneWayLayout Class

Implements a one-way graph layout algorithm. The one-way layout ensures that links enter into nodes from the same general direction and exit them from the opposite side. If the graph contains cycles, some links bend around the nodes to keep the enter/exit direction consistent. The algorithm aims to minimize the number of such links.

Syntax

Java

```
public class OneWayLayout extends AbstractLayout
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.AbstractLayout
    com.mindfusion.diagramming.OneWayLayout

OneWayLayout Members

Implements a one-way graph layout algorithm. The one-way layout ensures that links enter into nodes from the same general direction and exit them from the opposite side. If the graph contains cycles, some links bend around the nodes to keep the enter/exit direction consistent. The algorithm aims to minimize the number of such links.

The following tables list the members exposed by the OneWayLayout type.

Public Constructors

	Name	Description
	OneWayLayout	Initializes a new instance of the **OneWayLayout** class with the default settings.

Public Methods

	Name	Description
	arrange	Applies the layout to the specified diagram.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getNodeDistance	Gets the minimum spacing between adjacent nodes in the final layout.
	getOrientation	Gets the orientation of the arranged graph.
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	getRoundedLinks	Gets a value indicating whether the layout should smooth link bends.
	init	Returns an OneWayLayoutBuilder object used to configure this OneWayLayout instance.

	removeMidleSegmentPoint	(Inherited from AbstractLayout.)
	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setNodeDistance	Sets the minimum spacing between adjacent nodes in the final layout.
	setOrientation	Sets the orientation of the arranged graph.
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
	setRoundedLinks	Sets a value indicating whether the layout should smooth link bends.
	with	Returns an OneWayLayoutBuilder object used to configure and create new OneWayLayout instances.

Protected Methods

	Name	Description
	getDefaultMarginValue	Gets the default value of the **Margins** property.

OneWayLayout Methods

OneWayLayout.arrange Method

Applies the layout to the specified diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram

items

Return Value

See Also

OneWayLayout Members
OneWayLayout Class
com.mindfusion.diagramming Namespace

OneWayLayout.getDefaultMarginValue Method

Gets the default value of the Margins property.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected XDimension2D.Double getDefaultMarginValue ()
```

Return Value

OneWayLayout Members
OneWayLayout Class
com.mindfusion.diagramming Namespace

OneWayLayout.getNodeDistance Method

Gets the minimum spacing between adjacent nodes in the final layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getNodeDistance ()
```

Return Value

A **float** value specifying the desired distance between nodes.

See Also

OneWayLayout Members
OneWayLayout Class
com.mindfusion.diagramming Namespace

OneWayLayout.getOrientation Method

Gets the orientation of the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Orientation getOrientation ()
```

Return Value

A member of the Orientation enumeration.

See Also

OneWayLayout Members
OneWayLayout Class
com.mindfusion.diagramming Namespace

OneWayLayout.getRoundedLinks Method

Gets a value indicating whether the layout should smooth link bends.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getRoundedLinks ()
```

Return Value

true to set the links' Shape to Bezier, otherwise **false**.

OneWayLayout.setNodeDistance Method

Sets the minimum spacing between adjacent nodes in the final layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setNodeDistance (
    float value
)
```

Parameters

value
A **float** value specifying the desired distance between nodes.

See Also

OneWayLayout Members
OneWayLayout Class

OneWayLayout.setOrientation Method

Sets the orientation of the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setOrientation (
    Orientation value
)
```

Parameters

value
A member of the Orientation enumeration.

See Also

OneWayLayout Members
OneWayLayout Class
com.mindfusion.diagramming Namespace

OneWayLayout.setRoundedLinks Method

Sets a value indicating whether the layout should smooth link bends.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRoundedLinks (
    boolean value
)
```

Parameters

value
true to set the links' Shape to Bezier, otherwise **false**.

See Also

OneWayLayout Members
OneWayLayout Class
com.mindfusion.diagramming Namespace

OneWayLayout.with Method

Returns an OneWayLayoutBuilder object used to configure and create new OneWayLayout instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public static OneWayLayoutBuilder with ()`

Return Value

An **OneWayLayoutBuilder** instance.

See Also

OneWayLayout Members
OneWayLayout Class
com.mindfusion.diagramming Namespace

Orientation Enumeration

The members of this enumeration specify what orientation a graphic element should have - vertical, horizontal, or one determined automatically by JDiagram. They can be used as parameters of the setStartOrientation and setEndOrientation methods of RoutingOptions and the setCascadeOrientation method of the DiagramLink class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum Orientation`

Members

	Member name	Description
	Auto	JDiagram should select a proper orientation.
	Horizontal	Specifies horizontal orientation.

	Vertical	Specifies vertical orientation.

See Also

com.mindfusion.diagramming Namespace

OrthogonalLayout Class

Implements an orthogonal graph layout algorithm. Each link is drawn as a chain of alternating horizontal and vertical segments. Nodes are placed in a way that facilitates few links bends and crossings.

Syntax

Java
`public class OrthogonalLayout extends AbstractLayout`

Remarks

This algorithm is designed for planar graphs where the nodes have at most four incident links, and produces best results with such graphs as input. It can arrange any arbitrary graph as well, by adding some dummy nodes and links to planarize the graph and reduce its vertex degree, and removing them after the layout. However this might lead to using larger area than necessary, due to the space occupied by dummy elements.

OrthogonalLayout Members

Implements an orthogonal graph layout algorithm. Each link is drawn as a chain of alternating horizontal and vertical segments. Nodes are placed in a way that facilitates few links bends and crossings.

The following tables list the members exposed by the OrthogonalLayout type.

Public Constructors

	Name	Description
	OrthogonalLayout	Initializes a new instance of the OrthogonalLayout class.

Public Methods

	Name	Description

	arrange	Applies the layout on the specified subset of items from the specified Diagram instance.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getDirected	Gets a value indicating whether the graph being laid out is directed.
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMinimizeLinkBends	
	getMinLaneSize	Gets a value indicating the minimum size of a lane.
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getPadding	Gets a value indicating how much space to leave between nodes in adjacent lanes.
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	getRefine	Gets a value indicating whether to refine the layout.
	init	Returns an OrthogonalLayoutBuilder object used to configure this OrthogonalLayout instance.
	removeMidleSegmentPoint	(Inherited from AbstractLayout.)
	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setDirected	Sets a value indicating whether the graph being laid out is directed.
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)

	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMinimizeLinkBends	Sets a value indicating whether the layout should attempt to minimize link bends.
	setMinLaneSize	Sets a value indicating the minimum size of a lane.
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setPadding	Sets a value indicating how much space to leave between nodes in adjacent lanes.
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
	setRefine	Sets a value indicating whether to refine the layout.
S	with	Returns an OrthogonalLayoutBuilder object used to configure and create new OrthogonalLayout instances.

See Also

OrthogonalLayout Class
com.mindfusion.diagramming Namespace

OrthogonalLayout Constructor

Initializes a new instance of the OrthogonalLayout class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public OrthogonalLayout ()
```

See Also

OrthogonalLayout Class
com.mindfusion.diagramming Namespace

OrthogonalLayout Methods

OrthogonalLayout.arrange Method

Applies the layout on the specified subset of items from the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram
The Diagram that should be arranged.

items
A collection of nodes and links from diagram that define the subgraph to arrange.

Return Value

This method always returns **true**.

See Also

OrthogonalLayout Members
OrthogonalLayout Class
com.mindfusion.diagramming Namespace

OrthogonalLayout.getDirected Method

Gets a value indicating whether the graph being laid out is directed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getDirected ()
```

Return Value

true if the direction of graph edges should be considered, **false** if it is ignored; the default value is **false**.

See Also

OrthogonalLayout Members
OrthogonalLayout Class
com.mindfusion.diagramming Namespace

OrthogonalLayout.getMinimizeLinkBends Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getMinimizeLinkBends ()
```

Return Value

Gets a value indicating whether the layout should attempt to minimize link bends.

Remarks

If this option is disabled, the layout class applies a fast linear time algorithm, however the layouts produced usually contain more bending links and occupy more space. If enabled, the layout class applies an algorithm of polynomial complexity and runs much slower.

See Also

OrthogonalLayout Members
OrthogonalLayout Class
com.mindfusion.diagramming Namespace

OrthogonalLayout.getMinLaneSize Method

Gets a value indicating the minimum size of a lane.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getMinLaneSize ()
```

Return Value

A float value specifying the minimum lane size. The default value is 10.

Remarks

The result of the layout's arrange method is a grid that contains the diagram's nodes and links. This property specifies the size of lanes which does not contain nodes, but only links.

See Also

OrthogonalLayout Members
OrthogonalLayout Class
com.mindfusion.diagramming Namespace

OrthogonalLayout.getPadding Method

Gets a value indicating how much space to leave between nodes in adjacent lanes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getPadding ()
```

Return Value

A float value specifying the padding. The default is 15.

See Also

OrthogonalLayout Members
OrthogonalLayout Class

OrthogonalLayout.getRefine Method

Gets a value indicating whether to refine the layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getRefine ()
```

Return Value

true to run a refinement pass, otherwise **false**. The default value is **true**.

See Also

OrthogonalLayout Members
OrthogonalLayout Class
com.mindfusion.diagramming Namespace

OrthogonalLayout.init Method

Returns an OrthogonalLayoutBuilder object used to configure this OrthogonalLayout instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public OrthogonalLayoutBuilder init ()
```

Return Value

An **OrthogonalLayoutBuilder** instance.

OrthogonalLayout Members
OrthogonalLayout Class
com.mindfusion.diagramming Namespace

OrthogonalLayout.setDirected Method

Sets a value indicating whether the graph being laid out is directed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDirected (
    boolean directed
)
```

Parameters

directed
true to consider the direction of graph edges, **false** to ignore it; the default value is **false**.

See Also

OrthogonalLayout Members
OrthogonalLayout Class
com.mindfusion.diagramming Namespace

OrthogonalLayout.setMinimizeLinkBends Method

Sets a value indicating whether the layout should attempt to minimize link bends.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMinimizeLinkBends (
    boolean value
)
```

Parameters

value
true to minimize link bends, otherwise **false**. The default value is **true**.

Remarks

If this option is disabled, the layout class applies a fast linear time algorithm, however the layouts produced usually contain more bending links and occupy more space. If enabled, the layout class applies an algorithm of polynomial complexity and runs much slower.

OrthogonalLayout.setMinLaneSize Method

Sets a value indicating the minimum size of a lane.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMinLaneSize (
    float value
)
```

Parameters

value
A float value specifying the minimum lane size. The default value is 10.

Remarks

The result of the layout's arrange is a grid that contains the diagram's nodes and links. This property specifies the size of lanes which does not contain nodes, but only links.

Returns an OrthogonalLayoutBuilder object used to configure and create new OrthogonalLayout instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static OrthogonalLayoutBuilder with ()
```

Return Value

An **OrthogonalLayoutBuilder** instance.

See Also

OrthogonalLayout Members
OrthogonalLayout Class
com.mindfusion.diagramming Namespace

OrthogonalRouter Class

Implements an orthogonal link routing algorithm.

Syntax

Java
`public class OrthogonalRouter extends AbstractLayout`

Remarks

OrthogonalRouter is a secondary layout algorithm that can be used to arrange links after an initial node arrangement has already been applied. The orthogonal layout is useful when there are much more links than nodes in a graph. The algorithm strives to achieve the following criteria, while preserving as much of the initial node configuration as possible.

- links must not overlap;
- only vertical and horizontal routing lines are used;
- graph routing is performed with respect to the specified main layout direction;
- links crossings are minimized;
- bends are minimized;

To arrange a diagram, create an **OrthogonalRouter** instance, set its properties and call the arrange method.

Inheritance Hierarchy

OrthogonalRouter Members

Implements an orthogonal link routing algorithm.

The following tables list the members exposed by the OrthogonalRouter type.

Public Constructors

	Name	Description
	OrthogonalRouter	Initializes a new instance of the OrthogonalLayout class.

Public Methods

	Name	Description
	arrange	Applies the layout on the specified subset of items from the specified Diagram instance.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getBaseLayout	Gets a value indicating whether to arrange nodes or use their current configuration.
	getBendDistance	Gets how far from its adjacent node a link should bend. This should be a value between 0 and 1, specifying a distance proportional to the node size.
	getDirection	Gets the direction of the arranged diagram when BaseLayout is set to Layered. This value is assigned to the Direction property of the base LayeredLayout.
	getEndOrientation	Gets the desired orientation of the last segments of routed links.
	getGridSize	Gets the distance between adjacent grid points when BaseLayout is set to Grid. This value is assigned to the GridSize property of the base GridLayout.
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getLayerDistance	Gets the desired distance between layer axis lines. Specifies the distance between layers when BaseLayout is set to Layered or Cascading.
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getNodeDistance	Gets the desired distance between adjacent nodes in a layer. Specifies the distance between nodes in the same layer when BaseLayout is set to Layered or Cascading.
	getOrientation	Gets the overall orientation of the arranged diagram when BaseLayout is set to Layered. This value is assigned to the Orientation property of the base LayeredLayout.
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)

	getPutEndPointsAtNodeBorders	Gets a value indicating whether the end points of a link should be placed at the outlines of the nodes connected by that link.
	getRandomSeed	Gets the randomization seed to use for generating random node positions.
	getRoot	Gets a node indicating which subgraph of the diagram must be laid out. All links and nodes that can be reached from the root by following recursively its links form a graph. If the root is specified, only the graph which it defines is laid out by {#link arrange}.
	getSplitGraph	Gets a value indicating whether unconnected subgraphs should be laid out independently from each other. If this property is set to true, each independent graph in the diagram is laid out in its own layout area. Otherwise all subgraphs are arranged in the same layout area. If a Root node is specified and SplitGraph is true, only the graph that contains the root node will be arranged.
	getStartOrientation	Gets the desired orientation of the first segments of routed links.
S	removeMidleSegmentPoint	(Inherited from AbstractLayout.)
	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setBaseLayout	Sets a value indicating whether to arrange nodes or use their current configuration.
	setBendDistance	Sets how far from its adjacent node a link should bend. This should be a value between 0 and 1, specifying a distance proportional to the node size.
	setDirection	Sets the direction of the arranged diagram when BaseLayout is set to Layered. This value is assigned to the Direction property of the base LayeredLayout.
	setEndOrientation	Sets the desired orientation of the last segments of routed links.
	setGridSize	Sets the distance between adjacent grid points when BaseLayout is set to Grid. This value is assigned to the GridSize property of the base GridLayout.
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	setLayerDistance	Sets the desired distance between layer axis lines. Specifies the distance between layers when BaseLayout is set to Layered or Cascading.
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from

		AbstractLayout.)
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setNodeDistance	Sets the desired distance between adjacent nodes in a layer. Specifies the distance between nodes in the same layer when BaseLayout is set to Layered or Cascading.
	setOrientation	Sets the overall orientation of the arranged diagram when BaseLayout is set to Layered. This value is assigned to the Orientation property of the base LayeredLayout.
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
	setPutEndPointsAtNodeBorders	Sets a value indicating whether the end points of a link should be placed at the outlines of the nodes connected by that link.
	setRandomSeed	Sets the randomization seed to use for generating random node positions.
	setRoot	Sets a node indicating which subgraph of the diagram must be laid out. All links and nodes that can be reached from the root by following recursively its links form a graph. If the root is specified, only the graph which it defines is laid out by {#link arrange}.
	setSplitGraph	Sets a value indicating whether unconnected subgraphs should be laid out independently from each other. If this property is set to true, each independent graph in the diagram is laid out in its own layout area. Otherwise all subgraphs are arranged in the same layout area. If a Root node is specified and SplitGraph is true, only the graph that contains the root node will be arranged.
	setStartOrientation	Sets the desired orientation of the first segments of routed links.

OrthogonalRouter Class
com.mindfusion.diagramming Namespace

OrthogonalRouter Constructor

Initializes a new instance of the OrthogonalLayout class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public OrthogonalRouter ()
```

See Also

OrthogonalRouter Class
com.mindfusion.diagramming Namespace

OrthogonalRouter Methods

OrthogonalRouter.arrange Method

Applies the layout on the specified subset of items from the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram
The Diagram that should be arranged.

items
A collection of nodes and links from diagram that define the subgraph to arrange.

Return Value

This method always returns **true**.

OrthogonalRouter Members
OrthogonalRouter Class
com.mindfusion.diagramming Namespace

Overview Class

The Overview control provides a scaled-down view of Diagram contents and allows scrolling and zooming the diagram with the mouse.

Syntax

Java
`public class Overview extends JComponent implements MouseListener, MouseMotionListener`

Remarks

To specify which DiagramView instance is shown in the overview, call the setDiagramView method.

The scale in which the overview control paints items is specified by the setScaleFactor and setFitAll methods. If the FitAll mode is enabled, the whole diagram fits into the overview window.

To display scrollbars, call the setShowScrollbars method.

Inheritance Hierarchy

java.lang.Object
  java.awt.Component
    java.awt.Container
      javax.swing.JComponent
        com.mindfusion.diagramming.Overview

Overview Members

The Overview control provides a scaled-down view of Diagram contents and allows scrolling and zooming the diagram with the mouse.

The following tables list the members exposed by the Overview type.

Public Constructors

	Name	Description
	Overview	Initializes a new instance of the **Overview** class.

Public Methods

	Name	Description
	getBackgroundColor	Gets the background color of the overview control.
	getDiagramView	Gets the DiagramView instance whose contents is displayed in the overview.
	getDimColor	Gets a color used to blend with the part of the diagram that is not visible in the **Diagram**'s client rectangle.

	getFitAll	Gets a value that specifies whether to fit the whole diagram inside the overview.
	getScaleFactor	Gets the fixed scale factor that is used when the FitAll mode is disabled.
	getShowScrollbars	Gets a value indicating whether the overview control should display scrollbars.
	getTrackingRectPen	Gets the Pen object used to draw the tracking rectangle border.
	mouseClicked	
	mouseDragged	
	mouseEntered	
	mouseExited	
	mouseMoved	
	mousePressed	
	mouseReleased	
	overviewToDoc	
	paintComponent	
	resumeRepaint	Resumes repainting the control after a suspendRepaint call.
	setBackgroundColor	Sets the background color of the overview control.
	setDiagramView	Sets the **DiagramView** instance whose contents should be displayed in the overview.
	setDimColor	Sets a color used to blend with the part of the diagram that is not visible in the **Diagram**'s client rectangle.
	setFitAll	Sets a value indicating whether to fit the whole diagram inside the overview.
	setScaleFactor	Sets a fixed scale factor that should be used when the **FitAll** mode is disabled.
	setShowScrollbars	Sets a value indicating whether the overview control should display scrollbars.
	setTrackingRectPen	Sets the Pen object used to draw the tracking rectangle border.
	suspendRepaint	Stops repainting the control. This is useful when using the JDiagram API from JavaScript, where the control would be repainted after each script line executes.
	update	Causes the control to recalculate all its internals and repaint its client area.

Palette Class

A control that displays a palette of diagram items grouped into categories.

Syntax

Java

```
public class Palette extends JPanel
```

Remarks

The **Palette** control represents a tool palette that displays DiagramItem objects grouped into categories. It features an accordion-style user interface where each category is represented by a collapsible pane containing an ItemListView.

Structure

Palette follows the Model-View-Controller pattern. The control's data is managed by a PaletteModel (by default, a DefaultPaletteModel). The UI consists of an Accordion container that dynamically generates AccordionPane instances for each PaletteCategory defined in the model.

Population

The control can be populated using the following methods:

- Categories: Call addCategory to define a new category and create its respective accordion pane.
- Items: Call addItem to add an item to a specific category. If the category does not exist, it will be created automatically.
- Direct Model Access: You can also manipulate the PaletteCategory objects directly through the model's Categories collection.

Behavior and Appearance

The **Palette** exposes properties that govern the behavior and look of all its child list views:

- Sizing: Use IconSize and IconMargin properties to control the list icons, and NewInstanceSize to set the size of items created via drag-and-drop.
- Auto-Connection: The AutoConnectLinks and AutoConnectDistance properties control whether links created from the palette should automatically snap to nearby nodes in the target diagram.

- Expansion: Use AllowMultipleExpands to determine if more than one category can be expanded simultaneously.

Drag-and-Drop

When an item is dragged from a palette category and dropped onto a diagram, the control creates a new instance by calling the source item's clone method. The dimensions of the new item are set to the current NewInstanceSize.

Inheritance Hierarchy

Palette Members

A control that displays a palette of diagram items grouped into categories.

The following tables list the members exposed by the Palette type.

Public Constructors

	Name	Description
	Palette	Initializes a new instance of the Palette class.

Public Methods

	Name	Description
	addCategory	Overloaded.
	addItem	Overloaded.
	getAllowMultipleExpands	Gets a value indicating whether more than one category can be expanded at a time.
	getAutoConnectDistance	Gets the maximum distance within which a link dropped from the palette will attempt to auto-connect to a nearby node.
	getAutoConnectLinks	Gets a value indicating whether links should be automatically connected to nearby nodes when dropped from the palette.
	getIconMargin	Gets the margin space around icons.
	getIconSize	Gets the size of items displayed in the palette.
	getModel	Gets the data model for the palette.

	getNewInstanceSize	Gets the default size of items created by drag-and-drop from this palette.
	setAllowMultipleExpands	Sets a value indicating whether more than one category can be expanded at a time.
	setAutoConnectDistance	Sets the maximum distance within which a link dropped from the palette will attempt to auto-connect to a nearby node.
	setAutoConnectLinks	Sets a value indicating whether links should be automatically connected to nearby nodes when dropped from the palette.
	setIconMargin	Sets the margin space around icons.
	setIconSize	Sets the size of items displayed in the palette.
	setModel	Sets the data model for the palette.
	setNewInstanceSize	Sets the default size of items created by drag-and-drop from this palette.

PaletteCategory Class

Represents a category in a Palette control.

Syntax

Java
`public class PaletteCategory`

Remarks

The **PaletteCategory** class represents a single logical group or folder within a Palette control. It holds a collection of DiagramItem objects (accessible via getItems) that belong to that specific category.

In the user interface, each category is rendered as a collapsible pane within the palette's accordion. The class provides properties such as Title, Icon, and Expanded state to control the appearance and behavior of its corresponding pane header.

PaletteCategory acts as a standard Java Bean; it utilizes **PropertyChangeSupport** to notify the parent **Palette** of any modifications. This ensures that changing a category's title, icon, or expanded state programmatically will automatically update the UI.

PaletteModel Interface

Defines the data model for a Palette control.

Syntax

Java

```
public interface PaletteModel
```

Remarks

The **PaletteModel** interface defines the data contract for a Palette control. It provides a structured way to manage a collection of PaletteCategory objects, which in turn contain the DiagramItem instances displayed in the UI.

By implementing this interface, developers can create custom data sources for the palette, such as models that load categories dynamically from XML, database, or remote services. The **Palette** control uses this model to automatically generate its accordion panes and child list views.

For standard use cases, the library provides DefaultPaletteModel, a ready-to-use implementation that stores categories in an internal list.

Gets the number of links in the path.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getLength ()
```

Return Value

An integer value specifying the number of links.

See Also

Path Members
Path Class
com.mindfusion.diagramming Namespace

Path.getLinks Method

Gets a list of all links in the path.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramLinkList getLinks ()
```

Return Value

An DiagramLinkList containing the path links.

See Also

Path Members
Path Class
com.mindfusion.diagramming Namespace

Path.getNodes Method

Gets a list of all nodes in the path.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramNodeList getNodes ()
```

Return Value

A DiagramNodeList containing the path nodes.

See Also

Path Members
Path Class
com.mindfusion.diagramming Namespace

Path.getWeight Method

Gets the total weight of this path.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getWeight (
    boolean includeNodes,
    boolean includeLinks
)
```

Parameters

includeNodes
true to include node weights in the total weight sum, otherwise **false**.

includeLinks
true to include link weights in the total weight sum, otherwise **false**.

Return Value

A float value specifying the path weight.

PathFinder Class
com.mindfusion.diagramming Namespace

PathFinder Constructor

Overload List

Name	Description
PathFinder (Diagram)	Initializes a new instance of the PathFinder class. Path-finding will depend on the direction of links.
PathFinder (Diagram, boolean)	Initializes a new instance of the PathFinder class, optionally ignoring the link direction.

See Also

PathFinder Class
com.mindfusion.diagramming Namespace

PathFinder Constructor (Diagram)

Initializes a new instance of the PathFinder class. Path-finding will depend on the direction of links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public PathFinder (
    Diagram diagram
)
```

Parameters

diagram
An instance of the Diagram class in which to look for paths or cycles.

See Also

PathFinder Constructor Overload List
PathFinder Class
com.mindfusion.diagramming Namespace

PathFinder Constructor (Diagram, boolean)

Initializes a new instance of the PathFinder class, optionally ignoring the link direction.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public PathFinder (
    Diagram diagram,
    boolean ignoreDirection
)
```

Parameters

diagram
A Diagram instance in which to look for paths or cycles.

ignoreDirection
Specifies whether the direction of links should be considered when looking for paths or cycles.

See Also

PathFinder Constructor Overload List
PathFinder Class
com.mindfusion.diagramming Namespace

PathFinder Methods

PathFinder.findAllCycles Method

Finds all cycles in the underlying diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public PathList findAllCycles ()
```

Return Value

A PathList containing the found cycles; if no cycles are detected, the list is empty.

See Also

PathFinder Members
PathFinder Class

PathFinder.findAllPaths Method

Overload List

Name	Description
PathFinder.findAllPaths (DiagramNode, DiagramNode)	Finds and returns all paths that exist between two DiagramNode objects. The returned Path instances include the *from* an *to* nodes.
PathFinder.findAllPaths (DiagramNode, DiagramNode, int)	Finds and returns all paths that exist between two **DiagramNode** objects. The returned Path instances include the *from* an *to* nodes.

PathFinder.findAllPaths Method (DiagramNode, DiagramNode)

Finds and returns all paths that exist between two DiagramNode objects. The returned Path instances include the *from* an *to* nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public PathList findAllPaths (
    DiagramNode from,
    DiagramNode to
)
```

Parameters

from
The DiagramNode where the path should start.

to
The **DiagramNode** where the path should end.

Return Value

A collection of Path objects; if no paths are found, the collection is empty.

See Also

findAllPaths Method Overload List
PathFinder Members

PathFinder.findAllPaths Method (DiagramNode, DiagramNode, int)

Finds and returns all paths that exist between two DiagramNode objects. The returned Path instances include the *from* an *to* nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public PathList findAllPaths (
    DiagramNode from,
    DiagramNode to,
    int maxPaths
)
```

Parameters

from
The DiagramNode where the path should start.

to
The **DiagramNode** where the path should end.

maxPaths
The maximum number of paths to find.

Return Value

A collection of Path objects; if no paths are found, the collection is empty.

See Also

findAllPaths Method Overload List
PathFinder Members

PathFinder.findCycle Method

Overload List

Name	Description
PathFinder.findCycle ()	Detects whether there is a cycle in the diagram.
PathFinder.findCycle (DiagramNode)	Detects whether the specified DiagramNode participates in a cycle.

See Also

PathFinder Members
PathFinder Class
com.mindfusion.diagramming Namespace

PathFinder.findCycle Method ()

Detects whether there is a cycle in the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Path findCycle ()
```

Return Value

A Path object representing the first cycle found in the graph, or null if the graph does not contain any cycles.

See Also

findCycle Method Overload List
PathFinder Members
PathFinder Class
com.mindfusion.diagramming Namespace

PathFinder.findCycle Method (DiagramNode)

Detects whether the specified DiagramNode participates in a cycle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Path findCycle (
    DiagramNode participant
)
```

Parameters

participant
A DiagramNode that should be in the cycle.

Return Value

A Path object representing the cycle that containsthe specified node, or null if the node is not in a cycle.

See Also

PathFinder.findLongestPath Method

Overload List

Name	Description
PathFinder.findLongestPath ()	Finds the longest path in the graph.
PathFinder.findLongestPath (DiagramNode, DiagramNode)	Finds the longest path between the specified DiagramNode objects.
PathFinder.findLongestPath (long)	Finds the longest path in the diagram. The time limit specifies the maximal duration of the search process in milliseconds.

See Also

PathFinder Members
PathFinder Class
com.mindfusion.diagramming Namespace

PathFinder.findLongestPath Method ()

Finds the longest path in the graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Path findLongestPath ()
```

Return Value

A Path object representing the found path, or null if there aren't any linked nodes in the graph.

See Also

findLongestPath Method Overload List
PathFinder Members
PathFinder Class
com.mindfusion.diagramming Namespace

PathFinder.findLongestPath Method (DiagramNode, DiagramNode)

Finds the longest path between the specified DiagramNode objects.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public Path findLongestPath (
    DiagramNode from,
    DiagramNode to
)
```

Parameters

from
The DiagramNode where the path should start.

to
The **DiagramNode** where the path should end.

Return Value

A Path object representing the found path, or null if there isn't any path connecting the specified nodes.

See Also

findLongestPath Method Overload List
PathFinder Members
PathFinder Class
com.mindfusion.diagramming Namespace

PathFinder.findLongestPath Method (long)

Finds the longest path in the diagram. The time limit specifies the maximal duration of the search process in milliseconds.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public Path findLongestPath (
    long timeLimit
)
```

Parameters

timeLimit
Specifies the maximal amount of time the algorithm is allowed to run.

Return Value

A Path object representing the found path, or null if there aren't any linked nodes in the graph.

See Also

PathFinder.findShortestPath Method

Overload List

Name	Description
PathFinder.findShortestPath (DiagramNode, DiagramNode)	Finds and returns the shortest Path between the specified DiagramNode objects.
PathFinder.findShortestPath (DiagramNode, DiagramNode, boolean, boolean)	Finds and returns the shortest path between two **DiagramNode** elements, considering the Weight of the nodes, the **Weight** of the links or both.

See Also

PathFinder Members
PathFinder Class
com.mindfusion.diagramming Namespace

PathFinder.findShortestPath Method (DiagramNode, DiagramNode)

Finds and returns the shortest Path between the specified DiagramNode objects.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Path findShortestPath (
    DiagramNode from,
    DiagramNode to
)
```

Parameters

from
The DiagramNode where the path should start.

to
The **DiagramNode** where the path should end.

Return Value

A Path instance that represents the shortest path found; null, if there is no path connecting from and to.

See Also

findShortestPath Method Overload List
PathFinder Members

PathFinder.findShortestPath Method (DiagramNode, DiagramNode, boolean, boolean)

Finds and returns the shortest path between two DiagramNode elements, considering the Weight of the nodes, the **Weight** of the links or both.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Path findShortestPath (
    DiagramNode from,
    DiagramNode to,
    boolean useNodeWeights,
    boolean useLinkWeights
)
```

Parameters

from
The DiagramNode where the path should start.

to
The **DiagramNode** where the path should end.

useNodeWeights
true if the Weight attribute of nodes should be considered, otherwise **false**.

useLinkWeights
true if the **Weight** attribute of links should be considered, otherwise **false**.

Return Value

A Path object representing the found path, or **null** if there isn't any path connecting the specified nodes.

PathList Class

A strongly typed list of Path objects.

Syntax

Java

```
public class PathList extends BaseList<E>
```

Inheritance Hierarchy

java.lang.Object
  java.util.AbstractCollection(E)
    java.util.AbstractList(E)
      com.mindfusion.diagramming.BaseList(E)
        com.mindfusion.diagramming.PathList

See Also

PathList Members
com.mindfusion.diagramming Namespace

PathList Members

A strongly typed list of Path objects.

The following tables list the members exposed by the PathList type.

Protected Fields

	Name	Description
	list	(Inherited from BaseList.)
	listEvent	(Inherited from BaseList.)
	notifyParent	(Inherited from BaseList.)

Public Methods

	Name	Description
	add	Adds a new element to the list. (Inherited from BaseList.)
	clear	Removes all elements from the list. (Inherited from BaseList.)
	contains	Determines if this list contains the specified element. (Inherited from BaseList.)
	first	Gets the first element of this list. (Inherited from BaseList.)
	get	Gets the element at the specified position in this list. (Inherited from BaseList.)
	last	Gets the last element of this list. (Inherited from BaseList.)
	readExternal	Loads the list's contents. (Inherited from BaseList.)
	remove	Overloaded. (Inherited from BaseList.)
	removeRange	Removes a range of elements from this list. (Inherited from BaseList.)
	set	Sets the element at the specified position in this list. (Inherited from BaseList.)
	size	Gets the number of elements in this list. (Inherited from BaseList.)

	writeExternal	Saves the list's contents. (Inherited from BaseList.)

Protected Methods

	Name	Description
	raiseAdding	Raises the adding event. (Inherited from BaseList.)
	raiseClearing	Raises the clearing event. (Inherited from BaseList.)
	raiseRemoving	Raises the removing event. (Inherited from BaseList.)

PathList Class
com.mindfusion.diagramming Namespace

PatternRouter Class

Routes links by applying patterns of segment and turn sequences and accepting them when resulting paths do not cross nodes.

Syntax

Java

```
public class PatternRouter implements LinkRouter
```

Remarks

You can add custom patterns to the Patterns list, or replace the standard patterns altogether. Patterns are defined using RoutePattern and RouteStep objects.

Example

The following code defines a Z-like link route that will be accepted if it does not cross Obstacle nodes, nor passes by them within MinimumDistance.

Java

```
RoutePattern rightZigzag = new RoutePattern();
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.AdvanceRelative, 0.5f));
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.TurnRight));
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.AdvanceRelative, 1));
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.TurnLeft));
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.AdvanceRelative, 0.5f));
router.getPatterns().add(rightZigzag);

// this can be defined in shorter form using a pattern string
// RoutePattern rightZigzag2 = new RoutePattern(
//     "ADR0.5 TRR ADR1 TRL ADR0.5");
```

Inheritance Hierarchy

java.lang.Object
com.mindfusion.diagramming.PatternRouter

com.mindfusion.diagramming Namespace

PatternRouter Members

Routes links by applying patterns of segment and turn sequences and accepting them when resulting paths do not cross nodes.

The following tables list the members exposed by the PatternRouter type.

Public Constructors

	Name	Description
	PatternRouter	Overloaded.

Public Methods

	Name	Description
	getDiagram	Gets the Diagram whose links will be routed.
	getMinimizeCrossings	Gets a value indicating whether to minimize crossings with other links.
	getMinimumDistance	Gets the minimum allowed distance from obstacles for a route to be accepted.
	getObstacles	Gets a list of obstacle nodes.
	getPatterns	Gets a list of RoutePattern objects representing the routing patterns.
	getPreferredDistance	Gets the preferred distance from link's bend points to the link's nodes.
	routeLink	Implements LinkRouter.routeLink.
	routeLinks	Implements LinkRouter.routeLinks.
	setDiagram	Sets the **Diagram** whose links will be routed.
	setMinimizeCrossings	Sets a value indicating whether to minimize crossings with other links.
	setMinimumDistance	Sets the minimum allowed distance from obstacles for a route to be accepted.
	setObstacles	Sets a list of obstacle nodes.
	setPatterns	Sets a list of **RoutePattern** objects representing the routing patterns.
	setPreferredDistance	Sets the preferred distance from link's bend points to the link's nodes.

Syntax

Java

```
public PatternRouter ()
```

See Also

PatternRouter Constructor Overload List
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter Constructor (Diagram)

Initializes a new instance of the PatternRouter class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public PatternRouter (
    Diagram diagram
```

```
)
```

Parameters

diagram
The Diagram whose links will be routed.

See Also

PatternRouter Constructor Overload List
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter Constructor (Diagram, List<RoutePattern>)

Initializes a new instance of the PatternRouter class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public PatternRouter (
    Diagram diagram,
    List<RoutePattern> patterns
)
```

Parameters

diagram
The Diagram whose links will be routed.

patterns
A list of RoutePattern objects.

See Also

PatternRouter Constructor Overload List
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter Methods

PatternRouter.getDiagram Method

Gets the Diagram whose links will be routed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Diagram getDiagram ()
```

Return Value

A Diagram instance.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter.getMinimizeCrossings Method

Gets a value indicating whether to minimize crossings with other links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getMinimizeCrossings ()
```

Return Value

true to minimize crossings, or **false** otherwise. The default value is **false**.

Remarks

If this property is enabled, the algorithm runs an additional loop to count link crossings, which may affect performance for large diagrams.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter.getMinimumDistance Method

Gets the minimum allowed distance from obstacles for a route to be accepted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getMinimumDistance ()
```

Return Value

A **float** value specifying minimum distance. The default value is 4 millimeters.

See Also

PatternRouter.getObstacles Method

Gets a list of obstacle nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramNodeList getObstacles ()
```

Return Value

A list of obstacles.

Remarks

If this value is set, the router ignores diagram's Nodes and only considers nodes from specified list.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter.getPatterns Method

Gets a list of RoutePattern objects representing the routing patterns.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public List<RoutePattern> getPatterns ()
```

Return Value

A list of RoutePattern objects defining link route templates.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter.getPreferredDistance Method

Gets the preferred distance from link's bend points to the link's nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getPreferredDistance ()
```

Return Value

A **float** value specifying preferred distance.

Remarks

The value of this property can be used in route templates using an AdvancePreferred RouteStep.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace
MinimumDistance Property

PatternRouter.routeLink Method

Implements LinkRouter.routeLink.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean routeLink (
    DiagramLink link,
    ConnectionPoint originConnection,
    ConnectionPoint destinationConnection,
    boolean nowCreating
)
```

Parameters

link
The DiagramLink to route.

originConnection
Represents connection to Origin node, potentially different from link's stored connection when modifying first control point.

destinationConnection
Represents connection to Destination node, potentially different from link's stored connection when modifying last control point.

nowCreating

Indicates whether link is currently being created.

Return Value

true if a path has been found successfully, otherwise **false**.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter.routeLinks Method

Implements LinkRouter.routeLinks.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkList routeLinks (
    DiagramLinkList links
)
```

Parameters

links
A list of DiagramLink objects that should be routed.

Return Value

A list of links that were not routed successfully.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter.setDiagram Method

Sets the Diagram whose links will be routed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDiagram (
    Diagram value
)
```

Parameters

value
A Diagram instance.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter.setMinimizeCrossings Method

Sets a value indicating whether to minimize crossings with other links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMinimizeCrossings (
    boolean value
)
```

Parameters

value
true to minimize crossings, or **false** otherwise.

Remarks

If this property is enabled, the algorithm runs an additional loop to count link crossings, which may affect performance for large diagrams.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter.setMinimumDistance Method

Sets the minimum allowed distance from obstacles for a route to be accepted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMinimumDistance (
    float value
)
```

Parameters

value
A **float** value specifying minimum distance.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace
PreferredDistance Property

PatternRouter.setObstacles Method

Sets a list of obstacle nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setObstacles (
    DiagramNodeList value
)
```

Parameters

value
A list of obstacles.

Remarks

If this value is set, the router ignores diagram's Nodes and only considers nodes from specified list.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter.setPatterns Method

Sets a list of RoutePattern objects representing the routing patterns.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setPatterns (
    List<RoutePattern> value
)
```

Parameters

value
A list of RoutePattern objects defining link route templates.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace

PatternRouter.setPreferredDistance Method

Sets the preferred distance from link's bend points to the link's nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setPreferredDistance (
    float value
)
```

Parameters

value
A **float** value specifying preferred distance.

Remarks

The value of this property can be used in route templates using an AdvancePreferred RouteStep.

See Also

PatternRouter Members
PatternRouter Class
com.mindfusion.diagramming Namespace

PolylineRouting Enumeration

Defines values that indicate how Polyline links should be routed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum PolylineRouting
```

Members

	Member name	Description

	AllOrthogonal	Keep all segments orthogonal to node's sides and each other.
	EndSegmentsOrthogonal	Keep the end segments orthogonal to node's sides, and allow interior segments to be inclined.
	UnrestrictedInclined	Allow any segment to be inclined by non-multiple of 90 angles.

PrintOptions Class

Defines the attributes of a printed diagram. Use the PrintOptions object returned by the DiagramView.getPrintOptions method to set the attributes of a specific diagram.

Syntax

Java
`public class PrintOptions extends RenderOptions`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.RenderOptions
    com.mindfusion.diagramming.PrintOptions

See Also

PrintOptions Members
com.mindfusion.diagramming Namespace

PrintOptions Members

Defines the attributes of a printed diagram. Use the PrintOptions object returned by the DiagramView.getPrintOptions method to set the attributes of a specific diagram.

The following tables list the members exposed by the PrintOptions type.

Public Constructors

	Name	Description
	PrintOptions	Initializes a new PrintOptions instance.

Public Methods

	Name	Description
	getAntiAlias	(Inherited from RenderOptions.)

	getDocumentName	Gets the document name.
	getEnableAnchors	Gets a value indicating whether anchor point marks will be printed. (Inherited from RenderOptions.)
	getEnableBackground	Gets a value indicating whether the diagram background will be filled using the Diagram.getBackBrush background brush. (Inherited from RenderOptions.)
	getEnableBackgroundImage	Gets a value indicating whether the diagram's background image will be printed. (Inherited from RenderOptions.)
	getEnableEffects	Gets a value indicating whether to render special node effects. (Inherited from RenderOptions.)
	getEnableFitToPage	
	getEnableGrid	Gets a value indicating whether the alignment grid is rendered. (Inherited from RenderOptions.)
	getEnableImages	Gets a value indicating whether images that are displayed inside nodes will be printed. (Inherited from RenderOptions.)
	getEnableInterior	Gets a value indicating whether the nodes will be filled when printed. (Inherited from RenderOptions.)
	getEnableShadows	Gets a value indicating whether item shadows will be printed. (Inherited from RenderOptions.)
	getEnableText	(Inherited from RenderOptions.)
	getHeaderFont	Gets the font used to draw the page header string.
	getHeaderFormat	Gets the page header format string.
	getHyperLinkStyle	(Inherited from RenderOptions.)
	getHyperLinkTarget	(Inherited from RenderOptions.)
	getMeasureUnit	Gets the diagram's measure unit. (Inherited from RenderOptions.)
	getRenderTarget	(Inherited from RenderOptions.)
	getScale	Gets the scale of the printed diagram relatively to the original on-screen size of the diagram. (Inherited from RenderOptions.)
	getScrollX	(Inherited from RenderOptions.)
	getScrollY	(Inherited from RenderOptions.)
	getTargetView	(Inherited from RenderOptions.)
	getTextAntiAlias	(Inherited from RenderOptions.)
	getVisibleRect	(Inherited from RenderOptions.)
	setAntiAlias	(Inherited from RenderOptions.)
	setDocumentName	Sets the document name.
	setEnableAnchors	Sets a value indicating whether anchor point marks should be printed. (Inherited from RenderOptions.)

	setEnableBackground	Sets a value indicating whether the diagram background should be filled using the **Diagram.getBackBrush** background brush. (Inherited from RenderOptions.)
	setEnableBackgroundImage	Sets a value indicating whether the diagram's background image should be printed. (Inherited from RenderOptions.)
	setEnableEffects	Sets a value indicating whether to render special node effects. (Inherited from RenderOptions.)
	setEnableFitToPage	
	setEnableGrid	Gets a value indicating whether the alignment grid is rendered. (Inherited from RenderOptions.)
	setEnableImages	Sets a value indicating whether images that are displayed inside nodes should be printed. (Inherited from RenderOptions.)
	setEnableInterior	Sets a value indicating whether the nodes should be filled when printed. (Inherited from RenderOptions.)
	setEnableShadows	Sets a value indicating whether item shadows should be printed. (Inherited from RenderOptions.)
	setEnableText	(Inherited from RenderOptions.)
	setHeaderFont	Sets the font used to draw the page header string.
	setHeaderFormat	Sets the page header format string.
	setHyperLinkStyle	(Inherited from RenderOptions.)
	setHyperLinkTarget	(Inherited from RenderOptions.)
	setMeasureUnit	Sets the diagram's measure unit. (Inherited from RenderOptions.)
	setRenderTarget	(Inherited from RenderOptions.)
	setScale	Sets the scale of the printed diagram relatively to the original on-screen size of the diagram. (Inherited from RenderOptions.)
	setScrollX	(Inherited from RenderOptions.)
	setScrollY	(Inherited from RenderOptions.)
	setTargetView	(Inherited from RenderOptions.)
	setTextAntiAlias	(Inherited from RenderOptions.)
	setVisibleRect	(Inherited from RenderOptions.)

PrintOptions Constructor

Initializes a new PrintOptions instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public PrintOptions (
    DiagramView diagramView
)
```

Parameters

diagramView

See Also

PrintOptions Class
com.mindfusion.diagramming Namespace

PrintOptions Methods

PrintOptions.getDocumentName Method

Gets the document name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public String getDocumentName ()
```

Return Value

A String containing the document name.

See Also

PrintOptions Members
PrintOptions Class
com.mindfusion.diagramming Namespace

PrintOptions.getEnableFitToPage Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getEnableFitToPage ()
```

Return Value

See Also

PrintOptions Members
PrintOptions Class
com.mindfusion.diagramming Namespace

PrintOptions.getHeaderFont Method

Gets the font used to draw the page header string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Font getHeaderFont ()
```

Return Value

A Font instance.

See Also

PrintOptions Members
PrintOptions Class
com.mindfusion.diagramming Namespace
setHeaderFont Method

PrintOptions.getHeaderFormat Method

Gets the page header format string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getHeaderFormat ()
```

Return Value

A String containing formatting attributes for the page headers.

See Also

PrintOptions Members
PrintOptions Class
com.mindfusion.diagramming Namespace

PrintOptions.setDocumentName Method

Sets the document name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDocumentName (
    String value
)
```

Parameters

value
A String containing the document name.

See Also

PrintOptions Members
PrintOptions Class
com.mindfusion.diagramming Namespace

PrintOptions.setEnableFitToPage Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableFitToPage (
    boolean value
)
```

Parameters

value

See Also

PrintOptions Members
PrintOptions Class
com.mindfusion.diagramming Namespace

PrintOptions.setHeaderFont Method

Sets the font used to draw the page header string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHeaderFont (
    Font value
)
```

Parameters

value
A Font instance.

See Also

PrintOptions Members
PrintOptions Class
com.mindfusion.diagramming Namespace
getHeaderFont Method
setHeaderFormat Method

PrintOptions.setHeaderFormat Method

Sets the page header format string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHeaderFormat (
    String value
)
```

Parameters

value
A **String** containing formatting attributes for the page headers.

Remarks

The header format string can contain fixed text and format specifiers. Currently, there are three format specifiers supported:

- %D is a placeholder for the document title;
- %P is a placeholder for the page number;
- %T is a placeholder for the total number of pages;

QuickRouter Class

Implements a very fast link routing algorithm that uses a tree to represent the free and occupied regions in the diagram.

Syntax

Java
`public class QuickRouter implements LinkRouter`

Remarks

To use this class for link routing, assign its instance to the LinkRouter property of the Diagram class.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.QuickRouter

See Also

QuickRouter Members
com.mindfusion.diagramming Namespace

QuickRouter Members

Implements a very fast link routing algorithm that uses a tree to represent the free and occupied regions in the diagram.

The following tables list the members exposed by the QuickRouter type.

Public Constructors

	Name	Description
	QuickRouter	Initializes a new instance of the QuickRouter class.

Public Methods

	Name	Description
	getDiagram	
	getGranularity	Gets the granularity of the obstacles map generated by **QuickRouter**.
	getTurnCost	Gets a value added to the total cost of a route if it makes a turn.
	getUBendMaxLen	Gets the maximum U-bend length.
	routeAllLinks	Routes all links in the diagram.
	routeLink	Implements LinkRouter.routeLink.
	routeLinks	Implements LinkRouter.routeLinks.
	setDiagram	
	setGranularity	Sets the granularity of the obstacles map generated by **QuickRouter**.
	setTurnCost	Sets a value added to the total cost of a route if it makes a turn.

	setUBendMaxLen	Sets the maximum U-bend length.

See Also

QuickRouter Class
com.mindfusion.diagramming Namespace

QuickRouter Constructor

Initializes a new instance of the QuickRouter class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public QuickRouter (
    Diagram diagram
)
```

Parameters

diagram
The Diagram whose links will be routed.

See Also

QuickRouter Class
com.mindfusion.diagramming Namespace

QuickRouter Methods

QuickRouter.getDiagram Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Diagram getDiagram ()
```

Return Value

See Also

QuickRouter Members
QuickRouter Class
com.mindfusion.diagramming Namespace

QuickRouter.getGranularity Method

Gets the granularity of the obstacles map generated by QuickRouter.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Granularity getGranularity ()
```

Return Value

A member of the Granularity enumeration. The default value is **CoarseGrained**.

Remarks

A CoarseGrained obstacle map leads to faster path finding, however the found paths might be longer than necessary in a small percent of the cases. The coarse-grained map also takes slightly more time to build, so you might disable it if there are aren't many links in the diagram.

See Also

QuickRouter Members
QuickRouter Class
com.mindfusion.diagramming Namespace

QuickRouter.getTurnCost Method

Gets a value added to the total cost of a route if it makes a turn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getTurnCost ()
```

Return Value

See Also

QuickRouter Members
QuickRouter Class
com.mindfusion.diagramming Namespace

QuickRouter.getUBendMaxLen Method

Gets the maximum U-bend length.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getUBendMaxLen ()
```

Return Value

A float value specifying the maximum length of U-bends. The default is 30.

See Also

QuickRouter Members
QuickRouter Class
com.mindfusion.diagramming Namespace

QuickRouter.routeAllLinks Method

Routes all links in the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void routeAllLinks ()
```

See Also

QuickRouter Members
QuickRouter Class
com.mindfusion.diagramming Namespace

QuickRouter.routeLink Method

Implements LinkRouter.routeLink.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean routeLink (
    DiagramLink link,
    ConnectionPoint originConnection,
    ConnectionPoint destinationConnection,
    boolean nowCreating
)
```

Parameters

link
The DiagramLink to route.

originConnection
Represents connection to Origin node, potentially different from link's stored connection when modifying first control point.

destinationConnection
Represents connection to Destination node, potentially different from link's stored connection when modifying last control point.

nowCreating
Indicates whether link is currently being created.

Return Value

true if a path has been found successfully, otherwise **false**.

com.mindfusion.diagramming Namespace

QuickRouter.routeLinks Method

Implements LinkRouter.routeLinks.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkList routeLinks (
    DiagramLinkList links
)
```

Parameters

links
A list of DiagramLink objects that should be routed.

Return Value

A list of links that were not routed successfully.

QuickRouter.setGranularity Method

Sets the granularity of the obstacles map generated by QuickRouter.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setGranularity (
    Granularity value
)
```

Parameters

value
A member of the Granularity enumeration.

Remarks

A CoarseGrained obstacle map leads to faster path finding, however the found paths might be longer than necessary in a small percent of the cases. The coarse-grained map also takes slightly more time to build, so you might disable it if there are aren't many links in the diagram.

RedimTableCmd Members

Represents an action that changes the number of columns or rows in a table.

The following tables list the members exposed by the RedimTableCmd type.

Public Constructors

	Name	Description
	RedimTableCmd	Initializes a new RedimTableCmd instance.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)

	execute	This method is called internally by JDiagram when changing the number of rows or columns of a table.
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTable	Returns the table related to this command.
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	This method is called by the UndoManager when redoing actions.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	This method is called by the **UndoManager** when undoing actions.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related. (Inherited from Command.)
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

RedimTableCmd Methods

RedimTableCmd.execute Method

This method is called internally by JDiagram when changing the number of rows or columns of a table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void execute (
    boolean undoEnabled
)
```

Parameters

undoEnabled
true if the undo manager is enabledat this time, otherwise false.

Relationship Enumeration

The members of this enumeration specify how table rows should be related. They can be used as parameters of the addRelation method of the TableNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum Relationship`

Members

	Member name	Description

	ManyToOne	The specified row is at the "many" end of a one-to-many relation.
	OneToMany	The specified row is at the "one" end of a one-to-many relation.

See Also

com.mindfusion.diagramming Namespace

RelativeToLink Enumeration

The members of this enumeration specify how the link labels are positioned.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum RelativeToLink`

Members

	Member name	Description
	ControlPoint	Indicates that the link labels are positioned relative to a specified control point.
	LinkLength	Indicates that the link labels are positioned relative to the link.
	Segment	Indicates that the link labels are positioned relative to a specified segment.

See Also

com.mindfusion.diagramming Namespace

RelativeToNode Enumeration

The members of this enumeration specify how labels are positioned relative to their node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum RelativeToNode`

Members

	Member name	Description
	Center	Indicates that the node labels are positioned relative to the node center.
	Corner	Indicates that the node labels are positioned relative to a specified corner point.
	Edge	Indicates that the node labels are positioned relative to a specified edge.

RemoveFromContainerCmd Members

Undoable command that implements removal of nodes from a container.

The following tables list the members exposed by the RemoveFromContainerCmd type.

Protected Constructors

	Name	Description
	RemoveFromContainerCmd	Intializes a new instance of the **RemoveFromContainerCmd** class.

Public Methods

	Name	Description

	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)
	execute	Carries out the command action.
	getContainer	Gets the ContainerNode object associated with the command.
	getNode	Gets the DiagramNode instance associated with the command.
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	Redoes the command.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	Undoes the command.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related.
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

RemoveFromContainerCmd Class
com.mindfusion.diagramming Namespace

RemoveFromContainerCmd Constructor

Intializes a new instance of the RemoveFromContainerCmd class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected RemoveFromContainerCmd (
    ContainerNode container,
    DiagramNode node,
    boolean interactive
)
```

Parameters

container

A ContainerNode object.

node

A DiagramNode object.

interactive

RemoveFromContainerCmd Methods

RemoveFromContainerCmd.adopt Method

Merges adjacent commands in the history queue if they are related.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected boolean adopt (
    Command command
)
```

Parameters

command

The Command that might be adopted by this command.

Return Value

true if the specified command has been adopted; otherwise, **false**.

RenderCallback(T) Members

This functional interface declares the prototype of drawing callbacks called by various icon Renderers.

The following tables list the members exposed by the RenderCallback(T) type.

Public Methods

	Name	Description
	render	Called to render a node's icon using Graphics2D API.

See Also

RenderCallback<T> Interface
com.mindfusion.diagramming Namespace

RenderCallback(T) Methods

RenderCallback(T).render Method

Called to render a node's icon using Graphics2D API.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
boolean render (
    T item,
    Graphics2D graphics,
    Rectangle2D bounds
)
```

Parameters

item
The diagram item that invokes the callback.

graphics
A Graphics2D object representing the drawing canvas.

bounds
The icon's bounding rectangle.

Return Value

true to prevent standard icon rendering, or **false** to apply it.

RenderOptions Members

Defines the attributes of a printed diagram. Use the PrintOptions object returned by the DiagramView.getPrintOptions method to set the attributes of a specific diagram.

The following tables list the members exposed by the RenderOptions type.

Public Constructors

	Name	Description
	RenderOptions	Initializes a new RenderOptions instance.

Public Methods

	Name	Description

	getAntiAlias	
	getDocumentName	Gets the document name.
	getEnableAnchors	Gets a value indicating whether anchor point marks will be printed.
	getEnableBackground	Gets a value indicating whether the diagram background will be filled using the Diagram.getBackBrush background brush.
	getEnableBackgroundImage	Gets a value indicating whether the diagram's background image will be printed.
	getEnableEffects	Gets a value indicating whether to render special node effects.
	getEnableFitToPage	
	getEnableGrid	Gets a value indicating whether the alignment grid is rendered.
	getEnableImages	Gets a value indicating whether images that are displayed inside nodes will be printed.
	getEnableInterior	Gets a value indicating whether the nodes will be filled when printed.
	getEnableShadows	Gets a value indicating whether item shadows will be printed.
	getEnableText	
	getHeaderFormat	Gets the page header format string.
	getHyperLinkStyle	
	getHyperLinkTarget	
	getMeasureUnit	Gets the diagram's measure unit.
	getRenderTarget	
	getScale	Gets the scale of the printed diagram relatively to the original on-screen size of the diagram.
	getScrollX	
	getScrollY	
	getTargetView	
	getTextAntiAlias	
	getVisibleRect	
	setAntiAlias	
	setDocumentName	Sets the document name.
	setEnableAnchors	Sets a value indicating whether anchor point marks should be printed.
	setEnableBackground	Sets a value indicating whether the diagram background should be filled using the **Diagram.getBackBrush** background brush.

	setEnableBackgroundImage	Sets a value indicating whether the diagram's background image should be printed.
	setEnableEffects	Sets a value indicating whether to render special node effects.
	setEnableFitToPage	
	setEnableGrid	Gets a value indicating whether the alignment grid is rendered.
	setEnableImages	Sets a value indicating whether images that are displayed inside nodes should be printed.
	setEnableInterior	Sets a value indicating whether the nodes should be filled when printed.
	setEnableShadows	Sets a value indicating whether item shadows should be printed.
	setEnableText	
	setHeaderFormat	Sets the page header format string.
	setHyperLinkStyle	
	setHyperLinkTarget	
	setMeasureUnit	Sets the diagram's measure unit.
	setRenderTarget	
	setScale	Sets the scale of the printed diagram relatively to the original on-screen size of the diagram.
	setScrollX	
	setScrollY	
	setTargetView	
	setTextAntiAlias	
	setVisibleRect

Package: com.mindfusion.diagramming

Syntax

Java

```
public RenderTarget getRenderTarget ()
```

Return Value

See Also

RenderOptions Members
RenderOptions Class
com.mindfusion.diagramming Namespace

RenderOptions.getScale Method

Gets the scale of the printed diagram relatively to the original on-screen size of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getScale ()
```

Return Value

A float value specifying percents of the original diagram size.

RenderOptions.setAntiAlias Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAntiAlias (
    SmoothingMode smoothingMode
)
```

Parameters

smoothingMode
A SmoothingMode object.

See Also

RenderOptions Members
RenderOptions Class
com.mindfusion.diagramming Namespace

RenderOptions.setDocumentName Method

Sets the document name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDocumentName (
    String value
)
```

Parameters

value
A String containing the document name.

See Also

RenderOptions Members
RenderOptions Class
com.mindfusion.diagramming Namespace

RenderOptions.setEnableAnchors Method

Sets a value indicating whether anchor point marks should be printed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableAnchors (
    boolean value
)
```

Parameters

value
true if anchor point marks should be printed,otherwise false.

See Also

RenderOptions Members
RenderOptions Class
com.mindfusion.diagramming Namespace

RenderOptions.setEnableBackground Method

Sets a value indicating whether the diagram background should be filled using the Diagram.getBackBrush background brush.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableBackground (
    boolean value
)
```

Parameters

value
true if the background should be filled whenprinting, otherwise false.

See Also

RenderOptions Members
RenderOptions Class
com.mindfusion.diagramming Namespace

RenderOptions.setEnableBackgroundImage Method

Sets a value indicating whether the diagram's background image should be printed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void setEnableBackgroundImage (
    boolean value
)
```

Parameters

value
true if the background image should be printed,otherwise false.

See Also

RenderOptions Class
com.mindfusion.diagramming Namespace

RenderOptions.setEnableEffects Method

Sets a value indicating whether to render special node effects.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void setEnableEffects (
    boolean value
)
```

Parameters

value
true if node effects should be rendered; otherwise, false.

RenderOptions.setEnableFitToPage Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableFitToPage (
    boolean value
)
```

Parameters

value

See Also

RenderOptions Members
RenderOptions Class
com.mindfusion.diagramming Namespace

RenderOptions.setEnableGrid Method

Gets a value indicating whether the alignment grid is rendered.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableGrid (
    boolean value
)
```

Parameters

value

See Also

RenderOptions Members
RenderOptions Class
com.mindfusion.diagramming Namespace

RenderOptions.setEnableImages Method

Sets a value indicating whether images that are displayed inside nodes should be printed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableImages (
    boolean value
)
```

Parameters

value
true if images should be printed,otherwise false.

See Also

RenderOptions Members
RenderOptions Class
com.mindfusion.diagramming Namespace

RenderOptions.setEnableInterior Method

Sets a value indicating whether the nodes should be filled when printed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableInterior (
    boolean value
)
```

Parameters

value
true if nodes should be filled,otherwise false.

See Also

RenderOptions Members
RenderOptions Class
com.mindfusion.diagramming Namespace

RenderOptions.setEnableShadows Method

Sets a value indicating whether item shadows should be printed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableShadows (
    boolean value
)
```

Parameters

value
true if shadows should be printed,otherwise false.

RenderOptions.setRenderTarget Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRenderTarget (
    RenderTarget renderTarget
)
```

Parameters

renderTarget

See Also

RenderOptions Members
RenderOptions Class
com.mindfusion.diagramming Namespace

RenderOptions.setScale Method

Sets the scale of the printed diagram relatively to the original on-screen size of the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setScale (
    float value
)
```

Parameters

value
A float value specifying percents of the original diagram size. The default value is 100.

RepaintEvent Members

Specifies the coordinates of the area that should be repainted by views when the Repaint event is raised.

The following tables list the members exposed by the RepaintEvent type.

Public Constructors

	Name	Description
	RepaintEvent	Overloaded.

Public Methods

	Name	Description
	getInvalidRect	Gets the rectangular area in the diagram document that should be repainted.
	getRedrawCacheImage	Gets a value indicating whether the back-buffer cache image should be repainted as well.
	setInvalidRect	Sets the rectangular area in the diagram document that should be repainted.

See Also

RepaintEvent Class
com.mindfusion.diagramming Namespace

RepaintEvent Constructor

Overload List

Name	Description
RepaintEvent (Object, Rectangle2D)	
RepaintEvent (Object, Rectangle2D, boolean)	Initializes a new instance of the RepaintEvent class

See Also

RepaintEvent Class
com.mindfusion.diagramming Namespace

RepaintEvent Constructor (Object, Rectangle2D)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public RepaintEvent (
    Object source,
    Rectangle2D invalidRect
)
```

Parameters

source

invalidRect

See Also

RepaintEvent Constructor Overload List
RepaintEvent Class
com.mindfusion.diagramming Namespace

RepaintEvent Constructor (Object, Rectangle2D, boolean)

Initializes a new instance of the RepaintEvent class

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public RepaintEvent (
    Object source,
    Rectangle2D invalidRect,
    boolean redrawCacheImage
)
```

Parameters

source
The source of the event.

invalidRect
A **Rectangle2D** object representing the rectangle that should be repainted.

redrawCacheImage
A boolean value specifying whether the diagram cache image used during modification should be re-created.

See Also

RepaintEvent Constructor Overload List
RepaintEvent Class
com.mindfusion.diagramming Namespace

RepaintEvent Methods

RepaintEvent.getInvalidRect Method

Gets the rectangular area in the diagram document that should be repainted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Rectangle2D getInvalidRect ()
```

Return Value

A **Rectangle2D** instance specifying the invalid rectangle. A null value indicates that the whole view should be repainted.

See Also

RepaintEvent Members
RepaintEvent Class
com.mindfusion.diagramming Namespace

RepaintEvent.getRedrawCacheImage Method

Gets a value indicating whether the back-buffer cache image should be repainted as well.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getRedrawCacheImage ()
```

Return Value

true to redraw the back-buffer image; otherwise, false.

See Also

RepaintEvent Members
RepaintEvent Class
com.mindfusion.diagramming Namespace

RepaintEvent.setInvalidRect Method

Sets the rectangular area in the diagram document that should be repainted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setInvalidRect (
    Rectangle2D invalidRect
)
```

Parameters

invalidRect
A **Rectangle2D** instance specifying the invalid rectangle.

See Also

RepaintEvent Members
RepaintEvent Class
com.mindfusion.diagramming Namespace

RerouteLinks Enumeration

The members of this enumeration specify in what circumstances JDiagram should automatically re-route links. An EnumSet of **RerouteLinks** values can be used as a parameter of the setTriggerRerouting method of the RoutingOptions class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum RerouteLinks
```

Members

	Member name	Description
	WhenIntersectNode	Look for a new link route only if the link intersects a node.
	WhenModified	Look for a new link route each time an end point of the link is moved.
	WhileCreating	Looks for link route while the link is being initially drawn by the user.
	WhileModifying	Route links while the user modifies them or drags their incident nodes.

RestrictToBounds Enumeration

The members of this enumeration specify whether JDiagram lets users drag items outside of the currently define document bounds. They can be used as parameters of the setRestrictItemsToBounds method of the Diagram class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum RestrictToBounds`

Members

	Member name	Description
	InsideOnly	The items should be always inside the document area.
	Intersection	Let users drag items outside of the scrollable area as long as there is some part of them still inside.
	NoRestriction	Do not prevent users from dragging items outside of the document scrollable area.

Syntax

Java

```
public RoundRectangleTemplate (
    float x,
    float y,
    float w,
    float h,
    float r
)
```

Parameters

x
x coordinate of the upper left corner of the rectangle

y
y coordinate of the upper left corner of the rectangle

w
width of the rectangle

h
height of the rectangle

r
the radius of the rounded corners of this element.

RoutePattern Class
com.mindfusion.diagramming Namespace

RoutePattern Constructor ()

Initializes a new instance of the RoutePattern class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public RoutePattern ()`

See Also

RoutePattern Constructor Overload List
RoutePattern Class
com.mindfusion.diagramming Namespace

RoutePattern Constructor (String)

Initializes a new instance of the RoutePattern class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public RoutePattern (
    String data
)
```

Parameters

data
A string representing a sequence of RouteSteps.

Remarks

Members of the RouteStepKind enumeration are represented by three-character acronyms, with a numerical value appended to advance- steps.

Example

The following route can be represented by "ADR0.5 TRR ADR1 TRL ADR0.5" string.

Java

```
RoutePattern rightZigzag = new RoutePattern();
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.AdvanceRelative, 0.5f));
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.TurnRight));
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.AdvanceRelative, 1));
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.TurnLeft));
rightZigzag.getSteps().add(
    new RouteStep(RouteStepKind.AdvanceRelative, 0.5f));
router.getPatterns().add(rightZigzag);

// this can be defined in shorter form using a pattern string
// RoutePattern rightZigzag2 = new RoutePattern(
//     "ADR0.5 TRR ADR1 TRL ADR0.5");
```

RoutePattern Methods

RoutePattern.getSteps Method

Gets the list of RouteStep objects that generate a route.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public List<RouteStep> getSteps ()
```

Return Value

A List<RouteStep> instance.

See Also

RoutePattern Members
RoutePattern Class
com.mindfusion.diagramming Namespace

RoutePattern.setSteps Method

Sets the list of RouteStep objects that generate a route.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setSteps (
    List<RouteStep> value
)
```

Parameters

value
A List<RouteStep> instance.

See Also

RoutePattern Members
RoutePattern Class
com.mindfusion.diagramming Namespace

RouteStep Class

Represents segments or turns in routing patterns.

Syntax

```
Java
public class RouteStep
```

RouteStep Constructor (RouteStepKind)

Initializes a new instance of the RouteStep class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public RouteStep (
    RouteStepKind kind
)
```

Parameters

kind
A member of the RouteStepKind enumeration.

See Also

RouteStep Constructor Overload List
RouteStep Class
com.mindfusion.diagramming Namespace

RouteStep Constructor (RouteStepKind, float)

Initializes a new instance of the RouteStep class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public RouteStep (
    RouteStepKind kind,
    float amount
)
```

Parameters

kind
A member of the RouteStepKind enumeration.

amount
The distance to add when step kind is Advance*.

RouteStepKind Enumeration

Represents parts of a route template.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum RouteStepKind
```

Members

	Member name	Description

	AdvanceAbsolute	Advance by the specified absolute distance. Corresponds to "ADA" command in pattern strings.
	AdvanceDest	Advance by the specified relative remaining distance to destination node. Corresponds to "ADD" command in pattern strings.
	AdvancePreferred	Advance by PreferredDistance. Corresponds to "ADP" command in pattern strings.
	AdvanceRelative	Advance by the specified relative distance from origin to destination node. Equivalent to "ADR" command in pattern strings.
	AdvanceRemaining	Advance by the specified relative remaining distance to link's end point. Corresponds to "ADM" command in pattern strings.
	AlignToDestination	Advance to align with nearest side of destination node. Corresponds to "ALD" command in pattern strings.
	AlignToEnd	Advance to align with link's end point. Corresponds to "ALE" command in pattern strings.
	AlignToFarBorder	Advance to align with furthest border of both nodes. Corresponds to "AFB" command in pattern strings.
	AlignToOrigin	Advance to align with nearest side of origin node. Corresponds to "ALO" command in pattern strings.
	AlignToStart	Advance to align with link's start point. Corresponds to "ALS" command in pattern strings.
	TurnLeft	Turn 90 degrees to the left. Corresponds to "TRL" command in pattern strings.
	TurnRight	Turn 90 degrees to the right. Corresponds to "TRR" command in pattern strings.

RoutingOptions Members

An instance of this class accessible by the getRoutingOptions method lets you customize the behavior of the link routing algorithm.

The following tables list the members exposed by the RoutingOptions type.

Public Methods

	Name	Description
	getAnchoring	Gets a value indicating whether the routing algorithm should align links to the anchor points of nodes.
	getAvoidOverlaps	Gets whether link segments should be pulled apart when they overlap in initially found routes.
	getCrossingCost	Gets the value added to the total route cost if a link crosses another link.
S	getDistance	Return a heuristic function that returns the real distance sqrt(dx^2 + dy^2) between two pieces of the routing grid.
S	getDistSquare	Returns a heuristic function that returns the square distance dx^2 + dy^2 as a cost evaluation of the distance between two pieces of the routing grid.
	getDontOptimizeLongRoutes	Gets a value indicating whether the algorithm should spend time to optimize long routes.
	getEndOrientation	Gets a value indicating whether routes should end in horizontal or vertical direction.
	getEvaluateFarPoints	Gets a value indicating whether the router should evaluate paths between all sides of connected nodes to find ones with lower overall cost.
	getGridSize	Gets the size of the routing grid.
	getIgnoreAnchoring	For internal use.
	getLengthCost	Gets the value added to the total route cost for each grid square occupied by the link.
S	getMaxAbs	Returns a heuristic function that returns max(dx, dy) as a cost evaluation of the distance between two pieces of the routing grid.
	getNodeVicinityCost	Gets the value added to the total route cost when a link passes through the buffer area around a node.
	getNodeVicinitySize	Gets the size of the buffer area around a node for which link routes are assigned higher costs if they pass through that area.
	getPolylineRouting	Gets a value indicating whether the end segments of Polyline links should be oriented orthogonally to node's

		borders and each other.
	getRouteHeuristics	Gets the heuristic function used by the routing algorithm to choose next points in the route.
	getStartOrientation	Gets a value indicating whether routes should start in horizontal or vertical direction.
	getTriggerRerouting	Gets a value indicating when JDiagram should look for new link routes.
	getTurnCost	Gets the value added to the total route cost when a link makes a turn.
	setAnchoring	Sets a value indicating whether the routing algorithm should align links to the anchor points of nodes.
	setAvoidOverlaps	Sets whether link segments should be pulled apart when they overlap in initially found routes.
	setCrossingCost	Sets the value added to the total route cost if a link crosses another link.
	setDefaultMode	Sets the routing cost parameters to their default values.
	setDontOptimizeLongRoutes	Sets a value indicating whether the algorithm should spend time to optimize long routes.
	setEndOrientation	Sets a value indicating whether routes should end in horizontal or vertical direction.
	setEvaluateFarPoints	Sets a value indicating whether the router should evaluate paths between all sides of connected nodes to find ones with lower overall cost.
	setGridSize	Sets the size of the routing grid.
	setLengthCost	Sets the value added to the total route cost for each grid square occupied by the link.
	setMinSegmentsMode	Sets the routing costs to values that find routes having low number of segments.
	setNodeVicinityCost	Sets the value added to the total route cost when a link passes through the buffer area around a node.
	setNodeVicinitySize	Sets the size of the buffer area around a node for which link routes are assigned higher costs if they pass through that area.
	setPolylineRouting	Sets a value indicating whether the end segments of **Polyline** links should should be oriented orthogonally to node's borders and each other.
	setQuickMode	Sets the routing costs to values that quickly find routes, however with a lower route quality.
	setRouteHeuristics	Sets the heuristic function used by the routing algorithm to choose next points in the route.
	setStartOrientation	Sets a value indicating whether routes should start in horizontal or vertical direction.
	setTriggerRerouting	Sets a value indicating when JDiagram should look for new link routes.

	setTurnCost	Sets the value added to the total route cost when a link makes a turn.

RoutingOptions Methods

RoutingOptions.getAnchoring Method

Gets a value indicating whether the routing algorithm should align links to the anchor points of nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Anchoring getAnchoring ()
```

Return Value

A member of the Anchoring enumeration.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getAvoidOverlaps Method

Gets whether link segments should be pulled apart when they overlap in initially found routes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAvoidOverlaps ()
```

Return Value

true to pull apart overlapping segments, or **false** otherwise. The default value is **true**.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getCrossingCost Method

Gets the value added to the total route cost if a link crosses another link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public short getCrossingCost ()
```

Return Value

An integer value added to the cost of a route when a link crosses another link.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getDistance Method

Return a heuristic function that returns the real distance sqrt(dx^2 + dy^2) between two pieces of the routing grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public static RouteHeuristics getDistance ()
```

Return Value

A predefined RouteHeuristics object.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getDistSquare Method

Returns a heuristic function that returns the square distance dx^2 + dy^2 as a cost evaluation of the distance between two pieces of the routing grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public static RouteHeuristics getDistSquare ()
```

Return Value

A predefined RouteHeuristics object.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getDontOptimizeLongRoutes Method

Gets a value indicating whether the algorithm should spend time to optimize long routes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getDontOptimizeLongRoutes ()
```

Return Value

true if the shape of long routes should not be optimized, otherwise **false**.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getEndOrientation Method

Gets a value indicating whether routes should end in horizontal or vertical direction.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Orientation getEndOrientation ()
```

Return Value

A member of the Orientation enumeration.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getEvaluateFarPoints Method

Gets a value indicating whether the router should evaluate paths between all sides of connected nodes to find ones with lower overall cost.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getEvaluateFarPoints ()
```

Return Value

true to evaluate more distant pairs of node sides, or **false** otherwise. The default value is **false**.

Remarks

By default, routers evaluate paths only between the current start and end points of a link. Set this property to **true** to evaluate all combinations of anchor points or node sides. Note that enabling this property increases processing time.

Currently, EvaluateFarPoints is supported by GridRouter and PatternRouter.

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getGridSize Method

Gets the size of the routing grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getGridSize ()
```

Return Value

A float value specifying the size of the routing grid pieces.

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getIgnoreAnchoring Method

For internal use.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getIgnoreAnchoring ()
```

Return Value

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getLengthCost Method

Gets the value added to the total route cost for each grid square occupied by the link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public short getLengthCost ()
```

Return Value

An integer value added to the cost of a route for each routing grid square through which the link passes.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getMaxAbs Method

Returns a heuristic function that returns max(dx, dy) as a cost evaluation of the distance between two pieces of the routing grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public static RouteHeuristics getMaxAbs ()
```

Return Value

A predefined RouteHeuristics object.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getNodeVicinityCost Method

Gets the value added to the total route cost when a link passes through the buffer area around a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public short getNodeVicinityCost ()
```

Return Value

An integer value added to the cost of a route when the link passes near a node.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getNodeVicinitySize Method

Gets the size of the buffer area around a node for which link routes are assigned higher costs if they pass through that area.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getNodeVicinitySize ()
```

Return Value

A float value specifying the size of the buffer zone around a node where a penalty cost is added to the cost of a passing link.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getPolylineRouting Method

Gets a value indicating whether the end segments of Polyline links should be oriented orthogonally to node's borders and each other.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public PolylineRouting getPolylineRouting ()
```

Return Value

A member of the PolylineRouting enumeration. The default value is **AllOrthogonal**.

Remarks

This property is valid only for links whose Shape is set to Polyline.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getRouteHeuristics Method

Gets the heuristic function used by the routing algorithm to choose next points in the route.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public RouteHeuristics getRouteHeuristics ()
```

Return Value

A RouteHeuristics object used to predict the route cost.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getStartOrientation Method

Gets a value indicating whether routes should start in horizontal or vertical direction.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Orientation getStartOrientation ()
```

Return Value

A member of the Orientation enumeration.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getTriggerRerouting Method

Gets a value indicating when JDiagram should look for new link routes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public EnumSet<RerouteLinks> getTriggerRerouting ()
```

Return Value

A combination of RerouteLinks members.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.getTurnCost Method

Gets the value added to the total route cost when a link makes a turn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public short getTurnCost ()
```

Return Value

An integer value added to the cost of a route when the link makes a turn.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setAnchoring Method

Sets a value indicating whether the routing algorithm should align links to the anchor points of nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setAnchoring (
    Anchoring value
)
```

Parameters

value
A member of the Anchoring enumeration.

Remarks

By default, the routing algorithm ignores anchor points. To make it align link ends to the points specified through calling the setAnchorPattern method of nodes, invoke **setAnchoring** by passing Keep or **Reassign**. **Keep** specifies that the routing algorithm should not change the positions of link end points. **Reassign** lets the routing algorithm choose new end points for a link from the ones specified in the **setAnchorPattern** of its origin and destination nodes.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setAvoidOverlaps Method

Sets whether link segments should be pulled apart when they overlap in initially found routes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setAvoidOverlaps (
    boolean value
)
```

Parameters

value
true to pull apart overlapping segments, or **false** otherwise.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setCrossingCost Method

Sets the value added to the total route cost if a link crosses another link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setCrossingCost (
    short value
)
```

Parameters

value
An integer value added to the cost of a route when a link crosses another link.

Remarks

The routing algorithm aims to find paths that have a minimal cost, so assigning a greater value through **setCrossingCost** leads to fewer link intersections.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setDefaultMode Method

Sets the routing cost parameters to their default values.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDefaultMode ()
```

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setDontOptimizeLongRoutes Method

Sets a value indicating whether the algorithm should spend time to optimize long routes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDontOptimizeLongRoutes (
    boolean value
)
```

Parameters

value
true if the shape of long routes should not be optimized, otherwise **false**. The default value is **false**.

Remarks

Segment optimization done on routed links might need much processing time. The control allows disabling that optimization for long links. That would make the found routes have a "staircase" pattern when they run diagonally.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setEndOrientation Method

Sets a value indicating whether routes should end in horizontal or vertical direction.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEndOrientation (
    Orientation value
)
```

Parameters

value
A member of the Orientation enumeration.

Remarks

For some diagrams, it might be desirable that first and last segments of links always have a specific direction. For example, in database ER diagrams links usually connect to table rows on the left- or right-hand sides of tables; in that case their end segments must be horizontal. The **setEndOrientation** method specifies what orientation of links' last segments to be applied by the routing algorithm.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setEvaluateFarPoints Method

Sets a value indicating whether the router should evaluate paths between all sides of connected nodes to find ones with lower overall cost.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEvaluateFarPoints (
    boolean value
)
```

Parameters

value
true to evaluate more distant pairs of node sides, or **false** otherwise.

Remarks

By default, routers evaluate paths only between the current start and end points of a link. Set this property to **true** to evaluate all combinations of anchor points or node sides. Note that enabling this property increases processing time.

Currently, **EvaluateFarPoints** is supported by GridRouter and PatternRouter.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setGridSize Method

Sets the size of the routing grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setGridSize (
    float value
)
```

Parameters

value
A float value specifying the size of the routing grid pieces.

Remarks

A smaller size of routing grid pieces helps finding more precise paths, however since the number of pieces increases, there would be more time needed to find a path.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setLengthCost Method

Sets the value added to the total route cost for each grid square occupied by the link.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLengthCost (
    short value
)
```

Parameters

value
An integer value added to the cost of a route for each routing grid square through which the link passes.

Remarks

This is a penalty value added to the total cost of an evaluated link route for each piece of the routing grid it occupies. The routing algorithm aims to find paths that have a minimal cost, so assigning a greater value through **setLengthCost** leads to generating shorter paths.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setMinSegmentsMode Method

Sets the routing costs to values that find routes having low number of segments.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMinSegmentsMode ()
```

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setNodeVicinityCost Method

Sets the value added to the total route cost when a link passes through the buffer area around a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setNodeVicinityCost (
    short value
)
```

Parameters

value
An integer value added to the cost of a route when the link passes near a node.

Remarks

This is a penalty value added to the total cost of an evaluated link route if it passes too close to a node. The routing algorithm aims to find paths that have a minimal cost, so assigning a greater value through **setNodeVicinityCost** makes links avoid passing close to nodes. The size of the buffer area around nodes in which passing links get a penalty cost is specified by means of setNodeVicinitySize.

See Also

RoutingOptions Members
RoutingOptions Class

RoutingOptions.setNodeVicinitySize Method

Sets the size of the buffer area around a node for which link routes are assigned higher costs if they pass through that area.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setNodeVicinitySize (
    float value
)
```

Parameters

value
A float value specifying the size of the buffer zone around a node where a penalty cost is added to the cost of a passing link.

Remarks

The pieces of the routing grid that are closest to a node have the value passed through the setNodeVicinityCost method assigned as their cost. The outer pieces of the buffer zone are assigned a portion of NodeVicinityCost proportional to their distance to the node.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setPolylineRouting Method

Sets a value indicating whether the end segments of Polyline links should should be oriented orthogonally to node's borders and each other.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setPolylineRouting (
    PolylineRouting value
)
```

Parameters

value
A member of the PolylineRouting enumeration.

Remarks

This property is valid only for links whose Shape is set to Polyline.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setQuickMode Method

Sets the routing costs to values that quickly find routes, however with a lower route quality.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setQuickMode ()
```

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setRouteHeuristics Method

Sets the heuristic function used by the routing algorithm to choose next points in the route.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRouteHeuristics (
    RouteHeuristics value
)
```

Parameters

value
A RouteHeuristics object used to predict the route cost.

Remarks

While generating a path, the routing algorithm evaluates pieces of the routing grid adjacent to the current one. It takes into account the cost for passing trough a piece and adds to that cost a heuristic value calculated by **setRouteHeuristics**. So the smaller heuristic value a piece has, the greater the chance the found route to go through that piece.

There are three predefined heuristic functions that can be assigned through **setRouteHeuristics**: Distance, DistSquare and MaxAbs. All of them assign to pieces heuristic values that are larger for larger distances to the target. Thus of the four pieces adjacent to the current one, the piece closest to the target has the smallest value and the route generation continues through it.

See Also

RoutingOptions Members
RoutingOptions Class
com.mindfusion.diagramming Namespace

RoutingOptions.setStartOrientation Method

Sets a value indicating whether routes should start in horizontal or vertical direction.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setStartOrientation (
    Orientation value
)
```

Parameters

value
A member of the Orientation enumeration.

Remarks

For some diagrams, it might be desirable that first and last segments of links always have a specific direction. For example, in database ER diagrams links usually connect to table rows on the left- or right-hand sides of tables; in that case their end segments must be horizontal. **setStartOrientation** specifies what orientation of links' first segments to be applied by the routing algorithm.

RoutingOptions.setTurnCost Method

Sets the value added to the total route cost when a link makes a turn.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTurnCost (
    short value
)
```

Parameters

value
An integer value added to the cost of a route when the link makes a turn.

Remarks

This is a penalty value added to the total cost of an evaluated link route for each turn it makes. The routing algorithm aims to find paths that have a minimal cost, so assigning a greater value to **TurnCost** leads paths that make less turns (hence they have less segments).

Row Members

Represents a row of cells in a table. Rows are the entity to which links related to a table are connected.

The following tables list the members exposed by the Row type.

Public Constructors

	Name	Description
	Row	Overloaded.

Public Methods

	Name	Description
	clone	Copies the row attributes to a new **Row** instance.
	getAnchorPattern	Gets the AnchorPattern assigned to this row.
	getExpanded	Gets a value indicating whether the section of rows below this header row is expanded or collapsed.
	getHeader	Gets a value indicating whether this row is the header of a section of rows.
	getHeight	Gets the height of this row.
	getIncomingLinks	Gets a list of all links coming into this row.
	getOutgoingLinks	Gets a list of all links going out of this row.
	readExternal	Implements Externalizable.
	setAnchorPattern	Sets the **AnchorPattern** to whose point links should be aligned when connecting to this row.
	setExpanded	Expands or collapses the section of rows below this header row.
	setHeader	Sets a value indicating whether this row should be the header of a section of rows.
	setHeight	Sets the height of this row and all cells inside it.
	writeExternal	Implements Externalizable.

Protected Methods

	Name	Description
	loadFromJson	Loads the row from a JSON object.
	loadFromXml	Loads the row attributes from an XML element.
	saveToJson	Saves the row as a JSON object.
	saveToXml	Saves the row attributes into an XML element.

Row Constructor Overload List
Row Class
com.mindfusion.diagramming Namespace

Row Constructor (TableNode)

Initializes a new instance of the Row class and assigns the specified table as its parent.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Row (
    TableNode table
)
```

Parameters

table
The TableNode that contains this row.

See Also

Row Constructor Overload List
Row Class
com.mindfusion.diagramming Namespace

Row Methods

Row.clone Method

Copies the row attributes to a new Row instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object clone ()
```

Return Value

The new Row object.

See Also

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.getAnchorPattern Method

Gets the AnchorPattern assigned to this row.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public AnchorPattern getAnchorPattern ()
```

Return Value

An AnchorPattern object defining the row's anchor points.

Remarks

getAnchorPattern specifies a set of locations where links connected to a row are allowed to connect. When a link is connected to a row, the respective end of the link is aligned to the nearest AnchorPoint assigned to that row. If a row does not have associated anchor points of the appropriate type (incoming/outgoing), the link will be connected to the nearest row that has such anchors defined. If none of the rows of a table has an associated anchor pattern, links are connected to the middle of the left or right side of the pointed row.

See Also

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.getExpanded Method

Gets a value indicating whether the section of rows below this header row is expanded or collapsed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getExpanded ()
```

Return Value

true if the section of rows that starts from a header row is expanded, otherwise **false**.

Remarks

This property can be set only if the row is a Header. Links connected to the rows of a collapsed table section appear to be connected to the section header row.

See Also

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.getHeader Method

Gets a value indicating whether this row is the header of a section of rows.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getHeader ()
```

Return Value

true if this row is a header of an expandable section of table rows, otherwise **false**.

Remarks

Each header row defines a section of the table that includes all non-header rows after the header. Such sections can be expanded or collapsed, that is, the rows included in them can be shown or hidden. This can be done interactively by pressing the [±] button displayed in header rows, or programmatically by calling the setExpanded method. The tableSectionCollapsed and tableSectionExpanded events are raised when a user clicks the [±] button.

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.getHeight Method

Gets the height of this row.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getHeight ()
```

Return Value

A float value specifying the row height.

Remarks

The user can resize rows interactively when table's AllowResizeRows property is enabled.

See Also

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.getIncomingLinks Method

Gets a list of all links coming into this row.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkList getIncomingLinks ()
```

Return Value

An DiagramLinkList containing the incoming links.

Remarks

The method returns a collection of all links that point to this table row. Use it to access the links or get their number.

See Also

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.getOutgoingLinks Method

Gets a list of all links going out of this row.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkList getOutgoingLinks ()
```

Return Value

A DiagramLinkList containing the outgoing links.

Remarks

The method returns a collection of all links that start from this table row. Use it to access the links or get their number.

Row.loadFromJson Method

Loads the row from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the row's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.loadFromXml Method

Loads the row attributes from an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An **XmlElement** containing the row's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

Row Members
Row Class

Row.readExternal Method

Implements Externalizable.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.saveToJson Method

Saves the row as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.saveToXml Method

Saves the row attributes into an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An XmlElement the row's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.setAnchorPattern Method

Sets the AnchorPattern to whose point links should be aligned when connecting to this row.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAnchorPattern (
    AnchorPattern value
)
```

Parameters

value
An AnchorPattern object defining the row's anchor points.

Remarks

setAnchorPattern defines a set of locations where links connected to a row are allowed to connect. When a link is connected to a row, the respective end of the link is aligned to the nearest AnchorPoint assigned to that row. If a row does not have associated anchor points of the appropriate type (incoming/outgoing), the link will be connected to the nearest row that has such anchors defined. If none of the rows of a table has an associated anchor pattern, links are connected to the middle of the left or right side of the pointed row.

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.setExpanded Method

Expands or collapses the section of rows below this header row.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setExpanded (
    boolean value
)
```

Parameters

value
true if the section of rows that starts from a header row should be expanded, otherwise **false**.

Remarks

This property can be set only if the row is a Header. Links connected to the rows of a collapsed table section appear to be connected to the section header row.

See Also

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.setHeader Method

Sets a value indicating whether this row should be the header of a section of rows.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHeader (
    boolean value
)
```

Parameters

value
true if this row is a header of an expandable section of table rows, otherwise **false**.

Remarks

Setting the row as a header will automatically create a section of table rows spanning to the next header. Such sections can be collapsed so that only their header row will be visible.

Row Members
Row Class
com.mindfusion.diagramming Namespace

Row.setHeight Method

Sets the height of this row and all cells inside it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHeight (
    float value
)
```

Parameters

value
A float value specifying the row height.

Remarks

The user can resize rows interactively when table's AllowResizeRows property is enabled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public RowEvent (
    Object source,
    TableNode table,
    int rowIndex
)
```

Parameters

source
The source of the event.

table
The TableNode containing the event data.

rowIndex
The index of the row containing the event data.

See Also

RowEvent Class
com.mindfusion.diagramming Namespace

RowEvent Methods

RowEvent.getRowIndex Method

Gets the index of the table row for which the event has been raised.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getRowIndex ()
```

Return Value

An integer value specifying the row's index.

See Also

RowEvent Members
RowEvent Class

Ruler Class

The **Ruler** control provides horizontal and vertical scales that help users measure diagram items.

Syntax

```
Java
public class Ruler extends JComponent
```

Remarks

To specify which DiagramView instance is shown in the ruler, call the setDiagramView method.

The ruler tracks mouse movements and modifications being performed on an item, and displays markers over the scales indicating the current position in diagram's coordinate system. The colors of these markers can be changed using the setPointerColor and setProjectionColor methods.

Inheritance Hierarchy

java.lang.Object
  java.awt.Component
    java.awt.Container
      javax.swing.JComponent
        com.mindfusion.diagramming.Ruler

Ruler Members

The Ruler control provides horizontal and vertical scales that help users measure diagram items.

The following tables list the members exposed by the **Ruler** type.

Public Constructors

	Name	Description
	Ruler	Initializes a new instance of the Ruler class.

Public Methods

	Name	Description
	getDiagramView	Gets the DiagramView document this ruler is associated with.
	getGuideColor	Gets the color of alignment guides.
	getHorizontalScaleAlignment	Gets the alignment of the horizontal scale of the ruler.
	getHorizontalScaleVisible	Gets a value specifying whether the horizontal scale is visible.
	getPointerColor	Gets the color of mouse pointer's projections.
	getProjectionColor	Gets the color used to paint the projections of the active node on the ruler scales.
	getProjectRotatedBounds	Gets whether the projection of nodes on ruler's scales rotates with them.
	getScaleColor	Gets the color used to paint the color of the ruler scales.
	getTextColor	Gets the color used to paint texts in the ruler.

	getUnit	Gets the measure units displayed by the ruler.
	getVerticalScaleAlignment	Gets the alignment of the vertical scale of the ruler.
	getVerticalScaleVisible	Gets a value specifying whether the vertical scale is visible.
	setDiagramView	Sets the **DiagramView** document this ruler is associated with.
	setGuideColor	Sets the color of alignment guides.
	setHorizontalScaleAlignment	Sets the alignment of the horizontal scale of the ruler.
	setHorizontalScaleVisible	Sets a value specifying whether the horizontal scale is visible.
	setPointerColor	Sets the color of mouse pointer's projections.
	setProjectionColor	Sets the color used to paint the projections of the active node on the ruler scales.
	setProjectRotatedBounds	Sets whether the projection of nodes rotates with them or not.
	setScaleColor	Sets the color used to paint the color of the ruler scales.
	setTextColor	Sets the color used to paint texts in the ruler.
	setUnit	Sets the measure units displayed by the ruler.
	setVerticalScaleAlignment	Sets the alignment of the vertical scale.
	setVerticalScaleVisible	Sets a value specifying whether the vertval scale is visible.

Protected Methods

	Name	Description
	createImageIcon

Ruler.setHorizontalScaleAlignment Method

Sets the alignment of the horizontal scale of the ruler.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHorizontalScaleAlignment (
    int align
)
```

Parameters

align
the alignment of the horizontal scale.

See Also

Ruler Members
Ruler Class
com.mindfusion.diagramming Namespace

Ruler.setHorizontalScaleVisible Method

Sets a value specifying whether the horizontal scale is visible.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setHorizontalScaleVisible (
    boolean value
)
```

Parameters

value
a value specifying whether the horizontal scale is visible.

Sets the measure units displayed by the ruler.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setUnit (
    MeasureUnit unit
)
```

Parameters

unit
the measure unit used by the ruler.

See Also

Ruler Members
Ruler Class
com.mindfusion.diagramming Namespace

Ruler.setVerticalScaleAlignment Method

Sets the alignment of the vertical scale.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setVerticalScaleAlignment (
    int align
)
```

Parameters

align
the alignment of the vertical scale.

See Also

Ruler Members
Ruler Class
com.mindfusion.diagramming Namespace

Ruler.setVerticalScaleVisible Method

Sets a value specifying whether the vertval scale is visible.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setVerticalScaleVisible (
    boolean value
)
```

Parameters

value
a value specifying whether the vertical scale is visible.

Ruler Members
Ruler Class
com.mindfusion.diagramming Namespace

SaveToStringFormat Enumeration

The members of this enumeration specify in what format to save the diagram when generating a string using the Diagram.saveToString method.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public enum SaveToStringFormat
```

Members

	Member name	Description
	Base64	Indicates Base64 ASCII encoding.
	CompressedXml	Indicates compressed XML output.
	Json	Indicates a JSON output.
	Xml	Indicates non-compressed XML output.

ScrollBar Members

The following tables list the members exposed by the ScrollBar type.

Protected Constructors

	Name	Description
	ScrollBar	

Protected Fields

	Name	Description
	item	(Inherited from Manipulator.)

Public Methods

	Name	Description
	cancel	Called when the manipulator should cancel the current manipulation. (Inherited from Manipulator.)
	drawsInLocalCoordinates	Returns whether the manipulator object draws in local or global coordinates. (Inherited from Manipulator.)
	getEnabled	Gets or sets a value indicating whether the control can respond to user interaction.
	getItem	(Inherited from Manipulator.)
	getLargeChange	
	getValue	
	needsPointerMessages	Returns whether the manipulator object needs to track mouse events.
	onGotFocus	Called when the manipulator receives input focus. (Inherited from Manipulator.)
	onLostFocus	Called when the manipulator loses the input focus. (Inherited from Manipulator.)
	onPointerDown	Manipulator.onPointerDown override.
	onPointerMove	Manipulator.onPointerMove override.
	onPointerUp	Manipulator.onPointerUp override.
	setEnabled	
	setLargeChange	
	setMaximum	
	setMinimum	
	setMouseCursor	(Inherited from Manipulator.)
	setSmallChange	

	setValue	

Protected Methods

	Name	Description
	refresh

ScrollBar.needsPointerMessages Method

Returns whether the manipulator object needs to track mouse events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean needsPointerMessages (
    Point2D point
)
```

Parameters

point

Return Value

true to track mouse events; otherwise, **false**.

ScrollContainerCmd Members

Implements support for undo of ContainerNode scroll operations.

The following tables list the members exposed by the ScrollContainerCmd type.

Public Constructors

	Name	Description
	ScrollContainerCmd	Initializes a new instance of the ScrollContainerCmd class.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)
	execute	Command.execute override.
	getContainer	Gets a reference to the ContainerNode affected by this operation.
	getItem	Gets a reference to the modified item. (Inherited from ModifyItemCmd.)
	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	Command.redo override.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	Command.undo override.

Protected Methods

	Name	Description
	adopt	(Inherited from ModifyItemCmd.)
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

ScrollIconRenderer Class
com.mindfusion.diagramming Namespace

ScrollIconRenderer Constructor (Image, Image)

Initializes a new instance of the ScrollIconRenderer class that renders scroll arrow icons provided as bitmaps.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ScrollIconRenderer (
    Image scrollUpIcon,
    Image scrollDownIcon
)
```

Parameters

scrollUpIcon
A **java.awt.Image** representing the scroll-up icon.

scrollDownIcon
A **java.awt.Image** representing the scroll-down icon.

See Also

ScrollIconRenderer Constructor Overload List
ScrollIconRenderer Class
com.mindfusion.diagramming Namespace

ScrollIconRenderer Constructor (Image, Image, Image, Image)

Initializes a new instance of the ScrollIconRenderer class that renders scroll arrow icons provided as bitmaps.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ScrollIconRenderer (
    Image scrollUpIcon,
    Image scrollDownIcon,
    Image disabledScrollUpIcon,
    Image disabledScrollDownIcon
)
```

Parameters

scrollUpIcon
A **java.awt.Image** representing the scroll-up icon.

scrollDownIcon
A **java.awt.Image** representing the scroll-down icon.

disabledScrollUpIcon
A **java.awt.Image** representing disabled scroll-up icon.

disabledScrollDownIcon
A **java.awt.Image** representing disabled scroll-down icon.

com.mindfusion.diagramming Namespace

ScrollIconRenderer Constructor (RenderCallback<TableNode>)

Initializes a new instance of the ScrollIconRenderer class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ScrollIconRenderer (
    RenderCallback<TableNode> renderCallback
)
```

Parameters

renderCallback
A callback function that draws the icon using **Graphics2D** API.

See Also

ScrollIconRenderer Constructor Overload List
ScrollIconRenderer Class
com.mindfusion.diagramming Namespace

ScrollIconRenderer Constructor (SvgContent, SvgContent)

Initializes a new instance of the ScrollIconRenderer class that renders collapse / expand icons provided as SVG drawings.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ScrollIconRenderer (
    SvgContent scrollUpIcon,
    SvgContent scrollDownIcon
)
```

Parameters

scrollUpIcon
An SvgContent representing the scroll-up icon.

scrollDownIcon
An **SvgContent** representing the scroll-down icon.

See Also

ScrollIconRenderer Constructor Overload List
ScrollIconRenderer Class
com.mindfusion.diagramming Namespace

ScrollIconRenderer Constructor (SvgContent, SvgContent, SvgContent, SvgContent)

Initializes a new instance of the ScrollIconRenderer class that renders collapse / expand icons provided as SVG drawings.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ScrollIconRenderer (
    SvgContent scrollUpIcon,
    SvgContent scrollDownIcon,
    SvgContent disabledScrollUpIcon,
    SvgContent disabledScrollDownIcon
)
```

Parameters

scrollUpIcon
An SvgContent representing the scroll-up icon.

scrollDownIcon
An **SvgContent** representing the scroll-down icon.

disabledScrollUpIcon
An **SvgContent** representing disabled scroll-up icon.

disabledScrollDownIcon
An **SvgContent** representing disabled scroll-down icon.

See Also

ScrollIconRenderer Constructor Overload List
ScrollIconRenderer Class

ScrollIconRenderer Methods

ScrollIconRenderer.getWidth Method

Gets a float value specifying scroll arrows' width in diagram's MeasureUnit.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Float getWidth ()
```

Return Value

A **Float** value that lets you override the icon width. The default value is **null**.

Remarks

If this property is not set, scroll arrows are rendered using default unit-independent width (their height depends on CaptionHeight).

See Also

ScrollIconRenderer Members
ScrollIconRenderer Class

ScrollIconRenderer.setWidth Method

Sets a float value specifying scroll arrows' width in diagram's MeasureUnit.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setWidth (
    Float value
)
```

Parameters

value
A **Float** value that lets you override the icon width. The default value is **null**.

Remarks

If this property is not set, scroll arrows are rendered using default unit-independent width (their height depends on CaptionHeight).

ScrollTableCmd Members

Represents an action that scrolls table rows up or down.

The following tables list the members exposed by the ScrollTableCmd type.

Public Constructors

	Name	Description
	ScrollTableCmd	Initializes a new ScrollTableCmd instance.

Public Methods

	Name	Description
	addSubCmd	Adds a command object to a compound command. (Inherited from Command.)
	execute	This method is called internally by JDiagram when scrolling tables.

	getSubCommands	Gets a collection of all command objects contained within the composite one. (Inherited from Command.)
	getTable	Gets the table related to this command.
	getTitle	Gets the title of this command. (Inherited from Command.)
	redo	This method is called by the UndoManager when redoing actions.
	setTitle	Sets the command title. (Inherited from Command.)
	undo	This method is called by the **UndoManager** when undoing actions.

Protected Methods

	Name	Description
	adopt	Merges adjacent commands in the history queue if they are related. (Inherited from Command.)
	getContext	Gets the command's context. (Inherited from Command.)
	isContainerOf	Determines whether a command has been initiated by this command and should be treated as a derivative. (Inherited from Command.)

Selection Members

Represents a selection of multiple items. Each Diagram has its own Selection instance, which can be accessed by the getSelection method.

The following tables list the members exposed by the **Selection** type.

Public Constructors

	Name	Description
	Selection	Initializes a new **Selection** instance.

Protected Fields

	Name	Description
	brush	(Inherited from DiagramItem.)
	cycleDetected	(Inherited from DiagramItem.)
	cycleProtect	(Inherited from DiagramItem.)
	modifyDX	(Inherited from DiagramItem.)
	modifyDY	(Inherited from DiagramItem.)
	modifyHandle	(Inherited from DiagramItem.)
	modifying	(Inherited from DiagramItem.)
	pen	(Inherited from DiagramItem.)
	ptEnd	(Inherited from DiagramItem.)
	ptMdfLast	(Inherited from DiagramItem.)
	ptOrg	(Inherited from DiagramItem.)
	ptSavedEnd	(Inherited from DiagramItem.)
	ptSavedOrg	(Inherited from DiagramItem.)
	subordinateGroup	(Inherited from DiagramItem.)

Public Methods

	Name	Description
	addItem	Adds the specified item to the selection.

as	Down-casts the item to specified type. (Inherited from DiagramItem.)
change	Changes the selection to the specified item. That means that the item gets selected and all other items are unselected.
clear	Removes all items from the selection.
clone	Creates a copy of this item. (Inherited from DiagramItem.)
containsPoint	Overloaded.
getAllowMultipleSelection	Gets a value indicating whether users are allowed to select multiple items.
getBounds	Gets the smallest rectangle that bounds all selected items.
getBrush	Gets the brush used to fill the item's interior. (Inherited from DiagramItem.)
getEffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style. (Inherited from DiagramItem.)
getEffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style. (Inherited from DiagramItem.)
getEffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
getFont	Gets the font used to draw the text of an item. (Inherited from DiagramItem.)
getHandlesStyle	Gets a value indicating how multiple selection is drawn on the screen.
getHyperLink	Gets the hyperlink associated with an item. (Inherited from DiagramItem.)
getId	Gets user-defined identifier associated with this item. (Inherited from DiagramItem.)
getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
getIncludeItemsIfIntersect	Gets a value indicating which items are selected when drawing a selection rectangle.
getItems	Gets a list of all selected items.

	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms. (Inherited from DiagramItem.)
	getLinks	Gets a list of all selected links.
	getLocked	Gets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	getMasterGroup	Gets the hierarchical group in which this item is a subordinate. (Inherited from DiagramItem.)
	getNodes	Gets a list of all selected boxes.
	getOffsetUnconnectedLinks	Specifies whether to translate all points of selected unconnected links when moving multiple selection.
	getOpacity	Gets the opacity of this item. (Inherited from DiagramItem.)
	getParent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	getPen	Gets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	getPrintable	Gets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	getRuntimeIndex	For internal use. (Inherited from DiagramItem.)
	getSelected	Gets a value indicating whether this item is selected. (Inherited from DiagramItem.)
	getSetsDirtyFlag	Gets a value indicating whether the diagram's Dirty flag should be set when selection changes.
	getShadowBrush	Gets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getStyle	Gets the style associated with the item. (Inherited from DiagramItem.)
	getSubordinateGroup	Gets the group of subordinated items attached to this one. (Inherited from DiagramItem.)
	getTag	Gets user-defined data assigned to an item. (Inherited from DiagramItem.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	getTextPadding	Gets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)

	getToolTip	Gets the tooltip text displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	getVisible	Gets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	getWeight	Gets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	getZIndex	Gets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	hasSubordinates	Checks whether there are any nodes attached to this item. (Inherited from DiagramItem.)
	hitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	hitTestHandle	DiagramItem.hitTestHandle override.
	itemInSelection	Determines whether the specified item is selected.
	labelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramItem.)
	query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	readExternal	Implements Externalizable.
	removeItem	Removes the specified item from the selection.
	setAllowMultipleSelection	Sets a value indicating whether users are allowed to select multiple items.
	setBrush	Sets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	setFont	Sets the font used to draw the text of an item. (Inherited from DiagramItem.)
	setHandlesStyle	Sets a value indicating how multiple selection should be drawn on the screen.
	setHyperLink	Sets the hyperlink associated with an item. (Inherited from DiagramItem.)
	setId	Assigns user-defined identifier to this item. (Inherited from DiagramItem.)
	setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	setIncludeItemsIfIntersect	Sets a value indicating which items are selected when drawing a selection rectangle.
	setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	setLocked	Sets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)

	setOffsetUnconnectedLinks	Specifies whether to translate all points of selected unconnected links when moving multiple selection.
	setOpacity	Sets the opacity of this item. (Inherited from DiagramItem.)
	setPen	Sets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	setPrintable	Sets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	setSelected	Selects or deselects an item. (Inherited from DiagramItem.)
	setSetsDirtyFlag	Sets a value indicating whether the diagram's Dirty flag should be set when selection changes.
	setShadowBrush	Sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setStyle	Sets the style associated with the item. (Inherited from DiagramItem.)
	setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event. (Inherited from DiagramItem.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	setTextPadding	Sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	setVisible	Sets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	setWeight	Sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	setZIndex	Sets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	size	Returns the number of selected items.
	toggle	Toggles the selection state of the specified item.
	writeExternal	Implements Externalizable.
	zBottom	Moves an item to the bottom of the Z order. (Inherited from DiagramItem.)
	zLevelDown	Moves an item down in the Z order. (Inherited from DiagramItem.)

	zLevelUp	Moves an item up in the Z order. (Inherited from DiagramItem.)
	zTop	Moves an item to the top of the Z order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	allowCreate	
	allowModify	
	cancelModify	
	completeCreate	
	completeModify	
	createProperties	Creates an item property set corresponding to the type of this diagram item. This method is invoked by the undo/redo subsystem when creating a ChangeItemCmd instance. (Inherited from DiagramItem.)
	createState	Creates an item state corresponding to the type of this diagram item. (Inherited from DiagramItem.)
	draw	
	drawShadow	
	getMeasureUnit	(Inherited from DiagramItem.)
	getRepaintRect	DiagramItem.getRepaintRect override.
	getValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	loadFromJson	Loads the item from a JSON object. (Inherited from DiagramItem.)
	loadFromXml	Loads the item content from an XML element. (Inherited from DiagramItem.)
	onAdd	Called when an item is added to a **Diagram**, either by the user, programmatically or by undo / redo. (Inherited from DiagramItem.)
	onChangeFont	(Inherited from DiagramItem.)
	onChangeTextPadding	(Inherited from DiagramItem.)
	onChildModified	Called when a group child node has been modified. Override this method if you need to know when a node from the **SubordinateGroup** is modified. (Inherited from DiagramItem.)
	onClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	onDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)

	onLoad	Called when this item is loaded from a file. (Inherited from DiagramItem.)
	onMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	onRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or by undo / redo. (Inherited from DiagramItem.)
	onStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	onStyleFontChanged	Invoked when font property values of an associated style change. (Inherited from DiagramItem.)
	putSelected	(Inherited from DiagramItem.)
	repaint	Overloaded. (Inherited from DiagramItem.)
	restoreProperties	Restores the properties of this diagram item. This method is invoked by the undo/redo subsystem when undoing or redoing a **ChangeItemCmd** instance. (Inherited from DiagramItem.)
	restoreState	Restores the state of this diagram item. (Inherited from DiagramItem.)
	saveProperties	Saves the properties of this diagram item. This method is invoked by the undo/redo subsystem when saving a **ChangeItemCmd** instance. (Inherited from DiagramItem.)
	saveState	Saves the state of this diagram item. (Inherited from DiagramItem.)
	saveToJson	Saves the item as a JSON object. (Inherited from DiagramItem.)
	saveToXml	Saves the item content into an XML element. (Inherited from DiagramItem.)
	setDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	shouldRender	Determines whether the item is rendered in the current context. (Inherited from DiagramItem.)
	startCreate	
	startModify	DiagramItem.startModify override.
	updateCreate	
	updateModify

Selection Class
com.mindfusion.diagramming Namespace

Selection Constructor

Initializes a new Selection instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Selection ()
```

See Also

Selection Class
com.mindfusion.diagramming Namespace

Selection Methods

Selection.addItem Method

Adds the specified item to the selection.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addItem (
    DiagramItem item
)
```

Parameters

item
An DiagramItem that should be added to the multiple selection.

See Also

Selection Members

Selection.cancelModify Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void cancelModify (
    InteractionState ist
)
```

Parameters

ist

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.change Method

Changes the selection to the specified item. That means that the item gets selected and all other items are unselected.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void change (
    DiagramItem item
)
```

Parameters

item
The DiagramItem that should be selected.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.clear Method

Removes all items from the selection.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void clear ()
```

See Also

Selection Members

Selection.containsPoint Method

Overload List

Name	Description
Selection.containsPoint (Point2D)	DiagramItem.containsPoint override.
Selection.containsPoint (Point2D, float)	DiagramItem.containsPoint override.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.containsPoint Method (Point2D)

DiagramItem.containsPoint override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean containsPoint (
    Point2D point
)
```

Parameters

point
The point to check.

Return Value

true it any selected item contains the specified point; otherwise, **false**.

See Also

containsPoint Method Overload List
Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.containsPoint Method (Point2D, float)

DiagramItem.containsPoint override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean containsPoint (
    Point2D point,
    float threshold
)
```

Parameters

point
A **Point2D** value specifying the logical coordinates of a diagram point.

threshold
Specifies the size of the area around the item outlines where the point is still considered inside the item.

Return Value

true it any selected item contains the specified point; otherwise, **false**.

See Also

containsPoint Method Overload List
Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.draw Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void draw (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g

options

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.drawShadow Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void drawShadow (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g

options

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.getAllowMultipleSelection Method

Gets a value indicating whether users are allowed to select multiple items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowMultipleSelection ()
```

Return Value

true if users are allowed to selectmultiple items, otherwise false.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.getBounds Method

Gets the smallest rectangle that bounds all selected items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D.Float getBounds ()
```

Return Value

A **Rectangle2D.Float** object representingthe rectangle that bounds all selected items.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.getHandlesStyle Method

Gets a value indicating how multiple selection is drawn on the screen.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SelectionStyle getHandlesStyle ()
```

Return Value

A member of the SelectionStyle enumeration.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.getIncludeItemsIfIntersect Method

Gets a value indicating which items are selected when drawing a selection rectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getIncludeItemsIfIntersect ()
```

Return Value

true to select items which intersect the selection rectangle, or **false** to select only items that are entirely within the rectangle.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.getItems Method

Gets a list of all selected items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItemList getItems ()
```

Return Value

An DiagramItemList containing the selected items.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.getLinks Method

Gets a list of all selected links.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkList getLinks ()
```

Return Value

A DiagramLinkList containing the selected links.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.getNodes Method

Gets a list of all selected boxes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramNodeList getNodes ()
```

Return Value

A DiagramNodeList containing the selected boxes.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.getOffsetUnconnectedLinks Method

Specifies whether to translate all points of selected unconnected links when moving multiple selection.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getOffsetUnconnectedLinks ()
```

Return Value

true to offset all control points of unconnected links, or **false** otherwise.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.getRepaintRect Method

DiagramItem.getRepaintRect override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Rectangle2D getRepaintRect (
    boolean connected
)
```

Parameters

connected

Return Value

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.getSetsDirtyFlag Method

Gets a value indicating whether the diagram's Dirty flag should be set when selection changes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getSetsDirtyFlag ()
```

Return Value

true if the Dirty flag is set when selection changes, otherwise, **false**.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.hitTestHandle Method

DiagramItem.hitTestHandle override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AdjustmentHandle hitTestHandle (
    Point2D point
)
```

Parameters

point
A **Point2D** instance specifying the location where to look for adjustment handles.

Return Value

Returns an AdjustmentHandle instance representing the adjustment handle found at the specified location, or **null** if there is none.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.itemInSelection Method

Determines whether the specified item is selected.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean itemInSelection (
    DiagramItem item
)
```

Parameters

item
The DiagramItem whose selection state to check.

Return Value

true if the item is selected,otherwise false.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.readExternal Method

Implements Externalizable.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.removeItem Method

Removes the specified item from the selection.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean removeItem (
    DiagramItem item
)
```

Parameters

item
The DiagramItem that should be deselected.

Return Value

false if the specified item was not selected,otherwise true.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.setAllowMultipleSelection Method

Sets a value indicating whether users are allowed to select multiple items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowMultipleSelection (
    boolean value
)
```

Parameters

value
true if users are allowed to selectmultiple items, otherwise false.

See Also

Selection Members
Selection Class

Selection.setHandlesStyle Method

Sets a value indicating how multiple selection should be drawn on the screen.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHandlesStyle (
    SelectionStyle value
)
```

Parameters

value
A member of the SelectionStyle enumeration.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.setIncludeItemsIfIntersect Method

Sets a value indicating which items are selected when drawing a selection rectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIncludeItemsIfIntersect (
    boolean value
)
```

Parameters

value
true to select items which intersect the selection rectangle, or **false** to select only items that are entirely within the rectangle.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.setOffsetUnconnectedLinks Method

Specifies whether to translate all points of selected unconnected links when moving multiple selection.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setOffsetUnconnectedLinks (
    boolean value
)
```

Parameters

value
true to offset all control points of unconnected links, or **false** otherwise.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.setSetsDirtyFlag Method

Sets a value indicating whether the diagram's Dirty flag should be set when selection changes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSetsDirtyFlag (
    boolean value
)
```

Parameters

value
true to set the Dirty flag when selection changes, otherwise, **false**.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.size Method

Returns the number of selected items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int size ()
```

Return Value

An integer value specifying the number of selected items.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.startCreate Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void startCreate (
    Point2D org
)
```

Parameters

org

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.startModify Method

DiagramItem.startModify override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void startModify (
    Point2D org,
    AdjustmentHandle handle,
    InteractionState ist
)
```

Parameters

org

handle

ist

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.toggle Method

Toggles the selection state of the specified item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void toggle (
    DiagramItem item
)
```

Parameters

item
An DiagramItem whose selection state should be toggled.

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.updateCreate Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void updateCreate (
    Point2D current
)
```

Parameters

current

See Also

Selection Members
Selection Class
com.mindfusion.diagramming Namespace

Selection.updateModify Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```

SelectionCopy Class

Used internally in the implementation of copy/paste functions.

Syntax

Java
`public class SelectionCopy`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.SelectionCopy

See Also

SelectionCopy Members
com.mindfusion.diagramming Namespace

SelectionCopy Members

Used internally in the implementation of copy/paste functions.

The following tables list the members exposed by the SelectionCopy type.

Public Constructors

	Name	Description
	SelectionCopy	Initializes a new instance of the **SelectionCopy** class. This constructor supports the JDiagram infrastructure and is not intended to be used directly from your code.

Public Methods

	Name	Description
	getGroups	Gets the underlying collection of groups.
	getItems	Gets the underlying collection of items.
	getOriginalItems	Gets a collection of the original items.

See Also

SelectionCopy Class
com.mindfusion.diagramming Namespace

SelectionCopy Constructor

Initializes a new instance of the SelectionCopy class. This constructor supports the JDiagram infrastructure and is not intended to be used directly from your code.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public SelectionCopy (
    DiagramItemList items,
    DiagramItemList originalItems,
    GroupList groups
)
```

Parameters

items
A collection containing the item copies.

originalItems
A collection containing the original items.

groups
A collection containing the group copies.

See Also

SelectionCopy Class
com.mindfusion.diagramming Namespace

SelectionCopy Methods

SelectionCopy.getGroups Method

Gets the underlying collection of groups.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public GroupList getGroups ()
```

Return Value

A GroupList containing the related Group objects.

See Also

SelectionCopy Members
SelectionCopy Class
com.mindfusion.diagramming Namespace

SelectionCopy.getItems Method

Gets the underlying collection of items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramItemList getItems ()
```

Return Value

A DiagramItemList containing the cloned items.

See Also

SelectionCopy Members
SelectionCopy Class
com.mindfusion.diagramming Namespace

SelectionCopy.getOriginalItems Method

Gets a collection of the original items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramItemList getOriginalItems ()
```

Return Value

A DiagramItemList containing the original items.

SelectionEvent Constructor

Overload List

Name	Description
SelectionEvent (Object, Point2D, AdjustmentHandle)	Initializes a new instance of the SelectionEvent class.
SelectionEvent (Object, Rectangle2D)	Initializes a new instance of the **SelectionEvent** class with specified bounds.

See Also

SelectionEvent Class
com.mindfusion.diagramming Namespace

SelectionEvent Constructor (Object, Point2D, AdjustmentHandle)

Initializes a new instance of the SelectionEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SelectionEvent (
    Object source,
    Point2D mousePosition,
    AdjustmentHandle adjustmentHandle
)
```

Parameters

source
The source of the event.

mousePosition
The position of the mouse cursor, in document coordinates.

adjustmentHandle
The adjustment handle being moved by the user.

See Also

SelectionEvent Constructor Overload List
SelectionEvent Class
com.mindfusion.diagramming Namespace

SelectionEvent Constructor (Object, Rectangle2D)

Initializes a new instance of the SelectionEvent class with specified bounds.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SelectionEvent (
    Object source,
    Rectangle2D bounds
)
```

Parameters

source
The source of the event.

bounds
A Rectangle2D specifying lasso coordinates.

See Also

SelectionStyle Enumeration

The members of this enumeration specify what a multiple selection of items should look like. They can be used as parameters of the setHandlesStyle method of the Selection class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum SelectionStyle
```

Members

	Member name	Description
	Rectangle	Draw a rectangular selection frame that bounds all selected items.
	SelectionHandles	All items in the multiple selection are drawn with selection handles around them.
	SemiTransparent	Draw a semi-transparent rectangle that bounds all selected items.

SelectionValidationEvent Members

Contains information passed to the selection validation events defined in DiagramListener.

The following tables list the members exposed by the SelectionValidationEvent type.

Public Constructors

	Name	Description
	SelectionValidationEvent	Initializes a new **SelectionValidationEvent** instance.

Public Methods

	Name	Description

	cancelDrag	Immediately cancels the item's creation or modification. This differs from calling setValid(false), which would only change the cursor to indicate to users that they cannot complete the modification at the current mouse position.
	getAdjustmentHandle	Gets the adjustment handle being moved by the user. (Inherited from SelectionEvent.)
	getBounds	Gets the rectangular bounds of the drawn lasso. (Inherited from SelectionEvent.)
	getCancel	Gets a value indicating whether to prevent the user from completing the operation.
	getPointerPosition	Gets the current mouse pointer position. (Inherited from SelectionEvent.)
	getSelection	(Inherited from SelectionEvent.)
	setCancel	Sets a value indicating whether to prevent the user from completing the operation

SelectOnlyBehavior.setMouseCursor Method

BehaviorBase.setMouseCursor override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected CursorHint setMouseCursor (
    Point2D point,
    ByRef<Boolean> startInteraction
)
```

Parameters

point
A Point2D instance that specifies the position of the mouse cursor.

startInteraction
true if the user is going to create, delete, modify or select a DiagramItem; **false** if mouse behavior is not considered; in this case the mouse pointer is set to a default cursor according to the background LaneGrid.

Return Value

A member of the CursorHint enumeration.

SerializeTagEvent Constructor

Initializes a new instance of the ItemTagEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SerializeTagEvent (
    Object source,
    Object item,
    Object tag,
    String propertyName,
    Element tagElement,
    XmlPersistContext context
)
```

Parameters

source
The sender of this event.

item
The object whose tag should be serialized.

tag
The tag value.

propertyName

tagElement
The XML element where the tag should be saved or loaded.

context
An XmlPersistContext object providing more information about the serialization process.

ShadowsStyle Enumeration

The members of this enumeration specify how JDiagram should draw the shadows of items. They can be used as parameters of the setShadowsStyle method of the Diagram class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum ShadowsStyle`

Members

	Member name	Description
	None	Do not draw shadows.
	OneLevel	Draw all shadows at one level at the bottom of the Z order.
	ZOrder	Draw each shadow right below its item pertaining to the Z order.

Shape Class

A **Shape** object describes a shape consisting of a series of straight lines, arcs and Bezier curves. The main component of a shape definition is its outline, which describes the shape region that will be filled in color, and used for hit-testing and aligning links to the shape. A shape can also contain decorations - lines, arcs or Bezier curves that are drawn with the shape but do not influence the fill or hit testing.

A shape is used by applying it to a ShapeNode instance by calling the setShape method.

Syntax

Java
`public class Shape`

Remarks

Shape Definitions

The **Shape** class provides the means for defining complex node shapes. You can design any shape composed of lines, arcs and Bézier-curves. A shape template must always contain an outline to be used for hit testing, clipping and finding intersections with other items.

Predefined Shapes

JDiagram provides a set of about 100 predefined shape templates accessible by the static Shapes collection and the fromId method of Shape. A shape template can be applied to a node through the setShape method.

Custom Shapes

There are several Shape constructor overrides you might choose from, depending on the complexity of the shapes you want to create. They take arrays of ElementTemplate objects as arguments, which define the outline, decorations and text region definitions. Templates are described with coordinates expressed as percents of a shape node's area. It is also possible to associate an image with a shape definition by setImage and to define the area in which the image is displayed by setImageRectangle.

Shape Libraries

The ShapeDesigner tool included in the JDiagram suite lets you draw custom shapes and store them in shape libraries. A library file can be loaded into your application using the ShapeLibrary class. The definitions loaded from a shape library are automatically added to the Shapes collection and can be accessed through the FromId method, just as the predefined shapes.

Link Arrowheads

A **Shape** instance can be set as a link's arrowhead through the setHeadShape, setBaseShape or setIntermediateShape methods of DiagramLink. When used for arrowheads, position (50, 0) in the shape definition corresponds to the arrowhead's tip point. The link segment adjacent to an arrowhead connects to the point calculated from LinkSegmentInset. Several predefined arrowhead shapes are provided as static properties of the ArrowHeads class.

Shape Members

A Shape object describes a shape consisting of a series of straight lines, arcs and Bezier curves. The main component of a shape definition is its outline, which describes the shape region that will be filled in color, and used for hit-testing and aligning links to the shape. A shape can also contain decorations - lines, arcs or Bezier curves that are drawn with the shape but do not influence the fill or hit testing.

A shape is used by applying it to a ShapeNode instance by calling the setShape method.

The following tables list the members exposed by the **Shape** type.

Public Constructors

	Name	Description
	Shape	Overloaded.

Public Methods

	Name	Description
	draw	Draws this shape on the specified **Graphics2D** surface.
S	fromId	Returns the shape that has the specified identifier.
S	fromXmlElement	Creates a **Shape** from xml shape element

S	fromXmlElements	
	getAnchorPattern	Gets the anchor pattern to use for nodes using this shape, if their anchor pattern is set to **null**.
	getDecorations	Gets a list of all decorations of this shape.
	getDisplayName	
	getHitPath	
	getId	Returns the shape identifier.
	getImage	Gets an image that is displayed by default in all instances of this shape.
	getImageLocation	Get the image location. Will be null if the image was set with setImage, which does not provide location, or if there is no image.
	getImageRectangle	Gets the location of the shape image relatively to the bounding rectangles of boxes of this shape.
	getIsArrowhead	Gets a value indicating if this shape is used as arrowhead.
	getLinkSegmentInset	Gets what length of link's line segment is drawn inside the arrowhead shape, expressed as percents of arrowhead size.
	getOutline	Gets the outline of this shape.
	getRenderPath	
S	getShapes	Returns a list of all shapes definitions.
	getTextArea	Gets the outline of the text area of this shape.
	initData	
	isEllipse	Gets a value indicating whether this shape is elliptic.
	setAnchorPattern	Sets the anchor pattern to use for nodes using this shape, if their anchor pattern is set to **null**.
	setDisplayName	
	setId	
	setImage	Sets an image that should be displayed by default in all instances of this shape.
	setImageLocation	Accepted are absolute URLs, and relative paths with both back and forward slashes.
	setImageRectangle	Sets the location of the shape image relatively to the bounding rectangles of boxes of this shape.
	setLinkSegmentInset	Sets what length of link's line segment is drawn inside the arrowhead shape, expressed as percents of arrowhead size.
	setTextArea	Sets the outline of the text area of this shape.
	toDOM	
S	toDOM

Shape Constructor (ElementTemplate[], ElementTemplate[], ElementTemplate[], int, String)

Initializes a new Shape instance by setting its outline, decorations, text area, fill rule and shape identifier.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Shape (
    ElementTemplate[] outline,
    ElementTemplate[] decorations,
    ElementTemplate[] textArea,
    int windingRule,
    String id
)
```

Parameters

outline

An array of ElementTemplate objects representing the shape outline, which specifies what region of a node is filled, used for hit-testing and for aligning link end point to the node.

decorations
An array of **ElementTemplate** objects representing the shape decoration lines.

textArea
An array of **ElementTemplate** objects representing the region of the shape where box' text is laid out.

windingRule
GeneralPath.WIND_EVEN_ODD or GeneralPath.WIND_NON_ZERO.

id
An unique String identifier of this shape.

Shape Constructor (short[], String)

Initializes a new instance of the Shape class with the specified outline and id. The specified array should contain even number of values. Each odd value represents the x-coordinate and each even value represents the y-coordinate of the corresponding point in the shape outline.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Shape (
    short[] outline,
    String id
)
```

Parameters

outline
An array containing even number of coordinate values, which define the points of the shape outline.

id
The string identifier of the new shape.

Shape Methods

Shape.draw Method

Draws this shape on the specified **Graphics2D** surface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void draw (
    Graphics2D drawingContext,
    Brush brush,
    Pen pen,
    boolean shadow
)
```

Parameters

graphics
The Graphics2D surface on which to draw the shape.

brush
A Brush used to fill the shape.

pen
A Pen used to draw the shape outline.

shadow
When shadow is true the brush and pen parameters have higher priority over shape's brush and pen.

Syntax

Java

```
public AnchorPattern getAnchorPattern ()
```

Return Value

An AnchorPattern instance.

Remarks

If the AnchorPattern of a ShapeNode is set, it overrides the one associated with the Shape definition.

Shape Class
com.mindfusion.diagramming Namespace

Shape.getDecorations Method

Gets a list of all decorations of this shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ElementTemplate[] getDecorations ()
```

Return Value

An array of ElementTemplate objects specifying the decorations of this shape.

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.getDisplayName Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getDisplayName ()
```

Return Value

The name displayed for this shape in user interface.

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.getHitPath Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public GeneralPath getHitPath (
    Rectangle2D rect,
    boolean flipX,
    boolean flipY,
    double rotationAngle
)
```

Parameters

rect

flipX

flipY

rotationAngle

Return Value

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.getId Method

Returns the shape identifier.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getId ()
```

Return Value

A String object containing the shape identifier.

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.getImage Method

Gets an image that is displayed by default in all instances of this shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Image getImage ()
```

Return Value

An instance of the **java.awt.Image** class that should be displayed inside nodes with this shape.

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.getImageLocation Method

Get the image location. Will be null if the image was set with setImage, which does not provide location, or if there is no image.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public String getImageLocation ()`

Return Value

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.getImageRectangle Method

Gets the location of the shape image relatively to the bounding rectangles of boxes of this shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public Rectangle2D.Float getImageRectangle ()`

Return Value

A **Rectangle2D** object specifying the image coordinates as percents of the box bounds.

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.getIsArrowhead Method

Gets a value indicating if this shape is used as arrowhead.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public boolean getIsArrowhead ()`

Return Value

true if this shape is used as arrowhead, otherwise **false**.

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.getLinkSegmentInset Method

Gets what length of link's line segment is drawn inside the arrowhead shape, expressed as percents of arrowhead size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getLinkSegmentInset ()
```

Return Value

A **float** value specifying percentage of arrowhead size.

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.getOutline Method

Gets the outline of this shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ElementTemplate[] getOutline ()
```

Return Value

An array of ElementTemplate objects specifying the outline of the shape.

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.getRenderPath Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public GeneralPath getRenderPath (
    ShapeData data,
    boolean flipX,
    boolean flipY,
    double rotationAngle
)
```

Parameters

data

flipX

flipY

rotationAngle

Return Value

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.getShapes Method

Returns a list of all shapes definitions.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static ShapeList getShapes ()
```

Return Value

A ShapeList that contains all shape definitions.

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.getTextArea Method

Gets the outline of the text area of this shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ElementTemplate[] getTextArea ()
```

Return Value

An array of ElementTemplate objects specifying the text area of this shape.

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.initData Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ShapeData initData (
    Rectangle2D rc,
    double rotation
)
```

Parameters

rc

rotation

Return Value

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.isEllipse Method

Gets a value indicating whether this shape is elliptic.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
```

Java

```
public boolean isEllipse ()
```

Return Value

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.setAnchorPattern Method

Sets the anchor pattern to use for nodes using this shape, if their anchor pattern is set to **null**.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAnchorPattern (
    AnchorPattern value
)
```

Parameters

value
An AnchorPattern instance.

Remarks

If the AnchorPattern of a ShapeNode is set, it overrides the one associated with the Shape definition.

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.setDisplayName Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDisplayName (
    String displayName
)
```

Parameters

displayName
The name that should be displayed for this shape in user interface, for example in the ShapeListBox.

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.setId Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setId (
    String value
)
```

Parameters

value

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.setImage Method

Sets an image that should be displayed by default in all instances of this shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImage (
    Image image
)
```

Parameters

image
An instance of the **java.awt.Image** class that should be displayed inside boxes with this shape.

See Also

Shape Members
Shape Class

Shape.setImageLocation Method

Accepted are absolute URLs, and relative paths with both back and forward slashes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImageLocation (
    String url
)
```

Parameters

url

Remarks

The ShapeEditor tool may produce absolute filesystem image paths when the images are on different drive than the shape library xml, and they will not work on java. Workaround: copy images to the same drive.

See Also

Shape Members
Shape Class
com.mindfusion.diagramming Namespace

Shape.setImageRectangle Method

Sets the location of the shape image relatively to the bounding rectangles of boxes of this shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImageRectangle (
    Rectangle2D.Float imageRectangle
)
```

Parameters

imageRectangle
A **Rectangle2D** object specifying the image coordinates as percents of the box bounds.

See Also

Shape Members
Shape Class

Shape.setLinkSegmentInset Method

Sets what length of link's line segment is drawn inside the arrowhead shape, expressed as percents of arrowhead size.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkSegmentInset (
    float value
)
```

Parameters

value
A **float** value specifying percentage of arrowhead size.

Remarks

The inset value matters when using transparent or semi-transparent arrowhead brush, or when the link's Pen is thicker than one pixel and its cap might extend beyond the arrowhead outline. **LinkSegmentInset** is set to appropriate values for all shapes from the ArrowHeads class. You might want to set it when using custom arrowhead shapes for which the link's end segment should not reach all the way to the arrowhead tip.

Shape.setTextArea Method

Sets the outline of the text area of this shape.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTextArea (
    ElementTemplate[] value
)
```

Parameters

value
An array of ElementTemplate objects specifying the text area of this shape.

ShapeDecoration Members

That class contained an array of shape template elements that define shape decorations. Can contain lines, arcs and Bezier curves. The shape is closed and filled.

The following tables list the members exposed by the ShapeDecoration type.

Public Constructors

	Name	Description
	ShapeDecoration	Initializes a new instance of the ShapeDecoration class with the specified outline, brush, pen and rule.

Public Methods

	Name	Description
	draw	
S	fromXmlElement	
	getBrush	Gets the brush used to fill the interior of this shape.
	getFillMode	Gets a value indicating how the area is filled.
	getPen	Gets the pen used to paint the frame of the shape.
	setBrush	Sets the brush used to fill the interior of this shape.
	setFillMode	Sets a value indicating how the area is filled.
	setPen	Sets the pen used to paint the frame of the shape.
S	toDOM

ShapeDecoration Constructor

Initializes a new instance of the ShapeDecoration class with the specified outline, brush, pen and rule.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ShapeDecoration (
    ElementTemplate[] elements,
    Brush brush,
    int fillMode,
    Pen pen
)
```

Parameters

elements
An array of shape template elements that define shape decoration.

brush
Used to fill the interior of the shape.

fillMode
Specifies how areas are filled.

pen
Used to paint the frame of the shape.

Java
`public ShapeFormulaParam ()`

See Also

ShapeFormulaParam Constructor Overload List
ShapeFormulaParam Class
com.mindfusion.diagramming Namespace

ShapeFormulaParam Constructor (float, float)

Initializes a new instance of the ShapeFormulaParam class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ShapeFormulaParam (
    float x,
    float y
)
```

Parameters

x
Horizontal position of the control point.

y
Vertical position of the control point.

See Also

ShapeFormulaParam Constructor Overload List
ShapeFormulaParam Class
com.mindfusion.diagramming Namespace

ShapeFormulaParam Methods

ShapeFormulaParam.clone Method

Creates a copy of this ShapeFormulaParam.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ShapeFormulaParam clone ()
```

Return Value

A new ShapeFormulaParam object that is a copy of the current instance.

See Also

ShapeFormulaParam Members
ShapeFormulaParam Class
com.mindfusion.diagramming Namespace

ShapeFormulaParam.getX Method

Gets the horizontal position of the control point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getX ()
```

Return Value

A **float** value specifying X coordinate.

See Also

ShapeFormulaParam Members
ShapeFormulaParam Class
com.mindfusion.diagramming Namespace

ShapeFormulaParam.getY Method

Gets the vertical position of the control point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getY ()
```

Return Value

A **float** value specifying Y coordinate.

See Also

ShapeFormulaParam.loadFromXml Method

Loads the formula parameter from the specified XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

An XmlElement instance.

context

An XmlPersistContext instance.

See Also

ShapeFormulaParam Members
ShapeFormulaParam Class
com.mindfusion.diagramming Namespace

ShapeFormulaParam.saveToXml Method

Saves the formula parameter into the specified XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

An Element instance.

context

An XmlPersistContext instance.

See Also

ShapeFormulaParam Members

ShapeFormulaParam.setX Method

Sets the horizontal position of the control point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setX (
    float value
)
```

Parameters

value
A **float** value specifying X coordinate.

See Also

ShapeFormulaParam Members
ShapeFormulaParam Class
com.mindfusion.diagramming Namespace

ShapeFormulaParam.setY Method

Sets the vertical position of the control point.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setY (
    float value
)
```

Parameters

value
A **float** value specifying Y coordinate.

See Also

ShapeFormulaParam Members
ShapeFormulaParam Class
com.mindfusion.diagramming Namespace

ShapeLibrary Class

The **ShapeLibrary** class represents a collection of shape definitions stored together.

Syntax

Java

```
public class ShapeLibrary
```

Remarks

Shape libraries can be created using the ShapeDesigner tool that comes with JDiagram. Use the loadFrom method to load a shape library from a file. The loaded shapes can be accessed through the getShapes method. They will be automatically added to the shared list of shapes kept in the Shape class, which lets you access them by the fromId method. A shape library can be saved into a file in XML based format using the saveTo method.

ShapeLibrary Members
com.mindfusion.diagramming Namespace

ShapeLibrary Members

The ShapeLibrary class represents a collection of shape definitions stored together.

The following tables list the members exposed by the **ShapeLibrary** type.

Public Constructors

	Name	Description
	ShapeLibrary	

Public Methods

	Name	Description
	fromXmlElement	Creates a **ShapeLibrary** from a DOM tree.
	getShapes	Gets the shapes contained in this library.
	loadFrom	Overloaded.
	makeImagesRelativeTo	Makes image locations relative to specified shapeLibraryPath so that the shape library can be moved/distributed. This method is supposed to be called before serialization.
	saveTo	Saves the shape library to the specified file.
	setShapes	Sets the shape library shapes.
	toDOM	Converts the ShapeLibrary to a DOM element.

ShapeLibrary Fields

ShapeLibrary Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ShapeLibrary (
    Shape[] shapes
)
```

Parameters

shapes

See Also

ShapeLibrary Class
com.mindfusion.diagramming Namespace

ShapeLibrary Methods

ShapeLibrary.fromXmlElement Method

Creates a ShapeLibrary from a DOM tree.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static ShapeLibrary fromXmlElement (
    Element shapes
)
```

Parameters

shapes
An XML element containing the shape library data.

Return Value

The new ShapeLibrary instance.

See Also

ShapeLibrary Members
ShapeLibrary Class
com.mindfusion.diagramming Namespace

ShapeLibrary.getShapes Method

Gets the shapes contained in this library.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public Shape[] getShapes ()`

Return Value

An array of Shape objects.

See Also

ShapeLibrary Members
ShapeLibrary Class
com.mindfusion.diagramming Namespace

ShapeLibrary.loadFrom Method

Overload List

Name	Description
ShapeLibrary.loadFrom (File)	Loads (creates) a ShapeLibrary object from the specified file.
ShapeLibrary.loadFrom (InputSource)	Loads (creates) a ShapeLibrary object from the specified XML source.

See Also

ShapeLibrary Members
ShapeLibrary Class
com.mindfusion.diagramming Namespace

ShapeLibrary.loadFrom Method (File)

Loads (creates) a ShapeLibrary object from the specified file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

`public static ShapeLibrary loadFrom (`
`  File file`
`)`

Parameters

file
A File object that contains the shape library data.

Return Value

The new ShapeLibrary instance.

See Also

loadFrom Method Overload List
ShapeLibrary Members
ShapeLibrary Class
com.mindfusion.diagramming Namespace

ShapeLibrary.loadFrom Method (InputSource)

Loads (creates) a ShapeLibrary object from the specified XML source.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static ShapeLibrary loadFrom (
    InputSource source
)
```

Parameters

source
An InputSource object that contains the shape library data.

Return Value

The new ShapeLibrary instance.

See Also

loadFrom Method Overload List
ShapeLibrary Members
ShapeLibrary Class
com.mindfusion.diagramming Namespace

ShapeLibrary.makeImagesRelativeTo Method

Makes image locations relative to specified shapeLibraryPath so that the shape library can be moved/distributed. This method is supposed to be called before serialization.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void makeImagesRelativeTo (
    String shapeLibraryPath
)
```

Parameters

shapeLibraryPath

See Also

ShapeLibrary Members
ShapeLibrary Class
com.mindfusion.diagramming Namespace

ShapeLibrary.saveTo Method

Saves the shape library to the specified file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveTo (
    String filename
)
```

Parameters

filename
The name of the file where the library should be saved.

See Also

ShapeLibrary Members
ShapeLibrary Class
com.mindfusion.diagramming Namespace

ShapeLibrary.setShapes Method

Sets the shape library shapes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShapes (
    Shape[] shapes
)
```

Parameters

shapes
An array of Shape objects.

See Also

ShapeLibrary Members
ShapeLibrary Class
com.mindfusion.diagramming Namespace

ShapeLibrary.toDOM Method

Converts the ShapeLibrary to a DOM element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element toDOM (
    Document owner
)
```

Parameters

owner
The XML document.

Return Value

An XML element containing the shape library data.

See Also

ShapeLibrary Members
ShapeLibrary Class
com.mindfusion.diagramming Namespace

ShapeList Class

A strongly-typed list of Shape objects.

Syntax

Java

```
public class ShapeList extends BaseList<E>
```

Inheritance Hierarchy

java.lang.Object
  java.util.AbstractCollection(E)
    java.util.AbstractList(E)
      com.mindfusion.diagramming.BaseList(E)
        com.mindfusion.diagramming.ShapeList

com.mindfusion.diagramming Namespace

ShapeList Members

A strongly-typed list of Shape objects.

The following tables list the members exposed by the ShapeList type.

Public Constructors

	Name	Description
	ShapeList	Overloaded.

Protected Fields

	Name	Description
	list	(Inherited from BaseList.)
	listEvent	(Inherited from BaseList.)
	notifyParent	(Inherited from BaseList.)

Public Methods

	Name	Description
	add	Adds a new element to the list. (Inherited from BaseList.)
	clear	Removes all elements from the list. (Inherited from BaseList.)
	contains	Determines if this list contains the specified element. (Inherited from BaseList.)
	first	Gets the first element of this list. (Inherited from BaseList.)
	get	Gets the element at the specified position in this list. (Inherited from BaseList.)
	last	Gets the last element of this list. (Inherited from BaseList.)
	readExternal	Loads the list's contents. (Inherited from BaseList.)
	remove	Overloaded. (Inherited from BaseList.)
	removeRange	Removes a range of elements from this list. (Inherited from BaseList.)
	set	Sets the element at the specified position in this list. (Inherited from BaseList.)
	size	
	writeExternal	Saves the list's contents. (Inherited from BaseList.)

Protected Methods

	Name	Description
	raiseAdding	Raises the adding event. (Inherited from BaseList.)
	raiseClearing	Raises the clearing event. (Inherited from BaseList.)
	raiseRemoving	Raises the removing event. (Inherited from BaseList.)

ShapeList Methods

ShapeList.size Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int size ()
```

Return Value

See Also

ShapeList Members
ShapeList Class
com.mindfusion.diagramming Namespace

ShapeListBox Class

The **ShapeListBox** control displays a set of shapes defined in the Shape class.

Syntax

Java

```
public class ShapeListBox extends JList<E>
```

Remarks

Shapes from the list box can be dragged to the Diagram drawing canvas to create new nodes. Changing the shape of an existing node can be implemented by handling the shapeSelected event and assigning the selected shape to a node by calling setShape.

Initially, the **ShapeListBox** displays all shapes accessible through fromId. You can limit the list to only a subset of the available shapes by calling the setShapeFilter method. It is also possible to load a shape library from a file using the ShapeLibrary class, and display the loaded shapes as shown below:

Java

```
ShapeLibrary lib = ShapeLibrary.loadFrom("shapeLib.shl");
shapeListBox.setShapes(lib.getShapes());
```

The control creates an icon image for each shape added. The size of an icon displayed in the list box can be defined by calling the setIconSize method, and setIconMargin specifies the horizontal and vertical margin of the icon.

If the setAllowRename method is called, users can press the F2 key and rename a shape in the list box. When a shape is renamed, the shapeRenamed event is raised. If setAllowRemove is called, list box items can be deleted by pressing the Del key. When a shape is removed, the shapeRemoved event is raised.

Inheritance Hierarchy

java.lang.Object
  java.awt.Component
    java.awt.Container
      javax.swing.JComponent
        javax.swing.JList(E)
          com.mindfusion.diagramming.ShapeListBox

ShapeListBox Members

The ShapeListBox control displays a set of shapes defined in the Shape class.

The following tables list the members exposed by the **ShapeListBox** type.

Public Constructors

	Name	Description
	ShapeListBox	Initializes a new instance of the **ShapeListBox** class.

Public Methods

	Name	Description
	addShape	Adds a single **Shape** to the list box.
	addShapeListener	Adds a listener for select, rename and delete events.
	addShapes	Overloaded.
	clearShapes	Removes all shapes from the **ShapeListBox**, leaving it empty.
	getAllowRemove	Gets a value indicating whether deletion of listbox items by pressing DEL is allowed. Only the list box items are deleted, but not the **Shape** definitions themselves.
	getAllowRename	Gets a value indicating whether inline renaming of listbox items is allowed. Currently the list box displays shape identifiers as names.
	getDefaultShapeSize	Gets the size of the shape that is created when dragging items from the list box to the diagram.
	getIconMargin	Gets the horizontal and vertical margins of the shape icons in the ListBox.
	getIconSize	Gets the size of the shape icons displayed in the ListBox.
	getShapeAt	Returns the **Shape** at the specified index.
	getShapeCount	Returns the number of shapes after filtering.
	getShapeFillColor	Gets the fill color of the shapes in the list box.
	getShapeFilter	Gets the identifiers of the shapes that should be displayed in the list box.
	getShapes	Retrieves all shapes visible in the list box after filtering.
	getShowLabels	Gets a value indicating whether to show text labels along with icons for each list item.
	invalidateShapeAt	Invalidates the specified shape, causing its icon to be recreated and redrawn. Call this method when a shape definition changes.
	removeShapeAt	Removes a shape from the list box.
	removeShapeListener	Removes previously added listener for select, rename and delete events.

	resumeRepaint	Resumes repainting the control after a suspendRepaint call.
	setAllowRemove	Sets a value specifying whether removing of listbox items is allowed.
	setAllowRename	Sets a value specifying whether inline renaming of listbox items is allowed. Items can be renamed by pressing F2. Currently the list box displays shape identifiers as names.
	setDefaultShapeSize	Sets the size of the shape that is created when dragging items from the list box to the flowchart.
	setIconMargin	Sets the horizontal and vertical margins of the shape icons in the **ListBox**.
	setIconSize	Sets the size of the shape icons displayed in the **ListBox**.
	setShapeAt	Sets the shape at the specified position.
	setShapeFillColor	Sets the fill color of the shapes in the list box.
	setShapeFilter	Sets the identifiers of the shapes that should be displayed in the list box.
	setShapes	Replaces all current shapes with the specified ones.
	setShowLabels	
	startInlineEdit	Initiates inline editing of shape id.
	suspendRepaint	Stops repainting the control. This is useful when using the JDiagram API from JavaScript, where the control would be repainted after each script line executes.

Protected Methods

	Name	Description
	fireShapeRemoved	
	fireShapeRenamed	
	fireShapeSelected	
	onKeyDown	
	paintComponent

ShapeListBox Methods

ShapeListBox.addShape Method

Adds a single Shape to the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void addShape (
    Shape shape
)
```

Parameters

shape
The Shape that should be added to the list.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.addShapeListener Method

Adds a listener for select, rename and delete events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void addShapeListener (
    ShapeListBoxListener l
)
```

Parameters

l
A ShapeListBoxListener object.

com.mindfusion.diagramming Namespace

ShapeListBox.addShapes Method (ShapeList)

Adds a list of Shape objects to the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void addShapes (
    ShapeList shapes
)
```

Parameters

shapes
A ShapeList containing the shapes that should be added to the list.

See Also

addShapes Method Overload List
ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.clearShapes Method

Removes all shapes from the ShapeListBox, leaving it empty.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void clearShapes ()
```

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.fireShapeRemoved Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

protected void fireShapeRemoved (
    Shape shape,
    int index
)
```

Parameters

shape

index

See Also

ShapeListBox Members

ShapeListBox.fireShapeSelected Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void fireShapeSelected (
    Shape shape,
    int index
)
```

Parameters

shape

index

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.getAllowRemove Method

Gets a value indicating whether deletion of listbox items by pressing DEL is allowed. Only the list box items are deleted, but not the Shape definitions themselves.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowRemove ()
```

Return Value

true if deletion is allowed, otherwise **false**.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.getAllowRename Method

Gets a value indicating whether inline renaming of listbox items is allowed. Currently the list box displays shape identifiers as names.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowRename ()
```

Return Value

true if renaming is allowed, otherwise **false**.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.getDefaultShapeSize Method

Gets the size of the shape that is created when dragging items from the list box to the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Point2D getDefaultShapeSize ()
```

Return Value

A Point2D object representing the default ShapeNode size.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.getIconMargin Method

Gets the horizontal and vertical margins of the shape icons in the ListBox.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension getIconMargin ()
```

Return Value

A Dimension object specifying the margins size.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.getIconSize Method

Gets the size of the shape icons displayed in the ListBox.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension getIconSize ()
```

Return Value

A Dimension object specifying the icon size.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.getShapeAt Method

Returns the Shape at the specified index.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Shape getShapeAt (
    int index
)
```

Parameters

index
The shape position in the list.

Return Value

The shape found at the specified position.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.getShapeCount Method

Returns the number of shapes after filtering.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getShapeCount ()
```

Return Value

The number of shapes displayed in the list box.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.getShapeFillColor Method

Gets the fill color of the shapes in the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Color getShapeFillColor ()
```

Return Value

A Color object representing the shapes color.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.getShapeFilter Method

Gets the identifiers of the shapes that should be displayed in the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String[] getShapeFilter ()
```

Return Value

An array of strings containing the shape identifiers.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.getShapes Method

Retrieves all shapes visible in the list box after filtering.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Shape[] getShapes ()
```

Return Value

An array of Shape objects.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.getShowLabels Method

Gets a value indicating whether to show text labels along with icons for each list item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getShowLabels ()
```

Return Value

true if labels are shown.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.invalidateShapeAt Method

Invalidates the specified shape, causing its icon to be recreated and redrawn. Call this method when a shape definition changes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void invalidateShapeAt (
    int i
)
```

Parameters

i

See Also

```
protected void paintComponent (
    Graphics g
)
```

Parameters

g

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.removeShapeAt Method

Removes a shape from the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeShapeAt (
    int i
)
```

Parameters

i
The shape position in the list.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.removeShapeListener Method

Removes previously added listener for select, rename and delete events.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeShapeListener (
    ShapeListBoxListener l
)
```

Parameters

l

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.resumeRepaint Method

Resumes repainting the control after a suspendRepaint call.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void resumeRepaint ()
```

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.setAllowRemove Method

Sets a value specifying whether removing of listbox items is allowed.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowRemove (
    boolean value
)
```

Parameters

value
true if deletion is allowed, otherwise **false**.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.setAllowRename Method

Sets a value specifying whether inline renaming of listbox items is allowed. Items can be renamed by pressing F2. Currently the list box displays shape identifiers as names.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowRename (
    boolean value
)
```

Parameters

value
true if renaming is allowed, otherwise **false**.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.setDefaultShapeSize Method

Sets the size of the shape that is created when dragging items from the list box to the flowchart.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDefaultShapeSize (
    Point2D.Float value
)
```

Parameters

value
A Point2D object representing the default ShapeNode size.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.setIconMargin Method

Sets the horizontal and vertical margins of the shape icons in the ListBox.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIconMargin (
    Dimension value
)
```

Parameters

value
A **Dimension** object specifying the margins size.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.setIconSize Method

Sets the size of the shape icons displayed in the ListBox.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIconSize (
    Dimension value
)
```

Parameters

value
A Dimension object specifying the icon size.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.setShapeAt Method

Sets the shape at the specified position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShapeAt (
    int index,
    Shape shape
)
```

Parameters

index
The shape position in the list.

shape
The Shape that should be added to the list.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.setShapeFillColor Method

Sets the fill color of the shapes in the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShapeFillColor (
    Color value
)
```

Parameters

value
A Color object representing the shapes color.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.setShapeFilter Method

Sets the identifiers of the shapes that should be displayed in the list box.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShapeFilter (
    String[] value
)
```

Parameters

value
An array of strings containing the shape identifiers.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.setShapes Method

Replaces all current shapes with the specified ones.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShapes (
    Shape[] shapes
)
```

Parameters

shapes
An array of Shape objects.

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.setShowLabels Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShowLabels (
    boolean value
)
```

Parameters

value

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.startInlineEdit Method

Initiates inline editing of shape id.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void startInlineEdit ()
```

See Also

ShapeListBox Members
ShapeListBox Class
com.mindfusion.diagramming Namespace

ShapeListBox.suspendRepaint Method

Stops repainting the control. This is useful when using the JDiagram API from JavaScript, where the control would be repainted after each script line executes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void suspendRepaint ()
```

See Also

ShapeListBox Members

ShapeListBoxListener Methods

ShapeListBoxListener.shapeRemoved Method

Raised when the user removes a Shape from the ListBox.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void shapeRemoved (
    Shape shape,
    int oldIndex
)
```

Parameters

shape

oldIndex

See Also

ShapeListBoxListener Members

ShapeListBoxListener.shapeRenamed Method

Raised when the user renames a Shape in the ListBox.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
void shapeRenamed (
    Shape shape,
    int index,
    String oldName
)
```

Parameters

shape
A Shape object.

index

oldName

ShapeListBoxListener Interface
com.mindfusion.diagramming Namespace

ShapeListBoxListener.shapeSelected Method

Called when the user selects a Shape in the ListBox.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
void shapeSelected (
    Shape shape,
    int index
)
```

Parameters

shape

index

ShapeNode Class

ShapeNode objects represent nodes in graphs, tree, process diagrams, and so on.

Syntax

Java
`public class ShapeNode extends DiagramNode implements RenderTextCallback, InplaceEditable`

Remarks

Use the setShape method to specify the shape of a node. There are many predefined shapes provided by the Shape class, which also lets you define your custom shapes.

ShapeNodes can be rotated, either interactively using the rotation handle above a node, or programmatically using the setRotationAngle method.

Nodes can display images and text. Use the setImage method to specify an image that should be painted inside a node. The position and alignment of an image within the node are set by the setImageAlign method. To make a node as big as its image, call resizeToFitImage.

To set the node's text, call setText. The text attributes can be changed through the setTextColor and setTextFormat methods. To get even richer text formatting, call setEnableStyledText to true and embed HTML-like formatting tags in the raw text. To make a node big enough to display its text without clipping, call resizeToFitText.

Call setTransparent to make a shape node transparent, so that only its text and image will be drawn.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DiagramItem
    com.mindfusion.diagramming.DiagramNode
      com.mindfusion.diagramming.ShapeNode

ShapeNode Members

ShapeNode objects represent nodes in graphs, tree, process diagrams, and so on.

The following tables list the members exposed by the **ShapeNode** type.

Public Constructors

	Name	Description
	ShapeNode	Overloaded.

Protected Fields

	Name	Description
	allowIncomingLinks	(Inherited from DiagramNode.)
	allowOutgoingLinks	(Inherited from DiagramNode.)
	anchorPattern	(Inherited from DiagramNode.)
	AV_Cancel	(Inherited from DiagramNode.)

	AV_EndModIncoming	(Inherited from DiagramNode.)
	AV_EndModOutgoing	(Inherited from DiagramNode.)
	AV_StartModIncoming	(Inherited from DiagramNode.)
	AV_StartModOutgoing	(Inherited from DiagramNode.)
	AV_UpdateIncoming	(Inherited from DiagramNode.)
	AV_UpdateOutgoing	(Inherited from DiagramNode.)
	AV_UpdIntscIncoming	(Inherited from DiagramNode.)
	AV_UpdIntscOutgoing	(Inherited from DiagramNode.)
	AV_UpdPosIncoming	(Inherited from DiagramNode.)
	AV_UpdPosOutgoing	(Inherited from DiagramNode.)
	bounds	(Inherited from DiagramNode.)
	brush	(Inherited from DiagramItem.)
	cycleDetected	(Inherited from DiagramItem.)
	cycleProtect	(Inherited from DiagramItem.)
	enabledHandles	(Inherited from DiagramNode.)
	handlesStyle	(Inherited from DiagramNode.)
	incomingLinks	(Inherited from DiagramNode.)
	masterGroup	(Inherited from DiagramNode.)
	modifyDX	(Inherited from DiagramItem.)
	modifyDY	(Inherited from DiagramItem.)
	modifyHandle	(Inherited from DiagramItem.)
	modifying	(Inherited from DiagramItem.)
	obstacle	(Inherited from DiagramNode.)
	outgoingLinks	(Inherited from DiagramNode.)
	pen	(Inherited from DiagramItem.)
	ptEnd	(Inherited from DiagramItem.)
	ptMdfLast	(Inherited from DiagramItem.)
	ptOrg	(Inherited from DiagramItem.)
	ptSavedEnd	(Inherited from DiagramItem.)
	ptSavedOrg	(Inherited from DiagramItem.)
	savedBounds	(Inherited from DiagramNode.)
	subordinateGroup	(Inherited from DiagramItem.)

Public Methods

	Name	Description
	addLabel	Overloaded. (Inherited from DiagramNode.)
	as	Down-casts the item to specified type. (Inherited from DiagramItem.)
	attachTo	Overloaded. (Inherited from DiagramNode.)
	clone	Creates a copy of this item. (Inherited from DiagramItem.)
	containsPoint	Overloaded.
	detach	Detaches a node from its master group. (Inherited from DiagramNode.)
	getAllIncomingLinks	Gets a collection of all links entering this node. (Inherited from DiagramNode.)
	getAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	getAllOutgoingLinks	Gets a collection of all links going out of this node. (Inherited from DiagramNode.)
	getAllowFlip	Gets a value indicating whether the node's shape flips when an edge is dragged over its opposite edge.
	getAllowIncomingLinks	Gets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	getAllowOutgoingLinks	Gets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	getAnchorPattern	Gets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	getBounds	Gets the node location and size. (Inherited from DiagramNode.)
	getBrush	Gets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	getCenter	Returns the center point of this node. (Inherited from DiagramNode.)
	getConstraints	Gets the movement and size constraints applied to a node. (Inherited from DiagramNode.)
	getContainer	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	getCustomDraw	Gets a value indicating what type of custom drawing to perform on a node.
	getEditRect	Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).
	getEffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the

		DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style. (Inherited from DiagramItem.)
	getEffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style. (Inherited from DiagramItem.)
	getEffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	getEffects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	getEnabledHandles	Gets a combination of NodeHandleType members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	getEnableStyledText	Gets a value indicating whether the text of a node contains formatting tags which should be processed by JDiagram.
	getExpandable	Gets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	getExpanded	Gets a value indicating whether the tree branch that starts from a node is expanded or collapsed. (Inherited from DiagramNode.)
	getFlipX	Gets a value indicating whether the node's shape is flipped horizontally.
	getFlipY	Gets a value indicating whether the node's shape is flipped vertically.
	getFont	Gets the font used to draw the text label of a node.
	getHandlesStyle	Gets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	getHyperLink	Gets the hyperlink associated with an item. (Inherited from DiagramItem.)
	getId	Gets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	getImage	Gets the image displayed inside this node.
	getImageAlign	Gets the alignment of the node's image.

	getImagePadding	Gets the padding distance between node's borders and **Image**.
	getImageUrl	Gets a URL used to load an image into this cell.
	getIncomingLinks	Gets the links coming into a node. (Inherited from DiagramNode.)
	getLabels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms. (Inherited from DiagramItem.)
	getLocalCenter	(Inherited from DiagramNode.)
	getLocked	Gets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	getMasterGroup	Gets the hierarchical group in which this node is a subordinate item. (Inherited from DiagramNode.)
	getMasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	getNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getObstacle	Gets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	getOpacity	Gets the opacity of this item. (Inherited from DiagramItem.)
	getOutgoingLinks	Gets the links going out from a node. (Inherited from DiagramNode.)
	getParent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	getPen	Gets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	getPlainText	Gets the plain text extracted from the formatted text by removing the formatting tags.
	getPrintable	Gets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	getRotatedBounds	Gets the bounding rectangle of this node, when it is rotated at the specified angle around the specified pivot. (Inherited from DiagramNode.)
	getRotateImage	Gets a value indicating whether the image displayed inside a node should rotate together with the node.
	getRotateText	Gets a value indicating whether the text displayed inside a node should rotate together with the node.

	getRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	getRuntimeIndex	For internal use. (Inherited from DiagramItem.)
	getSelected	Gets a value indicating whether this item is selected. (Inherited from DiagramItem.)
	getShadowBrush	Gets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShape	Gets the shape of a node.
	getShapeOrientation	Gets an orientation angle applied to the shape definition before the shape points are mapped to the node's bounding rectangle.
	getStyle	Gets the style associated with the item. (Inherited from DiagramItem.)
	getSubordinateGroup	Gets the group of subordinated items attached to this one. (Inherited from DiagramItem.)
	getTag	Gets user-defined data assigned to an item. (Inherited from DiagramItem.)
	getText	Gets the text displayed inside this node.
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	getTextFormat	Gets a TextFormat object specifying how to format and align the text of this node.
	getTextPadding	Gets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	getTextToEdit	Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when this node is edited in-place.
	getToolTip	Gets the tooltip text displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	getTransparent	Gets a value indicating whether only the text and image of a node should be drawn on the screen.
	getVisible	Gets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	getWeight	Gets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	getZIndex	Gets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	hasSubordinates	Checks whether there are any nodes attached to this item. (Inherited from DiagramItem.)

	hitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	hitTestHandle	DiagramItem.hitTestHandle override. (Inherited from DiagramNode.)
	init	Returns a ShapeNodeBuilder object used to configure this ShapeNode instance.
	labelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	moveTo	Moves a node to the specified location. (Inherited from DiagramNode.)
	nodesIntersect	Determines whether two nodes intersect. (Inherited from DiagramNode.)
	onDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	onDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	onDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	readExternal	Implements Externalizable.
	removeLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	renderText	
	resize	Sets the size of a node. (Inherited from DiagramNode.)
	resizeToFitImage	Resizes a node so that it will be as big as the image displayed in the node.
	resizeToFitText	Makes a node big enough to display its text without clipping.
	setAllowFlip	Sets a value indicating whether the node's shape flips when an edge is dragged over its opposite edge.
	setAllowIncomingLinks	Sets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	setAllowOutgoingLinks	Sets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	setAnchorPattern	Sets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	setBounds	Overloaded. (Inherited from DiagramNode.)
	setBoundsDirect	For internal use. (Inherited from DiagramNode.)

	setBrush	Sets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	setConstraints	Sets constraints to the node size and movement direction. The constraints are applied when a user modifies the node interactively. They are not checked when the position of a node is set programmatically. (Inherited from DiagramNode.)
	setCustomDraw	Sets a value indicating what type of custom drawing to perform on a node.
	setEditedText	Implements InplaceEditable.setEditedText. Assigns the edited text to this node after in-place edit operation completes successfully.
	setEnabledHandles	Sets a combination of **NodeHandleType** members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	setEnableStyledText	Sets a value indicating whether the text of a node contains formatting tags which should be processed by JDiagram.
	setExpandable	Sets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	setExpanded	Expands or collapses the tree branch that starts from a node. (Inherited from DiagramNode.)
	setExpandedFlag	Changes the "expanded" flag without actually expanding or collapsing the tree branch that starts from a node. (Inherited from DiagramNode.)
	setFlipX	Sets a value indicating whether the node's shape is flipped horizontally.
	setFlipY	Sets a value indicating whether the node's shape is flipped vertically.
	setFont	Sets the font used to draw the text label of a node.
	setHandlesStyle	Sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	setHyperLink	Sets the hyperlink associated with an item. (Inherited from DiagramItem.)
	setId	Assigns user-defined identifier to this item. (Inherited from DiagramItem.)
	setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	setImage	Sets the image that should be displayed inside the node.
	setImageAlign	Sets the alignment of the node's image.
	setImagePadding	Sets the padding distance between node's borders and **Image**.

	setImageUrl	Sets a URL used to load an image into this cell.
	setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	setLocked	Sets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	setObstacle	Sets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	setOpacity	Sets the opacity of this item. (Inherited from DiagramItem.)
	setPen	Sets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	setPrintable	Sets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	setRotateImage	Sets a value indicating whether the image displayed inside a node should rotate together with the node.
	setRotateText	Sets a value indicating whether the text displayed inside a node should rotate together with the node.
	setRotationAngle	Sets the rotation angle of a node. (Inherited from DiagramNode.)
	setSelected	Selects or deselects an item. (Inherited from DiagramItem.)
	setShadowBrush	Sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShape	Sets the shape of a node to the specified Shape instance. The initial shape of a node is the one set by the setDefaultShape method.
	setShapeOrientation	Sets an orientation angle applied to the shape definition before the shape points are mapped to the node's bounding rectangle.
	setStyle	Sets the style associated with the item. (Inherited from DiagramItem.)
	setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event. (Inherited from DiagramItem.)
	setText	Sets the text label displayed inside this node.
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)

	setTextFormat	Sets a **TextFormat** object specifying how to format and align the text of this node.
	setTextPadding	Sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	setTransparent	Sets a value indicating whether only the text and image of a node should be drawn on the screen.
	setVisible	Sets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	setWeight	Sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	setZIndex	Sets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
S	with	Returns a ShapeNodeBuilder object used to configure and create new ShapeNode instances.
	writeExternal	Implements Externalizable.
	zBottom	Moves an item to the bottom of the Z order. (Inherited from DiagramItem.)
	zLevelDown	Moves an item down in the Z order. (Inherited from DiagramItem.)
	zLevelUp	Moves an item up in the Z order. (Inherited from DiagramItem.)
	zTop	Moves an item to the top of the Z order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	allowCreate	DiagramItem.allowCreate override. (Inherited from DiagramNode.)
	allowModify	(Inherited from DiagramNode.)
	allowModifyImpl	(Inherited from DiagramNode.)
	cancelModify	
	completeCreate	DiagramItem.completeCreate override. (Inherited from DiagramNode.)
	completeModify	(Inherited from DiagramNode.)
	constraintsInfringed	(Inherited from DiagramNode.)
	createConnectionPoint	
	createProperties	DiagramItem.createProperties override.
	createState	

	draw	DiagramItem.draw override. (Inherited from DiagramNode.)
	drawLocal	DiagramNode.drawLocal override.
	drawShadow	DiagramItem.drawShadow override. (Inherited from DiagramNode.)
	drawShadowLocal	DiagramNode.drawShadowLocal override.
	getImageRect	
	getLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getLocalBoundsD	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getMeasureUnit	(Inherited from DiagramItem.)
	getRepaintRect	DiagramItem.getRepaintRect override.
	getValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	groupContains	(Inherited from DiagramNode.)
	loadFromJson	Loads the node from a JSON object.
	loadFromXml	
	move	(Inherited from DiagramNode.)
	onAdd	DiagramItem.onAdd override.
	onChangeFont	(Inherited from DiagramItem.)
	onChangeTextPadding	Called when the value of **TextPadding** changes.
	onChildModified	Called when a group child node has been modified. Override this method if you need to know when a node from the **SubordinateGroup** is modified. (Inherited from DiagramItem.)
	onClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	onDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	onLoad	DiagramItem.onLoad override.
	onMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	onModify	Called when an item is modified (Inherited from DiagramNode.)
	onRemove	Called when an item is removed from a Diagram, either by the user, programmatically or by undo / redo. (Inherited from DiagramNode.)
	onRotationAngleChanged	DiagramNode.onRotationAngleChanged override.
	onStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)

	onStyleFontChanged	DiagramItem.onStyleFontChanged override.
	onUpdateBounds	
	parentConstraintsInfringed	(Inherited from DiagramNode.)
	putExpandable	(Inherited from DiagramNode.)
	putSelected	(Inherited from DiagramItem.)
	rectFromPoints	(Inherited from DiagramNode.)
	repaint	Overloaded. (Inherited from DiagramItem.)
	resizeToFitImage	(Inherited from DiagramNode.)
	restoreProperties	DiagramItem.restoreProperties override.
	restoreState	
	saveProperties	DiagramItem.saveProperties override.
	saveState	
	saveToJson	Saves the node as a JSON object.
	saveToXml	
	scaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	setDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	setReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	shouldRender	Determines whether the item is rendered in the current context. (Inherited from DiagramItem.)
	shouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	startCreate	DiagramItem.startCreate override. (Inherited from DiagramNode.)
	startModify	DiagramItem.startModify override. Invoked when the user starts modifying this node interactively. (Inherited from DiagramNode.)
	updateCreate	DiagramItem.updateCreate override. (Inherited from DiagramNode.)
	updateLinkPositions	(Inherited from DiagramNode.)
	updateModify

ShapeNode Constructor (Diagram)

Initializes a new ShapeNode instance by setting its properties to the default values specified in the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ShapeNode (
    Diagram parent
)
```

Parameters

parent

A Diagram instance whose default node attributes are copied to this node.

See Also

ShapeNode.getAllowFlip Method

Gets a value indicating whether the node's shape flips when an edge is dragged over its opposite edge.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowFlip ()
```

Return Value

true to let users flip the shape, or **false** otherwise. The default value is **false**.

See Also

ShapeNode.getCustomDraw Method

Gets a value indicating what type of custom drawing to perform on a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CustomDraw getCustomDraw ()
```

Return Value

A member of the CustomDraw enumeration.

Remarks

This property allows invoking custom painting code for a shape node. That code must execute in response to the drawNode event. There are several modes of custom painting, allowing the custom code to paint the shape node entirely, or do that in addition to what JDiagram paints by default. The following CustomDraw members can be assigned to this property to specify the custom painting mode:

Member Name	Description
None	Do not perform custom drawing, let all painting be done by JDiagram.
Additional	The custom painting code executes after the node interior and frame are painted by JDiagram, but before text is rendered. In this mode, the **Graphics** instance passed to the custom drawing event handler has a clipping region applied to it.
Full	The component does not do any standard drawing, the entire painting of the node is done by the application.
ShadowOnly	Only the shadow of the node is painted by custom code, the node itself is drawn by the component.
Additional2	The custom painting code executes after all parts of the node are painted by JDiagram. In this mode, the **Graphics** instance passed to the custom drawing event handler doesn't have a clipping region applied to it.

ShapeNode.getEditRect Method

Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getEditRect (
    DiagramItem item,
    Point2D mousePosition
)
```

Parameters

item

A reference to this node.

mousePosition

A **Point2D** instance specifying the current pointer position.

Return Value

A **Rectangle2D** specifying where the edit box should be placed.

ShapeNode.getEnableStyledText Method

Gets a value indicating whether the text of a node contains formatting tags which should be processed by JDiagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getEnableStyledText ()
```

Return Value

true if JDiagram should process formatting tagswhen rendering the node label, otherwise **false**.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

ShapeNode.getFlipX Method

Gets a value indicating whether the node's shape is flipped horizontally.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getFlipX ()
```

Return Value

true if the shape is flipped horizontally, or **false** otherwise.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

ShapeNode.getFlipY Method

Gets a value indicating whether the node's shape is flipped vertically.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getFlipY ()
```

Return Value

true if the shape is flipped vertically, or **false** otherwise.

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

ShapeNode.getFont Method

Gets the font used to draw the text label of a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Font getFont ()
```

Return Value

A java.awt.Font object representing the label font.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

ShapeNode.getImage Method

Gets the image displayed inside this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Image getImage ()
```

Return Value

An instance of the **java.awt.Image** class.

Remarks

If a node should display multiple images, you could add and arrange them using NodeLabel objects.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

ShapeNode.getImageAlign Method

Gets the alignment of the node's image.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ImageAlign getImageAlign ()
```

Return Value

A member of the ImageAlign enumeration.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

ShapeNode.getImagePadding Method

Gets the padding distance between node's borders and Image.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Thickness getImagePadding ()
```

Return Value

A Thickness value specifying padding distance. The default value is **null**.

See Also

ShapeNode.getImageRect Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Rectangle2D getImageRect (
    boolean inLocal
)
```

Parameters

inLocal

Return Value

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

ShapeNode.getImageUrl Method

Gets a URL used to load an image into this cell.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public String getImageUrl ()
```

Return Value

a String containing the URL.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

ShapeNode.getPlainText Method

Gets the plain text extracted from the formatted text by removing the formatting tags.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public String getPlainText ()
```

Return Value

A String containing the label text stripped fromformatting tags.

ShapeNode.getRepaintRect Method

DiagramItem.getRepaintRect override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
protected Rectangle2D getRepaintRect (
    boolean includeConnected
)
```

Parameters

includeConnected

Return Value

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

ShapeNode.getRotateImage Method

Gets a value indicating whether the image displayed inside a node should rotate together with the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getRotateImage ()
```

Return Value

true if the node image rotates when the node is rotated, otherwise **false**.

com.mindfusion.diagramming Namespace

ShapeNode.getShape Method

Gets the shape of a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Shape getShape ()
```

Return Value

A Shape object representing the node's shape.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

ShapeNode.getShapeOrientation Method

Gets an orientation angle applied to the shape definition before the shape points are mapped to the node's bounding rectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getShapeOrientation ()
```

Return Value

A float value specifying the shape definition orientation.

ShapeNode.getText Method

Gets the text displayed inside this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getText ()
```

Return Value

A String containing the label text.

Remarks

This property defines node's main text content. You can add more text labels by calling the addLabel method, and customize their position and appearance via the various members of returned NodeLabel object.

ShapeNode.loadFromJson Method

Loads the node from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

com.mindfusion.diagramming Namespace

ShapeNode.resizeToFitText Method

Makes a node big enough to display its text without clipping.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean resizeToFitText (
    FitSize fit
```

```
)
```

Parameters

fit
A member of the FitSize enumeration specifying whether the width or height of the node should remain unchanged.

Return Value

true if the node is resized successfully; otherwise **false**.

ShapeNode.saveToJson Method

Saves the node as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

ShapeNode.setAllowFlip Method

Sets a value indicating whether the node's shape flips when an edge is dragged over its opposite edge.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowFlip (
    boolean value
)
```

Parameters

value
true to let users flip the shape, or **false** otherwise. The default value is **false**.

FlipY Property

ShapeNode.setCustomDraw Method

Sets a value indicating what type of custom drawing to perform on a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCustomDraw (
    CustomDraw value
)
```

Parameters

value
A member of the CustomDraw enumeration.

Remarks

This property allows invoking custom painting code for a shape node. That code must execute in response to the drawNode event. There are several modes of custom painting, allowing the custom code

to paint the shape node entirely, or do that in addition to what JDiagram paints by default. The following CustomDraw members can be assigned to this property to specify the custom painting mode:

Member Name	Description
None	Do not perform custom drawing, let all painting be done by JDiagram.
Additional	The custom painting code executes after the node interior and frame are painted by JDiagram, but before text is rendered. In this mode, the **Graphics** instance passed to the custom drawing event handler has a clipping region applied to it.
Full	The component does not do any standard drawing, the entire painting of the node is done by the application.
ShadowOnly	Only the shadow of the node is painted by custom code, the node itself is drawn by the component.
Additional2	The custom painting code executes after all parts of the node are painted by JDiagram. In this mode, the **Graphics** instance passed to the custom drawing event handler doesn't have a clipping region applied to it.

ShapeNode.setEditedText Method

Implements InplaceEditable.setEditedText. Assigns the edited text to this node after in-place edit operation completes successfully.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEditedText (
    String newText
)
```

Parameters

newText
The new text of this node.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

ShapeNode.setEnableStyledText Method

Sets a value indicating whether the text of a node contains formatting tags which should be processed by JDiagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableStyledText (
    boolean value
)
```

Parameters

value
true if JDiagram should process formatting tags when rendering the node label, otherwise **false**.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

ShapeNode.setFlipX Method

Sets a value indicating whether the node's shape is flipped horizontally.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFlipX (
    boolean value
)
```

Parameters

value
true if the shape is flipped horizontally, or **false** otherwise.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

FlipY Property
AllowFlip Property

ShapeNode.setFlipY Method

Sets a value indicating whether the node's shape is flipped vertically.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFlipY (
    boolean value
)
```

Parameters

value
true if the shape is flipped vertically, or **false** otherwise.

AllowFlip Property

ShapeNode.setFont Method

Sets the font used to draw the text label of a node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFont (
    Font value
)
```

Parameters

value
A **java.awt.Font** object representing the label font.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace

Text Property
TextBrush Property

ShapeNode.setImage Method

Sets the image that should be displayed inside the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImage (
    Image value
)
```

Parameters

value
An instance of the **java.awt.Image** class.

Remarks

If a node should display multiple images, you could add and arrange them using NodeLabel objects.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace
setImageAlign Method
setImagePadding Method

ShapeNode.setImageAlign Method

Sets the alignment of the node's image.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImageAlign (
    ImageAlign value
)
```

Parameters

value
A member of the ImageAlign enumeration.

Remarks

This property specifies how the Image is aligned to the bounding rectangle of this node. The image is aligned relatively to the rectangle specified in the ImageRectangle attribute of the Shape definition.

ShapeNode.setShape Method

Sets the shape of a node to the specified Shape instance. The initial shape of a node is the one set by the setDefaultShape method.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShape (
    Shape value
)
```

Parameters

value
A Shape object representing the node's shape.

See Also

ShapeNode Members
ShapeNode Class
com.mindfusion.diagramming Namespace
AllowFlip Property

ShapeNode.setShapeOrientation Method

Sets an orientation angle applied to the shape definition before the shape points are mapped to the node's bounding rectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setShapeOrientation (
    float value
)
```

Parameters

value
A float value specifying the shape definition orientation.

ShapeNode.setText Method

Sets the text label displayed inside this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setText (
    String value
)
```

Parameters

value
A String containing the label text.

Remarks

This property defines node's main text content. You can add more text labels by calling the addLabel method, and customize their position and appearance via the various members of returned NodeLabel object.

ShapeNodeList Members

A strongly-typed list of ShapeNode objects.

The following tables list the members exposed by the ShapeNodeList type.

Public Constructors

	Name	Description
	ShapeNodeList	

Protected Fields

	Name	Description
	list	(Inherited from BaseList.)
	listEvent	(Inherited from BaseList.)
	notifyParent	(Inherited from BaseList.)

Public Methods

	Name	Description
	add	Adds a new element to the list. (Inherited from BaseList.)
	clear	Removes all elements from the list. (Inherited from BaseList.)
	clone	
	contains	Determines if this list contains the specified element. (Inherited from BaseList.)
	first	Gets the first element of this list. (Inherited from BaseList.)

	get	Gets the element at the specified position in this list. (Inherited from BaseList.)
	last	Gets the last element of this list. (Inherited from BaseList.)
	readExternal	Loads the list's contents. (Inherited from BaseList.)
	remove	Overloaded. (Inherited from BaseList.)
	removeRange	Removes a range of elements from this list. (Inherited from BaseList.)
	set	Sets the element at the specified position in this list. (Inherited from BaseList.)
	size	Gets the number of elements in this list. (Inherited from BaseList.)
	writeExternal	Saves the list's contents. (Inherited from BaseList.)

Protected Methods

	Name	Description
	raiseAdding	Raises the adding event. (Inherited from BaseList.)
	raiseClearing	Raises the clearing event. (Inherited from BaseList.)
	raiseRemoving	Raises the removing event. (Inherited from BaseList.)

ShapeNodeStyle Members

Represents a reusable set of properties that define the appearance of shape nodes.

The following tables list the members exposed by the ShapeNodeStyle type.

Public Constructors

	Name	Description
	ShapeNodeStyle	Initializes a new instance of the **ShapeNodeStyle** class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from Style.)
	getBrush	Gets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	getEffects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	getFontFamily	Gets the font family of the item text. (Inherited from DiagramItemStyle.)
	getFontSize	Gets the font size of the item text. (Inherited from DiagramItemStyle.)
	getFontStyle	Gets the font style of the item text. (Inherited from DiagramItemStyle.)
	getFontUnit	Gets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	getShadowBrush	Gets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	getStroke	Gets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	getStrokeThickness	Gets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)

	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
	init	Returns a ShapeNodeStyleBuilder object used to configure this ShapeNodeStyle instance.
	readExternal	**Externalizable.readExternal** implementation. (Inherited from Style.)
S	registerType	Associates a type with an alias. The alias is used when saving and loading objects of the specified type during style serialization and deserialization. (Inherited from Style.)
	removePropertyChangeListener	(Inherited from Style.)
	setBrush	Sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	setFontFamily	Sets the font family of the item text. (Inherited from DiagramItemStyle.)
	setFontSize	Sets the font size of the item text. (Inherited from DiagramItemStyle.)
	setFontStyle	Sets the font style of the item text. (Inherited from DiagramItemStyle.)
	setFontUnit	Sets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	setShadowBrush	Sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	setStroke	Sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	setStrokeThickness	Sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
S	with	Returns a ShapeNodeStyleBuilder object used to configure and create new ShapeNodeStyle instances.
	writeExternal	**Externalizable.writeExternal** implementation. (Inherited from Style.)

Protected Methods

	Name	Description
	getValue	Gets the value of the specified property. (Inherited from Style.)
	isPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	loadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)

	loadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	registerProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	saveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	saveToXml	Saves the style content into an XML element. (Inherited from Style.)
	setValue	Sets the value of the specified property. (Inherited from Style.)
	unsetValue	Clears the value of the specified property. (Inherited from Style.)

ShowAnchors Enumeration

The members of this enumeration specify whether JDiagram should display marks at the anchor points positions. They can be assigned to the ShowAnchors property of Diagram class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum ShowAnchors`

Members

	Member name	Description
	Always	Always display anchor point marks.
	Auto	Automatically display anchor points when there is a node under the mouse.

	Never	Never display anchor point marks.
	Selected	Display anchor points marks for selected nodes.
	SelectedAndAuto	Display anchor points marks for selected and pointed nodes.

SnapToAnchor Enumeration

The members of this enumeration specify when a link should be aligned to a node's anchor point. They can be used as parameters of the setSnapToAnchor method of the Diagram class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public enum SnapToAnchor
```

Members

	Member name	Description
	OnCreate	Align to anchor points only when the link is created. Let the user move the link end to any point of the node later.
	OnCreateOrModify	Align to anchor points both when creating or modifying.

SpringLayout Class

Implements the Spring-Embedder graph layout algorithm.

Syntax

Java
`public class SpringLayout implements Layout`

Remarks

Spring-Embedder produces layouts having uniform distribution of nodes by simulating a physical system in which nodes repulse each other and the links between them act as confining springs. Nodes are moved around in an iterative process. The forces that act on a node are calculated, taking in account the positions of surrounding nodes and links from the previous iteration.

To apply this layout to a diagram, call the arrange method of a **SpringLayout** instance.

If the LayoutTraits value associated with a node through SpringLayoutTraits.Frozen is **true**, SpringLayout considers the repulsion forces exerted by the node on other nodes, but ignores forces acting on the node and keeps it in place.

The final appearance of arranged graphs depends mostly on the values of EnableClusters and NodeDistance properties that specify how nodes are distributed by the layout routine. Enabling the MinimizeCrossings property helps to decrease the number of link crossings, though that makes the algorithm run somewhat slower.

The layout routine runs as much iterations as set in IterationCount, calculating better node positions at each step. When that stage of the algorithm completes, if Anchoring is enabled, link ends are aligned to nodes' anchor points.

The Spring-Embedder layout algorithm produces best results if it can place link ends at arbitrary positions over nodes' outlines, that is, when using the Ignore value. If your application logic requires links to be always attached to anchor points, use the other two values. In such cases Reassign would yield better results.

SpringLayout Members

Implements the Spring-Embedder graph layout algorithm.

The following tables list the members exposed by the SpringLayout type.

Public Constructors

	Name	Description
	SpringLayout	Overloaded.

Public Methods

	Name	Description

	arrange	Arranges the specified diagram.
	getAnchoring	Gets a value indicating how links will be aligned to the anchor points of tree nodes.
	getEnableClusters	Gets a value indicating whether the layout algorithm should place nodes into distinct clusters.
	getIterations	Gets the number of iterations that the layout algorithm should run.
	getKeepGroupLayout	Gets a value specifying whether the relative position of nodes within groups should be kept intact.
	getMinimizeCrossings	Gets a value indicating whether the algorithm should try to minimize the number of link crossings.
	getNodeDistance	Gets how much space should be left between adjacent nodes.
	getRandomSeed	Gets the randomization seed used for generating random node positions.
	getRepulsionFactor	Gets a multiplier value applied to the repulsive force between nodes.
	init	Returns a SpringLayoutBuilder object used to configure this SpringLayout instance.
	setAnchoring	Sets a value indicating how links should be aligned to the anchor points of tree nodes.
	setEnableClusters	Sets a value indicating whether the layout algorithm should place nodes into distinct clusters.
	setIterations	Sets the number of iterations that the layout algorithm should run.
	setKeepGroupLayout	Sets a value specifying whether the relative position of nodes within groups should be kept intact.
	setMinimizeCrossings	Sets a value indicating whether the algorithm should try to minimize the number of link crossings.
	setNodeDistance	Sets how much space should be left between adjacent nodes.
	setRandomSeed	Sets the randomization seed that should be used for generating random node positions.
	setRepulsionFactor	Sets a multiplier value applied to the repulsive force between nodes.
	with	Returns a SpringLayoutBuilder object used to configure and create new SpringLayout instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SpringLayout (
    int iterationCount,
    float nodeDistance,
    boolean minimizeCrossings
)
```

Parameters

iterationCount
The number of iterations that the layout algorithm should run.

nodeDistance
The desired distance between nodes.

minimizeCrossings
true to minimize link crossings, otherwise **false**.

Syntax

Java

```
public SpringLayout (
    int iterationCount,
    float nodeDistance,
    boolean minimizeCrossings,
    boolean keepGroupLayout
)
```

Parameters

iterationCount
The number of iterations that the layout algorithm should run.

nodeDistance
The desired distance between nodes.

minimizeCrossings
true to minimize link crossings, otherwise **false**.

keepGroupLayout
true if the relative position of nodes within groups should be preserved, otherwise **false**.

SpringLayout.setAnchoring Method

Sets a value indicating how links should be aligned to the anchor points of tree nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAnchoring (
    Anchoring value
)
```

Parameters

value
A member of the Anchoring enumeration.

See Also

SpringLayout Members
SpringLayout Class
com.mindfusion.diagramming Namespace

SpringLayout.setEnableClusters Method

Sets a value indicating whether the layout algorithm should place nodes into distinct clusters.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableClusters (
    boolean value
)
```

Parameters

value
true if nodes should be placed in clusterswhen possible, otherwise false.

See Also

SpringLayout Members
SpringLayout Class

SpringLayout.setIterations Method

Sets the number of iterations that the layout algorithm should run.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIterations (
    int value
)
```

Parameters

value
An integer value specifying the number of iterations.

See Also

SpringLayout Members
SpringLayout Class
com.mindfusion.diagramming Namespace

SpringLayout.setKeepGroupLayout Method

Sets a value specifying whether the relative position of nodes within groups should be kept intact.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setKeepGroupLayout (
    boolean value
)
```

Parameters

value
true if the relative position of nodes within groups should be preserved, otherwise **false**.

See Also

SpringLayout Members
SpringLayout Class
com.mindfusion.diagramming Namespace

SpringLayout.setMinimizeCrossings Method

Sets a value indicating whether the algorithm should try to minimize the number of link crossings.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMinimizeCrossings (
    boolean value
)
```

Parameters

value
true if the layout routine should try to minimize the number of link crossings, otherwise **false**.

Parameters

property
The property to check.

Return Value

true if the property has a local value; otherwise, false.

Style.loadFromXml Method

Loads the style content from an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An **Element** containing the style's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

Style.readExternal Method

Externalizable.readExternal implementation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

Style.registerProperty Method

Registers a new property with the specified name and type.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Object registerProperty (
    String name
)
```

Parameters

name
The name of the property.

Return Value

An object that can be used to identify the property in subsequent calls to methods like setValue and getValue.

Style.registerType Method

Associates a type with an alias. The alias is used when saving and loading objects of the specified type during style serialization and deserialization.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static void registerType (
    Class<?> type,
    String alias
)
```

Parameters

type
The type to associate.

alias
The unique alias for the type.

Style.removePropertyChangeListener Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removePropertyChangeListener (
    PropertyChangeListener listener
)
```

Parameters

listener

Style.saveToXml Method

Saves the style content into an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
```

```
    XmlPersistContext context
)
```

Parameters

xmlElement
An **Element** the style's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

Style.setValue Method

Sets the value of the specified property.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void setValue (
    Object property,
    Object value
)
```

Parameters

property
The property to set.

value
The new property value.

Style.unsetValue Method

Clears the value of the specified property.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void unsetValue (
    Object property
)
```

Parameters

property
The property to clear.

SvgNode Class

Represents nodes that can render SVG drawings.

Syntax

Java

```
public class SvgNode
    extends ShapeNode
```

Remarks

The **SvgNode** class represents nodes that can display SVG drawings in addition to the rendering provided by the base ShapeNode class. The SVG drawing is rendered after the associated Image and just before the drawNode event is raised for Additional custom drawing.

The SVG drawing of a node is specified through its Content property. The SVG elements are loaded and associated with the node through an SvgContent object, which should be initialized and then assigned to this property.

The following code illustrates how to load an SVG graphics from a local file and associate it with an existing **SvgNode** (referenced by the svgNode variable):

Java

```
SvgContent content = new SvgContent();
content.parse("drawing.svg");
svgNode.setContent(content);
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DiagramItem
    com.mindfusion.diagramming.DiagramNode
      com.mindfusion.diagramming.ShapeNode
        com.mindfusion.diagramming.SvgNode

SvgNode Members

Represents nodes that can render SVG drawings.

The following tables list the members exposed by the SvgNode type.

Public Constructors

	Name	Description
	SvgNode	Overloaded.

Protected Fields

	Name	Description
	allowIncomingLinks	(Inherited from DiagramNode.)
	allowOutgoingLinks	(Inherited from DiagramNode.)
	anchorPattern	(Inherited from DiagramNode.)
	AV_Cancel	(Inherited from DiagramNode.)
	AV_EndModIncoming	(Inherited from DiagramNode.)
	AV_EndModOutgoing	(Inherited from DiagramNode.)
	AV_StartModIncoming	(Inherited from DiagramNode.)
	AV_StartModOutgoing	(Inherited from DiagramNode.)
	AV_UpdateIncoming	(Inherited from DiagramNode.)

	AV_UpdateOutgoing	(Inherited from DiagramNode.)
	AV_UpdIntscIncoming	(Inherited from DiagramNode.)
	AV_UpdIntscOutgoing	(Inherited from DiagramNode.)
	AV_UpdPosIncoming	(Inherited from DiagramNode.)
	AV_UpdPosOutgoing	(Inherited from DiagramNode.)
	bounds	(Inherited from DiagramNode.)
	brush	(Inherited from DiagramItem.)
	cycleDetected	(Inherited from DiagramItem.)
	cycleProtect	(Inherited from DiagramItem.)
	enabledHandles	(Inherited from DiagramNode.)
	handlesStyle	(Inherited from DiagramNode.)
	incomingLinks	(Inherited from DiagramNode.)
	masterGroup	(Inherited from DiagramNode.)
	modifyDX	(Inherited from DiagramItem.)
	modifyDY	(Inherited from DiagramItem.)
	modifyHandle	(Inherited from DiagramItem.)
	modifying	(Inherited from DiagramItem.)
	obstacle	(Inherited from DiagramNode.)
	outgoingLinks	(Inherited from DiagramNode.)
	pen	(Inherited from DiagramItem.)
	ptEnd	(Inherited from DiagramItem.)
	ptMdfLast	(Inherited from DiagramItem.)
	ptOrg	(Inherited from DiagramItem.)
	ptSavedEnd	(Inherited from DiagramItem.)
	ptSavedOrg	(Inherited from DiagramItem.)
	savedBounds	(Inherited from DiagramNode.)
	subordinateGroup	(Inherited from DiagramItem.)

Public Methods

	Name	Description
	addLabel	Overloaded. (Inherited from DiagramNode.)
	as	Down-casts the item to specified type. (Inherited from DiagramItem.)
	attachTo	Overloaded. (Inherited from DiagramNode.)

	clone	Creates a copy of this item. (Inherited from DiagramItem.)
	containsPoint	Overloaded. (Inherited from ShapeNode.)
	detach	Detaches a node from its master group. (Inherited from DiagramNode.)
	getAllIncomingLinks	Gets a collection of all links entering this node. (Inherited from DiagramNode.)
	getAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	getAllOutgoingLinks	Gets a collection of all links going out of this node. (Inherited from DiagramNode.)
	getAllowFlip	Gets a value indicating whether the node's shape flips when an edge is dragged over its opposite edge. (Inherited from ShapeNode.)
	getAllowIncomingLinks	Gets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	getAllowOutgoingLinks	Gets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	getAnchorPattern	Gets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	getBounds	Gets the node location and size. (Inherited from DiagramNode.)
	getBrush	Gets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	getCenter	Returns the center point of this node. (Inherited from DiagramNode.)
	getConstraints	Gets the movement and size constraints applied to a node. (Inherited from DiagramNode.)
	getContainer	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	getContent	Gets an SvgContent instance representing the SVG drawing rendered in this node.
	getContentAlign	Gets the alignment of the **SvgContent** displayed in this node.
	getCustomDraw	Gets a value indicating what type of custom drawing to perform on a node. (Inherited from ShapeNode.)
	getEditRect	Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates). (Inherited from ShapeNode.)
	getEffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and

		DiagramItemStyle.getFontStyle properties of the item's style. (Inherited from DiagramItem.)
	getEffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style. (Inherited from DiagramItem.)
	getEffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	getEffects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	getEnabledHandles	Gets a combination of NodeHandleType members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	getEnableStyledText	Gets a value indicating whether the text of a node contains formatting tags which should be processed by JDiagram. (Inherited from ShapeNode.)
	getExpandable	Gets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	getExpanded	Gets a value indicating whether the tree branch that starts from a node is expanded or collapsed. (Inherited from DiagramNode.)
	getFlipX	Gets a value indicating whether the node's shape is flipped horizontally. (Inherited from ShapeNode.)
	getFlipY	Gets a value indicating whether the node's shape is flipped vertically. (Inherited from ShapeNode.)
	getFont	Gets the font used to draw the text label of a node. (Inherited from ShapeNode.)
	getHandlesStyle	Gets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	getHyperLink	Gets the hyperlink associated with an item. (Inherited from DiagramItem.)
	getId	Gets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	getImage	Gets the image displayed inside this node. (Inherited from ShapeNode.)

	getImageAlign	Gets the alignment of the node's image. (Inherited from ShapeNode.)
	getImagePadding	Gets the padding distance between node's borders and **Image**. (Inherited from ShapeNode.)
	getImageUrl	Gets a URL used to load an image into this cell. (Inherited from ShapeNode.)
	getIncomingLinks	Gets the links coming into a node. (Inherited from DiagramNode.)
	getLabels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms. (Inherited from DiagramItem.)
	getLocalCenter	(Inherited from DiagramNode.)
	getLocked	Gets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	getMasterGroup	Gets the hierarchical group in which this node is a subordinate item. (Inherited from DiagramNode.)
	getMasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	getNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getObstacle	Gets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	getOpacity	Gets the opacity of this item. (Inherited from DiagramItem.)
	getOutgoingLinks	Gets the links going out from a node. (Inherited from DiagramNode.)
	getParent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	getPen	Gets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	getPlainText	Gets the plain text extracted from the formatted text by removing the formatting tags. (Inherited from ShapeNode.)
	getPrintable	Gets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	getRotatedBounds	Gets the bounding rectangle of this node, when it is rotated at the specified angle around the specified pivot. (Inherited from DiagramNode.)

	getRotateImage	Gets a value indicating whether the image displayed inside a node should rotate together with the node. (Inherited from ShapeNode.)
	getRotateText	Gets a value indicating whether the text displayed inside a node should rotate together with the node. (Inherited from ShapeNode.)
	getRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	getRuntimeIndex	For internal use. (Inherited from DiagramItem.)
	getSelected	Gets a value indicating whether this item is selected. (Inherited from DiagramItem.)
	getShadowBrush	Gets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShape	Gets the shape of a node. (Inherited from ShapeNode.)
	getShapeOrientation	Gets an orientation angle applied to the shape definition before the shape points are mapped to the node's bounding rectangle. (Inherited from ShapeNode.)
	getStyle	Gets the style associated with the item. (Inherited from DiagramItem.)
	getSubordinateGroup	Gets the group of subordinated items attached to this one. (Inherited from DiagramItem.)
	getSvgUrl	Gets a URL used to load an SVG file into this node.
	getTag	Gets user-defined data assigned to an item. (Inherited from DiagramItem.)
	getText	Gets the text displayed inside this node. (Inherited from ShapeNode.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	getTextFormat	Gets a TextFormat object specifying how to format and align the text of this node. (Inherited from ShapeNode.)
	getTextPadding	Gets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	getTextToEdit	Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when this node is edited in-place. (Inherited from ShapeNode.)
	getToolTip	Gets the tooltip text displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	getTransparent	Gets a value indicating whether only the text and image of a node should be drawn on the screen. (Inherited from ShapeNode.)

	getVisible	Gets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	getWeight	Gets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	getZIndex	Gets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	hasSubordinates	Checks whether there are any nodes attached to this item. (Inherited from DiagramItem.)
	hitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	hitTestHandle	DiagramItem.hitTestHandle override. (Inherited from DiagramNode.)
	init	Returns a ShapeNodeBuilder object used to configure this ShapeNode instance. (Inherited from ShapeNode.)
	initSvg	Returns an **SvgNodeBuilder** object used to configure this **SvgNode** instance.
	labelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	moveTo	Moves a node to the specified location. (Inherited from DiagramNode.)
S	nodesIntersect	Determines whether two nodes intersect. (Inherited from DiagramNode.)
	onDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	onDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	onDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	readExternal	Deserializes the object from the specified reader.
	removeLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	renderText	(Inherited from ShapeNode.)
	resize	Sets the size of a node. (Inherited from DiagramNode.)
	resizeToFitImage	Resizes a node so that it will be as big as the image displayed in the node. (Inherited from ShapeNode.)
	resizeToFitText	Makes a node big enough to display its text without clipping. (Inherited from ShapeNode.)
	setAllowFlip	Sets a value indicating whether the node's shape flips when an edge is dragged over its opposite edge. (Inherited from ShapeNode.)

	setAllowIncomingLinks	Sets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	setAllowOutgoingLinks	Sets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	setAnchorPattern	Sets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	setBounds	Overloaded. (Inherited from DiagramNode.)
	setBoundsDirect	For internal use. (Inherited from DiagramNode.)
	setBrush	Sets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	setConstraints	Sets constraints to the node size and movement direction. The constraints are applied when a user modifies the node interactively. They are not checked when the position of a node is set programmatically. (Inherited from DiagramNode.)
	setContent	Sets an **SvgContent** instance representing the SVG drawing rendered in this node.
	setContentAlign	Sets the alignment of the **SvgContent** displayed in this node.
	setCustomDraw	Sets a value indicating what type of custom drawing to perform on a node. (Inherited from ShapeNode.)
	setEditedText	Implements InplaceEditable.setEditedText. Assigns the edited text to this node after in-place edit operation completes successfully. (Inherited from ShapeNode.)
	setEnabledHandles	Sets a combination of **NodeHandleType** members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	setEnableStyledText	Sets a value indicating whether the text of a node contains formatting tags which should be processed by JDiagram. (Inherited from ShapeNode.)
	setExpandable	Sets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	setExpanded	Expands or collapses the tree branch that starts from a node. (Inherited from DiagramNode.)
	setExpandedFlag	Changes the "expanded" flag without actually expanding or collapsing the tree branch that starts from a node. (Inherited from DiagramNode.)
	setFlipX	Sets a value indicating whether the node's shape is flipped horizontally. (Inherited from ShapeNode.)
	setFlipY	Sets a value indicating whether the node's shape is flipped vertically. (Inherited from ShapeNode.)

	setFont	Sets the font used to draw the text label of a node. (Inherited from ShapeNode.)
	setHandlesStyle	Sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	setHyperLink	Sets the hyperlink associated with an item. (Inherited from DiagramItem.)
	setId	Assigns user-defined identifier to this item. (Inherited from DiagramItem.)
	setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	setImage	Sets the image that should be displayed inside the node. (Inherited from ShapeNode.)
	setImageAlign	Sets the alignment of the node's image. (Inherited from ShapeNode.)
	setImagePadding	Sets the padding distance between node's borders and **Image**. (Inherited from ShapeNode.)
	setImageUrl	Sets a URL used to load an image into this cell. (Inherited from ShapeNode.)
	setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	setLocked	Sets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	setObstacle	Sets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	setOpacity	Sets the opacity of this item. (Inherited from DiagramItem.)
	setPen	Sets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	setPrintable	Sets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	setRotateImage	Sets a value indicating whether the image displayed inside a node should rotate together with the node. (Inherited from ShapeNode.)
	setRotateText	Sets a value indicating whether the text displayed inside a node should rotate together with the node. (Inherited from ShapeNode.)
	setRotationAngle	Sets the rotation angle of a node. (Inherited from DiagramNode.)
	setSelected	Selects or deselects an item. (Inherited from DiagramItem.)
	setShadowBrush	Sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)

	setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShape	Sets the shape of a node to the specified Shape instance. The initial shape of a node is the one set by the setDefaultShape method. (Inherited from ShapeNode.)
	setShapeOrientation	Sets an orientation angle applied to the shape definition before the shape points are mapped to the node's bounding rectangle. (Inherited from ShapeNode.)
	setStyle	Sets the style associated with the item. (Inherited from DiagramItem.)
	setSvgUrl	Sets a URL used to load an SVG file into this node.
	setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event. (Inherited from DiagramItem.)
	setText	Sets the text label displayed inside this node. (Inherited from ShapeNode.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	setTextFormat	Sets a **TextFormat** object specifying how to format and align the text of this node. (Inherited from ShapeNode.)
	setTextPadding	Sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	setTransparent	Sets a value indicating whether only the text and image of a node should be drawn on the screen. (Inherited from ShapeNode.)
	setVisible	Sets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	setWeight	Sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	setZIndex	Sets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	with	Returns a ShapeNodeBuilder object used to configure and create new ShapeNode instances. (Inherited from ShapeNode.)
	withSvg	Returns an **SvgNodeBuilder** object used to configure and create new **SvgNode** instances.
	writeExternal	Serializes the object to the specified writer.

	zBottom	Moves an item to the bottom of the Z order. (Inherited from DiagramItem.)
	zLevelDown	Moves an item down in the Z order. (Inherited from DiagramItem.)
	zLevelUp	Moves an item up in the Z order. (Inherited from DiagramItem.)
	zTop	Moves an item to the top of the Z order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	allowCreate	DiagramItem.allowCreate override. (Inherited from DiagramNode.)
	allowModify	(Inherited from DiagramNode.)
	allowModifyImpl	(Inherited from DiagramNode.)
	cancelModify	(Inherited from ShapeNode.)
	completeCreate	DiagramItem.completeCreate override. (Inherited from DiagramNode.)
	completeModify	(Inherited from DiagramNode.)
	constraintsInfringed	(Inherited from DiagramNode.)
	createConnectionPoint	(Inherited from ShapeNode.)
	createProperties	DiagramItem.createProperties override.
	createState	(Inherited from ShapeNode.)
	draw	DiagramItem.draw override. (Inherited from DiagramNode.)
	drawLocal	DiagramNode.drawLocal override. (Inherited from ShapeNode.)
	drawShadow	DiagramItem.drawShadow override. (Inherited from DiagramNode.)
	drawShadowLocal	DiagramNode.drawShadowLocal override. (Inherited from ShapeNode.)
	getImageRect	(Inherited from ShapeNode.)
	getLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getLocalBoundsD	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getMeasureUnit	(Inherited from DiagramItem.)
	getRepaintRect	DiagramItem.getRepaintRect override. (Inherited from ShapeNode.)

	getValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	groupContains	(Inherited from DiagramNode.)
	loadFromJson	Loads the node from a JSON object.
	loadFromXml	Loads the node's content from an XML element.
	move	(Inherited from DiagramNode.)
	onAdd	DiagramItem.onAdd override. (Inherited from ShapeNode.)
	onChangeFont	(Inherited from DiagramItem.)
	onChangeTextPadding	Called when the value of **TextPadding** changes. (Inherited from ShapeNode.)
	onChildModified	Called when a group child node has been modified. Override this method if you need to know when a node from the **SubordinateGroup** is modified. (Inherited from DiagramItem.)
	onClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	onDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	onLoad	DiagramItem.onLoad override. (Inherited from ShapeNode.)
	onMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	onModify	Called when an item is modified (Inherited from DiagramNode.)
	onRemove	Called when an item is removed from a Diagram, either by the user, programmatically or by undo / redo. (Inherited from DiagramNode.)
	onRotationAngleChanged	DiagramNode.onRotationAngleChanged override. (Inherited from ShapeNode.)
	onStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	onStyleFontChanged	DiagramItem.onStyleFontChanged override. (Inherited from ShapeNode.)
	onUpdateBounds	(Inherited from ShapeNode.)
	parentConstraintsInfringed	(Inherited from DiagramNode.)
	putExpandable	(Inherited from DiagramNode.)
	putSelected	(Inherited from DiagramItem.)
	rectFromPoints	(Inherited from DiagramNode.)
	repaint	Overloaded. (Inherited from DiagramItem.)
	resizeToFitImage	(Inherited from DiagramNode.)
	restoreProperties	DiagramNode.restoreProperties override.

	restoreState	(Inherited from ShapeNode.)
	saveProperties	DiagramNode.saveProperties override.
	saveState	(Inherited from ShapeNode.)
	saveToJson	Saves the node as a JSON object.
	saveToXml	Saves the node's content into an XML element.
	scaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	setDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	setReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	shouldRender	Determines whether the item is rendered in the current context. (Inherited from DiagramItem.)
	shouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	startCreate	DiagramItem.startCreate override. (Inherited from DiagramNode.)
	startModify	DiagramItem.startModify override. Invoked when the user starts modifying this node interactively. (Inherited from DiagramNode.)
	updateCreate	DiagramItem.updateCreate override. (Inherited from DiagramNode.)
	updateLinkPositions	(Inherited from DiagramNode.)
	updateModify	(Inherited from ShapeNode.)

SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode Constructor (Diagram)

Initializes a new instance of the SvgNode class with default values supplied form the specified Diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SvgNode (
    Diagram parent
)
```

Parameters

parent
The Diagram from which to obtain default values for the node properties.

See Also

SvgNode Constructor Overload List
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode Constructor (SvgNode)

Initializes a new instance of the SvgNode class using the specified node as a prototype.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SvgNode (
    SvgNode prototype
)
```

Parameters

prototype
The node to use as a prototype. The properties of the new node are initialized from the property values of this node

Syntax

Java

```
protected DiagramItemProperties createProperties ()
```

Return Value

An SvgNodeProperties object containing a snapshot of the node's properties.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.getContent Method

Gets an SvgContent instance representing the SVG drawing rendered in this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SvgContent getContent ()
```

Return Value

An instance of the com.mindfusion.svg.SvgContent class representing the SVG drawing.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.getContentAlign Method

Gets the alignment of the SvgContent displayed in this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ImageAlign getContentAlign ()
```

Return Value

A member of the ImageAlign enumeration. The default is **Fit**.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.getSvgUrl Method

Gets a URL used to load an SVG file into this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getSvgUrl ()
```

Return Value

A String containing file path.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.initSvg Method

Returns an **SvgNodeBuilder** object used to configure this SvgNode instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SvgNodeBuilder initSvg ()
```

Return Value

An **SvgNodeBuilder** instance.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.loadFromJson Method

Loads the node from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj

A JsonObject containing the node's data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.loadFromXml Method

Loads the node's content from an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

An Element containing the item's data.

context

An XmlPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.readExternal Method

Deserializes the object from the specified reader.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java

public void readExternal (
    ObjectInput in
)
```

Parameters

in

A BinaryReader object from which to read the item's data.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.restoreProperties Method

DiagramNode.restoreProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void restoreProperties (
    DiagramItemProperties props
)
```

Parameters

props
A DiagramItemProperties-derived object containing a snapshot of the item's properties.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.saveProperties Method

DiagramNode.saveProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void saveProperties (
    DiagramItemProperties props
)
```

Parameters

props
A DiagramItemProperties-derived object where the item's properties should be saved.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.saveToJson Method

Saves the node as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.saveToXml Method

Saves the node's content into an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Element the item's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and helper serialization methods.

SvgNode.setContent Method

Sets an SvgContent instance representing the SVG drawing rendered in this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setContent (
    SvgContent value
)
```

Parameters

value
An instance of the com.mindfusion.svg.SvgContent class representing the SVG drawing.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.setContentAlign Method

Sets the alignment of the SvgContent displayed in this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setContentAlign (
    ImageAlign value
)
```

Parameters

value
A member of the ImageAlign enumeration.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.setSvgUrl Method

Sets a URL used to load an SVG file into this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSvgUrl (
    String value
)
```

Parameters

value
A String containing file path.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.withSvg Method

Returns an **SvgNodeBuilder** object used to configure and create new SvgNode instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static SvgNodeBuilder withSvg ()
```

Return Value

An **SvgNodeBuilder** instance.

See Also

SvgNode Members
SvgNode Class
com.mindfusion.diagramming Namespace

SvgNode.writeExternal Method

Serializes the object to the specified writer.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out
A BinaryWriter object the item's data should be written to.

See Also

SvgNode Members
SvgNode Class

SvgNodeProperties Class

Stores the values of SvgNode properties during undo / redo operations. If you need to implement undo support for the additional properties defined by a class derived from **SvgNode**, do so by deriving from **SvgNodeProperties** and overriding the saveProperties, restoreProperties, and createProperties methods.

Syntax

Java

```
public class SvgNodeProperties
    extends ShapeNodeProperties
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DiagramItemProperties
    com.mindfusion.diagramming.DiagramNodeProperties
      com.mindfusion.diagramming.ShapeNodeProperties
        com.mindfusion.diagramming.SvgNodeProperties

SvgNodeStyle Class

Represents a reusable set of properties that define the appearance of SVG nodes.

Syntax

Java

```
public class SvgNodeStyle
    extends DiagramNodeStyle
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.Style
    com.mindfusion.diagramming.DiagramItemStyle
      com.mindfusion.diagramming.DiagramNodeStyle
        com.mindfusion.diagramming.SvgNodeStyle

See Also

SvgNodeStyle Members
com.mindfusion.diagramming Namespace

SvgNodeStyle Members

Represents a reusable set of properties that define the appearance of SVG nodes.

The following tables list the members exposed by the SvgNodeStyle type.

Public Constructors

	Name	Description

	SvgNodeStyle	Initializes a new instance of the SvgNodeStyle class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from Style.)
	getBrush	Gets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	getEffects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	getFontFamily	Gets the font family of the item text. (Inherited from DiagramItemStyle.)
	getFontSize	Gets the font size of the item text. (Inherited from DiagramItemStyle.)
	getFontStyle	Gets the font style of the item text. (Inherited from DiagramItemStyle.)
	getFontUnit	Gets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	getShadowBrush	Gets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	getStroke	Gets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	getStrokeThickness	Gets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
	init	Returns a SvgNodeStyleBuilder object used to configure this SvgNodeStyle instance.
	readExternal	**Externalizable.readExternal** implementation. (Inherited from Style.)
S	registerType	Associates a type with an alias. The alias is used when saving and loading objects of the specified type during style serialization and deserialization. (Inherited from Style.)
	removePropertyChangeListener	(Inherited from Style.)
	setBrush	Sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	setFontFamily	Sets the font family of the item text. (Inherited from DiagramItemStyle.)
	setFontSize	Sets the font size of the item text. (Inherited from DiagramItemStyle.)
	setFontStyle	Sets the font style of the item text. (Inherited from DiagramItemStyle.)

	setFontUnit	Sets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	setShadowBrush	Sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	setStroke	Sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	setStrokeThickness	Sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
S	with	Returns a SvgNodeStyleBuilder object used to configure and create new SvgNodeStyle instances.
	writeExternal	**Externalizable.writeExternal** implementation. (Inherited from Style.)

Protected Methods

	Name	Description
	getValue	Gets the value of the specified property. (Inherited from Style.)
	isPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	loadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	loadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	registerProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	saveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	saveToXml	Saves the style content into an XML element. (Inherited from Style.)
	setValue	Sets the value of the specified property. (Inherited from Style.)
	unsetValue	Clears the value of the specified property. (Inherited from Style.)

SwimlaneGrid Interface

Represents an object which can be used by a SwimlaneLayout to adjust the corresponding swimlane grid.

Syntax

Java
`public interface SwimlaneGrid`

Inheritors

com.mindfusion.diagramming.LaneGrid

See Also

SwimlaneGrid Members
com.mindfusion.diagramming Namespace

SwimlaneGrid Members

Represents an object which can be used by a SwimlaneLayout to adjust the corresponding swimlane grid.

The following tables list the members exposed by the SwimlaneGrid type.

Public Methods

	Name	Description
	getColumnCount	Gets the number of columns in the grid.
	getColumnWidth	Gets the the width of the specified column in the swimlane grid.
	getRowCount	Gets the number of rows in the swimlane grid.
	getRowHeight	Gets the the height of the specified row in the swimlane grid.
	setColumnCount	Sets the number of columns in the swimlane grid.
	setColumnWidth	Sets the the width of the specified column in the swimlane grid.
	setLeftMargin	Sets the left margin of the swimlane grid.
	setRowCount	Sets the number of rows in the swimlane grid.

	setRowHeight	Sets the the height of the specified row in the swimlane grid.
	setTopMargin	Sets the top margin of the swimlane grid.

See Also

SwimlaneGrid Interface

SwimlaneGrid Methods

SwimlaneGrid.getColumnCount Method

Gets the number of columns in the grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
int getColumnCount ()
```

Return Value

The number of columns in the grid.

See Also

SwimlaneGrid Members
SwimlaneGrid Interface
com.mindfusion.diagramming Namespace

SwimlaneGrid.getColumnWidth Method

Gets the the width of the specified column in the swimlane grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
float getColumnWidth (
    int index
)
```

Parameters

index
The zero-based index of the column.

Return Value

The width of the column.

See Also

SwimlaneGrid Members
SwimlaneGrid Interface
com.mindfusion.diagramming Namespace

SwimlaneGrid.getRowCount Method

Gets the number of rows in the swimlane grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
int getRowCount ()
```

Return Value

The number of rows in the grid.

See Also

SwimlaneGrid Members
SwimlaneGrid Interface
com.mindfusion.diagramming Namespace

SwimlaneGrid.getRowHeight Method

Gets the the height of the specified row in the swimlane grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
float getRowHeight (
    int index
)
```

Parameters

index
The zero-based index of the row.

Return Value

The height of the row.

See Also

SwimlaneGrid Members
SwimlaneGrid Interface

SwimlaneGrid.setColumnCount Method

Sets the number of columns in the swimlane grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void setColumnCount (
    int value
)
```

Parameters

value
A non-negative integer value specifying the number of columns.

See Also

SwimlaneGrid Members
SwimlaneGrid Interface
com.mindfusion.diagramming Namespace

SwimlaneGrid.setColumnWidth Method

Sets the the width of the specified column in the swimlane grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void setColumnWidth (
    int index,
    float value
)
```

Parameters

index
The zero-based index of the column.

value
The new width of the column.

See Also

SwimlaneGrid Members
SwimlaneGrid Interface

SwimlaneGrid.setLeftMargin Method

Sets the left margin of the swimlane grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void setLeftMargin (
    float value
)
```

Parameters

value
The distance between the left side of the grid and the diagram bounds.

See Also

SwimlaneGrid Members
SwimlaneGrid Interface

SwimlaneGrid.setRowHeight Method

Sets the the height of the specified row in the swimlane grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void setRowHeight (
    int index,
    float value
)
```

Parameters

index
The zero-based index of the row.

value
The new height of the row.

SwimlaneGrid.setTopMargin Method

Sets the top margin of the swimlane grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void setTopMargin (
    float value
)
```

Parameters

value
The distance between the top side of the grid and the diagram bounds.

See Also

SwimlaneGrid Members
SwimlaneGrid Interface
com.mindfusion.diagramming Namespace

SwimlaneLayout Class

Implements an algorithm which arranges nodes in lanes.

Syntax

Java
`public class SwimlaneLayout extends AbstractLayout`

Remarks

This layout algorithm can be used to arrange process diagrams in which nodes representing activities are placed in swimlanes representing resources. The index of the resource allocated to an activity should be assigned to the corresponding node's LayoutTraits via the SwimlaneLayoutTraits.Lane key.

By default, the algorithm works with the diagram's LaneGrid, but its SwimlaneGrid property can be set to any class that implements the SwimlaneGrid interface. This allows applying the layout to a custom-drawn grid rendered through the drawBackground event, or one composed of locked background nodes.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.AbstractLayout
    com.mindfusion.diagramming.SwimlaneLayout

See Also

SwimlaneLayout Members
com.mindfusion.diagramming Namespace

SwimlaneLayout Members

Implements an algorithm which arranges nodes in lanes.

The following tables list the members exposed by the SwimlaneLayout type.

Public Constructors

	Name	Description
	SwimlaneLayout	Initializes a new instance of the **SwimlaneLayout** class with the default settings.

Public Methods

	Name	Description
	arrange	Applies the layout on the specified subset of items from the specified Diagram instance.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getCollapseEmptyLanes	Get or sets a value indicating whether lanes without associated nodes will shrink to zero size. By default, empty

		lanes will have size equal to the value specified through setLaneDistance.
	getCompactNodes	Gets a value indicating whether the nodes within individual lanes are compacted.
	getDirection	Gets the direction of the arranged diagram.
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getKeepLaneSizes	Gets a value indicating whether the layout will attempt to preserve the original sizes of the lanes in the supplied grid.
	getLaneDistance	Gets the spacing between adjacent lanes in the final layout.
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getNodeDistance	Gets the spacing between adjacent nodes within a lane in the final layout.
	getOrientation	Gets a the orientation of the arranged graph.
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	getSwimlaneGrid	Gets the object through which the layout can manipulate the swimlane grid.
	init	Returns a SwimlaneLayoutBuilder object used to configure this SwimlaneLayout instance.
S	removeMidleSegmentPoint	(Inherited from AbstractLayout.)
	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setCollapseEmptyLanes	Set or sets a value indicating whether lanes without associated nodes will shrink to zero size. By default, empty lanes will have size equal to the value specified through **setLaneDistance**. To be able to shrink the lanes of a lane grid to zero size, the MinHeaderSize property of the lane grid must be set to an appropriate value.
	setCompactNodes	Sets a value indicating whether the nodes within individual lanes are compacted.

	setDirection	Sets the direction of the arranged diagram. If the orientation is set to com.mindfusion.diagramming.jlayout.Orientation.Horizontal, com.mindfusion.diagramming.jlayout.Direction.Straight stands for "left to right" and com.mindfusion.diagramming.jlayout.Direction.Reversed for "right to left". If the orientation is set to com.mindfusion.diagramming.jlayout.Orientation.Vertical, com.mindfusion.diagramming.jlayout.Direction.Straight stands for "top to bottom" and com.mindfusion.diagramming.jlayout.Direction.Reversed for "bottom to top".
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	setKeepLaneSizes	Sets a value indicating whether the layout will attempt to preserve the original sizes of the lanes in the supplied grid.
	setLaneDistance	Sets the spacing between adjacent lanes in the final layout.
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setNodeDistance	Sets the spacing between adjacent nodes within a lane in the final layout.
	setOrientation	Sets a the orientation of the arranged graph.
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
	setSwimlaneGrid	Sets the object through which the layout can manipulate the swimlane grid. If this is null at the time of layout, the layout will operate on the diagram's lane grid.
S	with	Returns a SwimlaneLayoutBuilder object used to configure and create new SwimlaneLayout instances.

SwimlaneLayout Methods

SwimlaneLayout.arrange Method

Applies the layout on the specified subset of items from the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram
The Diagram that should be arranged.

items
A collection of nodes and links from diagram that define the subgraph to arrange.

Return Value

This method always returns true.

com.mindfusion.diagramming Namespace

SwimlaneLayout.setCollapseEmptyLanes Method

Set or sets a value indicating whether lanes without associated nodes will shrink to zero size. By default, empty lanes will have size equal to the value specified through setLaneDistance. To be able to shrink the lanes of a lane grid to zero size, the MinHeaderSize property of the lane grid must be set to an appropriate value.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCollapseEmptyLanes (
    boolean value
)
```

Parameters

value

See Also

SwimlaneLayout Members
SwimlaneLayout Class
com.mindfusion.diagramming Namespace

SwimlaneLayout.setCompactNodes Method

Sets a value indicating whether the nodes within individual lanes are compacted.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCompactNodes (
    boolean value
)
```

Parameters

value

See Also

SwimlaneLayout Members
SwimlaneLayout Class
com.mindfusion.diagramming Namespace

SwimlaneLayout.setDirection Method

Sets the direction of the arranged diagram. If the orientation is set to com.mindfusion.diagramming.jlayout.Orientation.Horizontal, com.mindfusion.diagramming.jlayout.Direction.Straight stands for "left to right" and com.mindfusion.diagramming.jlayout.Direction.Reversed for "right to left". If the orientation is set to com.mindfusion.diagramming.jlayout.Orientation.Vertical, com.mindfusion.diagramming.jlayout.Direction.Straight stands for "top to bottom" and com.mindfusion.diagramming.jlayout.Direction.Reversed for "bottom to top".

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDirection (
    Direction value
)
```

Parameters

value

See Also

SwimlaneLayout Members
SwimlaneLayout Class
com.mindfusion.diagramming Namespace

SwimlaneLayout.setKeepLaneSizes Method

Sets a value indicating whether the layout will attempt to preserve the original sizes of the lanes in the supplied grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setKeepLaneSizes (
    boolean value
)
```

Parameters

value

See Also

SwimlaneLayout Members
SwimlaneLayout Class
com.mindfusion.diagramming Namespace

SwimlaneLayout.setLaneDistance Method

Sets the spacing between adjacent lanes in the final layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLaneDistance (
    float value
)
```

Parameters

value

See Also

SwimlaneLayout Members
SwimlaneLayout Class
com.mindfusion.diagramming Namespace

SwimlaneLayout.setNodeDistance Method

Sets the spacing between adjacent nodes within a lane in the final layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setNodeDistance (
    float value
)
```

Parameters

value

See Also

SwimlaneLayout Members
SwimlaneLayout Class
com.mindfusion.diagramming Namespace

SwimlaneLayout.setOrientation Method

Sets a the orientation of the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setOrientation (
    Orientation value
)
```

Parameters

value
A member of the Orientation enumeration.

See Also

SwimlaneLayout Members
SwimlaneLayout Class
com.mindfusion.diagramming Namespace

SwimlaneLayout.setSwimlaneGrid Method

Sets the object through which the layout can manipulate the swimlane grid. If this is null at the time of layout, the layout will operate on the diagram's lane grid.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSwimlaneGrid (
    SwimlaneGrid value
)
```

Parameters

value

See Also

SwimlaneLayout Members
SwimlaneLayout Class
com.mindfusion.diagramming Namespace

SwimlaneLayout.with Method

Returns a SwimlaneLayoutBuilder object used to configure and create new SwimlaneLayout instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static SwimlaneLayoutBuilder with ()
```

Return Value

A **SwimlaneLayoutBuilder** instance.

TabbedScrollPane Members

Represents a DiagramView that can display DiagramDocument objects. The individual diagram pages can be activated through the tabs in the tray located at one of the view sides.

The following tables list the members exposed by the TabbedScrollPane type.

Public Constructors

	Name	Description
	TabbedScrollPane	Overloaded.

Public Methods

	Name	Description
	addLayoutComponent	LayoutManager.addLayoutComponent implementation.
	addTabbedScrollPaneListener	Registers {@code listener} so that it will receive view events.
	getAllowTabReorder	Gets a value indicating whether tabs can be rearranged interactively.
	getCurrentPage	Gets the currently active page.
	getDiagramView	Gets a reference to the underlying diagram view.
	getDocument	Gets the displayed diagram document.
	getDocumentView	Gets the underlying document view.
	getShowCreateNewTab	Gets a value indicating whether to display the 'Create New Tab' button.
	getShowTabCloseButtons	Gets a value indicating whether to display a close button for each tab.
	getShowTabNavigationButtons	Gets a value indicating whether the tab navigation buttons.
	getShowTabs	Gets a value indicating whether the tabs are visible.
	getTabAlignment	Gets the tabs alignment.
	layoutContainer	LayoutManager.layoutContainer implementation.
	minimumLayoutSize	LayoutManager.minimumLayoutSize implementation.
	preferredLayoutSize	LayoutManager.preferredLayoutSize implementation.
	removeLayoutComponent	LayoutManager.removeLayoutComponent implementation.
	removeTabbedScrollPaneListener	Unregisters {@code listener} so that it will no longer receive view events.

	setAllowTabReorder	Sets a value indicating whether tabs can be rearranged interactively.
	setCurrentPage	Sets the currently active page.
	setDocument	Sets the displayed diagram document.
	setDocumentView	Sets the underlying document view.
	setShowCreateNewTab	Sets a value indicating whether to display the 'Create New Tab' button.
	setShowTabCloseButtons	Sets a value indicating whether to display a close button for each tab.
	setShowTabNavigationButtons	Sets a value indicating whether the tab navigation buttons.
	setShowTabs	Sets a value indicating whether the tabs are visible.
	setTabAlignment	Sets the tabs alignment.

TabbedScrollPane.getAllowTabReorder Method

Gets a value indicating whether tabs can be rearranged interactively.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowTabReorder ()
```

Return Value

true to allow interactive tab reordering; otherwise, **false**.

Remarks

Moving a tab also changes the position of its associated DiagramPage within the document's Pages collection.

TableConnectionStyle Enumeration

The members of this enumeration specify whether links drawn by users are connected to tables rows, to tables as integral nodes, or both. They can be used as parameters of the setConnectionStyle method of the TableNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum TableConnectionStyle
```

Members

	Member name	Description
	Both	Support both modes.
	Rows	Connect links to individual rows of the table.
	Table	Connect links to the table as an integral node.

See Also

com.mindfusion.diagramming Namespace

TableNode Class

Tables are diagram nodes that can contain multiple cells and can be related to other nodes through their rows.

Syntax

Java

```
public class TableNode extends DiagramNode implements RenderTextCallback, InplaceEditable
```

Remarks

Links can connect either to table rows or to the table as an integral node. Use the setConnectionStyle method to specify whether links drawn by the user should be connected to the table rows or to the table itself.

Tables consist of Cell instances distributed across rows and columns. The number of rows and columns can be set via the setRowCount and setColumnCount methods. The default width of the table columns is specified through setColumnWidth and the default height of the rows through setRowHeight. Cells can be made to span several rows and columns via their Cell.setRowSpan and Cell.setColumnSpan methods.

Rows can be assigned to distinct sections of the table. Each section can be collapsed or expanded, hiding or showing all rows in the section except the header one. To define a section, call the Row.setHeader method. A section consists of all rows after a header row and spans to the next header. Each header row displays a +/- button that allows expanding or collapsing the section interactively. The button appears either on the left of the first cell of a header row or in a separate column, as specified through the setOffsetHeaderRows method. Sections can be collapsed or expanded programmatically using the Row.setExpanded method of their header rows.

The structure of a table can be changed dynamically by adding and deleting rows and columns. This can be done with the addColumn and addRow methods as well with the insertColumn, insertRow and redimTable methods. Use the deleteRow and deleteColumn methods to delete existing rows and columns.

Tables have a caption text, which is set via the setCaption method. The height of the caption and the alignment of the text are specified via the setCaptionHeight and setCaptionFormat methods. To get even richer text formatting, call setEnableStyledText and embed HTML-like formatting tags in the caption.

In order to set an image as tables background, call the setImage method. The alignment of the image in relation to the tables rectangle is set via the setImageAlign method. The table can be resized to fit the size of its image by calling the resizeToFitImage method.

The rows and columns of a table can be accessed through the getRows and getColumns methods. The getCell method lets you access individual table cells.

	ptSavedEnd	(Inherited from DiagramItem.)
	ptSavedOrg	(Inherited from DiagramItem.)
	savedBounds	(Inherited from DiagramNode.)
	subordinateGroup	(Inherited from DiagramItem.)

Public Methods

	Name	Description
	addColumn	Appends a new column to this table.
	addLabel	Overloaded. (Inherited from DiagramNode.)
	addRelation	Creates a new DiagramLink related to this table.
	addRow	Adds a row to the table.
	as	Down-casts the item to specified type. (Inherited from DiagramItem.)
	attachTo	Overloaded. (Inherited from DiagramNode.)
	cellFromPoint	Returns the row and column indices of the cell located at the specified point, taking into consideration the cells span.
	clone	Creates a copy of this item. (Inherited from DiagramItem.)
	containsPoint	Overloaded. (Inherited from DiagramNode.)

	deleteColumn	Deletes the specified column.
	deleteRow	Deletes the specified row from the table.
	detach	Detaches a node from its master group. (Inherited from DiagramNode.)
	getAllIncomingLinks	Gets a collection of all links entering this node. (Inherited from DiagramNode.)
	getAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	getAllOutgoingLinks	Gets a collection of all links going out of this node. (Inherited from DiagramNode.)
	getAllowIncomingLinks	Gets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	getAllowOutgoingLinks	Gets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	getAllowResizeColumns	Gets a value indicating whether users are allowed to resize table columns.
	getAllowResizeRows	Gets a value indicating whether users are allowed to resize table rows.
	getAnchorPattern	Gets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	getBounds	Gets the node location and size. (Inherited from DiagramNode.)
	getBrush	Gets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	getCaption	Gets the caption text of a table.
	getCaptionBackBrush	Gets the brush used to paint the caption bar of this table.
	getCaptionBrush	Gets the brush used to draw the table's caption text.
	getCaptionFormat	Gets a TextFormat object specifying how to format and align the caption text.
	getCaptionHeight	Gets the height of the caption bar of the table.
	getCaptionPlainText	Gets the plain text extracted from the formatted caption text by removing the formatting tags.
	getCell	Gets the cell at the specified row and column.
	getCellCustomDraw	Gets the type of custom drawing performed on the table cells.
	getCellFrameStyle	Gets the style of the cell frame lines.
	getCellTextBrush	Gets the brush used to draw the cells' text in this table.
	getCenter	Returns the center point of this node. (Inherited from DiagramNode.)
	getColumnCount	Gets the number of columns of this table.

	getColumns	Gets a list of all columns in the table.
	getColumnWidth	Gets the initial width of the columns of this table.
	getConnectionStyle	Gets a value indicating whether links should connect to the rows of this table or to the table as an integral entity.
	getConstraints	Gets the movement and size constraints applied to a node. (Inherited from DiagramNode.)
	getContainer	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	getCurrentRow	Gets the index of the current scroll row.
	getCustomDraw	Gets the type of custom drawing performed on this table.
	getDividerPen	Gets the Pen used to draw the the divider line between node's caption bar and content area.
	getEditRect	Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).
	getEffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	getEffectiveCaptionBackBrush	Gets the effective caption back brush of the table.
	getEffectiveCaptionBrush	Returns a Brush object representing the currently effective caption brush of the table. This method returns the table's **CaptionBrush** if it's not **null**, or otherwise the TextBrush property of the current TableNodeStyle.
	getEffectiveCellTextBrush	Creates a Brush object representing the currently effective text brush of the table cells. This method returns a system brush corresponding to the table's **getCellTextBrush** if the table's **getCellTextBrush** is not null, or a system brush corresponding to the TableNodeStyle.getCellTextBrush property of the table's style.
	getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style. (Inherited from DiagramItem.)
	getEffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style. (Inherited from DiagramItem.)
	getEffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	getEffects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)

	getEnabledHandles	Gets a combination of NodeHandleType members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	getEnableStyledText	Gets a value indicating whether the text displayed inside a table contains formatting tags which should be processed by JDiagram.
	getExpandable	Gets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	getExpanded	Gets a value indicating whether the tree branch that starts from a node is expanded or collapsed. (Inherited from DiagramNode.)
	getFont	Gets the font used to draw the text displayed in this table.
	getHandlesStyle	Gets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	getHyperLink	Gets the hyperlink associated with an item. (Inherited from DiagramItem.)
	getId	Gets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	getImage	Gets the image displayed inside this table.
	getImageAlign	Gets the alignment of the table image relative to the boundaries of the table.
	getImagePadding	Gets the padding distance between node's borders and **Image**.
	getIncomingLinks	Gets the links coming into a node. (Inherited from DiagramNode.)
	getLabels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms. (Inherited from DiagramItem.)
	getLocalCenter	(Inherited from DiagramNode.)
	getLocked	Gets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	getMasterGroup	Gets the hierarchical group in which this node is a subordinate item. (Inherited from DiagramNode.)

	getMasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	getNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getObstacle	Gets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	getOffsetHeaderRows	Gets a value indicating whether the table cells are offset to the right to accommodate for the expand buttons displayed inside header rows.
	getOpacity	Gets the opacity of this item. (Inherited from DiagramItem.)
	getOutgoingLinks	Gets the links going out from a node. (Inherited from DiagramNode.)
	getParent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	getPen	Gets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	getPrintable	Gets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
S	getRotatedBounds	Gets the bounding rectangle of this node, when it is rotated at the specified angle around the specified pivot. (Inherited from DiagramNode.)
	getRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	getRowAnchorPattern	Gets the default row AnchorPattern.
	getRowCount	Gets the number of rows of this table.
	getRowHeight	Gets the initial height of the rows of this table.
	getRows	Gets a list of all rows in the table.
	getRuntimeIndex	For internal use. (Inherited from DiagramItem.)
	getScrollable	Gets a value indicating whether users are allowed to scroll the table.
	getSelected	Gets a value indicating whether this item is selected. (Inherited from DiagramItem.)
	getShadowBrush	Gets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShape	Gets the shape of this table.

	getStyle	Gets the style associated with the item. (Inherited from DiagramItem.)
	getSubordinateGroup	Gets the group of subordinated items attached to this one. (Inherited from DiagramItem.)
	getTag	Gets user-defined data assigned to an item. (Inherited from DiagramItem.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	getTextPadding	Gets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	getTextToEdit	Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when the table's caption is edited in-place.
	getToolTip	Gets the tooltip text displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	getVisible	Gets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	getWeight	Gets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	getZIndex	Gets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	hasSubordinates	Checks whether there are any nodes attached to this item. (Inherited from DiagramItem.)
	hitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	hitTestHandle	DiagramItem.hitTestHandle override. (Inherited from DiagramNode.)
	init	Returns a TableNodeBuilder object used to configure this TableNode instance.
	insertColumn	Inserts a new column at the specified position.
	insertRow	Inserts a row in the table.
	labelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	moveTo	Moves a node to the specified location. (Inherited from DiagramNode.)
	nodesIntersect	Determines whether two nodes intersect. (Inherited from DiagramNode.)
	onDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	onDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	onDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)

	query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	readExternal	Implements Externalizable.
	redimTable	Sets the number of rows and columns.
	removeLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	renderText	
	resize	Sets the size of a node. (Inherited from DiagramNode.)
	resizeToFitImage	Resizes a table so that it will be as big as the image displayed in the table.
	resizeToFitText	Resizes the columns and rows so that the cells are large enough to fit their text.
	setAllowIncomingLinks	Sets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	setAllowOutgoingLinks	Sets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	setAllowResizeColumns	Sets a value indicating whether users are allowed to resize table columns.
	setAllowResizeRows	Sets a value indicating whether users are allowed to resize table rows.
	setAnchorPattern	Sets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	setBounds	Overloaded. (Inherited from DiagramNode.)
	setBoundsDirect	For internal use. (Inherited from DiagramNode.)
	setBrush	Sets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	setCaption	Sets the caption text of a table.
	setCaptionBackBrush	Sets the brush used to paint the caption bar of this table.
	setCaptionBrush	Sets the brush used to draw the table's caption text.
	setCaptionFormat	Sets a TextFormat object specifying how to format and align the caption text.
	setCaptionHeight	Sets the height of the caption bar of the table.
	setCellCustomDraw	Sets the type of custom drawing performed on the table cells.
	setCellFrameStyle	Sets the style of the cell frame lines.
	setCellTextBrush	Sets the color used to draw the text in this table.
	setColumnCount	Sets the number of columns of this table.
	setColumnWidth	Sets the initial width of the columns of this table.

	setConnectionStyle	Sets a value indicating whether links should connect to the rows of this table or to the table as an integral entity.
	setConstraints	Sets constraints to the node size and movement direction. The constraints are applied when a user modifies the node interactively. They are not checked when the position of a node is set programmatically. (Inherited from DiagramNode.)
	setCurrentRow	Scrolls the table to the specified row.
	setCustomDraw	Sets the type of custom drawing performed on this table.
	setDividerPen	Sets the **Pen** used to draw the the divider line between node's caption bar and content area.
	setEditedText	Implements InplaceEditable.setEditedText. Assigns the edited text to the table's caption after in-place edit operation completes successfully.
	setEnabledHandles	Sets a combination of **NodeHandleType** members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	setEnableStyledText	Sets a value indicating whether the text displayed inside a table contains formatting tags which should be processed by JDiagram.
	setExpandable	Sets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	setExpanded	Expands or collapses the tree branch that starts from a node. (Inherited from DiagramNode.)
	setExpandedFlag	Changes the "expanded" flag without actually expanding or collapsing the tree branch that starts from a node. (Inherited from DiagramNode.)
	setFont	Sets the font used to draw the text displayed in this table.
	setHandlesStyle	Sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	setHyperLink	Sets the hyperlink associated with an item. (Inherited from DiagramItem.)
	setId	Assigns user-defined identifier to this item. (Inherited from DiagramItem.)
	setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	setImage	Sets the image that should be displayed inside this table.
	setImageAlign	Sets the alignment of the table image relative to the boundaries of the table.
	setImagePadding	Sets the padding distance between node's borders and **Image**.

	setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	setLocked	Sets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	setObstacle	Sets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	setOffsetHeaderRows	Sets a value indicating whether the table cells should be offset to the right to accommodate for the expand buttons displayed inside header rows.
	setOpacity	Sets the opacity of this item. (Inherited from DiagramItem.)
	setPen	Sets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	setPrintable	Sets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	setRotationAngle	Sets the rotation angle of a node. (Inherited from DiagramNode.)
	setRowAnchorPattern	Sets the default row **AnchorPattern**. A link is aligned to the points of this pattern if the row the link connects to doesn't have an **AnchorPattern** defined for it.
	setRowCount	Sets the number of rows of this table.
	setRowHeight	Sets the initial height of the rows of this table.
	setScrollable	Sets a value indicating whether users are allowed to scroll the table.
	setSelected	Selects or deselects an item. (Inherited from DiagramItem.)
	setShadowBrush	Sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShape	Sets the shape of this table.
	setStyle	Sets the style associated with the item. (Inherited from DiagramItem.)
	setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event. (Inherited from DiagramItem.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)

	setTextPadding	Sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	setVisible	Sets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	setWeight	Sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	setZIndex	Sets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
S	with	Returns a **TableNodeBuilder** object used to configure and create new **TableNode** instances.
	writeExternal	Implements Externalizable.
	zBottom	Moves an item to the bottom of the Z order. (Inherited from DiagramItem.)
	zLevelDown	Moves an item down in the Z order. (Inherited from DiagramItem.)
	zLevelUp	Moves an item up in the Z order. (Inherited from DiagramItem.)
	zTop	Moves an item to the top of the Z order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	allowCreate	DiagramItem.allowCreate override. (Inherited from DiagramNode.)
	allowModify	(Inherited from DiagramNode.)
	allowModifyImpl	(Inherited from DiagramNode.)
	cancelModify	DiagramItem.cancelModify override. Invoked when the interactive modification of this node has been canceled. (Inherited from DiagramNode.)
	completeCreate	DiagramItem.completeCreate override. (Inherited from DiagramNode.)
	completeModify	(Inherited from DiagramNode.)
	constraintsInfringed	(Inherited from DiagramNode.)
	createConnectionPoint	
	createProperties	DiagramItem.createProperties override.
	createState	DiagramItem.createState override. (Inherited from DiagramNode.)
	draw	DiagramItem.draw override. (Inherited from DiagramNode.)

	drawLocal	DiagramNode.drawLocal override.
	drawShadow	DiagramItem.drawShadow override. (Inherited from DiagramNode.)
	drawShadowLocal	DiagramNode.drawShadowLocal override.
	getLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getLocalBoundsD	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getMeasureUnit	(Inherited from DiagramItem.)
	getRepaintRect	DiagramItem.getRepaintRect override.
	getValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	groupContains	(Inherited from DiagramNode.)
	loadFromJson	Loads the node from a JSON object.
	loadFromXml	
	move	(Inherited from DiagramNode.)
	onAdd	Called when an item is added to a Diagram, either by the user, programmatically or by undo / redo. (Inherited from DiagramItem.)
	onChangeFont	(Inherited from DiagramItem.)
	onChangeTextPadding	DiagramItem.onChangeTextPadding override.
	onChildModified	Called when a group child node has been modified. Override this method if you need to know when a node from the **SubordinateGroup** is modified. (Inherited from DiagramItem.)
	onClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	onDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	onLoad	DiagramItem.onLoad override.
	onMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	onModify	Called when an item is modified (Inherited from DiagramNode.)
	onRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or by undo / redo. (Inherited from DiagramNode.)
	onRotationAngleChanged	Called when the node's rotation angle changes. (Inherited from DiagramNode.)
	onStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)

	onStyleFontChanged	DiagramItem.onStyleFontChanged override.
	onUpdateBounds	
	parentConstraintsInfringed	(Inherited from DiagramNode.)
	putExpandable	(Inherited from DiagramNode.)
	putSelected	(Inherited from DiagramItem.)
	rectFromPoints	(Inherited from DiagramNode.)
	repaint	Overloaded. (Inherited from DiagramItem.)
	resizeToFitImage	(Inherited from DiagramNode.)
	restoreProperties	DiagramItem.restoreProperties override.
	restoreState	DiagramItem.restoreState override. (Inherited from DiagramNode.)
	saveProperties	DiagramItem.saveProperties override.
	saveState	DiagramItem.saveState override. (Inherited from DiagramNode.)
	saveToJson	Saves the node as a JSON object.
	saveToXml	
	scaleElements	DiagramNode.scaleElements override.
	setDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	setReflexive	Invoked to let a node set the shape of a reflexive link connected to it.
	shouldRender	Determines whether the item is rendered in the current context. (Inherited from DiagramItem.)
	shouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	startCreate	DiagramItem.startCreate override. (Inherited from DiagramNode.)
	startModify	DiagramItem.startModify override. Invoked when the user starts modifying this node interactively. (Inherited from DiagramNode.)
	updateCreate	DiagramItem.updateCreate override. (Inherited from DiagramNode.)
	updateLinkPositions	(Inherited from DiagramNode.)
	updateModify	DiagramItem.updateModify override. Invoked during interactive modification of this node. (Inherited from DiagramNode.)

TableNode Constructor

Overload List

Name	Description
TableNode ()	Initializes a new instance of the TableNode class.
TableNode (Diagram)	Initializes a new instance of the **TableNode** class by setting its attributes to the default values set in the specified diagram.
TableNode (TableNode)	Initializes a new instance of the **TableNode** class by copying the attributes of the specified prototype table.

TableNode Constructor ()

Initializes a new instance of the TableNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public TableNode ()`

See Also

TableNode Constructor Overload List
TableNode Class
com.mindfusion.diagramming Namespace

TableNode Constructor (Diagram)

Initializes a new instance of the TableNode class by setting its attributes to the default values set in the specified diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TableNode (
    Diagram parent
)
```

Parameters

parent
A Diagram instance whose default table attributes are copied to this table.

See Also

TableNode Constructor Overload List
TableNode Class
com.mindfusion.diagramming Namespace

TableNode Constructor (TableNode)

Initializes a new instance of the TableNode class by copying the attributes of the specified prototype table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TableNode (
    TableNode prototype
)
```

Parameters

prototype
A TableNode instance whose attributes are copied to this table.

TableNode Methods

TableNode.addColumn Method

Appends a new column to this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int addColumn ()
```

Return Value

An integer value specifying the index of the new column.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.addRelation Method

Creates a new DiagramLink related to this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLink addRelation (
    int row,
    Relationship rel,
    TableNode table,
    int relRow
)
```

Parameters

row
Index of a row in this table.

rel
A member of the Relationship enumeration.

table
The related table.

relRow
Index of a row in the related table.

Return Value

An DiagramLink object representing the new link.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.addRow Method

Adds a row to the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int addRow ()
```

Return Value

An integer value specifying the index of the new row.

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.cellFromPoint Method

Returns the row and column indices of the cell located at the specified point, taking into consideration the cells span.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean cellFromPoint (
    Point2D point,
    Point cellPos
)
```

Parameters

point
The point to check.

cellPos
Receives the row and column indices if a cell is found at the specified position.

Return Value

true if a cell of this table contains the specified point; otherwise, **false**.

TableNode.createConnectionPoint Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected ConnectionPoint createConnectionPoint (
    DiagramLink link,
    Point2D point,
    boolean incoming
)
```

Parameters

link

point

incoming

Return Value

TableNode.createProperties Method

DiagramItem.createProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DiagramItemProperties createProperties ()
```

Return Value

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.deleteColumn Method

Deletes the specified column.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void deleteColumn (
    int col
)
```

Parameters

col
Index of the column that should be deleted.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.deleteRow Method

Deletes the specified row from the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void deleteRow (
    int row
)
```

Parameters

row
Index of the row that should be deleted.

TableNode.drawLocal Method

DiagramNode.drawLocal override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void drawLocal (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g

options

TableNode.getAllowResizeColumns Method

Gets a value indicating whether users are allowed to resize table columns.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowResizeColumns ()
```

Return Value

true to let users resize columns, or **false** otherwise.

Remarks

A column can be resized by dragging its right border. If the ColumnStyle property of a column is set to AutoWidth, it is automatically reset to FixedWidth when the column is resized. Rightmost columns always fill all remaining space in their tables and cannot be resized.

com.mindfusion.diagramming Namespace

TableNode.getAllowResizeRows Method

Gets a value indicating whether users are allowed to resize table rows.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getAllowResizeRows ()
```

Return Value

true to let users resize rows, or **false** otherwise.

Remarks

A row can be resized by dragging its bottom border.

TableNode.getCaption Method

Gets the caption text of a table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getCaption ()
```

Return Value

A String object containing the caption text.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getCaptionBackBrush Method

Gets the brush used to paint the caption bar of this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getCaptionBackBrush ()
```

Return Value

An instance of a Brush -derived class. The default is **null**.

Remarks

If there is no brush assigned to this property, the caption bar is painted using the Brush property of the TableNode class.

TableNode.getCaptionBrush Method

Gets the brush used to draw the table's caption text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getCaptionBrush ()
```

Return Value

A Brush object representing the color of the caption text.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getCaptionFormat Method

Gets a TextFormat object specifying how to format and align the caption text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public TextFormat getCaptionFormat ()
```

Return Value

A TextFormat object specifying the caption format and alignment.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getCaptionHeight Method

Gets the height of the caption bar of the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getCaptionHeight ()
```

Return Value

A float value specifying the height of the table caption bar.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getCaptionPlainText Method

Gets the plain text extracted from the formatted caption text by removing the formatting tags.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public String getCaptionPlainText ()
```

Return Value

A String containing the caption text stripped from any formatting tags.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getCell Method

Gets the cell at the specified row and column.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Cell getCell (
    int column,
    int row
)
```

Parameters

column
An integer value specifying the column index.

row
An integer value specifying the row index.

Return Value

A Cell object representing the specified cell.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getCellCustomDraw Method

Gets the type of custom drawing performed on the table cells.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CustomDraw getCellCustomDraw ()
```

Return Value

A member of the CustomDraw enumeration. Initialized with CellCustomDraw value of Diagram class.

Remarks

This property allows running custom painting code for the cells of a table. That code must execute in response to the drawCell event. There are several modes of custom painting, allowing the custom code to paint the cell entirely, or do that in addition to default rendering.

See Also

setCellCustomDraw Method

TableNode.getCellFrameStyle Method

Gets the style of the cell frame lines.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CellFrameStyle getCellFrameStyle ()
```

Return Value

A member of the CellFrameStyle enumeration.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getCellTextBrush Method

Gets the brush used to draw the cells' text in this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getCellTextBrush ()
```

Return Value

A Brush object representing the text color.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getColumnCount Method

Gets the number of columns of this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getColumnCount ()
```

Return Value

An integer value specifying the number of columns in this table.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getColumns Method

Gets a list of all columns in the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ColumnList getColumns ()
```

Return Value

A ColumnList containing the table columns.

See Also

TableNode Members
TableNode Class

TableNode.getColumnWidth Method

Gets the initial width of the columns of this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getColumnWidth ()
```

Return Value

A float value specifying the initial width of columns added to this table.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getConnectionStyle Method

Gets a value indicating whether links should connect to the rows of this table or to the table as an integral entity.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TableConnectionStyle getConnectionStyle ()
```

Return Value

A member of the TableConnectionStyle enumeration.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getCurrentRow Method

Gets the index of the current scroll row.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getCurrentRow ()
```

Return Value

An integer value specifying the index of the top-most visible row in a table.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getCustomDraw Method

Gets the type of custom drawing performed on this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public CustomDraw getCustomDraw ()
```

Return Value

A member of the CustomDraw enumeration. Initialized with value of TableCustomDraw property.

Remarks

This property allows running custom painting code for a table. That code must execute in response to the drawNode event. There are several modes of custom painting, allowing the custom code to paint the table entirely, or do that in addition to default rendering.

setCellCustomDraw Method

TableNode.getDividerPen Method

Gets the Pen used to draw the the divider line between node's caption bar and content area.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
```

Java

```
public Pen getDividerPen ()
```

Return Value

A Pen instance. The default value is **null**.

Remarks

If DividerPen is not set, the divider line is drawn using the pen assigned to Pen property.

TableNode Class
com.mindfusion.diagramming Namespace
Pen Property
CaptionBackBrush Property

TableNode.getEditRect Method

Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getEditRect (
    DiagramItem item,
    Point2D mousePosition
)
```

Parameters

item
A reference to this node.

mousePosition
A **Point2D** instance specifying the current pointer position.

Return Value

A **Rectangle2D** specifying where the edit box should be placed.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getEffectiveCaptionBackBrush Method

Gets the effective caption back brush of the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getEffectiveCaptionBackBrush ()
```

Return Value

An instance of a Brush -derived class.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getEffectiveCaptionBrush Method

Returns a Brush object representing the currently effective caption brush of the table. This method returns the table's CaptionBrush if it's not **null**, or otherwise the TextBrush property of the current TableNodeStyle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getEffectiveCaptionBrush ()
```

Return Value

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getEffectiveCellTextBrush Method

Creates a Brush object representing the currently effective text brush of the table cells. This method returns a system brush corresponding to the table's getCellTextBrush if the table's **getCellTextBrush** is not null, or a system brush corresponding to the TableNodeStyle.getCellTextBrush property of the table's style.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getEffectiveCellTextBrush ()
```

Return Value

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getEnableStyledText Method

Gets a value indicating whether the text displayed inside a table contains formatting tags which should be processed by JDiagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getEnableStyledText ()
```

Return Value

true if JDiagram should process formatting tags when rendering text in this table, otherwise **false**.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getFont Method

Gets the font used to draw the text displayed in this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Font getFont ()
```

Return Value

A **Font** object representing the table font.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getImage Method

Gets the image displayed inside this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Image getImage ()
```

Return Value

An instance of the **java.awt.Image** class.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getImageAlign Method

Gets the alignment of the table image relative to the boundaries of the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ImageAlign getImageAlign ()
```

Return Value

A member of the ImageAlign enumeration.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getImagePadding Method

Gets the padding distance between node's borders and Image.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Thickness getImagePadding ()
```

Return Value

A Thickness value specifying padding distance. The default value is **null**.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getOffsetHeaderRows Method

Gets a value indicating whether the table cells are offset to the right to accommodate for the expand buttons displayed inside header rows.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getOffsetHeaderRows ()
```

Return Value

true if table cells are offset to the right, otherwise **false**.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getRepaintRect Method

DiagramItem.getRepaintRect override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected Rectangle2D getRepaintRect (
    boolean includeConnected
)
```

Parameters

includeConnected

Return Value

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getRowAnchorPattern Method

Gets the default row AnchorPattern.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public AnchorPattern getRowAnchorPattern ()
```

Return Value

An AnchorPattern object representing the set of anchor points used when connecting links to the rows of this table.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getRowCount Method

Gets the number of rows of this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getRowCount ()
```

Return Value

An integer value specifying the number of rows in this table.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getRowHeight Method

Gets the initial height of the rows of this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getRowHeight ()
```

Return Value

A float value specifying the initial height of rows added to this table.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getRows Method

Gets a list of all rows in the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public RowList getRows ()
```

Return Value

A RowList containing the table rows.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getScrollable Method

Gets a value indicating whether users are allowed to scroll the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getScrollable ()
```

Return Value

true if users are allowed to scroll the table, otherwise **false**.

Remarks

A button containing up and down arrows appears in the caption bar of a table for which scrolling is enabled. If a user clicks these arrows, table rows scroll up or down. The table can always be scrolled programmatically using the CurrentRow property.

The appearance of the scroll icons can be customized by setting Renderers.ScrollIconRenderer.

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getShape Method

Gets the shape of this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SimpleShape getShape ()
```

Return Value

A member of the SimpleShape enumeration.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.getTextToEdit Method

Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when the table's caption is edited in-place.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getTextToEdit ()
```

Return Value

A **String** that represents the initial contents of the in-place edit box.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.init Method

Returns a TableNodeBuilder object used to configure this TableNode instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TableNodeBuilder init ()
```

Return Value

A **TableNodeBuilder** instance.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.insertColumn Method

Inserts a new column at the specified position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void insertColumn (
    int col
)
```

Parameters

col
The position where the new column must be inserted.

See Also

TableNode Members
TableNode Class

TableNode.insertRow Method

Inserts a row in the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void insertRow (
    int row
)
```

Parameters

row
The position where the new row should be inserted.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.loadFromJson Method

Loads the node from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.loadFromXml Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An **XmlElement** containing the TableNode's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

    Rectangle2D oldBounds
)
```

Parameters

oldBounds

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.readExternal Method

Implements Externalizable.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.redimTable Method

Sets the number of rows and columns.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void redimTable (
    int cols,
    int rows
)
```

Parameters

cols
The new number of columns.

rows
The new number of rows.

See Also

TableNode Members

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.resizeToFitImage Method

Resizes a table so that it will be as big as the image displayed in the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void resizeToFitImage ()
```

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.resizeToFitText Method

Resizes the columns and rows so that the cells are large enough to fit their text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void resizeToFitText (
    boolean ignoreCaption
)
```

Parameters

ignoreCaption
false if the caption bar should be resized too to fit the caption text; otherwise **true**.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.restoreProperties Method

DiagramItem.restoreProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void restoreProperties (
    DiagramItemProperties props
)
```

Parameters

props

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.saveProperties Method

DiagramItem.saveProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
protected void saveProperties (
    DiagramItemProperties props
)
```

Parameters

props

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.saveToJson Method

Saves the node as a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj

A JsonObject instance to contain the serialized data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.saveToXml Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An **XmlElement** the TableNode's data are stored.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.scaleElements Method

DiagramNode.scaleElements override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void scaleElements (
    float scale
)
```

Parameters

scale
The value by which to multiply node elements' sizes.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setAllowResizeColumns Method

Sets a value indicating whether users are allowed to resize table columns.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowResizeColumns (
    boolean value
)
```

Parameters

value
true to let users resize columns, or **false** otherwise.

Remarks

A column can be resized by dragging its right border. If the ColumnStyle property of a column is set to AutoWidth, it is automatically reset to FixedWidth when the column is resized. Rightmost columns always fill all remaining space in their tables and cannot be resized.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace
getAllowResizeColumns Method
setAllowResizeRows Method

TableNode.setAllowResizeRows Method

Sets a value indicating whether users are allowed to resize table rows.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAllowResizeRows (
    boolean value
)
```

Parameters

value
true to let users resize rows, or **false** otherwise.

Remarks

A row can be resized by dragging its bottom border.

setAllowResizeColumns Method

TableNode.setCaption Method

Sets the caption text of a table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCaption (
    String value
)
```

Parameters

value
A String object containing the caption text.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setCaptionBackBrush Method

Sets the brush used to paint the caption bar of this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCaptionBackBrush (
    Brush value
)
```

Parameters

value
An instance of a Brush -derived class.

Remarks

If there is no brush assigned to this property, the caption bar is painted using the Brush property of the TableNode class.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace
CaptionHeight Property

CaptionBrush Property
DividerPen Property

TableNode.setCaptionBrush Method

Sets the brush used to draw the table's caption text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCaptionBrush (
    Brush value
)
```

Parameters

value
A Brush object representing the color of the caption text.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setCaptionFormat Method

Sets a TextFormat object specifying how to format and align the caption text.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCaptionFormat (
    TextFormat value
)
```

Parameters

value
A TextFormat object specifying the caption format and alignment.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setCaptionHeight Method

Sets the height of the caption bar of the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCaptionHeight (
    float value
)
```

Parameters

value
A float value specifying the height of the table caption bar.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setCellCustomDraw Method

Sets the type of custom drawing performed on the table cells.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCellCustomDraw (
    CustomDraw value
)
```

Parameters

value
A member of the CustomDraw enumeration.

Remarks

This property allows running custom painting code for the cells of a table. That code must execute in response to the drawCell event. There are several modes of custom painting, allowing the custom code to paint the cell entirely, or do that in addition to default rendering.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

setCustomDraw Method

TableNode.setCellFrameStyle Method

Sets the style of the cell frame lines.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCellFrameStyle (
    CellFrameStyle value
)
```

Parameters

value
A member of the CellFrameStyle enumeration.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setCellTextBrush Method

Sets the color used to draw the text in this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCellTextBrush (
    Brush value
)
```

Parameters

value
A Brush object representing the text color.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setColumnCount Method

Sets the number of columns of this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setColumnCount (
    int value
)
```

Parameters

value
An integer value specifying the number of columns in this table.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setColumnWidth Method

Sets the initial width of the columns of this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setColumnWidth (
    float value
)
```

Parameters

value
A **float** value specifying the initial width of columns added to this table.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setConnectionStyle Method

Sets a value indicating whether links should connect to the rows of this table or to the table as an integral entity.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setConnectionStyle (
    TableConnectionStyle value
)
```

Parameters

value
A member of the TableConnectionStyle enumeration.

Remarks

There are three possible ways to relate tables to other nodes. This property specifies how users are allowed to create such relations:

- Rows - relation ends are the rows of a table. A link connected to the table is connected to a particular row. This mode is convenient for database diagrams.
- **Table** - relations target the table as a whole entity, and not any particular row. This mode is convenient for class diagrams.
- **Both** - a mixed mode where links can target either a row of the table or the table itself.

Programmatically, links can be connected to a table in any way, regardless of the ConnectionStyle. **ConnectionStyle** value is considered only when end-users draw links to or from a table. To link to a table as an entity and not to a specific row, pass -1 as row argument of the createDiagramLink method.

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setCurrentRow Method

Scrolls the table to the specified row.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setCurrentRow (
    int value
)
```

Parameters

value
An integer value specifying the index of the row that should be scrolled to the top of the table.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setCustomDraw Method

Sets the type of custom drawing performed on this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCustomDraw (
    CustomDraw value
)
```

Parameters

value
A member of the CustomDraw enumeration.

Remarks

This property allows running custom painting code for a table. That code must execute in response to the drawNode event. There are several modes of custom painting, allowing the custom code to paint the table entirely, or do that in addition to default rendering.

setCellCustomDraw Method

TableNode.setDividerPen Method

Sets the Pen used to draw the the divider line between node's caption bar and content area.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDividerPen (
    Pen value
)
```

Parameters

value
A Pen instance.

Remarks

If **DividerPen** is not set, the divider line is drawn using the pen assigned to Pen property.

CaptionBackBrush Property

TableNode.setEditedText Method

Implements InplaceEditable.setEditedText. Assigns the edited text to the table's caption after in-place edit operation completes successfully.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEditedText (
    String newText
)
```

Parameters

newText
The new text of the table's caption.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setEnableStyledText Method

Sets a value indicating whether the text displayed inside a table contains formatting tags which should be processed by JDiagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setEnableStyledText (
    boolean value
)
```

Parameters

value
true if JDiagram should process formatting tags when rendering text in this table, otherwise **false**.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setFont Method

Sets the font used to draw the text displayed in this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setFont (
    Font value
)
```

Parameters

value
A Font object representing the table font.

com.mindfusion.diagramming Namespace

TableNode.setImage Method

Sets the image that should be displayed inside this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImage (
    Image value
)
```

Parameters

value
An instance of the **java.awt.Image** class.

See Also

TableNode Members

setImageAlign Method
setImagePadding Method

TableNode.setImageAlign Method

Sets the alignment of the table image relative to the boundaries of the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImageAlign (
    ImageAlign value
)
```

Parameters

value
A member of the ImageAlign enumeration.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace
setImage Method
setImagePadding Method

TableNode.setImagePadding Method

Sets the padding distance between node's borders and Image.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setImagePadding (
    Thickness value
)
```

Parameters

value
A Thickness value specifying padding distance.

See Also

TableNode.setOffsetHeaderRows Method

Sets a value indicating whether the table cells should be offset to the right to accommodate for the expand buttons displayed inside header rows.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setOffsetHeaderRows (
    boolean value
)
```

Parameters

value
true if table cells should be offset to the right, otherwise **false**.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setReflexive Method

Invoked to let a node set the shape of a reflexive link connected to it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void setReflexive (
    DiagramLink link
)
```

Parameters

link
Reference to the link.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setRowAnchorPattern Method

Sets the default row AnchorPattern. A link is aligned to the points of this pattern if the row the link connects to doesn't have an **AnchorPattern** defined for it.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRowAnchorPattern (
    AnchorPattern value
)
```

Parameters

value
An AnchorPattern object representing the set of anchorpoints used when connecting links to the rows of this table.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setRowCount Method

Sets the number of rows of this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRowCount (
    int value
)
```

Parameters

value
An integer value specifying the number of rows in this table.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setRowHeight Method

Sets the initial height of the rows of this table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setRowHeight (
    float value
)
```

Parameters

value
A **float** value specifying the initial height of rows added to this table.

See Also

TableNode Members
TableNode Class
com.mindfusion.diagramming Namespace

TableNode.setScrollable Method

Sets a value indicating whether users are allowed to scroll the table.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setScrollable (
    boolean value
)
```

Parameters

value
true if users are allowed to scroll the table, otherwise **false**.

Remarks

A button containing up and down arrows appears in the caption bar of a table for which scrolling is enabled. If a user clicks these arrows, table rows scroll up or down. The table can always be scrolled programmatically using the CurrentRow property.

The appearance of the scroll icons can be customized by setting Renderers.ScrollIconRenderer.

TableNodeStyle Members

Represents a reusable set of properties that define the appearance of table nodes.

The following tables list the members exposed by the TableNodeStyle type.

Public Constructors

	Name	Description
	TableNodeStyle	Initializes a new instance of the **TableNodeStyle** class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from Style.)
	getBrush	Gets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	getCaptionBackBrush	Gets the brush used to paint the caption bar of this table.
	getCellTextBrush	Gets the brush used to paint texts inside table cells.
	getEffects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	getFontFamily	Gets the font family of the item text. (Inherited from DiagramItemStyle.)
	getFontSize	Gets the font size of the item text. (Inherited from DiagramItemStyle.)
	getFontStyle	Gets the font style of the item text. (Inherited from DiagramItemStyle.)
	getFontUnit	Gets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	getShadowBrush	Gets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	getStroke	Gets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	getStrokeThickness	Gets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
	init	Returns a TableNodeStyleBuilder object used to configure this TableNodeStyle instance.
	readExternal	**Externalizable.readExternal** implementation. (Inherited from Style.)
S	registerType	Associates a type with an alias. The alias is used when saving and loading objects of the specified type during style serialization and deserialization. (Inherited from Style.)
	removePropertyChangeListener	(Inherited from Style.)

	setBrush	Sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	setCaptionBackBrush	Sets the brush used to paint the caption bar of this table.
	setCellTextBrush	Gets the brush used to paint texts inside table cells.
	setFontFamily	Sets the font family of the item text. (Inherited from DiagramItemStyle.)
	setFontSize	Sets the font size of the item text. (Inherited from DiagramItemStyle.)
	setFontStyle	Sets the font style of the item text. (Inherited from DiagramItemStyle.)
	setFontUnit	Sets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	setShadowBrush	Sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	setStroke	Sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	setStrokeThickness	Sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
S	with	Returns a TableNodeStyleBuilder object used to configure and create new TableNodeStyle instances.
	writeExternal	**Externalizable.writeExternal** implementation. (Inherited from Style.)

Protected Methods

	Name	Description
	getValue	Gets the value of the specified property. (Inherited from Style.)
	isPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	loadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	loadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	registerProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	saveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	saveToXml	Saves the style content into an XML element. (Inherited from Style.)

	setValue	Sets the value of the specified property. (Inherited from Style.)
	unsetValue	Clears the value of the specified property. (Inherited from Style.)

Theme Methods

Theme.addThemeListener Method

Registers listener so that it will receive events when the theme changes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addThemeListener (
    ThemeListener listener
```

```
)
```

Parameters

listener
An object implementing the ThemeListener interface.

See Also

Theme Members
Theme Class
com.mindfusion.diagramming Namespace

Theme.loadFromString Method

Loads the theme from an XML string.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromString (
    String xml
)
```

Parameters

xml
The string to load from.

See Also

Theme Members
Theme Class
com.mindfusion.diagramming Namespace

Theme.loadFromXml Method

Loads the theme from an XML file.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void loadFromXml (
    String fileName
)
```

Parameters

fileName

The name of the file to load from.

TopologicalLayout Class

Implements a topological ordering.

Syntax

Java
`public class TopologicalLayout extends AbstractLayout`

Remarks

The algorithm arranges nodes in a row or a column (depending on the value of the Orientation property) in such a way that there are as fewer back links as possible. The links connecting nonadjacent nodes are rendered as arcs. The links connecting adjacent nodes are rendered either as arcs or as straight lines, depending on the BendAdjacentLinks property. The amplitude of the link arcs is proportional to the distance between the connected nodes.

All forward links are rendered at one side of the nodes and all back links are rendered at the opposite side. Thus, all bent links follow the same rotation direction.

TopologicalLayout Members

Implements a topological ordering.

The following tables list the members exposed by the TopologicalLayout type.

Public Constructors

	Name	Description
	TopologicalLayout	Initializes a new instance of the CircularLayout class with the default settings.

Public Methods

	Name	Description
	arrange	Overloaded.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getBendAdjacentLinks	Gets a value indicating whether to bend links connecting adjacent nodes or draw them as straight lines.
	getDirection	Gets the direction of the arranged diagram.
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getNodeDistance	Gets the distance between adjecent nodes in the diagram.
	getOrientation	Gets the overall orientation of the arranged diagram.
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	init	Returns a TopologicalLayoutBuilder object used to configure this TopologicalLayout instance.
S	removeMidleSegmentPoint	(Inherited from AbstractLayout.)

	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setBendAdjacentLinks	Sets a value indicating whether to bend links connecting adjacent nodes or draw them as straight lines.
	setDirection	Sets the direction of the arranged diagram.
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setNodeDistance	Sets the distance between adjecent nodes in the diagram.
	setOrientation	Sets the overall orientation of the arranged diagram.
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
S	with	Returns a TopologicalLayoutBuilder object used to configure and create new TopologicalLayout instances.

TopologicalLayout.arrange Method (Diagram)

Applies the layout on the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram
)
```

Parameters

diagram
The Diagram that should be arranged.

Return Value

See Also

arrange Method Overload List
TopologicalLayout Members
TopologicalLayout Class
com.mindfusion.diagramming Namespace

TopologicalLayout.arrange Method (Diagram, DiagramItemList)

Applies the layout on the specified subset of items from the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram
The Diagram that should be arranged.

items
A collection of nodes and links from diagram that define the subgraph to arrange.

Return Value

See Also

arrange Method Overload List
TopologicalLayout Members
TopologicalLayout Class
com.mindfusion.diagramming Namespace

TopologicalLayout.getBendAdjacentLinks Method

Gets a value indicating whether to bend links connecting adjacent nodes or draw them as straight lines.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getBendAdjacentLinks ()
```

Return Value

true to bend links connecting adjecent nodes; **false**, to draw them as straight lines. The default is **false**.

See Also

TopologicalLayout Members
TopologicalLayout Class
com.mindfusion.diagramming Namespace

TopologicalLayout.getDirection Method

Gets the direction of the arranged diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Direction getDirection ()
```

Return Value

A member of the Direction enumeration. The default is Straight.

Remarks

If Orientation is set to Horizontal, Direction.Straight stands for "left to right" and Direction.Reversed for "right to left". If Orientation is set to Vertical, Direction.Straight stands for "top to bottom" and Direction.Reversed for "bottom to top".

TopologicalLayout.getNodeDistance Method

Gets the distance between adjecent nodes in the diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getNodeDistance ()
```

Return Value

A float value specifying the distance between adjacent nodes. The default is 20.

See Also

TopologicalLayout Members
TopologicalLayout Class
com.mindfusion.diagramming Namespace

TopologicalLayout.getOrientation Method

Gets the overall orientation of the arranged diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Orientation getOrientation ()
```

Return Value

A member of the Orientation enumeration. The default is Horizontal.

See Also

TopologicalLayout Members
TopologicalLayout Class
com.mindfusion.diagramming Namespace

TopologicalLayout.init Method

Returns a TopologicalLayoutBuilder object used to configure this TopologicalLayout instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public TopologicalLayoutBuilder init ()
```

Return Value

A **TopologicalLayoutBuilder** instance.

See Also

TopologicalLayout Members
TopologicalLayout Class
com.mindfusion.diagramming Namespace

TopologicalLayout.setBendAdjacentLinks Method

Sets a value indicating whether to bend links connecting adjacent nodes or draw them as straight lines.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setBendAdjacentLinks (
    boolean value
)
```

Parameters

value
true to bend links connecting adjacent nodes; false, to draw them as straight lines. The default is false.

Remarks

This property applies only to forward links. Back links connecting adjacent nodes are always rendered as bent.

TreeLayout Class

Implements several algorithms for arranging tree structures.

Syntax

```
Java
public class TreeLayout implements Layout
```

Remarks

Set the Type property of a **TreeLayout** instance to select which tree layout algorithm to run, and call the arrange method to apply the layout on a tree/subtree in the current diagram.

As long as the graph is a tree, the algorithm can find the root node automatically. You can override it by setting the Root property, e.g. in order to arrange only a selected branch of the tree. The distance between the root and the second level and between all subsequent levels can be set through the LevelDistance property. The distance between adjacent nodes in the same level is set through NodeDistance.

In addition to arranging the tree nodes, **TreeLayout** also sets the shape of links as set through its LinkStyle property. Anchoring specifies whether the links should be attached to the anchor points of tree nodes. Note that links that are not part of the tree are ignored, e.g. graph links that go in opposite direction of the general parent-to-child flow or cross-links that connect different tree branches. The tree layout algorithm produces best results if it can place link ends at arbitrary positions over nodes' outlines, that is, when using the Ignore value. If your application logic requires links to be always attached to anchor points, use the other two values. In such cases Reassign would yield better results. You can post-process such links after calling **arrange**, e.g. by setting their ControlPoints coordinates or by calling their route method.

By default, the order of child nodes arranged under a parent corresponds to the order of links in the parent's OutgoingLinks collection. The Balance property can be set to Preserve to keep the original geometric order of child nodes when arranging them under their parent. This can be used to arrange tree branches in a specific order by first placing them in increasing horizontal or vertical positions. Another

possibility is to apply **TreeLayout** from nodeModified handler to let users rearrange the tree branches by dragging and dropping a node.

TreeLayout Members

Implements several algorithms for arranging tree structures.

The following tables list the members exposed by the TreeLayout type.

Public Constructors

	Name	Description
	TreeLayout	Overloaded. Initializes a new **TreeLayout** instance.

Public Methods

	Name	Description
	arrange	Arranges the specified diagram.
	getAnchoring	Gets a value indicating how links will be aligned to the anchor points of tree nodes.
	getBalance	Gets a value indicating the ordering of the child nodes in order to produce layouts with custom balance.
	getCompactAssistants	Gets a value indicating whether the "assistant" nodes on the same side of a single parent are arranged as close enough to each other as possible. Turning this off will force the nodes on one side to be aligned with their counterparts in the other and occasionally leaving space between adjacent branches.
	getDirection	Gets a value indicating in what direction child nodes should be placed relatively to their parent nodes.
	getEnableAssistants	Gets a value indicating whether the "assistant" trait is regarded when performing the layout.
	getIgnoreLinkDirection	Gets a value indicating whether the direction of links should be ignored.
	getKeepGroupLayout	Gets a value indicating whether groups of diagram nodes should be treated as integral nodes in the tree that will be laid out.
	getKeepRootPosition	Gets a value indicating whether the root node should be kept at its original position.

	getLevelDistance	Gets the desired distance between tree levels.
	getLinkStyle	Gets what style is assigned to the links processed by the **TreeLayout**.
	getNodeDistance	Gets the desired distance between nodes on the same level.
	getReversedLinks	Gets a value indicating which direction of links should be considered the parent-to-child one.
	getRoot	Gets the node which will be used as root of the tree.
	getStretchFactor	Gets a value defining the elliptic factor used with radial layouts.
	getType	Gets the layout mode.
	getXGap	Gets a value indicating how much horizontal space to leave between the document boundaries and the tree.
	getYGap	Gets a value indicating how much vertical space to leave between the document boundaries and the tree.
	init	Returns a TreeLayoutBuilder object used to configure this TreeLayout instance.
	setAnchoring	Sets a value indicating how links should be aligned to the anchor points of tree nodes.
	setBalance	Sets a value indicating the ordering of the child nodes in order to produce layouts with custom balance.
	setCompactAssistants	Sets a value indicating whether the "assistant" nodes on the same side of a single parent are arranged as close enough to each other as possible. Turning this off will force the nodes on one side to be aligned with their counterparts in the other and occasionally leaving space between adjacent branches.
	setDirection	Sets a value indicating in what direction child nodes should be placed relatively to their parent nodes.
	setEnableAssistants	Sets a value indicating whether the "assistant" trait is regarded when performing the layout.
	setIgnoreLinkDirection	Sets a value indicating whether the direction of links should be ignored.
	setKeepGroupLayout	Sets a value indicating whether groups of diagram nodes should be treated as integral nodes in the tree that will be laid out.
	setKeepRootPosition	Sets a value indicating whether the root node should be kept at its original position.
	setLevelDistance	Sets the desired distance between tree levels.
	setLinkStyle	Sets what style should be assigned to the links processed by the layout algorithm.
	setNodeDistance	Sets the desired distance between nodes on the same level.

	setReversedLinks	Sets a value indicating which direction of links should be considered the parent-to-child one.
	setRoot	Sets the object which will be used as root of the tree.
	setStretchFactor	Sets a value defining the elliptic factor used with radial layouts.
	setType	Sets the layout mode.
	setXGap	Sets a value indicating how much horizontal space to leave between the document boundaries and the tree.
	setYGap	Sets a value indicating how much vertical space to leave between the document boundaries and the tree.
S	with	Returns a TreeLayoutBuilder object used to configure and create new TreeLayout instances.

TreeLayout Constructor (DiagramNode, TreeLayoutType)

Initializes a new instance of the TreeLayout class, specifying the root node and layout mode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeLayout (
    DiagramNode root,
    TreeLayoutType type
)
```

Parameters

root
A DiagramNode -derived object representing the tree root node.

type
A member of the TreeLayoutType enumeration.

See Also

TreeLayout Constructor Overload List
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout Constructor (DiagramNode, TreeLayoutType, boolean, TreeLayoutLinkType, TreeLayoutDirection, float, float, boolean, float, float)

Initializes a new instance of the TreeLayout class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeLayout (
    DiagramNode root,
    TreeLayoutType type,
    boolean reversedLinks,
    TreeLayoutLinkType linkStyle,
    TreeLayoutDirection direction,
    float levelDistance,
    float nodeDistance,
    boolean keepRootPosition,
    float xGap,
    float yGap
)
```

Parameters

root
A DiagramNode -derived object representing the tree root node.

type
A member of the TreeLayoutType enumeration.

reversedLinks
true if the parent-to-child directionin the tree is considered to be the one from links destination nodes to links origin nodes, otherwise **false**.

linkStyle
A member of the TreeLayoutLinkType enumeration.

direction
A member of the TreeLayoutDirection enumeration.

levelDistance
A float value specifying the distance between tree levels.

nodeDistance
A float value specifying the distance between sibling nodes.

keepRootPosition
true if the root positionshould be preserved, otherwise false.

xGap
A float value specifying the horizontal offsetfrom the left document border.

yGap
A float value specifying the vertical offsetfrom the top document border.

TreeLayout Constructor (DiagramNode, TreeLayoutType, boolean, TreeLayoutLinkType, TreeLayoutDirection, float, float, boolean, float, float, boolean)

Initializes a new instance of the TreeLayout class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeLayout (
    DiagramNode root,
    TreeLayoutType type,
    boolean reversedLinks,
    TreeLayoutLinkType linkStyle,
    TreeLayoutDirection direction,
    float levelDistance,
    float nodeDistance,
    boolean keepRootPosition,
    float xGap,
    float yGap,
    boolean keepGroupLayout
)
```

Parameters

root
A DiagramNode -derived object representing the tree root node.

type
A member of the TreeLayoutType enumeration.

reversedLinks
true if the parent-to-child directionin the tree is considered to be the one from links destination nodes to links origin nodes, otherwise **false**.

linkStyle
A member of the TreeLayoutLinkType enumeration.

direction

A member of the TreeLayoutDirection enumeration.

levelDistance
A float value specifying the distance between tree levels.

nodeDistance
A float value specifying the distance between sibling nodes.

keepRootPosition
true if the root positionshould be preserved, otherwise false.

xGap
A float value specifying the horizontal offsetfrom the left document border.

yGap
A float value specifying the vertical offsetfrom the top document border.

keepGroupLayout
true if the relative position ofnodes within groups should be preserved, otherwise false.

Initializes a new instance of the TreeLayout class, specifying the layout mode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeLayout (
    TreeLayoutType type
)
```

Parameters

type
A member of the TreeLayoutType enumeration.

See Also

TreeLayout Constructor Overload List
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout Methods

TreeLayout.arrange Method

Arranges the specified diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean arrange (
    Diagram chart
)
```

Parameters

chart
The Diagram to arrange.

Return Value

true if the tree is arranged successfully, or **false** if JDiagram cannot find the tree root, for example, when the setIgnoreLinkDirection method is called and the tree root is not specified by the application.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getAnchoring Method

Gets a value indicating how links will be aligned to the anchor points of tree nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Anchoring getAnchoring ()
```

Return Value

A member of the Anchoring enumeration.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getBalance Method

Gets a value indicating the ordering of the child nodes in order to produce layouts with custom balance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeLayoutBalance getBalance ()
```

Return Value

A member of the TreeLayoutBalance enumeration.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getCompactAssistants Method

Gets a value indicating whether the "assistant" nodes on the same side of a single parent are arranged as close enough to each other as possible. Turning this off will force the nodes on one side to be aligned with their counterparts in the other and occasionally leaving space between adjacent branches.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getCompactAssistants ()
```

Return Value

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getDirection Method

Gets a value indicating in what direction child nodes should be placed relatively to their parent nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeLayoutDirection getDirection ()
```

Return Value

A member of the TreeLayoutDirection enumeration.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getEnableAssistants Method

Gets a value indicating whether the "assistant" trait is regarded when performing the layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getEnableAssistants ()
```

Return Value

true to enable assistant nodes, otherwise **false**; the default value is **false**.

Remarks

Enabling this property lets you create organizational charts as in MS office. To designate some nodes as assistants, assign **true** as a value for the TreeLayoutTraits.Assistant key in the node's LayoutTraits.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getIgnoreLinkDirection Method

Gets a value indicating whether the direction of links should be ignored.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getIgnoreLinkDirection ()
```

Return Value

true if the direction of links will be ignored when arranging a tree, otherwise **false**.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getKeepGroupLayout Method

Gets a value indicating whether groups of diagram nodes should be treated as integral nodes in the tree that will be laid out.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getKeepGroupLayout ()
```

Return Value

true if the relative position of nodes within groups should be preserved, otherwise **false**.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getKeepRootPosition Method

Gets a value indicating whether the root node should be kept at its original position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getKeepRootPosition ()
```

Return Value

true if the root position will be preserved, otherwise **false**.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getLevelDistance Method

Gets the desired distance between tree levels.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getLevelDistance ()
```

Return Value

A float value specifying the distance between tree levels.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getLinkStyle Method

Gets what style is assigned to the links processed by the TreeLayout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeLayoutLinkType getLinkStyle ()
```

Return Value

A member of the TreeLayoutLinkType enumeration.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getNodeDistance Method

Gets the desired distance between nodes on the same level.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getNodeDistance ()
```

Return Value

A float value specifying the distance between sibling nodes.

See Also

TreeLayout Members
TreeLayout Class

TreeLayout.getReversedLinks Method

Gets a value indicating which direction of links should be considered the parent-to-child one.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getReversedLinks ()
```

Return Value

true if the parent-to-child direction in the tree is considered to be the one from links destination nodes to links origin nodes, otherwise **false**.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getRoot Method

Gets the node which will be used as root of the tree.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public DiagramNode getRoot ()
```

Return Value

A DiagramNode -derived object representing the tree root node.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getStretchFactor Method

Gets a value defining the elliptic factor used with radial layouts.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getStretchFactor ()
```

Return Value

A float multiplier that is applied to the horizontal distance between nodes in a radial layout.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getType Method

Gets the layout mode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public TreeLayoutType getType ()
```

Return Value

A member of the TreeLayoutType enumeration.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getXGap Method

Gets a value indicating how much horizontal space to leave between the document boundaries and the tree.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getXGap ()
```

Return Value

A **float** value specifying the horizontal offset from the left document border.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.getYGap Method

Gets a value indicating how much vertical space to leave between the document boundaries and the tree.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getYGap ()
```

Return Value

A **float** value specifying the vertical offset from the top document border.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.init Method

Returns a TreeLayoutBuilder object used to configure this TreeLayout instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeLayoutBuilder init ()
```

Return Value

A **TreeLayoutBuilder** instance.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.setAnchoring Method

Sets a value indicating how links should be aligned to the anchor points of tree nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setAnchoring (
    Anchoring value
)
```

Parameters

value
A member of the Anchoring enumeration.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.setBalance Method

Sets a value indicating the ordering of the child nodes in order to produce layouts with custom balance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setBalance (
    TreeLayoutBalance value
)
```

Parameters

value
A member of the TreeLayoutBalance enumeration.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.setCompactAssistants Method

Sets a value indicating whether the "assistant" nodes on the same side of a single parent are arranged as close enough to each other as possible. Turning this off will force the nodes on one side to be aligned with their counterparts in the other and occasionally leaving space between adjacent branches.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setCompactAssistants (
    boolean value
)
```

Parameters

value

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.setDirection Method

Sets a value indicating in what direction child nodes should be placed relatively to their parent nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setDirection (
    TreeLayoutDirection value
)
```

Parameters

value
A member of the TreeLayoutDirection enumeration.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.setEnableAssistants Method

Sets a value indicating whether the "assistant" trait is regarded when performing the layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
```

```
public void setEnableAssistants (
    boolean value
)
```

Parameters

value
true to enable assistant nodes, otherwise **false**; the default value is **false**.

Remarks

Enabling this property lets you create organizational charts as in MS office. To designate some nodes as assistants, assign true as a value for the TreeLayoutTraits.Assistant key in the node's LayoutTraits.

TreeLayout.setIgnoreLinkDirection Method

Sets a value indicating whether the direction of links should be ignored.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIgnoreLinkDirection (
    boolean value
)
```

Parameters

value
true if the direction of links should be ignored when arranging a tree, otherwise **false**.

TreeLayout.setLevelDistance Method

Sets the desired distance between tree levels.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setLevelDistance (
    float value
)
```

Parameters

value
A float value specifying the distance between tree levels.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.setLinkStyle Method

Sets what style should be assigned to the links processed by the layout algorithm.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLinkStyle (
    TreeLayoutLinkType value
)
```

Parameters

value
A member of the TreeLayoutLinkType enumeration.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.setNodeDistance Method

Sets the desired distance between nodes on the same level.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setNodeDistance (
    float value
)
```

Parameters

value
A float value specifying the distance between sibling nodes.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.setReversedLinks Method

Sets a value indicating which direction of links should be considered the parent-to-child one.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setReversedLinks (
    boolean value
)
```

Parameters

value
true if the parent-to-child direction in the tree is considered to be the one from links destination nodes to links origin nodes, otherwise **false**.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.setRoot Method

Sets the object which will be used as root of the tree.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setRoot (
    DiagramNode value
)
```

Parameters

value
A DiagramNode -derived object representing the tree root node.

See Also

TreeLayout Members
TreeLayout Class

TreeLayout.setStretchFactor Method

Sets a value defining the elliptic factor used with radial layouts.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setStretchFactor (
    float value
)
```

Parameters

value
A float multiplier that is applied to the horizontal distance between nodes in a radial layout.

com.mindfusion.diagramming Namespace

TreeLayout.setType Method

Sets the layout mode.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setType (
    TreeLayoutType value
)
```

Parameters

value
A member of the TreeLayoutType enumeration.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.setXGap Method

Sets a value indicating how much horizontal space to leave between the document boundaries and the tree.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setXGap (
    float value
)
```

Parameters

value
A **float** value specifying the horizontal offset from the left document border.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.setYGap Method

Sets a value indicating how much vertical space to leave between the document boundaries and the tree.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setYGap (
    float value
)
```

Parameters

value
A **float** value specifying the vertical offset from the top document border.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayout.with Method

Returns a TreeLayoutBuilder object used to configure and create new TreeLayout instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public static TreeLayoutBuilder with ()`

Return Value

A **TreeLayoutBuilder** instance.

See Also

TreeLayout Members
TreeLayout Class
com.mindfusion.diagramming Namespace

TreeLayoutBalance Enumeration

Specifies how to order child nodes in order to produce tree layouts with custom balance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum TreeLayoutBalance`

Members

	Member name	Description
	LeftHeavy	Indicates that the child nodes with most total children will be processed first, thus producing a left-heavy layout.
	Original	Indicates that the child order should not be changed.
	Preserve	Indicates that the layout will attempt to preserve the initial relative ordering of nodes.
	Reversed	Indicates that the child order should be reversed.
	RightHeavy	Indicates that the child nodes with least total children will be processed first, thus producing a right-heavy layout.

See Also

com.mindfusion.diagramming Namespace

TreeLayoutLinkType Enumeration

The members of this enumeration specify what style to assign to the links processed by TreeLayout. They can be used as parameters of the setLinkStyle method of the **TreeLayout** class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum TreeLayoutLinkType`

Members

	Member name	Description
	Cascading2	Each link should be a cascade of two orthogonal straight line segments.
	Cascading3	Each link should be a cascade of three orthogonal straight line segments.
	Rounded	Each link should consist of one Bezier segment.
	Straight	Each link should consist of on straight line segment.

See Also

com.mindfusion.diagramming Namespace

TreeLayoutType Enumeration

The members of this enumeration specify what the shape of a tree arranged by the TreeLayout class should be. They can be used as parameters of the setType method of the **TreeLayout** class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum TreeLayoutType`

Members

	Member name	Description
	Cascading	Windows Explorer- like tree.
	Centered	Center parent nodes above their children.
	Radial	The root node is at the center and each next level of children is further from the root. Each level is arranged on a circle around the root.

See Also

com.mindfusion.diagramming Namespace

TreeMapLayout Class

Implements a tree map layout algorithm.

Syntax

Java
`public class TreeMapLayout extends AbstractLayout`

Remarks

Tree maps represent hierarchies by nesting child nodes within their parents, where the areas of leaf nodes are proportional to their Weight values. Unlike other layout algorithms, **TreeMapLayout** expects hierarchies to be defined via grouping or containment (see attachTo method and ContainerNode class), and will ignore any links in the diagram.

The diagram area covered by the topmost nodes in a hierarchy is specified via the LayoutArea property. By default, the layout tries to keep the ratio of node sides as close as possible to one. However this could make it hard to distinguish separate levels of the hierarchy. To alleviate that, set Squarify to **false**, and child nodes will be arranged either as a row or a column inside their parent node, alternating directions for each level. The drawback is that when **Weight** ratios differ greatly or nodes contain many children, some nodes could end up with very narrow rectangles.

The padding size between parent nodes and their outermost children is specified via the ContainerPadding property. The padding size between child nodes is specified via Padding.

com.mindfusion.diagramming Namespace

TreeMapLayout Members

Implements a tree map layout algorithm.

The following tables list the members exposed by the TreeMapLayout type.

Public Constructors

	Name	Description
	TreeMapLayout	Initializes a new instance of the **TreeMapLayout** class with the default settings.

Public Methods

	Name	Description
	arrange	Applies the layout to the specified diagram.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getContainerPadding	Gets the padding inside containers.
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getLayoutArea	Gets the rectangle in which the layout will try to arrange the nodes, or **null**, to use the diagram bounds.
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getOrientation	Gets the orientation of the arranged diagram.
	getPadding	Gets the distance between adjacent nodes.
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	getSquarify	Gets a value indicating whether the layout should attempt to keep the dimension ratio of the nodes closer to 1.
	init	Returns a TreeMapLayoutBuilder object used to configure this TreeMapLayout instance.
	removeMidleSegmentPoint	(Inherited from AbstractLayout.)
	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setContainerPadding	Sets the padding inside containers.
	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)

	setLayoutArea	Sets the rectangle in which the layout will try to arrange the nodes, or null, to use the diagram bounds.
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setOrientation	Sets the orientation of the arranged diagram.
	setPadding	Sets the distance between adjacent nodes.
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
	setSquarify	Sets a value indicating whether the layout should attempt to keep the dimension ratio of the nodes closer to 1.
S	with	Returns a TreeMapLayoutBuilder object used to configure and create new TreeMapLayout instances.

Protected Methods

	Name	Description
	getDefaultMarginValue	Gets the default value of the **Margins** property.

See Also

TreeMapLayout Class
com.mindfusion.diagramming Namespace

TreeMapLayout Constructor

Initializes a new instance of the TreeMapLayout class with the default settings.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeMapLayout ()
```

See Also

TreeMapLayout Methods

TreeMapLayout.arrange Method

Applies the layout to the specified diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram

items

Return Value

See Also

TreeMapLayout Members
TreeMapLayout Class
com.mindfusion.diagramming Namespace

TreeMapLayout.getContainerPadding Method

Gets the padding inside containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getContainerPadding ()
```

Return Value

A **float** value specifying the padding size between parent nodes and their outermost children. The default value is 0.

See Also

TreeMapLayout Members
TreeMapLayout Class

TreeMapLayout.getDefaultMarginValue Method

Gets the default value of the Margins property.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected XDimension2D.Double getDefaultMarginValue ()
```

Return Value

See Also

TreeMapLayout Members
TreeMapLayout Class
com.mindfusion.diagramming Namespace

TreeMapLayout.getLayoutArea Method

Gets the rectangle in which the layout will try to arrange the nodes, or **null**, to use the diagram bounds.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D.Float getLayoutArea ()
```

Return Value

A **Rectangle2D** specifying the area where topmost nodes in the hierarchy are laid out. The default value is **null**.

Remarks

If this property is not set, the algorithm uses the value of diagram's Bounds property as target layout rectangle.

See Also

TreeMapLayout Members
TreeMapLayout Class
com.mindfusion.diagramming Namespace

TreeMapLayout.getOrientation Method

Gets the orientation of the arranged diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Orientation getOrientation ()
```

Return Value

A member of the Orientation enumeration. The default is Vertical.

Remarks

This value is used only when Squarify is set to **false**, and specifies the orientation of the topmost level of the hierarchy. The algorithm alternates the orientation of each subsequent level, arranging its nodes either in rows or columns.

See Also

TreeMapLayout Members
TreeMapLayout Class
com.mindfusion.diagramming Namespace

TreeMapLayout.getPadding Method

Gets the distance between adjacent nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getPadding ()
```

Return Value

A real number specifying the distance between adjacent nodes. The default is 1.

See Also

TreeMapLayout Members
TreeMapLayout Class
com.mindfusion.diagramming Namespace

TreeMapLayout.getSquarify Method

Gets a value indicating whether the layout should attempt to keep the dimension ratio of the nodes closer to 1.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getSquarify ()
```

Return Value

true to keep the ratio of node sides as close as possible to one, or **false** otherwise. The default value is **true**.

Remarks

If set to **false**, each level of the hierarchy is arranged in rows or columns with same height/width, which might create very narrow rectangles when Weight values differ greatly or nodes have many children. The alternating orientation between levels however helps to distinguish between different levels in the hierarchy. The initial direction of nodes (in topmost level) depends on the value of Orientation.

TreeMapLayout Members
TreeMapLayout Class
com.mindfusion.diagramming Namespace

TreeMapLayout.init Method

Returns a TreeMapLayoutBuilder object used to configure this TreeMapLayout instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public TreeMapLayoutBuilder init ()
```

Return Value

A **TreeMapLayoutBuilder** instance.

See Also

TreeMapLayout Members
TreeMapLayout Class
com.mindfusion.diagramming Namespace

TreeMapLayout.setContainerPadding Method

Sets the padding inside containers.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setContainerPadding (
    float value
)
```

Parameters

value
A **float** value specifying the padding size between parent nodes and their outermost children.

See Also

TreeMapLayout Members
TreeMapLayout Class
com.mindfusion.diagramming Namespace
Padding Property

TreeMapLayout.setLayoutArea Method

Sets the rectangle in which the layout will try to arrange the nodes, or null, to use the diagram bounds.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setLayoutArea (
    Rectangle2D.Float value
)
```

Parameters

value
A **Rectangle2D** specifying the area where topmost nodes in the hierarchy are laid out. The default value is **null**.

Remarks

If this property is not set, the algorithm uses the value of diagram's Bounds property as target layout rectangle.

TreeMapLayout Members
TreeMapLayout Class
com.mindfusion.diagramming Namespace

TreeMapLayout.setOrientation Method

Sets the orientation of the arranged diagram.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setOrientation (
    Orientation value
)
```

Parameters

value
A member of the Orientation enumeration. The default is Vertical.

See Also

TreeMapLayout Members
TreeMapLayout Class
com.mindfusion.diagramming Namespace

TreeMapLayout.setPadding Method

Sets the distance between adjacent nodes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setPadding (
    float value
)
```

Parameters

value
A real number specifying the distance between adjacent nodes.

TreeMapLayout Members
TreeMapLayout Class
com.mindfusion.diagramming Namespace
ContainerPadding Property

TreeMapLayout.setSquarify Method

Sets a value indicating whether the layout should attempt to keep the dimension ratio of the nodes closer to 1.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setSquarify (
    boolean value
)
```

Parameters

value
true to keep the ratio of node sides as close as possible to one, or **false** otherwise.

Remarks

If set to **false**, each level of the hierarchy is arranged in rows or columns with same height/width, which might create very narrow rectangles when Weight values differ greatly or nodes have many children. The alternating orientation between levels however helps to distinguish between different levels in the hierarchy. The initial direction of nodes (in topmost level) depends on the value of Orientation.

TreeMapLayout.with Method

Returns a TreeMapLayoutBuilder object used to configure and create new TreeMapLayout instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public static TreeMapLayoutBuilder with ()
```

Return Value

A **TreeMapLayoutBuilder** instance.

TreeViewConnectionPoint Members

The following tables list the members exposed by the TreeViewConnectionPoint type.

Public Constructors

	Name	Description
	TreeViewConnectionPoint	Overloaded.

Protected Fields

	Name	Description
	node	(Inherited from ConnectionPoint.)

Public Methods

	Name	Description
	addLinkToNode	ConnectionPoint.addLinkToNode override.
	anchorPointFromIndex	Returns the AnchorPoint instance with the specified index. (Inherited from ConnectionPoint.)
	calculateIntersections	Determines whether the end of a link should be aligned to the point where the node contour is intersected by the line connecting the centers of the connected nodes. (Inherited from ConnectionPoint.)
	canMoveLink	Checks whether the specified point, expressed in document coordinates, is a valid location for this connection point. (Inherited from ConnectionPoint.)
	getAnchorPos	Overloaded. (Inherited from ConnectionPoint.)
	getEndPoint	ConnectionPoint.getEndPoint override.
	getInitialPoint	ConnectionPoint.getInitialPoint override.
	getIntersection	ConnectionPoint.getIntersection override.
	getNodeRect	Returns the bounding rectangle of the node associated with this connection point. (Inherited from ConnectionPoint.)
	getRelativePosition	Gets the position of this connection point, relative to the associated node's bounding rectangle, expressed in

		percents. (Inherited from ConnectionPoint.)
	getRow	ConnectionPoint.getRow override.
	linkChanges	ConnectionPoint.linkChanges override.
	nodesIntersect	Checks whether the node associated with the current connection point and the node associated with the specified connection point intersect. (Inherited from ConnectionPoint.)
	readExternal	
	removeLinkFromNode	ConnectionPoint.removeLinkFromNode override.
	sameNode	Checks whether the current connection point and the specified connection point are associated with the same node. (Inherited from ConnectionPoint.)
	saveEndRelative	ConnectionPoint.saveEndRelative override.
	setRelativePosition	Sets the position of this connection point, relative to the associated node's bounding rectangle, expressed in percents. (Inherited from ConnectionPoint.)
	writeExternal	

Protected Methods

	Name	Description
	getIncoming	Gets a flag indicating whether this connection point is at the origin or the destination of the associated link. (Inherited from ConnectionPoint.)
	getLink	Gets the link associated with this connection point. (Inherited from ConnectionPoint.)
	getNearestBorderPoint	ConnectionPoint.getNearestBorderPoint override.
	getNode	Gets the node associated with this connection point. (Inherited from ConnectionPoint.)
	updateFromPoint	Updates the connection stated according to the specified point, without changing the related node.

TreeViewConnectionPoint Constructor (TreeViewNode, DiagramLink, boolean, TreeViewItem)

Initializes a new instance of the TreeViewConnectionPoint class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeViewConnectionPoint (
    TreeViewNode node,
    DiagramLink link,
    boolean incoming,
    TreeViewItem item
)
```

Parameters

node
A TreeViewNode instance.

link
A DiagramLink instance.

incoming
Specifies which end of the link is represented by this TreeViewConnectionPoint.

item
The TreeViewItem to which the link connects.

TreeViewConnectionStyle Enumeration

The members of this enumeration specify the possible ways to connect links to TreeViewNodes. They can be assigned to the setConnectionStyle property of TreeViewNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public enum TreeViewConnectionStyle`

Members

	Member name	Description
	Items	Users are allowed to draw relations to individual items of a TreeViewNode.
	Node	Users are allowed to draw relations to the TreeViewNode as an integral entity.

See Also

com.mindfusion.diagramming Namespace

TreeViewItem Class

Represents a constituent item of the hierarchy displayed inside a TreeViewNode.

Syntax

Java
`public class TreeViewItem implements RenderTextCallback, InplaceEditable, Externalizable`

Remarks

The items of a TreeViewNode can be traversed recursively starting from the node's RootItems. Given an item, you can find its parent and child items by calling getParent and getChildren.

If the ConnectionStyle of a node is set to Items, links connect to specific items of the node. Such links can be accessed by means of the IncomingLinks and OutgoingLinks collections.

TreeViewItem Members

Represents a constituent item of the hierarchy displayed inside a TreeViewNode.

The following tables list the members exposed by the TreeViewItem type.

Public Constructors

	Name	Description
	TreeViewItem	Overloaded.

Public Methods

	Name	Description
	clone	Creates a copy of this item.
	getBrush	Gets the brush used to paint item's background.
	getChildren	Gets a list of this item's children in the hierarchy.
	getEditRect	Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).
	getExpanded	Gets whether this item is expanded to show its children.
	getHeight	Gets the height of this item.
	getIncomingLinks	Gets a collection of all links that point to this item.
	getLabel	Gets the label of this item.
	getLabelBrush	Gets the brush used to draw this item's label text.
	getLabelFont	Gets the label font of this item.
	getOutgoingLinks	Gets a collection of all links that go out of this item.
	getParent	Gets the parent item of this item.
	getTag	Gets custom data associated with this item.
	getTextToEdit	Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when this item is edited in-place.
	loadFromXml	Loads the item content from an XML element.
	readExternal	Implements Externalizable.
	renderText	

	setBrush	Sets the brush used to paint item's background.
	setEditedText	Implements InplaceEditable.setEditedText. Assigns the edited text to the item after in-place edit operation completes successfully
	setExpanded	Sets whether this item is expanded to show its children.
	setHeight	Sets the height of this item.
	setImage	Sets the image that is displayed in this treeview item.
	setLabel	Sets the label of this item.
	setLabelBrush	Sets the brush used to draw this item's label text.
	setLabelFont	Sets the label font of this item.
	setTag	Sets custom data associated with this item.
	writeExternal	Implements Externalizable.

Protected Methods

	Name	Description
	loadFromJson	
	saveToJson	
	saveToXml	Saves the item content into an XML element.

com.mindfusion.diagramming Namespace

TreeViewItem Constructor ()

Initializes a new instance of the TreeViewItem class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeViewItem ()
```

See Also

TreeViewItem Constructor Overload List
TreeViewItem Class
com.mindfusion.diagramming Namespace

TreeViewItem Constructor (String)

Initializes a new instance of the TreeViewItem class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeViewItem (
    String label
)
```

Parameters

label
The text initially displayed by the item.

See Also

TreeViewItem Constructor Overload List
TreeViewItem Class
com.mindfusion.diagramming Namespace

TreeViewItem Constructor (TreeViewItem)

Initializes a new instance of the TreeViewItem class using the specified item as a prototype.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeViewItem (
    TreeViewItem prototype
```

```
)
```

Parameters

prototype
The treeview item to use as a prototype. The properties of the new treeview are initialized from the property values of prototype.

Remarks

This constructor copies the TreeViewItem property values from the specified prototype item.

TreeViewItem Methods

TreeViewItem.clone Method

Creates a copy of this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object clone ()
```

Return Value

An instance of the TreeViewItem class.

See Also

TreeViewItem Members
TreeViewItem Class
com.mindfusion.diagramming Namespace

TreeViewItem.getBrush Method

Gets the brush used to paint item's background.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush getBrush ()
```

Return Value

An instance of Brush -derived class. The default value is **null**.

Remarks

If this property is not set, item's background is painted using the parent node's Brush.

See Also

TreeViewItem Members
TreeViewItem Class

TreeViewItem.getChildren Method

Gets a list of this item's children in the hierarchy.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeItemList getChildren ()
```

Return Value

A list of child TreeViewItem objects.

See Also

TreeViewItem Members
TreeViewItem Class
com.mindfusion.diagramming Namespace
TreeViewNode.getRootItems Method

TreeViewItem.getEditRect Method

Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getEditRect (
    DiagramItem item,
    Point2D mousePosition
)
```

Parameters

item
The TreeViewNode whose item's text will be edited.

mousePosition
A **Point2D** instance specifying the current pointer position.

Return Value

A **Rectangle2D** specifying where the edit box should be placed.

See Also

TreeViewItem Members
TreeViewItem Class
com.mindfusion.diagramming Namespace

TreeViewItem.getExpanded Method

Gets whether this item is expanded to show its children.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getExpanded ()
```

Return Value

true to show the children of this item, otherwise **false**; the default value is **true**.

See Also

TreeViewItem Members
TreeViewItem Class
com.mindfusion.diagramming Namespace

TreeViewItem.getHeight Method

Gets the height of this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getHeight ()
```

Return Value

A float value specifying the item's height. The default value is 5.

See Also

TreeViewItem Members

TreeViewItem.getIncomingLinks Method

Gets a collection of all links that point to this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramLinkList getIncomingLinks ()
```

Return Value

This method returns a collection of all links that point to this item. Use it to access the links or get their number.

See Also

TreeViewItem Members

TreeViewItem.getParent Method

Gets the parent item of this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeViewItem getParent ()
```

Return Value

A TreeViewItem instance.

See Also

TreeViewItem Members
TreeViewItem Class
com.mindfusion.diagramming Namespace

TreeViewItem.getTag Method

Gets custom data associated with this item.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object getTag ()
```

Return Value

An instance of any class derived from **java.lang.Object**. The default value is null.

See Also

TreeViewItem Members
TreeViewItem Class
com.mindfusion.diagramming Namespace

TreeViewItem.getTextToEdit Method

Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when this item is edited in-place.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getTextToEdit ()
```

Return Value

A **String** specifying the item's text.

See Also

TreeViewItem.loadFromJson Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the item's data.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

TreeViewItem Members
TreeViewItem Class
com.mindfusion.diagramming Namespace

TreeViewItem.loadFromXml Method

Loads the item content from an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An XmlElement containing the link's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

TreeViewItem.saveToJson Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject where item's data is stored

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

TreeViewItem Members
TreeViewItem Class
com.mindfusion.diagramming Namespace

TreeViewItem.saveToXml Method

Saves the item content into an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An XmlElement the item's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

TreeViewItem.setBrush Method

Sets the brush used to paint item's background.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setBrush (
    Brush value
)
```

Parameters

value
An instance of Brush -derived class.

Remarks

If this property is not set, item's background is painted using the parent node's Brush.

TreeViewNode Class

Represents nodes that can draw hierarchical data.

Syntax

Java
`public class TreeViewNode extends DiagramNode implements RenderTextCallback, InplaceEditable, Scrollable`

Remarks

The root items displayed in the node can be accessed through the getRootItems method. New items can be added to and removed from the returned collection. The root items can have child items on their own and so on. For more information, refer to the TreeViewItem class.

The text and image displayed in the node caption can be customized through the setCaption and setCaptionImage methods respectively. The scroll position can be manipulated through setScrollPosition.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.DiagramItem
    com.mindfusion.diagramming.DiagramNode
      com.mindfusion.diagramming.TreeViewNode

TreeViewNode Members
com.mindfusion.diagramming Namespace

TreeViewNode Members

Represents nodes that can draw hierarchical data.

The following tables list the members exposed by the TreeViewNode type.

Public Constructors

	Name	Description
	TreeViewNode	Overloaded.

Protected Fields

	Name	Description
	allowIncomingLinks	(Inherited from DiagramNode.)
	allowOutgoingLinks	(Inherited from DiagramNode.)

	anchorPattern	(Inherited from DiagramNode.)
	AV_Cancel	(Inherited from DiagramNode.)
	AV_EndModIncoming	(Inherited from DiagramNode.)
	AV_EndModOutgoing	(Inherited from DiagramNode.)
	AV_StartModIncoming	(Inherited from DiagramNode.)
	AV_StartModOutgoing	(Inherited from DiagramNode.)
	AV_UpdateIncoming	(Inherited from DiagramNode.)
	AV_UpdateOutgoing	(Inherited from DiagramNode.)
	AV_UpdIntscIncoming	(Inherited from DiagramNode.)
	AV_UpdIntscOutgoing	(Inherited from DiagramNode.)
	AV_UpdPosIncoming	(Inherited from DiagramNode.)
	AV_UpdPosOutgoing	(Inherited from DiagramNode.)
	bounds	(Inherited from DiagramNode.)
	brush	(Inherited from DiagramItem.)
	cycleDetected	(Inherited from DiagramItem.)
	cycleProtect	(Inherited from DiagramItem.)
	enabledHandles	(Inherited from DiagramNode.)
	handlesStyle	(Inherited from DiagramNode.)
	incomingLinks	(Inherited from DiagramNode.)
	masterGroup	(Inherited from DiagramNode.)
	modifyDX	(Inherited from DiagramItem.)
	modifyDY	(Inherited from DiagramItem.)
	modifyHandle	(Inherited from DiagramItem.)
	modifying	(Inherited from DiagramItem.)
	obstacle	(Inherited from DiagramNode.)
	outgoingLinks	(Inherited from DiagramNode.)
	pen	(Inherited from DiagramItem.)
	ptEnd	(Inherited from DiagramItem.)
	ptMdfLast	(Inherited from DiagramItem.)
	ptOrg	(Inherited from DiagramItem.)
	ptSavedEnd	(Inherited from DiagramItem.)
	ptSavedOrg	(Inherited from DiagramItem.)
	savedBounds	(Inherited from DiagramNode.)

	subordinateGroup	(Inherited from DiagramItem.)

Public Methods

	Name	Description
	addLabel	Overloaded. (Inherited from DiagramNode.)
	as	Down-casts the item to specified type. (Inherited from DiagramItem.)
	attachTo	Overloaded. (Inherited from DiagramNode.)
	clone	Creates a copy of this item. (Inherited from DiagramItem.)
	containsPoint	Overloaded. (Inherited from DiagramNode.)
	createConnectionPoint	DiagramNode.createConnectionPoint override.
	createScrollCommand	Implements the Scrollable interface. Creates a ScrollTreeViewCmd instance that can be used to undo the scroll operation.
	detach	Detaches a node from its master group. (Inherited from DiagramNode.)
	getAllIncomingLinks	Gets a collection of all links entering this node. (Inherited from DiagramNode.)
	getAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	getAllOutgoingLinks	Gets a collection of all links going out of this node. (Inherited from DiagramNode.)
	getAllowIncomingLinks	Gets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	getAllowOutgoingLinks	Gets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	getAnchorPattern	Gets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)
	getBounds	Gets the node location and size. (Inherited from DiagramNode.)
	getBrush	Gets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	getCaption	Gets the text displayed as caption of the node.
	getCaptionHeight	Gets the height of the node's caption bar.
	getCaptionImage	Gets the image that is displayed in the caption.
	getCenter	Returns the center point of this node. (Inherited from DiagramNode.)
	getConnectionStyle	Gets a value indicating whether drawing a link from/to this node should connect an item or the whole node as an integral entity.

	getConstraints	Gets the movement and size constraints applied to a node. (Inherited from DiagramNode.)
	getContainer	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	getDividerPen	Gets the Pen used to draw the the divider line between node's caption bar and content area.
	getEditRect	Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).
	getEffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	getEffectiveFont	Gets the currently effective font of the item. This property returns getFont if it is not null, or a font with the DiagramItemStyle.getFontFamily, DiagramItemStyle.getFontSize, and DiagramItemStyle.getFontStyle properties of the item's style. (Inherited from DiagramItem.)
	getEffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	getEffectiveShadowBrush	Creates a Brush object representing the currently effective shadow brush of the item. This method returns a system brush corresponding to the item's getShadowBrush if the item's **getShadowBrush** is not null, or a system brush corresponding to the DiagramItemStyle.getShadowBrush property of the item's style. (Inherited from DiagramItem.)
	getEffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	getEffects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	getEnabledHandles	Gets a combination of NodeHandleType members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	getEnableStyledText	Gets a value indicating whether styled text rendering is enabled.
	getExpandable	Gets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	getExpanded	Gets a value indicating whether the tree branch that starts from a node is expanded or collapsed. (Inherited from DiagramNode.)
	getFlatItemList	Gets a list of all items of this node.
	getFont	Gets or the font used to render the node's caption.
	getHandlesStyle	Gets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)

	getHyperLink	Gets the hyperlink associated with an item. (Inherited from DiagramItem.)
	getId	Gets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	getIgnoreLayout	Gets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	getIncomingLinks	Gets the links coming into a node. (Inherited from DiagramNode.)
	getItemRect	Gets the location and size of the specified TreeViewItem.
	getLabels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	getLayerIndex	Gets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	getLayoutTraits	Returns a hashtable containing properties specific to layout algorithms. (Inherited from DiagramItem.)
	getLocalCenter	(Inherited from DiagramNode.)
	getLocked	Gets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	getMasterGroup	Gets the hierarchical group in which this node is a subordinate item. (Inherited from DiagramNode.)
	getMasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	getNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getObstacle	Gets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	getOpacity	Gets the opacity of this item. (Inherited from DiagramItem.)
	getOutgoingLinks	Gets the links going out from a node. (Inherited from DiagramNode.)
	getParent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	getPen	Gets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	getPrintable	Gets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	getRepaintRect	getRepaintRect override.
	getRootItems	Gets a list of the root TreeViewItem objects displayed in this node.
S	getRotatedBounds	Gets the bounding rectangle of this node, when it is rotated at the specified angle around the specified pivot.

		(Inherited from DiagramNode.)
	getRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	getRuntimeIndex	For internal use. (Inherited from DiagramItem.)
	getScrollable	Gets a value indicating whether users are allowed to scroll this tree view.
	getScrollbarLargeChange	Implements the Scrollable interface. Gets the amount to scroll by when the user clicks above or below the scrollbar thumb.
	getScrollbarMaximum	Implements the Scrollable interface. Gets the maximum scroll position.
	getScrollPosition	Gets the current scroll position.
	getSelected	Gets a value indicating whether this item is selected. (Inherited from DiagramItem.)
	getShadowBrush	Gets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	getShadowOffsetX	Gets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShadowOffsetY	Gets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	getShape	Gets the shape of this node.
	getShowLines	Gets whether to display lines connecting child items to parent items.
	getStyle	Gets the style associated with the item. (Inherited from DiagramItem.)
	getSubordinateGroup	Gets the group of subordinated items attached to this one. (Inherited from DiagramItem.)
	getTag	Gets user-defined data assigned to an item. (Inherited from DiagramItem.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	getTextFormat	Gets a TextFormat object specifying how to format and align the text of this node.
	getTextPadding	Gets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	getTextToEdit	Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when the node's caption is edited in-place.
	getToolTip	Gets the tooltip text displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	getVisible	Gets a value indicating whether an item is visible. (Inherited from DiagramItem.)

	getWeight	Gets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	getZIndex	Gets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	hasSubordinates	Checks whether there are any nodes attached to this item. (Inherited from DiagramItem.)
	hitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	hitTestHandle	DiagramItem.hitTestHandle override. (Inherited from DiagramNode.)
	init	Returns a TreeViewNodeBuilder object used to configure this TreeViewNode instance.
	itemFromPoint	Returns the item at the specified location.
	labelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	moveTo	Moves a node to the specified location. (Inherited from DiagramNode.)
	nodesIntersect	Determines whether two nodes intersect. (Inherited from DiagramNode.)
	onDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	onDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	onDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	readExternal	Implements Externalizable.
	removeItem	Removes the specified item from the node.
	removeLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	renderText	
	resize	Sets the size of a node. (Inherited from DiagramNode.)
	resizeToFitText	Overloaded.
	setAllowIncomingLinks	Sets a value indicating whether users are allowed to draw links to this node. (Inherited from DiagramNode.)
	setAllowOutgoingLinks	Sets a value indicating whether users are allowed to draw links from this node. (Inherited from DiagramNode.)
	setAnchorPattern	Sets the anchor points to which link end points are aligned when links connect to this node. (Inherited from DiagramNode.)

	setBounds	Overloaded. (Inherited from DiagramNode.)
	setBoundsDirect	For internal use. (Inherited from DiagramNode.)
	setBrush	Sets the brush used to fill the item's interior. (Inherited from DiagramItem.)
	setCaption	Sets the text displayed as caption of the node.
	setCaptionHeight	Gets the height of the node's caption bar.
	setCaptionImage	Gets the image that is displayed in the caption.
	setConnectionStyle	Sets a value indicating whether drawing a link from/to this node should connect an item or the whole node as an integral entity.
	setConstraints	Sets constraints to the node size and movement direction. The constraints are applied when a user modifies the node interactively. They are not checked when the position of a node is set programmatically. (Inherited from DiagramNode.)
	setDividerPen	Sets the **Pen** used to draw the the divider line between node's caption bar and content area.
	setEditedText	Implements InplaceEditable.setEditedText. Assigns the edited text to the node's caption after in-place edit operation completes successfully.
	setEnabledHandles	Sets a combination of **NodeHandleType** members identifying which manipulation handles are enabled for a node. This effectively controls what kind of modifications users are allowed to perform on this node. (Inherited from DiagramNode.)
	setEnableStyledText	Sets a value indicating whether styled text rendering is enabled.
	setExpandable	Sets a value indicating whether users are allowed to expand or collapse the tree branch that starts from this node. (Inherited from DiagramNode.)
	setExpanded	Expands or collapses the tree branch that starts from a node. (Inherited from DiagramNode.)
	setExpandedFlag	Changes the "expanded" flag without actually expanding or collapsing the tree branch that starts from a node. (Inherited from DiagramNode.)
	setFont	Sets or the font used to render the node's caption.
	setHandlesStyle	Sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	setHyperLink	Sets the hyperlink associated with an item. (Inherited from DiagramItem.)
	setId	Assigns user-defined identifier to this item. (Inherited from DiagramItem.)

	setIgnoreLayout	Sets a value indicating whether an item should be ignored by the automatic layout algorithms. (Inherited from DiagramItem.)
	setLayerIndex	Sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with any layer. (Inherited from DiagramItem.)
	setLocked	Sets a value indicating whether users are allowed to modify an item. (Inherited from DiagramItem.)
	setObstacle	Sets a value indicating whether the link routing algorithm should consider this node an obstacle. (Inherited from DiagramNode.)
	setOpacity	Sets the opacity of this item. (Inherited from DiagramItem.)
	setPen	Sets the pen used to draw the item frame lines. (Inherited from DiagramItem.)
	setPrintable	Sets a value indicating whether an item will be printed. (Inherited from DiagramItem.)
	setRotationAngle	Sets the rotation angle of a node. (Inherited from DiagramNode.)
	setScrollable	Sets a value indicating whether users are allowed to scroll this tree view.
	setScrollPosition	Sets the current scroll position.
	setSelected	Selects or deselects an item. (Inherited from DiagramItem.)
	setShadowBrush	Sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	setShadowOffsetX	Sets the horizontal distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShadowOffsetY	Sets the vertical distance between a shadow and the item that casts it. (Inherited from DiagramItem.)
	setShape	Sets the shape of this node.
	setShowLines	Sets whether to display lines connecting child items to parent items.
	setStyle	Sets the style associated with the item. (Inherited from DiagramItem.)
	setTag	Assigns user-defined data to an item. If the tag object is serializable, it will be automatically saved when serializing the diagram into binary format. When serializing to XML, you can save the tag by handling the DiagramListener.serializeTag event. (Inherited from DiagramItem.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	setTextFormat	Sets a TextFormat object specifying how to format and align the text of this node.

	setTextPadding	Sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	setToolTip	Sets the tooltip text that should be displayed when the pointer rests over this item. (Inherited from DiagramItem.)
	setVisible	Sets a value indicating whether an item is visible. (Inherited from DiagramItem.)
	setWeight	Sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	setZIndex	Sets the position of an item within the diagram's Z-order. (Inherited from DiagramItem.)
	updateScrollPosition	Implements the Scrollable interface. Updates the node's scroll position from scrollbar's value.
S	with	Returns a TreeViewNodeBuilder object used to configure and create new TreeViewNode instances.
	writeExternal	Implements Externalizable.
	zBottom	Moves an item to the bottom of the Z order. (Inherited from DiagramItem.)
	zLevelDown	Moves an item down in the Z order. (Inherited from DiagramItem.)
	zLevelUp	Moves an item up in the Z order. (Inherited from DiagramItem.)
	zTop	Moves an item to the top of the Z order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	allowCreate	DiagramItem.allowCreate override. (Inherited from DiagramNode.)
	allowModify	(Inherited from DiagramNode.)
	allowModifyImpl	(Inherited from DiagramNode.)
	cancelModify	DiagramItem.cancelModify override. Invoked when the interactive modification of this node has been canceled. (Inherited from DiagramNode.)
	completeCreate	DiagramItem.completeCreate override. (Inherited from DiagramNode.)
	completeModify	(Inherited from DiagramNode.)
	constraintsInfringed	(Inherited from DiagramNode.)
	createProperties	Creates an item property set corresponding to the type of this diagram item. This method is invoked by the undo/redo subsystem when creating a ChangeItemCmd instance.
	createState	DiagramItem.createState override. (Inherited from DiagramNode.)

	draw	DiagramItem.draw override. (Inherited from DiagramNode.)
	drawLocal	Draws the tree node on the specified **Graphics2D** surface.
	drawShadow	DiagramItem.drawShadow override. (Inherited from DiagramNode.)
	drawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	getAllIncomingLinks	getAllIncomingLinks override.
	getAllOutgoingLinks	getAllOutgoingLinks override.
	getLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getLocalBoundsD	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	getMeasureUnit	(Inherited from DiagramItem.)
	getValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	groupContains	(Inherited from DiagramNode.)
	loadFromJson	Loads the node from a JSON object.
	loadFromXml	Loads the item content from an XML element.
	move	(Inherited from DiagramNode.)
	onAdd	Called when an item is added to a Diagram, either by the user, programmatically or by undo / redo. (Inherited from DiagramItem.)
	onChangeFont	(Inherited from DiagramItem.)
	onChangeTextPadding	DiagramItem.onChangeTextPadding override.
	onChildModified	Called when a group child node has been modified. Override this method if you need to know when a node from the **SubordinateGroup** is modified. (Inherited from DiagramItem.)
	onClick	DiagramItem.onClick override.
	onDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	onLoad	DiagramItem.onLoad override.
	onMeasureUnitChanged	Called when the Diagram's MeasureUnit changes.
	onModify	Called when an item is modified (Inherited from DiagramNode.)
	onRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or by undo / redo. (Inherited from DiagramNode.)
	onRotationAngleChanged	Called when the node's rotation angle changes. (Inherited from DiagramNode.)

	onStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	onStyleFontChanged	DiagramItem.onStyleFontChanged override.
	onUpdateBounds	**DiagramNode.onUpdateBounds**; override.
	onZoomChanged	Called when the Diagram's ZoomFactor changes.
	parentConstraintsInfringed	(Inherited from DiagramNode.)
	putExpandable	(Inherited from DiagramNode.)
	putSelected	(Inherited from DiagramItem.)
	rectFromPoints	(Inherited from DiagramNode.)
	repaint	Overloaded. (Inherited from DiagramItem.)
	resizeToFitImage	(Inherited from DiagramNode.)
	restoreProperties	DiagramNode.restoreProperties override.
	restoreState	DiagramItem.restoreState override. (Inherited from DiagramNode.)
	saveProperties	DiagramNode.saveProperties override.
	saveState	DiagramItem.saveState override. (Inherited from DiagramNode.)
	saveToJson	Saves the item content into a JsonObject.
	saveToXml	Saves the item content into an XML element.
	scaleElements	DiagramNode.scaleElements override.
	setDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	setReflexive	Invoked to let a node set the shape of a reflexive link connected to it.
	shouldRender	Determines whether the item is rendered in the current context. (Inherited from DiagramItem.)
	shouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	startCreate	DiagramItem.startCreate override. (Inherited from DiagramNode.)
	startModify	DiagramItem.startModify override. Invoked when the user starts modifying this node interactively. (Inherited from DiagramNode.)
	updateCreate	DiagramItem.updateCreate override. (Inherited from DiagramNode.)
	updateLinkPositions	(Inherited from DiagramNode.)
	updateModify	DiagramItem.updateModify override. Invoked during interactive modification of this node. (Inherited from DiagramNode.)

TreeViewNode Constructor

Overload List

Name	Description
TreeViewNode ()	Initializes a new instance of the TreeViewNode class.
TreeViewNode (Diagram)	Initializes a new instance of the TreeViewNode class.
TreeViewNode (TreeViewNode)	Initializes a new instance of the TreeViewNode class using the specified node as a prototype.

See Also

TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode Constructor ()

Initializes a new instance of the TreeViewNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public TreeViewNode ()`

See Also

TreeViewNode Constructor Overload List
TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode Constructor (Diagram)

Initializes a new instance of the TreeViewNode class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeViewNode (
    Diagram diagram
)
```

Parameters

diagram
The Diagram from which to obtain default values for the node properties.

Remarks

This constructor initializes the TreeViewNode properties with the values specified in the respective default-value properties of the Diagram object.

TreeViewNode Constructor (TreeViewNode)

Initializes a new instance of the TreeViewNode class using the specified node as a prototype.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeViewNode (
    TreeViewNode prototype
)
```

Parameters

prototype

TreeViewNode Methods

TreeViewNode.createConnectionPoint Method

DiagramNode.createConnectionPoint override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ConnectionPoint createConnectionPoint (
    DiagramLink link,
    Point2D point,
    boolean incoming
)
```

Parameters

link
A DiagramLink that should be connected to this node.

point
The point at which the link should be connected.

incoming
true if link is an incoming link; otherwise, false.

Return Value

A TreeViewConnectionPoint instance representing the connection.

TreeViewNode.createProperties Method

Creates an item property set corresponding to the type of this diagram item. This method is invoked by the undo/redo subsystem when creating a ChangeItemCmd instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected DiagramItemProperties createProperties ()
```

Return Value

A DiagramItemProperties-derived object containing a snapshot of the item's properties.

TreeViewNode.createScrollCommand Method

Implements the Scrollable interface. Creates a ScrollTreeViewCmd instance that can be used to undo the scroll operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Command createScrollCommand ()
```

Return Value

A ScrollTreeViewCmd instance

TreeViewNode.drawLocal Method

Draws the tree node on the specified **Graphics2D** surface.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
protected void drawLocal (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g
An **Graphics2D** object where the link should be rendered.

options
A RenderOptions object specifying options for the drawing operation.

TreeViewNode.getAllIncomingLinks Method

getAllIncomingLinks override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void getAllIncomingLinks (
    DiagramLinkList links
)
```

Parameters

links
A DiagramLinkList the links should be added to.

See Also

TreeViewNode.getAllOutgoingLinks Method

getAllOutgoingLinks override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void getAllOutgoingLinks (
    DiagramLinkList links
)
```

Parameters

links
A DiagramLinkList the links should be added to.

TreeViewNode.getCaption Method

Gets the text displayed as caption of the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getCaption ()
```

Return Value

A string specifying the caption text.

See Also

TreeViewNode Members
TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.getCaptionHeight Method

Gets the height of the node's caption bar.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public float getCaptionHeight ()`

Return Value

A float value specifying the caption bar height. The default value is 8.

TreeViewNode.getCaptionImage Method

Gets the image that is displayed in the caption.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public Image getCaptionImage ()`

Return Value

An instance of the **java.awt.Image** class.

TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.getConnectionStyle Method

Gets a value indicating whether drawing a link from/to this node should connect an item or the whole node as an integral entity.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeViewConnectionStyle getConnectionStyle ()
```

Return Value

A member of the TreeViewConnectionStyle enumeration.

TreeViewNode.getDividerPen Method

Gets the Pen used to draw the the divider line between node's caption bar and content area.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Pen getDividerPen ()
```

Return Value

A Pen instance. The default value is **null**.

Remarks

If DividerPen is not set, the divider line is drawn using the pen assigned to Pen property.

Pen Property

TreeViewNode.getEditRect Method

Implements InplaceEditable.getEditRect. Returns the rectangle where the in-place edit text box should appear (in document coordinates).

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Rectangle2D getEditRect (
    DiagramItem item,
    Point2D mousePosition
)
```

Parameters

item
A reference to this node.

mousePosition
A **Point2D** instance specifying the current pointer position.

Return Value

A **Rectangle2D** specifying where the edit box should be placed.

TreeViewNode.getEnableStyledText Method

Gets a value indicating whether styled text rendering is enabled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getEnableStyledText ()
```

Return Value

true to parse the text of the node's caption and items in order to find formatting tags; otherwise false. Initialized with the value of Diagram.getEnableStyledText.

TreeViewNode Members
TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.getFlatItemList Method

Gets a list of all items of this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ArrayList<TreeViewItem> getFlatItemList ()
```

Return Value

A list of TreeViewItem objects.

TreeViewNode.getFont Method

Gets or the font used to render the node's caption.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Font getFont ()
```

Return Value

A Font instance specifying the font attributes.

TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.getItemRect Method

Gets the location and size of the specified TreeViewItem.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Rectangle2D.Float getItemRect (
    TreeViewItem treeItem
)
```

Parameters

treeItem
A TreeViewItem instance.

Return Value

A **Rectangle2D.Float** specifying the item's position and size.

See Also

TreeViewNode Members
TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.getRepaintRect Method

getRepaintRect override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D getRepaintRect (
    boolean includeConnected
)
```

Parameters

includeConnected
true is related items should be considered too; otherwise, false.

Return Value

A rectangular region that should be repainted when this node is modified.

See Also

TreeViewNode Members
TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.getRootItems Method

Gets a list of the root TreeViewItem objects displayed in this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeItemList getRootItems ()
```

Return Value

A TreeItemList instance containing the root items of this node.

Remarks

You can directly manipulate this collection to add or remove root items.

TreeViewNode Members
TreeViewNode Class
com.mindfusion.diagramming Namespace
TreeViewItem.getChildren Method

TreeViewNode.getScrollable Method

Gets a value indicating whether users are allowed to scroll this tree view.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getScrollable ()
```

Return Value

true if users are allowed to scroll the tree view, otherwise **false**.

See Also

TreeViewNode Members
TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.getScrollbarLargeChange Method

Implements the Scrollable interface. Gets the amount to scroll by when the user clicks above or below the scrollbar thumb.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getScrollbarLargeChange (
    boolean vertical
)
```

Parameters

vertical

true if scrolling using a vertical scrollbar, or **false** if horizontal one.

Return Value

A **float** value specifying the amount to scroll.

See Also

TreeViewNode Members
TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.getScrollbarMaximum Method

Implements the Scrollable interface. Gets the maximum scroll position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getScrollbarMaximum (
    boolean vertical
)
```

Parameters

vertical
true if scrolling using a vertical scrollbar, or **false** if horizontal one.

Return Value

The maximum scroll position for specified scroll direction.

See Also

TreeViewNode Members
TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.getScrollPosition Method

Gets the current scroll position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getScrollPosition ()
```

Return Value

A float value specifying the scroll position.

See Also

TreeViewNode Members
TreeViewNode Class

TreeViewNode.getShape Method

Gets the shape of this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SimpleShape getShape ()
```

Return Value

A member of the SimpleShape enumeration.

See Also

TreeViewNode Members
TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.getShowLines Method

Gets whether to display lines connecting child items to parent items.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getShowLines ()
```

Return Value

true to draw connecting lines, or **false** otherwise. The default value is **true**.

setShowLines Method

TreeViewNode.getTextFormat Method

Gets a TextFormat object specifying how to format and align the text of this node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TextFormat getTextFormat ()
```

Return Value

A TextFormat object specifying the text format and alignment.

See Also

TreeViewNode Members
TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.getTextToEdit Method

Implements InplaceEditable.getTextToEdit. Returns the text that should be displayed initially when the node's caption is edited in-place.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String getTextToEdit ()
```

Return Value

A **String** that represents the initial contents of the in-place edit box.

TreeViewNode.init Method

Returns a TreeViewNodeBuilder object used to configure this TreeViewNode instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeViewNodeBuilder init ()
```

Return Value

A **TreeViewNodeBuilder** instance.

See Also

TreeViewNode Members
TreeViewNode Class

TreeViewNode.itemFromPoint Method

Returns the item at the specified location.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TreeViewItem itemFromPoint (
    Point2D point
)
```

Parameters

point
The point to check.

Return Value

The TreeViewItem instance that contains the specified point.

TreeViewNode.loadFromJson Method

Loads the node from a JSON object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

TreeViewNode Members
TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.loadFromXml Method

Loads the item content from an XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An XmlElement containing the item's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

TreeViewNode.onLoad Method

DiagramItem.onLoad override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onLoad (
    Diagram diagram
)
```

Parameters

diagram

See Also

TreeViewNode Members
TreeViewNode Class
com.mindfusion.diagramming Namespace

TreeViewNode.onMeasureUnitChanged Method

Called when the Diagram's MeasureUnit changes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void onMeasureUnitChanged ()
```

See Also

TreeViewNode Members

TreeViewNode.removeItem Method

Removes the specified item from the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeItem (
    TreeViewItem item
)
```

Parameters

item
The TreeViewItem to remove.

Remarks

This method recursively searches for the specified item and removes its from the Children collection of its parent item, or from the RootItems collection if it is a root item.

TreeViewNode.restoreProperties Method

DiagramNode.restoreProperties override.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void restoreProperties (
    DiagramItemProperties props
)
```

Parameters

props
A DiagramItemProperties-derived object containing a snapshot of the item's properties.

See Also

TreeViewNode Members

TreeViewNode.saveToJson Method

Saves the item content into a JsonObject.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
A JsonObject where item's data is stored

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

TreeViewNode.setCaption Method

Sets the text displayed as caption of the node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCaption (
    String caption
)
```

Parameters

caption
A string specifying the caption text.

TreeViewNode.setDividerPen Method

Sets the Pen used to draw the the divider line between node's caption bar and content area.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setDividerPen (
    Pen value
)
```

Parameters

value
A Pen instance.

Remarks

If **DividerPen** is not set, the divider line is drawn using the pen assigned to Pen property.

TreeViewNode.updateScrollPosition Method

Implements the Scrollable interface. Updates the node's scroll position from scrollbar's value.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void updateScrollPosition (
    float newValue,
    boolean vertical
)
```

Parameters

newValue
A **float** value specifying scroll offset.

vertical
true if scrolling using a vertical scrollbar, or **false** if horizontal one.

TreeViewNodeStyle Members

Represents a reusable set of properties that define the appearance of tree view nodes.

The following tables list the members exposed by the TreeViewNodeStyle type.

Public Constructors

	Name	Description
	TreeViewNodeStyle	Initializes a new instance of the **TreeViewNodeStyle** class.

Public Methods

	Name	Description
	addPropertyChangeListener	(Inherited from Style.)
	getBrush	Gets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	getEffects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	getFontFamily	Gets the font family of the item text. (Inherited from DiagramItemStyle.)
	getFontSize	Gets the font size of the item text. (Inherited from DiagramItemStyle.)
	getFontStyle	Gets the font style of the item text. (Inherited from DiagramItemStyle.)
	getFontUnit	Gets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	getShadowBrush	Gets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	getStroke	Gets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	getStrokeThickness	Gets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	getTextBrush	Gets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
	init	Returns a TreeViewNodeStyleBuilder object used to configure this TreeViewNodeStyle instance.
	readExternal	**Externalizable.readExternal** implementation. (Inherited from Style.)
S	registerType	Associates a type with an alias. The alias is used when saving and loading objects of the specified type during style serialization and deserialization. (Inherited from Style.)
	removePropertyChangeListener	(Inherited from Style.)
	setBrush	Sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)

	setFontFamily	Sets the font family of the item text. (Inherited from DiagramItemStyle.)
	setFontSize	Sets the font size of the item text. (Inherited from DiagramItemStyle.)
	setFontStyle	Sets the font style of the item text. (Inherited from DiagramItemStyle.)
	setFontUnit	Sets the measure unit used to specify font size. (Inherited from DiagramItemStyle.)
	setShadowBrush	Sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	setStroke	Sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	setStrokeThickness	Sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	setTextBrush	Sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)
S	with	Returns a TreeViewNodeStyleBuilder object used to configure and create new TreeViewNodeStyle instances.
	writeExternal	**Externalizable.writeExternal** implementation. (Inherited from Style.)

Protected Methods

	Name	Description
	getValue	Gets the value of the specified property. (Inherited from Style.)
	isPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	loadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	loadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	registerProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	saveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	saveToXml	Saves the style content into an XML element. (Inherited from Style.)
	setValue	Sets the value of the specified property. (Inherited from Style.)
	unsetValue	Clears the value of the specified property. (Inherited from Style.)

TreeViewNodeStyle Class
com.mindfusion.diagramming Namespace

TriangularLayout Class

Performs triangular layout on simple, connected graphs.

Syntax

Java
`public class TriangularLayout extends AbstractLayout`

Remarks

TriangularLayout places nodes on a virtual grid, such that if the source graph is planar, all links are guaranteed to have a single segment and not intersect. If the graph is not planar, its intersecting links can be optionally segmented and bended in order to improve readability. The layout method places the nodes from the external face on a triangle and recursively adds the rest of the nodes as vertices of internal triangles. As a result, it is very effective for near maximal-planar (a.k.a. triangular) graphs.

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.AbstractLayout
    com.mindfusion.diagramming.TriangularLayout

See Also

TriangularLayout Members
com.mindfusion.diagramming Namespace

TriangularLayout Members

Performs triangular layout on simple, connected graphs.

The following tables list the members exposed by the TriangularLayout type.

Public Constructors

	Name	Description

	TriangularLayout	Initializes a new instance of the TriangularLayout class.

Public Methods

	Name	Description
	arrange	Applies the layout on the specified subset of items from the specified Diagram instance.
	getAnchoring	Gets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	getBendNonplanarLinks	Gets a value indicating whether the intersecting links in a non-planar graphs will be segmented and bended to improve presentation.
	getGridSize	Gets the size of the virtual grid the layout will place vertices on.
	getGrowToFit	Gets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	getKeepGroupLayout	Gets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	getLayoutLink	Gets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	getLayoutNode	Gets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	getMargins	Gets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	getMultipleGraphsPlacement	Gets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	getOrientation	Gets a the orientation of the arranged graph.
	getProgress	Gets the progress callback delegate. (Inherited from AbstractLayout.)
	init	Returns a TriangularLayoutBuilder object used to configure this TriangularLayout instance.
S	removeMidleSegmentPoint	(Inherited from AbstractLayout.)
	setAnchoring	Sets how to align links to the anchor points of nodes. (Inherited from AbstractLayout.)
	setBendNonplanarLinks	Sets a value indicating whether the intersecting links in a non-planar graphs will be segmented and bended to improve presentation.
	setGridSize	Sets the size of the virtual grid the layout will place vertices on.

	setGrowToFit	Sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from AbstractLayout.)
	setKeepGroupLayout	Sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from AbstractLayout.)
	setLayoutLink	Sets an object, which is notified when the position of a link is changed by the layout. (Inherited from AbstractLayout.)
	setLayoutNode	Sets an object, which is notified when the position of a node is changed by the layout. (Inherited from AbstractLayout.)
	setMargins	Sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from AbstractLayout.)
	setMultipleGraphsPlacement	Sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from AbstractLayout.)
	setOrientation	Sets a the orientation of the arranged graph.
	setProgress	Sets the progress callback delegate. (Inherited from AbstractLayout.)
S	with	Returns a TriangularLayoutBuilder object used to configure and create new TriangularLayout instances.

TriangularLayout Class
com.mindfusion.diagramming Namespace

TriangularLayout Constructor

Initializes a new instance of the TriangularLayout class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TriangularLayout ()
```

See Also

TriangularLayout Class
com.mindfusion.diagramming Namespace

TriangularLayout Methods

TriangularLayout.arrange Method

Applies the layout on the specified subset of items from the specified Diagram instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean arrange (
    Diagram diagram,
    DiagramItemList items
)
```

Parameters

diagram
The Diagram that should be arranged.

items
A collection of nodes and links from diagram that define the subgraph to arrange.

Return Value

This method always returns true.

TriangularLayout Class
com.mindfusion.diagramming Namespace

TriangularLayout.getBendNonplanarLinks Method

Gets a value indicating whether the intersecting links in a non-planar graphs will be segmented and bended to improve presentation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getBendNonplanarLinks ()
```

Return Value

See Also

TriangularLayout Members
TriangularLayout Class
com.mindfusion.diagramming Namespace

TriangularLayout.getGridSize Method

Gets the size of the virtual grid the layout will place vertices on.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getGridSize ()
```

Return Value

TriangularLayout Members
TriangularLayout Class
com.mindfusion.diagramming Namespace

TriangularLayout.getOrientation Method

Gets a the orientation of the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Orientation getOrientation ()
```

Return Value

A member of the Orientation enumeration.

See Also

TriangularLayout Members
TriangularLayout Class
com.mindfusion.diagramming Namespace

TriangularLayout.init Method

Returns a TriangularLayoutBuilder object used to configure this TriangularLayout instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TriangularLayoutBuilder init ()
```

Return Value

A **TriangularLayoutBuilder** instance.

TriangularLayout Members
TriangularLayout Class
com.mindfusion.diagramming Namespace

TriangularLayout.setGridSize Method

Sets the size of the virtual grid the layout will place vertices on.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setGridSize (
    float value
)
```

Parameters

value

See Also

TriangularLayout Members
TriangularLayout Class
com.mindfusion.diagramming Namespace

TriangularLayout.setOrientation Method

Sets a the orientation of the arranged graph.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setOrientation (
    Orientation value
)
```

Parameters

value
A member of the Orientation enumeration.

See Also

TriangularLayout Members
TriangularLayout Class
com.mindfusion.diagramming Namespace

TriangularLayout.with Method

Returns a TriangularLayoutBuilder object used to configure and create new TriangularLayout instances.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static TriangularLayoutBuilder with ()
```

Return Value

A **TriangularLayoutBuilder** instance.

UndoEvent Members

Contains the arguments passed to the ActionRecorded, ActionUndone and ActionRedone event handlers.

The following tables list the members exposed by the UndoEvent type.

Public Constructors

	Name	Description
	UndoEvent	Initializes a new instance of the **UndoEvent** class.

Public Methods

	Name	Description
	getCommand	Gets a reference to the Command instance related to the event being handled.

See Also

UndoEvent Class
com.mindfusion.diagramming Namespace

UndoEvent Constructor

Initializes a new instance of the UndoEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public UndoEvent (
    Object source,
    Command command
)
```

Parameters

source
The source of the event.

command
The UndoEvent.getCommand command related to the event.

See Also

UndoEvent Class
com.mindfusion.diagramming Namespace

UndoEvent Methods

UndoEvent.getCommand Method

Gets a reference to the Command instance related to the event being handled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Command getCommand ()
```

Return Value

An instance of the Command class.

See Also

UndoEvent Members
UndoEvent Class
com.mindfusion.diagramming Namespace

UndoManager Class

Implements undo/redo functionality. The undo manager can be accessed by calling the getUndoManager method of the Diagram class.

Syntax

Java

```
public class UndoManager
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.UndoManager

UndoManager Members
com.mindfusion.diagramming Namespace

UndoManager Members

Implements undo/redo functionality. The undo manager can be accessed by calling the getUndoManager method of the Diagram class.

The following tables list the members exposed by the UndoManager type.

Public Methods

	Name	Description
	getHistory	Gets a reference to the list of commands stored for later undo/redo.
	getUndoEnabled	Gets a value indicating whether actions performed on the diagram can be undone or redone.
	redo	Redoes the next action in the undo/redo queue.
	setUndoEnabled	Enables or disabled undo/redo.
	startComposite	Overloaded.
	undo	Undoes the previous action in the undo/redo queue.

See Also

UndoManager Class
com.mindfusion.diagramming Namespace

UndoManager Methods

UndoManager.getHistory Method

Gets a reference to the list of commands stored for later undo/redo.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CommandHistory getHistory ()
```

Return Value

A CommandHistory object representing the undo/redo queue.

See Also

UndoManager Members
UndoManager Class
com.mindfusion.diagramming Namespace

UndoManager.getUndoEnabled Method

Gets a value indicating whether actions performed on the diagram can be undone or redone.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getUndoEnabled ()
```

Return Value

true if undo/redo is enabled, otherwise **false**.

See Also

UndoManager Members
UndoManager Class
com.mindfusion.diagramming Namespace

UndoManager.redo Method

Redoes the next action in the undo/redo queue.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void redo ()
```

See Also

UndoManager Members
UndoManager Class
com.mindfusion.diagramming Namespace

UndoManager.setUndoEnabled Method

Enables or disabled undo/redo.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setUndoEnabled (
    boolean value
)
```

Parameters

value
true if modifications done on the diagram should be tracked so that they can be undone or redone later, otherwise **false**.

See Also

UndoManager Members
UndoManager Class
com.mindfusion.diagramming Namespace

UndoManager.startComposite Method

Overload List

Name	Description
UndoManager.startComposite (String)	Starts recording a composite undo/redo command.
UndoManager.startComposite (String, boolean)	Starts recording a composite undo/redo command.

See Also

UndoManager Members
UndoManager Class

UndoManager.startComposite Method (String)

Starts recording a composite undo/redo command.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public CompositeCmd startComposite (
    String title
)
```

Parameters

title

A String containing the title of the composite command.

Return Value

A CompositeCmd object representing the composite command.

See Also

startComposite Method Overload List
UndoManager Members
UndoManager Class
com.mindfusion.diagramming Namespace

UndoManager.startComposite Method (String, boolean)

Starts recording a composite undo/redo command.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public CompositeCmd startComposite (
    String title,
    boolean saveZOrder
)
```

Parameters

title
A String containing the title of the composite command.

saveZOrder

Return Value

A CompositeCmd object representing the composite command.

See Also

startComposite Method Overload List
UndoManager Members
UndoManager Class
com.mindfusion.diagramming Namespace

UndoManager.undo Method

Undoes the previous action in the undo/redo queue.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void undo ()
```

See Also

UndoManager Members

UndoValidationEvent Members

Contains the arguments passed to the ActionRecording event handlers.

The following tables list the members exposed by the UndoValidationEvent type.

Public Constructors

	Name	Description
	UndoValidationEvent	Initializes a new instance of the UndoValidationEvent class.

Public Methods

	Name	Description
	getCancel	Gets a value indicating whether the operation should be canceled.
	getCommand	Gets a reference to the Command instance related to the event being handled. (Inherited from UndoEvent.)
	setCancel	Sets a value indicating whether the operation should be canceled.

See Also

UndoValidationEvent Class
com.mindfusion.diagramming Namespace

UndoValidationEvent Constructor

Initializes a new instance of the UndoValidationEvent class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public UndoValidationEvent (
    Object source,
    Command command
)
```

Parameters

source
The source of the event.

command
The Command related to the event.

See Also

UndoValidationEvent Class
com.mindfusion.diagramming Namespace

UndoValidationEvent Methods

UndoValidationEvent.getCancel Method

Gets a value indicating whether the operation should be canceled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getCancel ()
```

Return Value

true if the operation is canceled; **false** if approved.

See Also

UndoValidationEvent Members
UndoValidationEvent Class

UndoValidationEvent.setCancel Method

Sets a value indicating whether the operation should be canceled.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCancel (
    boolean cancel
)
```

Parameters

cancel
true to cancel the operation; **false** to approve it.

See Also

UndoValidationEvent Members
UndoValidationEvent Class
com.mindfusion.diagramming Namespace

UnitType Enumeration

Defines values that indicate whether point positions are specified as percentage, or in absolute units relative to the node's top-left corner.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public enum UnitType
```

Members

	Member name	Description
	Fixed	Point coordinates designate fixed offset from the node's top-left corner.
	Percentage	Point coordinates are specified as percentage of the node's size.

See Also

Utilities Class

Syntax

Java
`public class Utilities`

Utilities Members

The following tables list the members exposed by the Utilities type.

Public Constructors

	Name	Description
	Utilities	

Public Methods

	Name	Description
	add	Overloaded.
	areClose	
	cartesianToPolar	
	checkIntersect	Checks if the specified rectangle and circle intersect.
	clone	Overloaded.
	concat	Joins array elements using the specified delimiter.
	convertRect	
	deviceToDoc	
	distance	
	distToLineSegment	Calculates distance from the specified point to the specified line segment.
	distToRectPoint	Returns the nearest to pt point that lies on the outline of rectangle.

	docToDevice	
	drawImage	Overloaded.
	filter	Overloaded.
	findValidateRoot	Returns the ancestor component that acts as validate root
	FromLTRB	
	getArcParams	Calculates the bounding rectangle, start and sweep angle of an arc from the specified arc end points, direction flags and radius sizes.
	getLocation	
	getSize	
	inflate	
	lineIntersect	Calculates the intersection point of endless lines (pA, pB) and (pC, pD)
	lineIntersectHorizontal	Finds the x coordinate of the intersection point of the horizontal line at y and the line defined by points pA and pB. If the lines do not intersect, result is undefined.
	lineIntersectVertical	Finds the y coordinate of the intersection point of the vertical line at x and the line defined by points pA and pB. If the lines do not intersect, result is undefined.
	minDistToRect	Calculates the minimum distance between a given point and a given rectangle.
	newPoint2D	Overloaded.
	newPointDouble	Overloaded.
	newPointFloat	Overloaded.
	newRectangle2D	
	newRectangleDouble	Overloaded.
	newRectangleFloat	Overloaded.
	normalizeRect	
	parse	Parses space separated numbers into Point2D
	pointAlongLength	
	pointsInRect	
	polarToCartesian	
	readFileAsString	Returns the content of a file as a string.
	resize	
	revalidateSynced	Performs synchronized revalidation to ensure that layout is up to date after this method returns.
	set	Overloaded.

	setHeight	
	setLocation	
	setWidth	
	setX	Overloaded.
	setY	Overloaded.
	subtract	Subtract the coordinates of one point from the coordinates of another
	translate	
	translateX	Overloaded.
	translateY	Overloaded.
	unionNonEmptyRects	
	unzip	
	writeStringToFile	Writes the specified string to a file.

Utilities.add Method

Overload List

Name	Description

Utilities.add (T, double, double)	
Utilities.add (T, Point2D)	Add (translate) the coordinates of one point with the coordinates of another

See Also

Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.add<T> Method (T, double, double)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static <T> T add (
    T changed,
    double addX,
    double addY
)
```

Parameters

changed

addX

addY

Return Value

See Also

add Method Overload List
Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.add<T> Method (T, Point2D)

Add (translate) the coordinates of one point with the coordinates of another

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static <T> T add (
    T changed,
    Point2D changeVector
)
```

Parameters

changed

changeVector

Return Value

the first parameter which holds the result

See Also

add Method Overload List
Utilities Members
Utilities Class

Utilities.areClose Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static boolean areClose (
    float a,
    float b
)
```

Parameters

a

b

Return Value

See Also

Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.cartesianToPolar Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static void cartesianToPolar (
    Point2D coordCenter,
    Point2D point,
    Point2D result
)
```

Parameters

coordCenter

point

result

See Also

Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.checkIntersect Method

Checks if the specified rectangle and circle intersect.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static boolean checkIntersect (
    Point2D pt,
    Rectangle2D rc,
    float rad
)
```

Parameters

pt

rc

rad

Return Value

    T point
)
```

Parameters

point

Return Value

See Also

clone Method Overload List
Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.concat Method

Joins array elements using the specified delimiter.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static String concat (
    String delimiter,
    Object[] objs
)
```

Parameters

delimiter
A character inserted between the array elements.

objs
The objects to be joined.

Return Value

A string containing the concatenated string representations of the objects.

See Also

Utilities Members
Utilities Class

Utilities.distance Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public static double distance (
    Point2D pt1,
    Point2D pt2
)
```

Parameters

pt1

pt2

Return Value

See Also

Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.distToLineSegment Method

Calculates distance from the specified point to the specified line segment.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static float distToLineSegment (
    Point2D pt,
    Point2D p1,
    Point2D p2
)
```

Parameters

pt

p1

p2

Return Value

See Also

Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.distToRectPoint Method

Returns the nearest to pt point that lies on the outline of rectangle.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static Point2D distToRectPoint (
    Point2D pt,
    Rectangle2D r
)
```

Parameters

pt

r

Return Value

See Also

Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.docToDevice Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static Rectangle docToDevice (
    Graphics2D g,
    Rectangle2D r
)
```

Parameters

g

r

Return Value

See Also

Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.drawImage Method

Overload List

Name	Description
Utilities.drawImage (Graphics2D, Image, Rectangle2D, ImageAlign, Diagram)	
Utilities.drawImage (Graphics2D, Image, Rectangle2D, ImageAlign, Diagram, double, Point2D)	

See Also

Utilities.drawImage Method (Graphics2D, Image, Rectangle2D, ImageAlign, Diagram)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static void drawImage (
    Graphics2D g,
    Image image,
    Rectangle2D rect,
    ImageAlign imageAlign,
    Diagram diagram
)
```

Parameters

g

image

rect

imageAlign

diagram

drawImage Method Overload List
Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.drawImage Method (Graphics2D, Image, Rectangle2D, ImageAlign, Diagram, double, Point2D)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static void drawImage (
    Graphics2D g,
    Image image,
    Rectangle2D rect,
    ImageAlign imageAlign,
    Diagram diagram,
    double rotationAngle,
```

```
    Point2D pivot
)
```

Parameters

g

image

rect

imageAlign

diagram

rotationAngle

pivot

See Also

drawImage Method Overload List
Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.filter Method

Overload List

Name	Description
Utilities.filter (Iterable, Class)	Creates Iterable that iterates only over the subset of the given Iterable that consist of elements of desired type Example: for (TableNode t: filter(diagram .getItems(), TableNode.class)) t.getRowCount();
Utilities.filter (Iterator, Class)	Creates Iterator that iterates only over the subset of the given Iterator that consist of elements of desired type

See Also

Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.filter<T, D> Method (Iterable<T>, Class<D>)

Creates Iterable that iterates only over the subset of the given Iterable that consist of elements of desired type Example: for (TableNode t: filter(diagram .getItems(), TableNode.class)) t.getRowCount();

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static <T, D> Iterable<D> filter (
    Iterable<T> unfiltered,
    Class<D> desiredType
)
```

Parameters

unfiltered
the collection of items that can be of different type.

desiredType
the class of the items in the collection to be returned.

Return Value

An iterator over the collection items of the desired type.

See Also

filter Method Overload List
Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.filter<T, D> Method (Iterator<T>, Class<D>)

Creates Iterator that iterates only over the subset of the given Iterator that consist of elements of desired type

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static <T, D> Iterator<D> filter (
    Iterator<T> unfiltered,
    Class<D> desiredType
)
```

Parameters

unfiltered
the collection of items that can be of different type.

desiredType
the class of the items in the collection to be returned.

Return Value

An iterator over the collection items of the desired type.

See Also

filter Method Overload List
Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.findValidateRoot Method

Returns the ancestor component that acts as validate root

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static Component findValidateRoot (
    JComponent c
)
```

Parameters

c
A JComponent whose validation root should be returned.

Return Value

A Component that is the validation root of c.

See Also

Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.FromLTRB Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static Rectangle2D FromLTRB (
    double l,
    double t,
    double r,
    double b
)
```

Parameters

l

t

r

b

Return Value

Utilities.getArcParams Method

Calculates the bounding rectangle, start and sweep angle of an arc from the specified arc end points, direction flags and radius sizes.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static void getArcParams (
    Point2D.Float pt1,
    Point2D.Float pt2,
    boolean isLargeArc,
    boolean isCounterclockwise,
    float radiusX,
    float radiusY,
    float angleRotation,
    Point2D.Float centerPt,
    ByRef<Float> startAngle,
    ByRef<Float> sweepAngle
)
```

Parameters

pt1
The arc's start point.

pt2
The arc's end point.

isLargeArc
A flag specifying whether to choose the shorter ot longer arc.

isCounterclockwise
A flag specifying whether to choose the clockwise arc.

radiusX
Specifies the X radius of the ellipse.

radiusY
Specifies the Y radius of the ellipse.

angleRotation
Specifies the rotation of the ellipse.

centerPt
Returns the center of the bounding rectangle.

startAngle
Returns the start angle of the arc.

sweepAngle
Returns the sweep angle of the arc.

com.mindfusion.diagramming Namespace

Utilities.lineIntersect<T> Method

Calculates the intersection point of endless lines (pA, pB) and (pC, pD)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static <T> boolean lineIntersect (
    Point2D pA,
    Point2D pB,
    Point2D pC,
    Point2D pD,
    Point2D result
)
```

Parameters

pA

pB

pC

pD

result
the point that will receive the result if the lines intersect

Return Value

true if the lines intersect

See Also

Utilities.lineIntersectHorizontal Method

Finds the x coordinate of the intersection point of the horizontal line at y and the line defined by points pA and pB. If the lines do not intersect, result is undefined.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static double lineIntersectHorizontal (
    double y,
    Point2D pA,
    Point2D pB
)
```

Parameters

y

pA

pB

Return Value

The intersection point x coordinate.

See Also

Utilities Members
Utilities Class
com.mindfusion.diagramming Namespace

Utilities.lineIntersectVertical Method

Finds the y coordinate of the intersection point of the vertical line at x and the line defined by points pA and pB. If the lines do not intersect, result is undefined.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static double lineIntersectVertical (
    double x,
    Point2D pA,
    Point2D pB
)
```

Parameters

x

pA

pB

Return Value

The intersection point y coordinate.

ValidationEvent Members

Contains information passed to the validation events defined in DiagramListener.

The following tables list the members exposed by the ValidationEvent type.

Public Constructors

	Name	Description
	ValidationEvent	Initializes a new ValidationEvent instance.

Public Methods

	Name	Description
	cancelDrag	Immediately cancels the item's creation or modification. This differs from calling setCancel(false), which would only change the cursor to indicate to users that they cannot complete the modification at the current pointer position.
	getCancel	Gets a value indicating whether to prevent the user from completing the operation.
	setCancel	Sets a value indicating whether to prevent the user from completing the operation

See Also

ValidationEvent Class
com.mindfusion.diagramming Namespace

ValidationEvent Constructor

Initializes a new ValidationEvent instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public ValidationEvent (
    Object source
)
```

Parameters

source

See Also

ValidationEvent Class
com.mindfusion.diagramming Namespace

ValidationEvent Methods

ValidationEvent.cancelDrag Method

Immediately cancels the item's creation or modification. This differs from calling setCancel(false), which would only change the cursor to indicate to users that they cannot complete the modification at the current pointer position.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void cancelDrag ()
```

See Also

ValidationEvent Members
ValidationEvent Class
com.mindfusion.diagramming Namespace

ValidationEvent.getCancel Method

Gets a value indicating whether to prevent the user from completing the operation.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getCancel ()
```

Return Value

true to cancel the operation; **false** to approve it.

See Also

ValidationEvent Members
ValidationEvent Class
com.mindfusion.diagramming Namespace

ValidationEvent.setCancel Method

Sets a value indicating whether to prevent the user from completing the operation

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setCancel (
    boolean cancel
)
```

Parameters

cancel
true to cancel the operation; **false** to approve it.

ValidationEvent Members
ValidationEvent Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout Class

A version of **FlowLayout** which arranges its components vertically.

Syntax

Java
`public class VerticalFlowLayout implements LayoutManager2, Serializable`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.VerticalFlowLayout

See Also

VerticalFlowLayout Members
com.mindfusion.diagramming Namespace

VerticalFlowLayout Members

A version of **FlowLayout** which arranges its components vertically.

The following tables list the members exposed by the VerticalFlowLayout type.

Public Constructors

	Name	Description
	VerticalFlowLayout	Overloaded.

Public Fields

	Name	Description
	BOTTOM	This value indicates that each row of components should be bottom-justified.
	CENTER	This value indicates that each row of components should be centered.
	LEFT	This value indicates that the components should be left-aligned.
	MIDDLE	This value indicates that the components should be centered horizontally.

	RIGHT	This value indicates that the components should be right-aligned.
	STRETCH	This value indicates that the components should be stretched horizontally.
	TOP	This value indicates that each row of components should be top-justified.

Public Methods

	Name	Description
	addLayoutComponent	Overloaded.
	getAlignment	Gets the alignment for this layout.
	getHAlignment	Gets the horizontal alignment of layout components.
	getHgap	Gets the horizontal gap between components and between the components and the borders of the Container.
	getLayoutAlignmentX	
	getLayoutAlignmentY	
	getVgap	Gets the vertical gap between components and between the components and the borders of the Container.
	invalidateLayout	
	layoutContainer	Lays out the container. This method lets each *visible* component take its preferred size by reshaping the components in the target container in order to satisfy the alignment of this VerticalFlowLayout object.
	maximumLayoutSize	
	minimumLayoutSize	Returns the minimum dimensions needed to layout the *visible* components contained in the specified target container.
	preferredLayoutSize	Returns the preferred dimensions for this layout given the *visible* components in the specified target container.
	removeLayoutComponent	
	setAlignment	Sets the alignment for this layout.
	setHAlignment	Sets the horizontal alignment of layout components.
	setHgap	Sets the horizontal gap between components and between the components and the borders of the Container.
	setVgap	Sets the vertical gap between components and between the components and the borders of the Container.
	toString	Returns a string representation of this VerticalFlowLayout object and its values.

VerticalFlowLayout Fields

VerticalFlowLayout.BOTTOM Field

This value indicates that each row of components should be bottom-justified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static final int BOTTOM
```

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.CENTER Field

This value indicates that each row of components should be centered.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static final int CENTER
```

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.LEFT Field

This value indicates that the components should be left-aligned.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static final int LEFT
```

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.MIDDLE Field

This value indicates that the components should be centered horizontally.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static final int MIDDLE
```

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.RIGHT Field

This value indicates that the components should be right-aligned.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static final int RIGHT
```

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.STRETCH Field

This value indicates that the components should be stretched horizontally.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public static final int STRETCH`

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.TOP Field

This value indicates that each row of components should be top-justified.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public static final int TOP`

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout Constructor

Overload List

Name	Description
VerticalFlowLayout ()	Initializes a new instance of the VerticalFlowLayout class with a centered alignment and a default 5-unit horizontal and vertical gap.
VerticalFlowLayout (int)	Initializes a new instance of the **VerticalFlowLayout** class with the specified alignment and a default 5-unit horizontal and vertical gap.
VerticalFlowLayout (int, int, int)	Initializes a new instance of the **VerticalFlowLayout** class with the indicated alignment and the indicated horizontal and vertical gaps.
VerticalFlowLayout (int, int, int, int)	Initializes a new instance of the **VerticalFlowLayout** class.

See Also

VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout Constructor ()

Initializes a new instance of the VerticalFlowLayout class with a centered alignment and a default 5-unit horizontal and vertical gap.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public VerticalFlowLayout ()
```

See Also

VerticalFlowLayout Constructor Overload List
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout Constructor (int)

Initializes a new instance of the VerticalFlowLayout class with the specified alignment and a default 5-unit horizontal and vertical gap.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public VerticalFlowLayout (
    int align
)
```

Parameters

align

See Also

VerticalFlowLayout Constructor Overload List
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout Constructor (int, int, int)

Initializes a new instance of the VerticalFlowLayout class with the indicated alignment and the indicated horizontal and vertical gaps.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public VerticalFlowLayout (
    int align,
    int hgap,
    int vgap
)
```

Parameters

align

hgap

vgap

See Also

VerticalFlowLayout Constructor Overload List
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout Constructor (int, int, int, int)

Initializes a new instance of the VerticalFlowLayout class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public VerticalFlowLayout (
    int halign,
    int align,
    int hgap,
    int vgap
)
```

Parameters

halign

align

hgap

vgap

See Also

VerticalFlowLayout Constructor Overload List
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout Methods

VerticalFlowLayout.addLayoutComponent Method

Overload List

Name	Description
VerticalFlowLayout.addLayoutComponent (Component, Object)	
VerticalFlowLayout.addLayoutComponent (String, Component)	

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.addLayoutComponent Method (Component, Object)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addLayoutComponent (
    Component comp,
    Object constraints
)
```

Parameters

comp

constraints

See Also

addLayoutComponent Method Overload List
VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.addLayoutComponent Method (String, Component)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void addLayoutComponent (
    String name,
    Component comp
)
```

Parameters

name

comp

See Also

addLayoutComponent Method Overload List
VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.getAlignment Method

Gets the alignment for this layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getAlignment ()
```

Return Value

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.getHAlignment Method

Gets the horizontal alignment of layout components.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getHAlignment ()
```

Return Value

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.getHgap Method

Gets the horizontal gap between components and between the components and the borders of the Container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getHgap ()
```

Return Value

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.getLayoutAlignmentX Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getLayoutAlignmentX (
    Container target
)
```

Parameters

target

Return Value

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.getLayoutAlignmentY Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getLayoutAlignmentY (
    Container target
)
```

Parameters

target

Return Value

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.getVgap Method

Gets the vertical gap between components and between the components and the borders of the Container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getVgap ()
```

Return Value

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.invalidateLayout Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void invalidateLayout (
    Container target
)
```

Parameters

target

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.layoutContainer Method

Lays out the container. This method lets each *visible* component take its preferred size by reshaping the components in the target container in order to satisfy the alignment of this VerticalFlowLayout object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void layoutContainer (
    Container target
)
```

Parameters

target

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.maximumLayoutSize Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension maximumLayoutSize (
    Container target
)
```

Parameters

target

Return Value

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.minimumLayoutSize Method

Returns the minimum dimensions needed to layout the *visible* components contained in the specified target container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension minimumLayoutSize (
    Container target
)
```

Parameters

target

Return Value

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.preferredLayoutSize Method

Returns the preferred dimensions for this layout given the *visible* components in the specified target container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension preferredLayoutSize (
    Container target
)
```

Parameters

target

Return Value

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.removeLayoutComponent Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void removeLayoutComponent (
    Component comp
)
```

Parameters

comp

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.setAlignment Method

Sets the alignment for this layout.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setAlignment (
    int value
)
```

Parameters

value

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.setHAlignment Method

Sets the horizontal alignment of layout components.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHAlignment (
    int value
)
```

Parameters

value

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.setHgap Method

Sets the horizontal gap between components and between the components and the borders of the Container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setHgap (
    int hgap
)
```

Parameters

hgap

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.setVgap Method

Sets the vertical gap between components and between the components and the borders of the Container.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setVgap (
    int vgap
)
```

Parameters

vgap

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

VerticalFlowLayout.toString Method

Returns a string representation of this VerticalFlowLayout object and its values.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public String toString ()`

Return Value

See Also

VerticalFlowLayout Members
VerticalFlowLayout Class
com.mindfusion.diagramming Namespace

XDimension2D Class

Syntax

Java
`public class XDimension2D`

Inheritance Hierarchy

java.lang.Object
com.mindfusion.diagramming.XDimension2D

See Also

XDimension2D Members
com.mindfusion.diagramming Namespace

XDimension2D Members

The following tables list the members exposed by the XDimension2D type.

Public Constructors

	Name	Description
	XDimension2D	

Public Methods

	Name	Description
	fromRect	

See Also

XDimension2D Class
com.mindfusion.diagramming Namespace

XDimension2D Constructor

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public XDimension2D ()
```

See Also

XDimension2D Class
com.mindfusion.diagramming Namespace

XDimension2D Methods

XDimension2D.fromRect Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public static XDimension2D.Double fromRect (
    Rectangle2D rect
)
```

Parameters

rect

Return Value

See Also

XDimension2D Members
XDimension2D Class
com.mindfusion.diagramming Namespace

XmlElementNameAnnotation Interface

Specifies a string to be used as a XML element name of a type during XML serialization.

Syntax

Java

```
public interface XmlElementNameAnnotation extends Annotation
```

See Also

XmlElementNameAnnotation Members
com.mindfusion.diagramming Namespace

XmlElementNameAnnotation Members

Specifies a string to be used as a XML element name of a type during XML serialization.

The following tables list the members exposed by the XmlElementNameAnnotation type.

See Also

XmlElementNameAnnotation Interface
com.mindfusion.diagramming Namespace

XmlPersistContext Class

Contains methods that can help you serialize and deserialize diagram items to and from XML documents.

Syntax

Java

```
public class XmlPersistContext
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.XmlPersistContext

See Also

XmlPersistContext Members
com.mindfusion.diagramming Namespace

XmlPersistContext Members

Contains methods that can help you serialize and deserialize diagram items to and from XML documents.

The following tables list the members exposed by the XmlPersistContext type.

Public Constructors

	Name	Description
	XmlPersistContext	Overloaded.

Public Fields

	Name	Description
	LatestFormat	

Public Methods

	Name	Description
	addChildElement	Overloaded.
	getChildElement	
	getClassVersion	
	getDiagram	
	getIncludeUnalteredProperties	Gets whether properties should be saved to XML when they have the default values.
	getXmlDocument	
	loadHeaderFromXml	Reads a lane header from the specified XML element.
	readAnchorPattern	
	readBool	Overloaded.
	readBrush	
	readByte	
	readChar	
	readColor	Overloaded.
	readColorArray	
	readDouble	
	readEffect	Overloaded.
	readEnum	Overloaded.
	readFloat	Overloaded.
	readFloatArray	
	readFont	

	readGroup	
	readHashtable	Reads a hash or traits table object with the specified name.
	readImage	Overloaded.
	readInt	Overloaded.
	readItemReference	Overloaded.
	readLong	
	readNodeConstraints	
	readObject	
	readPen	Overloaded.
	readPointCollection	
	readPointCoordinates	
	readPointF	
	readRectangleF	
	readShape	Overloaded.
	readShort	Overloaded.
	readSizeF	
	readSizeF	
	readString	Overloaded.
	readStringFormat	Overloaded.
	readStyle	Reads a Style object with the specified name.
	readSvg	Reads a SVG object with the specified name.
	readTag	
	readTheme	Reads a Theme object with the specified name.
	readThickness	
	saveHeaderToXml	Saves the specified lane header to the underlying document under the specified name.
	setIncludeUnalteredProperties	Sets whether properties should be saved to XML when they have the default values.
	writeAnchorPattern	Writes the specified anchor pattern.
	writeBool	Writes a boolean value with the specified name.
	writeBrush	
	writeByte	Write a byte value with the specified name.
	writeChar	Write a char value with the specified name.
	writeColor	

	writeColorArray	
	writeDouble	Writes a double value with the specified name.
	writeEffect	Writes a reference to the specified effect. The effect is registered within the internal hashtable for subsequent serialization.
	writeEnum	
	writeFloat	Writes a float value with the specified name.
	writeFloatArray	
	writeFont	Overloaded.
	writeGroup	
	writeImage	
	writeInt	Writes an integer value with the specified name.
	writeItemReference	Writes a reference to the specified item with the specified name.
	writeLong	Writes a long value with the specified name.
	writePen	
	writePointCollection	
	writePointCoordinates	
	writePointF	Writes a Point2D with the specified name.
	writeRectangleF	Writes a Rectangle2D with the specified name.
	writeShape	Writes the specified shape with the specified name.
	writeShort	Writes a short value with the specified name.
	writeSizeF	Writes a **Dimension2D** object with the specified name.
	writeString	Writes a string value with the specified name.
	writeStringFormat	
	writeStyle	Writes a reference to the specified style. The style is registered within the internal hashtable for subsequent serialization.
	writeSvg	Writes a reference to the specified SVG. The SVG is registered within the internal hashtable for subsequent serialization.
	writeTag	Writes the specified tag of the specified object.
	writeTheme	Writes the specified Theme object.
	writeThickness	
	writeTraits

XmlPersistContext Fields

XmlPersistContext.LatestFormat Field

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public static int LatestFormat`

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext Constructor

Overload List

Name	Description
XmlPersistContext (Diagram, Document)	Initializes a new instance of the XmlPersistContext class.
XmlPersistContext (Diagram, Document, int)	Initializes a new instance of the XmlPersistContext class.

See Also

XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext Constructor (Diagram, Document)

Initializes a new instance of the XmlPersistContext class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public XmlPersistContext (
    Diagram diagram,
```

```
    Document document
)
```

Parameters

diagram
The Diagram this class will operate on.

document
The Xml Document to serializeto / deserialize from.

See Also

XmlPersistContext Constructor Overload List
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext Constructor (Diagram, Document, int)

Initializes a new instance of the XmlPersistContext class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public XmlPersistContext (
    Diagram diagram,
    Document document,
    int fileVersion
)
```

Parameters

diagram
The Diagram this class will operate on.

document
The Xml Document to serialize to / deserialize from.

fileVersion

XmlPersistContext Constructor Overload List
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext Methods

XmlPersistContext.addChildElement Method

Overload List

Name	Description
XmlPersistContext.addChildElement (String, Element)	Adds a new child node with the specified name to the specified parent node.
XmlPersistContext.addChildElement (String, Element, String)	Adds a new child node with the specified name and value to the specified parent node.

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.addChildElement Method (String, Element)

Adds a new child node with the specified name to the specified parent node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element addChildElement (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

addChildElement Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.addChildElement Method (String, Element, String)

Adds a new child node with the specified name and value to the specified parent node.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element addChildElement (
    String elementName,
```

```
    Element parentElement,
    String innerText
)
```

Parameters

elementName

parentElement

innerText

Return Value

See Also

addChildElement Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.getChildElement Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element getChildElement (
    Element element,
    String name
)
```

Parameters

element

name

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.getClassVersion Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int getClassVersion ()
```

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.getDiagram Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
public Diagram getDiagram ()
```

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.getIncludeUnalteredProperties Method

Gets whether properties should be saved to XML when they have the default values.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean getIncludeUnalteredProperties ()
```

Return Value

true if all properties should be saved; false if only the altered ones should be saved

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.getXmlDocument Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Document getXmlDocument ()
```

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.loadHeaderFromXml Method

Reads a lane header from the specified XML element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Header loadHeaderFromXml (
    Element element
)
```

Parameters

element

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readAnchorPattern Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public AnchorPattern readAnchorPattern (
    String elementName,
```

```
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readBool Method

Overload List

Name	Description
XmlPersistContext.readBool (String, Element)	
XmlPersistContext.readBool (String, Element, boolean)	

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readBool Method (String, Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean readBool (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

readBool Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readBool Method (String, Element, boolean)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean readBool (
    String elementName,
    Element parentElement,
    boolean defaultValue
)
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

readBool Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readBrush Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Brush readBrush (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readByte Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public byte readByte (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readChar Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Character readChar (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readColor Method

Overload List

Name	Description
XmlPersistContext.readColor (String, Element)	
XmlPersistContext.readColor (String, Element, Color)	

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readColor Method (String, Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Color readColor (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

readColor Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readColor Method (String, Element, Color)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Color readColor (
    String elementName,
    Element parentElement,
    Color defaultValue
)
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

readColor Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readColorArray Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Color[] readColorArray (
    String elementName,
    String subElementName,
    Element parentElement
)
```

Parameters

elementName

subElementName

parentElement

Return Value

See Also

XmlPersistContext.readDouble Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public double readDouble (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readEffect Method

Overload List

Name	Description
XmlPersistContext.readEffect (Element)	Reads a NodeEffect object from the specified element.
XmlPersistContext.readEffect (String, Element)	Reads a **NodeEffect** object with the specified name.

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readEffect Method (Element)

Reads a NodeEffect object from the specified element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeEffect readEffect (
    Element element
)
```

Parameters

element

Return Value

See Also

readEffect Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readEffect Method (String, Element)

Reads a NodeEffect object with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeEffect readEffect (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

readEffect Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readEnum Method

Overload List

Name	Description
XmlPersistContext.readEnum (String, Element)	
XmlPersistContext.readEnum (String, Element, int)	

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readEnum Method (String, Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int readEnum (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

readEnum Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readEnum Method (String, Element, int)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int readEnum (
    String elementName,
    Element parentElement,
    int defaultValue
)
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

readEnum Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readFloat Method

Overload List

Name	Description
XmlPersistContext.readFloat (String, Element)	
XmlPersistContext.readFloat (String, Element, float)	

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readFloat Method (String, Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public float readFloat ( String elementName, Element parentElement )`

Parameters

elementName

parentElement

Return Value

See Also

readFloat Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readFloat Method (String, Element, float)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float readFloat (
    String elementName,
    Element parentElement,
    float defaultValue
)
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

readFloat Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readFloatArray Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float[] readFloatArray (
    String elementName,
    String subElementName,
```

```
    Element parentElement
)
```

Parameters

elementName

subElementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readFont Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Font readFont (
    String elementName,
    Element parentElement,
    boolean convertToPoint
)
```

Parameters

elementName

parentElement

convertToPoint

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readGroup Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

`public Group readGroup (`
`  String elementName,`
`  Element parentElement`
`)`

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readHashtable Method

Reads a hash or traits table object with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

`public Hashtable<Object, Object> readHashtable (`
`  String elementName,`
`  Element parentElement`
`)`

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readImage Method

Overload List

Name	Description

XmlPersistContext.readImage (Element)	
XmlPersistContext.readImage (String, Element)	

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readImage Method (Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Image readImage (
    Element element
)
```

Parameters

element

Return Value

See Also

readImage Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readImage Method (String, Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Image readImage (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

readImage Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readInt Method

Overload List

Name	Description
XmlPersistContext.readInt (String, Element)	
XmlPersistContext.readInt (String, Element, int)	

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readInt Method (String, Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int readInt (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

readInt Method Overload List
XmlPersistContext Members

XmlPersistContext.readInt Method (String, Element, int)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public int readInt (
    String elementName,
    Element parentElement,
    int defaultValue
)
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

readInt Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readItemReference Method

Overload List

Name	Description
XmlPersistContext.readItemReference (Element)	Reads an item reference from the specified element.
XmlPersistContext.readItemReference (String, Element)	

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readItemReference Method (Element)

Reads an item reference from the specified element.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem readItemReference (
    Element itemElement
)
```

Parameters

itemElement

Return Value

See Also

readItemReference Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readItemReference Method (String, Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramItem readItemReference (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

readItemReference Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readLong Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public long readLong (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readNodeConstraints Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public NodeConstraints readNodeConstraints (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readObject Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object readObject (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readPen Method

Overload List

Name	Description
XmlPersistContext.readPen (String, Element)	
XmlPersistContext.readPen (String, Element, Pen)	

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readPen Method (String, Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Pen readPen (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

readPen Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readPen Method (String, Element, Pen)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Pen readPen (
    String elementName,
    Element parentElement,
    Pen defaultPen
)
```

Parameters

elementName

parentElement

defaultPen

Return Value

See Also

readPen Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readPointCollection Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public PointList readPointCollection (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readPointCoordinates Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public ArrayList<Point2D.Float> readPointCoordinates (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readPointF Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Point2D.Float readPointF (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readRectangleF Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Rectangle2D.Float readRectangleF (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readShape Method

Overload List

Name	Description

XmlPersistContext.readShape (String, Element)	
XmlPersistContext.readShape (String, Element, Shape)	

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readShape Method (String, Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Shape readShape (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

readShape Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readShape Method (String, Element, Shape)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Shape readShape (
    String elementName,
    Element parentElement,
    Shape defaultValue
)
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

readShape Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readShort Method

Overload List

Name	Description
XmlPersistContext.readShort (String, Element)	
XmlPersistContext.readShort (String, Element, short)	

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readShort Method (String, Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public short readShort (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

readShort Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readShort Method (String, Element, short)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public short readShort (
    String elementName,
    Element parentElement,
    short defaultValue
)
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

readShort Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readSizeF Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension2D readSizeF (
    String elementName,
    Element parentElement,
    Dimension2D defaultValue
)
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readSizeF Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Dimension2D readSizeF (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readString Method

Overload List

Name	Description
XmlPersistContext.readString (String, Element)	
XmlPersistContext.readString (String, Element, String)	

See Also

XmlPersistContext Members
XmlPersistContext Class

XmlPersistContext.readString Method (String, Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String readString (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

readString Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readString Method (String, Element, String)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public String readString (
    String elementName,
    Element parentElement,
    String defaultValue
)
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

readString Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readStringFormat Method

Overload List

Name	Description
XmlPersistContext.readStringFormat (String, Element)	
XmlPersistContext.readStringFormat (String, Element, TextFormat)	

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readStringFormat Method (String, Element)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TextFormat readStringFormat (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

readStringFormat Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readStringFormat Method (String, Element, TextFormat)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TextFormat readStringFormat (
    String elementName,
    Element parentElement,
    TextFormat defaultValue
)
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

readStringFormat Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readStyle Method

Reads a Style object with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Style readStyle (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readSvg Method

Reads a SVG object with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public SvgContent readSvg (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readTag Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Object readTag (
    Object item,
    String elementName,
    Element parentElement
)
```

Parameters

item

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readTheme Method

Reads a Theme object with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Theme readTheme (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.readThickness Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Thickness readThickness (
    String elementName,
    Element parentElement
)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.saveHeaderToXml Method

Saves the specified lane header to the underlying document under the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void saveHeaderToXml (
    Header header,
    Element collectionElement,
    String elementName
)
```

Parameters

header

collectionElement

elementName

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.setIncludeUnalteredProperties Method

Sets whether properties should be saved to XML when they have the default values.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setIncludeUnalteredProperties (
    boolean value
)
```

Parameters

value
true to save all properties; false to save only altered properties

See Also

XmlPersistContext Members
XmlPersistContext Class

XmlPersistContext.writeAnchorPattern Method

Writes the specified anchor pattern.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeAnchorPattern (
    AnchorPattern anchorPattern,
    String elementName,
    Element parentElement
)
```

Parameters

anchorPattern

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeBool Method

Writes a boolean value with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeBool (
    boolean boolValue,
    String elementName,
    Element parentElement
)
```

Parameters

boolValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeBrush Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeBrush (
    Brush brush,
    String elementName,
    Element parentElement
)
```

Parameters

brush

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeByte Method

Write a byte value with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeByte (
    byte byteValue,
    String elementName,
    Element parentElement
)
```

Parameters

byteValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeChar Method

Write a char value with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeChar (
    Character charValue,
    String elementName,
    Element parentElement
)
```

Parameters

charValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeColor Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeColor (
    Color color,
    String elementName,
    Element parentElement
)
```

Parameters

color

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeColorArray Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeColorArray (
    Color[] array,
    String elementName,
    String subElementName,
    Element parentElement
)
```

Parameters

array

elementName

subElementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeDouble Method

Writes a double value with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeDouble (
    double doubleValue,
    String elementName,
    Element parentElement
)
```

Parameters

doubleValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeEffect Method

Writes a reference to the specified effect. The effect is registered within the internal hashtable for subsequent serialization.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeEffect (
    NodeEffect effect,
    String elementName,
    Element parentElement
)
```

Parameters

effect

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeEnum Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeEnum (
    int enumValue,
    String elementName,
    Element parentElement
)
```

Parameters

enumValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeFloat Method

Writes a float value with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeFloat (
    float floatValue,
    String elementName,
    Element parentElement
)
```

Parameters

floatValue

elementName

parentElement

Return Value

See Also

XmlPersistContext.writeFloatArray Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeFloatArray (
    float[] array,
    String elementName,
    String subElementName,
    Element parentElement
)
```

Parameters

array

elementName

subElementName

parentElement

Return Value

See Also

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeFont (
    Font font,
    String elementName,
    Element parentElement
)
```

Parameters

font

elementName

parentElement

Return Value

See Also

writeFont Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeFont Method (Font, String, Element, GraphicsUnit)

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeFont (
    Font font,
    String elementName,
    Element parentElement,
    GraphicsUnit unit
)
```

Parameters

font

elementName

parentElement

unit

Return Value

See Also

writeFont Method Overload List
XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeGroup Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeGroup (
    Group group,
    String elementName,
    Element parentElement
)
```

Parameters

group

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class

XmlPersistContext.writeImage Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeImage (
    Image image,
    String elementName,
    Element parentElement
)
```

Parameters

image

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeInt Method

Writes an integer value with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeInt (
    int intValue,
    String elementName,
    Element parentElement
)
```

Parameters

intValue

elementName

parentElement

Return Value

com.mindfusion.diagramming Namespace

XmlPersistContext.writeItemReference Method

Writes a reference to the specified item with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeItemReference (
    DiagramItem item,
    String elementName,
    Element parentElement
)
```

Parameters

item

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeLong Method

Writes a long value with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeLong (
    long longValue,
    String elementName,
    Element parentElement
)
```

Parameters

longValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writePen Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writePen (
    Pen pen,
    String elementName,
    Element parentElement
)
```

Parameters

pen

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writePointCollection Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writePointCollection (
    PointList points,
    String elementName,
    Element parentElement
)
```

Parameters

points

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writePointCoordinates Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Element writePointCoordinates (
    List<Point2D.Float> points,
    String elementName,
    Element parentElement
)
```

Parameters

points

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writePointF Method

Writes a Point2D with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Element writePointF (
    Point2D point,
    String elementName,
    Element parentElement
)
```

Parameters

point

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeRectangleF Method

Writes a Rectangle2D with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeRectangleF (
    Rectangle2D rectangle,
    String elementName,
    Element parentElement
)
```

Parameters

rectangle

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeShape Method

Writes the specified shape with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeShape (
    Shape shape,
    String elementName,
    Element parentElement
)
```

Parameters

shape

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeShort Method

Writes a short value with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeShort (
    short shortValue,
    String elementName,
    Element parentElement
)
```

Parameters

shortValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeSizeF Method

Writes a **Dimension2D** object with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeSizeF (
    Dimension2D size,
    String elementName,
    Element parentElement
)
```

Parameters

size

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeString Method

Writes a string value with the specified name.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeString (
    String stringValue,
    String elementName,
    Element parentElement
)
```

Parameters

stringValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeStringFormat Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeStringFormat (
    TextFormat stringFormat,
    String elementName,
    Element parentElement
)
```

Parameters

stringFormat

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeStyle Method

Writes a reference to the specified style. The style is registered within the internal hashtable for subsequent serialization.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeStyle (
    Style style,
    String elementName,
    Element parentElement
)
```

Parameters

style

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeSvg Method

Writes a reference to the specified SVG. The SVG is registered within the internal hashtable for subsequent serialization.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeSvg (
    SvgContent svg,
    String elementName,
    Element parentElement
)
```

Parameters

svg

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeTag Method

Writes the specified tag of the specified object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeTag (
    Object item,
    Object tagValue,
    String elementName,
    Element parentElement
)
```

Parameters

item

tagValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeTheme Method

Writes the specified Theme object.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeTheme (
    Theme theme,
    String elementName,
    Element parentElement
)
```

Parameters

theme

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeThickness Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeThickness (
    Thickness thickness,
    String elementName,
    Element parentElement
)
```

Parameters

thickness

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
com.mindfusion.diagramming Namespace

XmlPersistContext.writeTraits Method

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public Element writeTraits (
    Hashtable<Object, Object> traits,
    String elementName,
    Element parentElement
)
```

Parameters

traits

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class

XmlReaderException Class

An exception thrown by XmlReader if it cannot parse an input file.

Syntax

Java

```
public class XmlReaderException extends Exception
```

Inheritance Hierarchy

java.lang.Object
  java.lang.Throwable
    java.lang.Exception
      com.mindfusion.diagramming.XmlReaderException

See Also

XmlReaderException Members
com.mindfusion.diagramming Namespace

XmlReaderException Members

An exception thrown by XmlReader if it cannot parse an input file.

The following tables list the members exposed by the XmlReaderException type.

Public Constructors

	Name	Description
	XmlReaderException	Initializes a new XmlReaderException instance.

See Also

XmlReaderException Class
com.mindfusion.diagramming Namespace

XmlReaderException Constructor

Initializes a new XmlReaderException instance.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public XmlReaderException (
    Throwable cause
)
```

Parameters

cause
Specifies the cause of the exception.

See Also

XmlReaderException Class
com.mindfusion.diagramming Namespace

XmlReaderListener Interface

Defines events that let you load custom tag data from XML files.

Syntax

Java

```
public interface XmlReaderListener extends EventListener
```

See Also

XmlReaderListener Members
com.mindfusion.diagramming Namespace

XmlReaderListener Members

Defines events that let you load custom tag data from XML files.

The following tables list the members exposed by the XmlReaderListener type.

Public Methods

	Name	Description
	readTag	Called when a tag object must be read.

See Also

XmlReaderListener Interface
com.mindfusion.diagramming Namespace

XmlReaderListener Methods

XmlReaderListener.readTag Method

Called when a tag object must be read.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
void readTag (
    SerializeTagEvent e
)
```

Parameters

e
A SerializeTagEvent object providing information about the event.

See Also

XmlReaderListener Members
XmlReaderListener Interface
com.mindfusion.diagramming Namespace

ZoomControl Class

ZoomControl lets users zoom and pan a target DiagramView interactively.

Syntax

Java

```
public class ZoomControl extends JComponent implements MouseListener, MouseMotionListener,
PropertyChangeListener
```

Remarks

The **ZoomControl** class lets user change interactively the current zoom level and scroll position of a DiagramView. To set it up, add a **ZoomControl** to the frame, place it anywhere over a **DiagramView**, and set the control's View property to that view. Set the ZoomStep and ScrollStep properties to specify the amount added to view's zoom level or scroll position by **ZoomControl**'s buttons. You can customize the control's appearance by setting properties such as Fill, BorderColor, CornerRadius and TickPosition.

Inheritance Hierarchy

java.lang.Object
  java.awt.Component
    java.awt.Container
      javax.swing.JComponent
        com.mindfusion.diagramming.ZoomControl

See Also

ZoomControl Members
com.mindfusion.diagramming Namespace

ZoomControl Members

ZoomControl lets users zoom and pan a target DiagramView interactively.

The following tables list the members exposed by the **ZoomControl** type.

Public Constructors

	Name	Description
	ZoomControl	Initializes a new instance of the ZoomControl class.

Public Methods

	Name	Description
	getActiveColor	Gets the color used to render depressed buttons.
	getBorderColor	Gets the color of ZoomControl elements' borders.
	getCornerRadius	Gets the corner radius of rounded child elements.
	getFill	Gets the brush used to fill the ZoomControl elements.
	getInnerColor	Gets the color of plus, minus and arrow icons.
	getMaxZoomFactor	Gets the maximum zoom level allowed to set through this control.
	getMinZoomFactor	Gets the minimum zoom level allowed to set through this control.
	getScrollStep	Gets the scroll offset added when users click the pan arrows.
	getShadowColor	Gets the shadow color.
	getShowLabel	Gets a value indicating whether the label that shows the current zoom level should be visible.

	getSnapToZoomStep	Gets whether the trackbar should snap to ZoomStep values when dragged.
	getTickPosition	Gets the current tick position of the trackbar.
	getView	Gets the DiagramView object controlled by this ZoomControl.
	getZoomFactor	Gets current zoom level.
	getZoomStep	Gets the amount by which to change zoom level when + and - buttons are clicked.
	isDoubleBuffered	Overrides JComponent.isDoubleBuffered method.
	isOpaque	Overrides JComponent.isOpaque method.
	mouseClicked	
	mouseDragged	Implements MouseListener.mouseDragged
	mouseEntered	
	mouseExited	
	mouseMoved	Implements MouseListener.mouseMoved
	mousePressed	Implements MouseListener.mousePressed
	mouseReleased	Implements MouseListener.mouseReleased
	propertyChange	
	setActiveColor	Sets the color used to render depressed buttons.
	setBorderColor	Sets the color of ZoomControl elements' borders.
	setCornerRadius	Sets the corner radius of rounded child elements.
	setFill	Sets the brush used to fill the ZoomControl elements.
	setInnerColor	Sets the color of plus, minus and arrow icons.
	setMaxZoomFactor	Sets the maximum zoom level allowed to set through this control.
	setMinZoomFactor	Sets the minimum zoom level allowed to set through this control.
	setScrollStep	Sets the scroll offset added when users click the pan arrows.
	setShadowColor	Sets the shadow color.
	setShowLabel	Sets a value indicating whether the label that shows the current zoom level should be visible.
	setSnapToZoomStep	Sets whether the trackbar should snap to ZoomStep values when dragged.
	setTickPosition	Sets the current tick position of the trackbar.
	setView	Sets the DiagramView object controlled by this ZoomControl.
	setZoomFactor	Overloaded. Sets current zoom level.

	setZoomStep	Sets the amount by which to change zoom level when + and - buttons are clicked.

Protected Methods

	Name	Description
	paintComponent

ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl Constructor

Initializes a new instance of the ZoomControl class.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public ZoomControl ()`

See Also

ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl Methods

ZoomControl.getActiveColor Method

Gets the color used to render depressed buttons.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java
`public Color getActiveColor ()`

Return Value

A java.awt.Color instance. The default value is RGB(135, 206, 235)

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getBorderColor Method

Gets the color of ZoomControl elements' borders.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Color getBorderColor ()
```

Return Value

A java.awt.Color instance. The default value is RGB(77, 83, 94).

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getCornerRadius Method

Gets the corner radius of rounded child elements.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public int getCornerRadius ()
```

Return Value

An integer value specifying the radius of corner arcs. The default value is 6.

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getFill Method

Gets the brush used to fill the ZoomControl elements.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Brush getFill ()
```

Return Value

A Brush instance.

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getInnerColor Method

Gets the color of plus, minus and arrow icons.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Color getInnerColor ()
```

Return Value

A java.awt.Color instance. The default value is RGB(91, 91, 91).

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getMaxZoomFactor Method

Gets the maximum zoom level allowed to set through this control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public float getMaxZoomFactor ()
```

Return Value

A float value specifying the maximum zoom level. The default value is 200.

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getMinZoomFactor Method

Gets the minimum zoom level allowed to set through this control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getMinZoomFactor ()
```

Return Value

A float value specifying the minimum zoom level. The default value is 0.

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getScrollStep Method

Gets the scroll offset added when users click the pan arrows.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getScrollStep ()
```

Return Value

A float value specifying the scroll offset. The default value is 0.5.

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getShadowColor Method

Gets the shadow color.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public Color getShadowColor ()
```

Return Value

A java.awt.Color instance. The default value is ARGB(150, 0, 0, 0).

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getShowLabel Method

Gets a value indicating whether the label that shows the current zoom level should be visible.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getShowLabel ()
```

Return Value

true to show the zoom level label, or false otherwise. The default value is true.

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getSnapToZoomStep Method

Gets whether the trackbar should snap to ZoomStep values when dragged.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public boolean getSnapToZoomStep ()
```

Return Value

true to snap to multiples of ZoomStep, or false otherwise. The default value is true.

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getTickPosition Method

Gets the current tick position of the trackbar.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public TickPosition getTickPosition ()
```

Return Value

A member of the TickPosition enumeration.

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getView Method

Gets the DiagramView object controlled by this ZoomControl.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public DiagramView getView ()
```

Return Value

The DiagramView object controlled by this ZoomControl.

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getZoomFactor Method

Gets current zoom level.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getZoomFactor ()
```

Return Value

A float value specifying the current zoom level.

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.getZoomStep Method

Gets the amount by which to change zoom level when + and - buttons are clicked.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public float getZoomStep ()
```

Return Value

A float value specifying the zoom level change. The default value is 10.

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.isDoubleBuffered Method

Overrides JComponent.isDoubleBuffered method.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean isDoubleBuffered ()
```

Return Value

true

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.isOpaque Method

Overrides JComponent.isOpaque method.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public boolean isOpaque ()
```

Return Value

false

ZoomControl.setMaxZoomFactor Method

Sets the maximum zoom level allowed to set through this control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMaxZoomFactor (
    float value
)
```

Parameters

value
A float value specifying the maximum zoom level.

See Also

ZoomControl Members
ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.setMinZoomFactor Method

Sets the minimum zoom level allowed to set through this control.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setMinZoomFactor (
    float value
)
```

Parameters

value
A float value specifying the minimum zoom level.

See Also

ZoomControl Members

com.mindfusion.diagramming Namespace

ZoomControl.setSnapToZoomStep Method

Sets whether the trackbar should snap to ZoomStep values when dragged.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setSnapToZoomStep (
    boolean value
)
```

Parameters

value
true to snap to multiples of ZoomStep, or false otherwise. The default value is true.

ZoomControl Class
com.mindfusion.diagramming Namespace

ZoomControl.setTickPosition Method

Sets the current tick position of the trackbar.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setTickPosition (
    TickPosition position
)
```

Parameters

position
A member of the TickPosition enumeration.

com.mindfusion.diagramming Namespace

ZoomControl.setView Method

Sets the DiagramView object controlled by this ZoomControl.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

```
public void setView (
    DiagramView value
)
```

Parameters

value
The DiagramView object controlled by this ZoomControl.

ZoomControl.setZoomFactor Method (float)

Sets current zoom level.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setZoomFactor (
    float value
)
```

Parameters

value
A float value specifying the new zoom level.

See Also

setZoomFactor Method Overload List

ZoomControl.setZoomFactor Method (float, boolean)

Sets current zoom level.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

```
Java
public void setZoomFactor (
    float value,
    boolean applyConstraints
)
```

Parameters

value

applyConstraints

ZoomControl.setZoomStep Method

Sets the amount by which to change zoom level when + and - buttons are clicked.

Namespace: com.mindfusion.diagramming
Package: com.mindfusion.diagramming

Syntax

Java

`public void setZoomStep (`
`    float value`
`)`

Parameters

value
A float value specifying the zoom level change.

BorderComponent Members

Represents a component that draws a border around another component.

The following tables list the members exposed by the BorderComponent type.

Public Constructors

	Name	Description
	BorderComponent	Initializes a new instance of the BorderComponent class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	accept	ComponentBase.accept override. (Inherited from ContentComponent.)
	addChild	Implements AddChild.addChild (Inherited from ContentComponent.)
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	arrangeComponents	ComponentBase.arrangeComponents override. (Inherited from ContentComponent.)
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	ComponentBase.createOutlinePath override
	draw	ContentComponent.draw override

find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
getBackground	Gets the brush used to fill the border background.
getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
getChildCount	ComponentBase.getChildCount override. (Inherited from ContentComponent.)
getContent	Gets the content of this component. (Inherited from ContentComponent.)
getCursor	Gets the cursor to display when the mouse is at the specified position. (Inherited from ComponentBase.)
getDesiredSize	ComponentBase.getDesiredSize override. (Inherited from ContentComponent.)
getDocumentBounds	For internal use. (Inherited from ComponentBase.)
getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
getIsOutline	Gets a value indicating whether this component defines the outline of its host.
getName	Gets the name of the component. (Inherited from ComponentBase.)

	getPadding	Gets the padding around this component's content. (Inherited from ContentComponent.)
	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getPen	Gets the pen used to stroke the border sides.
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	(Inherited from ComponentBase.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
	onKeyUp	(Inherited from ComponentBase.)
	onMouseMove	Overloaded. (Inherited from ComponentBase.)
	onMouseUp	Overloaded. (Inherited from ComponentBase.)
	onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	Implements Externalizable
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	setBackground	Sets the brush used to fill the border background.
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from

		ComponentBase.)
	setContent	Sets the content of this component. (Inherited from ContentComponent.)
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setIsOutline	Sets a value indicating whether this component defines the outline of its host.
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setPadding	Sets the padding around this component's content. (Inherited from ContentComponent.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setPen	Sets the pen used to stroke the border sides.
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)

	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	Implements Externalizable

Protected Methods

	Name	Description
	getThickness	ContentComponent.getThickness override
	loadFromJson	ContentComponent.LoadFromJson override.
	loadFromXml	ContentComponent.loadFromXml override
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onMouseDown	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	ContentComponent.SaveToJson override.
	saveToXml	ContentComponent.saveToXml override
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)

ButtonComponent Members

Represents a button-like component, which can respond to user clicks.

The following tables list the members exposed by the ButtonComponent type.

Public Constructors

	Name	Description
	ButtonComponent	Initializes a new instance of the ButtonComponent class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	accept	ComponentBase.accept override. (Inherited from ContentComponent.)
	addButtonComponentListener	Registers an event listener.
	addChild	Implements AddChild.addChild (Inherited from ContentComponent.)
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from

		ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	arrangeComponents	ComponentBase.arrangeComponents override. (Inherited from ContentComponent.)
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	For internal use. (Inherited from ComponentBase.)
	draw	ComponentBase.draw override.
	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getBrush	Gets the background brush of the button when it is in normal state.
	getBrushHovered	Gets the background brush of the button when it is in hovered state.
	getBrushPressed	Gets the background brush of the button when it is in pressed state.
	getChildCount	ComponentBase.getChildCount override. (Inherited from ContentComponent.)
	getContent	Gets the content of this component. (Inherited from ContentComponent.)
	getCursor	ComponentBase.getCursor override.
	getDesiredSize	ComponentBase.getDesiredSize override.
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)
	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)

getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
getImageList	Gets a list with images. Each image in the list represents the appearance of the button in one of its states: 0 - normal, 1 - pressed, 2 - disabled, 3 - hovered.
getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
getName	Gets the name of the component. (Inherited from ComponentBase.)
getPadding	Gets the padding around this component's content. (Inherited from ContentComponent.)
getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
getParentHost	For internal use. (Inherited from ComponentBase.)
getPen	Gets the border pen of the button when it is in normal state.
getPenHovered	Gets the border pen of the button when it is in hovered state.
getPenPressed	Gets the border pen of the button when it is in pressed state.
getType	Gets the type of the button.
getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)

onContextChanged	(Inherited from ComponentBase.)
onKeyDown	ComponentBase.onKeyDown override.
onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
onKeyUp	(Inherited from ComponentBase.)
onMouseDown	ComponentBase.onMouseDown override.
onMouseMove	ComponentBase.onMouseMove override.
onMouseUp	ComponentBase.onMouseUp override.
onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
raiseValidated	(Inherited from ComponentBase.)
readExternal	ComponentBase.readExternal override.
removeButtonComponentListener	Unregisters an event listener.
removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
setBrush	Sets the background brush of the button when it is in normal state.
setBrushHovered	Sets the background brush of the button when it is in hovered state.
setBrushPressed	Sets the background brush of the button when it is in pressed state.
setContent	Sets the content of this component. (Inherited from ContentComponent.)
setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)

	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setImageList	Sets a list with images. Each image in the list represents the appearance of the button in one of its states: 0 - normal, 1 - pressed, 2 - disabled, 3 - hovered.
	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setPadding	Sets the padding around this component's content. (Inherited from ContentComponent.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setPen	Sets the border pen of the button when it is in normal state.
	setPenHovered	Sets the border pen of the button when it is in hovered state.
	setPenPressed	Sets the border pen of the button when it is in pressed state.
	setType	Sets the type of the button.
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)

	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ComponentBase.writeExternal override.

Protected Methods

	Name	Description
	fireCustomDraw	Raises the customDraw event.
	fireOnClicked	Raises the mouseClicked event.
	fireRepeatEnded	Raises the repeatEnded event.
	getImage	Gets the image from the button's image list corresponding to the current state of the button.
	getState	Gets the current state of the button
	getThickness	Gets the space around the component's content. This space includes padding by default but can be subsequently adjusted as necessary by the deriving classes. (Inherited from ContentComponent.)
	loadFromJson	
	loadFromXml	ComponentBase.loadFromXml override.
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	
	saveToXml	ComponentBase.saveToXml override.
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)

ButtonComponent.fireOnClicked Method

Raises the mouseClicked event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void fireOnClicked (
    ComponentMouseEvent e
)
```

Parameters

e
An object containing the event data.

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.fireRepeatEnded Method

Raises the repeatEnded event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void fireRepeatEnded (
    ComponentEvent e
)
```

Parameters

e
An object containing the event data.

ButtonComponent.getBrush Method

Gets the background brush of the button when it is in normal state.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getBrush ()
```

Return Value

An instance of the Brush class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.getBrushHovered Method

Gets the background brush of the button when it is in hovered state.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public Brush getBrushHovered ()
```

Return Value

An instance of the Brush class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.getBrushPressed Method

Gets the background brush of the button when it is in pressed state.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public Brush getBrushPressed ()
```

Return Value

An instance of the Brush class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.getCursor Method

ComponentBase.getCursor override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public CursorHint getCursor (
    Point2D.Float point
)
```

Parameters

point

Return Value

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.getDesiredSize Method

ComponentBase.getDesiredSize override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public XDimension2D.Double getDesiredSize (
    XDimension2D.Double availableSize,
    Graphics2D g2d
)
```

Parameters

availableSize

g2d

Return Value

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.getImage Method

Gets the image from the button's image list corresponding to the current state of the button.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected Image getImage ()
```

Return Value

An instance of the Image class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.getImageList Method

Gets a list with images. Each image in the list represents the appearance of the button in one of its states: 0 - normal, 1 - pressed, 2 - disabled, 3 - hovered.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public ArrayList<Image> getImageList ()
```

Return Value

A list of java.awt.Image objects.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.getPen Method

Gets the border pen of the button when it is in normal state.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Pen getPen ()
```

Return Value

An instance of the Pen class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.getPenHovered Method

Gets the border pen of the button when it is in hovered state.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public Pen getPenHovered ()
```

Return Value

An instance of the Pen class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.getPenPressed Method

Gets the border pen of the button when it is in pressed state.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public Pen getPenPressed ()
```

Return Value

An instance of the Pen class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.getState Method

Gets the current state of the button

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
protected ButtonComponent.ButtonState getState ()
```

Return Value

A member of the ButtonState enumerator.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.getType Method

Gets the type of the button.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public ButtonComponent.ButtonType getType ()
```

Return Value

A member of the ButtonType enumerator.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.loadFromJson Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj

An JsonObject containing the ButtonComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.loadFromXml Method

ComponentBase.loadFromXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.onKeyDown Method

ComponentBase.onKeyDown override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean onKeyDown (
    int keyCode,
    int modifiers
)
```

Parameters

keyCode

modifiers

Return Value

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.onMouseDown Method

ComponentBase.onMouseDown override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onMouseDown (
    Point2D.Float point
)
```

Parameters

point

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.onMouseMove Method

ComponentBase.onMouseMove override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onMouseMove (
    Point2D.Float point
)
```

Parameters

point

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.onMouseUp Method

ComponentBase.onMouseUp override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onMouseUp (
    Point2D.Float point
)
```

Parameters

point

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.readExternal Method

ComponentBase.readExternal override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.removeButtonComponentListener Method

Unregisters an event listener.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void removeButtonComponentListener (
    ButtonComponentListener listener
)
```

Parameters

listener
An object implementing ButtonComponentListener interface.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.saveToJson Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the ButtonComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.saveToXml Method

ComponentBase.saveToXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

ButtonComponent.setBrush Method

Sets the background brush of the button when it is in normal state.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setBrush (
    Brush value
)
```

Parameters

value
An instance of the Brush class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.setBrushHovered Method

Sets the background brush of the button when it is in hovered state.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public void setBrushHovered (
    Brush value
)
```

Parameters

value
An instance of the Brush class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.setBrushPressed Method

Sets the background brush of the button when it is in pressed state.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public void setBrushPressed (
    Brush value
)
```

Parameters

value
An instance of the Brush class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.setImageList Method

Sets a list with images. Each image in the list represents the appearance of the button in one of its states: 0 - normal, 1 - pressed, 2 - disabled, 3 - hovered.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setImageList (
    ArrayList<Image> value
)
```

Parameters

value
A list of java.awt.Image objects.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.setPen Method

Sets the border pen of the button when it is in normal state.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setPen (
    Pen value
)
```

Parameters

value
An instance of the Pen class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.setPenHovered Method

Sets the border pen of the button when it is in hovered state.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setPenHovered (
    Pen value
)
```

Parameters

value
An instance of the Pen class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.setPenPressed Method

Sets the border pen of the button when it is in pressed state.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setPenPressed (
    Pen value
)
```

Parameters

value
An instance of the Pen class.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.setType Method

Sets the type of the button.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setType (
    ButtonComponent.ButtonType value
)
```

Parameters

value
A member of the ButtonType enumerator.

See Also

ButtonComponent Members
ButtonComponent Class
com.mindfusion.diagramming.components Namespace

ButtonComponent.writeExternal Method

ComponentBase.writeExternal override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

ButtonComponentAdapter Class

Provides empty implementations for the methods defined in the ButtonComponentListener interface. This lets you override only the handlers for the events you are interested in, instead of implementing all methods of ButtonComponentListener.

Syntax

Java

```
public class ButtonComponentAdapter implements ButtonComponentListener
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.components.ButtonComponentAdapter

See Also

ButtonComponentAdapter Members
com.mindfusion.diagramming.components Namespace

ButtonComponentAdapter Members

Provides empty implementations for the methods defined in the ButtonComponentListener interface. This lets you override only the handlers for the events you are interested in, instead of implementing all methods of ButtonComponentListener.

The following tables list the members exposed by the ButtonComponentAdapter type.

Public Constructors

	Name	Description
	ButtonComponentAdapter	

Public Methods

	Name	Description
	customDraw	Raised when the button is drawn to allow for custom drawing.
	repeatEnded	Raised when a repeat button has been released.

See Also

ButtonComponentAdapter Class
com.mindfusion.diagramming.components Namespace

ButtonComponentAdapter Constructor

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java
`public ButtonComponentAdapter ()`

See Also

ButtonComponentAdapter Class
com.mindfusion.diagramming.components Namespace

ButtonComponentAdapter Methods

ButtonComponentAdapter.customDraw Method

Raised when the button is drawn to allow for custom drawing.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void customDraw (
    Object sender,
    ButtonDrawEvent e
)
```

Parameters

sender

e

See Also

ButtonComponentAdapter Members
ButtonComponentAdapter Class
com.mindfusion.diagramming.components Namespace

ButtonComponentAdapter.repeatEnded Method

Raised when a repeat button has been released.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void repeatEnded (
    Object sender,
    ComponentEvent e
)
```

Parameters

sender

e

See Also

ButtonComponentAdapter Members
ButtonComponentAdapter Class
com.mindfusion.diagramming.components Namespace

ButtonComponentListener Interface

Defines the events that can be raised by ButtonComponent.

Syntax

Java

```
public interface ButtonComponentListener extends EventListener
```

Inheritors

com.mindfusion.diagramming.components.ButtonComponentAdapter

See Also

ButtonComponentListener Members
com.mindfusion.diagramming.components Namespace

ButtonComponentListener Members

Defines the events that can be raised by ButtonComponent.

The following tables list the members exposed by the ButtonComponentListener type.

Public Methods

	Name	Description
	customDraw	Raised when the button is drawn to allow for custom drawing.
	repeatEnded	Raised when a repeat button has been released.

See Also

ButtonComponentListener Interface
com.mindfusion.diagramming.components Namespace

ButtonComponentListener Methods

ButtonComponentListener.customDraw Method

Raised when the button is drawn to allow for custom drawing.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void customDraw (
    Object sender,
    ButtonDrawEvent e
)
```

Parameters

sender
The button that raises the event.

e
An object providing information about the event.

See Also

ButtonComponentListener Members
ButtonComponentListener Interface
com.mindfusion.diagramming.components Namespace

ButtonComponentListener.repeatEnded Method

Raised when a repeat button has been released.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void repeatEnded (
    Object sender,
    ComponentEvent e
)
```

Parameters

sender
The button that raises the event.

e
An object providing information about the event.

See Also

ButtonComponentListener Members
ButtonComponentListener Interface
com.mindfusion.diagramming.components Namespace

ButtonDrawEvent Class

Contains arguments passed to the customDraw event of buttons.

Syntax

Java

```
public class ButtonDrawEvent extends EventObject
```

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.diagramming.components.ButtonDrawEvent

See Also

ButtonDrawEvent Members
com.mindfusion.diagramming.components Namespace

ButtonDrawEvent Members

Contains arguments passed to the customDraw event of buttons.

The following tables list the members exposed by the ButtonDrawEvent type.

Public Methods

	Name	Description
	getClipBounds	Gets the current clip rectangle.
	getGraphics	Gets the Graphics surface where the event handler should draw.

See Also

ButtonDrawEvent Class
com.mindfusion.diagramming.components Namespace

ButtonDrawEvent Methods

ButtonDrawEvent.getClipBounds Method

Gets the current clip rectangle.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java
`public Rectangle2D getClipBounds ()`

Return Value

See Also

ButtonDrawEvent Members
ButtonDrawEvent Class
com.mindfusion.diagramming.components Namespace

ButtonDrawEvent.getGraphics Method

Gets the Graphics surface where the event handler should draw.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java
`public Graphics getGraphics ()`

Return Value

See Also

ButtonDrawEvent Members
ButtonDrawEvent Class
com.mindfusion.diagramming.components Namespace

ButtonState Enumeration

Indicates the state of a button.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java
`public enum ButtonState`

Members

	Member name	Description
	Hovered	Specifies that the button is hovered with the mouse.
	Normal	Specifies a normal state.
	Pressed	Specifies that the button is pressed.

See Also

com.mindfusion.diagramming.components Namespace

ButtonType Enumeration

Indicates the behavior of the button.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java
`public enum ButtonType`

Members

	Member name	Description
	Normal	Specifies a normal, clickable button.

	Repeat	Specifies a repeat button.

See Also

com.mindfusion.diagramming.components Namespace

CheckBoxComponent Class

Displays a check-box that lets users select true / false values.

Syntax

Java
`public class CheckBoxComponent` `    extends ButtonComponent`

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.components.ComponentBase
    com.mindfusion.diagramming.components.ContentComponent
      com.mindfusion.diagramming.components.ButtonComponent
        com.mindfusion.diagramming.components.CheckBoxComponent

See Also

CheckBoxComponent Members
com.mindfusion.diagramming.components Namespace

CheckBoxComponent Members

Displays a check-box that lets users select true / false values.

The following tables list the members exposed by the CheckBoxComponent type.

Public Constructors

	Name	Description
	CheckBoxComponent	Initializes a new instance of the CheckBoxComponent class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description

accept	ComponentBase.accept override. (Inherited from ContentComponent.)
addButtonComponentListener	Registers an event listener. (Inherited from ButtonComponent.)
addChild	Implements AddChild.addChild (Inherited from ContentComponent.)
addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
arrangeComponents	ComponentBase.arrangeComponents override. (Inherited from ContentComponent.)
confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
createOutlinePath	For internal use. (Inherited from ComponentBase.)
draw	ButtonComponent.draw override.
find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
getBrush	Gets the background brush of the button when it is in normal state. (Inherited from ButtonComponent.)
getBrushHovered	Gets the background brush of the button when it is in hovered state. (Inherited from ButtonComponent.)
getBrushPressed	Gets the background brush of the button when it is in pressed state. (Inherited from ButtonComponent.)
getCheckedImageList	Gets a list with images. Each image in the list represents the appearance of the check box in its checked state: 0 - normal, 1 - pressed, 2 - disabled, 3 - hovered.
getChildCount	ComponentBase.getChildCount override. (Inherited from ContentComponent.)
getContent	Gets the content of this component. (Inherited from ContentComponent.)

getCursor	ComponentBase.getCursor override. (Inherited from ButtonComponent.)
getDesiredSize	ComponentBase.getDesiredSize override. (Inherited from ButtonComponent.)
getDocumentBounds	For internal use. (Inherited from ComponentBase.)
getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
getImageList	Gets a list with images. Each image in the list represents the appearance of the button in one of its states: 0 - normal, 1 - pressed, 2 - disabled, 3 - hovered. (Inherited from ButtonComponent.)
getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
getName	Gets the name of the component. (Inherited from ComponentBase.)
getPadding	Gets the padding around this component's content. (Inherited from ContentComponent.)
getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
getParentHost	For internal use. (Inherited from ComponentBase.)
getPen	Gets the border pen of the button when it is in normal state. (Inherited from ButtonComponent.)
getPenHovered	Gets the border pen of the button when it is in hovered state. (Inherited from ButtonComponent.)

	getPenPressed	Gets the border pen of the button when it is in pressed state. (Inherited from ButtonComponent.)
	getType	Gets the type of the button. (Inherited from ButtonComponent.)
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	isChecked	Gets a value indicating whether the check box is checked.
	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	ComponentBase.onKeyDown override. (Inherited from ButtonComponent.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
	onKeyUp	(Inherited from ComponentBase.)
	onMouseDown	ComponentBase.onMouseDown override. (Inherited from ButtonComponent.)
	onMouseMove	ComponentBase.onMouseMove override. (Inherited from ButtonComponent.)
	onMouseUp	ComponentBase.onMouseUp override. (Inherited from ButtonComponent.)
	onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	ComponentBase.readExternal override.
	removeButtonComponentListener	Unregisters an event listener. (Inherited from ButtonComponent.)
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)

	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setBrush	Sets the background brush of the button when it is in normal state. (Inherited from ButtonComponent.)
	setBrushHovered	Sets the background brush of the button when it is in hovered state. (Inherited from ButtonComponent.)
	setBrushPressed	Sets the background brush of the button when it is in pressed state. (Inherited from ButtonComponent.)
	setCheckedImageList	Sets a list with images. Each image in the list represents the appearance of the check box in its checked state: 0 - normal, 1 - pressed, 2 - disabled, 3 - hovered.
	setContent	Sets the content of this component. (Inherited from ContentComponent.)
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setImageList	Sets a list with images. Each image in the list represents the appearance of the button in one of its states: 0 - normal, 1 - pressed, 2 - disabled, 3 - hovered. (Inherited from ButtonComponent.)
	setIsChecked	Sets a value indicating whether the check box is checked.
	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)

	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setPadding	Sets the padding around this component's content. (Inherited from ContentComponent.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setPen	Sets the border pen of the button when it is in normal state. (Inherited from ButtonComponent.)
	setPenHovered	Sets the border pen of the button when it is in hovered state. (Inherited from ButtonComponent.)
	setPenPressed	Sets the border pen of the button when it is in pressed state. (Inherited from ButtonComponent.)
	setType	Sets the type of the button. (Inherited from ButtonComponent.)
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ComponentBase.writeExternal override.

Protected Methods

	Name	Description
	fireCustomDraw	Raises the customDraw event. (Inherited from ButtonComponent.)
	fireOnClicked	Raises the mouseClicked event. (Inherited from ButtonComponent.)
	fireRepeatEnded	Raises the repeatEnded event. (Inherited from ButtonComponent.)
	getImage	ButtonComponent.getImage override.
	getState	Gets the current state of the button (Inherited from ButtonComponent.)

	getThickness	Gets the space around the component's content. This space includes padding by default but can be subsequently adjusted as necessary by the deriving classes. (Inherited from ContentComponent.)
	loadFromJson	
	loadFromXml	ComponentBase.loadFromXml override.
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	
	saveToXml	ComponentBase.saveToXml override.
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)

CheckBoxComponent Constructor

Initializes a new instance of the CheckBoxComponent class.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public CheckBoxComponent ()
```

See Also

CheckBoxComponent Class
com.mindfusion.diagramming.components Namespace

CheckBoxComponent Methods

CheckBoxComponent.draw Method

ButtonComponent.draw override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java

public void draw (
    Graphics2D g2d,
    RenderOptions options
)
```

Parameters

g2d

options

CheckBoxComponent.getCheckedImageList Method

Gets a list with images. Each image in the list represents the appearance of the check box in its checked state: 0 - normal, 1 - pressed, 2 - disabled, 3 - hovered.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java

public ArrayList<Image> getCheckedImageList ()
```

Return Value

A list of java.awt.Image objects.

See Also

CheckBoxComponent Members
CheckBoxComponent Class
com.mindfusion.diagramming.components Namespace

CheckBoxComponent.getImage Method

ButtonComponent.getImage override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected Image getImage ()
```

Return Value

See Also

CheckBoxComponent Members
CheckBoxComponent Class
com.mindfusion.diagramming.components Namespace

CheckBoxComponent.isChecked Method

Gets a value indicating whether the check box is checked.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean isChecked ()
```

Return Value

true if the box is checked, or false otherwise.

CheckBoxComponent.loadFromJson Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the CheckBoxComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

CheckBoxComponent.setCheckedImageList Method

Sets a list with images. Each image in the list represents the appearance of the check box in its checked state: 0 - normal, 1 - pressed, 2 - disabled, 3 - hovered.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setCheckedImageList (
    ArrayList<Image> value
)
```

Parameters

value
A list of java.awt.Image objects.

See Also

CheckBoxComponent Members
CheckBoxComponent Class
com.mindfusion.diagramming.components Namespace

CheckBoxComponent.setIsChecked Method

Sets a value indicating whether the check box is checked.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setIsChecked (
    boolean value
)
```

Parameters

value
true if the box is checked, or false otherwise.

ComponentBase Members

Represents the abstract base of all components.

The following tables list the members exposed by the ComponentBase type.

Protected Constructors

	Name	Description
	ComponentBase	Initializes a new instance of the ComponentBase class.

Protected Fields

	Name	Description
	eventListenerList	

Public Methods

	Name	Description
	addComponentEventListener	Adds the specified component listener to receive events from this component.
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component.
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component.
	arrangeComponents	Recursively arranges the child components, within the specified space and using the specified graphics for measurement purposes.
	confirmValidating	Confirms validation by raising the Validating event.
	contains	Checks if the specified component is contained in the hierarchy defined by the current component.
	createOutlinePath	For internal use.
	draw	Renders the component in the specified Graphics2D.
	find	Returns the component with the specified name within the hierarchy defined by the current component.
	getBounds	Gets the calculated bounds of this component relative to its parent.
	getChildCount	Gets the number of child components of this component.
	getCursor	Gets the cursor to display when the mouse is at the specified position.
	getDesiredSize	Gets the desired size of this component in case the width and/or height have not been explicitly specified.

getDocumentBounds	For internal use.
getFocusable	Gets a value indicating whether the component can receive the input focus.
getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel.
getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel.
getHeight	Gets the explicit height of this component.
getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent.
getIsEnabled	Gets a value indicating whether the component is enabled.
getIsFocused	Gets a value indicating whether this component currently holds the input focus.
getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations.
getIsInteractive	Gets a value indicating whether this component can be interacted with.
getName	Gets the name of the component.
getParent	Gets the parent component, if the current component is hosted.
getParentHost	For internal use.
getVerticalAlignment	Gets the vertical alignment of this component relative to its parent.
getVisible	Gets a value indicating whether the component is visible.
getWidth	Gets the explicit width of this component.
invalidate	Invalidates the visual appearance of the component.
invalidateLayout	Invalidates the layout of this component and all its children.
onContextChanged	
onKeyDown	
onKeyPress	Called when a character key is pressed when this component has the input focus.
onKeyUp	
onMouseMove	Overloaded.
onMouseUp	Overloaded.
onUnitChanged	Invoked when the measure unit of the document containing the component has changed.
raiseValidated	

	readExternal	Implements Externalizable
	removeComponentEventListener	Removes the specified component listener to not receive events from this component.
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component.
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component.
	setBounds	Sets the calculated bounds of this component relative to its parent.
	setFocusable	Sets a value indicating whether the component can receive the input focus.
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel.
	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel.
	setHeight	Sets the explicit height of this component.
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent.
	setIsEnabled	Sets a value indicating whether the component is enabled.
	setIsFocused	Sets a value indicating whether this component currently holds the input focus.
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations.
	setIsInteractive	Sets a value indicating whether this component can be interacted with.
	setName	Sets the name of the component.
	setParent	For internal use.
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent.
	setVisible	Sets a value indicating whether the component is visible.
	setWidth	Sets the explicit width of this component.
	toDocument	Converts a point from local to document coordinates.
	toLocal	Converts a point from document to local coordinates.
	toParent	Converts a point from local coordinates to the specified parent's coordinates.
	writeExternal	Implements Externalizable

Protected Methods

	Name	Description
	loadFromJson	Deserializes the component from a JsonObject.
	loadFromXml	Deserializes the component from an XML element.
	onAddedToParent	Invoked when the component is added to a parent component.
	onGotFocus	Overloaded.
	onLostFocus	Overloaded.
	onMouseDown	Overloaded.
	onRemovedFromParent	Invoked when the component is removed from a parent component.
	onValidated	Raises the Validated event.
	onValidating	Raises the Validating event.
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed.
	saveToJson	Serializes the component into a JsonObject.
	saveToXml	Serializes the component into an XML element.
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user.

ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase Fields

ComponentBase.eventListenerList Field

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java
`protected EventListenerList eventListenerList`

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase Constructor

Initializes a new instance of the ComponentBase class.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected ComponentBase ()
```

See Also

ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase Methods

ComponentBase.addComponentEventListener Method

Adds the specified component listener to receive events from this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void addComponentEventListener (
    ComponentEventListener listener
)
```

Parameters

listener
A ComponentEventListener object.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.addComponentMouseEventListener Method

Adds the specified component listener to receive events from this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void addComponentMouseEventListener (
    ComponentMouseEventListener listener
)
```

Parameters

listener
A ComponentMouseEventListener object.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.addComponentValidationEventListener Method

Adds the specified component listener to receive events from this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void addComponentValidationEventListener (
    ComponentValidationEventListener listener
)
```

Parameters

listener
A ComponentValidationEventListener object.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.arrangeComponents Method

Recursively arranges the child components, within the specified space and using the specified graphics for measurement purposes.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void arrangeComponents (
    Rectangle2D.Float bounds,
    Graphics2D g2d
)
```

Parameters

bounds
The space available for arrangement.

g2d
A relevant Graphics2D object.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.confirmValidating Method

Confirms validation by raising the Validating event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean confirmValidating ()
```

Return Value

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.contains Method

Checks if the specified component is contained in the hierarchy defined by the current component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean contains (
    ComponentBase component
)
```

Parameters

component
The component to search for.

Return Value

true if the component is a direct or indirect child of the current component; otherwise, false.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.createOutlinePath Method

For internal use.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public GeneralPath createOutlinePath (
    Rectangle2D.Float bounds,
    float rotationAngle
)
```

Parameters

bounds

rotationAngle

Return Value

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.draw Method

Renders the component in the specified Graphics2D.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void draw (
    Graphics2D g2d,
    RenderOptions options
)
```

Parameters

g2d
The drawing target.

options
A RenderOptions object specifying the drawing context.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.find Method

Returns the component with the specified name within the hierarchy defined by the current component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public ComponentBase find (
    String name
)
```

Parameters

name
The name of the component to search for.

Return Value

The found component, or null, if no component matches. The search is case-sensitive.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getBounds Method

Gets the calculated bounds of this component relative to its parent.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Rectangle2D.Float getBounds ()
```

Return Value

An instance of the Rectangle2D.Float class.

See Also

ComponentBase Members
ComponentBase Class

ComponentBase.getChildCount Method

Gets the number of child components of this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public int getChildCount ()
```

Return Value

An integer value specifying the number of direct children of this component.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getCursor Method

Gets the cursor to display when the mouse is at the specified position.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public CursorHint getCursor (
    Point2D.Float point
)
```

Parameters

point
A Point2D.Float instance that specifies the current mouse position, in document coordinates.

Return Value

A member of the CursorHint enumeration.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getDesiredSize Method

Gets the desired size of this component in case the width and/or height have not been explicitly specified.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public XDimension2D.Double getDesiredSize (
    XDimension2D.Double availableSize,
    Graphics2D g2d
)
```

Parameters

availableSize
The available size.

g2d
A relevant Graphics2D object.

Return Value

A XDimension2D.Double object representing the desired size.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getDocumentBounds Method

For internal use.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Rectangle2D.Float getDocumentBounds ()
```

Return Value

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getFocusable Method

Gets a value indicating whether the component can receive the input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public boolean getFocusable ()
```

Return Value

true if the component can receive the input focus; otherwise false.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getGridColumn Method

Gets the index of the grid column this component will be associated with when added to a GridPanel.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public int getGridColumn ()
```

Return Value

An integer value specifying the 0-based index of the grid column in which this component is placed.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getGridRow Method

Gets the index of the grid row this component will be associated with when added to a GridPanel.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public int getGridRow ()
```

Return Value

An integer value specifying the 0-based index of the grid row in which this component is placed.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getHeight Method

Gets the explicit height of this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public float getHeight ()
```

Return Value

The height of this component or float.NaN to auto-size the component.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getHorizontalAlignment Method

Gets the horizontal alignment of this component relative to its parent.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public int getHorizontalAlignment ()
```

Return Value

An integer value specifying the horizontal alignment of this component relative to its parent.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getIsEnabled Method

Gets a value indicating whether the component is enabled.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean getIsEnabled ()
```

Return Value

true if the component is enabled and can be interacted with; otherwise, false.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getIsFocused Method

Gets a value indicating whether this component currently holds the input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean getIsFocused ()
```

Return Value

true if the component currently holds the input focus; otherwise, false.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getIsHitTestVisible Method

Gets a value indicating whether this component and all its children are subject to hit-testing operations.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean getIsHitTestVisible ()
```

Return Value

true if the component can be hit-tested; otherwise, false.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getIsInteractive Method

Gets a value indicating whether this component can be interacted with.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean getIsInteractive ()
```

Return Value

true if the component accepts user input, or false otherwise.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getName Method

Gets the name of the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public String getName ()
```

Return Value

A String value specifying the name of the component.

See Also

ComponentBase Members
ComponentBase Class

ComponentBase.getParent Method

Gets the parent component, if the current component is hosted.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public Object getParent ()
```

Return Value

The parent component, if the current component is hosted.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getParentHost Method

For internal use.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public ComponentHost getParentHost ()
```

Return Value

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getVerticalAlignment Method

Gets the vertical alignment of this component relative to its parent.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
```

Java

```
public int getVerticalAlignment ()
```

Return Value

An integer value specifying the vertical alignment of this component relative to its parent.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getVisible Method

Gets a value indicating whether the component is visible.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean getVisible ()
```

Return Value

true if the component is visible; otherwise, false.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.getWidth Method

Gets the explicit width of this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public float getWidth ()
```

Return Value

The width of this component or float.NaN to auto-size the component.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.invalidate Method

Invalidates the visual appearance of the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void invalidate ()
```

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.invalidateLayout Method

Invalidates the layout of this component and all its children.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void invalidateLayout ()
```

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.loadFromJson Method

Deserializes the component from a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
```

```
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the component's data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.loadFromXml Method

Deserializes the component from an XML element.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Element containing the component's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

ComponentBase.onGotFocus Method ()

Invokes when the component gains the input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onGotFocus ()
```

See Also

onGotFocus Method Overload List
ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onGotFocus Method (ComponentEvent)

Raises the GotFocus event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onGotFocus (
    ComponentEvent e
)
```

Parameters

e
An object providing the event data.

See Also

onGotFocus Method Overload List
ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onKeyDown Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean onKeyDown (
    int keyCode,
    int modifiers
)
```

Parameters

keyCode

modifiers

Return Value

ComponentBase.onKeyPress Method

Called when a character key is pressed when this component has the input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onKeyPress (
    Character keyChar
)
```

Parameters

keyChar
The character representing the pressed key.

See Also

ComponentBase.onKeyUp Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onKeyUp (
    int keyCode,
    int modifiers
)
```

Parameters

keyCode

modifiers

See Also

ComponentBase.onLostFocus Method

Overload List

Name	Description
ComponentBase.onLostFocus ()	Invokes when the component loses the input focus.
ComponentBase.onLostFocus (ComponentEvent)	Raises the LostFocus event.

See Also

ComponentBase.onLostFocus Method ()

Invokes when the component loses the input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onLostFocus ()
```

See Also

onLostFocus Method Overload List
ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onLostFocus Method (ComponentEvent)

Raises the LostFocus event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onLostFocus (
    ComponentEvent e
)
```

Parameters

e
An object providing the event data.

ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onMouseDown Method (Point2D.Float)

Called when the left mouse button is pressed while the pointer is over this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onMouseDown (
    Point2D.Float point
)
```

Parameters

point
A Point2D.Float instance that specifies the current mouse position.

See Also

onMouseDown Method Overload List
ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onMouseMove Method

Overload List

Name	Description
ComponentBase.onMouseMove (ComponentMouseEvent)	Raises the MouseMove event.
ComponentBase.onMouseMove (Point2D.Float)	Called when the mouse is moved while this component tracks the mouse events.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onMouseMove Method (ComponentMouseEvent)

Raises the MouseMove event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onMouseMove (
    ComponentMouseEvent e
)
```

Parameters

e
An object providing the event data.

See Also

onMouseMove Method Overload List
ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onMouseMove Method (Point2D.Float)

Called when the mouse is moved while this component tracks the mouse events.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onMouseMove (
    Point2D.Float point
)
```

Parameters

point
A Point2D.Float instance that specifies the current mouse position.

See Also

onMouseMove Method Overload List
ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onMouseUp Method

Overload List

Name	Description

ComponentBase.onMouseUp (ComponentMouseEvent)	
ComponentBase.onMouseUp (Point2D.Float)	Called when the left mouse button is released while this component tracks the mouse events.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onMouseUp Method (ComponentMouseEvent)

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onMouseUp (
    ComponentMouseEvent e
)
```

Parameters

e

See Also

onMouseUp Method Overload List
ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onMouseUp Method (Point2D.Float)

Called when the left mouse button is released while this component tracks the mouse events.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onMouseUp (
    Point2D.Float point
)
```

Parameters

point
A Point2D.Float instance that specifies the current mouse position.

See Also

onMouseUp Method Overload List
ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onRemovedFromParent Method

Invoked when the component is removed from a parent component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onRemovedFromParent ()
```

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onUnitChanged Method

Invoked when the measure unit of the document containing the component has changed.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onUnitChanged ()
```

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onValidated Method

Raises the Validated event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onValidated (
    ComponentEvent e
)
```

Parameters

e
An object providing the event data.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onValidating Method

Raises the Validating event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onValidating (
    ComponentValidationEvent e
)
```

Parameters

e
An object providing the event data.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.onZoomChanged Method

Invoked when the zoom factor of the document containing the component has changed.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onZoomChanged ()
```

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.raiseValidated Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void raiseValidated ()
```

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.readExternal Method

Implements Externalizable

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.removeComponentEventListener Method

Removes the specified component listener to not receive events from this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void removeComponentEventListener (
    ComponentEventListener listener
)
```

Parameters

listener

ComponentEventListener object to remove.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.removeComponentMouseEventListener Method

Removes the specified component listener to not receive events from this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void removeComponentMouseEventListener (
    ComponentMouseEventListener listener
)
```

Parameters

listener

ComponentMouseEventListener object to remove.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.removeComponentValidationEventListener Method

Removes the specified component listener to not receive events from this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void removeComponentValidationEventListener (
    ComponentValidationEventListener listener
)
```

Parameters

listener
ComponentValidationEventListener object to remove.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.saveToJson Method

Serializes the component into a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the component's data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.saveToXml Method

Serializes the component into an XML element.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement
An Element the component's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.serializeSubcomponents Method

Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected boolean serializeSubcomponents ()
```

Return Value

true to inform the caller to automatically serialize the subcomponent tree; false to skip the automatic component serialization.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setBounds Method

Sets the calculated bounds of this component relative to its parent.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setBounds (
    Rectangle2D.Float value
)
```

Parameters

value

The bounds of this component relative to its parent.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setFocusable Method

Sets a value indicating whether the component can receive the input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setFocusable (
    boolean value
)
```

Parameters

value
A boolean value specifying if the component can receive the input focus. The default is false.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setGridColumn Method

Sets the index of the grid row this component will be associated with when added to a GridPanel.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setGridColumn (
    int value
)
```

Parameters

value
An integer value specifying the 0-based index of the grid column in which to place this component. The default is 0.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setGridRow Method

Sets the index of the grid row this component will be associated with when added to a GridPanel.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setGridRow (
    int value
)
```

Parameters

value
An integer value specifying the 0-based index of the grid row in which to place this component. The default is 0.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setHeight Method

Sets the explicit height of this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setHeight (
    float value
)
```

Parameters

value
A floating point value specifying the component's height. The default is NaN.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setHorizontalAlignment Method

Sets the horizontal alignment of this component relative to its parent.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setHorizontalAlignment (
    int value
)
```

Parameters

value
A member of the HorizontalAlignment enumeration. The default is Stretch.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setIsEnabled Method

Sets a value indicating whether the component is enabled.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setIsEnabled (
    boolean value
)
```

Parameters

value
A boolean value specifying if the component is enabled and can be interacted with. The default is true.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setIsFocused Method

Sets a value indicating whether this component currently holds the input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setIsFocused (
    boolean value
)
```

Parameters

value
A boolean value specifying if the component currently holds the input focus.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setIsHitTestVisible Method

Sets a value indicating whether this component and all its children are subject to hit-testing operations.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setIsHitTestVisible (
    boolean value
)
```

Parameters

value
true if the component can be hit-tested; otherwise, false. The default is true.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setIsInteractive Method

Sets a value indicating whether this component can be interacted with.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setIsInteractive (
    boolean value
)
```

Parameters

value
true if the component accepts user input, or false otherwise.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setName Method

Sets the name of the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setName (
    String value
)
```

Parameters

value
A String identifying this component within its component tree.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setParent Method

For internal use.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setParent (
    Object value
)
```

Parameters

value

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setVerticalAlignment Method

Sets the vertical alignment of this component relative to its parent.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setVerticalAlignment (
    int value
)
```

Parameters

value
A member of the VerticalAlignment enumeration. The default is Stretch.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setVisible Method

Sets a value indicating whether the component is visible.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setVisible (
    boolean value
)
```

Parameters

value
true if the component is visible; otherwise, false. The default is true.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.setWidth Method

Sets the explicit width of this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setWidth (
    float value
)
```

Parameters

value
A floating point value specifying the component's width. The default is NaN.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.toDocument Method

Converts a point from local to document coordinates.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Point2D.Float toDocument (
    Point2D.Float point
)
```

Parameters

point
The local Point2D.Float to convert.

Return Value

A Point2D.Float instance containing coordinates of the specified point relative to the diagram.

See Also

ComponentBase Members
ComponentBase Class

ComponentBase.toLocal Method

Converts a point from document to local coordinates.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Point2D.Float toLocal (
    Point2D.Float point
)
```

Parameters

point
The document Point2D.Float to convert.

Return Value

A Point2D.Float instance containing coordinates of the specified point relative to the component.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.toParent Method

Converts a point from local coordinates to the specified parent's coordinates.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Point2D.Float toParent (
    ComponentBase parent,
    Point2D.Float point
)
```

Parameters

parent
A ComponentBase representing a direct or indirect parent.

point
The local Point2D.Float to convert.

Return Value

A Point2D.Float representing the specified point in the specified parent's coordinate space.

See Also

ComponentBase Members
ComponentBase Class
com.mindfusion.diagramming.components Namespace

ComponentBase.writeExternal Method

Implements Externalizable

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

See Also

ComponentEvent Class

The base class for arguments supplied to various component-related events.

Syntax

Java

```
public class ComponentEvent extends EventObject
```

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.diagramming.components.ComponentEvent
      com.mindfusion.diagramming.components.ComponentKeyEvent
      com.mindfusion.diagramming.components.ComponentMouseEvent
      com.mindfusion.diagramming.components.ComponentTextEvent
      com.mindfusion.diagramming.components.ComponentValidationEvent

See Also

ComponentEvent Members

The base class for arguments supplied to various component-related events.

The following tables list the members exposed by the ComponentEvent type.

Public Constructors

	Name	Description
	ComponentEvent	

Public Methods

	Name	Description
	getComponent	
	getParentHost	

See Also

ComponentEvent Class

ComponentEventListener Interface

Defines events raised by components.

Syntax

Java

```
public interface ComponentEventListener extends EventListener
```

See Also

ComponentEventListener Members
com.mindfusion.diagramming.components Namespace

ComponentEventListener Members

Defines events raised by components.

The following tables list the members exposed by the ComponentEventListener type.

Public Methods

	Name	Description
	gotFocus	Raised when the component receives the input focus.
	lostFocus	Raised when the component loses the input focus.
	validated	Raised after validating event confirms the change.

See Also

ComponentEventListener Interface
com.mindfusion.diagramming.components Namespace

ComponentEventListener Methods

ComponentEventListener.gotFocus Method

Raised when the component receives the input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void gotFocus (
    Object sender,
    ComponentEvent e
)
```

Parameters

sender
The component that raises the event.

e
An object providing information about the event.

See Also

ComponentEventListener Members
ComponentEventListener Interface
com.mindfusion.diagramming.components Namespace

ComponentEventListener.lostFocus Method

Raised when the component loses the input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void lostFocus (
    Object sender,
    ComponentEvent e
)
```

Parameters

sender
The component that raises the event.

e
An object providing information about the event.

See Also

ComponentEventListener Members
ComponentEventListener Interface
com.mindfusion.diagramming.components Namespace

ComponentEventListener.validated Method

Raised after validating event confirms the change.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void validated (
    Object sender,
    ComponentEvent e
)
```

Parameters

sender
The component that raises the event.

e
An object providing information about the event.

ComponentHitTester Methods

ComponentHitTester.enterVisit Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean enterVisit (
    ComponentBase component
)
```

Parameters

component

Return Value

See Also

ComponentHitTester Members
ComponentHitTester Class

ComponentHitTester.getHitComponent Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public ComponentBase getHitComponent ()
```

Return Value

ComponentHost.getBounds Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
Rectangle2D.Float getBounds ()
```

Return Value

See Also

ComponentHost Members
ComponentHost Interface
com.mindfusion.diagramming.components Namespace

ComponentHost.getClipboard Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
Object getClipboard (
    ComponentBase source,
    Class<?> data
)
```

Parameters

source

data

Return Value

See Also

ComponentHost Members
ComponentHost Interface
com.mindfusion.diagramming.components Namespace

ComponentHost.getFocusedComponent Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java
`ComponentBase getFocusedComponent ()`

Return Value

See Also

ComponentKeyEventAdapter Class

Provides empty implementations for the methods defined in the ComponentKeyEventListener interface. This lets you override only the handlers for the events you are interested in, instead of implementing all methods of ComponentKeyEventListener.

Syntax

Java

```
public class ComponentKeyEventAdapter implements ComponentKeyEventListener
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.components.ComponentKeyEventAdapter

See Also

ComponentKeyEventAdapter Members
com.mindfusion.diagramming.components Namespace

ComponentKeyEventAdapter Members

Provides empty implementations for the methods defined in the ComponentKeyEventListener interface. This lets you override only the handlers for the events you are interested in, instead of implementing all methods of ComponentKeyEventListener.

The following tables list the members exposed by the ComponentKeyEventAdapter type.

Public Constructors

	Name	Description
	ComponentKeyEventAdapter	

Public Methods

	Name	Description
	keyDown	Raised when a key is pressed while the component has input focus.
	keyPressed	Raised when a key is pressed while the component has input focus.
	keyUp	Raised when a key is released while the component has input focus.

See Also

ComponentKeyEventAdapter Class
com.mindfusion.diagramming.components Namespace

ComponentKeyEventAdapter Constructor

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public ComponentKeyEventAdapter ()
```

See Also

ComponentKeyEventAdapter Class
com.mindfusion.diagramming.components Namespace

ComponentKeyEventAdapter Methods

ComponentKeyEventAdapter.keyDown Method

Raised when a key is pressed while the component has input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void keyDown (
    Object sender,
    ComponentKeyEvent e
)
```

Parameters

sender

e

See Also

ComponentKeyEventAdapter Members
ComponentKeyEventAdapter Class
com.mindfusion.diagramming.components Namespace

ComponentKeyEventAdapter.keyPressed Method

Raised when a key is pressed while the component has input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void keyPressed (
    Object sender,
    ComponentKeyEvent e
)
```

Parameters

sender

e

See Also

ComponentKeyEventAdapter Members
ComponentKeyEventAdapter Class
com.mindfusion.diagramming.components Namespace

ComponentKeyEventAdapter.keyUp Method

Raised when a key is released while the component has input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void keyUp (
    Object sender,
    ComponentKeyEvent e
)
```

Parameters

sender

e

See Also

ComponentKeyEventAdapter Members
ComponentKeyEventAdapter Class
com.mindfusion.diagramming.components Namespace

ComponentKeyEventListener Interface

Defines keyboard events that can be raised by components.

Syntax

Java

```
public interface ComponentKeyEventListener extends EventListener
```

Inheritors

com.mindfusion.diagramming.components.ComponentKeyEventAdapter

See Also

ComponentKeyEventListener Members
com.mindfusion.diagramming.components Namespace

ComponentKeyEventListener Members

Defines keyboard events that can be raised by components.

The following tables list the members exposed by the ComponentKeyEventListener type.

Public Methods

	Name	Description
	keyDown	Raised when a key is pressed while the component has input focus.
	keyPressed	Raised when a key is pressed while the component has input focus.
	keyUp	Raised when a key is released while the component has input focus.

See Also

ComponentKeyEventListener Interface
com.mindfusion.diagramming.components Namespace

ComponentKeyEventListener Methods

ComponentKeyEventListener.keyDown Method

Raised when a key is pressed while the component has input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void keyDown (
    Object sender,
    ComponentKeyEvent e
)
```

Parameters

sender
The component that raises the event.

e
An object providing information about the event.

See Also

ComponentKeyEventListener Members
ComponentKeyEventListener Interface
com.mindfusion.diagramming.components Namespace

ComponentKeyEventListener.keyPressed Method

Raised when a key is pressed while the component has input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void keyPressed (
    Object sender,
    ComponentKeyEvent e
)
```

Parameters

sender
The component that raises the event.

e
An object providing information about the event.

See Also

ComponentKeyEventListener Members
ComponentKeyEventListener Interface
com.mindfusion.diagramming.components Namespace

ComponentKeyEventListener.keyUp Method

Raised when a key is released while the component has input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void keyUp (
    Object sender,
    ComponentKeyEvent e
)
```

Parameters

sender
The component that raises the event.

e
An object providing information about the event.

See Also

ComponentKeyEventListener Members
ComponentKeyEventListener Interface
com.mindfusion.diagramming.components Namespace

ComponentMouseEvent Class

Provides data to mouse-related component events.

Syntax

Java
`public class ComponentMouseEvent extends ComponentEvent`

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.diagramming.components.ComponentEvent
      com.mindfusion.diagramming.components.ComponentMouseEvent

See Also

ComponentMouseEvent Members
com.mindfusion.diagramming.components Namespace

ComponentMouseEvent Members

Provides data to mouse-related component events.

The following tables list the members exposed by the ComponentMouseEvent type.

Public Constructors

	Name	Description
	ComponentMouseEvent	

Public Methods

	Name	Description
	getComponent	(Inherited from ComponentEvent.)
	getMousePosition	
	getParentHost	(Inherited from ComponentEvent.)

See Also

ComponentMouseEvent Class
com.mindfusion.diagramming.components Namespace

ComponentMouseEvent Constructor

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public ComponentMouseEvent (
    ComponentBase component,
    Point2D.Float mousePosition
)
```

Parameters

component

mousePosition

See Also

ComponentMouseEvent Class
com.mindfusion.diagramming.components Namespace

ComponentMouseEvent Methods

ComponentMouseEvent.getMousePosition Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Point2D.Float getMousePosition ()
```

Return Value

See Also

ComponentMouseEvent Members
ComponentMouseEvent Class
com.mindfusion.diagramming.components Namespace

ComponentMouseEventAdapter Class

Provides empty implementations for the methods defined in the ComponentMouseEventListener interface. This lets you override only the handlers for the events you are interested in, instead of implementing all methods of ComponentMouseEventListener.

Syntax

Java
`public class ComponentMouseEventAdapter implements ComponentMouseEventListener`

Inheritance Hierarchy

java.lang.Object

ComponentMouseEventListener Methods

ComponentMouseEventListener.mouseClicked Method

Raised when mouse button is clicked over the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void mouseClicked (
    Object sender,
    ComponentMouseEvent e
)
```

Parameters

sender
The component that raises the event.

e
An object providing information about the event.

See Also

ComponentMouseEventListener Members
ComponentMouseEventListener Interface
com.mindfusion.diagramming.components Namespace

ComponentMouseEventListener.mouseMove Method

Raised when the mouse moves over the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void mouseMove (
    Object sender,
    ComponentMouseEvent e
)
```

Parameters

sender
The component that raises the event.

e
An object providing information about the event.

ComponentPostLoader Methods

ComponentPostLoader.enterVisit Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean enterVisit (
    ComponentBase component
)
```

Parameters

component

Return Value

See Also

ComponentPostLoader Members
ComponentPostLoader Class
com.mindfusion.diagramming.components Namespace

ComponentPostLoader.leaveVisit Method

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void leaveVisit (
    ComponentBase component
)
```

Parameters

component

See Also

ComponentPostLoader Members
ComponentPostLoader Class
com.mindfusion.diagramming.components Namespace

ComponentTextEvent Class

Provides arguments for text-related events.

Syntax

Java
`public class ComponentTextEvent extends ComponentEvent`

Inheritance Hierarchy

java.lang.Object
  java.util.EventObject
    com.mindfusion.diagramming.components.ComponentEvent
      com.mindfusion.diagramming.components.ComponentTextEvent

ComponentValidationEventListener Interface

Defines validation events that can be raised by components.

Syntax

```
Java
public interface ComponentValidationEventListener extends EventListener
```

See Also

ComponentValidationEventListener Members

Defines validation events that can be raised by components.

The following tables list the members exposed by the ComponentValidationEventListener type.

Public Methods

	Name	Description
	validating	Raised when the component is about to lose input focus in order to validate it.

See Also

ComponentValidationEventListener Interface
com.mindfusion.diagramming.components Namespace

ComponentValidationEventListener Methods

ComponentValidationEventListener.validating Method

Raised when the component is about to lose input focus in order to validate it.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void validating (
    Object sender,
    ComponentValidationEvent e
)
```

Parameters

sender
The component that raises the event.

e
An object providing information about the event.

com.mindfusion.diagramming.components Namespace

ContainerComponent Members

Represents a component which can host other components.

The following tables list the members exposed by the ContainerComponent type.

Protected Constructors

	Name	Description
	ContainerComponent	Initializes a new instance of the ContainerComponent class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	accept	ComponentBase.accept override.
	addChild	Implements AddChild.addChild.
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	arrangeComponents	ComponentBase.arrangeComponents override.
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	For internal use. (Inherited from ComponentBase.)
	draw	ComponentBase.draw override.
	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)

	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getChildCount	Gets the number of child components of this component.
	getComponents	Gets the child components of this container.
	getCursor	Gets the cursor to display when the mouse is at the specified position. (Inherited from ComponentBase.)
	getDesiredSize	Gets the desired size of this component in case the width and/or height have not been explicitly specified. (Inherited from ComponentBase.)
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)
	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
	getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	getName	Gets the name of the component. (Inherited from ComponentBase.)
	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)

	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	loadComponents	Overloaded.
	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	(Inherited from ComponentBase.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
	onKeyUp	(Inherited from ComponentBase.)
	onMouseMove	Overloaded. (Inherited from ComponentBase.)
	onMouseUp	Overloaded. (Inherited from ComponentBase.)
	onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	ComponentBase.readExternal override.
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	saveComponents	Overloaded.
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)

	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ComponentBase.writeExternal override.

Protected Methods

	Name	Description
	loadFromJson	Deserializes the component from a JsonObject.
	loadFromXml	ComponentBase.loadFromXml override.
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)

	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onMouseDown	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	Serializes the component into a JsonObject.
	saveToXml	ComponentBase.saveToXml override.
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)

ContainerComponent.getChildCount Method

Gets the number of child components of this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public int getChildCount ()
```

Return Value

An integer value specifying the number of direct children of this component.

ContainerComponent.loadComponents Method (Element, XmlPersistContext)

For internal use.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void loadComponents (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

loadComponents Method Overload List
ContainerComponent Members
ContainerComponent Class
com.mindfusion.diagramming.components Namespace

ContainerComponent.loadComponents Method (JsonObject, JsonPersistContext)

Loads the child components from Json. For internal use.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void loadComponents (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the ContainerComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

loadComponents Method Overload List
ContainerComponent Members

ContainerComponent.loadFromJson Method

Deserializes the component from a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the ContainerComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

ContainerComponent Members
ContainerComponent Class

ContentComponent Members

Represents a component which can host a single component as its child.

The following tables list the members exposed by the ContentComponent type.

Public Constructors

	Name	Description

	ContentComponent	Initializes a new instance of the ContentComponent class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	accept	ComponentBase.accept override.
	addChild	Implements AddChild.addChild
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	arrangeComponents	ComponentBase.arrangeComponents override.
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	For internal use. (Inherited from ComponentBase.)
	draw	ComponentBase.draw override.
	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getChildCount	ComponentBase.getChildCount override.
	getContent	Gets the content of this component.
	getCursor	Gets the cursor to display when the mouse is at the specified position. (Inherited from ComponentBase.)
	getDesiredSize	ComponentBase.getDesiredSize override.
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)
	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from

		ComponentBase.)
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
	getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	getName	Gets the name of the component. (Inherited from ComponentBase.)
	getPadding	Gets the padding around this component's content.
	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	(Inherited from ComponentBase.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)

	onKeyUp	(Inherited from ComponentBase.)
	onMouseMove	Overloaded. (Inherited from ComponentBase.)
	onMouseUp	Overloaded. (Inherited from ComponentBase.)
	onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	ComponentBase.readExternal override.
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setContent	Sets the content of this component.
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)

	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setPadding	Sets the padding around this component's content.
	setParent	For internal use. (Inherited from ComponentBase.)
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ComponentBase.writeExternal override.

Protected Methods

	Name	Description
	getThickness	Gets the space around the component's content. This space includes padding by default but can be subsequently adjusted as necessary by the deriving classes.
	loadFromJson	Deserializes the component from a JsonObject.
	loadFromXml	ComponentBase.loadFromXml override.
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onMouseDown	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	Serializes the component into a JsonObject.

	saveToXml	ComponentBase.saveToXml override.
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)

ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.getChildCount Method

ComponentBase.getChildCount override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public int getChildCount ()
```

Return Value

See Also

ContentComponent Members
ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.getContent Method

Gets the content of this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public ComponentBase getContent ()
```

Return Value

An instance of the ComponentBase class representing the sole child of the component.

See Also

ContentComponent Members
ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.getDesiredSize Method

ComponentBase.getDesiredSize override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public XDimension2D.Double getDesiredSize (
    XDimension2D.Double availableSize,
    Graphics2D g2d
)
```

Parameters

availableSize

g2d

Return Value

See Also

ContentComponent Members
ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.getPadding Method

Gets the padding around this component's content.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Thickness getPadding ()
```

Return Value

A Thickness object specifying the spacing between this component and its child.

See Also

ContentComponent Members
ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.getThickness Method

Gets the space around the component's content. This space includes padding by default but can be subsequently adjusted as necessary by the deriving classes.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected Thickness getThickness ()
```

Return Value

An instance of the Thickness class.

See Also

ContentComponent Members
ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.loadFromJson Method

Deserializes the component from a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the ContentComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

ContentComponent Members
ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.loadFromXml Method

ComponentBase.loadFromXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

ContentComponent Members
ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.readExternal Method

ComponentBase.readExternal override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

ContentComponent Members
ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.saveToJson Method

Serializes the component into a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the ContentComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

ContentComponent Members
ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.saveToXml Method

ComponentBase.saveToXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

ContentComponent Members
ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.setContent Method

Sets the content of this component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setContent (
    ComponentBase value
)
```

Parameters

value
An instance of the ComponentBase class representing the sole child of the component.

See Also

ContentComponent Members
ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.setPadding Method

Sets the padding around this component's content.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setPadding (
    Thickness value
)
```

Parameters

value
A Thickness object specifying the spacing between this component and its child. The default is 0.

ContentComponent Members
ContentComponent Class
com.mindfusion.diagramming.components Namespace

ContentComponent.writeExternal Method

ComponentBase.writeExternal override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

EditComponent Members
com.mindfusion.diagramming.components Namespace

EditComponent Members

Represents an editable text area.

The following tables list the members exposed by the EditComponent type.

Public Constructors

	Name	Description
	EditComponent	Initializes a new instance of the EditComponent class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	acceptsReturn	Gets a value indicating whether the edit component will insert new line when the user presses the ENTER key.
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentKeyEventListener	Registers an event listener.
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addEditComponentListener	Registers an event listener.
	arrangeComponents	Recursively arranges the child components, within the specified space and using the specified graphics for measurement purposes. (Inherited from ComponentBase.)
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	For internal use. (Inherited from ComponentBase.)
	draw	ComponentBase.draw override.
	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getBrush	Gets the background brush of the edit component.
	getChildCount	Gets the number of child components of this component. (Inherited from ComponentBase.)
	getCursor	ComponentBase.getCursor override.
	getDesiredSize	ComponentBase.getDesiredSize override.
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)

	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	getFont	Gets the font of the text.
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
	getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getInactiveSelectionColor	Gets the color of the selection when the edit component does not have input focus.
	getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	getName	Gets the name of the component. (Inherited from ComponentBase.)
	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getPen	Gets the border pen of the edit component.
	getScrollFirstLine	Gets the index of the first visible line in the edit component.
	getSelectionColor	Gets the color of the selection.
	getSelectionLength	Gets the length of the selection in the edit component.
	getSelectionStart	Gets the start of the selection in the edit component.
	getText	Gets the text of the edit component.
	getTextAlignment	Gets the horizontal alignment of the text in the edit component.

	getTextColor	Gets the color of the text.
	getTextPadding	Gets the padding of the edit component.
	getTextWrapping	Gets the wrapping of of the text in the edit component.
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	isHideSelection	Gets a value indicating whether to hide the selection when the edit component does not have input focus.
	onContextChanged	ComponentBase.onContextChanged override.
	onGotFocus	ComponentBase.onGotFocus override.
	onKeyPress	ComponentBase.onKeyPress override.
	onKeyUp	Overloaded.
	onLostFocus	ComponentBase.onLostFocus override.
	onMouseDown	ComponentBase.onMouseDown override.
	onMouseMove	ComponentBase.onMouseMove override.
	onMouseUp	ComponentBase.onMouseUp override.
	onUnitChanged	ComponentBase.onUnitChanged override.
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	ComponentBase.readExternal override.
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentKeyEventListener	Unregisters an event listener.
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeEditComponentListener	Unregisters an event listener.

setAcceptsReturn	Sets a value indicating whether the edit component will insert new line when the user presses the ENTER key.
setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
setBrush	Sets the background brush of the edit component.
setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
setFont	Sets the font of the text.
setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
setHideSelection	Sets a value indicating whether to hide the selection when the edit component does not have input focus.
setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
setInactiveSelectionColor	Sets the color of the selection when the edit component does not have input focus.
setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
setName	Sets the name of the component. (Inherited from ComponentBase.)
setParent	For internal use. (Inherited from ComponentBase.)
setPen	Sets the border pen of the edit component.
setScrollFirstLine	Sets the index of the first visible line in the edit component.
setSelectionColor	Sets the color of the selection.

	setSelectionLength	Sets the length of the selection in the edit component.
	setSelectionStart	Sets the start of the selection in the edit component. Setting this property will reset SelectionLength to 0.
	setText	Sets the text of the edit component.
	setTextAlignment	Sets the horizontal alignment of the text in the edit component.
	setTextColor	Sets the color of the text.
	setTextPadding	Sets the padding of the edit component.
	setTextWrapping	Sets the wrapping of of the text in the edit component.
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ComponentBase.writeExternal override.

Protected Methods

	Name	Description
	loadFromJson	Deserializes the component from a JsonObject.
	loadFromXml	ComponentBase.loadFromXml override.
	onAddedToParent	ComponentBase.onAddedToParent override.
	onClicked	Raises the mouseClicked event.
	onKeyDown	Overloaded.
	onKeyPressed	Raises the keyPressed event.
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onTextChanged	Raises the textChanged event.
	onTextChanging	Raises the textChanging event.

	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	ComponentBase.onZoomChanged override.
	saveToJson	Serializes the component into a JsonObject.
	saveToXml	ComponentBase.saveToXml override.
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)

EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent Constructor

Initializes a new instance of the EditComponent class.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public EditComponent ()
```

See Also

EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent Methods

EditComponent.acceptsReturn Method

Gets a value indicating whether the edit component will insert new line when the user presses the ENTER key.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean acceptsReturn ()
```

Return Value

true to insert new line when the user presses ENTER, or false to ignore the key.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.addComponentKeyEventListener Method

Registers an event listener.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void addComponentKeyEventListener (
    ComponentKeyEventListener listener
)
```

Parameters

listener
An object implementing ComponentKeyEventListener interface.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.addEditComponentListener Method

Registers an event listener.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void addEditComponentListener (
    EditComponentListener listener
)
```

Parameters

listener
An object implementing EditComponentListener interface.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.draw Method

ComponentBase.draw override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void draw (
    Graphics2D g2d,
    RenderOptions options
)
```

Parameters

g2d

options

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getBrush Method

Gets the background brush of the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getBrush ()
```

Return Value

A Brush instance.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getCursor Method

ComponentBase.getCursor override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public CursorHint getCursor (
    Point2D.Float point
)
```

Parameters

point

Return Value

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getDesiredSize Method

ComponentBase.getDesiredSize override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public XDimension2D.Double getDesiredSize (
    XDimension2D.Double availableSize,
    Graphics2D g2d
)
```

Parameters

availableSize

g2d

Return Value

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getFont Method

Gets the font of the text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Font getFont ()
```

Return Value

A jawa.awt.Font instance.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getInactiveSelectionColor Method

Gets the color of the selection when the edit component does not have input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Color getInactiveSelectionColor ()
```

Return Value

A jawa.awt.Color instance.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getPen Method

Gets the border pen of the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Pen getPen ()
```

Return Value

A Pen instance.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getScrollFirstLine Method

Gets the index of the first visible line in the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public int getScrollFirstLine ()
```

Return Value

An integer value specifying the scroll position.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getSelectionColor Method

Gets the color of the selection.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Color getSelectionColor ()
```

Return Value

A jawa.awt.Color instance.

See Also

EditComponent Members
EditComponent Class

com.mindfusion.diagramming.components Namespace

EditComponent.getSelectionLength Method

Gets the length of the selection in the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public int getSelectionLength ()
```

Return Value

An integer specifying the length of the current selection.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getSelectionStart Method

Gets the start of the selection in the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public int getSelectionStart ()
```

Return Value

An integer specifying the start of the current selection.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getText Method

Gets the text of the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public String getText ()
```

Return Value

A String containing the component's text.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getTextAlignment Method

Gets the horizontal alignment of the text in the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Align getTextAlignment ()
```

Return Value

A member of the Align enumeration.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getTextColor Method

Gets the color of the text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Color getTextColor ()
```

Return Value

A jawa.awt.Color instance.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getTextPadding Method

Gets the padding of the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public float getTextPadding ()
```

Return Value

A floating point value specifying the spacing between the component border and displayed text.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.getTextWrapping Method

Gets the wrapping of of the text in the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public TextWrapping getTextWrapping ()
```

Return Value

A member of the TextWrapping enumeration.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.isHideSelection Method

Gets a value indicating whether to hide the selection when the edit component does not have input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public boolean isHideSelection ()
```

Return Value

true, to hide selection when the edit component does not have input focus, or false otherwise.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.loadFromJson Method

Deserializes the component from a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the EditComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.loadFromXml Method

ComponentBase.loadFromXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
```

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

EditComponent.onAddedToParent Method

ComponentBase.onAddedToParent override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onAddedToParent ()
```

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.onClicked Method

Raises the mouseClicked event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onClicked (
    ComponentMouseEvent e
)
```

Parameters

e
An object containing the event data.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.onContextChanged Method

ComponentBase.onContextChanged override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onContextChanged ()
```

See Also

EditComponent Members

EditComponent.onKeyDown Method (int, int)

ComponentBase.onKeyDown override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean onKeyDown (
    int keyCode,
    int modifiers
)
```

Parameters

keyCode

modifiers

Return Value

See Also

onKeyDown Method Overload List
EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.onKeyPress Method

ComponentBase.onKeyPress override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onKeyPress (
    Character keyChar
)
```

Parameters

keyChar

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.onKeyPressed Method

Raises the keyPressed event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onKeyPressed (
    ComponentKeyEvent e
)
```

Parameters

e
An object containing the event data.

See Also

EditComponent.onKeyUp Method

Overload List

Name	Description
EditComponent.onKeyUp (ComponentKeyEvent)	Raises the keyUp event.
EditComponent.onKeyUp (int, int)	ComponentBase.onKeyUp override.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.onKeyUp Method (ComponentKeyEvent)

Raises the keyUp event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onKeyUp (
    ComponentKeyEvent e
)
```

Parameters

e
An object containing the event data.

See Also

onKeyUp Method Overload List
EditComponent Members
EditComponent Class

EditComponent.onTextChanged Method

Raises the textChanged event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onTextChanged (
    ComponentTextEvent e
)
```

Parameters

e
An object containing the event data.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.onTextChanging Method

Raises the textChanging event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onTextChanging (
    ComponentTextValidationEvent e
)
```

Parameters

e
An object containing the event data.

EditComponent.removeComponentKeyEventListener Method

Unregisters an event listener.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void removeComponentKeyEventListener (
    ComponentKeyEventListener listener
)
```

Parameters

listener
An object implementing ComponentKeyEventListener interface.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.removeEditComponentListener Method

Unregisters an event listener.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void removeEditComponentListener (
    EditComponentListener listener
)
```

Parameters

listener
An object implementing EditComponentListener interface.

See Also

EditComponent Members
EditComponent Class

EditComponent.saveToJson Method

Serializes the component into a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the EditComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

EditComponent.setAcceptsReturn Method

Sets a value indicating whether the edit component will insert new line when the user presses the ENTER key.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setAcceptsReturn (
    boolean value
)
```

Parameters

value
true to insert new line when the user presses ENTER, or false to ignore the key.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.setBrush Method

Sets the background brush of the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setBrush (
    Brush value
)
```

Parameters

value
A Brush instance.

EditComponent.setHideSelection Method

Sets a value indicating whether to hide the selection when the edit component does not have input focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setHideSelection (
    boolean value
)
```

Parameters

value
true, to hide selection when the edit component does not have input focus, or false otherwise.

See Also

EditComponent Members
EditComponent Class

EditComponent.setScrollFirstLine Method

Sets the index of the first visible line in the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
```

```
public void setScrollFirstLine (
    int value
)
```

Parameters

value
An integer value specifying the scroll position.

EditComponent.setSelectionLength Method

Sets the length of the selection in the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setSelectionLength (
    int value
)
```

Parameters

value
An integer specifying the length of the current selection.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.setSelectionStart Method

Sets the start of the selection in the edit component. Setting this property will reset SelectionLength to 0.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setSelectionStart (
    int value
)
```

Parameters

value
An integer specifying the start of the current selection.

EditComponent.setText Method

Sets the text of the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setText (
    String value
)
```

Parameters

value
A String containing the component's text.

See Also

EditComponent Members
EditComponent Class

EditComponent.setTextAlignment Method

Sets the horizontal alignment of the text in the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setTextAlignment (
    Align value
)
```

Parameters

value
A member of the Align enumeration.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.setTextColor Method

Sets the color of the text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setTextColor (
    Color value
)
```

Parameters

value
A jawa.awt.Color instance.

See Also

EditComponent Members
EditComponent Class

EditComponent.setTextPadding Method

Sets the padding of the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setTextPadding (
    float value
)
```

Parameters

value
A floating point value specifying the spacing between the component border and displayed text.

See Also

EditComponent Members
EditComponent Class
com.mindfusion.diagramming.components Namespace

EditComponent.setTextWrapping Method

Sets the wrapping of of the text in the edit component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setTextWrapping (
    TextWrapping value
)
```

Parameters

value
A member of the TextWrapping enumeration.

GridPanel Members

Represents a container which arranges it's children in a two-dimensional grid.

The following tables list the members exposed by the GridPanel type.

Public Constructors

	Name	Description
	GridPanel	Initializes a new instance of the GridPanel class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	accept	ComponentBase.accept override. (Inherited from ContainerComponent.)
	addChild	Implements AddChild.addChild. (Inherited from ContainerComponent.)
	addColumns	
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addRows	
	arrangeComponents	ContainerComponent.arrangeComponents override.
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	For internal use. (Inherited from ComponentBase.)
	draw	ComponentBase.draw override. (Inherited from ContainerComponent.)
	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getChildCount	Gets the number of child components of this component. (Inherited from ContainerComponent.)
	getColumns	Gets a list with the definitions of all columns in the grid.
	getComponents	Gets the child components of this container. (Inherited from ContainerComponent.)
	getCursor	Gets the cursor to display when the mouse is at the specified position. (Inherited from ComponentBase.)

	getDesiredSize	ContainerComponent.getDesiredSize override.
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)
	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
	getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	getName	Gets the name of the component. (Inherited from ComponentBase.)
	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getRows	Gets a list with the definitions of all rows in the grid.
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)

loadComponents	Overloaded. (Inherited from ContainerComponent.)
onContextChanged	(Inherited from ComponentBase.)
onKeyDown	(Inherited from ComponentBase.)
onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
onKeyUp	(Inherited from ComponentBase.)
onMouseMove	Overloaded. (Inherited from ComponentBase.)
onMouseUp	Overloaded. (Inherited from ComponentBase.)
onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
raiseValidated	(Inherited from ComponentBase.)
readExternal	ContainterComponent.readExternal override.
removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
saveComponents	Overloaded. (Inherited from ContainerComponent.)
setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)

	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ContainerComponent.writeExternal override.

Protected Methods

	Name	Description
	loadFromJson	Deserializes the component from a JsonObject.
	loadFromXml	ContainerComponent.loadFromXml override.
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onMouseDown	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)

	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	Serializes the component into a JsonObject.
	saveToXml	ContainerComponent.saveToXml override.
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)

GridPanel.getColumns Method

Gets a list with the definitions of all columns in the grid.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public ArrayList<GridColumn> getColumns ()
```

Return Value

A list with GridColumn objects.

See Also

GridPanel Members
GridPanel Class
com.mindfusion.diagramming.components Namespace

GridPanel.getDesiredSize Method

ContainerComponent.getDesiredSize override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public XDimension2D.Double getDesiredSize (
    XDimension2D.Double availableSize,
    Graphics2D g2d
)
```

Parameters

availableSize

g2d

Return Value

GridPanel.loadFromJson Method

Deserializes the component from a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the GridPanel data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

GridPanel Members
GridPanel Class
com.mindfusion.diagramming.components Namespace

GridPanel.loadFromXml Method

ContainerComponent.loadFromXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
```

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

HorizontalAlignment Class

Contains static constants that specify the horizontal alignment of a component relative to its allocated space. Center - Indicates that the component should be centered. Left - Indicates that the component should be left-aligned. Right - Indicates that the component should be right-aligned. Stretch - Indicates that the component should be stretched horizontally. @author Anton

Syntax

Java
`public class HorizontalAlignment`

Inheritance Hierarchy

HorizontalAlignment Members

Contains static constants that specify the horizontal alignment of a component relative to its allocated space. Center - Indicates that the component should be centered. Left - Indicates that the component should be left-aligned. Right - Indicates that the component should be right-aligned. Stretch - Indicates that the component should be stretched horizontally. @author Anton

The following tables list the members exposed by the HorizontalAlignment type.

Public Constructors

	Name	Description

ImageComponent Members

Represents a component which can display an image.

The following tables list the members exposed by the ImageComponent type.

Public Constructors

	Name	Description
	ImageComponent	Initializes a new instance of the ImageComponent class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	arrangeComponents	Recursively arranges the child components, within the specified space and using the specified graphics for measurement purposes. (Inherited from ComponentBase.)
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	For internal use. (Inherited from ComponentBase.)

draw	ComponentBase.draw override.
find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
getChildCount	Gets the number of child components of this component. (Inherited from ComponentBase.)
getCursor	Gets the cursor to display when the mouse is at the specified position. (Inherited from ComponentBase.)
getDesiredSize	ComponentBase.getDesiredSize override.
getDocumentBounds	For internal use. (Inherited from ComponentBase.)
getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
getImage	Gets the displayed image.
getImageAlign	Gets the alignment of the displayed image relative to the bounds of the component.
getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
getName	Gets the name of the component. (Inherited from ComponentBase.)
getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)

	getParentHost	For internal use. (Inherited from ComponentBase.)
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	(Inherited from ComponentBase.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
	onKeyUp	(Inherited from ComponentBase.)
	onMouseMove	Overloaded. (Inherited from ComponentBase.)
	onMouseUp	Overloaded. (Inherited from ComponentBase.)
	onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	ComponentBase.readExternal override.
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)

	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setImage	Sets the displayed image.
	setImageAlign	Sets the alignment of the displayed image relative to the bounds of the component.
	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ComponentBase.writeExternal override.

Protected Methods

	Name	Description
	loadFromJson	Deserializes the component from a JsonObject.

	loadFromXml	ComponentBase.loadFromXml override.
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onClicked	Invokes when the image component is clicked.
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onMouseDown	ComponentBase.onMouseDown override.
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	Serializes the component into a JsonObject.
	saveToXml	ComponentBase.saveToXml override.
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)

ImageComponent Methods

ImageComponent.draw Method

ComponentBase.draw override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void draw (
    Graphics2D g2d,
    RenderOptions options
)
```

Parameters

g2d

options

ImageComponent.getDesiredSize Method

ComponentBase.getDesiredSize override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public XDimension2D.Double getDesiredSize (
    XDimension2D.Double availableSize,
    Graphics2D g2d
)
```

Parameters

availableSize

g2d

Return Value

ImageComponent.getImage Method

Gets the displayed image.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Image getImage ()
```

Return Value

An instance of the Image class.

See Also

ImageComponent Members
ImageComponent Class
com.mindfusion.diagramming.components Namespace

ImageComponent.getImageAlign Method

Gets the alignment of the displayed image relative to the bounds of the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public ImageAlign getImageAlign ()
```

Return Value

A member of the ImageAlign enumeration.

See Also

ImageComponent Members
ImageComponent Class
com.mindfusion.diagramming.components Namespace

ImageComponent.loadFromJson Method

Deserializes the component from a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the ImageComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

ImageComponent.loadFromXml Method

ComponentBase.loadFromXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

ImageComponent Members
ImageComponent Class
com.mindfusion.diagramming.components Namespace

ImageComponent.saveToJson Method

Serializes the component into a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the ImageComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

ImageComponent.setImage Method

Sets the displayed image.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setImage (
    Image value
)
```

Parameters

value
An instance of the java.awt.Image class. The default is null.

ImageComponent.setImageAlign Method

Sets the alignment of the displayed image relative to the bounds of the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setImageAlign (
    ImageAlign value
)
```

Parameters

value
A member of the ImageAlign enumeration. The default is Center.

NumericEditComponent Members

Represents a numeric-only edit component.

The following tables list the members exposed by the NumericEditComponent type.

Public Constructors

	Name	Description
	NumericEditComponent	Initializes a new instance of the NumericEditComponent class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	acceptsReturn	Gets a value indicating whether the edit component will insert new line when the user presses the ENTER key. (Inherited from EditComponent.)
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentKeyEventListener	Registers an event listener. (Inherited from EditComponent.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addEditComponentListener	Registers an event listener. (Inherited from EditComponent.)
	addNumericEditComponentListener	Registers an event listener.
	arrangeComponents	Recursively arranges the child components, within the specified space and using the specified graphics for measurement purposes. (Inherited from ComponentBase.)
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	For internal use. (Inherited from ComponentBase.)
	draw	ComponentBase.draw override. (Inherited from EditComponent.)

	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getBrush	Gets the background brush of the edit component. (Inherited from EditComponent.)
	getChildCount	Gets the number of child components of this component. (Inherited from ComponentBase.)
	getCursor	ComponentBase.getCursor override. (Inherited from EditComponent.)
	getDesiredSize	ComponentBase.getDesiredSize override. (Inherited from EditComponent.)
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)
	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	getFont	Gets the font of the text. (Inherited from EditComponent.)
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
	getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getInactiveSelectionColor	Gets the color of the selection when the edit component does not have input focus. (Inherited from EditComponent.)
	getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	getName	Gets the name of the component. (Inherited from ComponentBase.)

	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getPen	Gets the border pen of the edit component. (Inherited from EditComponent.)
	getScrollFirstLine	Gets the index of the first visible line in the edit component. (Inherited from EditComponent.)
	getSelectionColor	Gets the color of the selection. (Inherited from EditComponent.)
	getSelectionLength	Gets the length of the selection in the edit component. (Inherited from EditComponent.)
	getSelectionStart	Gets the start of the selection in the edit component. (Inherited from EditComponent.)
	getText	Gets the text of the edit component. (Inherited from EditComponent.)
	getTextAlignment	Gets the horizontal alignment of the text in the edit component. (Inherited from EditComponent.)
	getTextColor	Gets the color of the text. (Inherited from EditComponent.)
	getTextPadding	Gets the padding of the edit component. (Inherited from EditComponent.)
	getTextWrapping	Gets the wrapping of of the text in the edit component. (Inherited from EditComponent.)
	getValue	Gets the value displayed in the edit box.
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	isHideSelection	Gets a value indicating whether to hide the selection when the edit component does not have input focus. (Inherited from EditComponent.)
	onContextChanged	ComponentBase.onContextChanged override. (Inherited from EditComponent.)
	onGotFocus	ComponentBase.onGotFocus override. (Inherited from EditComponent.)

	onKeyDown	EditComponent.onKeyDown override.
	onKeyPress	EditComponent.onKeyPress override.
	onKeyUp	Overloaded. (Inherited from EditComponent.)
	onLostFocus	EditComponent.onLostFocus override.
	onMouseDown	ComponentBase.onMouseDown override. (Inherited from EditComponent.)
	onMouseMove	ComponentBase.onMouseMove override. (Inherited from EditComponent.)
	onMouseUp	ComponentBase.onMouseUp override. (Inherited from EditComponent.)
	onUnitChanged	ComponentBase.onUnitChanged override. (Inherited from EditComponent.)
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	EditComponent.readExternal override.
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentKeyEventListener	Unregisters an event listener. (Inherited from EditComponent.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeEditComponentListener	Unregisters an event listener. (Inherited from EditComponent.)
	removeNumericEditComponentListener	Unregisters an event listener.
	selectAll	Selects the entire text inside this edit box.
	setAcceptsReturn	Sets a value indicating whether the edit component will insert new line when the user presses the ENTER key. (Inherited from EditComponent.)
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setBrush	Sets the background brush of the edit component. (Inherited from EditComponent.)
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setFont	Sets the font of the text. (Inherited from EditComponent.)

	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHideSelection	Sets a value indicating whether to hide the selection when the edit component does not have input focus. (Inherited from EditComponent.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setInactiveSelectionColor	Sets the color of the selection when the edit component does not have input focus. (Inherited from EditComponent.)
	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setPen	Sets the border pen of the edit component. (Inherited from EditComponent.)
	setScrollFirstLine	Sets the index of the first visible line in the edit component. (Inherited from EditComponent.)
	setSelectionColor	Sets the color of the selection. (Inherited from EditComponent.)
	setSelectionLength	Sets the length of the selection in the edit component. (Inherited from EditComponent.)
	setSelectionStart	Sets the start of the selection in the edit component. Setting this property will reset SelectionLength to 0. (Inherited from EditComponent.)
	setText	Sets the text of the edit component. (Inherited from EditComponent.)
	setTextAlignment	Sets the horizontal alignment of the text in the edit component. (Inherited from EditComponent.)

	setTextColor	Sets the color of the text. (Inherited from EditComponent.)
	setTextPadding	Sets the padding of the edit component. (Inherited from EditComponent.)
	setTextWrapping	Sets the wrapping of of the text in the edit component. (Inherited from EditComponent.)
	setValue	Sets the value displayed in the edit box.
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	EditComponent.writeExternal override.

Protected Methods

	Name	Description
	loadFromJson	Deserializes the component from a JsonObject.
	loadFromXml	EditComponent.loadFromXml override.
	onAddedToParent	ComponentBase.onAddedToParent override. (Inherited from EditComponent.)
	onClicked	Raises the mouseClicked event. (Inherited from EditComponent.)
	onKeyPressed	Raises the keyPressed event. (Inherited from EditComponent.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onTextChanged	EditComponent.onTextChanged override.
	onTextChanging	Raises the textChanging event. (Inherited from EditComponent.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidateValue	Raises the validateValue event.

	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onValueChanged	Raises the valueChanged event.
	onZoomChanged	ComponentBase.onZoomChanged override. (Inherited from EditComponent.)
	saveToJson	Serializes the component into a JsonObject.
	saveToXml	EditComponent.saveToXml override.
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void onKeyPress (
    Character keyChar
)
```

Parameters

keyChar

NumericEditComponent.onTextChanged Method

EditComponent.onTextChanged override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onTextChanged (
    ComponentTextEvent e
)
```

Parameters

e

See Also

NumericEditComponent Members
NumericEditComponent Class
com.mindfusion.diagramming.components Namespace

NumericEditComponent.onValidateValue Method

Raises the validateValue event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onValidateValue (
    ValueChangingEvent<Float> e
)
```

Parameters

e
An object containing the event data.

See Also

NumericEditComponent Members
NumericEditComponent Class
com.mindfusion.diagramming.components Namespace

NumericEditComponent.onValueChanged Method

Raises the valueChanged event.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void onValueChanged (
    ValueChangedEvent<Float> e
)
```

Parameters

e
An object containing the event data.

NumericEditComponent Members
NumericEditComponent Class
com.mindfusion.diagramming.components Namespace

NumericEditComponent.removeNumericEditComponentListener Method

Unregisters an event listener.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void removeNumericEditComponentListener (
    NumericEditComponentListener listener
)
```

Parameters

listener
An object implementing NumericEditComponentListener interface.

See Also

NumericEditComponent Members
NumericEditComponent Class
com.mindfusion.diagramming.components Namespace

NumericEditComponent.saveToJson Method

Serializes the component into a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the NumericEditComponent data

context
An JsonPersistContext object providing information a bout the serialization process and some helper methods.

NumericEditComponent Members
NumericEditComponent Class
com.mindfusion.diagramming.components Namespace

NumericEditComponent.saveToXml Method

EditComponent.saveToXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

NumericEditComponent.setValue Method

Sets the value displayed in the edit box.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setValue (
    float value
)
```

Parameters

value
The numerical value to display in the component.

NumericEditComponentListener Interface

Defines the events that can be raised by NumericEditComponent.

Syntax

```
Java
public interface NumericEditComponentListener extends EventListener
```

See Also

NumericEditComponentListener Members
com.mindfusion.diagramming.components Namespace

NumericEditComponentListener Members

Defines the events that can be raised by NumericEditComponent.

The following tables list the members exposed by the NumericEditComponentListener type.

Public Methods

	Name	Description
	validateValue	Raised when the value inside the component needs to be validated.
	valueChanged	Raised when the component's value has changed.

See Also

NumericEditComponentListener Interface
com.mindfusion.diagramming.components Namespace

NumericEditComponentListener Methods

NumericEditComponentListener.validateValue Method

Raised when the value inside the component needs to be validated.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void validateValue (
    Object sender,
    ValueChangingEvent<Float> e
)
```

Parameters

sender

The component that raises the event.

e

An object providing information about the event.

See Also

NumericEditComponentListener Members
NumericEditComponentListener Interface
com.mindfusion.diagramming.components Namespace

NumericEditComponentListener.valueChanged Method

Raised when the component's value has changed.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void valueChanged (
    Object sender,
    ValueChangedEvent<Float> e
)
```

Parameters

sender

The component that raises the event.

e

An object providing information about the event.

RangeSliderRailComponent Members

Represents a slider rail component.

The following tables list the members exposed by the RangeSliderRailComponent type.

Public Constructors

	Name	Description
	RangeSliderRailComponent	

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description

	accept	ComponentBase.accept override. (Inherited from ContainerComponent.)
	addChild	Implements AddChild.addChild. (Inherited from ContainerComponent.)
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addSliderListener	
	arrangeComponents	ContentComponent.arrangeComponents override.
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	For internal use. (Inherited from ComponentBase.)
	draw	ComponentBase.draw override.
	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getChildCount	Gets the number of child components of this component. (Inherited from ContainerComponent.)
	getComponents	Gets the child components of this container. (Inherited from ContainerComponent.)
	getCursor	ComponentBase.getCursor override.
	getDesiredSize	ContentComponent.GetDesiredSize override.
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)
	getEndValue	Gets the currently selected end value.
	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel.

		(Inherited from ComponentBase.)
	getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
	getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	getMaximum	Gets the maximum value of the rail.
	getMinimum	Gets the minimum value of the rail.
	getName	Gets the name of the component. (Inherited from ComponentBase.)
	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getRailBrush	Gets the brush used to fill the rail.
	getRailPen	Gets the pen used to draw the rail outline.
	getRailThickness	Gets the rail thickness.
	getStartValue	Gets the currently selected start value.
	getThumbBrush	Gets the brush of the rail's thumbs.
	getThumbPen	Gets the border pen of the rail's thumbs.
	getTickSize	Gets the size of the tick in the middle of the rail.
	getValueBrush	Gets the brush used to fill the portion of the rail between StartValue and EndValue.
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)

	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	loadComponents	Overloaded. (Inherited from ContainerComponent.)
	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	(Inherited from ComponentBase.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
	onKeyUp	(Inherited from ComponentBase.)
	onMouseDown	ComponentBase.onMouseDown override.
	onMouseMove	ComponentBase.onMouseMove override.
	onMouseUp	ComponentBase.onMouseUp override.
	onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	ComponentBase.readExternal override. (Inherited from ContainerComponent.)
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeSliderListener	
	saveComponents	Overloaded. (Inherited from ContainerComponent.)
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setEndValue	Sets the currently selected end value.
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)

setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
setMaximum	Sets the maximum value of the rail.
setMinimum	Sets the minimum value of the rail.
setName	Sets the name of the component. (Inherited from ComponentBase.)
setParent	For internal use. (Inherited from ComponentBase.)
setRailBrush	Sets the brush used to fill the rail.
setRailPen	Sets the pen used to draw the rail outline.
setRailThickness	Sets the rail thickness.
setStartValue	Sets the currently selected start value.
setThumbBrush	Sets the brush of the rail's thumbs.
setThumbPen	Sets the border pen of the rail's thumbs.
setTickSize	Sets the size of the tick in the middle of the rail.
setValueBrush	Sets the brush used to fill the portion of the rail between StartValue and EndValue.
setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from

		ComponentBase.)
	writeExternal	ComponentBase.writeExternal override. (Inherited from ContainerComponent.)

Protected Methods

	Name	Description
	fireOnBatchValueChanged	
	fireOnEndValueChanged	
	fireOnStartValueChanged	
	loadFromJson	Deserializes the component from a JsonObject. (Inherited from ContainerComponent.)
	loadFromXml	ComponentBase.loadFromXml override. (Inherited from ContainerComponent.)
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	Serializes the component into a JsonObject. (Inherited from ContainerComponent.)
	saveToXml	ComponentBase.saveToXml override. (Inherited from ContainerComponent.)
	serializeSubcomponents	ComponentBase.serializeSubcomponents override.

RangeSliderRailComponent Class
com.mindfusion.diagramming.components Namespace

RangeSliderRailComponent.setThumbPen Method

Sets the border pen of the rail's thumbs.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setThumbPen (
    Pen value
)
```

Parameters

value

RangeSliderRailComponent.setTickSize Method

Sets the size of the tick in the middle of the rail.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setTickSize (
    float value
)
```

Parameters

value

RangeSliderRailComponent.setValueBrush Method

Sets the brush used to fill the portion of the rail between StartValue and EndValue.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setValueBrush (
    Brush value
)
```

Parameters

value

ShapeComponent Members

Represents components which can display geometric shapes.

The following tables list the members exposed by the ShapeComponent type.

Public Constructors

	Name	Description
	ShapeComponent	Initializes a new instance of the ShapeComponent class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)

	arrangeComponents	Recursively arranges the child components, within the specified space and using the specified graphics for measurement purposes. (Inherited from ComponentBase.)
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	ComponentBase.createOutlinePath override.
	draw	ComponentBase.draw override.
	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getBrush	Gets the brush used to fill the component.
	getChildCount	Gets the number of child components of this component. (Inherited from ComponentBase.)
	getCursor	Gets the cursor to display when the mouse is at the specified position. (Inherited from ComponentBase.)
	getDesiredSize	Gets the desired size of this component in case the width and/or height have not been explicitly specified. (Inherited from ComponentBase.)
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)
	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
	getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)

getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
getIsOutline	Gets a value indicating whether this component defines the outline of its host.
getName	Gets the name of the component. (Inherited from ComponentBase.)
getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
getParentHost	For internal use. (Inherited from ComponentBase.)
getPen	Gets the pen used to stroke the outline of the component.
getShape	Gets the Shape object defining the outline of the component.
getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
onContextChanged	(Inherited from ComponentBase.)
onKeyDown	(Inherited from ComponentBase.)
onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
onKeyUp	(Inherited from ComponentBase.)
onMouseMove	Overloaded. (Inherited from ComponentBase.)
onMouseUp	Overloaded. (Inherited from ComponentBase.)
onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
raiseValidated	(Inherited from ComponentBase.)
readExternal	ComponentBase.readExternal override.
removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from

		ComponentBase.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setBrush	Sets the brush used to fill the component.
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setIsOutline	Sets a value indicating whether this component defines the outline of its host.
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setPen	Sets the pen used to stroke the outline of the component.
	setShape	Sets the Shape object defining the outline of the component.
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from

		ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ComponentBase.writeExternal override.

Protected Methods

	Name	Description
	createGeneralPath	Creates a GeneralPath object representing the shape.
	loadFromJson	Deserializes the component from a JsonObject.
	loadFromXml	ComponentBase.loadFromXml override.
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onMouseDown	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	Serializes the component into a JsonObject.
	saveToXml	ComponentBase.saveToXml override.
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)

ShapeComponent Methods

ShapeComponent.createGeneralPath Method

Creates a GeneralPath object representing the shape.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
protected GeneralPath createGeneralPath ()
```

Return Value

A GeneralPath object representing the shape.

See Also

ShapeComponent Members

ShapeComponent.createOutlinePath Method

ComponentBase.createOutlinePath override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public GeneralPath createOutlinePath (
    Rectangle2D.Float bounds,
    float rotationAngle
)
```

Parameters

bounds

rotationAngle

Return Value

ShapeComponent.draw Method

ComponentBase.draw override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void draw (
    Graphics2D g,
    RenderOptions options
)
```

Parameters

g

options

ShapeComponent Members
ShapeComponent Class
com.mindfusion.diagramming.components Namespace

ShapeComponent.getBrush Method

Gets the brush used to fill the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getBrush ()
```

Return Value

An instance of a Brush-derived class.

See Also

ShapeComponent Members
ShapeComponent Class
com.mindfusion.diagramming.components Namespace

ShapeComponent.getIsOutline Method

Gets a value indicating whether this component defines the outline of its host.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public boolean getIsOutline ()
```

Return Value

true to mark this component as the node's outline, otherwise false.

ShapeComponent Members
ShapeComponent Class
com.mindfusion.diagramming.components Namespace

ShapeComponent.getPen Method

Gets the pen used to stroke the outline of the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Pen getPen ()
```

Return Value

An instance of the Pen class.

See Also

ShapeComponent Members
ShapeComponent Class
com.mindfusion.diagramming.components Namespace

ShapeComponent.getShape Method

Gets the Shape object defining the outline of the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Shape getShape ()
```

Return Value

An instance of the Shape class.

See Also

ShapeComponent Members
ShapeComponent Class
com.mindfusion.diagramming.components Namespace

ShapeComponent.loadFromJson Method

Deserializes the component from a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the ShapeComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

ShapeComponent Members
ShapeComponent Class
com.mindfusion.diagramming.components Namespace

ShapeComponent.loadFromXml Method

ComponentBase.loadFromXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

ShapeComponent.readExternal Method

ComponentBase.readExternal override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

ShapeComponent Members
ShapeComponent Class
com.mindfusion.diagramming.components Namespace

ShapeComponent.saveToJson Method

Serializes the component into a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the ShapeComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

ShapeComponent.setBrush Method

Sets the brush used to fill the component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setBrush (
    Brush value
)
```

Parameters

value
An instance of a Brush-derived class. The default is null.

See Also

ShapeComponent Members
ShapeComponent Class
com.mindfusion.diagramming.components Namespace

ShapeComponent.setIsOutline Method

Sets a value indicating whether this component defines the outline of its host.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setIsOutline (
    boolean value
)
```

Parameters

value
true to mark this component as the node's outline, otherwise false. The default value is false.

SimplePanel Members

A container which arranges its items so that they fill all available space.

The following tables list the members exposed by the SimplePanel type.

Public Constructors

	Name	Description
	SimplePanel	Initializes a new instance of the SimplePanel class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	accept	ComponentBase.accept override. (Inherited from ContainerComponent.)

	addChild	Implements AddChild.addChild. (Inherited from ContainerComponent.)
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	arrangeComponents	ContainerComponent.arrangeComponents override.
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	For internal use. (Inherited from ComponentBase.)
	draw	ComponentBase.draw override. (Inherited from ContainerComponent.)
	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getChildCount	Gets the number of child components of this component. (Inherited from ContainerComponent.)
	getComponents	Gets the child components of this container. (Inherited from ContainerComponent.)
	getCursor	Gets the cursor to display when the mouse is at the specified position. (Inherited from ComponentBase.)
	getDesiredSize	ContainerComponent.getDesiredSize override.
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)
	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)

	getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	getName	Gets the name of the component. (Inherited from ComponentBase.)
	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	loadComponents	Overloaded. (Inherited from ContainerComponent.)
	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	(Inherited from ComponentBase.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
	onKeyUp	(Inherited from ComponentBase.)
	onMouseMove	Overloaded. (Inherited from ComponentBase.)
	onMouseUp	Overloaded. (Inherited from ComponentBase.)
	onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
	raiseValidated	(Inherited from ComponentBase.)

	readExternal	ComponentBase.readExternal override. (Inherited from ContainerComponent.)
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	saveComponents	Overloaded. (Inherited from ContainerComponent.)
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)

	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ComponentBase.writeExternal override. (Inherited from ContainerComponent.)

Protected Methods

	Name	Description
	loadFromJson	Deserializes the component from a JsonObject. (Inherited from ContainerComponent.)
	loadFromXml	ComponentBase.loadFromXml override. (Inherited from ContainerComponent.)
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onMouseDown	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	Serializes the component into a JsonObject. (Inherited from ContainerComponent.)

addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
addSliderListener	Registers an event listener.
addSliderRailListener	Registers an event listener.
arrangeComponents	ComponentBase.arrangeComponents override. (Inherited from ContentComponent.)
confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
createOutlinePath	For internal use. (Inherited from ComponentBase.)
draw	ComponentBase.draw override. (Inherited from ContentComponent.)
find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
getActiveBrush	Gets the brush used to fill the portion of the rail between StartValue and EndValue. This property is relevant only when the slider Type is set to Range.
getBackground	Gets the brush used to fill the background of the slider.
getBorder	Gets the pen used to draw the border of the slider.
getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
getButtonBrush	Gets the brush of the slider's buttons and thumbs.
getButtonBrushHovered	Gets the background brush of the slider's buttons when they are pointed with the mouse.
getButtonBrushPressed	Gets the background brush of the slider's buttons when they are pressed.
getButtonContentColor	Gets the color of the content of the slider's buttons.
getButtonPen	Gets the border pen of the slider's buttons and thumbs.

getButtonPenHovered	Gets the border pen of the slider's buttons when they are pointed with the mouse.
getButtonPenPressed	Gets the border pen of the slider's buttons when they are pressed.
getChildCount	ComponentBase.getChildCount override. (Inherited from ContentComponent.)
getContent	Gets the content of this component. (Inherited from ContentComponent.)
getCursor	ComponentBase.getCursor override.
getDesiredSize	ComponentBase.getDesiredSize override. (Inherited from ContentComponent.)
getDocumentBounds	For internal use. (Inherited from ComponentBase.)
getEndValue	Gets the end value of the slider. This property is relevant only when the slider Type is set to Range.
getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
getMaximum	Gets the maximum value of the rail.
getMinimum	Gets the minimum value of the rail.
getName	Gets the name of the component. (Inherited from ComponentBase.)
getPadding	Gets the padding around this component's content. (Inherited from ContentComponent.)

	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getRailBrush	Gets the background of the slider rail.
	getRailPen	Gets the border pen of the slider rail.
	getStartValue	Gets the start value of the slider. This property is relevant only when the slider Type is set to Range.
	getType	Gets the type of this slider component.
	getValue	Gets the value of the slider. This property is relevant only when the slider Type is set to SingleValue.
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	(Inherited from ComponentBase.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
	onKeyUp	(Inherited from ComponentBase.)
	onMouseMove	Overloaded. (Inherited from ComponentBase.)
	onMouseUp	Overloaded. (Inherited from ComponentBase.)
	onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	ContentComponent.readExternal override.
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)

	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeSliderListener	Unregisters an event listener.
	removeSliderRailListener	Unregisters an event listener.
	setActiveBrush	Sets the brush used to fill the portion of the rail between StartValue and EndValue. This property is relevant only when the slider Type is set to Range.
	setBackground	Sets the brush used to fill the background of the slider.
	setBorder	Sets the pen used to draw the border of the slider.
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setButtonBrush	Sets the brush of the slider's buttons and thumbs.
	setButtonBrushHovered	Sets the background brush of the slider's buttons when they are pointed with the mouse.
	setButtonBrushPressed	Sets the background brush of the slider's buttons when they are pressed.
	setButtonContentColor	Sets the color of the content of the slider's buttons.
	setButtonPen	Sets the border pen of the slider's buttons and thumbs.
	setButtonPenHovered	Sets the border pen of the slider's buttons when they are pointed with the mouse.
	setButtonPenPressed	Sets the border pen of the slider's buttons when they are pressed.
	setContent	Sets the content of this component. (Inherited from ContentComponent.)
	setEndValue	Sets the end value of the slider. This property is relevant only when the slider Type is set to Range.
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)

	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setMaximum	Sets the maximum value of the rail.
	setMinimum	Sets the minimum value of the rail.
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setPadding	Sets the padding around this component's content. (Inherited from ContentComponent.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setRailBrush	Sets the background of the slider rail.
	setRailPen	Sets the border pen of the slider rail.
	setStartValue	Sets the start value of the slider. This property is relevant only when the slider Type is set to Range.
	setType	Sets the type of this slider component.
	setValue	Sets the value of the slider. This property is relevant only when the slider Type is set to SingleValue.
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ContentComponent.writeExternal override.

Protected Methods

	Name	Description

	getThickness	Gets the space around the component's content. This space includes padding by default but can be subsequently adjusted as necessary by the deriving classes. (Inherited from ContentComponent.)
	loadFromJson	Deserializes the component from a JsonObject.
	loadFromXml	ContentComponent.loadFromXml override.
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onMouseDown	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	Serializes the component into a JsonObject.
	saveToXml	ContentComponent.saveToXml override.
	serializeSubcomponents	ComponentBase.serializeSubcomponents override.

SliderComponent Constructor

Initializes a new instance of the SliderComponent class.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public SliderComponent ()
```

See Also

SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent Methods

SliderComponent.addSliderListener Method

Registers an event listener.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void addSliderListener (
    SliderListener listener
)
```

Parameters

listener
An object implementing SliderListener interface.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.addSliderRailListener Method

Registers an event listener.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void addSliderRailListener (
    SliderRailListener listener
)
```

Parameters

listener
An object implementing SliderRailListener interface.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getActiveBrush Method

Gets the brush used to fill the portion of the rail between StartValue and EndValue. This property is relevant only when the slider Type is set to Range.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getActiveBrush ()
```

Return Value

An instance of the Brush class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getBackground Method

Gets the brush used to fill the background of the slider.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getBackground ()
```

Return Value

An instance of the Brush class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getBorder Method

Gets the pen used to draw the border of the slider.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Pen getBorder ()
```

Return Value

An instance of the Pen class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getButtonBrush Method

Gets the brush of the slider's buttons and thumbs.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getButtonBrush ()
```

Return Value

An instance of the Brush class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getButtonBrushHovered Method

Gets the background brush of the slider's buttons when they are pointed with the mouse.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getButtonBrushHovered ()
```

Return Value

An instance of the Brush class.

See Also

SliderComponent Members
SliderComponent Class

com.mindfusion.diagramming.components Namespace

SliderComponent.getButtonBrushPressed Method

Gets the background brush of the slider's buttons when they are pressed.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public Brush getButtonBrushPressed ()
```

Return Value

An instance of the Brush class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getButtonContentColor Method

Gets the color of the content of the slider's buttons.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public Color getButtonContentColor ()
```

Return Value

An instance of the java.awt.Color class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getButtonPen Method

Gets the border pen of the slider's buttons and thumbs.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Pen getButtonPen ()
```

Return Value

An instance of the Pen class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getButtonPenHovered Method

Gets the border pen of the slider's buttons when they are pointed with the mouse.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Pen getButtonPenHovered ()
```

Return Value

An instance of the Pen class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getButtonPenPressed Method

Gets the border pen of the slider's buttons when they are pressed.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Pen getButtonPenPressed ()
```

Return Value

An instance of the Pen class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getCursor Method

ComponentBase.getCursor override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public CursorHint getCursor (
    Point2D.Float point
)
```

Parameters

point

Return Value

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getEndValue Method

Gets the end value of the slider. This property is relevant only when the slider Type is set to Range.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public float getEndValue ()
```

Return Value

The end value of slider's current range.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getMaximum Method

Gets the maximum value of the rail.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public float getMaximum ()
```

Return Value

The maximum value of slider's range.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getMinimum Method

Gets the minimum value of the rail.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public float getMinimum ()
```

Return Value

The minimum value of slider's range.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getRailBrush Method

Gets the background of the slider rail.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getRailBrush ()
```

Return Value

An instance of the Brush class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getRailPen Method

Gets the border pen of the slider rail.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Pen getRailPen ()
```

Return Value

An instance of the Pen class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getStartValue Method

Gets the start value of the slider. This property is relevant only when the slider Type is set to Range.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public float getStartValue ()
```

Return Value

The start value of slider's current range.

See Also

SliderComponent Members
SliderComponent Class

SliderComponent.getType Method

Gets the type of this slider component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public SliderComponent.SliderType getType ()
```

Return Value

A member of the SliderType enumeration.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.getValue Method

Gets the value of the slider. This property is relevant only when the slider Type is set to SingleValue.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public float getValue ()
```

Return Value

The current value displayed by slider.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.loadFromJson Method

Deserializes the component from a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the SliderComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.loadFromXml Method

ContentComponent.loadFromXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.readExternal Method

ContentComponent.readExternal override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.removeSliderListener Method

Unregisters an event listener.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void removeSliderListener (
    SliderListener listener
)
```

Parameters

listener
An object implementing SliderListener interface.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.removeSliderRailListener Method

Unregisters an event listener.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void removeSliderRailListener (
    SliderRailListener listener
)
```

Parameters

listener
An object implementing SliderRailListener interface.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.saveToJson Method

Serializes the component into a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the SliderComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.saveToXml Method

ContentComponent.saveToXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

SliderComponent Members
SliderComponent Class

SliderComponent.serializeSubcomponents Method

ComponentBase.serializeSubcomponents override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected boolean serializeSubcomponents ()
```

Return Value

Always returns false.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.setActiveBrush Method

Sets the brush used to fill the portion of the rail between StartValue and EndValue. This property is relevant only when the slider Type is set to Range.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setActiveBrush (
    Brush value
)
```

Parameters

value
An instance of the Brush class.

See Also

SliderComponent Members
SliderComponent Class

SliderComponent.setBackground Method

Sets the brush used to fill the background of the slider.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setBackground (
    Brush value
)
```

Parameters

value
An instance of the Brush class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.setBorder Method

Sets the pen used to draw the border of the slider.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setBorder (
    Pen value
)
```

Parameters

value
An instance of the Pen class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.setButtonBrush Method

Sets the brush of the slider's buttons and thumbs.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setButtonBrush (
    Brush value
)
```

Parameters

value
An instance of the Brush class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.setButtonBrushHovered Method

Sets the background brush of the slider's buttons when they are pointed with the mouse.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setButtonBrushHovered (
    Brush value
)
```

Parameters

value
An instance of the Brush class.

See Also

SliderComponent Members
SliderComponent Class

SliderComponent.setButtonBrushPressed Method

Sets the background brush of the slider's buttons when they are pressed.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public void setButtonBrushPressed (
    Brush value
)
```

Parameters

value
An instance of the Brush class.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.setButtonContentColor Method

Sets the color of the content of the slider's buttons.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public void setButtonContentColor (
    Color value
)
```

Parameters

value
An instance of the java.awt.Color class.

See Also

SliderComponent Members

SliderComponent.setEndValue Method

Sets the end value of the slider. This property is relevant only when the slider Type is set to Range.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setEndValue (
    float value
)
```

Parameters

value
The end value of slider's current range.

See Also

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.setMaximum Method

Sets the maximum value of the rail.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setMaximum (
    float value
)
```

Parameters

value
The maximum value of slider's range.

See Also

SliderComponent Members

com.mindfusion.diagramming.components Namespace

SliderComponent.setValue Method

Sets the value of the slider. This property is relevant only when the slider Type is set to SingleValue.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public void setValue (
    float value
)
```

Parameters

value
The current value displayed by slider.

SliderComponent Members
SliderComponent Class
com.mindfusion.diagramming.components Namespace

SliderComponent.writeExternal Method

ContentComponent.writeExternal override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
```

```
public void writeExternal (
    ObjectOutput out
)
```

Parameters

out

SliderListener Interface

Defines the events that can be raised by SliderComponent.

Syntax

Java
`public interface SliderListener extends EventListener`

Inheritors

com.mindfusion.diagramming.components.SliderAdapter

See Also

SliderListener Members
com.mindfusion.diagramming.components Namespace

SliderListener Members

Defines the events that can be raised by SliderComponent.

The following tables list the members exposed by the SliderListener type.

Public Methods

	Name	Description
	batchValueChanged	Raised when the slider value has been changed after a sequence of similar changes.
	endValueChanged	Raised when the selected end value has been changed interactively.
	startValueChanged	Raised when the selected start value has been changed interactively.

See Also

SliderListener Methods

SliderListener.batchValueChanged Method

Raised when the slider value has been changed after a sequence of similar changes.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void batchValueChanged (
    Object sender,
    ValueChangedEvent<Float> e
)
```

Parameters

sender
The component that raises the event.

e
An object providing information about the event.

See Also

SliderListener Members
SliderListener Interface
com.mindfusion.diagramming.components Namespace

SliderListener.endValueChanged Method

Raised when the selected end value has been changed interactively.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void endValueChanged (
    Object sender,
    ValueChangedEvent<Float> e
)
```

Parameters

sender
The component that raises the event.

e
An object providing information about the event.

See Also

SliderListener Members
SliderListener Interface
com.mindfusion.diagramming.components Namespace

SliderListener.startValueChanged Method

Raised when the selected start value has been changed interactively.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
void startValueChanged (
    Object sender,
    ValueChangedEvent<Float> e
)
```

Parameters

sender
The component that raises the event.

e
An object providing information about the event.

SliderRailComponent Members

Represents a slider rail component.

The following tables list the members exposed by the SliderRailComponent type.

Public Constructors

	Name	Description
	SliderRailComponent	Initializes a new instance of the SliderRailComponent class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	accept	ComponentBase.accept override. (Inherited from ContainerComponent.)
	addChild	Implements AddChild.addChild. (Inherited from ContainerComponent.)
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addSliderRailListener	
	arrangeComponents	ContentComponent.ArrangeComponents override.
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)

contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
createOutlinePath	For internal use. (Inherited from ComponentBase.)
draw	ComponentBase.Draw override.
find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
getChildCount	Gets the number of child components of this component. (Inherited from ContainerComponent.)
getComponents	Gets the child components of this container. (Inherited from ContainerComponent.)
getCursor	ComponentBase.getCursor override.
getDesiredSize	ContentComponent.GetDesiredSize override.
getDocumentBounds	For internal use. (Inherited from ComponentBase.)
getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
getMaximum	Gets the maximum value of the rail.
getMinimum	Gets the minimum value of the rail.

	getName	Gets the name of the component. (Inherited from ComponentBase.)
	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getRailBrush	Gets the brush used to fill the rail.
	getRailPen	Gets the pen used to draw the rail outline.
	getRailThickness	Gets the rail thickness.
	getThumbBrush	Gets the brush of the rail's thumb.
	getThumbPen	Gets the border pen of the rail's thumb.
	getValue	Gets the currently selected value.
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	loadComponents	Overloaded. (Inherited from ContainerComponent.)
	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	(Inherited from ComponentBase.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
	onKeyUp	(Inherited from ComponentBase.)
	onMouseDown	ComponentBase.onMouseDown override.
	onMouseMove	ComponentBase.onMouseMove override.
	onMouseUp	ComponentBase.onMouseUp override.
	onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	ComponentBase.readExternal override. (Inherited from ContainerComponent.)

	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeSliderRailListener	
	saveComponents	Overloaded. (Inherited from ContainerComponent.)
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setMaximum	Sets the maximum value of the rail.
	setMinimum	Sets the minimum value of the rail.
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setRailBrush	Sets the brush used to fill the rail.

	setRailPen	Sets the pen used to draw the rail outline.
	setRailThickness	Sets the rail thickness.
	setThumbBrush	Sets the brush of the rail's thumb.
	setThumbPen	Sets the border pen of the rail's thumb.
	setValue	Sets the currently selected value.
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ComponentBase.writeExternal override. (Inherited from ContainerComponent.)

Protected Methods

	Name	Description
	fireOnBatchValueChanged	
	fireOnValueChanged	
	loadFromJson	Deserializes the component from a JsonObject. (Inherited from ContainerComponent.)
	loadFromXml	ComponentBase.loadFromXml override. (Inherited from ContainerComponent.)
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from

		ComponentBase.)
	saveToJson	Serializes the component into a JsonObject. (Inherited from ContainerComponent.)
	saveToXml	ComponentBase.saveToXml override. (Inherited from ContainerComponent.)
	serializeSubcomponents	ComponentBase.serializeSubcomponents override.

SliderType Enumeration

Specifies the type of a slider component.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java
`public enum SliderType`

Members

	Member name	Description
	Range	Indicates that the slider can be used to select range of values.
	SingleValue	Indicates that the slider can be used to select a single value.

SpinnerComponent Members

Represents a spin edit component.

The following tables list the members exposed by the SpinnerComponent type.

Public Constructors

	Name	Description
	SpinnerComponent	Initializes a new instance of the SpinnerComponent class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	accept	ComponentBase.accept override. (Inherited from ContentComponent.)
	addChild	Implements AddChild.addChild (Inherited from ContentComponent.)
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addSpinnerComponentListener	Registers an event listener.
	arrangeComponents	ComponentBase.arrangeComponents override. (Inherited from ContentComponent.)
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)

	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	For internal use. (Inherited from ComponentBase.)
	draw	ComponentBase.draw override. (Inherited from ContentComponent.)
	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
	getBackground	Gets the brush used to fill the background of the spinner.
	getBorder	Gets the pen used to draw the border of the spinner.
	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getButtonBrush	Gets the brush of the spinner's buttons.
	getButtonBrushHovered	Gets the background brush of the spinner's buttons when they are pointed with the mouse.
	getButtonBrushPressed	Gets the background brush of the spinner's buttons when they are pressed.
	getButtonContentColor	Gets the color of the content of the spinner's buttons.
	getButtonPen	Gets the border pen of the spinner's buttons.
	getButtonPenHovered	Gets the border pen of the spinner's buttons when they are pointed with the mouse.
	getButtonPenPressed	Gets the border pen of the spinner's buttons when they are pressed.
	getChildCount	ComponentBase.getChildCount override. (Inherited from ContentComponent.)
	getContent	Gets the content of this component. (Inherited from ContentComponent.)
	getCursor	Gets the cursor to display when the mouse is at the specified position. (Inherited from ComponentBase.)
	getDesiredSize	ComponentBase.getDesiredSize override. (Inherited from ContentComponent.)
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)
	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	getFont	Gets the font of the spinner's text.
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)

	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
	getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	getLargeStep	Gets the amount to add or subtract from the spinner value when the page up or page down keys are pressed while the spinner has focus.
	getMaximum	Gets the maximum value of the spinner.
	getMinimum	Gets the minimum value of the spinner.
	getName	Gets the name of the component. (Inherited from ComponentBase.)
	getPadding	Gets the padding around this component's content. (Inherited from ContentComponent.)
	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getSmallStep	Gets the amount to add or subtract from the spinner value when the adjustment buttons are clicked or when the up or down arrow keys are pressed while the spinner has focus.
	getTextColor	Gets the color of the spinner's text.
	getValue	Gets the value displayed in the spinner.
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)

	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	isSpinning	Gets a value indicating whether the spinner should revolve when the value passes beyond the Minimum or Maximum value.
	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	(Inherited from ComponentBase.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
	onKeyUp	(Inherited from ComponentBase.)
	onMouseMove	Overloaded. (Inherited from ComponentBase.)
	onMouseUp	Overloaded. (Inherited from ComponentBase.)
	onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	ContentComponent.readExternal override.
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeSpinnerComponentListener	Unregisters an event listener.
	setBackground	Sets the brush used to fill the background of the spinner.
	setBorder	Sets the pen used to draw the border of the spinner.
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setButtonBrush	Sets the brush of the spinner's buttons.
	setButtonBrushHovered	Sets the background brush of the spinner's buttons when they are pointed with the mouse.
	setButtonBrushPressed	Sets the background brush of the spinner's buttons when they are pressed.

setButtonContentColor	Sets the color of the content of the spinner's buttons.
setButtonPen	Sets the border pen of the spinner's buttons.
setButtonPenHovered	Sets the border pen of the spinner's buttons when they are pointed with the mouse.
setButtonPenPressed	Sets the border pen of the spinner's buttons when they are pressed.
setContent	Sets the content of this component. (Inherited from ContentComponent.)
setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
setFont	Sets the font of the spinner's text.
setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
setIsSpinning	Sets a value indicating whether the spinner should revolve when the value passes beyond the Minimum or Maximum value.
setLargeStep	Sets the amount to add or subtract from the spinner value when the page up or page down keys are pressed while the spinner has focus.
setMaximum	Sets the maximum value of the spinner.
setMinimum	Sets the minimum value of the spinner.
setName	Sets the name of the component. (Inherited from ComponentBase.)

	setPadding	Sets the padding around this component's content. (Inherited from ContentComponent.)
	setParent	For internal use. (Inherited from ComponentBase.)
	setSmallStep	Sets the amount to add or subtract from the spinner value when the adjustment buttons are clicked or when the up or down arrow keys are pressed while the spinner has focus.
	setTextColor	Sets the color of the spinner's text.
	setValue	Sets the value displayed in the spinner.
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ContentComponent.writeExternal override.

Protected Methods

	Name	Description
	getThickness	Gets the space around the component's content. This space includes padding by default but can be subsequently adjusted as necessary by the deriving classes. (Inherited from ContentComponent.)
	loadFromJson	Deserializes the component from a JsonObject.
	loadFromXml	ContentComponent.loadFromXml override.
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onMouseDown	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)
	onValidated	Raises the Validated event. (Inherited from ComponentBase.)

	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	Serializes the component into a JsonObject
	saveToXml	ContentComponent.saveToXml override.
	serializeSubcomponents	ComponentBase.serializeSubcomponents override.

SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent Constructor

Initializes a new instance of the SpinnerComponent class.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public SpinnerComponent ()
```

See Also

SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent Methods

SpinnerComponent.addSpinnerComponentListener Method

Registers an event listener.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void addSpinnerComponentListener (
    SpinnerComponentListener listener
)
```

Parameters

listener

An object implementing SpinnerComponentListener interface.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getBackground Method

Gets the brush used to fill the background of the spinner.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getBackground ()
```

Return Value

An instance of the Brush class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getBorder Method

Gets the pen used to draw the border of the spinner.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Pen getBorder ()
```

Return Value

An instance of the Pen class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getButtonBrush Method

Gets the brush of the spinner's buttons.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getButtonBrush ()
```

Return Value

An instance of the Brush class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getButtonBrushHovered Method

Gets the background brush of the spinner's buttons when they are pointed with the mouse.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getButtonBrushHovered ()
```

Return Value

An instance of the Brush class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getButtonBrushPressed Method

Gets the background brush of the spinner's buttons when they are pressed.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Brush getButtonBrushPressed ()
```

Return Value

An instance of the Brush class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getButtonContentColor Method

Gets the color of the content of the spinner's buttons.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Color getButtonContentColor ()
```

Return Value

An instance of the java.awt.Color class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getButtonPen Method

Gets the border pen of the spinner's buttons.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Pen getButtonPen ()
```

Return Value

An instance of the Pen class.

See Also

SpinnerComponent Members
SpinnerComponent Class

SpinnerComponent.getButtonPenHovered Method

Gets the border pen of the spinner's buttons when they are pointed with the mouse.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public Pen getButtonPenHovered ()
```

Return Value

An instance of the Pen class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getButtonPenPressed Method

Gets the border pen of the spinner's buttons when they are pressed.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public Pen getButtonPenPressed ()
```

Return Value

An instance of the Pen class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getFont Method

Gets the font of the spinner's text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public Font getFont ()
```

Return Value

An instance of the java.awt.Font class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getLargeStep Method

Gets the amount to add or subtract from the spinner value when the page up or page down keys are pressed while the spinner has focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public float getLargeStep ()
```

Return Value

A float value representing the large step.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getMaximum Method

Gets the maximum value of the spinner.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public float getMaximum ()
```

Return Value

The maximum spinner value.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getMinimum Method

Gets the minimum value of the spinner.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public float getMinimum ()
```

Return Value

The minimum spinner value.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getSmallStep Method

Gets the amount to add or subtract from the spinner value when the adjustment buttons are clicked or when the up or down arrow keys are pressed while the spinner has focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public float getSmallStep ()
```

Return Value

A float value representing the small step.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getTextColor Method

Gets the color of the spinner's text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public Color getTextColor ()
```

Return Value

An instance of the java.awt.Color class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.getValue Method

Gets the value displayed in the spinner.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public float getValue ()
```

Return Value

The current spinner value.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.isSpinning Method

Gets a value indicating whether the spinner should revolve when the value passes beyond the Minimum or Maximum value.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public boolean isSpinning ()
```

Return Value

true to let the value revolve to the other end of the range, or false otherwise.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.loadFromJson Method

Deserializes the component from a JsonObject.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the SpinnerComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.loadFromXml Method

ContentComponent.loadFromXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void loadFromXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.readExternal Method

ContentComponent.readExternal override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void readExternal (
    ObjectInput in
)
```

Parameters

in

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.removeSpinnerComponentListener Method

Unregisters an event listener.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void removeSpinnerComponentListener (
    SpinnerComponentListener listener
)
```

Parameters

listener
An object implementing SpinnerComponentListener interface.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.saveToJson Method

Serializes the component into a JsonObject

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Parameters

obj
An JsonObject containing the SpinnerComponent data

context
An JsonPersistContext object providing information about the serialization process and some helper methods.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.saveToXml Method

ContentComponent.saveToXml override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected void saveToXml (
    Element xmlElement,
    XmlPersistContext context
)
```

Parameters

xmlElement

context

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.serializeSubcomponents Method

ComponentBase.serializeSubcomponents override.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
protected boolean serializeSubcomponents ()
```

Return Value

Always returns false.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setBackground Method

Sets the brush used to fill the background of the spinner.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setBackground (
    Brush value
)
```

Parameters

value
An instance of the Brush class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setBorder Method

Sets the pen used to draw the border of the spinner.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public void setBorder (
    Pen value
)
```

Parameters

value
An instance of the Pen class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setButtonBrush Method

Sets the brush of the spinner's buttons.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public void setButtonBrush (
    Brush value
)
```

Parameters

value
An instance of the Brush class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setButtonBrushHovered Method

Sets the background brush of the spinner's buttons when they are pointed with the mouse.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setButtonBrushHovered (
    Brush value
)
```

Parameters

value
An instance of the Brush class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setButtonBrushPressed Method

Sets the background brush of the spinner's buttons when they are pressed.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setButtonBrushPressed (
    Brush value
)
```

Parameters

value
An instance of the Brush class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setButtonContentColor Method

Sets the color of the content of the spinner's buttons.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setButtonContentColor (
    Color value
)
```

Parameters

value
An instance of the java.awt.Color class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setButtonPen Method

Sets the border pen of the spinner's buttons.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setButtonPen (
    Pen value
)
```

Parameters

value
An instance of the Pen class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setButtonPenHovered Method

Sets the border pen of the spinner's buttons when they are pointed with the mouse.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setButtonPenHovered (
    Pen value
)
```

Parameters

value
An instance of the Pen class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setButtonPenPressed Method

Sets the border pen of the spinner's buttons when they are pressed.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setButtonPenPressed (
    Pen value
)
```

Parameters

value
An instance of the Pen class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setFont Method

Sets the font of the spinner's text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setFont (
    Font value
)
```

Parameters

value
An instance of the java.awt.Font class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setIsSpinning Method

Sets a value indicating whether the spinner should revolve when the value passes beyond the Minimum or Maximum value.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setIsSpinning (
    boolean value
)
```

Parameters

value
true to let the value revolve to the other end of the range, or false otherwise.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setLargeStep Method

Sets the amount to add or subtract from the spinner value when the page up or page down keys are pressed while the spinner has focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setLargeStep (
    float value
)
```

Parameters

value
A float value representing the large step.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setMaximum Method

Sets the maximum value of the spinner.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setMaximum (
    float value
)
```

Parameters

value
The maximum spinner value.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setMinimum Method

Sets the minimum value of the spinner.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setMinimum (
    float value
)
```

Parameters

value
The minimum spinner value.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setSmallStep Method

Sets the amount to add or subtract from the spinner value when the adjustment buttons are clicked or when the up or down arrow keys are pressed while the spinner has focus.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public void setSmallStep (
    float value
)
```

Parameters

value
A float value representing the small step.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setTextColor Method

Sets the color of the spinner's text.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

```
Java
public void setTextColor (
    Color value
)
```

Parameters

value
An instance of the java.awt.Color class.

See Also

SpinnerComponent Members
SpinnerComponent Class
com.mindfusion.diagramming.components Namespace

SpinnerComponent.setValue Method

Sets the value displayed in the spinner.

Namespace: com.mindfusion.diagramming.components
Package: com.mindfusion.diagramming.components

Syntax

Java

```
public void setValue (
    float value
)
```

Parameters

value

The current spinner value.

StackPanel Class

Represents a container which arranges its children either vertically or horizontally.

Syntax

```
Java
public class StackPanel extends ContainerComponent
```

Inheritance Hierarchy

java.lang.Object
  com.mindfusion.diagramming.components.ComponentBase
    com.mindfusion.diagramming.components.ContainerComponent
      com.mindfusion.diagramming.components.StackPanel

See Also

StackPanel Members
com.mindfusion.diagramming.components Namespace

StackPanel Members

Represents a container which arranges its children either vertically or horizontally.

The following tables list the members exposed by the StackPanel type.

Public Constructors

	Name	Description
	StackPanel	Initializes a new instance of the StackPanel class.

Protected Fields

	Name	Description
	eventListenerList	(Inherited from ComponentBase.)

Public Methods

	Name	Description
	accept	ComponentBase.accept override. (Inherited from ContainerComponent.)
	addChild	Implements AddChild.addChild. (Inherited from ContainerComponent.)
	addComponentEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentMouseEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	addComponentValidationEventListener	Adds the specified component listener to receive events from this component. (Inherited from ComponentBase.)
	arrangeComponents	ContainerComponent.arrangeComponents override.
	confirmValidating	Confirms validation by raising the Validating event. (Inherited from ComponentBase.)
	contains	Checks if the specified component is contained in the hierarchy defined by the current component. (Inherited from ComponentBase.)
	createOutlinePath	For internal use. (Inherited from ComponentBase.)
	draw	ComponentBase.draw override. (Inherited from ContainerComponent.)
	find	Returns the component with the specified name within the hierarchy defined by the current component. (Inherited from ComponentBase.)
	getBounds	Gets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	getChildCount	Gets the number of child components of this component. (Inherited from ContainerComponent.)
	getComponents	Gets the child components of this container. (Inherited from ContainerComponent.)
	getCursor	Gets the cursor to display when the mouse is at the specified position. (Inherited from ComponentBase.)
	getDesiredSize	ContainerComponent.getDesiredSize override.
	getDocumentBounds	For internal use. (Inherited from ComponentBase.)

	getFocusable	Gets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	getGridColumn	Gets the index of the grid column this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getGridRow	Gets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	getHeight	Gets the explicit height of this component. (Inherited from ComponentBase.)
	getHorizontalAlignment	Gets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getIsEnabled	Gets a value indicating whether the component is enabled. (Inherited from ComponentBase.)
	getIsFocused	Gets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	getIsHitTestVisible	Gets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	getIsInteractive	Gets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	getName	Gets the name of the component. (Inherited from ComponentBase.)
	getOrientation	Gets the orientation of the panel.
	getParent	Gets the parent component, if the current component is hosted. (Inherited from ComponentBase.)
	getParentHost	For internal use. (Inherited from ComponentBase.)
	getSpacing	Gets the distance between adjacent items in the panel.
	getVerticalAlignment	Gets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	getVisible	Gets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	getWidth	Gets the explicit width of this component. (Inherited from ComponentBase.)
	invalidate	Invalidates the visual appearance of the component. (Inherited from ComponentBase.)
	invalidateLayout	Invalidates the layout of this component and all its children. (Inherited from ComponentBase.)
	loadComponents	Overloaded. (Inherited from ContainerComponent.)

	onContextChanged	(Inherited from ComponentBase.)
	onKeyDown	(Inherited from ComponentBase.)
	onKeyPress	Called when a character key is pressed when this component has the input focus. (Inherited from ComponentBase.)
	onKeyUp	(Inherited from ComponentBase.)
	onMouseMove	Overloaded. (Inherited from ComponentBase.)
	onMouseUp	Overloaded. (Inherited from ComponentBase.)
	onUnitChanged	Invoked when the measure unit of the document containing the component has changed. (Inherited from ComponentBase.)
	raiseValidated	(Inherited from ComponentBase.)
	readExternal	ContainerComponent.readExternal override.
	removeComponentEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentMouseEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	removeComponentValidationEventListener	Removes the specified component listener to not receive events from this component. (Inherited from ComponentBase.)
	saveComponents	Overloaded. (Inherited from ContainerComponent.)
	setBounds	Sets the calculated bounds of this component relative to its parent. (Inherited from ComponentBase.)
	setFocusable	Sets a value indicating whether the component can receive the input focus. (Inherited from ComponentBase.)
	setGridColumn	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setGridRow	Sets the index of the grid row this component will be associated with when added to a GridPanel. (Inherited from ComponentBase.)
	setHeight	Sets the explicit height of this component. (Inherited from ComponentBase.)
	setHorizontalAlignment	Sets the horizontal alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setIsEnabled	Sets a value indicating whether the component is enabled. (Inherited from ComponentBase.)

	setIsFocused	Sets a value indicating whether this component currently holds the input focus. (Inherited from ComponentBase.)
	setIsHitTestVisible	Sets a value indicating whether this component and all its children are subject to hit-testing operations. (Inherited from ComponentBase.)
	setIsInteractive	Sets a value indicating whether this component can be interacted with. (Inherited from ComponentBase.)
	setName	Sets the name of the component. (Inherited from ComponentBase.)
	setOrientation	Sets the orientation of the panel.
	setParent	For internal use. (Inherited from ComponentBase.)
	setSpacing	Sets the distance between adjacent items in the panel.
	setVerticalAlignment	Sets the vertical alignment of this component relative to its parent. (Inherited from ComponentBase.)
	setVisible	Sets a value indicating whether the component is visible. (Inherited from ComponentBase.)
	setWidth	Sets the explicit width of this component. (Inherited from ComponentBase.)
	toDocument	Converts a point from local to document coordinates. (Inherited from ComponentBase.)
	toLocal	Converts a point from document to local coordinates. (Inherited from ComponentBase.)
	toParent	Converts a point from local coordinates to the specified parent's coordinates. (Inherited from ComponentBase.)
	writeExternal	ContainerComponent.writeExternal override.

Protected Methods

	Name	Description
	loadFromJson	Deserializes the component from a JsonObject.
	loadFromXml	ContainerComponent.loadFromXml override.
	onAddedToParent	Invoked when the component is added to a parent component. (Inherited from ComponentBase.)
	onGotFocus	Overloaded. (Inherited from ComponentBase.)
	onLostFocus	Overloaded. (Inherited from ComponentBase.)
	onMouseDown	Overloaded. (Inherited from ComponentBase.)
	onRemovedFromParent	Invoked when the component is removed from a parent component. (Inherited from ComponentBase.)

	onValidated	Raises the Validated event. (Inherited from ComponentBase.)
	onValidating	Raises the Validating event. (Inherited from ComponentBase.)
	onZoomChanged	Invoked when the zoom factor of the document containing the component has changed. (Inherited from ComponentBase.)
	saveToJson	Serializes the component into a JsonObject
	saveToXml	ContainerComponent.saveToXml override.
	serializeSubcomponents	Invoked to query whether the underlying component structure should be automatically serialized or serialized by the user. (Inherited from ComponentBase.)
