Rect (Number, Number, Number, Number)	Initializes a new instance of the Rect class.

See Also

Rect Class
MindFusion.Drawing Namespace

Rect Constructor (Number | Point, Number | Size, Number, Number)

Initializes a new instance of the Rect class.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function Rect (x, y, [width, [height]])
```

Parameters

x
Number | Point. The X-coordinate of the top left corner of the rectangle.

y
Number | Size. The Y-coordinate of the top left corner of the rectangle.

width
Optional.
Number. The width of the rectangle.

height
Optional.
Number. The height of the rectangle.

See Also

Rect Constructor Overload List
Rect Class
MindFusion.Drawing Namespace

Rect Constructor (Number, Number, Number, Number)

Initializes a new instance of the Rect class.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function Rect (x, y, width, height)
```

Parameters

x

The X-coordinate of the top left corner of the rectangle.

y
The Y-coordinate of the top left corner of the rectangle.

width
The width of the rectangle.

height
The height of the rectangle.

See Also

Rect Constructor Overload List
Rect Class
MindFusion.Drawing Namespace

Rect Methods

Rect.bottom Method

Gets the y-coordinate that is the sum of the y and height values of this Rect object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function bottom ()
```

Return Value

The y-coordinate that is the sum of y and height of this Rect.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.bottomLeft Method

Gets the bottom-left edge of this Rect object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function bottomLeft ()
```

Return Value

The bottom-left edge, which is a Point with x that is equal to x and with y that is the sum of y and height.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.bottomRight Method

Gets the bottom-right edge of this Rect object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript — Copy Code

```
function bottomRight ()
```

Return Value

The bottom-right edge, which is a Point with x that is the sum of x and width and with y that is the sum of y and height.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.center Method

Gets the center of this Rect object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript — Copy Code

```
function center ()
```

Return Value

The center, which is a Point with x that is the sum of x and half of width and with y that is the sum of y and half of height.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.clone Method

Creates a Rect object identical to the current object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript — Copy Code

```
function clone ()
```

Return Value

Rect. The newly created Rect object.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.contains Method

Determines if the rectangular region represented by *rect* is entirely contained within this Rect object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript — Copy Code

```
function contains (rect)
```

Parameters

rect
The Rect to test.

Return Value

true if the rectangular region represented by *rect* is entirely contained within this **Rect**; otherwise, **false**.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.containsPoint Method

Determines if the specified point is contained within this Rect object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript — Copy Code

```
function containsPoint (point)
```

Parameters

point
Point. The point to check.

Return Value

true if point is contained within the Rect; otherwise, **false**.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.equals Method

Specifies whether this Rect contains the same coordinates as the specified rectangle.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript — Copy Code

```
function equals (rect)
```

Parameters

rect
Rect. The Rect to test.

Return Value

Boolean. true if rect has the same coordinates as this Rect.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.fromLTRB Method

Creates a Rect object with the specified edge locations.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function fromLTRB (l, t, r, b)
```

Parameters

l
Number. The x-coordinate of the upper-left corner of this Rect.

t
Number. The y-coordinate of the upper-left corner of this Rect.

r
Number. The x-coordinate of the lower-right corner of this Rect.

b
Number. The y-coordinate of the lower-right corner of this Rect.

Return Value

Rect. A rectangle with the specified coordinates.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.intersect Method

Returns a Rect object representing the intersection of the current rectangle with the specified rectangle.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function intersect (rect)
```

Parameters

rect
Rect. The rectangle to intersect.

Return Value

A Rect object representing the intersection of the two rectangles.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.intersectsWith Method

Checks if this Rect intersects with the specified rect.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function intersectsWith (rect)
```

Parameters

rect
The other Rect.

Return Value

true if this **Rect** and the specified **Rect** intersect; otherwise, **false**.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.isEmpty Method

Gets a value indicating whether this Rect is empty.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function isEmpty ()
```

Return Value

true if both width and height are 0; otherwise, **false**.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.left Method

Gets the x-coordinate of the left edge of this Rect object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function left ()
```

Return Value

The x-coordinate of the left edge of this Rect object.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.right Method

Gets the x-coordinate that is the sum of x and width values of this Rect.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function right ()
```

Return Value

The x-coordinate that is the sum of x and width of this rectangle.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.setCenter Method

Sets the center of this Rect object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function setCenter (point)
```

Parameters

point
The center of this Rect.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.setLocation Method

Sets the top-left edge of this Rect object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function setLocation (point)
```

Parameters

point
The top-left edge of the Rect.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.top Method

Gets the y-coordinate of the top edge of this Rect object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function top ()
```

Return Value

Number. The y-coordinate of the top edge of this Rect object.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.topLeft Method

Gets the top-left edge of this Rect.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function topLeft ()
```

Return Value

The top-left edge of this Rect.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.topMiddle Method

Gets the top-middle of this Rect object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function topMiddle ()
```

Return Value

The top-middle coordinate, which is a Point with x that is the sum of x and half of width and with y equal to y.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.topRight Method

Gets the top-right edge of this Rect object.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function topRight ()
```

Return Value

The top-right edge, which is a Point with x that is the sum of x and width and with y equal to y.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.union Method

Returns a Rect object representing the union of the current rectangle with the specified rectangle.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
function union (rect)
```

Parameters

rect
Rect. The rectangle to union.

Return Value

A Rect object that bounds the union of the two rectangles.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect Properties

Rect.height Property

Gets or sets the height of the rectangle.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
get height() {}
set height(value) {}
```

Property Value

Number

The height of the rectangle.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.width Property

Gets or sets the width of the rectangle.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
get width() {}
set width(value) {}
```

Property Value

Number

The width of the rectangle.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.x Property

Gets or sets the x-coordinate of the upper-left corner of the rectangle.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
get x() {}
set x(value) {}
```

Property Value

Number

The x-coordinate of the upper-left corner of the rectangle.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Rect.y Property

Gets or sets the y-coordinate of the upper-left corner of the rectangle.

Namespace: MindFusion.Drawing
Assembly: Rect.js

Syntax

JavaScript Copy Code

```
get y() {}
set y(value) {}
```

Property Value

Number

The x-coordinate of the upper-left corner of the rectangle.

See Also

Rect Members
Rect Class
MindFusion.Drawing Namespace

Size Class

Represents the size of 2D object.

Syntax

JavaScript Copy Code

```
// class
Size.prototype = {}
```

Inheritance Hierarchy

MindFusion.Drawing.Size

See Also

Size Members
MindFusion.Drawing Namespace

Size Members

Represents the size of 2D object.

The following tables list the members exposed by the Size type.

Public Constructors

	Name	Description
	Size	Initializes a new instance of the **Size** class with the specified width and height.

Public Properties

	Name	Description
	height	Gets or sets the size height.
	width	Gets or sets the size width.

Public Methods

	Name	Description
	empty	Gets a value indicating whether this Size is empty.

See Also

Size Class
MindFusion.Drawing Namespace

Size Constructor

Initializes a new instance of the Size class with the specified width and height.

Namespace: MindFusion.Drawing
Assembly: Size.js

Syntax

JavaScript Copy Code

```
function Size (width, height)
```

Parameters

width
Number. Specifies width.

height
Number. Specifies height.

See Also

Size Class
MindFusion.Drawing Namespace

Size Methods

Size.empty Method

Gets a value indicating whether this Size is empty.

Namespace: MindFusion.Drawing
Assembly: Size.js

Syntax

JavaScript Copy Code

```
function empty ()
```

Return Value

Boolean. true if both width and height are 0; otherwise, false.

See Also

Size Members
Size Class
MindFusion.Drawing Namespace

Size Properties

Size.height Property

Gets or sets the size height.

Namespace: MindFusion.Drawing
Assembly: Size.js

Syntax

JavaScript Copy Code

```
get height() {}
set height(value) {}
```

Property Value

Number

The size height.

See Also

Size Members
Size Class
MindFusion.Drawing Namespace

Size.width Property

Gets or sets the size width.

Namespace: MindFusion.Drawing
Assembly: Size.js

Syntax

JavaScript Copy Code

```
get width() {}
set width(value) {}
```

Property Value

Number

The size width.

See Also

Size Members
Size Class
MindFusion.Drawing Namespace

StringAlignment Enumeration

Specifies the alignment of a text string relative to its layout rectangle.

Namespace: MindFusion.Drawing
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
StringAlignment = {}
```

Members

	Member name	Description
	Near	The text is drawn in the near corner of the layout rectangle.
	Center	The text is drawn in the center of the layout rectangle.
	Far	The text is drawn in the far corner of the layout rectangle.le.

See Also

MindFusion.Drawing Namespace

StringFormat Class

Encapsulates text layout information.

Syntax

JavaScript — Copy Code

```
// class
StringFormat.prototype = {}
```

Inheritance Hierarchy

MindFusion.Drawing.StringFormat

See Also

StringFormat Members
MindFusion.Drawing Namespace

StringFormat Members

Encapsulates text layout information.

The following tables list the members exposed by the StringFormat type.

Public Constructors

	Name	Description
	StringFormat	Initializes a new instance of the StringFormat class.

Public Properties

	Name	Description

	alignment	Gets or sets the horizontal alignment of the text.
	lineAlignment	Gets or sets the vertical alignment of the text.

See Also

StringFormat Class
MindFusion.Drawing Namespace

StringFormat Constructor

Initializes a new instance of the StringFormat class.

Namespace: MindFusion.Drawing
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
function StringFormat ()
```

See Also

StringFormat Class
MindFusion.Drawing Namespace

StringFormat Properties

StringFormat.alignment Property

Gets or sets the horizontal alignment of the text.

Namespace: MindFusion.Drawing
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
get alignment() {}
set alignment(value) {}
```

Property Value

StringAlignment

See Also

StringFormat Members
StringFormat Class
MindFusion.Drawing Namespace

StringFormat.lineAlignment Property

Gets or sets the vertical alignment of the text.

Namespace: MindFusion.Drawing
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
get lineAlignment() {}
set lineAlignment(value) {}
```

Property Value

StringAlignment

See Also

StringFormat Members
StringFormat Class
MindFusion.Drawing Namespace

Text Class

Represents a text container.

Syntax

JavaScript Copy Code

```
// class
Text.prototype = {}
```

Inheritance Hierarchy

MindFusion.Drawing.Text

See Also

Text Members
MindFusion.Drawing Namespace

Text Members

Represents a text container.

The following tables list the members exposed by the Text type.

Public Constructors

	Name	Description
	Text	Initializes a new instance of the **Text** class.

Public Fields

	Name	Description
	bounds	The object's bounds.

Public Properties

	Name	Description
	font	Gets or sets the font used to render text.
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)

	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	lineAlignment	Gets or sets the vertical alignment of this text.
	rotationAngle	Gets a value indicating the rotation of the text container.
	text	Gets or sets the text to render.
	textAlignment	Gets or sets the horizontal alignment of this text.
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

Public Methods

	Name	Description
	clone	Creates a **Text** object identical to the current object.
	getBounds	Gets a value indicating the bounding rectangle of the text container.
	setBounds	Sets a value indicating the bounding rectangle of the text container.

See Also

Text Class
MindFusion.Drawing Namespace

Text Fields

Text.bounds Field

The object's bounds.

Namespace: MindFusion.Drawing
Assembly: Text.js

Syntax

JavaScript Copy Code

```
var bounds
```

See Also

Text Members
Text Class
MindFusion.Drawing Namespace

Text Constructor

Initializes a new instance of the Text class.

Namespace: MindFusion.Drawing
Assembly: Text.js

Syntax

JavaScript Copy Code

```
function Text (text, bounds)
```

Parameters

text
String. The text to be displayed in the container.

bounds
Rect. The bounds of the container.

See Also

Text Class
MindFusion.Drawing Namespace

Text Methods

Text.clone Method

Creates a Text object identical to the current object.

Namespace: MindFusion.Drawing
Assembly: Text.js

Syntax

JavaScript Copy Code

```
function clone ()
```

Return Value

The newly created Text object.

See Also

Text Members
Text Class
MindFusion.Drawing Namespace

Text.getBounds Method

Gets a value indicating the bounding rectangle of the text container.

Namespace: MindFusion.Drawing
Assembly: Text.js

Syntax

JavaScript Copy Code

```
function getBounds ()
```

Return Value

Rect. The bounding rectangle.

See Also

Text Members
Text Class
MindFusion.Drawing Namespace

Text.setBounds Method

Sets a value indicating the bounding rectangle of the text container.

Namespace: MindFusion.Drawing
Assembly: Text.js

Syntax

JavaScript — Copy Code

```
function setBounds (bounds, [angle])
```

Parameters

bounds
Rect. The bounding rectangle.

angle
Optional.
Number. The rotation angle to be applied to the bounding rectangle.

See Also

Text Members
Text Class
MindFusion.Drawing Namespace

Text Properties

Text.font Property

Gets or sets the font used to render text.

Namespace: MindFusion.Drawing
Assembly: Text.js

Syntax

JavaScript — Copy Code

```
get font() {}
set font(value) {}
```

Property Value

Font

The Font of this text.

See Also

Text Members
Text Class
MindFusion.Drawing Namespace

Text.lineAlignment Property

Gets or sets the vertical alignment of this text.

Namespace: MindFusion.Drawing
Assembly: Text.js

Syntax

JavaScript — Copy Code

```
get lineAlignment() {}
set lineAlignment(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration.

See Also

Text Members
Text Class
MindFusion.Drawing Namespace

Text.rotationAngle Property

Gets a value indicating the rotation of the text container.

Namespace: MindFusion.Drawing
Assembly: Text.js

Syntax

JavaScript Copy Code

```
get rotationAngle() {}
set rotationAngle(value) {}
```

Property Value

Number

The angle.

See Also

Text Members
Text Class
MindFusion.Drawing Namespace

Text.text Property

Gets or sets the text to render.

Namespace: MindFusion.Drawing
Assembly: Text.js

Syntax

JavaScript Copy Code

```
get text() {}
set text(value) {}
```

Property Value

String

The text.

See Also

Text Members
Text Class
MindFusion.Drawing Namespace

Text.textAlignment Property

Gets or sets the horizontal alignment of this text.

Namespace: MindFusion.Drawing
Assembly: Text.js

Syntax

JavaScript Copy Code

```
get textAlignment() {}
set textAlignment(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration.

See Also

Text Members
Text Class
MindFusion.Drawing Namespace

Thickness Class

Describes the thickness of a rectangular frame.

Syntax

JavaScript Copy Code

```
// class
Thickness.prototype = {}
```

Inheritance Hierarchy

MindFusion.Drawing.Thickness

See Also

Thickness Members
MindFusion.Drawing Namespace

Thickness Members

Describes the thickness of a rectangular frame.

The following tables list the members exposed by the Thickness type.

Public Constructors

	Name	Description
	Thickness	Overloaded.

Public Properties

	Name	Description
	bottom	Gets or sets the width of the bottom side of the frame.
	isRelative	Gets or sets a flag indicating whether the thickness properties are expressed as relative or absolute quantities.

	left	Gets or sets the width of the left side of the frame.
	right	Gets or sets the width of the right side of the frame.
	top	Gets or sets the width of the top side of the frame.

Public Methods

	Name	Description
	addToRect	Applies the current thickness to the specified rectangle by inflating the rectangle.
	applyTo	Applies the current thickness to the specified rectangle by deflating the rectangle.
	toAbsolute	Converts the current thickness to absolute value relative to the specified size.

See Also

Thickness Class
MindFusion.Drawing Namespace

Thickness Constructor

Overload List

Name	Description
Thickness (Number, Number, Number, Number)	Initializes a new instance of the Thickness class with the specified widths.
Thickness (Number, Number, Number, Number, Boolean)	Initializes a new instance of the Thickness class with the specified widths.

See Also

Thickness Class
MindFusion.Drawing Namespace

Thickness Constructor (Number, Number, Number, Number)

Initializes a new instance of the Thickness class with the specified widths.

Namespace: MindFusion.Drawing
Assembly: Thickness.js

Syntax

JavaScript Copy Code

```
function Thickness (left, top, right, bottom)
```

Parameters

left
Specifies the width of the left side of the frame.

top
Specifies the width of the top side of the frame.

right
Specifies the width of the right side of the frame.

bottom
Specifies the width of the bottom side of the frame.

See Also

Thickness Constructor Overload List
Thickness Class
MindFusion.Drawing Namespace

Thickness Constructor (Number, Number, Number, Number, Boolean)

Initializes a new instance of the Thickness class with the specified widths.

Namespace: MindFusion.Drawing
Assembly: Thickness.js

Syntax

JavaScript Copy Code

```
function Thickness (left, [top, [right, [bottom, [isRelative]]]])
```

Parameters

left
Number. Specifies the width of the left side of the frame.

top
Optional.
Number. Specifies the width of the top side of the frame.

right
Optional.
Number. Specifies the width of the right side of the frame.

bottom
Optional.
Number. Specifies the width of the bottom side of the frame.

isRelative
Optional.
Boolean. A flag indicating whether the thickness properties are expressed as relative or absolute quantities.

See Also

Thickness Constructor Overload List
Thickness Class
MindFusion.Drawing Namespace

Thickness Methods

Thickness.addToRect Method

Applies the current thickness to the specified rectangle by inflating the rectangle.

Namespace: MindFusion.Drawing
Assembly: Thickness.js

Syntax

JavaScript Copy Code

```
function addToRect (rect)
```

Parameters

rect
Rect. The rectangle to inflate.

See Also

Thickness Members
Thickness Class
MindFusion.Drawing Namespace

Thickness.applyTo Method

Applies the current thickness to the specified rectangle by deflating the rectangle.

Namespace: MindFusion.Drawing
Assembly: Thickness.js

Syntax

JavaScript Copy Code

```
function applyTo (rect)
```

Parameters

rect
Rect. The rectangle to deflate.

See Also

Thickness Members
Thickness Class
MindFusion.Drawing Namespace

Thickness.toAbsolute Method

Converts the current thickness to absolute value relative to the specified size.

Namespace: MindFusion.Drawing
Assembly: Thickness.js

Syntax

JavaScript Copy Code

```
function toAbsolute ()
```

See Also

Thickness Members
Thickness Class
MindFusion.Drawing Namespace

Thickness Properties

Thickness.bottom Property

Gets or sets the width of the bottom side of the frame.

Namespace: MindFusion.Drawing
Assembly: Thickness.js

Syntax

JavaScript Copy Code

```
get bottom() {}
set bottom(value) {}
```

Property Value

Number

The width of the bottom side of the frame.

See Also

Thickness Members
Thickness Class
MindFusion.Drawing Namespace

Thickness.isRelative Property

Gets or sets a flag indicating whether the thickness properties are expressed as relative or absolute quantities.

Namespace: MindFusion.Drawing
Assembly: Thickness.js

Syntax

JavaScript Copy Code

```
get isRelative() {}
set isRelative(value) {}
```

Property Value

Boolean

true if the thickness is relative, or **false** otherwise.

See Also

Thickness Members
Thickness Class
MindFusion.Drawing Namespace

Thickness.left Property

Gets or sets the width of the left side of the frame.

Namespace: MindFusion.Drawing
Assembly: Thickness.js

Syntax

JavaScript Copy Code

```
get left() {}
set left(value) {}
```

Property Value

Number

The width of the left side of the frame.

See Also

Thickness Members
Thickness Class
MindFusion.Drawing Namespace

Thickness.right Property

Gets or sets the width of the right side of the frame.

Namespace: MindFusion.Drawing
Assembly: Thickness.js

Syntax

JavaScript Copy Code

```
get right() {}
set right(value) {}
```

Property Value

Number

The width of the right side of the frame.

See Also

Thickness Members
Thickness Class
MindFusion.Drawing Namespace

Thickness.top Property

Gets or sets the width of the top side of the frame.

Namespace: MindFusion.Drawing
Assembly: Thickness.js

Syntax

JavaScript Copy Code

```
get top() {}
set top(value) {}
```

Property Value

Number

The width of the top side of the frame.

Vector Class

Represents displacement in 2D space.

Syntax

JavaScript Copy Code

```
// class
Vector.prototype = {}
```

Inheritance Hierarchy

MindFusion.Drawing.Vector

See Also

Vector Members
MindFusion.Drawing Namespace

Vector Members

Represents displacement in 2D space.

The following tables list the members exposed by the Vector type.

Public Constructors

	Name	Description
	Vector	Initializes a new instance of the Vector class with the specified X and Y coordinates.

Public Fields

	Name	Description
	x	The x-coordinate of the vector.
	y	The y-coordinate of the vector.

See Also

Vector Class
MindFusion.Drawing Namespace

Vector Fields

Vector.x Field

The x-coordinate of the vector.

Namespace: MindFusion.Drawing
Assembly: Vector.js

Syntax

JavaScript Copy Code

```
var x
```

See Also

Vector Members
Vector Class
MindFusion.Drawing Namespace

Vector.y Field

The y-coordinate of the vector.

Namespace: MindFusion.Drawing
Assembly: Vector.js

Syntax

JavaScript Copy Code

```
var y
```

See Also

Vector Members
Vector Class
MindFusion.Drawing Namespace

Vector Constructor

Initializes a new instance of the Vector class with the specified X and Y coordinates.

Namespace: MindFusion.Drawing
Assembly: Vector.js

Syntax

JavaScript Copy Code

```
function Vector (x, y)
```

Parameters

x
Number. The X-coordinate of the Vector.

y
Number. The Y-coordinate of the Vector.

See Also

Vector Class
MindFusion.Drawing Namespace

Video Class

A component that displays video stream.

Syntax

JavaScript Copy Code

```
// class
Video.prototype = {}
```

Remarks

The video does not play automatically. To start playing it, call the component's play method in response to user input events.

If autoProperty is enabled for a **Video** component in CompositeNode template, the template loader creates getter and setter wrapping the component's MediaLocation property.

Example

The following template fragment adds a Video component to the node:

JavaScript Copy Code

```
{
    component: "Video",
    name: "Video",
    autoProperty: true,
    mediaLocation: "video.webm",
    margin: "1"
},
```

It automatically adds getVideo and setVideo methods to the node class, which can be used to get or set the video stream URL:

JavaScript Copy Code

```
var VideoNode = CompositeNode.classFromTemplate(
    "VideoNode", templateJson);
var node = new VideoNode();
node.setVideo("video2.webm");
diagram.addItem(node);
```

Inheritance Hierarchy

MindFusion.Drawing.ComponentBase
  MindFusion.Drawing.Video

Video Members
MindFusion.Drawing Namespace

Video Members

A component that displays video stream.

The following tables list the members exposed by the Video type.

Public Constructors

	Name	Description
	Video	Initializes a new instance of the Video class.

Public Fields

	Name	Description
	bounds	The object's bounds.

Public Properties

	Name	Description
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	mediaLocation	Gets or sets URL of the video stream displayed in this component.
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

Public Methods

	Name	Description
	clone	Creates a Video object identical to the current object.
	isPlaying	Detects if video is playing.
	pause	Pauses the video.

	play	Starts playing the video stream.

Video Properties

Video.mediaLocation Property

Gets or sets URL of the video stream displayed in this component.

Namespace: MindFusion.Drawing
Assembly: Video.js

Syntax

JavaScript Copy Code

```
get mediaLocation() {}
set mediaLocation(value) {}
```

Property Value

String

A URL string that identifies the video to play.

Video Class
MindFusion.Drawing Namespace

Visibility Enumeration

Specifies visibility for components.

Namespace: MindFusion.Drawing
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
Visibility = {}
```

Members

	Member name	Description
	Hidden	Specifies that the component is hidden, but the space it occupies in the layout is preserved.
	Collapsed	Specifies that the component is hidden, and the space it occupies in the layout is not preserved.
	Visible	Specifies that the component is visible.

See Also

MindFusion.Graphs Namespace

Anchoring Enumeration

Defines values that specify how automatic layout algorithms align links to anchor points.

Namespace: MindFusion.Graphs
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
Anchoring = {}
```

Members

	Member name	Description
	Ignore	Anchor points are ignored.
	Keep	Links are aligned to their original anchor points.
	Reassign	Links are aligned to new anchor points, depending on the positions of graph nodes after a layout is applied.
	Custom	Custom alignment logic.

Remarks

Members of this enumeration can be assigned to the anchoring property of layout classes.

See Also

MindFusion.Graphs Namespace

AssistantPosition Enumeration

Specifies the final position of an assistant node. Assistants with type left or right are always positioned to the left or right respectively. The position of the "normal" assistants depends on their index in the children list.

Namespace: MindFusion.Graphs
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
AssistantPosition = {}
```

Members

	Member name	Description
	Left	The node is distributed to the left of its parent.
	Right	The node is distributed to the right of its parent.

See Also

MindFusion.Graphs Namespace

AssistantType Enumeration

Indicates the type of an assistant node in a tree.

Namespace: MindFusion.Graphs
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
AssistantType = {}
```

Members

	Member name	Description
	Normal	The node is an assistant and its relative position is determinedautomatically by the layout.
	Left	The node is an assistant and it is always positioned to the left of its parent.
	Right	The node is an assistant and it is always positioned to the right of its parent.

Remarks

Members of this enumeration can be assigned to the **treeLayoutAssistant** key of node's layoutTraits.

See Also

MindFusion.Graphs Namespace

BorderedTreeLayout Class

Implements algorithms for arranging tree structures.

Syntax

JavaScript — Copy Code

```
// class
BorderedTreeLayout.prototype = {}
```

Remarks

To apply this layout to a diagram, create a **BorderedTreeLayout** instance, set its members and invoke the arrange method of the Diagram class. The method lays out all subtrees in a diagram.

As long as the graph is a tree, the algorithm can find the root node automatically. The distance between the root and the second level and between all subsequent levels can be set through the levelDistance property. The distance between adjacent nodes in the same level is set through nodeDistance.

In addition to arranging the tree nodes, **BorderedTreeLayout** also sets the shape of links as set through its linkType property.

Inheritance Hierarchy

MindFusion.Graphs.Layout
  MindFusion.Graphs.BorderedTreeLayout

See Also

BorderedTreeLayout Members

Implements algorithms for arranging tree structures.

The following tables list the members exposed by the BorderedTreeLayout type.

Public Constructors

	Name	Description
	BorderedTreeLayout	Initializes a new instance of the BorderedTreeLayout class.

Public Properties

	Name	Description
	anchoring	Gets or sets a value indicating how to align links to the anchor points of nodes.
	direction	Gets or sets the orientation of the arranged graph.
	keepGroupLayout	Gets or sets a value indicating whether to treat each group of nodes as a single vertex in the arranged graph.
	keepRootPosition	Gets or sets a value indicating whether to keep the root node at its original position.
	levelDistance	Gets or sets the space to leave between adjacent levels of the tree.
	linkType	Gets or sets the type of links in the arranged tree.
	margins	Gets or sets the margins' size around individual subgraphs processed by this layout object. (Inherited from Layout.)
	multipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.
	nodeDistance	Gets or sets the space to leave between adjacent nodes on the same level.
	reversedLinks	Gets or sets a value indicating the link direction that relates parent nodes to child nodes.

Public Methods

	Name	Description
	arrange	Applies the layout to the specified graph.

BorderedTreeLayout Methods

BorderedTreeLayout.arrange Method

Applies the layout to the specified graph.

Namespace: MindFusion.Graphs
Assembly: BorderedTreeLayout.js

Syntax

JavaScript Copy Code

```
function arrange (graph)
```

Parameters

graph
The Graph to arrange.

Remarks

This method is called internally by Diagram.arrange and ContainerNode.arrange.

BorderedTreeLayout.direction Property

Gets or sets the orientation of the arranged graph.

Namespace: MindFusion.Graphs
Assembly: BorderedTreeLayout.js

Syntax

JavaScript Copy Code

```
get direction() {}
set direction(value) {}
```

Property Value

LayoutDirection

A member of the LayoutDirection enumeration. The default value is **TopToBottom**.

See Also

BorderedTreeLayout Members
BorderedTreeLayout Class
MindFusion.Graphs Namespace

BorderedTreeLayout.keepGroupLayout Property

Gets or sets a value indicating whether to treat each group of nodes as a single vertex in the arranged graph.

Namespace: MindFusion.Graphs
Assembly: BorderedTreeLayout.js

Syntax

JavaScript Copy Code

```
get keepGroupLayout() {}
set keepGroupLayout(value) {}
```

Property Value

Boolean

true if each group of attached nodes should be treated as a single vertex in the arranged graph, or **false** otherwise.

See Also

BorderedTreeLayout Members
BorderedTreeLayout Class

BorderedTreeLayout.linkType Property

Gets or sets the type of links in the arranged tree.

Namespace: MindFusion.Graphs
Assembly: BorderedTreeLayout.js

Syntax

JavaScript Copy Code

```
get linkType() {}
set linkType(value) {}
```

Property Value

TreeLayoutLinkType

A member of the TreeLayoutLinkType enumeration. The default value is **Default**,

See Also

BorderedTreeLayout Members
BorderedTreeLayout Class
MindFusion.Graphs Namespace

BorderedTreeLayout.multipleGraphsPlacement Property

Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.

Namespace: MindFusion.Graphs
Assembly: BorderedTreeLayout.js

Syntax

JavaScript Copy Code

```
get multipleGraphsPlacement() {}
set multipleGraphsPlacement(value) {}
```

Property Value

MultipleGraphsPlacement

A member of the MultipleGraphsPlacement enumeration. The default value is **Horizontal**.

BorderedTreeLayout.reversedLinks Property

Gets or sets a value indicating the link direction that relates parent nodes to child nodes.

Namespace: MindFusion.Graphs
Assembly: BorderedTreeLayout.js

Syntax

JavaScript Copy Code

```
get reversedLinks() {}
set reversedLinks(value) {}
```

Property Value

Boolean

true to indicate reversed direction (links point to parent nodes), or **false** otherwise.

Edge Members
MindFusion.Graphs Namespace

Edge Members

Represents an edge connecting two vertices in a graph.

The following tables list the members exposed by the Edge type.

Public Constructors

	Name	Description
	Edge	Initializes a new instance of the **Edge** class.

Public Fields

	Name	Description
	destination	The destination vertex.
	origin	The origin vertex.

Public Methods

	Name	Description
	adjacentTo	Checks if the current edge is adjacent to the specified edge, that is, they have common vertex.
	changeDestination	Changes the destination of the current edge to the specified vertex.
	changeOrigin	Changes the origin of the current edge to the specified vertex.
	createReverseEdge	Creates a new edge similar to the current edge but with reversed direction.
	getCommonVertex	Returns a common vertex for the current edge and the specified edge.
	getEnds	Returns an array containing the origin and destination vertices of this edge.

	getOtherEnd	Returns the vertex connected by this edge that is not the specified vertex.
	incidentWith	Checks if the current edge is incident with the specified vertex.
	joins	Checks if the current edge connects the specified vertices.
	reverse	Reverses this edge.

Edge Constructor

Initializes a new instance of the Edge class.

Namespace: MindFusion.Graphs
Assembly: Edge.js

Syntax

JavaScript Copy Code

```
function Edge (origin, destination)
```

Parameters

origin
Vertex. The origin vertex.

destination
Vertex. The destination vertex.

See Also

Edge Class
MindFusion.Graphs Namespace

Edge Methods

Edge.adjacentTo Method

Checks if the current edge is adjacent to the specified edge, that is, they have common vertex.

Namespace: MindFusion.Graphs
Assembly: Edge.js

Syntax

JavaScript Copy Code

```
function adjacentTo (edge)
```

Parameters

edge
Edge. The edge to check.

Return Value

true if the current edge is adjacent to the specified edge; otherwise, **false**.

See Also

Edge Members
Edge Class
MindFusion.Graphs Namespace

Edge.changeDestination Method

Changes the destination of the current edge to the specified vertex.

Namespace: MindFusion.Graphs
Assembly: Edge.js

Syntax

JavaScript Copy Code

```
function changeDestination (vertex)
```

Parameters

vertex
Vertex. The new destination of the edge.

See Also

Edge Members
Edge Class
MindFusion.Graphs Namespace

Edge.changeOrigin Method

Changes the origin of the current edge to the specified vertex.

Namespace: MindFusion.Graphs
Assembly: Edge.js

Syntax

JavaScript Copy Code

```
function changeOrigin (vertex)
```

Parameters

vertex
Vertex. The new origin of the edge.

See Also

Edge Members
Edge Class
MindFusion.Graphs Namespace

Edge.createReverseEdge Method

Creates a new edge similar to the current edge but with reversed direction.

Namespace: MindFusion.Graphs
Assembly: Edge.js

Syntax

JavaScript Copy Code

```
function createReverseEdge ()
```

Return Value

See Also

Edge Members
Edge Class
MindFusion.Graphs Namespace

Edge.getCommonVertex Method

Returns a common vertex for the current edge and the specified edge.

Namespace: MindFusion.Graphs
Assembly: Edge.js

Syntax

JavaScript Copy Code

```
function getCommonVertex (edge)
```

Parameters

edge

Edge. The edge for which to find common vertex.

Return Value

The common vertex if it exists, otherwise **null**.

See Also

Edge Members
Edge Class
MindFusion.Graphs Namespace

Edge.getEnds Method

Returns an array containing the origin and destination vertices of this edge.

Namespace: MindFusion.Graphs
Assembly: Edge.js

Syntax

JavaScript Copy Code

```
function getEnds ()
```

Return Value

Array. An array containing the related vertices.

See Also

Edge Members
Edge Class
MindFusion.Graphs Namespace

Edge.getOtherEnd Method

Returns the vertex connected by this edge that is not the specified vertex.

Namespace: MindFusion.Graphs
Assembly: Edge.js

Syntax

JavaScript Copy Code

```
function getOtherEnd (vertex)
```

Parameters

vertex
Vertex. One of the vertices connected by this edge.

Return Value

Vertex. The other vertex connected by this edge.

See Also

Edge Members
Edge Class
MindFusion.Graphs Namespace

Edge.incidentWith Method

Checks if the current edge is incident with the specified vertex.

Namespace: MindFusion.Graphs
Assembly: Edge.js

Syntax

JavaScript Copy Code

```
function incidentWith (vertex)
```

Parameters

vertex
Vertex. The vertex to check.

Return Value

true if the edge is incident with the vertex; otherwise, **false**.

See Also

Edge Members
Edge Class
MindFusion.Graphs Namespace

Edge.joins Method

Checks if the current edge connects the specified vertices.

Namespace: MindFusion.Graphs
Assembly: Edge.js

Syntax

JavaScript Copy Code

```
function joins (v1, v2)
```

Parameters

v1
Vertex. The first vertex.

v2
Vertex. The second vertex.

Return Value

true if the current edge connects the specified vertices; otherwise, **false**.

See Also

Edge Members
Edge Class
MindFusion.Graphs Namespace

Edge.reverse Method

Reverses this edge.

Namespace: MindFusion.Graphs
Assembly: Edge.js

Syntax

JavaScript Copy Code

```
function reverse ()
```

See Also

FlowchartLayout Class

FlowchartLayout can be used to arrange flowcharts representing program source code.

Syntax

JavaScript Copy Code

```
// class
FlowchartLayout.prototype = {}
```

Remarks

The algorithm recognizes program code -like patterns in the graph, such as loops, sequences and if/switch branchings, and arranges them recursively. **FlowchartLayout** could be used to arrange other types of graphs as well, though with some restrictions. For example it treats all back links as loops in the code, and expects that they are nested - loop links starting closer to the stop node should end closer to the start node. Another similar restriction is that there shouldn't be any cross-links that connect different branches of a decision sub-graph.

Inheritance Hierarchy

MindFusion.Graphs.Layout

MindFusion.Graphs Namespace

FlowchartLayout Members

FlowchartLayout can be used to arrange flowcharts representing program source code.

The following tables list the members exposed by the **FlowchartLayout** type.

Public Constructors

	Name	Description
	FlowchartLayout	Initializes a new instance of the **FlowchartLayout** class.

Public Properties

	Name	Description
	anchoring	Gets or sets a value indicating how to align links to the anchor points of nodes.
	branchPadding	Gets or sets how much space to leave between adjacent decision branches in the flowchart.
	keepGroupLayout	Gets or sets a value indicating whether to treat each group of nodes as a single vertex in the arranged graph.
	linkPadding	Gets or sets how much space to leave between adjacent back links designating nested loops.
	margins	Gets or sets the margins' size around individual subgraphs processed by this layout object. (Inherited from Layout.)
	multipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.

	nodeDistance	Gets or sets the distance between consecutive nodes in the flowchart.
	orientation	Gets or sets the orientation of the arranged graph.

Public Methods

	Name	Description
	init	Returns a Builder object used to configure this **FlowchartLayout** instance.
S	With	Returns a Builder object used to configure and create new **FlowchartLayout** instances.

Graph.createEdge Method

Creates a new edge connecting the specified vertices and adds it to the graph.

Namespace: MindFusion.Graphs
Assembly: Graph.js

Syntax

JavaScript — Copy Code

```
function createEdge (origin, destination, [owner])
```

Parameters

origin

Vertex. The origin vertex.

destination
Vertex. The destination vertex.

owner
Optional.
Object. The owner of the new edge.

Return Value

Edge. The newly created edge.

See Also

Graph Members
Graph Class
MindFusion.Graphs Namespace

Graph.createVertex Method

Creates a new vertex with the specified position and size and adds it to the graph.

Namespace: MindFusion.Graphs
Assembly: Graph.js

Syntax

JavaScript Copy Code

```
function createVertex (layoutRect, [owner])
```

Parameters

layoutRect
Rect. A rectangle specifying the position and size of the vertex.

owner
Optional.
Object. The owner of the new vertex.

Return Value

Vertex. The newly created vertex.

Graph.getConnectedComponents Method

Returns a list with the connected subgraphs in the current graph.

Namespace: MindFusion.Graphs
Assembly: Graph.js

Syntax

JavaScript Copy Code

```
function getConnectedComponents ()
```

Return Value

An array with connected Graph objects.

See Also

Graph Members
Graph Class

Graph.getUpwardEmbedding Method

Should be called on a planar graph.

Namespace: MindFusion.Graphs
Assembly: Graph.js

Syntax

JavaScript Copy Code

```
function getUpwardEmbedding ([embedding, [embeddingInfo]])
```

Parameters

embedding
Optional.
Map. Receives the embedding lists.

embeddingInfo
Optional.
Map. Optional.

Return Value

Vertex. The t node in st ordering.

See Also

Graph Members
Graph Class
MindFusion.Graphs Namespace

Graph.makeAcyclic Method

Makes the graph acyclic by reversing the direction of selected edges.

Namespace: MindFusion.Graphs
Assembly: Graph.js

Syntax

JavaScript Copy Code

```
function makeAcyclic ()
```

Return Value

Array. A list with all edges that were reversed in order to make the graph acyclic.

Remarks

Must be called on a simple connected graph.

Graph.removeEdge Method

Removes an edge from the graph.

Namespace: MindFusion.Graphs
Assembly: Graph.js

Syntax

JavaScript — Copy Code

```
function removeEdge (edge)
```

Parameters

edge
Edge. The edge to remove.

Graph.tree Method (Vertex)

Returns a new graph object containing a subset of the vertices and edges of the original graph, such that the new graph is a tree.

Namespace: MindFusion.Graphs
Assembly: Graph.js

Syntax

JavaScript — Copy Code

```
function tree (root)
```

Parameters

root
The desired root vertex of the tree.

Return Value

The newly created tree.

Graph.tree Method (Vertex, Boolean, Boolean)

Returns a new graph object containing a subset of the vertices and edges of the original graph, such that the new graph is a tree.

Namespace: MindFusion.Graphs
Assembly: Graph.js

Syntax

JavaScript Copy Code

```
function tree (root, enableAssistants, compactAssistants)
```

Parameters

root
Vertex. The desired root vertex of the tree.

enableAssistants

compactAssistants

Return Value

Graph. The newly created tree.

See Also

tree Method Overload List

MindFusion.Graphs Namespace

GridLayout Class

Implements a grid graph layout algorithm.

Syntax

JavaScript Copy Code

```
// class
GridLayout.prototype = {}
```

Remarks

GridLayout arranges diagram nodes in a grid, keeping connected nodes close to each other. The algorithm strives to achieve a small number of link crossings. It is based on an iterative process whose initial steps shuffle the grid nodes randomly. That can lead to very different results each time the algorithm is run.

To apply the layout to a diagram, create a **GridLayout** instance, set its property values, and invoke the arrange method.

The distance between points in the layout grid can be changed through gridSize. Nodes to be placed at the upper-left and lower-right corners of the grid can be assigned to startNode and endNode.

Inheritance Hierarchy

MindFusion.Graphs.Layout
  MindFusion.Graphs.GridLayout

See Also

GridLayout Members
MindFusion.Graphs Namespace

GridLayout Members

Implements a grid graph layout algorithm.

The following tables list the members exposed by the GridLayout type.

Public Constructors

	Name	Description
	GridLayout	Initializes a new instance of the GridLayout class.

Public Properties

	Name	Description
	anchoring	Gets or sets how to align links to the anchor points of nodes. (Inherited from Layout.)
	endNode	Gets or sets the node that is placed at the lower right corner of the grid.
	gridSize	Gets or sets the desired distance between adjacent grid points.
	iterations	Gets or sets for how many iterations to run the grid layout algorithm.
	keepGroupLayout	Gets or sets whether to treat each group of attached nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	margins	Gets or sets the margins' size around individual subgraphs processed by this layout object. (Inherited from Layout.)
	multipleGraphsPlacement	Gets or sets how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	startNode	Gets or sets the node that is placed at the upper left corner of the grid.
	timeLimit	Gets or sets a time-out value for the path-finding part of the grid layout algorithm.
	useLongestPath	Gets or sets a value indicating whether the algorithm should arrange nodes around the longest path in the graph.

Public Methods

	Name	Description
	arrange	Applies the layout to the specified graph.

GridLayout Constructor

Initializes a new instance of the GridLayout class.

Namespace: MindFusion.Graphs
Assembly: GridLayout.js

Syntax

JavaScript Copy Code

```
function GridLayout ()
```

See Also

GridLayout Class
MindFusion.Graphs Namespace

GridLayout Methods

GridLayout.arrange Method

Applies the layout to the specified graph.

Namespace: MindFusion.Graphs
Assembly: GridLayout.js

Syntax

JavaScript — Copy Code

```
function arrange (graph)
```

Parameters

graph
Graph. The graph to arrange.

Remarks

This method is called internally by Diagram.arrange.

See Also

GridLayout Members
GridLayout Class
MindFusion.Graphs Namespace

GridLayout Properties

GridLayout.endNode Property

Gets or sets the node that is placed at the lower right corner of the grid.

Namespace: MindFusion.Graphs
Assembly: GridLayout.js

Syntax

JavaScript — Copy Code

```
get endNode() {}
set endNode(value) {}
```

Property Value

DiagramNode

An instance of the DiagramNode class. Default value is **null**.

Remarks

If you assign a node to this property, then startNode cannot be **null** and must be set too. GridLayout usually produces better layouts if both **startNode** and **endNode** are **null** references; in such a case the algorithm automatically selects suitable nodes.

See Also

GridLayout Members
GridLayout Class
MindFusion.Graphs Namespace

GridLayout.gridSize Property

Gets or sets the desired distance between adjacent grid points.

Namespace: MindFusion.Graphs
Assembly: GridLayout.js

Syntax

JavaScript Copy Code

```
get gridSize() {}
set gridSize(value) {}
```

Property Value

Number

A number specifying the grid size. The default is 25.

Remarks

When placing a node at a grid position, the node center point is aligned to the grid point at that position.

See Also

GridLayout Members
GridLayout Class
MindFusion.Graphs Namespace

GridLayout.iterations Property

Gets or sets for how many iterations to run the grid layout algorithm.

Namespace: MindFusion.Graphs
Assembly: GridLayout.js

Syntax

JavaScript Copy Code

```
get iterations() {}
set iterations(value) {}
```

Property Value

Number

An integer number specifying the number of iterations. The default is 3000.

Remarks

More iterations would yield better layouts but require more time to complete.

See Also

GridLayout Members
GridLayout Class
MindFusion.Graphs Namespace

GridLayout.startNode Property

Gets or sets the node that is placed at the upper left corner of the grid.

Namespace: MindFusion.Graphs
Assembly: GridLayout.js

Syntax

JavaScript Copy Code

```
get startNode() {}
set startNode(value) {}
```

Property Value

DiagramNode

An instance of the DiagramNode class. The default is **null**.

Remarks

If you assign a node to this property, then endNode cannot be **null** and must be set too. GridLayout usually produces better layouts if both **startNode** and **endNode** are **null** references; in such a case the algorithm automatically selects suitable nodes.

See Also

GridLayout Members
GridLayout Class
MindFusion.Graphs Namespace

GridLayout.timeLimit Property

Gets or sets a time-out value for the path-finding part of the grid layout algorithm.

Namespace: MindFusion.Graphs
Assembly: GridLayout.js

Syntax

JavaScript Copy Code

```
get timeLimit() {}
set timeLimit(value) {}
```

Property Value

Number

An integer value specifying time-out in milliseconds. The default is 10000 (10 seconds).

Remarks

The grid layout algorithm arranges graph nodes and links along the longest path in the graph. Large graphs with many links could contain hundreds of thousands of possible paths, so finding the longest one would be very time-consuming. When the time-out set with this property occurs, the path-finding routine stops and the layout algorithm uses the longest path known at that moment. Usually, for graphs containing several hundreds of nodes, 1-2 seconds are enough to find a path long enough to produce a nice layout.

See Also

GridLayout Members
GridLayout Class
MindFusion.Graphs Namespace
useLongestPath Property

GridLayout.useLongestPath Property

Gets or sets a value indicating whether the algorithm should arrange nodes around the longest path in the graph.

Namespace: MindFusion.Graphs
Assembly: GridLayout.js

Syntax

JavaScript Copy Code

```
get useLongestPath() {}
set useLongestPath(value) {}
```

Property Value

Boolean

true to look for the longest path in the graph and arrange nodes around it; otherwise, **false**.

Remarks

Initially, the algorithm places nodes and links from the longest path in the graph at the grid diagonal, and arranges the rest of the nodes around the diagonal. Large graphs with many links could contain hundreds of thousands of possible paths, so finding the longest one would be very time-consuming. Disabling this property will let you skip the path-finding part of the algorithm, which will make it work much faster.

GridLayout Members
GridLayout Class
MindFusion.Graphs Namespace
timeLimit Property

LayeredLayout Class

Implements a layered graph layout algorithm.

Syntax

JavaScript Copy Code

```
// class
LayeredLayout.prototype = {}
```

Remarks

This algorithm assigns diagram nodes to distinct horizontal or vertical layers. While arranging the layers, the layout routine seeks to meet the following criteria:

- connected nodes must be placed close together;
- links must flow in one direction if possible;
- links must cross as few layers as possible;
- links must not cross other links;

To apply this layout to a diagram, create a **LayeredLayout** instance, set its members and invoke the arrange method of the Diagram class. The method lays out all subgraphs in a diagram.

The final appearance of arranged graphs depends mostly on the direction value, which defines the overall orientation of the layout. The layerDistance and nodeDistance values specify how much space to leave between adjacent layers and adjacent nodes in a layer.

Example

The following example applies a **LayeredLayout** to a diagram:

JavaScript Copy Code

```
var layout = new MindFusion.Graphs.LayeredLayout();
layout.direction = MindFusion.Graphs.LayoutDirection.TopToBottom;
layout.siftingRounds = 3;
diagram.arrange(layout);
```

Inheritance Hierarchy

MindFusion.Graphs.Layout
  MindFusion.Graphs.LayeredLayout

LayeredLayout Members

Implements a layered graph layout algorithm.

The following tables list the members exposed by the LayeredLayout type.

Public Constructors

	Name	Description
	LayeredLayout	Initializes a new instance of the **LayeredLayout** class.

Public Properties

	Name	Description
	anchoring	Gets or sets a value indicating how to align links to the anchor points of nodes.
	direction	Gets or sets the orientation of the arranged graph.
	endNode	Gets or sets the node that should be placed in the last layer of the arranged graph.
	keepGroupLayout	Gets or sets a value indicating whether to treat each group of nodes as a single vertex in the arranged graph.
	layerDistance	Gets or sets the desired distance between layer axis lines.
	margins	Gets or sets the margins' size around individual subgraphs processed by this layout object. (Inherited from Layout.)
	multipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.
	nodeDistance	Gets or sets the space to leave between adjacent nodes on the same level.
	siftingRounds	Gets or sets how many times to perform pair-swapping iterations on each layer.
	startNode	Gets or sets the node that should be placed in the first layer of the arranged graph.

Public Methods

	Name	Description
	arrange	Applies the layout to the specified graph.

LayeredLayout.endNode Property

Gets or sets the node that should be placed in the last layer of the arranged graph.

Namespace: MindFusion.Graphs
Assembly: LayeredLayout.js

Syntax

JavaScript — Copy Code

```
get endNode() {}
set endNode(value) {}
```

Property Value

DiagramNode

A DiagramNode representing the end node.

Remarks

This value is honored only if startNode is specified too.

See Also

LayeredLayout Members
LayeredLayout Class

LayeredLayout.keepGroupLayout Property

Gets or sets a value indicating whether to treat each group of nodes as a single vertex in the arranged graph.

Namespace: MindFusion.Graphs
Assembly: LayeredLayout.js

Syntax

JavaScript — Copy Code

```
get keepGroupLayout() {}
set keepGroupLayout(value) {}
```

Property Value

Boolean

true if each group of attached nodes should be treated as a single vertex in the arranged graph, or **false** otherwise.

LayeredLayout.multipleGraphsPlacement Property

Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.

Namespace: MindFusion.Graphs
Assembly: LayeredLayout.js

Syntax

JavaScript Copy Code

```
get multipleGraphsPlacement() {}
set multipleGraphsPlacement(value) {}
```

Property Value

MultipleGraphsPlacement

A member of the MultipleGraphsPlacement enumeration. The default value is **Horizontal**.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Graphs Namespace

LayeredLayout.nodeDistance Property

Gets or sets the space to leave between adjacent nodes on the same level.

Namespace: MindFusion.Graphs
Assembly: LayeredLayout.js

Syntax

JavaScript Copy Code

```
get nodeDistance() {}
set nodeDistance(value) {}
```

Property Value

Number

The space to leave between adjacent nodes on the same level.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Graphs Namespace

LayeredLayout.siftingRounds Property

Gets or sets how many times to perform pair-swapping iterations on each layer.

Namespace: MindFusion.Graphs
Assembly: LayeredLayout.js

Syntax

JavaScript Copy Code

```
get siftingRounds() {}
set siftingRounds(value) {}
```

Property Value

Number

An integer value specifying how many pair-swapping iterations to perform. The default is 1.

Remarks

The algorithm swaps node pairs on each layer aiming to decrease the number of crossing links. Assigning a higher value to this property helps decrease the number of crossings, at the cost of longer execution times.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Graphs Namespace

LayeredLayout.startNode Property

Gets or sets the node that should be placed in the first layer of the arranged graph.

Namespace: MindFusion.Graphs
Assembly: LayeredLayout.js

Syntax

JavaScript Copy Code

```
get startNode() {}
set startNode(value) {}
```

Property Value

DiagramNode

A DiagramNode representing the start node.

Remarks

If there is no start node specified, the algorithm selects one automatically based on graph's topological order.

RadialTreeLayout Class

Implements a radial tree layout algorithm.

Syntax

JavaScript Copy Code

```
// class
RadialTreeLayout.prototype = {}
```

Remarks

This layout class arranges tree levels in concentric circles around the root. The levelDistance property specifies the distance between adjacent circles. The direction property specifies placement of first child node. Set stretchFactor to a value larger than 1 in order to stretch level circles into ellipses, providing more space for the layout when using wider nodes.

RadialTreeLayout Members

Implements a radial tree layout algorithm.

The following tables list the members exposed by the RadialTreeLayout type.

Public Constructors

	Name	Description
	RadialTreeLayout	Initializes a new instance of the RadialTreeLayout class.

Public Properties

	Name	Description
	anchoring	Gets or sets how to align links to the anchor points of nodes. (Inherited from Layout.)
	direction	Gets or sets the orientation of the arranged graph.
	keepGroupLayout	Gets or sets whether to treat each group of attached nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	keepRootPosition	Gets or sets a value indicating whether to keep the root node at its original position.
	levelDistance	Gets or sets the space to leave between adjacent levels of the tree.
	margins	Gets or sets the margins' size around individual subgraphs processed by this layout object. (Inherited from Layout.)
	multipleGraphsPlacement	Gets or sets how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	reversedLinks	Gets or sets a value indicating the link direction that relates parent nodes to child nodes.
	stretchFactor	Gets or sets the stretch factor in radial layouts.

Public Methods

	Name	Description
	arrange	Applies the layout to the specified graph.

RadialTreeLayout Properties

RadialTreeLayout.direction Property

Gets or sets the orientation of the arranged graph.

Namespace: MindFusion.Graphs
Assembly: RadialTreeLayout.js

Syntax

JavaScript Copy Code

```
get direction() {}
set direction(value) {}
```

Property Value

LayoutDirection

A member of the LayoutDirection enumeration.

Remarks

In radial layouts, the **direction** property specifies placement of first child node relatively to the root.

See Also

RadialTreeLayout Members
RadialTreeLayout Class
MindFusion.Graphs Namespace

RadialTreeLayout.keepRootPosition Property

Gets or sets a value indicating whether to keep the root node at its original position.

Namespace: MindFusion.Graphs
Assembly: RadialTreeLayout.js

Syntax

JavaScript Copy Code

```
get keepRootPosition() {}
set keepRootPosition(value) {}
```

Property Value

Boolean

true if the root node should be kept at its original position, or **false** otherwise.

See Also

RadialTreeLayout Members

RadialTreeLayout.levelDistance Property

Gets or sets the space to leave between adjacent levels of the tree.

Namespace: MindFusion.Graphs
Assembly: RadialTreeLayout.js

Syntax

JavaScript Copy Code

```
get levelDistance() {}
set levelDistance(value) {}
```

Property Value

Number

The space to leave between adjacent levels of the tree.

See Also

RadialTreeLayout Members
RadialTreeLayout Class
MindFusion.Graphs Namespace

RadialTreeLayout.reversedLinks Property

Gets or sets a value indicating the link direction that relates parent nodes to child nodes.

Namespace: MindFusion.Graphs
Assembly: RadialTreeLayout.js

Syntax

JavaScript Copy Code

```
get reversedLinks() {}
set reversedLinks(value) {}
```

Property Value

Boolean

true to indicate reversed direction (links point to parent nodes), or **false** otherwise.

See Also

RadialTreeLayout Members
RadialTreeLayout Class
MindFusion.Graphs Namespace

RadialTreeLayout.stretchFactor Property

Gets or sets the stretch factor in radial layouts.

Namespace: MindFusion.Graphs
Assembly: RadialTreeLayout.js

Syntax

JavaScript Copy Code

```
get stretchFactor() {}
set stretchFactor(value) {}
```

Property Value

Number

A stretch factor that lets you set ellipse eccentricity. The default value is 1.

Remarks

Set **stretchFactor** to a value larger than 1 in order to stretch level circles into ellipses, providing more space for the layout when using wider nodes.

RadialTreeLayout Class
MindFusion.Graphs Namespace

SpringLayout Class

Implements the Spring-Embedder graph layout algorithm.

Syntax

JavaScript Copy Code

```
// class
SpringLayout.prototype = {}
```

Remarks

To apply this layout to a diagram, create a **SpringLayout** instance, set its members and invoke the arrange method of the Diagram class. The method lays out all subgraphs in the diagram.

Spring-Embedder produces layouts having uniform distribution of nodes by simulating a physical system in which nodes repulse each other and the links between them act as confining springs. Nodes are moved around in an iterative process. The forces that act on a node are calculated, taking in account the positions of surrounding nodes and links from the previous iteration.

The final appearance of arranged graphs depends on the nodeDistance value that specifies how nodes are distributed by the layout routine. The layout routine runs as much iterations as set in iterations, calculating better node positions at each step.

Example

The following example applies a **SpringLayout** to a diagram:

JavaScript Copy Code

```
var layout = new MindFusion.Graphs.SpringLayout();
layout.iterations = 100;
diagram.arrange(layout);
```

SpringLayout Members

Implements the Spring-Embedder graph layout algorithm.

The following tables list the members exposed by the SpringLayout type.

Public Constructors

	Name	Description
	SpringLayout	Initializes a new instance of the **SpringLayout** class.

Public Properties

	Name	Description
	anchoring	Gets or sets a value indicating how to align links to the anchor points of nodes.
	iterations	Gets or sets the number of iterations to run the layout routine.
	keepGroupLayout	Gets or sets a value indicating whether to treat each group of nodes as a single vertex in the arranged graph.
	margins	Gets or sets the margins' size around individual subgraphs processed by this layout object. (Inherited from Layout.)
	multipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.
	nodeDistance	Gets or sets the desired distance between nodes.

Public Methods

	Name	Description
	arrange	Applies the layout to the specified graph.

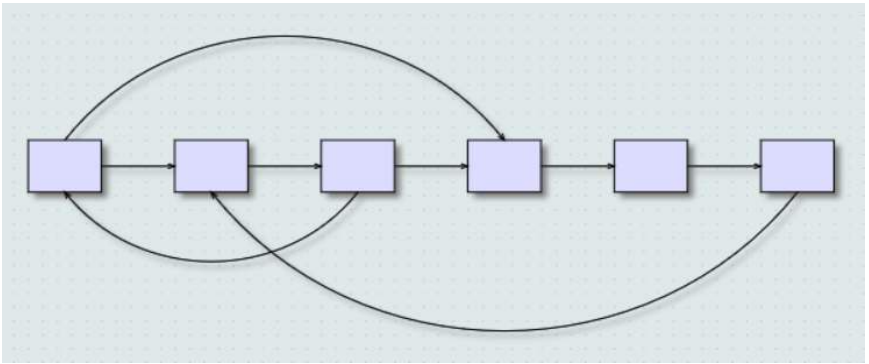
TopologicalLayout Class

Applies topological ordering to the graph. This layout makes it easy to discern graph features such as overall flow direction, cycles and nested cycles.

Syntax



JavaScript — Copy Code

```
// class
TopologicalLayout.prototype = {}
```

Remarks

Topological ordering of graph nodes is one where link's origin node is placed before link's destination. TopologicalLayout arranges nodes in a row or a column (depending on the value of the direction property) in such a way that there are no backward links when the graph is acyclic. If the graph contains cycles, the algorithms selects ordering with as few backward links as possible.

Links that connect non-adjacent nodes are rendered as arcs. Links connecting adjacent nodes can be rendered either as arcs or as straight lines, depending on the bendAdjacentLinks property. The amplitude of link arcs is proportional to the distance between respective connected nodes. All forward links are rendered at one side of the nodes and all back links are rendered at the opposite side. Thus, all bent links follow the same rotation direction.

Example

The following example applies TopologicalLayout to the diagram:

JavaScript — Copy Code

```
var layout = new MindFusion.Graphs.TopologicalLayout();
layout.direction = MindFusion.Graphs.LayoutDirection.LeftToRight;
```

```
diagram.arrange(layout);
diagram.resizeToFitItems();
```

TopologicalLayout Members
TopologicalLayout Class
MindFusion.Graphs Namespace

TreeLayout Class

Implements algorithms for arranging tree structures.

Syntax

JavaScript Copy Code

```
// class
TreeLayout.prototype = {}
```

Remarks

To apply this layout to a diagram, create a **TreeLayout** instance, set its members and invoke the arrange method of the Diagram class. The method lays out all subtrees in a diagram.

As long as the graph is a tree, the algorithm can find the root node automatically. The distance between the root and the second level and between all subsequent levels can be set through the levelDistance field. The distance between adjacent nodes in the same level is set through nodeDistance.

In addition to arranging the tree nodes, **TreeLayout** also sets the shape of links as set through its linkType property.

Example

The following example applies a **TreeLayout** to a diagram:

JavaScript Copy Code

```
var layout = new MindFusion.Graphs.TreeLayout();
layout.direction = MindFusion.Graphs.LayoutDirection.TopToBottom;
linkType = MindFusion.Graphs.TreeLayoutLinkType.Cascading;
diagram.arrange(layout);
```

Inheritance Hierarchy

MindFusion.Graphs.Layout
  MindFusion.Graphs.TreeLayout

TreeLayoutLinkType Enumeration

Specifies the shape of the diagram links after they are laid out.

Namespace: MindFusion.Graphs
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
TreeLayoutLinkType = {}
```

Members

	Member name	Description
	Default	Indicates that links will be arranged to point to the centers of the related nodes.
	Straight	Indicates that links will be attached to the middles of the adjoining node sides.
	Cascading	Indicates that links will be arranged as cascading and attached to the middles of the adjoining node sides.

Remarks

Members of this enumeration can be assigned to the linkType property of TreeLayout.

See Also

MindFusion.Graphs Namespace

TreeMapLayout Class

Performs tree-map layout on a graph.

Syntax

JavaScript Copy Code

```
// class
TreeMapLayout.prototype = {}
```

Remarks

Tree maps represent hierarchies by nesting child nodes within their parents, where the areas of leaf nodes are proportional to their Weight values. Unlike other layout algorithms, **TreeMapLayout** expects hierarchies to be defined via grouping or containment (see attachTo method and ContainerNode class), and will ignore any links in the diagram.

The diagram area covered by the topmost nodes in a hierarchy is specified via the layoutArea property. By default, the layout tries to keep the ratio of node sides as close as possible to one. However this could make it hard to distinguish separate levels of the hierarchy. To alleviate that, set squarify to **false**, and child nodes will be arranged either as a row or a column inside their parent node, alternating directions for each level. The drawback is that when weight ratios differ greatly or nodes contain many children, some nodes could end up with very narrow rectangles.

The padding size between parent nodes and their outermost children is specified via the containerPadding property. The padding size between child nodes is specified via padding.

Vertex Members
Vertex Class
MindFusion.Graphs Namespace

Vertex.degree Method

Returns the number of incident edges.

Namespace: MindFusion.Graphs
Assembly: Vertex.js

Syntax

JavaScript Copy Code

```
function degree ()
```

Return Value

Number. The number of incident edges.

See Also

Vertex Members
Vertex Class
MindFusion.Graphs Namespace

Vertex.getCommonEdge Method

Finds the edge connecting the current vertex with the specified vertex.

Namespace: MindFusion.Graphs
Assembly: Vertex.js

Syntax

JavaScript Copy Code

```
function getCommonEdge (vertex)
```

Parameters

vertex
Vertex. The vertex to find an edge for.

Return Value

The edge connecting the vertices or **null**.

See Also

Vertex Members
Vertex Class
MindFusion.Graphs Namespace

Vertex.getNeighbors Method

Returns an array containing all vertices adjacent to the current vertex.

Namespace: MindFusion.Graphs
Assembly: Vertex.js

Syntax

JavaScript Copy Code

```
function getNeighbors ()
```

Return Value

Array. A list with all neighbors.

See Also

Vertex Members
Vertex Class
MindFusion.Graphs Namespace

Vertex.incidentWith Method

Checks if the current vertex is incident with the specified edge.

Namespace: MindFusion.Graphs
Assembly: Vertex.js

Syntax

JavaScript Copy Code

```
function incidentWith (edge)
```

Parameters

edge
Edge. The edge to check.

Return Value

true if the vertex is incident with the edge; otherwise, **false**.

Server Side Reference

MindFusion.Diagramming Namespace

Action Enumeration

Defines values that identify the possible actions a user can carry out on diagram items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum Action
```

Visual Basic Copy Code

```
Public Enum Action
```

Members

	Member name	Description
	None	Do not perform any action.
	Create	Draw a new item.
	Modify	Modify an existing item.
	Split	Split a link's segment.

Remarks

Members of this enumeration are used as parameters of the InteractionState constructor.

AdjustmentHandle Members

Represents an adjustment handle used to move or modify diagram items.

The following tables list the members exposed by the AdjustmentHandle type.

Public Constructors

	Name	Description
	AdjustmentHandle	Initializes a new instance of the **AdjustmentHandle** class.

Public Methods

	Name	Description
	IsMoveHandle	Returns a value indicating whether this handle is used to move items.
	IsResizeHandle	Gets whether this adjustment handle resizes the item.
	IsRotationHandle	Gets whether this adjustment handle changes item's rotation angle.

AdjustmentHandle Constructor

Initializes a new instance of the AdjustmentHandle class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AdjustmentHandle ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

AdjustmentHandle Class
MindFusion.Diagramming Namespace

AdjustmentHandle Methods

AdjustmentHandle.IsMoveHandle Method

Returns a value indicating whether this handle is used to move items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool IsMoveHandle ()
```

Visual Basic Copy Code

```
Public Overridable Function IsMoveHandle () As Boolean
```

Return Value

true if this is a move handle, or **false** otherwise.

See Also

AdjustmentHandle Members
AdjustmentHandle Class
MindFusion.Diagramming Namespace

AdjustmentHandle.IsResizeHandle Method

Gets whether this adjustment handle resizes the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool IsResizeHandle ()
```

Visual Basic Copy Code

```
Public Overridable Function IsResizeHandle () As Boolean
```

Return Value

true if this handle resizes the item, or false otherwise.

AdjustmentHandle Members
AdjustmentHandle Class
MindFusion.Diagramming Namespace

AdjustmentHandle.IsRotationHandle Method

Gets whether this adjustment handle changes item's rotation angle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool IsRotationHandle ()
```

Visual Basic Copy Code

```
Public Overridable Function IsRotationHandle () As Boolean
```

Return Value

true if this handle rotates the item, or false otherwise.

See Also

AdjustmentHandles Enumeration

Identifies the distinct selection handles of a node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum AdjustmentHandles
```

Visual Basic Copy Code

```
Public Enum AdjustmentHandles
```

Members

	Member name	Description
	None	Specifies that none of the selection handles can be used to modify the node.
	ResizeTopLeft	The top-left handle is enabled and can be used to resize the node.
	ResizeTopRight	The top-right handle is enabled and can be used to resize the node.
	ResizeBottomRight	The bottom-right handle is enabled and can be used to resize the node.
	ResizeBottomLeft	The bottom-left handle is enabled and can be used to resize the node.

	ResizeTopCenter	The top-center handle is enabled and can be used to resize the node vertically.
	TopHandles	The top-left, top-center and top-right handles are enabled.
	ResizeMiddleRight	The middle-right handle is enabled and can be used to resize the node horizontally.
	RightHandles	The top-right, bottom-right and middle-right handles are enabled.
	ResizeBottomCenter	The bottom-center handle is enabled and can be used to resize the node vertically.
	BottomHandles	The bottom-left, bottom-center and bottom-right handles are enabled.
	ResizeMiddleLeft	The middle-left handle is enabled and can be used to resize the node horizontally.
	LeftHandles	The top-left, middle-left and bottom-left handles are enabled.
	Move	The center selection handle is enabled and can be used to move the node.
	Rotate	The rotation handle is enabled and can be used to rotate the node.
	All	All selection handles are enabled and can be used to modify the node.

Remarks

A combination of these flags can be assigned to the **EnabledHandles** property of nodes.

MindFusion.Diagramming Namespace

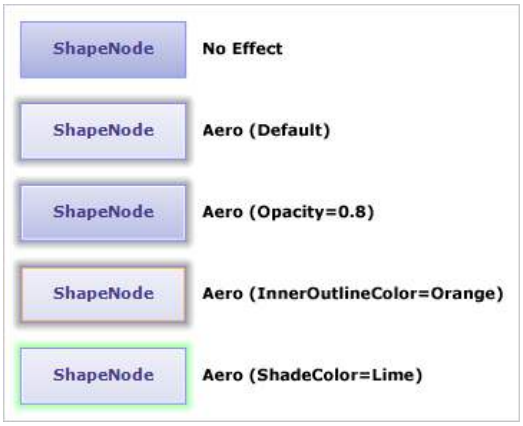
AeroEffect Class

Represents an effect that adds semitransparency to the node and emphasizes its outline by adding a shade and an inner stroke.

Syntax

C# Copy Code

```
public sealed class AeroEffect : NodeEffect
```



Visual Basic Copy Code

```
Public NotInheritable Class AeroEffect
    Inherits NodeEffect
```

Remarks

This effect can be applied to the nodes in a Diagram by adding an instance of this class to the NodeEffects collection.

The following image illustrates the Aero effect applied to a rectangular node as well as how the different properties affect the output:

Example

The following example demonstrates how to apply aero effect to the nodes of an existing diagram.

C# Copy Code

```
diagram.NodeEffects.Add(new AeroEffect());
```

Visual Basic Copy Code

```
diagram.NodeEffects.Add(New AeroEffect())
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.NodeEffect
    MindFusion.Diagramming.AeroEffect

AeroEffect Members

Represents an effect that adds semitransparency to the node and emphasizes its outline by adding a shade and an inner stroke.

The following tables list the members exposed by the AeroEffect type.

Public Constructors

	Name	Description
	AeroEffect	Initializes a new instance of the **AeroEffect** class.

Public Properties

	Name	Description
	InnerOutlineColor	Gets or sets the color of the inner outline.
	Opacity	Gets or sets the opacity to apply to the node's background.
	ShadeColor	Gets or sets the color of the shade.

Public Methods

	Name	Description
	Clone	NodeEffect.Clone override.

Public Events

	Name	Description
	PropertyChanged	INotifyPropertyChanged.PropertyChanged implementation. (Inherited from NodeEffect.)

AeroEffect Methods

AeroEffect.Clone Method

NodeEffect.Clone override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Object Clone ()
```

Visual Basic Copy Code

```
Public Overrides Function Clone () As Object
```

Return Value

The copy of this effect.

See Also

AeroEffect Members
AeroEffect Class
MindFusion.Diagramming Namespace

AeroEffect Properties

AeroEffect.InnerOutlineColor Property

Gets or sets the color of the inner outline.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Color InnerOutlineColor { get; set; }
```

Visual Basic Copy Code

```
Public Property InnerOutlineColor As Color
```

Property Value

A **Microsoft.Maui.Graphic.Color** instance. The default is **White**.

See Also

AeroEffect Members
AeroEffect Class

AeroEffect.Opacity Property

Gets or sets the opacity to apply to the node's background.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Opacity { get; set; }
```

Visual Basic Copy Code

```
Public Property Opacity As Double
```

Property Value

A **double** value.

Remarks

Opacity varies in the range [0..1] where 0 indicates full transparency and 1 indicates the original transparency. Opacity has no effect on image backgrounds.

Anchoring Enumeration

Defines values that specify how automatic layout algorithms align links to anchor points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum Anchoring
```

Visual Basic Copy Code

```
Public Enum Anchoring
```

Members

	Member name	Description
	Ignore	Anchor points are ignored.
	Keep	Links are aligned to their original anchor points.
	Reassign	Links are aligned to new anchor points, depending on the positions of graph nodes after a layout is applied.

Remarks

Assign values of this enumeration to the Anchoring property of layout algorithms. Most algorithms produce best results if they can place link ends at arbitrary positions over nodes' outlines, that is, when using the Ignore value. If your application logic requires links to be always attached to anchor points, use the other two values. In such cases Reassign would yield better results.

MindFusion.Diagramming Namespace
AnchorPattern Class
TreeLayout Class
GridLayout Class

LayeredLayout Class
SpringLayout Class

AnchorPattern Class

Represents a set of anchor points, which specify the exact locations where links are allowed to connect to nodes.

Syntax

C# Copy Code

```
public class AnchorPattern : ICloneable
```

Visual Basic Copy Code

```
Public Class AnchorPattern
    Implements ICloneable
```

Remarks

A pattern can be assigned as an integral entity to the AnchorPattern property of nodes. By default, when assigning a pattern to a node, a new copy of the pattern is created. Thus you can modify nodes' anchor patterns independently at runtime. However, if your anchor patterns won't change while the application executes, you can register them as shared to save storage space for the diagram. To do so, use AnchorPattern constructors that take a string id parameter. The **AnchorPattern** class exposes several predefined patterns as static properties; all of them are considered shared.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.AnchorPattern

MindFusion.Diagramming Namespace

AnchorPattern Members

Represents a set of anchor points, which specify the exact locations where links are allowed to connect to nodes.

The following tables list the members exposed by the AnchorPattern type.

Public Constructors

	Name	Description
	AnchorPattern	Overloaded. Initializes a new instance of the **AnchorPattern** class.

Public Properties

	Name	Description
	Decision1In3Out	Gets the predefined anchor pattern Decision1In3Out.
	Decision2In2Out	Gets the predefined anchor pattern Decision2In2Out.
	Id	Gets the **AnchorPattern** unique identifier.
	LeftInRightOut	Gets the predefined anchor pattern LeftInRightOut.
	Points	Gets a collection of the anchor points in this pattern.
	TopInBottomOut	Gets the predefined anchor pattern TopInBottomOut.

Public Methods

	Name	Description
	Clone	Creates an exact clone of this **AnchorPattern** object.
S	FromId	Returns a reference to the anchor pattern with the specified string identifier.
S	Register	Registers an anchor pattern as shared.

AnchorPattern Constructor ()

Initializes a new empty instance of the AnchorPattern class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPattern ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

AnchorPattern Constructor Overload List
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern Constructor (AnchorPoint[])

Initializes a new instance of the AnchorPattern class with the specified anchor points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPattern (
    AnchorPoint[] points
)
```

Visual Basic Copy Code

```
Public New ( _
    points() As AnchorPoint _
)
```

Parameters

points
Contains the initial set of AnchorPoint instances for the new pattern.

Example

The following code creates a decision node with two incoming anchors at the top and the left, and two outgoing at the bottom and the right vertices.

C# Copy Code

```
AnchorPattern decision2In2Out =
    new AnchorPattern(new AnchorPoint[] {
        new AnchorPoint(50, 0, true, false, MarkStyle.Circle, Color.Blue),
        new AnchorPoint(0, 50, true, false, MarkStyle.Circle, Color.Blue),
        new AnchorPoint(50, 100, false, true, MarkStyle.Rectangle, Color.Green),
        new AnchorPoint(100, 50, false, true, MarkStyle.Rectangle, Color.Red)
    });

ShapeNode decisionNode = diagram.Factory.CreateShapeNode(10, 10, 50, 35);
decisionNode.AnchorPattern = decision2In2Out;
```

Visual Basic Copy Code

```
Dim decision2In2Out As AnchorPattern = _
    New AnchorPattern(New AnchorPoint() { _
        New AnchorPoint(50, 0, True, False, MarkStyle.Circle, Color.Blue), _
        New AnchorPoint(0, 50, True, False, MarkStyle.Circle, Color.Blue), _
        New AnchorPoint(50, 100, False, True, MarkStyle.Rectangle, Color.Green), _
        New AnchorPoint(100, 50, False, True, MarkStyle.Rectangle, Color.Red) _
    })

Dim decisionNode As ShapeNode = Diagram.Factory.CreateShapeNode(10, 10, 50, 35)
decisionNode.AnchorPattern = decision2In2Out
```

AnchorPattern Constructor (AnchorPoint[], String)

Initializes a new instance of the AnchorPattern class with the specified anchor points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPattern (
    AnchorPoint[] points,
    string id
)
```

Visual Basic Copy Code

```
Public New ( _
    points() As AnchorPoint, _
    id As String _
)
```

Parameters

points

Contains the initial set of AnchorPoint instances for the new pattern.

id

An unique identifier for this anchor pattern.

See Also

MindFusion.Diagramming Namespace

AnchorPattern Constructor (AnchorPointCollection)

Initializes a new instance of the AnchorPattern class with the specified anchor points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPattern (
    AnchorPointCollection points
)
```

Visual Basic Copy Code

```
Public New ( _
    points As AnchorPointCollection _
)
```

Parameters

points

A collection of AnchorPoint objects.

See Also

AnchorPattern Constructor Overload List
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern Constructor (AnchorPointCollection, String)

Initializes a new instance of the AnchorPattern class with the specified anchor points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPattern (
    AnchorPointCollection points,
    string id
)
```

Visual Basic Copy Code

```
Public New ( _
    points As AnchorPointCollection, _
    id As String _
)
```

Parameters

points

A collection of AnchorPoint objects.

id

An unique identifier for this anchor pattern.

See Also

AnchorPattern Constructor Overload List
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern Constructor (String)

Initializes a new empty instance of the AnchorPattern class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPattern (
    string id
)
```

Visual Basic Copy Code

```
Public New ( _
    id As String _
)
```

Parameters

id

An unique identifier for this anchor pattern.

See Also

AnchorPattern Constructor Overload List
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern Methods

AnchorPattern.Clone Method

Creates an exact clone of this AnchorPattern object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Clone ()
```

Visual Basic Copy Code

```
Public Function Clone () As Object
```

Return Value

An instance of the AnchorPattern class.

See Also

AnchorPattern Members
AnchorPattern Class

AnchorPattern.FromId Method

Returns a reference to the anchor pattern with the specified string identifier.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static AnchorPattern FromId (
    string id
)
```

Visual Basic Copy Code

```
Public Shared Function FromId( _
    id As String _
) As AnchorPattern
```

Parameters

id

A string identifying an AnchorPattern instance.

Return Value

The **AnchorPattern** object whose Id is equal to the id parameter, or **null** (**Nothing** in Visual Basic) if no such object exists.

Remarks

The *id* argument should match an identifier passed to the constructor of an existing AnchorPattern object.

Shapes Property

AnchorPattern.Register Method

Registers an anchor pattern as shared.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static void Register (
    AnchorPattern pattern
)
```

Visual Basic Copy Code

```
Public Shared Sub Register( _
    pattern As AnchorPattern _
)
```

Parameters

pattern
The AnchorPattern to register.

Remarks

This method is obsolete. Please use the Id property to create shared anchor patterns.

AnchorPattern Properties

AnchorPattern.Decision1In3Out Property

Gets the predefined anchor pattern **Decision1In3Out**.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static AnchorPattern Decision1In3Out { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Decision1In3Out As AnchorPattern
```

Property Value

An instance of the AnchorPattern class.

Remarks

Incoming links connect to the top vertex; outgoing links can start from the other vertices.

See Also

AnchorPattern Members
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern.Decision2In2Out Property

Gets the predefined anchor pattern **Decision2In2Out**.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static AnchorPattern Decision2In2Out { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Decision2In2Out As AnchorPattern
```

Property Value

An instance of the AnchorPattern class.

Remarks

Incoming links can connect with the top and left vertices; outgoing links can start from the right and bottom vertices.

See Also

AnchorPattern Members
AnchorPattern Class

AnchorPattern.Id Property

Gets the AnchorPattern unique identifier.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Id { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Id As String
```

Property Value

The string id that was passed as an argument to the AnchorPattern constructor. The default is an empty string.

See Also

AnchorPattern Members
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern.LeftInRightOut Property

Gets the predefined anchor pattern **LeftInRightOut**.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static AnchorPattern LeftInRightOut { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property LeftInRightOut As AnchorPattern
```

Property Value

An instance of the AnchorPattern class.

Remarks

The middle point of a node's bounding rectangle left side is anchor for incoming links; that on the right side - for outgoing.

See Also

AnchorPattern Members
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern.Points Property

Gets a collection of the anchor points in this pattern.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPointCollection Points { get; set; }
```

Visual Basic Copy Code

```
Public Property Points As AnchorPointCollection
```

Property Value

The string id that was passed as an argument to the AnchorPattern constructor. The default is an empty string.

Remarks

To find an anchor pattern by its id, call the static FromId method.

See Also

AnchorPattern Members
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern.TopInBottomOut Property

Gets the predefined anchor pattern **TopInBottomOut**.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static AnchorPattern TopInBottomOut { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property TopInBottomOut As AnchorPattern
```

Property Value

An instance of the AnchorPattern class.

Remarks

The middle point of a node's bounding rectangle top side is anchor for incoming links; that on the bottom - for outgoing.

See Also

AnchorPattern Members
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPoint Class

Specify the locations in a node, to which the user is allowed to connect links.

Syntax

C# Copy Code

```
public class AnchorPoint : ICloneable
```

Visual Basic Copy Code

```
Public Class AnchorPoint
    Implements ICloneable
```

Remarks

An anchor point can accept incoming or outgoing links, or both, as specified by the AllowIncoming and AllowOutgoing properties. The position of the anchor point inside a node's bounding rectangle is set through the X and Y properties, expressed as percentage of the rectangle width and height.

How anchor points are marked on the display can be set using MarkStyle and Color properties. Custom painting can be done by setting **MarkStyle** to Custom and handling the DrawAnchorPoint event.

Inheritance Hierarchy

System.Object
MindFusion.Diagramming.AnchorPoint

AnchorPoint Members
MindFusion.Diagramming Namespace

AnchorPoint Members

Specify the locations in a node, to which the user is allowed to connect links.

The following tables list the members exposed by the AnchorPoint type.

Public Constructors

	Name	Description

	AnchorPoint	Overloaded. The following constructors are provided for creating new **AnchorPoint** objects.

Public Properties

	Name	Description
	AllowIncoming	Gets or sets a value indicating whether incoming links can be connected to this anchor.
	AllowOutgoing	Gets or sets a value indicating whether the anchor point accepts outgoing connections.
	Color	Gets or sets the color of the anchor point mark.
	Column	Gets or sets the column index of a cell with which the anchor point is associated.
	MarkStyle	Gets or sets the appearance of the anchor point mark.
	Tag	Gets or sets a user-defined data associated with the anchor point.
	ToolTip	Gets or sets a tooltip text that should be displayed when the mouse hovers over an anchor point mark.
	X	Gets or sets the horizontal position of the anchor point expressed as percentage of a node's width.
	XUnit	Gets or sets whether the point's X position is specified as percentage of node's size or fixed offset from the node's left side.
	Y	Gets or sets the vertical position of the anchor point expressed as percentage of a node's height.
	YUnit	Gets or sets whether the point's Y position is specified as percentage of node's size or fixed offset from the node's top side.

Public Methods

	Name	Description
	Clone	Creates an exact clone of this **AnchorPoint** object.

Protected Methods

	Name	Description
	Draw	Renders the anchor point.
	LoadFromJson	Deserializes the anchor point from JSON format.
	LoadFromXml	Deserializes the anchor point from XML format.
	SaveToJson	Serializes the anchor point in JSON format.
	SaveToXml	Serializes the anchor point in XML format.

AnchorPoint Constructor (Double, Double)

Initializes a new instance of the AnchorPoint class with the specified coordinates.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPoint (
    double x,
    double y
)
```

Visual Basic

```
Public New ( _
    x As Double, _
    y As Double _
)
```

Parameters

x
The horizontal position of the anchor expressed as percentage of the width of a node.

y
The vertical position of the anchor expressed as percentage of the height of a node.

AnchorPoint Constructor Overload List
AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint Constructor (Double, Double, Boolean, Boolean)

Initializes a new instance of the AnchorPoint class with the specified coordinates and restrictions.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public AnchorPoint (
    double x,
    double y,
    bool allowIncoming,
    bool allowOutgoing
)
```

Visual Basic

```
Public New ( _
    x As Double, _
    y As Double, _
    allowIncoming As Boolean, _
    allowOutgoing As Boolean _
)
```

Parameters

x
The horizontal position of the anchor expressed as percentage of the width of a node.

y
The vertical position of the anchor expressed as percentage of the height of a node.

allowIncoming
Specifies whether incoming links can connect to this anchor.

allowOutgoing
Specifies whether outgoing links can connect to this anchor.

See Also

AnchorPoint Constructor Overload List
AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint Constructor (Double, Double, Boolean, Boolean, Color, Int32)

Initializes a new instance of the AnchorPoint class with the specified coordinates, restrictions and color.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPoint (
    double x,
    double y,
    bool allowIncoming,
    bool allowOutgoing,
    Color color,
    int col
)
```

Visual Basic Copy Code

```
Public New ( _
    x As Double, _
    y As Double, _
    allowIncoming As Boolean, _
    allowOutgoing As Boolean, _
    color As Color, _
    col As Integer _
)
```

Parameters

x
The horizontal position of the anchor expressed as percentage of the width of a node.

y
The vertical position of the anchor expressed as percentage of the height of a node.

allowIncoming
Specifies whether incoming links can connect to this anchor.

allowOutgoing
Specifies whether outgoing links can connect to this anchor.

color
The color with which the anchor mark is painted.

col
Specifies a table's column, with which an anchor point is associated.

MindFusion.Diagramming Namespace

AnchorPoint Constructor (Double, Double, Boolean, Boolean, Color, Int32, Object)

Initializes a new instance of the AnchorPoint class with the specified coordinates, restrictions, color and tag.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPoint (
    double x,
    double y,
    bool allowIncoming,
    bool allowOutgoing,
    Color color,
    int col,
    Object tag
)
```

Visual Basic Copy Code

```
Public New ( _
    x As Double, _
    y As Double, _
    allowIncoming As Boolean, _
    allowOutgoing As Boolean, _
    color As Color, _
    col As Integer, _
    tag As Object _
)
```

Parameters

x
The horizontal position of the anchor expressed as percentage of the width of a node.

y
The vertical position of the anchor expressed as percentage of the height of a node.

allowIncoming
Specifies whether incoming links can connect to this anchor.

allowOutgoing
Specifies whether outgoing links can connect to this anchor.

color
The color with which the anchor mark is painted.

col
The table's column, with which an anchor point is associated.

tag
User-defined data associated with the anchor point.

AnchorPoint Constructor (Double, Double, Boolean, Boolean, MarkStyle)

Initializes a new instance of the AnchorPoint class with the specified coordinates, restrictions and style.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPoint (
    double x,
    double y,
    bool allowIncoming,
    bool allowOutgoing,
    MarkStyle markStyle
)
```

Visual Basic Copy Code

```
Public New ( _
    x As Double, _
    y As Double, _
    allowIncoming As Boolean, _
    allowOutgoing As Boolean, _
    markStyle As MarkStyle _
)
```

Parameters

x
The horizontal position of the anchor expressed as percentage of the width of a node.

y
The vertical position of the anchor expressed as percentage of the height of a node.

allowIncoming
Specifies whether incoming links can connect to this anchor.

allowOutgoing
Specifies whether outgoing links can connect to this anchor.

markStyle
Defines how the anchor point is marked visually.

AnchorPoint Constructor (Double, Double, Boolean, Boolean, MarkStyle, Color)

Initializes a new instance of the AnchorPoint class with the specified coordinates, restrictions, style and color.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPoint (
    double x,
    double y,
    bool allowIncoming,
    bool allowOutgoing,
    MarkStyle markStyle,
    Color color
)
```

Visual Basic Copy Code

```
Public New ( _
    x As Double, _
    y As Double, _
    allowIncoming As Boolean, _
    allowOutgoing As Boolean, _
    markStyle As MarkStyle, _
    color As Color _
)
```

Parameters

x
The horizontal position of the anchor expressed as percentage of the width of a node.

y
The vertical position of the anchor expressed as percentage of the height of a node.

allowIncoming
Specifies whether incoming links can connect to this anchor.

allowOutgoing
Specifies whether outgoing links can connect to this anchor.
markStyle
Defines how the anchor point is marked visually.
color
The color with which the anchor mark is painted.

AnchorPoint Methods

AnchorPoint.Clone Method

Creates an exact clone of this AnchorPoint object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Object Clone ()
```

Visual Basic Copy Code

```
Public Overridable Function Clone () As Object
```

Return Value

An instance of the AnchorPoint class.

See Also

AnchorPoint Members
AnchorPoint Class

AnchorPoint.Draw Method

Renders the anchor point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void Draw (
    IGraphics graphics,
    Rect nodeRect,
    double angle,
    Point pivot,
    DrawAnchorPointEventArgs customDrawArgs,
    double markSize
)
```

Visual Basic Copy Code

```
Protected Overridable Sub Draw( _
    graphics As IGraphics, _
    nodeRect As Rect, _
    angle As Double, _
    pivot As Point, _
    customDrawArgs As DrawAnchorPointEventArgs, _
    markSize As Double _
)
```

Parameters

graphics

nodeRect

angle

pivot

customDrawArgs

markSize

AnchorPoint.LoadFromJson Method

Deserializes the anchor point from JSON format.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject instance containing the data to load.

context
A JsonPersistContext instance providing contextual information about the serialization process and helper serialization methods.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint.LoadFromXml Method

Deserializes the anchor point from XML format.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

context

AnchorPoint.SaveToJson Method

Serializes the anchor point in JSON format.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

AnchorPoint.SaveToXml Method

Serializes the anchor point in XML format.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

context

AnchorPoint Properties

AnchorPoint.AllowIncoming Property

Gets or sets a value indicating whether incoming links can be connected to this anchor.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowIncoming { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowIncoming As Boolean
```

Property Value

true to allow incoming links connect to the anchor; **false** to forbid that. The default is **true**.

Remarks

If no incoming anchors are defined for a node, links end points can be placed anywhere inside that node, unless AllowUnanchoredLinks is disabled.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace

AllowOutgoing Property
ValidateAnchorPoint Event

AnchorPoint.AllowOutgoing Property

Gets or sets a value indicating whether the anchor point accepts outgoing connections.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowOutgoing { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowOutgoing As Boolean
```

Property Value

true to allow outgoing links connect to the anchor; **false** to forbid that. The default is **true**.

Remarks

If no outgoing anchors are defined for a node, links start points can be placed anywhere inside that node, unless AllowUnanchoredLinks is disabled.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace
AllowIncoming Property
ValidateAnchorPoint Event

AnchorPoint.Color Property

Gets or sets the color of the anchor point mark.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Color Color { get; set; }
```

Visual Basic Copy Code

```
Public Property Color As Color
```

Property Value

A **Microsoft.Maui.Graphics.Color** instance. The default is **Color.Black**.

Remarks

The anchor mark shape specified by MarkStyle is painted with this color.

See Also

AnchorPoint Members
AnchorPoint Class

AnchorPoint.Column Property

Gets or sets the column index of a cell with which the anchor point is associated.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Column { get; set; }
```

Visual Basic Copy Code

```
Public Property Column As Integer
```

Property Value

An integer value specifying the zero-based index of a table's column. The default is -1.

Remarks

This property is useful when the anchor point is included in table row's AnchorPattern. It defines whether the anchor point is relative to a cell or to a whole row. If **Column** is set to -1, the point relative coordinates specify percents of row's extents. Otherwise the point coordinates specify percents of cell's extents.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace
Row.AnchorPattern Property

AnchorPoint.MarkStyle Property

Gets or sets the appearance of the anchor point mark.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public MarkStyle MarkStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property MarkStyle As MarkStyle
```

Property Value

A member of the MarkStyle enumeration. The default is **MarkStyle.X**.

Remarks

Specifies how anchor points are marked visually on the display. Custom code can be used to draw the marks by setting the property value to MarkStyle.Custom and handling the DrawAnchorPoint event.

See Also

AnchorPoint Members
AnchorPoint Class

AnchorPoint.Tag Property

Gets or sets a user-defined data associated with the anchor point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Tag { get; set; }
```

Visual Basic Copy Code

```
Public Property Tag As Object
```

Property Value

An instance of any class derived from **System.Object**. The default is **null**.

Remarks

This property holds data that you define. MvcDiagram does not use it in any way. You might associate with the anchor point any value of primitive data types. The tag also might be a complex object from the .NET class library or a class defined by you. If the tag is an instance of value type, it will be serialized together with the object containing it when saving / loading a diagram. Reference types are serialized if marked with the **[Serializable]** attribute or if they implement the **ISerializable** interface.

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace
SerializeTag Event

AnchorPoint.ToolTip Property

Gets or sets a tooltip text that should be displayed when the mouse hovers over an anchor point mark.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ToolTip { get; set; }
```

Visual Basic Copy Code

```
Public Property ToolTip As String
```

Property Value

A string specifying the tool-tip text displayed for this anchor point. The default is an empty string.

Remarks

When the mouse rests for a while over an anchor point, the tool-tip text is displayed in a small popup window near the mouse cursor. If the anchor point tooltip is an empty string, the ToolTip of the node to which the anchor point is assigned is displayed instead.

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint.X Property

Gets or sets the horizontal position of the anchor point expressed as percentage of a node's width.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double X { get; set; }
```

Visual Basic Copy Code

```
Public Property X As Double
```

Property Value

A **double** value specifying the location of the anchor point, expressed as percentage.

Remarks

Set the property value to a number from 0 to 100, otherwise you might get unexpected behavior.

XUnit Property

AnchorPoint.XUnit Property

Gets or sets whether the point's X position is specified as percentage of node's size or fixed offset from the node's left side.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public UnitType XUnit { get; set; }
```

Visual Basic Copy Code

```
Public Property XUnit As UnitType
```

Property Value

A member of the UnitType enumeration. The default value is **Percentage**.

YUnit Property

AnchorPoint.Y Property

Gets or sets the vertical position of the anchor point expressed as percentage of a node's height.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Y { get; set; }
```

Visual Basic Copy Code

```
Public Property Y As Double
```

Property Value

A **double** value specifying the location of the anchor point, expressed as percentage.

Remarks

Set the property value to a number from 0 to 100, otherwise you might get unexpected behavior.

YUnit Property

AnchorPoint.YUnit Property

Gets or sets whether the point's Y position is specified as percentage of node's size or fixed offset from the node's top side.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public UnitType YUnit { get; set; }
```

Visual Basic Copy Code

```
Public Property YUnit As UnitType
```

Property Value

A member of the UnitType enumeration. The default value is **Percentage**.

AnchorPointCollection Members

Represents a strongly typed collection of anchor points.

The following tables list the members exposed by the AnchorPointCollection type.

Public Constructors

	Name	Description
	AnchorPointCollection	Overloaded.

Protected Fields

	Name	Description
	InnerList	Gets a **List<T>** containing the list of elements in the collection instance. (Inherited from CollectionBase.)

Public Properties

	Name	Description
	Count	Gets the number of elements actually contained in the collection. (Inherited from CollectionBase.)
	IsReadOnly	Gets a value indicating whether the collection is read-only. (Inherited from CollectionBase.)
	Item	Gets or sets the element at the specified index. (Inherited from CollectionBase.)

Public Methods

	Name	Description
	Add	Adds an object to the end of the collection. (Inherited from CollectionBase.)
	Add	Adds the specified anchor point to the collection.
	Clear	Removes all anchor points from the collection.

	Contains	Determines whether an element is in the collection. (Inherited from CollectionBase.)
	CopyTo	Copies the entire collection to a compatible one-dimensional array, starting at the specified index of the target array. (Inherited from CollectionBase.)
	GetAt	Gets the anchor point at the specified position.
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from CollectionBase.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire collection. (Inherited from CollectionBase.)
	Insert	Inserts an element into the collection at the specified index. (Inherited from CollectionBase.)
	Insert	Inserts the specified anchor point in the collection at the specified position.
	Remove	Removes the first occurrence of a specific object from the collection. (Inherited from CollectionBase.)
	Remove	Removes the specified anchor point from the collection.
	RemoveAt	Removes the anchor point at the specified index of the collection.
	Sort	Overloaded. (Inherited from CollectionBase.)

AnchorPointEventArgs Constructor

Initializes a new instance of the AnchorPointEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPointEventArgs (
    DiagramLink link,
    int oldAnchorIndex,
    int newAnchorIndex
)
```

Visual Basic Copy Code

```
Public New ( _
    link As DiagramLink, _
    oldAnchorIndex As Integer, _
    newAnchorIndex As Integer _
)
```

Parameters

link
The link whose end has been attached to a different anchor point.

oldAnchorIndex
The index of the old anchor point.

newAnchorIndex
The index of the new anchor point.

AnchorPointEventArgs.NewAnchorIndex Property

Gets the index of the new anchor point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int NewAnchorIndex { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property NewAnchorIndex As Integer
```

Property Value

An integer value that represents the index of the anchor point within its containing AnchorPattern class.

See Also

AnchorPointEventArgs Members
AnchorPointEventArgs Class
MindFusion.Diagramming Namespace

AnchorPointEventArgs.OldAnchorIndex Property

Gets the index of the old anchor point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int OldAnchorIndex { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property OldAnchorIndex As Integer
```

Property Value

An integer value that represents the index of the anchor point within its containing AnchorPattern class.

ArcTemplate Members

Represents an arc in a shape definition.

The following tables list the members exposed by the ArcTemplate type.

Public Constructors

	Name	Description
	ArcTemplate	Overloaded. Initializes a new instance of the **ArcTemplate** class.

Public Properties

	Name	Description
	Bounds	Gets the bounding rectangle of this element.
	Color	Gets or sets the outline color of this element. (Inherited from ElementTemplate.)
	DashStyle	Gets or sets the dash style of the outline of this element. (Inherited from ElementTemplate.)
	StartAngle	Gets the start angle of this arc element.
	SweepAngle	Gets the sweep angle of this arc element.
	Width	Gets or sets the outline width of this element. (Inherited from ElementTemplate.)

Public Methods

	Name	Description
	Clone	Creates an exact copy of this **ArcTemplate** element.
	SameAs	ElementTemplate.SameAs override.

Protected Methods

	Name	Description
	GetElementPen	Gets a pen used to render the element. If no pen properties are explicitly specified for this element, returns the pen passed as an argument. (Inherited from ElementTemplate.)

ArcTemplate Constructor (Double, Double, Double, Double, Double, Double)

Initializes a new instance of the ArcTemplate class with the specified coordinates.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ArcTemplate (
    double x,
    double y,
    double w,
    double h,
    double a,
    double s
)
```

Visual Basic Copy Code

```
Public New ( _
    x As Double, _
    y As Double, _
    w As Double, _
    h As Double, _
    a As Double, _
    s As Double _
)
```

Parameters

x
The x-coordinate of the upper left corner of the ellipse's bounding rectangle.

y
The y-coordinate of the upper left corner of the ellipse's bounding rectangle.

w
The width of the ellipse's bounding rectangle.

h
The height of the ellipse's bounding rectangle.

a
The clockwise angle, in degrees, between the horizontal axis of the ellipse and the starting point of the arc.

s
The clockwise angle, in degrees, between the starting point and the ending point of the arc.

Remarks

An arc template is defined by an ellipse and starting and sweeping angles.

ArcTemplate Constructor (Double, Double, Double, Double, Double, Double, Color, DashStyle, Double)

Initializes a new instance of the ArcTemplate class with the specified coordinates and visualization settings.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ArcTemplate (
    double x,
    double y,
    double w,
    double h,
    double a,
    double s,
    Color color,
    DashStyle dashStyle,
    double width
)
```

Visual Basic Copy Code

```
Public New ( _
    x As Double, _
    y As Double, _
    w As Double, _
    h As Double, _
    a As Double, _
    s As Double, _
    color As Color, _
```

```
    dashStyle As DashStyle, _
    width As Double _
)
```

Parameters

x
The x-coordinate of the upper left corner of the ellipse's bounding rectangle.

y
The y-coordinate of the upper left corner of the ellipse's bounding rectangle.

w
The width of the ellipse's bounding rectangle.

h
The height of the ellipse's bounding rectangle.

a
The clockwise angle, in degrees, between the horizontal axis of the ellipse and the starting point of the arc.

s
The clockwise angle, in degrees, between the starting point and the ending point of the arc.

color
The color of this segment.

dashStyle
The dash style of this segment.

width
The width of this segment.

Remarks

An arc template is defined by an ellipse and starting and sweeping angles.

ArcTemplate Methods

ArcTemplate.Clone Method

Creates an exact copy of this ArcTemplate element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Object Clone ()
```

Visual Basic Copy Code

```
Public Overrides Function Clone () As Object
```

Return Value

An instance of the ArcTemplate class.

See Also

ArcTemplate Members
ArcTemplate Class
MindFusion.Diagramming Namespace

ArcTemplate.SameAs Method

ElementTemplate.SameAs override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool SameAs (
    ElementTemplate obj
)
```

Visual Basic Copy Code

```
Public Overrides Function SameAs( _
    obj As ElementTemplate _
) As Boolean
```

Parameters

obj
The ElementTemplate to compare to this template.

Return Value

true if the specified object is an ArcTemplate closely approximating this template; otherwise, **false**.

ArcTemplate Properties

ArcTemplate.Bounds Property

Gets the bounding rectangle of this element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect Bounds { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Bounds As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** instance.

See Also

ArcTemplate Members
ArcTemplate Class
MindFusion.Diagramming Namespace

ArcTemplate.StartAngle Property

Gets the start angle of this arc element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double StartAngle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property StartAngle As Double
```

Property Value

A **double** value specifying the start angle of the arc, in degrees.

See Also

ArcTemplate Members
ArcTemplate Class
MindFusion.Diagramming Namespace

ArcTemplate.SweepAngle Property

Gets the sweep angle of this arc element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double SweepAngle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property SweepAngle As Double
```

Property Value

A **double** value specifying the sweep angle of the arc, in degrees.

AreaEventArgs Members

Contains arguments passed to handlers of the CreatingArea event of the HtmlBuilder class.

The following tables list the members exposed by the AreaEventArgs type.

Public Properties

	Name	Description
	AreaTag	Gets or sets the HTML AREA tag created by **HtmlBuilder**. You can insert additional attributes or JavaScript event handlers into that string.
	Column	Gets the index of a column if the event is raised for a table cell.
	Item	Gets the diagram element represented by **AreaTag** in the image map.
	Row	Gets the index of a row if the event is raised for a table cell.

See Also

AreaEventArgs Class
MindFusion.Diagramming Namespace

AreaEventArgs Properties

AreaEventArgs.AreaTag Property

Gets or sets the HTML AREA tag created by HtmlBuilder. You can insert additional attributes or JavaScript event handlers into that string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string AreaTag { get; set; }
```

Visual Basic Copy Code

```
Public Property AreaTag As String
```

Property Value

A string value that represents the AREA tag, including the opening and closing brackets.

See Also

AreaEventArgs Members
AreaEventArgs Class
MindFusion.Diagramming Namespace

AreaEventArgs.Column Property

Gets the index of a column if the event is raised for a table cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Column { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Column As Integer
```

Property Value

An integer value specifying the zero-based index of the related column.

See Also

AreaEventArgs Members
AreaEventArgs Class
MindFusion.Diagramming Namespace

AreaEventArgs.Item Property

Gets the diagram element represented by AreaTag in the image map.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem Item { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Item As DiagramItem
```

Property Value

An instance of the DiagramItem class.

See Also

AreaEventArgs Members
AreaEventArgs Class
MindFusion.Diagramming Namespace

AreaEventArgs.Row Property

Gets the index of a row if the event is raised for a table cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Row { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Row As Integer
```

Property Value

An integer value specifying the zero-based index of the related row.

ArrowHeads Class

Contains predefined arrowhead shapes.

Syntax

C# Copy Code

```
public sealed class ArrowHeads
```

Visual Basic Copy Code

```
Public NotInheritable Class ArrowHeads
```

Remarks

Shape objects exposed as properties of this class can be assigned to the HeadShape, BaseShape and IntermediateShape properties of links.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.ArrowHeads

MindFusion.Diagramming Namespace

ArrowHeads Members

Contains predefined arrowhead shapes.

The following tables list the members exposed by the ArrowHeads type.

Public Fields

	Name	Description
	Arrow	Display an arrow-like shape.
	BackSlash	Display a back slash.
	BowArrow	Display a bow arrow.

	Circle	Display a circle.
	DefaultFlow	"Default flow" in BPMN diagrams.
	DoubleArrow	Display a double arrow.
	None	Do not display an arrowhead shape.
	Pentagon	Display a pentagon.
	PointerArrow	Display a pointer arrow.
	Quill	Display a quill.
	Reversed	Reversed arrowhead.
	RevTriangle	Display a reversed triangle.
	RevWithCirc	Reversed arrowhead with a circle.
	RevWithLine	Reversed arrowhead with intersecting line.
	Rhombus	Display a rhombus.
	Slash	Display a slash.
	Tetragon	Display a tetragon.
	Triangle	Display a triangle.

AttachTo Enumeration

Specifies the type of attachment in a group.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum AttachTo
```

Visual Basic Copy Code

```
Public Enum AttachTo
```

Members

	Member name	Description
	FixedCorner	Indicates attachment to a fixed corner of a node.
	Proportional	Indicates proportional attachment to a node.
	LinkPoint	Indicates attachment to a link's control point.
	LinkSegment	Indicates attachment to a link's segment.
	LongestHSegment	Indicates attachment to the longest horizontal segment of a link.
	SideMiddle	Indicates attachment to the middle of a side of a node's bounding rectangle.
	AnchorToEdges	Indicates attachment that is anchored to one or more sides of a node.
	ControlledByMaster	The virtual UpdateGroup method of master items is called to update subordinates.
	DistanceAlongLink	Preserves the absolute distance from a node to link's start or end point.
	ProportionalToLength	Preserves the relative distance from a node to link's start point.
	FractionalPosition	Keeps attached node's size and maintains its original distance to point specified as fraction of main node's size.

See Also

MindFusion.Diagramming Namespace

AttachToLink Enumeration

Defines values specifying the possible ways to attach a node to a link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum AttachToLink
```

Visual Basic — Copy Code

```
Public Enum AttachToLink
```

Members

	Member name	Description
	Point	The node is attached to a fixed control point of the link.
	Segment	The node is attached to a fixed segment of the link.
	LongestHSegment	The node stays attached to the longest horizontal segment of the link.
	FixedDistance	Preserves the absolute distance from a node to link's start or end point.
	RelativeDistance	Preserves the relative distance from a node to link's start point.

Remarks

Members of this enumeration are used as values for the *attType* argument of the AttachTo method of the DiagramNode class.

See Also

MindFusion.Diagramming Namespace

AttachToNode Enumeration

Defines values specifying the possible ways to attach a node to another node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# — Copy Code

```
public enum AttachToNode
```

Visual Basic — Copy Code

```
Public Enum AttachToNode
```

Members

	Member name	Description
	TopLeft	The node follows the top-left corner of the master node.
	TopRight	The node follows the top-right corner of the master node.
	BottomLeft	The node follows the bottom-left corner of the master node.
	BottomRight	The node follows the bottom-right corner of the master node.
	TopCenter	The node follows the top-center point of the master node.
	MiddleRight	The node follows the middle-right point of the master node.
	BottomCenter	The node follows the bottom-center point of the master node.
	MiddleLeft	The node follows the middle-left point of the master node.

Remarks

Members of this enumeration are used as values for the *attType* argument of the AttachTo method of the DiagramNode class.

AutoJson Members

Apply the AutoJson attribute to a property of a CompositeNode-derived class to indicate that it should be included in JSON serialization.

The following tables list the members exposed by the **AutoJson** type.

Public Constructors

	Name	Description
	AutoJson	Initializes a new instance of the **AutoJson** attribute.

See Also

AutoJson Class
MindFusion.Diagramming Namespace

AutoJson Constructor

Initializes a new instance of the AutoJson attribute.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AutoJson ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

AutoJson Class
MindFusion.Diagramming Namespace

AutoResize Enumeration

Defines in which directions automatic resizing can enlarge the diagram scrollable area.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum AutoResize
```

Visual Basic Copy Code

```
Public Enum AutoResize
```

Members

	Member name	Description
	None	Do not enlarge the diagram area automatically.
	RightAndDown	Enlarge the diagram area to the right and down if an item is moved outside the boundaries in these directions.
	AllDirections	Enlarge the diagram area in any direction if an item is moved outside the boundaries.

Remarks

Values from this enumeration can be assigned to the AutoResize property.

See Also

MindFusion.Diagramming Namespace

Axis Enumeration

Specifies a coordinate axis.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum Axis
```

Visual Basic Copy Code

```
Public Enum Axis
```

Members

	Member name	Description
	X	Indicates the X coordinate axis.
	Y	Indicates the Y coordinate axis.

See Also

MindFusion.Diagramming Namespace

Behavior Enumeration

Defines values that specify how the component responds to actions performed by the user.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum Behavior
```

Visual Basic Copy Code

```
Public Enum Behavior
```

Members

	Member name	Description
	Modify	Items can be selected and modified. New items cannot be created.
	DrawShapes	Drawing with the mouse creates ShapeNode instances.
	DrawLinks	Drawing started over a node creates a DiagramLink. Otherwise a lasso rectangle is displayed allowing the selection of items.
	LinkShapes	A mode that is suitable for creating flowcharts and process diagrams. Drawing over empty document area creates a **ShapeNode** instance. Drawing started over a node creates a **DiagramLink**.
	LinkTables	A mode that is suitable for creating entity-relationship diagrams. Drawing over empty document area creates a TableNode instance. Drawing started over a node creates a **DiagramLink**.
	DrawTables	Drawing with the mouse creates **TableNode** instances.
	DrawControls	Drawing with the mouse creates **ControlNode** instances.
	LinkControls	Drawing over empty document area creates a **ControlNode** instance. Drawing started over a node creates a **DiagramLink**.
	DoNothing	The control ignores users actions with the mouse, but raises the appropriate mouse events. This mode allows applications to implement their own mouse-drawing behavior, disabling the MvcDiagram default response to users actions.
	Custom	Specifies that user input will be handled by the **BehaviorBase**-derived object assigned to **CustomBehavior**.
	DrawContainers	Drawing with the mouse creates ContainerNode instances.
	LinkContainers	Drawing over empty document area creates a **ContainerNode** instance. Drawing started over a node creates a **DiagramLink**.

	Pan	Dragging with the mouse pans the view.
	DrawTreeViews	Drawing with the mouse creates TreeViewNode instances.
	LinkTreeViews	Drawing over empty document area creates a **TreeViewNode** instance. Drawing started over a node creates a **DiagramLink**.
	DrawSvgNodes	Drawing with the mouse creates SvgNode instances.
	LinkSvgNodes	Drawing over empty document area creates an **SvgNode** instance. Drawing started over a node creates a **DiagramLink**.
	SelectOnly	Allow only selection of existing items. Modifying them or drawing new ones is disabled.
	Magnify	Dragging the mouse magnifies the view. Interactive creation or modification of items is disabled.
	DrawVisioNodes	Drawing with the mouse creates **VisioNode** instances.
	LinkVisioNodes	Drawing over empty document area creates a **VisioNode** instance. Drawing started over a node creates a **DiagramLink**.
	DrawBarcodes	Drawing with the mouse creates **BarcodeNode** instances.
	LinkBarcodes	Drawing over empty document area creates a **BarcodeNode** instance. Drawing started over a node creates a **DiagramLink**.
	DrawFreeForms	Drawing with the mouse creates FreeFormNode instances.
	LinkFreeForms	Drawing over empty document area creates a **FreeFormNode** instance. Drawing started over a node creates a **DiagramLink**.
	DrawFreeShapes	Points from user input are shown using a **FreeFormNode** instance. Once the user finishes drawing, the **FreeFormNode** is replaced by a **ShapeNode** with a matching shape from Diagram.FreeFormTargets list.
	LinkFreeShapes	Points from user input are shown using a **FreeFormNode** instance. Once the user finishes drawing, the **FreeFormNode** is replaced by a **ShapeNode** with a matching shape from **Diagram.FreeFormTargets** list. Drawing started over a node creates a **DiagramLink**.
	PanAndModify	Items can be selected and modified. New items cannot be created, and dragging without grabbing an adjustment handle pans the view.
	MoveNodes	Dragging with the mouse moves the node under mouse pointer.
	Zoom	Dragging with the mouse draws a lasso tool that zooms the diagram view to selected rectangular area.
	MoveLabels	Dragging with the mouse moves the label under mouse pointer.
	DrawPagedContainers	Drawing with the mouse creates PagedContainerNode instances.
	LinkPagedContainers	Drawing over empty document area creates a PagedContainerNode instance. Drawing started over a node creates a DiagramLink.

Remarks

Set the **Behavior** property to specify how MvcDiagram interprets user's actions. In all modes:

- single clicking selects the item under the mouse pointer and make it the ActiveItem;
- dragging while CTRL is pressed creates multiple selection;
- dragging while ALT is pressed pans the view;

Behavior Property

BezierTemplate Class

Represents a Bézier curve in a shape definition.

Syntax

C# Copy Code

```
public class BezierTemplate : ElementTemplate
```

Visual Basic Copy Code

```
Public Class BezierTemplate
    Inherits ElementTemplate
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.ElementTemplate
    MindFusion.Diagramming.BezierTemplate

See Also

BezierTemplate Members
MindFusion.Diagramming Namespace

BezierTemplate Members

Represents a Bézier curve in a shape definition.

The following tables list the members exposed by the BezierTemplate type.

Public Constructors

	Name	Description
	BezierTemplate	Overloaded. Initializes a new instance of the **BezierTemplate** class.

Public Properties

	Name	Description
	Color	Gets or sets the outline color of this element. (Inherited from ElementTemplate.)
	Coordinates	Gets an array containing the coordinates of the points defining the Bézier curve represented by this element.
	DashStyle	Gets or sets the dash style of the outline of this element. (Inherited from ElementTemplate.)
	Width	Gets or sets the outline width of this element. (Inherited from ElementTemplate.)

Public Methods

	Name	Description
	Clone	Creates an exact copy of this **BezierTemplate** element.
	SameAs	ElementTemplate.SameAs override.

Protected Methods

	Name	Description

	GetElementPen	Gets a pen used to render the element. If no pen properties are explicitly specified for this element, returns the pen passed as an argument. (Inherited from ElementTemplate.)

BezierTemplate Constructor

Initializes a new instance of the BezierTemplate class.

Overload List

Name	Description
BezierTemplate (Double, Double, Double, Double, Double, Double, Double, Double)	Initializes a new instance of the **BezierTemplate** class with the specified coordinates.
BezierTemplate (Double, Double, Double, Double, Double, Double, Color, DashStyle, Double)	Initializes a new instance of the **BezierTemplate** class with the specified coordinates and visualization settings.

See Also

BezierTemplate Class
MindFusion.Diagramming Namespace

BezierTemplate Constructor (Double, Double, Double, Double, Double, Double, Double, Double)

Initializes a new instance of the BezierTemplate class with the specified coordinates.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public BezierTemplate (
    double x1,
    double y1,
    double x2,
    double y2,
    double x3,
    double y3,
    double x4,
    double y4
)
```

Visual Basic Copy Code

```
Public New ( _
    x1 As Double, _
    y1 As Double, _
    x2 As Double, _
    y2 As Double, _
    x3 As Double, _
    y3 As Double, _
    x4 As Double, _
    y4 As Double _
)
```

Parameters

x1
The x-coordinate of the first control point of the curve.

y1
The y-coordinate of the first control point of the curve.

x2
The x-coordinate of the second control point of the curve.

y2
The y-coordinate of the second control point of the curve.

x3
The x-coordinate of the third control point of the curve.

y3
The y-coordinate of the third control point of the curve.

x4
The x-coordinate of the fourth control point of the curve.

y4
The y-coordinate of the fourth control point of the curve.

Remarks

A Bézier spline is defined by four control points. The spline goes through the first and last points, and the other two define the tension of the spline.

BezierTemplate Constructor Overload List
BezierTemplate Class
MindFusion.Diagramming Namespace

BezierTemplate Constructor (Double, Double, Double, Double, Double, Double, Double, Double, Color, DashStyle, Double)

Initializes a new instance of the BezierTemplate class with the specified coordinates and visualization settings.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public BezierTemplate (
    double x1,
    double y1,
    double x2,
    double y2,
    double x3,
    double y3,
    double x4,
    double y4,
    Color color,
    DashStyle dashStyle,
    double width
)
```

Visual Basic Copy Code

```
Public New ( _
    x1 As Double, _
    y1 As Double, _
    x2 As Double, _
    y2 As Double, _
    x3 As Double, _
    y3 As Double, _
    x4 As Double, _
    y4 As Double, _
```

```
    color As Color, _
    dashStyle As DashStyle, _
    width As Double _
)
```

Parameters

x1
The x-coordinate of the first control point of the curve.

y1
The y-coordinate of the first control point of the curve.

x2
The x-coordinate of the second control point of the curve.

y2
The y-coordinate of the second control point of the curve.

x3
The x-coordinate of the third control point of the curve.

y3
The y-coordinate of the third control point of the curve.

x4
The x-coordinate of the fourth control point of the curve

y4
The y-coordinate of the fourth control point of the curve.

color
The color of this segment.

dashStyle
The dash style of this segment.

width
The width of this segment.

Remarks

A Bézier spline is defined by four control points. The spline goes through the first and last points, and the other two define the tension of the spline.

BezierTemplate Constructor Overload List
BezierTemplate Class
MindFusion.Diagramming Namespace

BezierTemplate Methods

BezierTemplate.Clone Method

Creates an exact copy of this BezierTemplate element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Object Clone ()
```

Visual Basic Copy Code

```
Public Overrides Function Clone () As Object
```

Return Value

An instance of the BezierTemplate class.

See Also

BezierTemplate Members
BezierTemplate Class
MindFusion.Diagramming Namespace

BezierTemplate.SameAs Method

ElementTemplate.SameAs override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool SameAs (
    ElementTemplate obj
)
```

Visual Basic Copy Code

```
Public Overrides Function SameAs( _
    obj As ElementTemplate _
) As Boolean
```

Parameters

obj
The ElementTemplate to compare to this template.

Return Value

true if the specified object is a BezierTemplate closely approximating this template; otherwise, **false**.

See Also

BezierTemplate Members
BezierTemplate Class
MindFusion.Diagramming Namespace

BezierTemplate Properties

BezierTemplate.Coordinates Property

Gets an array containing the coordinates of the points defining the Bézier curve represented by this element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double[] Coordinates { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Coordinates As Double()
```

Property Value

An array of **double** values containing the coordinates of the points composing this element.

See Also

BezierTemplate Members
BezierTemplate Class
MindFusion.Diagramming Namespace

BranchIndicator Enumeration

Defines values that indicate how to mark link branching points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum BranchIndicator
```

Visual Basic Copy Code

```
Public Enum BranchIndicator
```

Members

	Member name	Description
	None	Do not draw indicators.
	Circle	Draw a circle centered on the branching point.
	Arrow	Draw a bent arrow that also shows the link direction.
	Custom	Raise DrawBranchIndicator event to enable custom drawing of branch indicators.

MindFusion.Diagramming Namespace

CellEventArgs Class

Contains the arguments passed to event handlers, such as CellClicked.

Syntax

C# Copy Code

```
public class CellEventArgs : EventArgs
```

Visual Basic Copy Code

```
Public Class CellEventArgs
    Inherits EventArgs
```

Inheritance Hierarchy

System.Object
  System.EventArgs
    MindFusion.Diagramming.CellEventArgs
      MindFusion.Diagramming.CellValidationEventArgs

See Also

CellEventArgs Members

Contains the arguments passed to event handlers, such as CellClicked.

The following tables list the members exposed by the CellEventArgs type.

Public Constructors

	Name	Description
	CellEventArgs	Initializes a new instance of the **CellEventArgs** class.

Public Properties

	Name	Description
	Cell	Get the cell for which the event is raised.
	Column	Gets the index of the table's column that contains **Cell**.
	MouseButton	Gets which mouse button has been pressed.
	MousePosition	Gets the current mouse pointer position.
	PreventNodeEvent	Gets or sets whether to prevent node event from being raised after cell's one.
	Row	Gets the index of the table's row that contains **Cell**.
	Table	Get the table that contains **Cell**.

See Also

CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs Constructor

Initializes a new instance of the CellEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CellEventArgs (
    TableNode.Cell cell,
    MouseButton mouseButton,
    Point mousePosition,
    int column,
    int row
)
```

Visual Basic Copy Code

```
Public New ( _
    cell As TableNode.Cell, _
    mouseButton As MouseButton, _
    mousePosition As Point, _
    column As Integer, _
```

```
    row As Integer _
)
```

Parameters

cell
The TableNode.Cell related to the event.

mouseButton
The mouse button related to the event.

mousePosition
The position of the mouse at the time the event was raised.

column
The zero-based index of the column related to the event.

row
The zero-based index of the row related to the event.

See Also

CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs Properties

CellEventArgs.Cell Property

Get the cell for which the event is raised.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.Cell Cell { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Cell As TableNode.Cell
```

Property Value

An instance of the TableNode.Cell class specifying the cell related to the event.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.Column Property

Gets the index of the table's column that contains Cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Column { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Column As Integer
```

Property Value

An integer value specifying the zero-based index of the table column related to the event.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.MouseButton Property

Gets which mouse button has been pressed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public MouseButton MouseButton { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property MouseButton As MouseButton
```

Property Value

A member of the MouseButton enumeration specifying the currently pressed mouse button.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.MousePosition Property

Gets the current mouse pointer position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point MousePosition { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property MousePosition As Point
```

Property Value

A **Microsoft.Maui.Graphics.Point** specifying the current mouse position.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.PreventNodeEvent Property

Gets or sets whether to prevent node event from being raised after cell's one.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool PreventNodeEvent { get; set; }
```

Visual Basic Copy Code

```
Public Property PreventNodeEvent As Boolean
```

Property Value

true to stop node event from being raised after cell one, or **false** otherwise. The default value is **false**.

Remarks

This applies to NodeClicked or NodeDoubleClicked events raised for a TableNode, after respective CellClicked or CellDoubleClicked.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.Row Property

Gets the index of the table's row that contains Cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Row { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Row As Integer
```

Property Value

An integer value specifying the zero-based index of the table row related to the event.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.Table Property

Get the table that contains Cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode Table { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Table As TableNode
```

Property Value

An instance of the TableNode class specifying the table related to the event.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellFrameStyle Enumeration

Specifies the style of the cells' frame lines.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum CellFrameStyle
```

Visual Basic Copy Code

```
Public Enum CellFrameStyle
```

Members

	Member name	Description
	None	Table cells have no border.
	Simple	The border of table cells is simple line.
	System3D	The border has 3D look.

Remarks

The enumeration values are used when customizing table cells.

MindFusion.Diagramming Namespace
CellFrameStyle Property

CellValidationEventArgs Class

Contains the arguments passed to event handlers, such as CellTextEditing.

Syntax

C# Copy Code

```
public class CellValidationEventArgs : CellEventArgs
```

Visual Basic — Copy Code

```
Public Class CellValidationEventArgs
    Inherits CellEventArgs
```

Inheritance Hierarchy

System.Object
  System.EventArgs
    MindFusion.Diagramming.CellEventArgs
      MindFusion.Diagramming.CellValidationEventArgs

See Also

CellValidationEventArgs Members
MindFusion.Diagramming Namespace

CellValidationEventArgs Members

Contains the arguments passed to event handlers, such as CellTextEditing.

The following tables list the members exposed by the CellValidationEventArgs type.

Public Constructors

	Name	Description
	CellValidationEventArgs	Initializes a new instance of the **CellValidationEventArgs** class.

Public Properties

	Name	Description
	Cancel	Gets or sets a value indicating whether to prevent the user from completing the operation.
	Cell	Get the cell for which the event is raised. (Inherited from CellEventArgs.)
	Column	Gets the index of the table's column that contains **Cell**. (Inherited from CellEventArgs.)
	MouseButton	Gets which mouse button has been pressed. (Inherited from CellEventArgs.)
	MousePosition	Gets the current mouse pointer position. (Inherited from CellEventArgs.)
	PreventNodeEvent	Gets or sets whether to prevent node event from being raised after cell's one. (Inherited from CellEventArgs.)
	Row	Gets the index of the table's row that contains **Cell**. (Inherited from CellEventArgs.)
	Table	Get the table that contains **Cell**. (Inherited from CellEventArgs.)

Public Methods

	Name	Description
	CancelDrag	Cancels the resize of the node's row or column.

See Also

CellValidationEventArgs Class
MindFusion.Diagramming Namespace

CellValidationEventArgs Constructor

Initializes a new instance of the CellValidationEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CellValidationEventArgs (
    TableNode.Cell cell,
    MouseButton mouseButton,
    Point mousePosition,
    int column,
    int row
)
```

Visual Basic Copy Code

```
Public New ( _
    cell As TableNode.Cell, _
    mouseButton As MouseButton, _
    mousePosition As Point, _
    column As Integer, _
    row As Integer _
)
```

Parameters

cell
The TableNode.Cell related to the event.

mouseButton
The mouse button related to the event.

mousePosition
The position of the mouse at the time the event was raised.

column
The zero-based index of the column related to the event.

row
The zero-based index of the row related to the event.

See Also

CellValidationEventArgs Class
MindFusion.Diagramming Namespace

CellValidationEventArgs Methods

CellValidationEventArgs.CancelDrag Method

Cancels the resize of the node's row or column.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void CancelDrag ()
```

Visual Basic Copy Code

```
Public Sub CancelDrag ()
```

Remarks

Calling this method immediately stops the operation.

See Also

CellValidationEventArgs Members
CellValidationEventArgs Class
MindFusion.Diagramming Namespace

CellValidationEventArgs Properties

CellValidationEventArgs.Cancel Property

Gets or sets a value indicating whether to prevent the user from completing the operation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Cancel { get; set; }
```

Visual Basic Copy Code

```
Public Property Cancel As Boolean
```

Property Value

true to cancel the operation; **false** to approve it.

See Also

CellValidationEventArgs Members
CellValidationEventArgs Class
MindFusion.Diagramming Namespace

ClipboardEventArgs Class

Contains the arguments passed to the RequestClipboard event handlers.

Syntax

C# Copy Code

```
public class ClipboardEventArgs : EventArgs
```

Visual Basic Copy Code

```
Public Class ClipboardEventArgs
    Inherits EventArgs
```

Inheritance Hierarchy

System.Object
  System.EventArgs
    MindFusion.Diagramming.ClipboardEventArgs

See Also

ClipboardEventArgs Members

Contains the arguments passed to the RequestClipboard event handlers.

The following tables list the members exposed by the ClipboardEventArgs type.

Public Constructors

	Name	Description
	ClipboardEventArgs	Overloaded.

Public Properties

	Name	Description
	Data	Gets or sets the clipboard data.
	DataType	Gets or sets the type of the data to get or set from the clipboard. This should be **null** (**Nothing** in Visual Basic) for clipboard set operations.
	IsGetOperation	Gets a value indicating whether getting or setting the clipboard.
	IsHandled	Gets or sets a value indicating whether the event is handled.
	Source	Gets the object, which initiated the event.

See Also

ClipboardEventArgs Class
MindFusion.Diagramming Namespace

ClipboardEventArgs Constructor

Overload List

Name	Description
ClipboardEventArgs (Object)	Initializes a new instance of the ClipboardEventArgs class for a Clipboard get operation.
ClipboardEventArgs (Object, Object)	Initializes a new instance of the **ClipboardEventArgs** class for a Clipboard set operation.

See Also

ClipboardEventArgs Class
MindFusion.Diagramming Namespace

ClipboardEventArgs Constructor (Object)

Initializes a new instance of the ClipboardEventArgs class for a Clipboard get operation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ClipboardEventArgs (
    Object source
)
```

Visual Basic Copy Code

```
Public New ( _
    source As Object _
)
```

Parameters

source
The object requesting the Clipboard contents.

See Also

ClipboardEventArgs Constructor Overload List
ClipboardEventArgs Class
MindFusion.Diagramming Namespace

ClipboardEventArgs Constructor (Object, Object)

Initializes a new instance of the ClipboardEventArgs class for a Clipboard set operation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ClipboardEventArgs (
    Object source,
    Object value
)
```

Visual Basic Copy Code

```
Public New ( _
    source As Object, _
    value As Object _
)
```

Parameters

source
The object requesting to set the Clipboard contents.

value
The new contents for the Clipboard.

See Also

ClipboardEventArgs Constructor Overload List
ClipboardEventArgs Class
MindFusion.Diagramming Namespace

ClipboardEventArgs Properties

ClipboardEventArgs.Data Property

Gets or sets the clipboard data.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Data { get; set; }
```

Visual Basic Copy Code

```
Public Property Data As Object
```

Property Value

An object representing the Clipboard contents.

Remarks

The purpose of this property depends on the type of the Clipboard operation, as specified by IsGetOperation. During *get* operations the property will contain the contents of the Clipboard after the event is handled. For *set* operations the property specifies the new contents of the Clipboard.

See Also

ClipboardEventArgs Members
ClipboardEventArgs Class
MindFusion.Diagramming Namespace

ClipboardEventArgs.DataType Property

Gets or sets the type of the data to get or set from the clipboard. This should be **null** (**Nothing** in Visual Basic) for clipboard set operations.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Type DataType { get; set; }
```

Visual Basic Copy Code

```
Public Property DataType As Type
```

Property Value

A **Type** instance.

See Also

ClipboardEventArgs Members
ClipboardEventArgs Class
MindFusion.Diagramming Namespace

ClipboardEventArgs.IsGetOperation Property

Gets a value indicating whether getting or setting the clipboard.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool IsGetOperation { get; }
```

Visual Basic

```
Public ReadOnly Property IsGetOperation As Boolean
```

Property Value

true if the request is to get the Clipboard contents; **false** if the request is to set Clipboard contents.

Remarks

The value of this property is inferred by the constructor used to create the event argument and cannot be subsequently changed.

See Also

ClipboardEventArgs Members
ClipboardEventArgs Class
MindFusion.Diagramming Namespace

ClipboardEventArgs.IsHandled Property

Gets or sets a value indicating whether the event is handled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public bool IsHandled { get; set; }
```

Visual Basic

```
Public Property IsHandled As Boolean
```

Property Value

See Also

ClipboardEventArgs Members
ClipboardEventArgs Class
MindFusion.Diagramming Namespace

ClipboardEventArgs.Source Property

Gets the object, which initiated the event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public Object Source { get; }
```

Visual Basic

```
Public ReadOnly Property Source As Object
```

Property Value

The object requesting the Clipboard.

See Also

ClipboardEventArgs Members
ClipboardEventArgs Class

CollectionBase(T) Class

An implementation of the **IList<T>** interface.

Syntax

C# Copy Code

```
public abstract class CollectionBase<T> : IList<T>, ICollection<T>, IEnumerable<T>, IEnumerable
```

Visual Basic Copy Code

```
Public MustInherit Class CollectionBase(Of T)
    Implements IList(Of T), ICollection(Of T), IEnumerable(Of T), IEnumerable
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.CollectionBase(T)
    MindFusion.Diagramming.AnchorPointCollection
    MindFusion.Diagramming.GroupCollection
    MindFusion.Diagramming.ItemCollectionBase(T)

See Also

CollectionBase(T) Members
MindFusion.Diagramming Namespace

CollectionBase(T) Members

An implementation of the **IList<T>** interface.

The following tables list the members exposed by the CollectionBase(T) type.

Protected Constructors

	Name	Description
	CollectionBase	Initializes a new instance of the **CollectionBase<T>** class.

Protected Fields

	Name	Description
	InnerList	Gets a **List<T>** containing the list of elements in the collection instance.

Public Properties

	Name	Description
	Count	Gets the number of elements actually contained in the collection.
	IsReadOnly	Gets a value indicating whether the collection is read-only.
	Item	Gets or sets the element at the specified index.

Public Methods

	Name	Description
	Add	Adds an object to the end of the collection.

	Clear	Removes all elements from the collection.
	Contains	Determines whether an element is in the collection.
	CopyTo	Copies the entire collection to a compatible one-dimensional array, starting at the specified index of the target array.
	GetEnumerator	Returns an enumerator that iterates through the collection.
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire collection.
	Insert	Inserts an element into the collection at the specified index.
	Remove	Removes the first occurrence of a specific object from the collection.
	RemoveAt	Removes the element at the specified index of the collection.
	Sort	Overloaded.

See Also

CollectionBase(T) Class
MindFusion.Diagramming Namespace

CollectionBase(T) Fields

CollectionBase(T).InnerList Field

Gets a **List<T>** containing the list of elements in the collection instance.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected List<T> InnerList
```

Visual Basic Copy Code

```
Protected InnerList As List(Of T)
```

CollectionBase(T) Methods

CollectionBase(T).Add Method

Adds an object to the end of the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public abstract void Add (
    T item
)
```

Visual Basic Copy Code

```
Public MustOverride Sub Add( _
    item As T _
)
```

Parameters

item
The object to be added to the end of the collection.

CollectionBase(T).Clear Method

Removes all elements from the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public abstract void Clear ()
```

Visual Basic Copy Code

```
Public MustOverride Sub Clear ()
```

See Also

CollectionBase(T) Members
CollectionBase(T) Class

CollectionBase(T).Contains Method

Determines whether an element is in the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Contains (
    T item
)
```

Visual Basic Copy Code

```
Public Function Contains( _
    item As T _
) As Boolean
```

Parameters

item
The object to locate in the collection.

Return Value

true if item is found in the collection; otherwise, **false**.

See Also

CollectionBase(T) Members
CollectionBase(T) Class
MindFusion.Diagramming Namespace

CollectionBase(T).CopyTo Method

Copies the entire collection to a compatible one-dimensional array, starting at the specified index of the target array.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void CopyTo (
    T[] array,
    int arrayIndex
)
```

Visual Basic Copy Code

```
Public Sub CopyTo( _
    array() As T, _
    arrayIndex As Integer _
)
```

Parameters

array
The one-dimensional array that is the destination of the elements copied from collection.

arrayIndex
The zero-based index in array at which copying begins.

See Also

CollectionBase(T) Members
CollectionBase(T) Class
MindFusion.Diagramming Namespace

CollectionBase(T).GetEnumerator Method

Returns an enumerator that iterates through the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IEnumerator<T> GetEnumerator ()
```

Visual Basic Copy Code

```
Public Function GetEnumerator () As IEnumerator(Of T)
```

Return Value

An **IEnumerator<T>** for the collection.

See Also

CollectionBase(T) Members
CollectionBase(T) Class
MindFusion.Diagramming Namespace

CollectionBase(T).IndexOf Method

Searches for the specified object and returns the zero-based index of the first occurrence within the entire collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int IndexOf (
    T item
)
```

Visual Basic Copy Code

```
Public Function IndexOf( _
    item As T _
) As Integer
```

Parameters

item
The object to locate in the collection.

Return Value

The zero-based index of the first occurrence of item within the entire collection, if found; otherwise, –1.

See Also

CollectionBase(T).Insert Method

Inserts an element into the collection at the specified index.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public abstract void Insert (
    int index,
    T item
)
```

Visual Basic Copy Code

```
Public MustOverride Sub Insert( _
    index As Integer, _
    item As T _
)
```

Parameters

index
The zero-based index at which item should be inserted.

item
The object to insert.

See Also

CollectionBase(T) Members

MindFusion.Diagramming Namespace

CollectionBase(T).Remove Method

Removes the first occurrence of a specific object from the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public abstract bool Remove (
    T item
)
```

Visual Basic Copy Code

```
Public MustOverride Function Remove( _
    item As T _
) As Boolean
```

Parameters

item
The object to remove from the collection.

Return Value

true if item is successfully removed; otherwise, **false**.

See Also

CollectionBase(T) Members
CollectionBase(T) Class
MindFusion.Diagramming Namespace

CollectionBase(T).RemoveAt Method

Removes the element at the specified index of the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public abstract void RemoveAt (
    int index
)
```

Visual Basic Copy Code

```
Public MustOverride Sub RemoveAt( _
    index As Integer _
)
```

Parameters

index
The zero-based index of the element to remove.

MindFusion.Diagramming Namespace

CollectionBase(T).Sort Method (Comparison(T))

Sorts the elements in this collection using the specified comparison.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Sort (
    Comparison<T> comparison
)
```

Visual Basic Copy Code

```
Public Sub Sort( _
    comparison As Comparison(Of T) _
)
```

Parameters

comparison
The **System.Comparison** to use when comparing elements.

See Also

Sort Method Overload List
CollectionBase(T) Members
CollectionBase(T) Class

CollectionBase(T).Sort Method (IComparer(T))

Sorts the elements in this collection using the specified comparer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Sort (
    IComparer<T> comparer
)
```

Visual Basic Copy Code

```
Public Sub Sort( _
    comparer As IComparer(Of T) _
)
```

Parameters

comparer
The **IComparer** implementation to use when comparing elements.

MindFusion.Diagramming Namespace

CollectionBase(T) Properties

CollectionBase(T).Count Property

Gets the number of elements actually contained in the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Count { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Count As Integer
```

Property Value

An integer value.

See Also

CollectionBase(T) Members
CollectionBase(T) Class
MindFusion.Diagramming Namespace

CollectionBase(T).IsReadOnly Property

Gets a value indicating whether the collection is read-only.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool IsReadOnly { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property IsReadOnly As Boolean
```

Property Value

true if the collection is read-only; otherwise, **false**.

CollectionBase(T) Members
CollectionBase(T) Class
MindFusion.Diagramming Namespace

CollectionBase(T).Item Property

Gets or sets the element at the specified index.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public T Item [
    int index
] { get; set; }
```

Visual Basic Copy Code

```
Public Property Item( _
    index As Integer _
) As T
```

Parameters

index
The zero-based index of the element to get or set.

Property Value

The element at the specified index.

ColumnStyle Enumeration

Specifies how table columns' width is set.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum ColumnStyle
```

Visual Basic Copy Code

```
Public Enum ColumnStyle
```

Members

	Member name	Description
	FixedWidth	The columns has fixed, unchangeable width.
	AutoWidth	The columns' width changes when the table is resized.

Remarks

Use the enumeration values to set the behavior of table columns, when the user resizes the table.

MindFusion.Diagramming Namespace
ColumnStyle Property

CommandHistory Class

Maintains a queue of Command records used to undo or redo actions.

Syntax

C# Copy Code

```
public class CommandHistory
```

Visual Basic Copy Code

```
Public Class CommandHistory
```

Remarks

The only instance of **CommandHistory** can be accessed through the History property of UndoManager.

The Capacity property specifies how many Command instances can be stored in the history queue. If the queue is full and a new action is recorded, the oldest one will be removed and made unavailable for undo/redo. A read-only access to the command queue is provided by the Commands property.

The **CommandHistory** instance maintains an internal record pointer. The pointer is decreased or increased by one when an action is respectively undone or redone through the undo manager. The pointer actually refers to two adjacent action records - the older one to be used when undoing, the newer one when redoing commands. Those two records can be accessed by NextUndo and NextRedo properties. When no action has been undone, the pointer refers to the end of the queue and **NextRedo** returns **null** (**Nothing** in Visual Basic). When all actions have been undone, the pointer refers to the start of the queue and **NextUndo** returns **null**.

Call Clear to remove all action records that are currently in the history queue, making those actions unavailable for undo or redo anymore. That won't disable adding new records to the queue, so it will be possible to undo/redo any actions executed after **Clear**.

CommandHistory Members

Maintains a queue of Command records used to undo or redo actions.

The following tables list the members exposed by the CommandHistory type.

Public Properties

	Name	Description
	Capacity	Gets or sets the maximum number of records to keep in the history queue.
	Commands	Gets the commands saved in the undo / redo history queue.
	NextRedo	Gets a reference to the command that would be redone if Redo is invoked.
	NextUndo	Gets a reference to the command that would be undone if Undo is invoked.

Public Methods

	Name	Description
	Clear	Removes all records from the history queue.
	MergeUndoRecords	Merges several undo records into a single composite record.

See Also

CommandHistory Class
MindFusion.Diagramming Namespace

CommandHistory Methods

CommandHistory.Clear Method

Removes all records from the history queue.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Clear ()
```

Visual Basic Copy Code

```
Public Sub Clear ()
```

Remarks

Call **Clear** to remove all action records that are currently in the history queue, making those actions unavailable for undo or redo anymore. That won't disable adding new records to the queue, so it will be possible to undo/redo any actions executed after the call.

UndoEnabled Property

CommandHistory.MergeUndoRecords Method

Merges several undo records into a single composite record.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool MergeUndoRecords (
    int numRecords,
    string title
)
```

Visual Basic Copy Code

```
Public Function MergeUndoRecords( _
    numRecords As Integer, _
    title As String _
) As Boolean
```

Parameters

numRecords

Specifies how many records at the end of the command list should be merged.

title

Specifies the title of the new command.

Return Value

false if the commands saved in the history are less than *numRecords*; otherwise, **true**.

See Also

CommandHistory Members
CommandHistory Class

CommandHistory Properties

CommandHistory.Capacity Property

Gets or sets the maximum number of records to keep in the history queue.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Capacity { get; set; }
```

Visual Basic Copy Code

```
Public Property Capacity As Integer
```

Property Value

An integer value specifying the number of records to keep in the queue; cannot be less than 1. The default is 10.

Remarks

If the history queue is full, the oldest command records are removed from the beginning when new ones are added. The queue is cleared when you change **Capacity**, so better do this at application's startup phase.

See Also

CommandHistory Members
CommandHistory Class
MindFusion.Diagramming Namespace

CommandHistory.Commands Property

Gets the commands saved in the undo / redo history queue.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CommandList Commands { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Commands As CommandList
```

Property Value

An instance of the CommandList class representing a read-only collection of Command objects.

See Also

CommandHistory Members
CommandHistory Class
MindFusion.Diagramming Namespace
NextUndo Property
NextRedo Property

CommandHistory.NextRedo Property

Gets a reference to the command that would be redone if Redo is invoked.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Command NextRedo { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property NextRedo As Command
```

Property Value

An instance of the Command class.

Remarks

When no action has been undone, the current action pointer refers to the end of the history queue and **NextRedo** returns **null** (**Nothing** in Visual Basic).

See Also

CommandHistory Members

MindFusion.Diagramming Namespace
Redo Method
NextUndo Property

CommandHistory.NextUndo Property

Gets a reference to the command that would be undone if Undo is invoked.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Command NextUndo { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property NextUndo As Command
```

Property Value

An instance of the Command class.

Remarks

When all actions have been undone, the current action pointer refers to the start of the history queue and **NextUndo** returns **null** (**Nothing** in Visual Basic).

CompositeNode Class

CompositeNode implements nodes whose appearance can be defined via composition of components and layout containers.

Syntax

C# Copy Code

```
public class CompositeNode : DiagramNode, IComponentHost
```

Visual Basic Copy Code

```
Public Class CompositeNode
    Inherits DiagramNode
    Implements IComponentHost
```

Remarks

Use the Components property to add components to the node. The components are arranged on top of each other by default. To apply custom arrangement logic either parent the components in a ContainerComponent, such as GridPanel, and add this **ContainerComponent** to the **CompositeNode** or override the ArrangeComponents method to apply custom arrangement logic.

To search for a component given its name, use the FindComponent method. To get a component at a specific position, use GetComponentAt.

For additional information about components, check the **Components** topic.

CompositeNode Members

CompositeNode implements nodes whose appearance can be defined via composition of components and layout containers.

The following tables list the members exposed by the **CompositeNode** type.

Public Constructors

	Name	Description
	CompositeNode	Overloaded. Initializes a new instance of the **CompositeNode** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)

	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	ClipToOutline	Gets or sets a value specifying whether contents will clip to outline, when an outline component is used.
	Components	Gets a list with the root components contained in the node.
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)

	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)

	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	ArrangeComponents	Invokes when the components within this node are being arranged.
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsComponent	Checks whether the specified component is contained in this node.
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DocToComponent	Converts a point from document coordinates to the local coordinate space of a component inside this node.
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Draws the node on the specified IGraphics surface.
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified **IGraphics** surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Draws the shadow of this node on the specified IGraphics surface.

	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	FindComponent	Returns the child component with the specified name or **null** (**Nothing** in Visual Basic), if the component was not found.
	GenerateJsonTemplate	Generates a Json template from current component hierarchy.
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetComponentAt	Returns the component at the specified point, expressed in document coordinates.
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	InvalidateLayout	Invalidates the component layout, causing rearrangement of content.
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	LoadJsonTemplate	Loads the item's components from a Json template.
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)

	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	PointToComponent	For internal use.
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from

		DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a IGraphicsPath object for this node as though it is contained in the specified rectangle.
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object.
	LoadFromXml	DiagramItem.LoadFromXml override.
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override.
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramNode.OnRemove override.
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	DiagramNode.OnUpdateBounds override.
	OnZoomChanged	DiagramItem.OnZoomChanged override.

	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object.
	SaveToXml	DiagramItem.SaveToXml override.
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SerializeComponents	Invoked to query whether the underlying component structure should be automatically serialized.
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

CompositeNode Class
MindFusion.Diagramming Namespace

CompositeNode Constructor

Initializes a new instance of the CompositeNode class.

Overload List

Name	Description
CompositeNode ()	Initializes a new instance of the **CompositeNode** class.
CompositeNode (CompositeNode)	Initializes a new instance of the **CompositeNode** class using the specified diagram item as a prototype.
CompositeNode (Diagram)	Initializes a new instance of the **CompositeNode** class with default values supplied form the specified Diagram.

See Also

CompositeNode Class
MindFusion.Diagramming Namespace

CompositeNode Constructor ()

Initializes a new instance of the CompositeNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CompositeNode ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

CompositeNode Constructor Overload List
CompositeNode Class
MindFusion.Diagramming Namespace

CompositeNode Constructor (CompositeNode)

Initializes a new instance of the CompositeNode class using the specified diagram item as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CompositeNode (
    CompositeNode prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As CompositeNode _
)
```

Parameters

prototype
The item to use as a prototype. The properties of the new item are initialized from the property values of this item.

Remarks

This constructor copies the DiagramNode property values from the specified prototype node.

See Also

CompositeNode Constructor Overload List
CompositeNode Class
MindFusion.Diagramming Namespace

CompositeNode Constructor (Diagram)

Initializes a new instance of the CompositeNode class with default values supplied form the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CompositeNode (
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram _
)
```

Parameters

diagram
The Diagram from which to obtain default values for the node properties.

Remarks

This constructor initializes the CompositeNode properties with the values specified in the respective default-value properties of the Diagram object.

See Also

CompositeNode Constructor Overload List
CompositeNode Class
MindFusion.Diagramming Namespace

CompositeNode Methods

CompositeNode.ArrangeComponents Method

Invokes when the components within this node are being arranged.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void ArrangeComponents (
    Rect availableSpace,
    IGraphics graphics
)
```

Visual Basic Copy Code

```
Public Overridable Sub ArrangeComponents( _
    availableSpace As Rect, _
    graphics As IGraphics _
)
```

Parameters

availableSpace
The available space.

graphics
An IGraphics object that can be used for text measurement.

Remarks

By default components are arranged on top of each other, in the order they were added to the Components collection. To apply more specialized arrangement add the components to a ContainerComponent (such as SimplePanel, StackPanel or GridPanel) then add this **ContainerComponent** as a child of the CompositeNode. The component system allows you to implement additional **ContainerComponent**-derived classes to apply custom arrangement logic.

Another way to apply custom arrangement is to derive from **CompositeNode** and override the ArrangeComponents method. Then position the components by setting their Bounds property.

CompositeNode Members
CompositeNode Class
MindFusion.Diagramming Namespace

CompositeNode.ContainsComponent Method

Checks whether the specified component is contained in this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ContainsComponent (
    ComponentBase component
)
```

Visual Basic Copy Code

```
Public Function ContainsComponent( _
    component As ComponentBase _
) As Boolean
```

Parameters

component
The component to check.

Return Value

true if the component is contained in the node; otherwise, false.

CompositeNode.DocToComponent Method

Converts a point from document coordinates to the local coordinate space of a component inside this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point DocToComponent (
    Point docPoint,
    ComponentBase component
)
```

Visual Basic Copy Code

```
Public Function DocToComponent( _
    docPoint As Point, _
    component As ComponentBase _
) As Point
```

Parameters

docPoint
The point to convert.

component
The target component.

Return Value

A **Microsoft.Maui.Graphics.Point** instance representing the point in local coordinates.

CompositeNode.DrawLocal Method

Draws the node on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawLocal (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawLocal( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
The IGraphics surface to draw the node on.

options
Provides options for the drawing operation.

See Also

CompositeNode Members
CompositeNode Class
MindFusion.Diagramming Namespace

CompositeNode.DrawShadowLocal Method

Draws the shadow of this node on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawShadowLocal (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawShadowLocal( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
An IGraphics object where the shadow should be rendered.

options
Provides options for the drawing operation.

CompositeNode.FindComponent Method

Returns the child component with the specified name or **null** (**Nothing** in Visual Basic), if the component was not found.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ComponentBase FindComponent (
    string name
)
```

Visual Basic Copy Code

```
Public Function FindComponent( _
    name As String _
) As ComponentBase
```

Parameters

name

The name of the component to search for.

Return Value

An instance of the ComponentBase class identifying the found component or **null** (**Nothing** in Visual Basic).

Remarks

This method is useful for obtaining a references to components defined in XML.

CompositeNode.GenerateJsonTemplate Method

Generates a Json template from current component hierarchy.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string GenerateJsonTemplate ()
```

Visual Basic Copy Code

```
Public Function GenerateJsonTemplate () As String
```

Return Value

A Json template string containing the item's components data.

CompositeNode.GetComponentAt Method

Returns the component at the specified point, expressed in document coordinates.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual ComponentBase GetComponentAt (
    Point point
)
```

Visual Basic Copy Code

```
Public Overridable Function GetComponentAt( _
    point As Point _
) As ComponentBase
```

Parameters

point

A **Microsoft.Maui.Graphics.Point** specifying the point to hit-test, expressed in document coordinates.

Return Value

An instance of the ComponentBase class identifying the topmost component at the specified point, or **null** if no component found.

Remarks

This method ignores components with any of the following properties set to **false**: IsEnabled, IsHitTestVisible, IsInteractive.

CompositeNode.GetRgnInRect Method

Creates and returns a IGraphicsPath object for this node as though it is contained in the specified rectangle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override IGraphicsPath GetRgnInRect (
    Rect rc,
    bool inLocal
)
```

Visual Basic Copy Code

```
Protected Overrides Function GetRgnInRect( _
    rc As Rect, _
    inLocal As Boolean _
) As IGraphicsPath
```

Parameters

rc

inLocal

Return Value

CompositeNode.InvalidateLayout Method

Invalidates the component layout, causing rearrangement of content.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void InvalidateLayout ()
```

Visual Basic Copy Code

```
Public Sub InvalidateLayout ()
```

Remarks

Calling this method will cause ArrangeComponents to be invoked before the next drawing pass.

See Also

CompositeNode Members
CompositeNode Class
MindFusion.Diagramming Namespace

CompositeNode.LoadFromJson Method

Loads the node from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

Remarks

By default, all components of a CompositeNode are saved in the JSON document along with their associated data. This will lead to wasted space if the instances of a derived class are built upon the same hierarchy of components and expose only a few properties corresponding to component attributes. The recommended approach of serializing such classes is to override SerializeComponents and return **false** to stop the built-in serialization of components, and save / load the node properties from SaveToJson / **LoadFromJson** overrides.

See Also

CompositeNode.LoadFromXml Method

DiagramItem.LoadFromXml override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromXml (
    XmlElement xmlElement,
```

```
    XmlPersistContext context
)
```

Visual Basic — Copy Code

```
Protected Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** containing the item's data.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

Remarks

By default, all components of a CompositeNode are saved in the XML document along with their associated data. This will lead to wasted space if the instances of a derived class are built upon the same hierarchy of components and expose only a few properties corresponding to component attributes. The recommended approach of serializing such classes is to override SerializeComponents and return **false** to stop the built-in serialization of components, and save / load the node properties from SaveToXml / **LoadFromXml** overrides. This is demonstrated in the *Scripting* sample project.

CompositeNode.LoadJsonTemplate Method

Loads the item's components from a Json template.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# — Copy Code

```
public void LoadJsonTemplate (
    string template
)
```

Visual Basic — Copy Code

```
Public Sub LoadJsonTemplate( _
    template As String _
)
```

Parameters

template

A Json template string containing the item's components data.

Example

Components can be defined in JSON format as shown in this example:

C# — Copy Code

```
string template = @"{
""component"": ""SimplePanel"",
""children"":
[
 {
  ""component"": ""Shape"",
```

```
  ""name"": ""Frame"",
  ""pen"": ""black"",
  ""strokeThickness"": 0.2,
  ""isOutline"": true,
  ""autoProperty"": true
 },
{
""component"": ""GridPanel"",
""rowDefinitions"": [""*""],
""columnDefinitions"": [""22"", ""*""],
""children"":
[
 {
  ""component"": ""Image"",
  ""name"": ""Image"",
  ""autoProperty"": true,
  ""location"": ""../Images/icon4.png"",
  ""margin"": ""1"",
  ""imageAlign"": ""Fit""
 },
       {
         ""component"": ""Button"",
        ""brush"": ""red"",
        ""textColor"": ""#fff"",
        ""font"": ""Arial bold"",
        ""text"": ""x"",
        ""cornerRadius"": 3.5,
        ""width"": 6,
        ""height"": 6,
        ""clickHandler"": ""onDeleteClick""
       },
 {
  ""component"": ""StackPanel"",
  ""orientation"": ""Vertical"",
  ""gridColumn"": 1,
  ""margin"": ""1"",
  ""verticalAlignment"": ""Near"",
  ""children"":
  [
   {
    ""component"": ""Text"",
    ""name"": ""Title"",
    ""autoProperty"": true,
    ""text"": ""title"",
    ""font"": ""Arial bold""
   },
   {
    ""component"": ""Text"",
    ""name"": ""FullName"",
    ""autoProperty"": true,
    ""text"": ""full name"",
    ""pen"": ""blue"",
    ""padding"": ""1,0,1,0"",
    ""enableStyledText"": true
   },
   {
    ""component"": ""Text"",
    ""name"": ""Details"",
    ""autoProperty"": true,
    ""text"": ""details"",
    ""font"": ""Arial 3""
   }
  ]
 }
]
}]}
"
```

CompositeNode.SaveToJson Method

Saves the node as a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject instance to contain the serialized data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

Remarks

By default, all components of a CompositeNode are saved in the JSON document along with their associated data. This will lead to wasted space if the instances of a derived class are built upon the same hierarchy of components and expose only a few properties corresponding to component attributes. The recommended approach of serializing such classes is to override SerializeComponents and return **false** to stop the built-in serialization of components, and save / load the node properties from **SaveToJson** / LoadFromJson overrides.

DiagramItem.SaveToXml override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** the item's data should be stored into.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

Remarks

By default, all components of a CompositeNode are saved in the XML document along with their associated data. This will lead to wasted space if the instances of a derived class are built upon the same hierarchy of components and expose only a few properties corresponding to component attributes. The recommended approach of serializing such classes is to override SerializeComponents and return **false** to stop the built-in serialization of components, and save / load the node properties from **SaveToXml** / LoadFromXml overrides. This is demonstrated in the *Scripting* sample project.

CompositeNode Members
CompositeNode Class
MindFusion.Diagramming Namespace

CompositeNode.SerializeComponents Method

Invoked to query whether the underlying component structure should be automatically serialized.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual bool SerializeComponents ()
```

Visual Basic Copy Code

```
Protected Overridable Function SerializeComponents () As Boolean
```

Return Value

true to automatically serialize the component tree; **false** to skip the automatic component serialization.

Remarks

By default, all components of a CompositeNode are saved along with their associated data. This will lead to wasted space if the instances of a derived class are built upon the same hierarchy of components and expose only a few properties corresponding to component attributes. The recommended approach of serializing such classes is to override **SerializeComponents** and return **false** to stop the built-in serialization of components. Then you can save or load only the necessary node properties from SaveTo / LoadFrom overrides for binary format, or SaveToXml / LoadFromXml for XML format. This is demonstrated in *EmployeeNode.cs* in the *Demo* sample project.

CompositeNodeStyle Members

Represents a reusable set of properties that define the appearance of composite nodes.

The following tables list the members exposed by the CompositeNodeStyle type.

Public Constructors

	Name	Description
	CompositeNodeStyle	Initializes a new instance of the **CompositeNodeStyle** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	Effects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	FontFamily	Gets or sets the font family of the item text. (Inherited from DiagramItemStyle.)
	FontSize	Gets or sets the font size of the item text. (Inherited from DiagramItemStyle.)
	FontStyle	Gets or sets the font style of the item text. (Inherited from DiagramItemStyle.)
	FontUnit	Gets or sets the font unit of the item text. (Inherited from DiagramItemStyle.)
	ShadowBrush	Gets or sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	Stroke	Gets or sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	StrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline items. (Inherited from DiagramItemStyle.)
	StrokeThickness	Gets or sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)

Public Methods

	Name	Description
	GetProperties	Gets all properties in the style. (Inherited from Style.)
	GetProperty	Returns the property with the specified name, if any. (Inherited from Style.)
S	RegisterType	Associates a type with an alias. (Inherited from Style.)

Protected Methods

	Name	Description
	GetValue	Gets the value of the specified property. (Inherited from Style.)
	IsPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	LoadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	LoadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from Style.)
	RegisterProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	SaveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	SaveToXml	Saves the style content into an XML element. (Inherited from Style.)
	SetValue	Sets the value of the specified property. (Inherited from Style.)
	UnsetValue	Clears the value of the specified property. (Inherited from Style.)

Public Events

	Name	Description
	PropertyChanged	Raised when any of the registered style properties has changed. (Inherited from Style.)

CompositeRouter Class

Implements a chain of link routers (objects implementing ILinkRouter interface) so that a link passes through the sequence until it gets routed successfully.

Syntax

C# Copy Code

```
public class CompositeRouter : ILinkRouter
```

Visual Basic Copy Code

```
Public Class CompositeRouter
    Implements ILinkRouter
```

Remarks

By default diagram's LinkRouter is set to a **CompositeRouter** instance that chains PatternRouter and GridRouter. You can insert additional link routers into the Routers list, including custom implementations of ILinkRouter if target diagram should favor some specific link paths.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.CompositeRouter

CompositeRouter Methods

CompositeRouter.RouteLink Method

Implements ILinkRouter.RouteLink.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RouteLink (
    DiagramLink link,
    ConnectionPoint originConnection,
    ConnectionPoint destinationConnection,
    bool nowCreating
)
```

Visual Basic Copy Code

```
Public Function RouteLink( _
    link As DiagramLink, _
    originConnection As ConnectionPoint, _
    destinationConnection As ConnectionPoint, _
    nowCreating As Boolean _
) As Boolean
```

Parameters

link

The DiagramLink to route.

originConnection

Represents connection to Origin node, potentially different from link's stored connection when modifying first control point.

destinationConnection

Represents connection to Destination node, potentially different from link's stored connection when modifying last control point.

nowCreating

Indicates whether link is currently being created.

Return Value

true if a path has been found successfully, otherwise false.

CompositeRouter.Routers Property

A list of router objects forming a chain through which links pass until they are routed successfully.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public List<ILinkRouter> Routers { get; set; }
```

Visual Basic Copy Code

```
Public Property Routers As List(Of ILinkRouter)
```

Property Value

A list of objects implementing ILinkRouter interface.

Remarks

By default the list contains PatternRouter and GridRouter objects.

See Also

CompositeRouter Members
CompositeRouter Class
MindFusion.Diagramming Namespace

ConnectionPoint Class

This class represents a connection between an edge and a node in a graph. It decouples the DiagramLink class from the DiagramNode class, allowing edges to connect different types of nodes without knowing anything of their implementation details. Each **DiagramLink** object contains two **ConnectionPoint** instances describing the connections at both ends of the link.

Syntax

C# Copy Code

```
public class ConnectionPoint
```

Visual Basic Copy Code

```
Public Class ConnectionPoint
```

Remarks

If custom nodes should store additional information about their connections, inherit the **ConnectionPoint** class, add the necessary members and return an instance of this class from the CreateConnectionPoint override. For example, TreeViewNode uses TreeViewConnectionPoint objects to store reference to the item associated with the connection.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.ConnectionPoint
    MindFusion.Diagramming.TreeViewConnectionPoint
    MindFusion.Diagramming.TableConnectionPoint
    MindFusion.Diagramming.TreeViewConnectionPoint

See Also

ConnectionPoint Members
MindFusion.Diagramming Namespace

ConnectionPoint Members

This class represents a connection between an edge and a node in a graph. It decouples the DiagramLink class from the DiagramNode class, allowing edges to connect different types of nodes without knowing anything of their implementation details. Each **DiagramLink** object contains two ConnectionPoint instances describing the connections at both ends of the link.

The following tables list the members exposed by the **ConnectionPoint** type.

Public Constructors

	Name	Description
	ConnectionPoint	Overloaded. Initializes a new instance of the **ConnectionPoint** class.

Public Properties

	Name	Description
	RelativePosition	Gets or sets the position of this connection point, relative to the associated node's bounding rectangle, expressed as percentage.
	Row	Gets the index of a constituent item within the associated node where the link represented by this connection point is connected, or -1, if the link is connected to the node itself.

Protected Properties

	Name	Description
	Incoming	Gets a flag indicating whether this connection point is at the origin or the destination of the associated link.
	Link	Gets the link associated with this connection point.
	Node	Gets the node associated with this connection point.

Public Methods

	Name	Description

	AddLinkToNode	Adds the link associated with this connection point to the associated node.
	CalculateIntersections	Determines whether the end of a link should be aligned to the point where the node contour is intersected by the line connecting the centers of the connected nodes.
	CanMoveLink	Checks whether the specified point, expressed in document coordinates, is a valid location for this connection point.
	GetAnchorPos	Overloaded.
	GetEndPoint	Calculates the coordinates of the this connection point expressed in document coordinates.
	GetInitialPoint	Returns a point (usually the center of the bounding rectangle) contained within the associated node.
	GetIntersection	Calculates the intersection point between the specified line segment and the contour of the node associated with this connection point.
	GetNodeRect	Returns the bounding rectangle of the node associated with this connection point.
	LinkChanges	Checks whether the relationship represented by the associated link would change if the link is attached to the specified node at the specified point.
	NearestAnchorPoint	Returns the anchor point closest to the specified point from the node's associated anchor pattern.
	NodesIntersect	Checks whether the node associated with the current connection point and the node associated with the specified connection point intersect.
	RemoveLinkFromNode	Removes the link associated with this connection point from the associated node.
	SameNode	Checks whether the current connection point and the specified connection point are associated with the same node.
	SaveEndRelative	Updates the coordinates of the connection point represented by this link, relative to the bounding rectangle of the associated node.

Protected Methods

	Name	Description
	GetNearestBorderPoint	Returns the nearest point lying on the node border.
	UpdateFromPoint	Updates the connection state according to the specified point, without changing the related node.

ConnectionPoint Constructor

Initializes a new instance of the ConnectionPoint class.

Overload List

Name	Description
ConnectionPoint ()	Initializes a new instance of the **ConnectionPoint** class.
ConnectionPoint (DiagramNode, DiagramLink, Boolean)	Initializes a new instance of the **ConnectionPoint** class between the specified node and link.

See Also

ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint Constructor ()

Initializes a new instance of the ConnectionPoint class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected ConnectionPoint ()
```

Visual Basic Copy Code

```
Protected Sub New ()
```

Remarks

This constructor is used only during deserialization.

See Also

ConnectionPoint Constructor Overload List
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint Constructor (DiagramNode, DiagramLink, Boolean)

Initializes a new instance of the ConnectionPoint class between the specified node and link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ConnectionPoint (
    DiagramNode node,
    DiagramLink link,
    bool incoming
)
```

Visual Basic Copy Code

```
Public New ( _
    node As DiagramNode, _
    link As DiagramLink, _
    incoming As Boolean _
)
```

Parameters

node
The node whose connection to a link is managed by this ConnectionPoint.

link
The link whose connection to a node is managed by this **ConnectionPoint**.

incoming

Specifies which end of the link is represented by this **ConnectionPoint**.

See Also

ConnectionPoint Constructor Overload List
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint Methods

ConnectionPoint.AddLinkToNode Method

Adds the link associated with this connection point to the associated node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void AddLinkToNode ()
```

Visual Basic Copy Code

```
Public Overridable Sub AddLinkToNode ()
```

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.CalculateIntersections Method

Determines whether the end of a link should be aligned to the point where the node contour is intersected by the line connecting the centers of the connected nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool CalculateIntersections ()
```

Visual Basic Copy Code

```
Public Overridable Function CalculateIntersections () As Boolean
```

Return Value

true to align the link end; otherwise, **false**.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.CanMoveLink Method

Checks whether the specified point, expressed in document coordinates, is a valid location for this connection point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool CanMoveLink (
    Point point
)
```

Visual Basic Copy Code

```
Public Overridable Function CanMoveLink( _
    point As Point _
) As Boolean
```

Parameters

point
The Point to check for validity.

Return Value

true if the specified point represents a valid location for the connection point; otherwise, **false**.

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.GetAnchorPos Method

Overload List

Name	Description
ConnectionPoint.GetAnchorPos (Int32)	Returns the point from the node's associated anchor pattern (if any) with the specified index or the link's initial point.
ConnectionPoint.GetAnchorPos (Int32, Point@)	Retrieves the point from the node's associated anchor pattern (if any) with the specified index.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.GetAnchorPos Method (Int32)

Returns the point from the node's associated anchor pattern (if any) with the specified index or the link's initial point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Point GetAnchorPos (
    int anchorIdx
)
```

Visual Basic Copy Code

```
Public Overridable Function GetAnchorPos( _
    anchorIdx As Integer _
) As Point
```

Parameters

anchorIdx

Return Value

See Also

GetAnchorPos Method Overload List
ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.GetAnchorPos Method (Int32, Point@)

Retrieves the point from the node's associated anchor pattern (if any) with the specified index.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool GetAnchorPos (
    int anchorIdx,
    ref Point point
)
```

Visual Basic Copy Code

```
Public Overridable Function GetAnchorPos( _
    anchorIdx As Integer, _
    ByRef point As Point _
) As Boolean
```

Parameters

anchorIdx

point

Return Value

See Also

GetAnchorPos Method Overload List
ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.GetEndPoint Method

Calculates the coordinates of the this connection point expressed in document coordinates.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Point GetEndPoint ()
```

Visual Basic Copy Code

```
Public Overridable Function GetEndPoint () As Point
```

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.GetInitialPoint Method

Returns a point (usually the center of the bounding rectangle) contained within the associated node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Point GetInitialPoint ()
```

Visual Basic Copy Code

```
Public Overridable Function GetInitialPoint () As Point
```

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.GetIntersection Method

Calculates the intersection point between the specified line segment and the contour of the node associated with this connection point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Point GetIntersection (
    Point pt1,
    Point pt2
)
```

Visual Basic Copy Code

```
Public Overridable Function GetIntersection( _
    pt1 As Point, _
```

```
    pt2 As Point _
) As Point
```

Parameters

pt1

pt2

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.GetNearestBorderPoint Method

Returns the nearest point lying on the node border.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual Point GetNearestBorderPoint (
    Point point
)
```

Visual Basic Copy Code

```
Protected Overridable Function GetNearestBorderPoint( _
    point As Point _
) As Point
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** specifying the point to align to node's borders.

Return Value

A **Microsoft.Maui.Graphics.Point** containing coordinates of nearest border point.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.GetNodeRect Method

Returns the bounding rectangle of the node associated with this connection point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Rect GetNodeRect (
    bool rotated
)
```

Visual Basic

```
Public Overridable Function GetNodeRect( _
    rotated As Boolean _
) As Rect
```

Parameters

rotated

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.LinkChanges Method

Checks whether the relationship represented by the associated link would change if the link is attached to the specified node at the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public virtual bool LinkChanges (
    DiagramItem item,
    Point point
)
```

Visual Basic

```
Public Overridable Function LinkChanges( _
    item As DiagramItem, _
    point As Point _
) As Boolean
```

Parameters

item

The item under the mouse pointer.

point

The current mouse pointer position.

Return Value

true if the node should create a new ConnectionPoint instance, otherwise **false**.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.NearestAnchorPoint Method

Returns the anchor point closest to the specified point from the node's associated anchor pattern.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Point NearestAnchorPoint (
    Point point,
    ref int idx
)
```

Visual Basic Copy Code

```
Public Overridable Function NearestAnchorPoint( _
    point As Point, _
    ByRef idx As Integer _
) As Point
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** that should be aligned to anchor point.

idx
An integer variable that receives the anchor point index within AnchorPattern.

Return Value

A **Microsoft.Maui.Graphics.Point** containing anchor point coordinates.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.NodesIntersect Method

Checks whether the node associated with the current connection point and the node associated with the specified connection point intersect.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool NodesIntersect (
    ConnectionPoint connectionPoint
)
```

Visual Basic Copy Code

```
Public Function NodesIntersect( _
    connectionPoint As ConnectionPoint _
) As Boolean
```

Parameters

connectionPoint

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.RemoveLinkFromNode Method

Removes the link associated with this connection point from the associated node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void RemoveLinkFromNode ()
```

Visual Basic Copy Code

```
Public Overridable Sub RemoveLinkFromNode ()
```

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.SameNode Method

Checks whether the current connection point and the specified connection point are associated with the same node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool SameNode (
    ConnectionPoint otherConnectionPoint
)
```

Visual Basic Copy Code

```
Public Overridable Function SameNode( _
    otherConnectionPoint As ConnectionPoint _
) As Boolean
```

Parameters

otherConnectionPoint

Return Value

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.SaveEndRelative Method

Updates the coordinates of the connection point represented by this link, relative to the bounding rectangle of the associated node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void SaveEndRelative ()
```

Visual Basic

```
Public Overridable Sub SaveEndRelative ()
```

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.UpdateFromPoint Method

Updates the connection state according to the specified point, without changing the related node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected virtual void UpdateFromPoint (
    Point point
)
```

Visual Basic

```
Protected Overridable Sub UpdateFromPoint( _
    point As Point _
)
```

Parameters

point
The current mouse pointer position.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint Properties

ConnectionPoint.Incoming Property

Gets a flag indicating whether this connection point is at the origin or the destination of the associated link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected bool Incoming { get; }
```

Visual Basic

```
Protected ReadOnly Property Incoming As Boolean
```

Property Value

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.Link Property

Gets the link associated with this connection point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected DiagramLink Link { get; }
```

Visual Basic Copy Code

```
Protected ReadOnly Property Link As DiagramLink
```

Property Value

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.Node Property

Gets the node associated with this connection point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual DiagramNode Node { get; }
```

Visual Basic Copy Code

```
Protected Overridable ReadOnly Property Node As DiagramNode
```

Property Value

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.RelativePosition Property

Gets or sets the position of this connection point, relative to the associated node's bounding rectangle, expressed as percentage.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point RelativePosition { get; set; }
```

Visual Basic Copy Code

```
Public Property RelativePosition As Point
```

Property Value

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.Row Property

Gets the index of a constituent item within the associated node where the link represented by this connection point is connected, or -1, if the link is connected to the node itself.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual int Row { get; set; }
```

Visual Basic Copy Code

```
Public Overridable Property Row As Integer
```

Property Value

An integer ID of the related item, or -1 if the link connects to the node as integral entity.

Constants Members

Contains various global constants, also provides measure unit independent constants.

The following tables list the members exposed by the Constants type.

Public Fields

	Name	Description
	E	A very small positive real number (0.01).
	IdentityMatrix	The identity matrix.
	NoAnchorPattern	A constant indicating no anchor pattern during binary serialization.

Public Methods

	Name	Description
	GetAutoScroll	Gets the number of units to scroll the control during auto-scroll operation.
	GetContainerFolderPadding	Gets the padding around the fold button of a container node.
	GetExpandIconSize	Gets the size of the expand/collapse manipulator icon.
	GetFitTextStep	Gets a value used when fitting the size of a node to its contained text.
	GetHalfInch	Gets the size of a half inch.
	GetHScrollButtonSize	Gets the size of horizontal scrollbar arrow buttons.
	GetInch	Gets the size of one inch.
	GetInflation	Gets a relax value used when testing object intersections.
	GetLineHitTest	Gets a value specifying relative distance from an arrow used during hit-testing operations.
	GetMarkSize	Gets the size of an anchor point mark.
	GetMillimeter	Gets the size of one millimeter.
	GetMinArrowheadSize	Gets the minimum allowed size of an arrowhead.
	GetMinItemSize	Gets the minimum size for a diagram node that can be achieved interactively.
	GetPixel	Gets the size of one pixel.
	GetReflHth	Gets the initial distance between adjacent control points of a reflexive arrow along the Y-axis.
	GetReflWth2	Gets the initial distance between adjacent control points of a reflexive link along the X-axis.
	GetRoundRectArc	Gets the radius of the arc of the rounded rectangle node shape.
	GetRouteGridSize	Gets the default size of the link routing grid.
	GetScrollerWdt	Gets the width of the scroller manipulator icon.
	GetSelPtTest	Gets a relax value used during selection handles hit-testing.

	GetTableHeaderOffset	Gets the width of a header row icon.
	GetVScrollButtonSize	Gets the size of vertical scrollbar arrow buttons.
	TouchHitDistance	Gets default value for unset TouchHitDistance.

Constants Fields

Constants.E Field

A very small positive real number (0.01).

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double E
```

Visual Basic Copy Code

```
Public Shared E As Double
```

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.IdentityMatrix Field

The identity matrix.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static IMatrix IdentityMatrix
```

Visual Basic Copy Code

```
Public Shared IdentityMatrix As IMatrix
```

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.NoAnchorPattern Field

A constant indicating no anchor pattern during binary serialization.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static int NoAnchorPattern
```

Visual Basic Copy Code

```
Public Shared NoAnchorPattern As Integer
```

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants Methods

Constants.GetAutoScroll Method

Gets the number of units to scroll the control during auto-scroll operation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetAutoScroll (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetAutoScroll( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

A MeasureUnit instance.

Return Value

The number of units to add to or remove from the scroll position.

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetContainerFolderPadding Method

Gets the padding around the fold button of a container node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetContainerFolderPadding (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetContainerFolderPadding( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

A MeasureUnit instance.

Return Value

The padding space to leave around fold buttons, expressed in the specified unit.

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetExpandIconSize Method

Gets the size of the expand/collapse manipulator icon.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetExpandIconSize (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetExpandIconSize( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

A MeasureUnit instance.

Return Value

The +/- icon size, expressed in the specified unit.

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetFitTextStep Method

Gets a value used when fitting the size of a node to its contained text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetFitTextStep (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetFitTextStep( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit
A MeasureUnit instance.

Return Value

The step size, expressed in the specified unit.

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetHalfInch Method

Gets the size of a half inch.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetHalfInch (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetHalfInch( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit
A MeasureUnit instance.

Return Value

Half of an inch in the specified unit.

See Also

Constants.GetHScrollButtonSize Method

Gets the size of horizontal scrollbar arrow buttons.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Size GetHScrollButtonSize (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetHScrollButtonSize( _
    currUnit As MeasureUnit _
) As Size
```

Parameters

currUnit
A MeasureUnit instance.

Return Value

The size of scrollbar left and right arrow buttons, expressed in the specified unit.

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetInch Method

Gets the size of one inch.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetInch (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetInch( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit
A MeasureUnit instance.

Return Value

The size of an inch measured in the specified unit.

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetInflation Method

Gets a relax value used when testing object intersections.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetInflation (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetInflation( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

Return Value

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetLineHitTest Method

Gets a value specifying relative distance from an arrow used during hit-testing operations.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetLineHitTest (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetLineHitTest( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

Return Value

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetMarkSize Method

Gets the size of an anchor point mark.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetMarkSize (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetMarkSize( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

Return Value

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetMillimeter Method

Gets the size of one millimeter.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetMillimeter (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetMillimeter( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit
A MeasureUnit instance.

Return Value

The size of a millimeter measured in the specified unit.

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetMinArrowheadSize Method

Gets the minimum allowed size of an arrowhead.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetMinArrowheadSize (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetMinArrowheadSize( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

Return Value

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetMinItemSize Method

Gets the minimum size for a diagram node that can be achieved interactively.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetMinItemSize (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetMinItemSize( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

Return Value

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetPixel Method

Gets the size of one pixel.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetPixel (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetPixel( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

Return Value

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetReflHth Method

Gets the initial distance between adjacent control points of a reflexive arrow along the Y-axis.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetReflHth (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetReflHth( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

Return Value

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetReflWth2 Method

Gets the initial distance between adjacent control points of a reflexive link along the X-axis.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetReflWth2 (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetReflWth2( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

Return Value

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetRoundRectArc Method

Gets the radius of the arc of the rounded rectangle node shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetRoundRectArc (
    MeasureUnit currUnit,
    double factor
)
```

Visual Basic Copy Code

```
Public Shared Function GetRoundRectArc( _
    currUnit As MeasureUnit, _
    factor As Double _
) As Double
```

Parameters

currUnit

factor

Return Value

See Also

Constants Members
Constants Class
MindFusion.Diagramming Namespace

Constants.GetRouteGridSize Method

Gets the default size of the link routing grid.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetRouteGridSize (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetRouteGridSize( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

Return Value

Constants.GetScrollerWdt Method

Gets the width of the scroller manipulator icon.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetScrollerWdt (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetScrollerWdt( _
    currUnit As MeasureUnit _
) As Double
```

Parameters

currUnit

Return Value

Constants.GetTableHeaderOffset Method

Gets the width of a header row icon.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double GetTableHeaderOffset (
    MeasureUnit unit
)
```

Visual Basic Copy Code

```
Public Shared Function GetTableHeaderOffset( _
    unit As MeasureUnit _
) As Double
```

Parameters

unit
A MeasureUnit instance.

Return Value

The offset of header rows, expressed in the specified unit.

Constants.GetVScrollButtonSize Method

Gets the size of vertical scrollbar arrow buttons.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Size GetVScrollButtonSize (
    MeasureUnit currUnit
)
```

Visual Basic Copy Code

```
Public Shared Function GetVScrollButtonSize( _
    currUnit As MeasureUnit _
) As Size
```

Parameters

currUnit
A MeasureUnit instance.

Return Value

The size of scrollbar top and bottom arrow buttons, expressed in the specified unit.

Constants.TouchHitDistance Method

Gets default value for unset TouchHitDistance.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static double TouchHitDistance (
    MeasureUnit unit
)
```

Visual Basic Copy Code

```
Public Shared Function TouchHitDistance( _
    unit As MeasureUnit _
) As Double
```

Parameters

unit
Current measure unit.

Return Value

Default hit distance.

ContainerChildEventArgs Members

Contains arguments passed to events related to container children.

The following tables list the members exposed by the ContainerChildEventArgs type.

Public Constructors

	Name	Description
	ContainerChildEventArgs	Initializes a new instance of the **ContainerChildEventArgs** class.

Public Properties

	Name	Description
	AdjustmentHandle	Gets or sets the adjustment handle being moved by the user. (Inherited from NodeEventArgs.)
	Container	Refers to the container related to the event.
	Label	Gets or sets a NodeLabel related to this event. (Inherited from NodeEventArgs.)
	MouseButton	Gets which mouse button has been pressed. (Inherited from NodeEventArgs.)
	MousePosition	Gets or sets the current mouse pointer position. (Inherited from NodeEventArgs.)

	Node	Gets the node for which the event was raised. (Inherited from NodeEventArgs.)

Public Methods

	Name	Description
	ToString	NodeEventArgs.ToString override.

MindFusion.Diagramming Namespace

ContainerChildEventArgs Constructor

Initializes a new instance of the ContainerChildEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerChildEventArgs (
    ContainerNode container,
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public New ( _
    container As ContainerNode, _
    node As DiagramNode _
)
```

Parameters

container
A ContainerNode object related to the event.

node
A DiagramNode added to or removed from the container.

ContainerChildEventArgs Properties

ContainerChildEventArgs.Container Property

Refers to the container related to the event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerNode Container { get; set; }
```

Visual Basic Copy Code

```
Public Property Container As ContainerNode
```

Property Value

An instance of the ContainerNode class.

See Also

ContainerChildEventArgs Class
MindFusion.Diagramming Namespace

ContainerNode Class

Represents a diagram node that can contain other nodes.

Syntax

C# Copy Code

```
public class ContainerNode : DiagramNode, Scrollable
```

Visual Basic Copy Code

```
Public Class ContainerNode
    Inherits DiagramNode
    Implements Scrollable
```

Remarks

Users can drag nodes into a container interactively. When a dragged node is over a container, the container frame is painted using the HighlightPen property to indicate that the node would be added to the container.

Call the Add method to add a node to container programmatically, and the Remove method to remove a node from the container. Child nodes of a container are stored in its Children collection. The Container property of child nodes returns their

parent **ContainerNode**.

AutoShrink specifies whether the size of a container should shrink when a node is removed from it. The container node will not shrink to a size smaller than MinimumSize, even if it does not contain any items. Adding child nodes to a container will automatically grow its size, unless AutoGrow is set to **false**. Enable the Scrollable property to let users scroll container's content if it overflows.

A container node can be folded and unfolded, either interactively or programmatically, as specified through the Foldable and Folded properties. When a container is folded, it occupies a minimal area and its child nodes are hidden. You can get the original size of a folded container using the UnfoldedSize property.

The Caption property specifies the caption text of a container node, and CaptionBrush specifies its color. Use the CaptionFormat property to define the alignment and position of the caption text. The height of the caption bar of a container can be set using the CaptionHeight property.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.DiagramItem
    MindFusion.Diagramming.DiagramNode
      MindFusion.Diagramming.ContainerNode
        MindFusion.Diagramming.PagedContainerNode

ContainerNode Members

Represents a diagram node that can contain other nodes.

The following tables list the members exposed by the ContainerNode type.

Public Constructors

	Name	Description
	ContainerNode	Overloaded. Initializes a new instance of the **ContainerNode** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowAddChildren	Gets or sets a value indicating whether child nodes can be added interactively to this container.
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AllowRemoveChildren	Gets or sets a value indicating whether child nodes can be removed interactively from this container.
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	AutoDeleteChildren	Gets or sets whether deleting this container should also remove its child items from the diagram.
	AutoGrow	Gets or sets a value indicating whether the container should grow in size when nodes are added to it.

	AutoShrink	Gets or sets a value indicating whether the container should shrink in size when nodes are removed from it.
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Caption	Gets or sets the text displayed as caption of the table.
	CaptionBackBrush	Gets or sets the brush used to paint the caption bar of this container.
	CaptionBrush	Gets or sets the brush used to paint the container caption.
	CaptionFormat	Gets or sets the caption alignment and format.
	CaptionHeight	Gets or sets the height of the container's caption bar.
	Children	Gets the child nodes of this container.
	ClipChildren	Gets or sets a value indicating whether child items should be clipped by container boundaries.
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent **ContainerNode** containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveCaptionBackBrush	Gets the effective caption back brush of the container.
	EffectiveCaptionBrush	Gets the effective caption brush of the container.
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled.
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Foldable	Gets or sets a value indicating whether the user is allowed to fold this container.
	Folded	Gets or sets a value indicating whether this container is folded.
	FoldedSize	Gets or sets the size of the container when folded.
	FoldIconSize	Gets or sets the size of the fold/unfold icon.
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)

	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HighlightPen	Gets or sets the pen used to draw the container frame lines when an item is dragged over the container.
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	Margin	Gets or sets how much space should be left between contained nodes and the container borders.
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	MinimumSize	Gets or sets the minimum size of the container.
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Scrollable	Gets or sets a value indicating whether users are allowed to scroll the contents of this container.
	ScrollX	Gets or sets the container's horizontal scroll position.
	ScrollY	Gets or sets the container's vertical scroll position.
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)

	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Shape	Gets or sets the shape of the container's outline.
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	UnfoldedSize	Returns the original size of a folded container.
	Visible	Gets or sets a value indicating whether the container is visible.
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	Add	Adds a node to this container.
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	Arrange	Arranges the container's children with the given layout.

	ArrangeAnimated	Arranges the container's children using the given layout, and animates items moving to their new positions.
	ArrangeAsync	Arranges the container's children with the given layout asynchronously.
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	Clone	DiagramItem.Clone override. Creates a copy of this item.
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	ContainsRecursively	Determines whether this container contains the specified node, either directly or recursively through other containers.
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramNode.Draw override. Draws the container on the specified IGraphics surface.
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	DiagramNode.DrawLocal override. Draws the container on the specified IGraphics surface.
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified **IGraphics** surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
S	GetContainer	Retrieves the container node (if any) the specified node belongs to.
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectiveCaptionBackBrush	Returns a Brush object representing the currently effective caption background of the container.

	GetEffectiveCaptionBrush	Returns a Brush object representing the currently effective caption brush of the container.
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramNode.GetRepaintRect override.
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	DiagramItem.HitTest override.
	HitTestHandle	DiagramNode.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point.
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node.
	OnDragOver	Invoked when a diagram item is being dragged over this node.
	OnDropOver	Invoked when a diagram item is dropped over this node.
	OnLoad	DiagramItem.OnLoad override.
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	Remove	Removes a node from this container.
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)

	Resize	Resizes the node. (Inherited from DiagramNode.)
	ResizeToFitChildren	Resizes the container making it big enough to contain its child nodes.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	UpdateBounds	Overloaded.
	VisitNodes	Visits the diagram nodes in reverse Z order.
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override.
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)

	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object.
	LoadFromXml	Loads the item content from an XML element.
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified.
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramNode.OnRemove override.
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramNode.RestoreProperties override.
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramNode.SaveProperties override.
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object.
	SaveToXml	Saves the item content into an XML element.
	ScaleElements	DiagramNode.ScaleElements override.
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary.

		(Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

ContainerNode Constructor ()

Initializes a new instance of the ContainerNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerNode ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

ContainerNode Constructor Overload List
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode Constructor (ContainerNode)

Initializes a new instance of the ContainerNode class using the specified node as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerNode (
    ContainerNode prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As ContainerNode _
)
```

Parameters

prototype

ContainerNode Constructor Overload List
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode Constructor (Diagram)

Initializes a new instance of the ContainerNode class with the default values of the specified diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerNode (
    Diagram parent
)
```

Visual Basic Copy Code

```
Public New ( _
    parent As Diagram _
)
```

Parameters

parent

See Also

ContainerNode Constructor Overload List
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode Methods

ContainerNode.Add Method

Adds a node to this container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Add (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public Sub Add( _
    node As DiagramNode _
)
```

Parameters

node

The DiagramNode that will be added to the container.

Remarks

By default, if container's bounding rectangle does not include specified node's bounds, the container grows automatically to accommodate the new node. To disable that, set AutoGrow to **false**.

Child nodes that have been added to a container are stored in its Children collection. The parent ContainerNode of a child node can be accessed via the Container property.

Remove Method
ClipChildren Property

ContainerNode.Arrange Method

Arranges the container's children with the given layout.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Arrange (
    ILayout layout
)
```

Visual Basic Copy Code

```
Public Function Arrange( _
    layout As ILayout _
) As Boolean
```

Parameters

layout
An instance of Layout -derived class specifying the layout algorithm to apply.

Return Value

true if the container has been arranged successfully, or **false** otherwise.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.ArrangeAnimated Method

Arranges the container's children using the given layout, and animates items moving to their new positions.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ArrangeAnimated (
    ILayout layout,
    int duration,
    AnimationType animationType,
    EasingType easingType
)
```

Visual Basic Copy Code

```
Public Function ArrangeAnimated( _
    layout As ILayout, _
    duration As Integer, _
    animationType As AnimationType, _
    easingType As EasingType _
) As Boolean
```

Parameters

layout
An instance of Layout -derived class specifying the layout algorithm to apply.

duration
An integer, specifying the duration of the animation in milliseconds.

animationType
A member of the AnimationType enumeration, specifying the animation type to use.

easingType
A member of the EasingType enumeration, specifying the type of easing function to apply to the animation.

Return Value

true if the container has been arranged successfully, or **false** otherwise.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.ArrangeAsync Method

Arranges the container's children with the given layout asynchronously.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Task<Boolean> ArrangeAsync (
    ILayout layout
)
```

Visual Basic Copy Code

```
Public Function ArrangeAsync( _
    layout As ILayout _
) As Task(Of Boolean)
```

Parameters

layout
An instance of Layout -derived class specifying the layout algorithm to apply.

Return Value

true if the container has been arranged successfully, or **false** otherwise.

ContainerNode.Clone Method

DiagramItem.Clone override. Creates a copy of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override DiagramItem Clone (
    bool clipboard
)
```

Visual Basic Copy Code

```
Public Overrides Function Clone( _
    clipboard As Boolean _
) As DiagramItem
```

Parameters

clipboard
true if copying during clipboard operations, or **false** otherwise.

Return Value

A copy of this ContainerNode.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.ContainsRecursively Method

Determines whether this container contains the specified node, either directly or recursively through other containers.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ContainsRecursively (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public Function ContainsRecursively( _
    node As DiagramNode _
) As Boolean
```

Parameters

node
The DiagramNode to check.

Return Value

true if this container contains the node; otherwise, **false**.

ContainerNode.CreateProperties Method

DiagramItem.CreateProperties override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override DiagramItemProperties CreateProperties ()
```

Visual Basic Copy Code

```
Protected Overrides Function CreateProperties () As DiagramItemProperties
```

Return Value

An instance of the DiagramItemProperties class.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.Draw Method

DiagramNode.Draw override. Draws the container on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void Draw (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub Draw( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics

The IGraphics surface to draw the node on.

options

Provides options for the drawing operation.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.DrawLocal Method

DiagramNode.DrawLocal override. Draws the container on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawLocal (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawLocal( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics

An IGraphics object where the node should be rendered.

options

Provides options for the drawing operation.

ContainerNode.GetContainer Method

Retrieves the container node (if any) the specified node belongs to.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static ContainerNode GetContainer (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public Shared Function GetContainer( _
    node As DiagramNode _
) As ContainerNode
```

Parameters

node

The DiagramNode whose container you need to find.

Return Value

A ContainerNode that contains the specified node, or **null** (**Nothing** in Visual Basic) if the node is not contained.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.GetEffectiveCaptionBackBrush Method

Returns a Brush object representing the currently effective caption background of the container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush GetEffectiveCaptionBackBrush (
    Rect bounds,
    double dx,
```

```
    double dy
)
```

Visual Basic Copy Code

```
Public Function GetEffectiveCaptionBackBrush( _
    bounds As Rect, _
    dx As Double, _
    dy As Double _
) As Brush
```

Parameters

bounds

dx

dy

Return Value

Remarks

This method returns either the container's CaptionBackBrush if not null, or the CaptionBackBrush property of the container's style. This method can return null.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.GetEffectiveCaptionBrush Method

Returns a Brush object representing the currently effective caption brush of the container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush GetEffectiveCaptionBrush ()
```

Visual Basic Copy Code

```
Public Function GetEffectiveCaptionBrush () As Brush
```

Return Value

A Brush instance.

Remarks

This method returns either the container's CaptionBrush if not **null**, or the TextBrush property of the container's style.

ContainerNode.GetRepaintRect Method

DiagramNode.GetRepaintRect override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Rect GetRepaintRect (
    bool includeConnected
)
```

Visual Basic Copy Code

```
Public Overrides Function GetRepaintRect( _
    includeConnected As Boolean _
) As Rect
```

Parameters

includeConnected

true is related items should be considered too, or **false** otherwise.

Return Value

A rectangular region that should be repainted when this node is modified.

ContainerNode.HitTest Method

DiagramItem.HitTest override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override DiagramItem HitTest (
    Point point,
    double threshold,
    bool onlyNodes,
    bool onlyInteractive,
    bool includeHandles,
    bool includeLabels
)
```

Visual Basic Copy Code

```
Public Overrides Function HitTest( _
    point As Point, _
    threshold As Double, _
    onlyNodes As Boolean, _
    onlyInteractive As Boolean, _
    includeHandles As Boolean, _
    includeLabels As Boolean _
) As DiagramItem
```

Parameters

point

A **Microsoft.Maui.Graphics.Point** value specifying the logical coordinates of a diagram point.

threshold

Specifies the size of the area around the item outlines where the point is still considered inside the item.

onlyNodes

true to exclude child links from the search.

onlyInteractive

true to exclude locked items from the search.

includeHandles
true to also consider adjustment handle locations (possibly outside of node's bounds).

includeLabels
true to also consider item label locations (possibly outside of node's bounds).

Return Value

The item that contains the specified point.

Remarks

This method performs recursive search if items contain child items.

See Also

ContainerNode Members

MindFusion.Diagramming Namespace

ContainerNode.HitTestHandle Method

DiagramNode.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override AdjustmentHandle HitTestHandle (
    Point point,
    double distance
)
```

Visual Basic Copy Code

```
Public Overrides Function HitTestHandle( _
    point As Point, _
    distance As Double _
) As AdjustmentHandle
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** value specifying where to look for a selection handle.

distance
Maximum distance from a handle at which it is still considered as hit.

Return Value

An AdjustmentHandle instance representing the adjustment handle found at the specified location, or **null** if there is none.

ContainerNode.LoadFromJson Method

Loads the node from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.LoadFromXml Method

Loads the item content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** containing the item's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

ContainerNode.OnChildModified Method

Called when a group child node has been modified.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void OnChildModified (
    DiagramNode node,
    AdjustmentHandles handle
)
```

Visual Basic Copy Code

```
Protected Overrides Sub OnChildModified( _
    node As DiagramNode, _
    handle As AdjustmentHandles _
)
```

Parameters

node
The DiagramNode that has been moved or resized.

handle
The adjustment handle used to modify the node.

ContainerNode.OnDragOut Method

Invoked when a diagram item is being dragged out of this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void OnDragOut (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Overrides Sub OnDragOut( _
    item As DiagramItem _
)
```

Parameters

item
The DiagramItem being dragged.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.OnDragOver Method

Invoked when a diagram item is being dragged over this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool OnDragOver (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Overrides Function OnDragOver( _
    item As DiagramItem _
) As Boolean
```

Parameters

item
The DiagramItem being dragged.

Return Value

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.OnDropOver Method

Invoked when a diagram item is dropped over this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool OnDropOver (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Overrides Function OnDropOver( _
    item As DiagramItem _
) As Boolean
```

Parameters

item
The DiagramItem being dragged.

Return Value

ContainerNode.Remove Method

Removes a node from this container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Remove (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public Sub Remove( _
    node As DiagramNode _
)
```

Parameters

node

The DiagramNode that should be removed from the container.

See Also

ContainerNode Members

Add Method

ContainerNode.ResizeToFitChildren Method

Resizes the container making it big enough to contain its child nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ResizeToFitChildren (
    bool allowShrink,
    Size margins
)
```

Visual Basic Copy Code

```
Public Sub ResizeToFitChildren( _
    allowShrink As Boolean, _
    margins As Size _
)
```

Parameters

allowShrink

true to allow reducing container's size, or **false** otherwise.

margins

A **Microsoft.Maui.Graphics.Size** specifying size of margin space left around container's child items.

ContainerNode.SaveToJson Method

Saves the node as a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
```

```
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.SaveToXml Method

Saves the item content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** the item's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

ContainerNode.UpdateBounds Method (Boolean)

Updates the container bounds to fit its contents.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void UpdateBounds (
    bool includeLinks
)
```

Visual Basic Copy Code

```
Public Sub UpdateBounds( _
    includeLinks As Boolean _
)
```

Parameters

includeLinks
Specifies whether the bounding rectangle should contain the control points of links whose ends are both child nodes of this container.

See Also

UpdateBounds Method Overload List
ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.VisitNodes Method

Visits the diagram nodes in reverse Z order.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool VisitNodes (
    Point point,
    VisitNode visitNode,
    DiagramItem relatedItem
)
```

Visual Basic Copy Code

```
Public Function VisitNodes( _
    point As Point, _
    visitNode As VisitNode, _
    relatedItem As DiagramItem _
) As Boolean
```

Parameters

point
Location of the nodes that should be visited.

visitNode
An operation to be performed on the nodes.

relatedItem
Parameter to pass to the visitNode operation.

Return Value

ContainerNode Properties

ContainerNode.AllowAddChildren Property

Gets or sets a value indicating whether child nodes can be added interactively to this container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowAddChildren { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowAddChildren As Boolean
```

Property Value

true to allow adding child nodes, otherwise **false**. The default value is **true**.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace
AllowRemoveChildren Property

ContainerNode.AllowRemoveChildren Property

Gets or sets a value indicating whether child nodes can be removed interactively from this container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowRemoveChildren { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowRemoveChildren As Boolean
```

Property Value

true to allow removing child nodes, otherwise **false**. The default value is **true**.

See Also

ContainerNode Members

MindFusion.Diagramming Namespace
AllowAddChildren Property

ContainerNode.AutoDeleteChildren Property

Gets or sets whether deleting this container should also remove its child items from the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AutoDeleteChildren { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoDeleteChildren As Boolean
```

Property Value

true to automatically delete child items, or **false** otherwise.

See Also

ContainerNode Members

MindFusion.Diagramming Namespace
Children Property

ContainerNode.AutoGrow Property

Gets or sets a value indicating whether the container should grow in size when nodes are added to it.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AutoGrow { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoGrow As Boolean
```

Property Value

true to grow container's size automatically, or **false** otherwise. The default value is **true**.

Remarks

When **AutoGrow** is enabled, the container size will grow to include newly added nodes when they wouldn't fit in its current size. The new **Bounds** of the container is set to the union of bounding rectangles of all child nodes inflated by Margin.

AutoShrink Property
ResizeToFitChildren Method

ContainerNode.AutoShrink Property

Gets or sets a value indicating whether the container should shrink in size when nodes are removed from it.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AutoShrink { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoShrink As Boolean
```

Property Value

true if the container should shrink automatically; otherwise, **false**. The default is **false**.

Remarks

The container won't shrink to a size smaller than MinimumSize.

Gets or sets a value indicating whether styled text rendering is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableStyledText { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableStyledText As Boolean
```

Property Value

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.Foldable Property

Gets or sets a value indicating whether the user is allowed to fold this container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Foldable { get; set; }
```

Visual Basic Copy Code

```
Public Property Foldable As Boolean
```

Property Value

true if the container can be folded, or **false** otherwise. Initialized with the value of ContainersFoldable.

Remarks

A foldable container can be folded and unfolded by clicking the up/down arrow displayed in the caption bar. The appearance of that icon can be customized by setting **Renderers.FoldIconRenderer**.

Folded Property

ContainerNode.Folded Property

Gets or sets a value indicating whether this container is folded.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Folded { get; set; }
```

Visual Basic Copy Code

```
Public Property Folded As Boolean
```

Property Value

true if the container is folded; otherwise, **false**. The default is **false**.

Remarks

When folded, the container children are not visible, and only its caption bar is displayed.

Foldable Property
Diagram.FoldedContainerSize Property

ContainerNode.FoldedSize Property

Gets or sets the size of the container when folded.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Size FoldedSize { get; set; }
```

Visual Basic Copy Code

```
Public Property FoldedSize As Size
```

Property Value

A **Size** instance specifying the folded size of a container. The default value is **Empty**.

Remarks

If this property is not set, the width of the folded container is set to its MinimumSize.Width, and the height to CaptionHeight.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.FoldIconSize Property

Gets or sets the size of the fold/unfold icon.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Nullable<Double> FoldIconSize { get; set; }
```

Visual Basic Copy Code

```
Public Property FoldIconSize As Nullable(Of Double)
```

Property Value

An optional **double** value specifying the size of fold/unfold icon. The default value is **null**.

Remarks

If this property is not set, the fold icon derives its size from CaptionHeight.

Foldable Property

ContainerNode.HighlightPen Property

Gets or sets the pen used to draw the container frame lines when an item is dragged over the container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen HighlightPen { get; set; }
```

Visual Basic Copy Code

```
Public Property HighlightPen As Pen
```

Property Value

An instance of the Pen class. Initialized with the value of ContainerHighlightPen.

Remarks

The highlight rectangle is not drawn when AllowAddChildren is disabled.

ContainerNode.Margin Property

Gets or sets how much space should be left between contained nodes and the container borders.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Margin { get; set; }
```

Visual Basic Copy Code

```
Public Property Margin As Double
```

Property Value

A float value specifying the margin size. Initialized with the value of ContainerMargin.

AutoShrink Property

ContainerNode.MinimumSize Property

Gets or sets the minimum size of the container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Size MinimumSize { get; set; }
```

Visual Basic Copy Code

```
Public Property MinimumSize As Size
```

Property Value

A **Size** object specifying the minimum size. Initialized with the value of ContainerMinimumSize.

Remarks

The container won't shrink smaller than that size, even if it does not contain any items.

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace
AutoShrink Property

ContainerNode.Scrollable Property

Gets or sets a value indicating whether users are allowed to scroll the contents of this container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Scrollable { get; set; }
```

Visual Basic Copy Code

```
Public Property Scrollable As Boolean
```

Property Value

true to let users scroll this container, or **false** otherwise.

Remarks

Note that in order to let container's contents overflow and become scrollable, you must either disable AutoGrow, or allow users reduce container size by changing HandlesStyle and EnabledHandles properties from their default MoveOnly / Move values.

ScrollX Property
ScrollY Property

ContainerNode.ScrollX Property

Gets or sets the container's horizontal scroll position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ScrollX { get; set; }
```

Visual Basic Copy Code

```
Public Property ScrollX As Double
```

Property Value

A **float** value specifying horizontal scroll offset.

Remarks

ScrollX is one of the few properties that automatically create a record in the undo history. If you need to undo a sequence of property changes that includes **ScrollX** as a single operation, you will need to use composite undo commands.

ScrollY Property
Scrollable Property

ContainerNode.ScrollY Property

Gets or sets the container's vertical scroll position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ScrollY { get; set; }
```

Visual Basic Copy Code

```
Public Property ScrollY As Double
```

Property Value

A **float** value specifying vertical scroll offset.

Remarks

ScrollY is one of the few properties that automatically create a record in the undo history. If you need to undo a sequence of property changes that includes **ScrollY** as a single operation, you will need to use composite undo commands.

ContainerNode.Shape Property

Gets or sets the shape of the container's outline.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SimpleShape Shape { get; set; }
```

Visual Basic Copy Code

```
Public Property Shape As SimpleShape
```

Property Value

A member of the SimpleShape enumeration.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace
ClipChildren Property

ContainerNode.UnfoldedSize Property

Returns the original size of a folded container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Size UnfoldedSize { get; set; }
```

Visual Basic Copy Code

```
Public Property UnfoldedSize As Size
```

Property Value

A **Size** instance containing the original size of the container.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.Visible Property

Gets or sets a value indicating whether the container is visible.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool Visible { get; set; }
```

Visual Basic Copy Code

```
Public Overrides Property Visible As Boolean
```

Property Value

true if the item is visible; otherwise, **false**.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNodeProperties Class

Stores the values of ContainerNode properties during undo / redo operations.

Syntax

C# Copy Code

```
public class ContainerNodeProperties : DiagramNodeProperties
```

Visual Basic Copy Code

```
Public Class ContainerNodeProperties
    Inherits DiagramNodeProperties
```

Remarks

If you need to implement undo support for the additional properties defined by a class derived from ContainerNode, do so by deriving from **ContainerNodeProperties** and overriding the SaveProperties, RestoreProperties, and CreateProperties methods of

ContainerNode.

MindFusion.Diagramming Namespace

ContainerNodeStyle Members

Represents a reusable set of properties that define the appearance of container nodes.

The following tables list the members exposed by the ContainerNodeStyle type.

Public Constructors

	Name	Description
	ContainerNodeStyle	Initializes a new instance of the **ContainerNodeStyle** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	Effects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	FontFamily	Gets or sets the font family of the item text. (Inherited from DiagramItemStyle.)
	FontSize	Gets or sets the font size of the item text. (Inherited from DiagramItemStyle.)
	FontStyle	Gets or sets the font style of the item text. (Inherited from DiagramItemStyle.)
	FontUnit	Gets or sets the font unit of the item text. (Inherited from DiagramItemStyle.)
	ShadowBrush	Gets or sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	Stroke	Gets or sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	StrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline items. (Inherited from DiagramItemStyle.)
	StrokeThickness	Gets or sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)

Public Methods

	Name	Description
	GetProperties	Gets all properties in the style. (Inherited from Style.)
	GetProperty	Returns the property with the specified name, if any. (Inherited from Style.)
S	RegisterType	Associates a type with an alias. (Inherited from Style.)

Protected Methods

	Name	Description
	GetValue	Gets the value of the specified property. (Inherited from Style.)
	IsPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	LoadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	LoadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from Style.)
	RegisterProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	SaveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	SaveToXml	Saves the style content into an XML element. (Inherited from Style.)
	SetValue	Sets the value of the specified property. (Inherited from Style.)
	UnsetValue	Clears the value of the specified property. (Inherited from Style.)

Public Events

	Name	Description
	PropertyChanged	Raised when any of the registered style properties has changed. (Inherited from Style.)

ContainerPage Constructor (ContainerPage)

Initializes a new instance of the ContainerPage class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerPage (
    ContainerPage prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As ContainerPage _
)
```

Parameters

prototype

See Also

ContainerPage Properties

ContainerPage.Links Property

Gets the links on this page.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLinkCollection Links { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Links As DiagramLinkCollection
```

Property Value

A DiagramLinkCollection instance.

Remarks

Unlike Nodes, the control does not add links to this collection automatically, as ownership could be ambiguous (when considering nested containers, cross-container links, etc). This list lets you associate links with a page yourself when you want it hidden along with the page. The container automatically hides links between direct child nodes of non-current page.

See Also

ContainerPage Members
ContainerPage Class
MindFusion.Diagramming Namespace

ContainerPage.Nodes Property

Gets the nodes on this page.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNodeCollection Nodes { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Nodes As DiagramNodeCollection
```

Property Value

A DiagramNodeCollection instance.

Remarks

PagedContainerNode automatically adds child nodes to this list when users drag them into CurrentPage.

ContainerPage Members
ContainerPage Class
MindFusion.Diagramming Namespace

ContainerPage.Title Property

Gets or sets the title of this page.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Title { get; set; }
```

Visual Basic Copy Code

```
Public Property Title As String
```

Property Value

A string containing title text.

Remarks

PagedContainerNode set its Caption text to the title of CurrentPage.

ContainmentKeys Enumeration

For internal use.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum ContainmentKeys
```

Visual Basic Copy Code

```
Public Enum ContainmentKeys
```

Members

	Member name	Description
	InContainer	Set for Group.Attachment objects for nodes in a container.

See Also

MindFusion.Diagramming Namespace

ControlMouseAction Enumeration

Specifies available ways to handle mouse clicks on .NET controls hosted in a **ControlNode**.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum ControlMouseAction
```

Visual Basic Copy Code

```
Public Enum ControlMouseAction
```

Members

	Member name	Description
	PassToControl	Let the control handle the mouse click. Do not select the host node.
	SelectNode	The host node gets selected when the control is clicked. The control is left to handle the mouse click too.
	IgnoreControl	MvcDiagram tries to intercept the mouse message and not pass it to the control. That allows drawing links from anywhere within the control.

Remarks

IgnoreControl works only with controls that do not capture the mouse.

ControlPointEventArgs Class
MindFusion.Diagramming Namespace

ControlPointEventArgs Constructor

Initializes a new instance of the ControlPointEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ControlPointEventArgs (
    ShapeControlPoint controlPoint,
    ShapeNode node,
    ShapeFormulaParam oldValue,
    ShapeFormulaParam newValue
)
```

Visual Basic Copy Code

```
Public New ( _
    controlPoint As ShapeControlPoint, _
    node As ShapeNode, _
    oldValue As ShapeFormulaParam, _
    newValue As ShapeFormulaParam _
)
```

Parameters

controlPoint
The ShapeControlPoint used to modify the node's shape.

node
The ShapeNode whose Shape has been modified.

oldValue
A ShapeFormulaParam specifying the original position of the control point.

newValue
A **ShapeFormulaParam** specifying the new position of the control point.

Converter Members

Provides capabilities to convert various types to and from strings in a culture-independent way.

The following tables list the members exposed by the Converter type.

Public Methods

	Name	Description
	FromBoolean	Converts the specified bool value to string.
	FromByte	Converts the specified byte value to string.
	FromChar	Converts the specified char value to string.
	FromColor	Converts the specified color value to string in the format #AARRGGBB.
	FromDecimal	Converts the specified decimal to string.
	FromDouble	Converts the specified double value to string.
	FromEnum	Converts the specified enum value to a string.
	FromImage	Converts the specified image to string.
	FromInt16	Converts the specified 16-bit integer value to string.
	FromInt32	Converts the specified 32-bit integer value to string.
	FromInt64	Converts the specified 64-bit integer to string.
	FromSByte	Converts the specified 8-bit signed integer to string.
	FromSingle	Converts the specified float value to string.
	FromStream	Converts the specified stream to string.
	FromStreamV4	Converts the specified memory stream to string.
	FromUInt16	Converts the specified unsigned 16-bit integer value to string.
	FromUInt32	Converts the specified unsigned 32-bit integer value to string.
	FromUInt64	Converts the specified unsigned 64-bit integer value to string.
	ImageFromString	Converts the specified string value to image.
	ToBoolean	Converts the specified string value to bool.
	ToByte	Converts the specified string value to byte value.
	ToChar	Converts the specified string value to char.
	ToColor	Converts the specified string value to Color.
	ToDecimal	Converts the specified string value to decimal.

	ToDouble	Converts the specified string value to double.
	ToEnum	Converts the specified string value to its corresponding enumeration member of the specified type.
	ToImage	Converts the specified string value to image.
	ToInt16	Converts the specified string value to 16-bit integer.
	ToInt32	Overloaded. Converts a string value to 32-bit integer.
	ToInt64	Converts the specified string value to 64-bit integer.
	ToSByte	Converts the specified string value to 8-bit signed integer.
	ToSingle	Converts the specified string value to float.
	ToStream	Converts the specified string value to stream.
	ToStreamV4	Converts the specified string value to stream.
	ToUint16	Converts the specified string value to unsigned 16-bit integer.
	ToUint32	Converts the specified string value to unsigned 32-bit integer.
	ToUint64	Converts the specified string value to unsigned 64-bit integer.

Converter Methods

Converter.FromBoolean Method

Converts the specified bool value to string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static string FromBoolean (
    bool val
)
```

Visual Basic Copy Code

```
Public Shared Function FromBoolean( _
    val As Boolean _
) As String
```

Parameters

val
The value to convert.

Return Value

A string representing the specified value.

See Also

Converter.FromByte Method

Converts the specified byte value to string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static string FromByte (
    byte val
)
```

Visual Basic Copy Code

```
Public Shared Function FromByte( _
    val As Byte _
) As String
```

Parameters

val
The value to convert.

Return Value

A string representing the specified value.

C# Copy Code

```
public static string FromDecimal (
    decimal val
)
```

Visual Basic Copy Code

```
Public Shared Function FromDecimal( _
    val As Decimal _
) As String
```

Parameters

val
The value to convert.

Return Value

A string representing the specified value.

See Also

Converter Members
Converter Class
MindFusion.Diagramming Namespace

Converter.FromDouble Method

Converts the specified double value to string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static string FromDouble (
    double val
)
```

Visual Basic Copy Code

```
Public Shared Function FromDouble( _
    val As Double _
) As String
```

Parameters

val
The value to convert.

Return Value

A string representing the specified value.

See Also

Converter Members
Converter Class
MindFusion.Diagramming Namespace

Converter.FromEnum Method

Converts the specified enum value to a string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static string FromEnum (
    Object val
)
```

Visual Basic Copy Code

```
Public Shared Function FromEnum( _
    val As Object _
) As String
```

Parameters

val
The value to convert.

Return Value

A string representing the specified value.

Converter.FromImage Method

Converts the specified image to string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static string FromImage (
    IImage val
)
```

Visual Basic Copy Code

```
Public Shared Function FromImage( _
    val As IImage _
) As String
```

Parameters

val
The **Image** object to convert.

Return Value

A string representing the specified value.

See Also

Converter Members
Converter Class
MindFusion.Diagramming Namespace

Converter.FromInt16 Method

Converts the specified 16-bit integer value to string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static string FromInt16 (
    short val
)
```

Visual Basic Copy Code

```
Public Shared Function FromInt16( _
    val As Short _
) As String
```

Parameters

val
The value to convert.

Return Value

A string representing the specified value.

See Also

Converter Members

Converter.FromInt32 Method

Converts the specified 32-bit integer value to string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static string FromInt32 (
    int val
)
```

Visual Basic Copy Code

```
Public Shared Function FromInt32( _
    val As Integer _
) As String
```

Parameters

val
The value to convert.

Return Value

A string representing the specified value.

See Also

Converter Members

Converter.FromInt64 Method

Converts the specified 64-bit integer to string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static string FromInt64 (
    long val
)
```

Visual Basic Copy Code

```
Public Shared Function FromInt64( _
    val As Long _
```

```
) As String
```

Parameters

val
The value to convert.

Return Value

A string representing the specified value.

See Also

Converter.FromSByte Method

Converts the specified 8-bit signed integer to string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static string FromSByte (
    sbyte val
)
```

Visual Basic Copy Code

```
Public Shared Function FromSByte( _
    val As SByte _
) As String
```

Parameters

val
The value to convert.

Return Value

A string representing the specified value.

Converter.FromStreamV4 Method

Converts the specified memory stream to string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static string FromStreamV4 (
    MemoryStream val
)
```

Visual Basic

```
Public Shared Function FromStreamV4( _
    val As MemoryStream _
) As String
```

Parameters

val
The **Stream** object to convert.

Return Value

A string representing the specified value.

Remarks

This method is used in XML file format 4 and earlier.

Converter.ToEnum Method

Converts the specified string value to its corresponding enumeration member of the specified type.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Object ToEnum (
    Type type,
    string s
)
```

Visual Basic Copy Code

```
Public Shared Function ToEnum( _
    type As Type, _
    s As String _
) As Object
```

Parameters

type
The type of the enumeration to convert to.

s

The string value to convert from.

Return Value

A member of the specified enumeration that is deserialized from the specified string, possibly a **null** reference (**Nothing** in Visual Basic) if the deserialization failed.

ToInt32 Method Overload List
Converter Members

Converter.ToInt32 Method (String, Int32)

Converts the specified string value to 32-bit integer without throwing exceptions. In case the specified string cannot be converted, the specified default value is returned.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static int ToInt32 (
    string s,
    int defaultValue
)
```

Visual Basic Copy Code

```
Public Shared Function ToInt32( _
    s As String, _
    defaultValue As Integer _
) As Integer
```

Parameters

s
The string value to convert from.

defaultValue
The default value to return if *s* cannot be deserialized.

Return Value

A 32-bit integer value that is deserialized from the specified string.

Converter.ToStream Method

Converts the specified string value to stream.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Stream ToStream (
    string s
)
```

Visual Basic Copy Code

```
Public Shared Function ToStream( _
    s As String _
) As Stream
```

Parameters

s
The string value to convert from.

Return Value

A .NET **Stream** object that is deserialized from the specified string.

See Also

Converter.ToStreamV4 Method

Converts the specified string value to stream.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Stream ToStreamV4 (
    string s
)
```

Visual Basic Copy Code

```
Public Shared Function ToStreamV4( _
    s As String _
```

```
) As Stream
```

Parameters

s
The string value to convert from.

Return Value

A .NET **Stream** object that is deserialized from the specified string.

Remarks

This method is used in XML file format 4 and earlier.

Converter.ToUint16 Method

Converts the specified string value to unsigned 16-bit integer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static ushort ToUint16 (
    string s
)
```

Visual Basic Copy Code

```
Public Shared Function ToUint16( _
    s As String _
) As UShort
```

Parameters

s
The string value to convert from.

Return Value

An unsigned 16-bit integer value that is deserialized from the specified string.

See Also

Converter.ToUint32 Method

Converts the specified string value to unsigned 32-bit integer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static uint ToUint32 (
    string s
```

```
)
```

Visual Basic Copy Code

```
Public Shared Function ToUint32( _
    s As String _
) As UInteger
```

Parameters

s
The string value to convert from.

Return Value

An unsigned 32-bit integer value that is deserialized from the specified string.

See Also

Converter Members
Converter Class
MindFusion.Diagramming Namespace

Converter.ToUint64 Method

Converts the specified string value to unsigned 64-bit integer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static ulong ToUint64 (
    string s
)
```

Visual Basic Copy Code

```
Public Shared Function ToUint64( _
    s As String _
) As ULong
```

Parameters

s
The string value to convert from.

Return Value

An unsigned 64-bit integer value that is deserialized from the specified string.

CreatePathDelegate Delegate

Specifies the signature of callback functions used to generate dynamic node shapes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public delegate IGraphicsPath CreatePathDelegate (
    Rect nodeBounds
)
```

Visual Basic Copy Code

```
Public Delegate Function CreatePathDelegate( _
    nodeBounds As Rect _
) As IGraphicsPath
```

Parameters

nodeBounds
A Rect object.

Return Value

A IGraphicsPath specifying the shape outline or decorations.

See Also

MindFusion.Diagramming Namespace

CustomDraw Enumeration

Specifies what kind of custom painting to perform on diagram elements.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum CustomDraw
```

Visual Basic Copy Code

```
Public Enum CustomDraw
```

Members

	Member name	Description
	None	Do not perform custom drawing, let all painting be done by MvcDiagram.
	Additional	The custom painting code executes after item's interior and frame are painted by MvcDiagram, but before text is rendered. In this mode, the **Graphics** instance passed to the custom drawing event handler has a clipping region applied to it.
	Full	The component does not do any standard drawing, the entire painting of an item is done by the application.
	ShadowOnly	Only the shadow of an item is painted by custom code, the item itself is drawn by the component.
	Additional2	The custom painting code executes after all parts of an item are painted by MvcDiagram. In this mode, the **Graphics** instance passed to the custom drawing event handler doesn't have a clipping region applied to it.

Remarks

These values can be assigned to the **CustomDraw** property of shapes, tables and links.

Diagram Class

Represents a flow diagram.

Syntax

C# Copy Code

```
public class Diagram : DiagramBase
```

Visual Basic Copy Code

```
Public Class Diagram
    Inherits DiagramBase
```

Remarks

An instance of the **Diagram** class represents a diagram document. A **Diagram** instance does not provide its own user interface. To display a diagram on a form, add a **DiagramView** instance to the form and set the view's **Diagram** property. A diagram can be displayed in more than one view.

A diagram can contain connected nodes and links. Nodes are instances of DiagramNode-derived classes. Nodes are stored in the Nodes collection. Links in MvcDiagram are instances of the DiagramLink class and are stored in the Links collection. Diagram items can be grouped in hierarchical structures and the so formed groups can be accessed by means of the Groups collection.

Managing Items

Items can be created by using the **new** operator and added to the diagram by means of the **Add** method of the Nodes or Links collection. Items are deleted by using the **Remove** method of the respective collection. There are shortcut methods provided by the diagram's Factory object that can be used to create an item and add it to the diagram with just one method call. Use the CreateTableNode, CreateShapeNode and CreateDiagramLink factory methods to create new items of the respective type.

Hierarchical groups of items are created by adding a Group instance to the diagram's Groups collection. The **Factory** object provides a shortcut CreateGroup method to do that with a single method call. Use the Remove method of the **Groups** collection to destroy a group.

Searching for a particular kind of items is done with the FindLink, FindNode and FindGroup methods, which look for an item that has a particular Tag, or FindLinkById and FindNodeById to find items by their Id. To get the item placed at a certain location, use

the GetItemAt method.

Serialization

Binary serialization of diagrams is provided by the SaveToStream and LoadFromStream methods which serialize diagrams to / from .NET streams. SaveToFile and LoadFromFile wrap their stream counterparts to implement easy serialization to disk files. SaveToString and LoadFromString store or load diagrams to/from ASCII strings, allowing easy storage of whole diagrams in a database or their transfer between a web-server and a browser through a hidden html element.

Use the SaveToXml and LoadFromXml methods to serialize a diagram into/from XML documents.

Controlling Users' Actions

Most aspects of user interaction are controlled by the **DiagramView** class.

Users actions can be validated by handling various events, fired while items are being created, modified or deleted.

The following properties control what kind of links users can create: AllowLinksRepeat, AllowSelfLoops, AllowUnanchoredLinks, AllowUnconnectedLinks.

The order in which items are hit-tested when clicking on them depends on the value of HitTestPriority. The LinkHitDistance property specifies the furthest distance from a link that a click would be still considered a hit.

Alignment

Items are aligned to a grid when AlignToGrid is enabled. To display the grid, set ShowGrid to true. The grid size and appearance can be customized via the GridSizeX, GridSizeY, GridColor and GridStyle properties.
If AutoAlignNodes is enabled, nodes are aligned to other nodes so that a pair of their vertical or horizontal sides become collinear. To specify the maximal distance at which nodes are aligned, set the AutoAlignDistance property. The pair of aligned nodes is indicated visually by drawing an alignment guide using the pen assigned to AlignmentGuidePen.

Links can also automatically snap to nodes when AutoSnapLinks is set. The maximal distance at which links will connect to a nearby node is set via AutoSnapDistance.

Appearance

The **Diagram** background area can be painted using a solid, gradient, texture or color brush, by setting the BackBrush property, and/or using an image specified by BackgroundImage and BackgroundImageAlign. Some more elaborate visual effects can be applied by means of the EffectsProvider, EnableEmbossEffects and EnableShadowEffects properties.

To further customize the diagram appearance, handle the DrawBackground event to render custom background graphics, or the DrawForeground event to render custom foreground graphics.

Lanes

The lane grid lets you emphasize the relationship between a group of diagram items by displaying them in a distinct lane or cell within the grid. Use the EnableLanes property to display a background grid of lanes, optionally divided into cells. The grid can be set up using the LaneGrid property.

Text Formatting

Use TextFormat and TextColor to specify alignment and color of the text for all diagram items. EnableStyledText allows using HTML-like tags to format item's text. PolygonalTextLayout allows laying text out inside non-rectangular node shapes.

Tweaks

- While moving grouped items, they are drawn in depth conforming to either their z-order or their group hierarchy, as set in SortGroupsByZ.
- SelectionOnTop specifies whether selected items should be painted on top of other items.
- MergeThreshold specifies how closely to each other adjacent link points should be placed in order to merge link segments.

Default Item Properties

Many properties of the **Diagram** class provide initial values for the properties of new items.

Inheritance Hierarchy

System.Object
  System.MarshalByRefObject
    System.ComponentModel.Component
      MindFusion.Diagramming.DiagramBase

Diagram Members

Represents a flow diagram.

The following tables list the members exposed by the Diagram type.

Public Constructors

	Name	Description
	Diagram	The Diagram class represents a flow diagram.

Public Fields

	Name	Description
	Dummy	A shared DummyNode instance.

Public Properties

	Name	Description
	ActiveItem	Gets or sets the active diagram element.
	ActiveItemHandlesStyle	Gets the visual style of adjustment handles of the active item.
	ActiveLayer	Gets or sets the zero-based index of the active layer.
	AdjustmentHandlesSize	Gets or sets the size of the handles, which appear around selected objects.
	AlignmentGuidePen	Gets or sets the pen used to draw alignment guides.
	AlignToGrid	Gets or sets a value indicating whether the diagram items is aligned to a grid.
	AllowLinksRepeat	Gets or sets a value indicating whether more than one link can connect the same origin and destination diagram nodes.
	AllowMultipleResize	Gets or sets whether multiple selected nodes can be resized simultaneously.
	AllowSelfLoops	Gets or sets a value indicating whether self-loops are allowed.
	AllowSplitLinks	Gets or sets a value indicating whether link segments can be added and removed interactively.
	AllowUnanchoredLinks	Gets or sets a value indicating whether links can be connected to nodes to which there aren't anchor points assigned.
	AllowUnconnectedLinks	Gets or sets a value indicating whether users are allowed to draw links that are not connected to any node.
	AutoAlignDistance	Gets or sets the maximal horizontal or vertical distance at which a node aligns to the borders of other nodes.
	AutoAlignNodes	Gets or sets whether nodes should automatically align to the borders of other nodes during user interaction.
	AutoArrangeAvoidContainers	Gets or sets a value indicating whether auto-arranged link labels should avoid containers.
	AutoArrangeAvoidSegments	Gets or sets a value indicating whether auto-arranged link labels should avoid link segments.
	AutoCloseDistance	Gets or sets the maximum distance between first and last points of a FreeFormNode for which the node's outline is closed automatically.
	AutoDeleteLinks	Gets or sets whether links are deleted automatically when their Origin or Destination is deleted.
	AutoHighlightRows	Gets or sets whether a table row should be highlighted when the user clicks on it.
	AutoResize	Gets or sets a value indicating whether the document area must be resized automatically so it fits the diagram contents.

	AutoSnapDistance	Specifies the maximum distance at which links auto-snap to nodes.
	AutoSnapLinks	Gets or sets the default value for the AutoSnapToNode property of new links.
	BackBrush	Gets or sets the brush used for painting the diagram background.
	BackgroundImage	Gets or sets the image displayed as background of this diagram.
	BackgroundImageAlign	Gets or sets a value indicating how the background image is positioned, relatively to the scrollable document area.
	BackgroundImageUrl	URL of the image painted as diagram's background.
	BarcodeNodeStyle	Gets the theme-level style for barcode nodes.
	Bounds	Gets or sets a value representing the size of the diagram's scrollable area.
	BoundsPen	The pen with which the document bounds should be drawn.
	BranchIndicatorColor	Gets or sets the color of link branch indicators.
	BranchIndicatorSize	Gets or sets the size of link branch indicators.
	CellCustomDraw	Gets or sets the default type of custom painting done on the cells of tables.
	CellFrameStyle	Gets or sets the default cell border style of new tables.
	CompositeNodeStyle	Gets the theme-level style for composite nodes.
	ContainerCaption	Gets or sets the default value for the Caption property of containers.
	ContainerCaptionHeight	Gets or sets the default value for the CaptionHeight property of containers.
	ContainerHighlightPen	Gets or sets the default value for the HighlightPen property of containers.
	ContainerMargin	Gets or sets the default value for the Margin property of containers.
	ContainerMinimumSize	Gets or sets the default value for the MinimumSize property of containers.
	ContainerNodeStyle	Gets the theme-level style for container nodes.
	ContainersFoldable	Gets or sets the default value for the Foldable property of containers.
	CrossingRadius	Gets or sets the radius length of decorations displayed at link intersection points.
	DefaultShape	Gets or sets the default shape of shape nodes.
	DiagramLinkStyle	Gets the theme-level style for diagram links.
	DiagramStyle	Gets the theme-level style for the diagram.
	Dirty	Gets or sets a value indicating whether the diagram has changed since the last save.
	DisabledHandlesStyle	Gets the visual style of disabled adjustment handles.
	DynamicLinks	Gets or sets the default value for the Dynamic property of new links.
	EffectiveBackBrush	Gets the currently effective background brush of the diagram.
	EffectsProvider	Gets or sets an object used to generate visual effects for shape nodes such as embossment and shadow dispersion.
	EnableEmbossEffects	Gets or sets a value indicating whether emboss effect for shape nodes is enabled.
	EnableLanes	Gets or sets whether lanes are enabled.

	EnableShadowEffects	Gets or sets a value indicating whether the shadow dispersion effect for nodes is enabled.
	EnableSpatialIndex	Gets or sets whether to index item positions for faster hit-testing and viewport clipping queries.
	EnableStyledText	Gets or sets the default value for the EnableStyledText property of new nodes.
	ExpandButtonAction	Gets or sets a value indicating what should happen when a user clicks the [±] button that is displayed near expandable nodes.
	ExpandButtonPosition	Gets or sets where expand/collapse buttons are located relatively to their nodes.
	ExpandOnIncoming	Gets or sets a value, indicating in which direction object hierarchies are expanded.
	ExteriorBrush	Gets or sets the brush used for painting the area outside **Bounds**.
	Factory	Gets a Factory instance that lets you add programmatically new items to the diagram.
	FocusedComponent	Gets or sets the component within this diagram which currently has the input focus.
	FoldedContainerSize	Gets or sets the size of folded containers.
	Font	Gets or sets the default font for new diagram items.
	FreeFormAttractDistance	Gets or sets the radius around dragged free-form adjustment handle in which other points of FreeFormNode are modified too.
	FreeFormTargets	An array of Shape objects used to replace FreeFormNode instances with ShapeNode ones when Behavior is set to LinkFreeShapes or DrawFreeShapes.
	GridColor	Gets or sets the color of the grid points.
	GridOffsetX	Gets or sets the horizontal offset of the first point of the alignment grid.
	GridOffsetY	Gets or sets the vertical offset of the first point of the alignment grid.
	GridPatternHatch	Gets or sets a hatch style used to draw dense alignment grid at low zoom levels.
	GridPatternThreshold	Gets or sets the distance between grid points (in pixels) that triggers drawing using **GridPatternHatch**.
	GridSizeX	Gets or sets the horizontal distance between adjacent grid points.
	GridSizeY	Gets or sets the vertical distance between adjacent grid points.
	GridStyle	Gets or sets the visual style of the alignment grid.
	Groups	Gets a collection of all groups in the diagram.
	HitTestPriority	Gets or sets a value indicating the order in which items are hit-tested.
	Interaction	Gets an InteractionState instance representing the current action being carried out by the user.
	IsProEdition	Gets a value indicating whether the currently loaded MvcDiagram is a professional version of the control.
	Items	Gets a collection of all items in this diagram.
	LaneGrid	Gets the Grid instance that represents the lane grid.
	Layers	Gets a list of the layers in the current diagram.
	LinkBaseShape	Gets or sets the shape displayed at the base of new links.
	LinkBaseShapeSize	Gets or sets the default size of the base of new links.

	LinkBranchIndicator	Gets or sets a value indicating what shapes to display as markers at points where overlapping Cascading links diverge.
	LinkBrush	Gets or sets the default value for the Brush property of links.
	LinkCascadeOrientation	Gets or sets the initial orientation of the first segment of new cascading links.
	LinkCrossings	Gets or sets how to render the intersection points where links cross their paths.
	LinkCustomDraw	Gets or sets the default type of custom painting done on links.
	LinkEndsMovable	Gets or sets a value indicating whether link ends can be moved by users after the link is created.
	LinkHandlesStyle	Gets or sets the default value for the HandlesStyle property of new links.
	LinkHeadShape	Gets or sets the shape displayed as head of new links.
	LinkHeadShapeSize	Gets or sets the default size of arrowheads.
	LinkHitDistance	Gets or sets a value specifying how far from a link a click is still considered a hit.
	LinkIntermediateShape	Gets or sets the default shape to be displayed in the middle of each segment of links.
	LinkIntermediateShapeSize	Gets or sets the default size of the shapes at middles of link segments.
	LinkMergeIndicator	Gets or sets a value indicating what shapes to display as markers at points where overlapping **Cascading** links merge.
	LinkPen	Gets or sets the default value for the Pen and HeadPen properties of links.
	LinkRouter	Gets or sets the component used to find paths for auto-routed links when diagram nodes are added or their positions change.
	Links	Gets a collection of all DiagramLink objects in the diagram.
	LinkSegments	Gets or sets the default number of link segments.
	LinkShape	Gets or sets the default value of the Shape property of new links.
	LinksRetainForm	Gets or sets whether links should maintain their forms if the nodes linked with those links are moved around.
	LinkText	Gets or sets the default text of links.
	LinkTextStyle	Gets or sets default placement and orientation for links' text.
	MeasureTextRenderingHint	Gets or sets the TextRenderingHint to use when measuring texts. This should be effectively set to the value of DiagramView.TextRenderingHint.
	MeasureUnit	Gets or sets the unit of measure used for logical coordinates in this diagram.
	MergeIndicatorColor	Gets or sets the color of link merge indicators.
	MergeIndicatorSize	Gets or sets the size of link merge indicators.
	MergeThreshold	Gets or sets the maximum distance between adjacent control points of a link at which the respective segments can be merged.
	MinimumNodeSize	Gets or sets the minimum node size that the user is allowed to set.
	ModificationEffect	Gets or sets the visual effect to apply during interactive modification of items.
	NodeEffects	Gets a collection with all effects applied to the nodes of this diagram.
	Nodes	Gets a collection of all DiagramNode objects in the diagram.

	NodesExpandable	Gets or sets a value indicating whether newly created nodes can be expanded.
	NowLoading	Gets a value indicating whether the diagram data is now being loaded from a file.
	PolygonalTextLayout	Gets or sets a value indicating whether to enable the formatting of text inside non-rectangular shape node outlines.
	RecursiveExpand	Gets or sets value indicating how a tree is expanded.
	RenderOptions	Gets the current rendering options for this diagram.
	RestrictItemsToBounds	Gets or sets a value indicating whether users are allowed to place items outside the scrollable area of the diagram.
	RoundedLinks	Gets or sets a value indicating whether the joins between segments of **Polyline** and **Cascading** links should be rounded.
	RoundedLinksRadius	Gets or sets the radius of arc joins of rounded links' segments.
	RoundRectFactor	Gets or sets the relative size of arcs displayed at the corners of rounded rectangles.
	RouteLinks	Gets or sets a value indicating whether links should avoid nodes by going the shortest path from their origin to their destination without crossing any other nodes.
	RoutingOptions	Gets an object, which allows customizing various parameters of the link routing algorithm.
	RowHighlightBrush	Gets or sets the Brush used to fill highlighted table rows.
	ScriptHelper	Gets a ScriptHelper object which can be used in html scripts to instantiate various objects and to call static methods.
	SelectAfterCreate	Gets or sets a value indicating whether newly created objects are automatically selected.
	SelectedItemHandlesStyle	Gets the visual style of adjustment handles of selected items.
	Selection	Gets a Selection instance that represents the selection of items in this diagram.
	SelectionOnTop	Gets or sets a value indicating whether selected items should be painted on top of other items.
	SerializationBinder	Gets or sets a SerializationBinder object used to control class loading.
	ShadowBrush	Gets or sets the default brush used to paint the shadows cast by diagram items.
	ShadowOffsetX	Gets or sets the horizontal offset of item shadows.
	ShadowOffsetY	Gets or sets the vertical offset of item shadows.
	ShadowsStyle	Gets or sets the style for rendering shadows.
	ShapeBrush	Gets or sets the default value for the **Brush** property of shape nodes.
	ShapeCustomDraw	Gets or sets the default type of custom painting done for shape nodes.
	ShapeHandlesStyle	Gets or sets the default value for the **HandlesStyle** property of new shape nodes.
	ShapeNodeStyle	Gets the theme-level style for shape nodes.
	ShapeOrientation	Gets or sets the default value for the ShapeOrientation property of shape nodes.
	ShapePen	Gets or sets the default value for the **Pen** property of shape nodes.
	ShapeText	Gets or sets the default text of shape nodes.

	ShowAnchors	Gets or sets a value indicating whether and when node anchor points should be displayed.
	ShowDisabledHandles	Gets or sets a value indicating whether manipulation handles are painted when they are disabled.
	ShowGrid	Gets or sets a value indicating whether the alignment grid is visible.
	ShowHandlesOnDrag	Gets or sets a value indicating whether to display selection handles of objects under the mouse while another object is being modified.
	SnapToAnchor	Gets or sets when link end points should be aligned to the nearest anchor points.
	SortGroupsByZ	Gets or sets a value indicating whether grouped items should be drawn sorted by their z-order while the whole group is being moved.
	Style	Gets or sets the style associated with the diagram.
	SvgNodeStyle	Gets the theme-level style for SVG nodes.
	TableBrush	Gets or sets the default value for the **Brush** property of tables.
	TableCaption	Gets or sets the default text for tables' captions.
	TableCaptionHeight	Gets or sets the default height of table captions.
	TableColumnCount	Gets or sets the default number of table columns.
	TableColumnWidth	Gets or sets the default width of tables' columns.
	TableConnectionStyle	Gets or sets a value indicating whether drawing a link between tables should connect the rows of those tables, or the tables as whole entities.
	TableCustomDraw	Gets or sets the default type of custom painting done on tables.
	TableHandlesStyle	Gets or sets the default value for the **HandlesStyle** property of new tables.
	TableNodeStyle	Gets the theme-level style for table nodes.
	TablePen	Gets or sets the default value for the **Pen** property of tables.
	TableRowCount	Gets or sets the default number of table rows.
	TableRowHeight	Gets or sets the default height of tables' rows.
	TableShape	Gets or sets the default value of the Shape property of new tables.
	TablesScrollable	Gets or sets the default value for the Scrollable property of new tables.
	Tag	Gets or sets custom data associated with this diagram.
	TextColor	Gets or sets the default color of text displayed inside diagram items.
	TextFormat	Gets or sets the default alignment and formatting style for text displayed inside nodes and table cells.
	Theme	Gets or sets the theme associated with the diagram.
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram.
	TouchHitDistance	Specifies distance from adjustment handles at which they are still considered as hit when processing touch input.
	TouchThreshold	Gets or sets the threshold value for easier touch interaction through adjustment handles.
	TreeViewNodeStyle	Gets the theme-level style for tree view nodes.
	UndoManager	Gets a reference to the diagram's UndoManager instance.

	ValidityChecks	Gets or sets a value indicating whether validity checks are performed each time an item is added to the diagram.
	VisioNodeStyle	Gets the theme-level style for Visio nodes.
	XmlOptions	An XmlOptions object providing properties for customizing the XML serialization process. (Inherited from DiagramBase.)

Public Methods

	Name	Description
	AlignPointToGrid	Returns a point of the alignment grid nearest to the one passed as an argument.
	AllowNodeBounds	Determines whether node can be placed at specified coordinates.
	Arrange	Arranges the diagram using the specified graph layout algorithm.
	ArrangeAnimated	Arranges the diagram using the specified graph layout algorithm, and animates items moving to their new positions.
	ArrangeAsync	Arranges the diagram asynchronously using the specified graph layout algorithm.
	ArrangeLinkLabels	Rearranges link labels whose AutoArrange property is enabled.
	ChangeUnit	Sets new **MeasureUnit** value and scales the coordinates of diagram items so that their absolute size remains unchanged.
	ClearAll	Removes all items from the diagram.
	Clone	Creates a copy of this diagram.
	CopySelection	Overloaded. Creates a copy of specified diagram elements.
	CopyTo	Copies this diagram's properties and items to specified target diagram.
	CreateImage	Overloaded. Creates a bitmap containing an image of the diagram.
	CreateMeasureGraphics	Creates an IGraphics object that can be used to obtain various string size measurements.
	CreateThemeFromDefaults	Creates a Theme object representing the default properties of the diagram.
	Draw	Renders the diagram on the specified **IGraphics** object.
	DrawAlignmentGuides	Draws the current alignment guides.
	DrawInteraction	Draws the items that the user is currently modifying.
	DrawInteractions	For internal use.
	DrawLayer	Renders all diagram items to the specified graphics.
S	DrawStyledText	Draws a formatted text string, the same way text is drawn in shape nodes whose **EnableStyledText** property is set to **true**. This method lets you display styled text in custom-drawn nodes or links.
	EffectiveTouchHitDistance	Returns **TouchHitDistance** or a default value.
	EnumByReverseZ	Hit-tests diagram items in reverse Z order.
	EnumTopLevelByReverseZ	Hit-tests diagram top-level items in reverse Z order.
	ExecuteCommand	Executes the specified command on this diagram.
	FindGroup	Finds the group that has the specified tag value.
	FindLink	Finds the link that has the specified tag value.
	FindLinkById	Finds the link that has the specified id value.

	FindNode	Finds the node that has the specified tag value.
	FindNodeById	Finds the node that has the specified id value.
	GetContentBounds	Returns the smallest rectangle that bounds all diagram objects.
	GetItemAt	Overloaded.
	GetLinkAt	Overloaded. Finds and returns the link that lies at the specified location.
	GetLinksAt	Returns the links that contain the specified point.
	GetNearestNode	Returns the node nearest to the specified point.
	GetNodeAt	Overloaded. Gets the node that lies at the specified location.
	GetNodesAt	Returns the nodes that contain the specified point.
	GetNodesInViewport	Returns all nodes visible in the current viewport.
	HandleKeyDown	Propagates keyboard input to interested manipulators and components.
	HandleKeyPress	Propagates keyboard input to interested manipulators.
	HandleKeyUp	Propagates keyboard input to interested components.
	HandleMouseMove	Propagates mouse input to interested manipulators.
	HitTestComponents	Tests whether the specified point is within a component of a diagram item and returns this component.
	HitTestLabels	Returns the item label located at specified position.
	HitTestManipulators	Tests whether the specified point is within the manipulator of a diagram object and triggers the manipulator.
	Invalidate	Overloaded. Invalidates the diagram or a region of the diagram, causing it to be repainted.
	InvalidateZOrder	Forces a new sort of the Z order list before next redraw.
	IsClassRegistered	Checks if a class is registered for serialization support.
	IsClientClassRegistered	Checks if a class is registered for JSON serialization support.
	IsItemInteractive	Checks if the specified item can be modified interactively.
	IsItemLocked	Checks if the specified item is locked.
	IsItemVisible	Checks if the specified item is currently visible.
	LoadFromJson	Loads the diagram from a JSON-formatted string.
	LoadFromJsonAsync	Loads the diagram from a JSON-formatted string.
	LoadFromJsonFile	Loads the diagram from a JSON file.
	LoadFromJsonFileAsync	Loads the diagram from a JSON file.
	LoadFromJsonObject	Loads the diagram from a JSON object.
	LoadFromString	Decodes diagram contents from a string that was created with SaveToString.
	LoadFromXml	Overloaded. Loads the contents of an XML diagram document into the control.
	LoadFromXmlAsync	Overloaded.
	LoadSelectionFromJson	
	MeasureString	Overloaded. Measures a text taking into consideration the current affine transform of the diagram.

	Navigate	Selects the nearest item in the specified direction.
	NewInstance	Custom Diagram classes must override this method to return an instance of their type.
	PasteSelection	Adds the specified items and groups to the specified diagram document.
	RaiseCellTextEdited	Raises the CellTextEdited event .
	RaiseCellTextEditing	Raises the CellTextEditing event to validate entering in-place editing mode.
	RaiseClicked	Overloaded. Raises the Clicked event of the diagram or one of the *Clicked events related to diagram items.
	RaiseCreated	Raises the appropriate *Created event according to the type of the specified item.
	RaiseDeleting	Raises the appropriate *Deleting event according to the type of the specified item.
	RaiseDoubleClicked	Overloaded. Raises the DoubleClicked event of the diagram or one of the *DoubleClicked events related to diagram items.
	RaiseLinkTextEdited	Raises the LinkTextEdited event.
	RaiseLinkTextEditing	Raises the LinkTextEditing event to validate entering inplace edit mode.
	RaiseModified	Raises the NodeModified event.
	RaiseMouseHover	Raises the appropriate Pointed event.
	RaiseNodeModifying	Raises the NodeModifying event. (Inherited from DiagramBase.)
	RaiseNodeTextEdited	Raises the NodeTextEdited event.
	RaiseNodeTextEditing	Raises the NodeTextEditing event to validate entering inplace edit mode.
	RaisePasted	Raises the appropriate Pasted event.
	RaiseSelecting	Raises the appropriate Selecting event.
	RaiseTreeItemTextEditing	Raises the TreeItemTextEditing event to validate entering inplace edit mode.
	RaiseViewRemoved	Raises the ViewRemoved event.
	RegisterClass	Overloaded.
	RegisterDefaultStyle	Registers a default style for the objects of the specified type.
	RegisterItemClass	Overloaded.
	ResetAlignmentGuides	For internal use.
	ResizeToFitItem	Resizes the document extents so that the specified item is contained within.
	ResizeToFitItems	Overloaded. Resizes the document scrollable area so it fits all diagram items.
	ResumeLinkRouter	Called when the control ends a batch update operation that might affect many links.
	RouteAllLinks	Overloaded.
	SaveSelectionToJson	Saves the diagram selection to a JSON object.
	SaveToJson	Saves the diagram to a JSON-formatted string.
	SaveToJsonAsync	Saves the diagram to a JSON-formatted string.
	SaveToJsonFile	Saves the diagram into a JSON file.

	SaveToJsonFileAsync	Saves the diagram into a JSON file.
	SaveToJsonObject	Saves the diagram to a JSON object.
	SaveToString	Encodes the diagram contents into an ASCII string using the specified format and optionally clearing the **Dirty** flag.
	SaveToXml	Overloaded. Saves the diagram to an XML document.
	SaveToXmlAsync	Overloaded.
	SetShadowOffset	Sets the default offset at which items shadows are drawn.
	SuspendLinkRouter	Called when the control starts a batch update operation that might affect many links. The diagram collects links specified through Route and RouteAllLinks calls and defers finding their paths to when **ResumeLinkRouter** is called.
	TrackMouseHover	Specifies whether the diagram view should track mouse hover events. (Inherited from DiagramBase.)
	UpdateMeasureTextScale	Gets or sets the scale to use when measuring texts. This should be effectively set to the value of DiagramView.Zoom / 100.
	UpdateRuntimeIndices	For internal use.
	UpdateZOrder	Immediately sorts the Z-order list if Z-order has been invalidated. Otherwise it will be sorted next time the diagram draws its contents.

Protected Methods

	Name	Description
	AddItem	Invoked by the AddItemCmd and RemoveItemCmd classes to effectively add the specified item to the diagram.
	CreateAddItemCmd	Creates an **AddItemCmd** instance that implements undo/redo of adding an item to the diagram.
	CreateModifyItemCmd	Creates a ModifyItemCmd instance that implements undo/redo of item move and resize operations.
	CreateRemoveItemCmd	Creates a **RemoveItemCmd** instance that implements undo/redo of removing an item from the diagram.
	DeleteGroup	Removes the specified group from the group collection.
	Dispose	Clean up any resources being used.
	GetValue	Gets the effective value of the style property with the specified name.
	OnActionRecorded	Raises the ActionRecorded event. (Inherited from DiagramBase.)
	OnActionRecording	Raises the ActionRecording event. (Inherited from DiagramBase.)
	OnActionRedone	Raises the ActionRedone event. (Inherited from DiagramBase.)
	OnActionUndone	Raises the ActionUndone event. (Inherited from DiagramBase.)
	OnBeginLoad	Raises the BeginLoad event. (Inherited from DiagramBase.)
	OnBoundsChanged	Raises the BoundsChanged event. (Inherited from DiagramBase.)
	OnCellClicked	Raises the CellClicked event. (Inherited from DiagramBase.)
	OnCellDoubleClicked	Raises the CellDoubleClicked event. (Inherited from DiagramBase.)
	OnCellTextEdited	Raises the **CellTextEdited** event. (Inherited from DiagramBase.)
	OnCellTextEditing	Raises the **CellTextEditing** event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnClicked	Raises the **Clicked** event. (Inherited from DiagramBase.)

	OnContainerChildAdded	Raises the ContainerChildAdded event. (Inherited from DiagramBase.)
	OnContainerChildRemoved	Raises the ContainerChildRemoved event. (Inherited from DiagramBase.)
	OnContainerFolded	Raises the ContainerFolded event. (Inherited from DiagramBase.)
	OnContainerPageChanged	Raises the ContainerPageChanged event. (Inherited from DiagramBase.)
	OnContainerUnfolded	Raises the ContainerUnfolded event. (Inherited from DiagramBase.)
	OnContentVisibilityChanged	Raises the ContentVisibilityChanged event. (Inherited from DiagramBase.)
	OnDefaultShapeChanged	Raises the DefaultShapeChanged event. (Inherited from DiagramBase.)
	OnDeserializeTag	Raises the DeserializeTag event. (Inherited from DiagramBase.)
	OnDestinationAnchorChanged	Raises the DestinationAnchorChanged event. (Inherited from DiagramBase.)
	OnDirtyChanged	Raises the DirtyChanged event. (Inherited from DiagramBase.)
	OnDoubleClicked	Raises the **DoubleClicked** event. (Inherited from DiagramBase.)
	OnDrawAdjustmentHandles	Raises the DrawAdjustmentHandles event. (Inherited from DiagramBase.)
	OnDrawAnchorPoint	Raises the DrawAnchorPoint event. (Inherited from DiagramBase.)
	OnDrawBackground	Raises the DrawBackground event. (Inherited from DiagramBase.)
	OnDrawBranchIndicator	Raises the DrawBranchIndicator event. (Inherited from DiagramBase.)
	OnDrawCell	Raises the DrawCell event. (Inherited from DiagramBase.)
	OnDrawForeground	Raises the DrawForeground event. (Inherited from DiagramBase.)
	OnDrawLink	Raises the DrawLink event. (Inherited from DiagramBase.)
	OnDrawNode	Raises the DrawNode event. (Inherited from DiagramBase.)
	OnEndLoad	Raises the EndLoad event. (Inherited from DiagramBase.)
	OnExpandButtonClicked	Raises the ExpandButtonClicked event. (Inherited from DiagramBase.)
	OnGroupDestroyed	Raises the GroupDestroyed event. (Inherited from DiagramBase.)
	OnHitTestAdjustmentHandles	Raises the HitTestAdjustmentHandles event. (Inherited from DiagramBase.)
	OnInitializeLasso	Raises the InitializeLasso event. (Inherited from DiagramBase.)
	OnInitializeLink	Raises the InitializeLink event. (Inherited from DiagramBase.)
	OnInitializeNode	Raises the InitializeNode event. (Inherited from DiagramBase.)
	OnItemAdded	Raises the ItemAdded event. (Inherited from DiagramBase.)
	OnItemRemoved	Raises the ItemRemoved event. (Inherited from DiagramBase.)
	OnJsonDeserializeTag	Raises the JsonDeserializeTag event. (Inherited from DiagramBase.)
	OnJsonSerializeTag	Raises the JsonSerializeTag event. (Inherited from DiagramBase.)
	OnLayerVisibilityChanged	Raises the LayerVisibilityChanged event. (Inherited from DiagramBase.)
	OnLinkActivated	Raises the LinkActivated event. (Inherited from DiagramBase.)
	OnLinkClicked	Raises the LinkClicked event. (Inherited from DiagramBase.)
	OnLinkCreateCancelled	Raises the LinkCreateCancelled event. (Inherited from DiagramBase.)
	OnLinkCreated	Raises the LinkCreated event. (Inherited from DiagramBase.)
	OnLinkCreating	Raises the LinkCreating event. (Inherited from DiagramBase.)

	OnLinkDeactivated	Raises the LinkDeactivated event. (Inherited from DiagramBase.)
	OnLinkDeleted	Raises the LinkDeleted event. (Inherited from DiagramBase.)
	OnLinkDeleting	Raises the LinkDeleting event. (Inherited from DiagramBase.)
	OnLinkDeselected	Raises the LinkDeselected event. (Inherited from DiagramBase.)
	OnLinkDoubleClicked	Raises the LinkDoubleClicked event. (Inherited from DiagramBase.)
	OnLinkHovered	Raises the LinkHovered event. (Inherited from DiagramBase.)
	OnLinkModified	Raises the LinkModified event. (Inherited from DiagramBase.)
	OnLinkModifyCancelled	Raises the LinkModifyCancelled event. (Inherited from DiagramBase.)
	OnLinkModifying	Raises the LinkModifying event. (Inherited from DiagramBase.)
	OnLinkPasted	Raises the LinkPasted event. (Inherited from DiagramBase.)
	OnLinkRouted	Raises the LinkRouted event. (Inherited from DiagramBase.)
	OnLinkSelected	Raises the LinkSelected event. (Inherited from DiagramBase.)
	OnLinkSelecting	Raises the LinkSelecting event. (Inherited from DiagramBase.)
	OnLinkSplit	Raises the LinkSplit event. (Inherited from DiagramBase.)
	OnLinkStartModifying	Raises the LinkStartModifying event. (Inherited from DiagramBase.)
	OnLinkTextEdited	Raises the **LinkTextEdited** event. (Inherited from DiagramBase.)
	OnLinkTextEditing	Raises the **LinkTextEditing** event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnMeasureUnitChanged	Raises the MeasureUnitChanged event. (Inherited from DiagramBase.)
	OnNodeActivated	Raises the NodeActivated event. (Inherited from DiagramBase.)
	OnNodeClicked	Raises the NodeClicked event. (Inherited from DiagramBase.)
	OnNodeCreateCancelled	Raises the NodeCreateCancelled event. (Inherited from DiagramBase.)
	OnNodeCreated	Raises the NodeCreated event. (Inherited from DiagramBase.)
	OnNodeCreating	Raises the NodeCreating event. (Inherited from DiagramBase.)
	OnNodeDeactivated	Raises the NodeDeactivated event. (Inherited from DiagramBase.)
	OnNodeDeleted	Raises the NodeDeleted event. (Inherited from DiagramBase.)
	OnNodeDeleting	Raises the NodeDeleting event. (Inherited from DiagramBase.)
	OnNodeDeselected	Raises the NodeDeselected event. (Inherited from DiagramBase.)
	OnNodeDoubleClicked	Raises the NodeDoubleClicked event. (Inherited from DiagramBase.)
	OnNodeHovered	Raises the NodeHovered event. (Inherited from DiagramBase.)
	OnNodeModified	Raises the **NodeModified** event. (Inherited from DiagramBase.)
	OnNodeModifyCancelled	Raises the NodeModifyCancelled event. (Inherited from DiagramBase.)
	OnNodeModifying	Raises the NodeModifying event. (Inherited from DiagramBase.)
	OnNodePasted	Raises the NodePasted event. (Inherited from DiagramBase.)
	OnNodeSelected	Raises the NodeSelected event. (Inherited from DiagramBase.)
	OnNodeSelecting	Raises the NodeSelecting event. (Inherited from DiagramBase.)
	OnNodeStartModifying	Raises the NodeStartModifying event. (Inherited from DiagramBase.)

	OnNodeTextEdited	Raises the **NodeTextEdited** event. (Inherited from DiagramBase.)
	OnNodeTextEditing	Raises the NodeTextEditing event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnOriginAnchorChanged	Raises the OriginAnchorChanged event. (Inherited from DiagramBase.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from DiagramBase.)
	OnQueryAlignTarget	Raises the QueryAlignTarget event. (Inherited from DiagramBase.)
	OnRepaint	Raises the Repaint event. (Inherited from DiagramBase.)
	OnRequestClipboard	Raises the RequestClipboard event. (Inherited from DiagramBase.)
	OnRequestDrawInteractions	Raises the RequestDrawInteractions event. (Inherited from DiagramBase.)
	OnRequestTimer	Raises the RequestTimer event. (Inherited from DiagramBase.)
	OnSelectionChanged	Raises the SelectionChanged event. (Inherited from DiagramBase.)
	OnSelectionModified	Raises the SelectionModified event. (Inherited from DiagramBase.)
	OnSelectionModifying	Raises the SelectionModifying event. (Inherited from DiagramBase.)
	OnSerializeTag	Raises the SerializeTag event. (Inherited from DiagramBase.)
	OnSetSelfLoopShape	Raises the SetSelfLoopShape event. (Inherited from DiagramBase.)
	OnShapeModified	Raises the ShapeModified event. (Inherited from DiagramBase.)
	OnShapeNotDefined	Raises the ShapeNotDefined event. (Inherited from DiagramBase.)
	OnTableColumnResized	Raises the TableColumnResized event. (Inherited from DiagramBase.)
	OnTableColumnResizing	Raises the TableColumnResizing event. (Inherited from DiagramBase.)
	OnTableRowResized	Raises the TableRowResized event. (Inherited from DiagramBase.)
	OnTableRowResizing	Raises the TableRowResizing event. (Inherited from DiagramBase.)
	OnTableSectionCollapsed	Raises the TableSectionCollapsed event. (Inherited from DiagramBase.)
	OnTableSectionExpanded	Raises the TableSectionExpanded event. (Inherited from DiagramBase.)
	OnTreeCollapsed	Raises the TreeCollapsed event. (Inherited from DiagramBase.)
	OnTreeExpanded	Raises the TreeExpanded event. (Inherited from DiagramBase.)
	OnTreeItemTextEditing	Raises the **TreeItemTextEditing** event. (Inherited from DiagramBase.)
	OnValidateAnchorPoint	Raises the ValidateAnchorPoint event. (Inherited from DiagramBase.)
	OnValidateLinkCrossing	Raises the ValidateLinkCrossing event. (Inherited from DiagramBase.)
	OnViewRemoved	Raises the **ViewRemoved** event. (Inherited from DiagramBase.)
	RemoveItem	Invoked by the **AddItemCmd** and **RemoveItemCmd** classes to effectively remove the specified item from the diagram.

Public Events

	Name	Description
	ActionRecorded	Raised when an action is recorded in the undo buffer. (Inherited from DiagramBase.)
	ActionRecording	A validation event raised before an action is recorded in the undo buffer. (Inherited from DiagramBase.)
	ActionRedone	Raised when an action is redone. (Inherited from DiagramBase.)

	ActionUndone	Raised when an action is undone. (Inherited from DiagramBase.)
	ActiveLayerChanged	Raised when the diagram's active layer has changed. (Inherited from DiagramBase.)
	BeginLoad	Raised when the component starts loading diagram data from a file or memory stream. (Inherited from DiagramBase.)
	BoundsChanged	Raised when the **Bounds** property value has changed. (Inherited from DiagramBase.)
	CellClicked	Raised when the user clicks a table's cell. (Inherited from DiagramBase.)
	CellDoubleClicked	Raised when the user double-clicks a table's cell. (Inherited from DiagramBase.)
	CellTextEdited	Raised when the user edits the text of a table's cell. (Inherited from DiagramBase.)
	CellTextEditing	A validation event that lets you approve or reject changes made to the text of a table's cell. (Inherited from DiagramBase.)
	Clicked	Raised when the user clicks the diagram at a point where no items are located. (Inherited from DiagramBase.)
	ContainerChildAdded	Raised when a node is added to a ContainerNode, either programmatically or by the user. (Inherited from DiagramBase.)
	ContainerChildRemoved	Raised when a node is removed from a **ContainerNode**, either programmatically or by the user. (Inherited from DiagramBase.)
	ContainerFolded	Raised when the user folds a container by clicking the arrow-up button in the container's caption bar. (Inherited from DiagramBase.)
	ContainerPageChanged	Raised when the user changes current page of a PagedContainerNode. (Inherited from DiagramBase.)
	ContainerUnfolded	Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar. (Inherited from DiagramBase.)
	ContentVisibilityChanged	Raised when the visibility of container's content changes. (Inherited from DiagramBase.)
	DefaultShapeChanged	Raised when the **DefaultShape** property value has changed. (Inherited from DiagramBase.)
	DeserializeTag	Raised when the Tag of a diagram item must be deserialized from XML format. (Inherited from DiagramBase.)
	DestinationAnchorChanged	Raised when the DestinationAnchor property value of a link has changed. (Inherited from DiagramBase.)
	DirtyChanged	Raised when the **Dirty** property value has changed. (Inherited from DiagramBase.)
	DoubleClicked	Raised when the user double-clicks the diagram at a point where no items are located. (Inherited from DiagramBase.)
	DrawAdjustmentHandles	Raised when item's adjustment handles must be custom-drawn. (Inherited from DiagramBase.)
	DrawAnchorPoint	Raised when an anchor point must be custom-drawn. (Inherited from DiagramBase.)
	DrawBackground	Raised to let you custom draw the diagram background. (Inherited from DiagramBase.)
	DrawBranchIndicator	Raised when a branch indicator must be custom-drawn. (Inherited from DiagramBase.)
	DrawCell	Raised when a table's cell must be custom drawn. (Inherited from DiagramBase.)

	DrawForeground	Raised to let you custom draw the diagram foreground. (Inherited from DiagramBase.)
	DrawLink	Raised when a diagram link must be custom drawn. (Inherited from DiagramBase.)
	DrawNode	Raised when a diagram node must be custom drawn. (Inherited from DiagramBase.)
	EndLoad	Raised when the component ends loading diagram data from a file or memory stream. (Inherited from DiagramBase.)
	ExpandButtonClicked	Raised when the user clicks the [±] button of an Expandable node. (Inherited from DiagramBase.)
	GroupDestroyed	Raised when a Group object is destroyed. (Inherited from DiagramBase.)
	HitTestAdjustmentHandles	Raised when custom hit testing of item's adjustment handles must be performed. (Inherited from DiagramBase.)
	InitializeLasso	Raised when the user starts drawing a selection lasso, before it is rendered on screen. (Inherited from DiagramBase.)
	InitializeLink	Raised when the user starts drawing a new link, just after the **DiagramLink** instance is created. (Inherited from DiagramBase.)
	InitializeNode	Raised when the user starts drawing a new node, just after the **DiagramNode** instance is created. (Inherited from DiagramBase.)
	ItemAdded	Raised when an item is added to the diagram, either programmatically or interactively. (Inherited from DiagramBase.)
	ItemRemoved	Raised when an item is removed from the diagram, either programmatically or interactively. (Inherited from DiagramBase.)
	JsonDeserializeTag	Raised when the **Tag** of a diagram item must be deserialized from JSON. (Inherited from DiagramBase.)
	JsonSerializeTag	Raised when the **Tag** of a diagram item must be serialized to JSON. (Inherited from DiagramBase.)
	LayerVisibilityChanged	Raised when the visibility of a Layer changes. (Inherited from DiagramBase.)
	LinkActivated	Raised when a link becomes the **ActiveItem**. (Inherited from DiagramBase.)
	LinkClicked	Raised when the user clicks a link. (Inherited from DiagramBase.)
	LinkCreateCancelled	Raised when the user cancels link creation. (Inherited from DiagramBase.)
	LinkCreated	Raised when the user draws a new link. (Inherited from DiagramBase.)
	LinkCreating	A validation event raised while the user is drawing a new link. (Inherited from DiagramBase.)
	LinkDeactivated	Raised when a link is no longer the **ActiveItem**. (Inherited from DiagramBase.)
	LinkDeleted	Raised when a link is deleted, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkDeleting	Raised when the user tries to delete a link, this event lets you cancel the operation. (Inherited from DiagramBase.)
	LinkDeselected	Raised when a link is deselected, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkDoubleClicked	Raised when the user double-clicks a link. (Inherited from DiagramBase.)
	LinkHovered	Raised when the mouse pointer hovers over a link. (Inherited from DiagramBase.)

	LinkModified	Raised when the user moves any control point of a link. (Inherited from DiagramBase.)
	LinkModifyCancelled	Raised when the user cancels move or resize operation being done on a link. (Inherited from DiagramBase.)
	LinkModifying	A validation event raised while the user is modifying a link. (Inherited from DiagramBase.)
	LinkPasted	Raised when a link has been pasted from the clipboard. (Inherited from DiagramBase.)
	LinkRouted	Raised when a link is routed by the auto-routing algorithm. (Inherited from DiagramBase.)
	LinkSelected	Raised when a link is selected, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkSelecting	Raised when the user tries to select a link, this event lets you cancel the operation. (Inherited from DiagramBase.)
	LinkSplit	Raised when the user splits a link interactively. (Inherited from DiagramBase.)
	LinkStartModifying	A validation event raised when the user starts modifying a link. (Inherited from DiagramBase.)
	LinkTextEdited	Raised when the user edits the text of a link. (Inherited from DiagramBase.)
	LinkTextEditing	A validation event that lets you approve or reject changes made to the text of a link. (Inherited from DiagramBase.)
	MeasureUnitChanged	Raised when the **MeasureUnit** property value has changed. (Inherited from DiagramBase.)
	NodeActivated	Raised when a node becomes the **ActiveItem**. (Inherited from DiagramBase.)
	NodeClicked	Raised when the user clicks a node. (Inherited from DiagramBase.)
	NodeCreateCancelled	Raised when the user cancels node creation. (Inherited from DiagramBase.)
	NodeCreated	Raised when the user draws a new node. (Inherited from DiagramBase.)
	NodeCreating	A validation event raised while the user is drawing a new node. (Inherited from DiagramBase.)
	NodeDeactivated	Raised when a node is no longer the **ActiveItem**. (Inherited from DiagramBase.)
	NodeDeleted	Raised when a node is deleted, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeDeleting	Raised when the user tries to delete a node, this event lets you cancel the operation. (Inherited from DiagramBase.)
	NodeDeselected	Raised when a node is deselected, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeDoubleClicked	Raised when the user double-clicks a node. (Inherited from DiagramBase.)
	NodeHovered	Raised when the mouse pointer hovers over a node. (Inherited from DiagramBase.)
	NodeModified	Raised when the user moves or resizes a node. (Inherited from DiagramBase.)
	NodeModifyCancelled	Raised when the user cancels move or resize operation being done on a node. (Inherited from DiagramBase.)
	NodeModifying	A validation event raised while the user is moving or resizing a node. (Inherited from DiagramBase.)

	NodePasted	Raised when a node has been pasted from the clipboard. (Inherited from DiagramBase.)
	NodeSelected	Raised when a node is selected, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeSelecting	Raised when the user tries to select a node, this event lets you cancel the operation. (Inherited from DiagramBase.)
	NodeStartModifying	A validation event raised when the user starts modifying a node. (Inherited from DiagramBase.)
	NodeTextEdited	Raised when the user edits the text of a node. (Inherited from DiagramBase.)
	NodeTextEditing	A validation event that lets you approve or reject changes made to the text of a node. (Inherited from DiagramBase.)
	OriginAnchorChanged	Raised when the OriginAnchor property value of a link has changed. (Inherited from DiagramBase.)
	PropertyChanged	INotifyPropertyChanged.PropertyChanged implementation. (Inherited from DiagramBase.)
	QueryAlignTarget	Raised to validate a node as target for alignment guides when **AutoAlignNodes** is enabled. (Inherited from DiagramBase.)
	Repaint	Raised when the diagram views should be repainted. (Inherited from DiagramBase.)
	RequestCacheReset	Raised when an object within the diagram requests a reset of the cached bitmap. (Inherited from DiagramBase.)
	RequestClipboard	Raised when an object within the diagram requests an operation with the clipboard. (Inherited from DiagramBase.)
	RequestDrawInteractions	For internal use. (Inherited from DiagramBase.)
	RequestTimer	Raised when an object within the diagram needs to start or stop a timer. (Inherited from DiagramBase.)
	SelectionChanged	Raised when an item is added to or removed from the selection (Inherited from DiagramBase.)
	SelectionModified	Raised when the user moves multiple selected items. (Inherited from DiagramBase.)
	SelectionModifying	Raised while the user is moving multiple selected items, this event lets you cancel the modification. (Inherited from DiagramBase.)
	SerializeTag	Raised when the **Tag** of a diagram item must be serialized into an XML document. (Inherited from DiagramBase.)
	SetSelfLoopShape	Raised when a link becomes a self-loop, giving you a chance to override the default look shape. (Inherited from DiagramBase.)
	ShapeModified	Raised when the user modifies the shape of a ShapeNode by moving one of the control points corresponding to shape formula parameters. (Inherited from DiagramBase.)
	ShapeNotDefined	Raised when the diagram being loaded contains nodes with an undefined shape. (Inherited from DiagramBase.)
	TableColumnResized	Raised when the user finishes resizing a column in a table. (Inherited from DiagramBase.)
	TableColumnResizing	Raised when the user resizes a column in a table interactively. (Inherited from DiagramBase.)
	TableRowResized	Raised when the user finishes resizing a row in a table. (Inherited from DiagramBase.)
	TableRowResizing	Raised when the user resizes a row in a table interactively. (Inherited from DiagramBase.)

	TableSectionCollapsed	Raised when the user collapses the rows of a table's section by clicking the [-] button in the section's header row. (Inherited from DiagramBase.)
	TableSectionExpanded	Raised when the user expands the rows of a table's section by clicking the [+] button in the section's header row. (Inherited from DiagramBase.)
	TreeCollapsed	Raised when a user collapses a tree branch by clicking the [-] button of an **Expandable** node. (Inherited from DiagramBase.)
	TreeExpanded	Raised when a user expands a tree branch by clicking the [+] button of an **Expandable** node. (Inherited from DiagramBase.)
	TreeItemTextEditing	A validation event that lets you approve or reject changes made to the text of a TreeViewNode's item. (Inherited from DiagramBase.)
	ValidateAnchorPoint	A validation event that lets you approve or reject connecting a link to an anchor point. (Inherited from DiagramBase.)
	ValidateLinkCrossing	A validation event that lets you approve or reject displaying a decoration at the intersection point of links. (Inherited from DiagramBase.)
	ViewRemoved	Raised when a DiagramView is detached from this diagram. (Inherited from DiagramBase.)

Diagram Fields

Diagram.Dummy Field

A shared DummyNode instance.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DummyNode Dummy
```

Visual Basic Copy Code

```
Public Dummy As DummyNode
```

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram Constructor

The Diagram class represents a flow diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Diagram ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

Diagram Class
MindFusion.Diagramming Namespace

Diagram Methods

Diagram.AddItem Method

Invoked by the AddItemCmd and RemoveItemCmd classes to effectively add the specified item to the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void AddItem (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Protected Sub AddItem( _
    item As DiagramItem _
)
```

Parameters

item
The DiagramItem being added to the diagram.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
RemoveItem Method

Diagram.AlignPointToGrid Method

Returns a point of the alignment grid nearest to the one passed as an argument.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point AlignPointToGrid (
    Point point
)
```

Visual Basic Copy Code

```
Public Function AlignPointToGrid( _
    point As Point _
) As Point
```

Parameters

point
A point specified in diagram coordinates.

Return Value

A point from the alignment grid.

Remarks

Items created or moved by a user are automatically aligned to the grid. However, if items are placed in the diagram programmatically, their coordinates are set to the specified positions without aligning. In such cases use **AlignPointToGrid** if items must be placed exactly at grid points.

GridSizeY Property

Diagram.AllowNodeBounds Method

Determines whether node can be placed at specified coordinates.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowNodeBounds (
    DiagramNode node,
    Rect rect
)
```

Visual Basic Copy Code

```
Public Function AllowNodeBounds( _
    node As DiagramNode, _
    rect As Rect _
) As Boolean
```

Parameters

node
A DiagramNode instance.

rect
A **Microsoft.Maui.Graphics.Rect** specifying node's coordinates.

Return Value

true if node and diagram constraints allow placing the node at specified coordinates, or **false** otherwise.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.Arrange Method

Arranges the diagram using the specified graph layout algorithm.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Arrange (
    ILayout layout
)
```

Visual Basic Copy Code

```
Public Function Arrange( _
    layout As ILayout _
) As Boolean
```

Parameters

layout
An instance of Layout -derived class specifying the layout algorithm to apply.

Return Value

true if the diagram has been arranged successfully, or **false** otherwise.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.ArrangeAnimated Method

Arranges the diagram using the specified graph layout algorithm, and animates items moving to their new positions.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ArrangeAnimated (
    ILayout layout,
    int duration,
    AnimationType animationType,
    EasingType easingType
)
```

Visual Basic Copy Code

```
Public Function ArrangeAnimated( _
    layout As ILayout, _
    duration As Integer, _
    animationType As AnimationType, _
    easingType As EasingType _
) As Boolean
```

Parameters

layout
An instance of Layout -derived class specifying the layout algorithm to apply.

duration
An integer, specifying the duration of the animation in milliseconds.

animationType
A member of the AnimationType enumeration, specifying the animation type to use.

easingType
A member of the EasingType enumeration, specifying the type of easing function to apply to the animation.

Return Value

true if the diagram has been arranged successfully, or **false** otherwise.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.ArrangeAsync Method

Arranges the diagram asynchronously using the specified graph layout algorithm.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Task<Boolean> ArrangeAsync (
    ILayout layout
)
```

Visual Basic Copy Code

```
Public Function ArrangeAsync( _
    layout As ILayout _
) As Task(Of Boolean)
```

Parameters

layout
An instance of Layout -derived class specifying the layout algorithm to apply.

Return Value

true if the diagram has been arranged successfully, or **false** otherwise.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.ArrangeLinkLabels Method

Rearranges link labels whose AutoArrange property is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ArrangeLinkLabels ()
```

Visual Basic Copy Code

```
Public Sub ArrangeLinkLabels ()
```

See Also

Diagram.ChangeUnit Method

Sets new MeasureUnit value and scales the coordinates of diagram items so that their absolute size remains unchanged.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ChangeUnit (
    MeasureUnit newUnit
)
```

Visual Basic Copy Code

```
Public Sub ChangeUnit( _
    newUnit As MeasureUnit _
)
```

Parameters

newUnit

A MeasureUnit instance specifying the new unit.

Remarks

This method scales the coordinates of nodes' **Bounds** values and links' ControlPoints to preserve their size when measured in the new unit. In addition, it scales values of some size and distance -related properties such as ShadowOffsetX and HeadShapeSize.

Diagram.ClearAll Method

Removes all items from the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ClearAll ()
```

Visual Basic Copy Code

```
Public Sub ClearAll ()
```

Remarks

Use this method to clear all Groups, Links and Nodes in the diagram.

See Also

Diagram.Clone Method

Creates a copy of this diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Diagram Clone ()
```

Visual Basic Copy Code

```
Public Overridable Function Clone () As Diagram
```

Return Value

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.CopySelection Method

Creates a copy of specified diagram elements.

Overload List

Name	Description
Diagram.CopySelection (Boolean, Boolean)	Creates a copy of the currently selected objects and groups.
Diagram.CopySelection (DiagramItemCollection, Boolean, Boolean)	Creates a copy of the specified objects and groups.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.CopySelection Method (Boolean, Boolean)

Creates a copy of the currently selected objects and groups.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SelectionCopy CopySelection (
    bool unconnectedLinks,
    bool copyGroups
)
```

Visual Basic Copy Code

```
Public Function CopySelection( _
    unconnectedLinks As Boolean, _
    copyGroups As Boolean _
) As SelectionCopy
```

Parameters

unconnectedLinks
true to allow copying unconnected links, or **false** otherwise.

copyGroups
true to copy group information, or **false** otherwise.

Return Value

An instance of the SelectionCopy class.

Remarks

Call PasteSelection to add the copied objects to a target diagram.

See Also

CopySelection Method Overload List

Diagram Class
MindFusion.Diagramming Namespace

Diagram.CopySelection Method (DiagramItemCollection, Boolean, Boolean)

Creates a copy of the specified objects and groups.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SelectionCopy CopySelection (
    DiagramItemCollection selectedItems,
    bool unconnectedLinks,
    bool copyGroups
)
```

Visual Basic Copy Code

```
Public Function CopySelection( _
    selectedItems As DiagramItemCollection, _
    unconnectedLinks As Boolean, _
    copyGroups As Boolean _
) As SelectionCopy
```

Parameters

selectedItems
A list of items to copy.

unconnectedLinks
true to allow copying unconnected links, or **false** otherwise.

copyGroups
true to copy group information, or **false** otherwise.

Return Value

An instance of the SelectionCopy class.

Remarks

Call PasteSelection to add the copied objects to a target diagram.

See Also

CopySelection Method Overload List
Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.CopyTo Method

Copies this diagram's properties and items to specified target diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void CopyTo (
    Diagram target
)
```

Visual Basic Copy Code

```
Public Overridable Sub CopyTo( _
    target As Diagram _
)
```

Parameters

target
The target diagram.

See Also

Diagram Class
MindFusion.Diagramming Namespace

Diagram.CreateAddItemCmd Method

Creates an AddItemCmd instance that implements undo/redo of adding an item to the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual AddItemCmd CreateAddItemCmd (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Protected Overridable Function CreateAddItemCmd( _
    item As DiagramItem _
) As AddItemCmd
```

Parameters

item
The item being added to the diagram.

Return Value

An instance of AddItemCmd or derived class.

Remarks

You can override this method to return a custom command that stores additional information about the added item, or handles the addition of more than one items.

Diagram.CreateImage Method

Creates a bitmap containing an image of the diagram.

Overload List

Name	Description
Diagram.CreateImage ()	Creates a bitmap image representing this diagram.
Diagram.CreateImage (Rect)	Creates a bitmap image containing specified diagram region.
Diagram.CreateImage (Rect, Double)	Creates a bitmap image representing this diagram using the specified scale factor.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.CreateImage Method ()

Creates a bitmap image representing this diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage CreateImage ()
```

Visual Basic Copy Code

```
Public Function CreateImage () As IImage
```

Return Value

A **Microsoft.Maui.Graphics.IImage** instance.

Remarks

The method creates a new bitmap instance as big as the current document extents and paints the diagram in it. The **Save** method of the **IImage** object can be used to save the image in a jpeg, gif or bmp file.

HtmlBuilder Class

Diagram.CreateImage Method (Rect)

Creates a bitmap image containing specified diagram region.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage CreateImage (
    Rect bounds
)
```

Visual Basic Copy Code

```
Public Function CreateImage( _
    bounds As Rect _
) As IImage
```

Parameters

bounds
A Rect specifying what region of the diagram to export, in logical coordinates.

Return Value

An ImageSource instance.

See Also

CreateImage Method Overload List
Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.CreateImage Method (Rect, Double)

Creates a bitmap image representing this diagram using the specified scale factor.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage CreateImage (
    Rect viewport,
    double scale
)
```

Visual Basic Copy Code

```
Public Function CreateImage( _
    viewport As Rect, _
    scale As Double _
) As IImage
```

Parameters

viewport
Specifies what region of the diagram to export.

scale
Specifies the scale factor as percentage of the original size.

Return Value

A **Microsoft.Maui.Graphics.IImage** instance containing the diagram image.

Remarks

The method creates a new bitmap instance as big as the current document extents and paints the diagram in it. The **Save** method of the **IImage** object can be used to save the image in a jpeg, gif or bmp file.

Diagram.CreateMeasureGraphics Method

Creates an IGraphics object that can be used to obtain various string size measurements.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IGraphics CreateMeasureGraphics ()
```

Visual Basic Copy Code

```
Public Function CreateMeasureGraphics () As IGraphics
```

Return Value

An object implementing the IGraphics interface.

See Also

Diagram Members

Diagram.CreateModifyItemCmd Method

Creates a ModifyItemCmd instance that implements undo/redo of item move and resize operations.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual ModifyItemCmd CreateModifyItemCmd (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Protected Overridable Function CreateModifyItemCmd( _
    item As DiagramItem _
) As ModifyItemCmd
```

Parameters

item
The item being modified.

Return Value

An instance of ModifyItemCmd or derived class.

Remarks

By overriding this method, you can use custom ModifyItemCmd objects to store additional information about the modified item, or handle the modification of additional items.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.CreateRemoveItemCmd Method

Creates a RemoveItemCmd instance that implements undo/redo of removing an item from the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual RemoveItemCmd CreateRemoveItemCmd (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Protected Overridable Function CreateRemoveItemCmd( _
    item As DiagramItem _
) As RemoveItemCmd
```

Parameters

item
The item being removed from the diagram.

Return Value

An instance of RemoveItemCmd or derived class.

Remarks

You can override this method to return a custom command that stores additional information about the removed item, or handles the removal of more than one items.

Diagram.CreateThemeFromDefaults Method

Creates a Theme object representing the default properties of the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Theme CreateThemeFromDefaults ()
```

Visual Basic Copy Code

```
Public Function CreateThemeFromDefaults () As Theme
```

Return Value

An instance of the Theme class.

Remarks

This method is only for compatibility with files saved with versions earlier than 6.0.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.DeleteGroup Method

Removes the specified group from the group collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void DeleteGroup (
    Group group
)
```

Visual Basic Copy Code

```
Protected Sub DeleteGroup( _
    group As Group _
)
```

Parameters

group
The Group to be removed.

See Also

Diagram Members
Diagram Class

Diagram.Dispose Method

Clean up any resources being used.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void Dispose (
    bool disposing
)
```

Visual Basic Copy Code

```
Protected Overrides Sub Dispose( _
    disposing As Boolean _
)
```

Parameters

disposing
true to release both managed and unmanaged resources; **false** to release only unmanaged resources.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.Draw Method

Renders the diagram on the specified IGraphics object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void Draw (
    IGraphics graphics,
    RenderOptions options,
    Rect clipRect,
    bool backBuffer
)
```

Visual Basic Copy Code

```
Public Overridable Sub Draw( _
    graphics As IGraphics, _
    options As RenderOptions, _
    clipRect As Rect, _
    backBuffer As Boolean _
)
```

Parameters

graphics
The IGraphics surface to draw the diagram on.

options
A RenderOptions object specifying options for the drawing operation.

clipRect
A **Microsoft.Maui.Graphics.Rect** specifying the current clipping rectangle.

backBuffer

Remarks

MvcDiagram calls this method to draw a representation of the diagram onto the specified graphics surface. You can override **Draw** if you need to render additional elements over what's already drawn by the Diagram object.

Diagram.DrawAlignmentGuides Method

Draws the current alignment guides.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void DrawAlignmentGuides (
    IGraphics graphics
)
```

Visual Basic Copy Code

```
Public Sub DrawAlignmentGuides( _
    graphics As IGraphics _
)
```

Parameters

graphics
An IGraphics drawing surface.

See Also

Diagram.DrawInteraction Method

Draws the items that the user is currently modifying.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void DrawInteraction (
    IGraphics graphics,
    RenderOptions options,
    Rect clipRect
)
```

Visual Basic Copy Code

```
Public Sub DrawInteraction( _
    graphics As IGraphics, _
    options As RenderOptions, _
    clipRect As Rect _
)
```

Parameters

graphics
The IGraphics surface to draw the items on.

options

A RenderOptions object specifying options for the drawing operation.

clipRect

A **Microsoft.Maui.Graphics.Rect** specifying the current clipping rectangle.

Remarks

This method draws the items that are currently being modified by the user.

Diagram.DrawStyledText Method

Draws a formatted text string, the same way text is drawn in shape nodes whose EnableStyledText property is set to **true**. This method lets you display styled text in custom-drawn nodes or links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static void DrawStyledText (
    IGraphics graphics,
    string text,
    Font font,
    Brush textBrush,
    Rect textBounds,
    StringFormat format
)
```

Visual Basic Copy Code

```
Public Shared Sub DrawStyledText( _
    graphics As IGraphics, _
    text As String, _
    font As Font, _
    textBrush As Brush, _
    textBounds As Rect, _
    format As StringFormat _
)
```

Parameters

graphics
The IGraphics canvas on which to draw.

text
The text that should be drawn, including formatting tags.

font
The font used to draw the text.

textBrush
The brush used to draw the text.

textBounds
The bounds of the text layout rectangle.

format
Specifies the text alignment.

Remarks

You might use this method when you custom-draw shape nodes and still need to use the EnableStyledText rendering functionality of MvcDiagram.

Example

The following sample code illustrates how to manually render styled text.

C# Copy Code

```
private void diagram_DrawNode(object sender, DrawNodeEventArgs e)
{
    Diagram.DrawStyledText(e.Graphics, "<b>test</b> <i>test</i>",
        diagram.Font, Brushes.Black, e.Node.Bounds, StringFormat.GenericDefault);
}
```

Visual Basic Copy Code

```
Private Sub diagram_DrawNode(ByVal sender As Object, ByVal e As DrawNodeEventArgs) Handles
diagram.DrawNode

    Diagram.DrawStyledText(e.Graphics, "<b>test</b> <i>test</i>", _
        diagram.Font, Brushes.Black, e.Node.Bounds, StringFormat.GenericDefault)

End Sub
```

Diagram.EffectiveTouchHitDistance Method

Returns TouchHitDistance or a default value.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double EffectiveTouchHitDistance ()
```

Visual Basic Copy Code

```
Public Function EffectiveTouchHitDistance () As Double
```

Return Value

Distance from adjustment handles at which they are still considered as hit when processing touch input.

Diagram.EnumByReverseZ Method

Hit-tests diagram items in reverse Z order.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IEnumerable<DiagramItem> EnumByReverseZ (
    Point hitTest
)
```

Visual Basic Copy Code

```
Public Function EnumByReverseZ( _
    hitTest As Point _
) As IEnumerable(Of DiagramItem)
```

Parameters

hitTest
A point specifying at what location to search for items.

Return Value

The found items.

See Also

Diagram.EnumTopLevelByReverseZ Method

Hit-tests diagram top-level items in reverse Z order.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IEnumerable<DiagramItem> EnumTopLevelByReverseZ (
    Point hitTest
)
```

Visual Basic Copy Code

```
Public Function EnumTopLevelByReverseZ( _
    hitTest As Point _
) As IEnumerable(Of DiagramItem)
```

Parameters

hitTest
A point specifying at what location to search for items.

Return Value

The found items.

Diagram.FindGroup Method

Finds the group that has the specified tag value.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Group FindGroup (
    Object tagValue
)
```

Visual Basic Copy Code

```
Public Function FindGroup( _
    tagValue As Object _
) As Group
```

Parameters

tagValue
A .NET object assigned as a tag and characterizing the group to be searched for.

Return Value

The Group instance if found, or **null** otherwise.

Remarks

Use this method to find a group that has been marked earlier with the specified tag.

```
public Rect GetContentBounds (
    bool forPrint,
    bool onlyVisible
)
```

Visual Basic Copy Code

```
Public Function GetContentBounds( _
    forPrint As Boolean, _
    onlyVisible As Boolean _
) As Rect
```

Parameters

forPrint
Specifies whether only printable items should be considered.

onlyVisible
Specifies whether only visible items should be considered.

Return Value

The smallest rectangle that bounds all diagram items.

Diagram.GetItemAt Method (Point, Boolean)

Finds and returns the top-most diagram item that lies at the specified location.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem GetItemAt (
    Point point,
    bool exclLocked
)
```

Visual Basic Copy Code

```
Public Function GetItemAt( _
    point As Point, _
    exclLocked As Boolean _
) As DiagramItem
```

Parameters

point
Specifies a location in the diagram where to look for items.

exclLocked
Specifies whether to ignore locked items.

Return Value

The DiagramItem found or **null** (**Nothing** in Visual Basic) if no item has been found.

Remarks

Call the method to get the item at a certain location in the diagram. The method searches starting from the top of z-order and returns the first item found.

Diagram.GetItemAt Method (Point, Predicate(DiagramItem), Boolean, Boolean, Boolean, Boolean)

Returns the top-most diagram item lying at the specified location.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem GetItemAt (
    Point point,
    Predicate<DiagramItem> predicate,
    bool exclLocked,
    bool includeHandles,
    bool includeLabels,
    bool activeFirst
)
```

Visual Basic Copy Code

```
Public Function GetItemAt( _
    point As Point, _
    predicate As Predicate(Of DiagramItem), _
    exclLocked As Boolean, _
    includeHandles As Boolean, _
    includeLabels As Boolean, _
    activeFirst As Boolean _
) As DiagramItem
```

Parameters

point
Specifies a location in the diagram where to look for items.

predicate
A predicate specifying which items to hit-test.

exclLocked
Specifies whether locked links should be excluded from the search.

includeHandles
true to also consider adjustment handle locations (possibly outside of item's bounds).

includeLabels
true to also consider item label locations (possibly outside of item's bounds).

activeFirst
Specifies whether to test ActiveItem first, disregarding Z order.

Return Value

A DiagramItem instance found at the specified point.

GetNodeAt Method
GetItemAt Method

Diagram.GetLinkAt Method (Point, Double)

Finds and returns the top-most link that lies at the specified location.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink GetLinkAt (
    Point point,
    double maxDist
)
```

Visual Basic Copy Code

```
Public Function GetLinkAt( _
    point As Point, _
    maxDist As Double _
) As DiagramLink
```

Parameters

point
A Point specifying a diagram point in logical coordinates.

maxDist
The maximal distance between the point and a link, within which to consider the point as lying on the link.

Return Value

The DiagramLink found or a **null** reference (**Nothing** in Visual Basic) if no item has been found.

Remarks

Call the method to get the link at a certain place in the document. The method searches starting from the top of z-order and returns the first link found. The specified point might not be laying exactly on the link, but within a certain threshold distance from it. This threshold is specified through the second parameter.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink GetLinkAt (
    Point point,
    double maxDist,
    bool exclLocked
)
```

Visual Basic Copy Code

```
Public Function GetLinkAt( _
    point As Point, _
    maxDist As Double, _
    exclLocked As Boolean _
) As DiagramLink
```

Parameters

point
A Point specifying a diagram point in logical coordinates.

maxDist
The maximal distance between the point and a link, within which to consider the point as lying on the link.

exclLocked
Specifies that locked links should be ignored by the search.

Return Value

The DiagramLink found or a **null** reference (**Nothing** in Visual Basic) if no item has been found.

Remarks

Call the method to get the link at a certain place in the document. The method searches starting from the top of z-order and returns the first link found. The specified point might not be laying exactly on the link, but within a certain threshold distance from it. This threshold is specified through the second parameter. Locked and invisible links can be skipped from the search by setting the third parameter to **true**.

GetNodeAt Method

Diagram.GetLinkAt Method (Point, Double, Boolean, Int32@)

Finds and returns the top-most link that lies at the specified location, optionally excluding locked links from the search. The zero-based index of the exact link segment at the specified position is also returned.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink GetLinkAt (
    Point point,
    double maxDist,
    bool exclLocked,
    ref int segmNum
)
```

Visual Basic Copy Code

```
Public Function GetLinkAt( _
    point As Point, _
    maxDist As Double, _
    exclLocked As Boolean, _
    ByRef segmNum As Integer _
) As DiagramLink
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** specifying a diagram point in logical coordinates.

maxDist
The maximal distance between the point and a link, within which to consider the point as lying on the link.

exclLocked
Specifies that locked links should be ignored by the search.

segmNum
Returns the index of the link segment that lies at the specified point.

Return Value

The DiagramLink found or a **null** reference (**Nothing** in Visual Basic) if no item has been found.

Remarks

Call the method to get the link at a certain place in the document. The method searches starting from the top of z-order and returns the first link found. The specified point might not be laying exactly on the link, but within a certain threshold distance from it. This threshold is specified through the second parameter. Locked and invisible links can be skipped from the search by setting the third parameter to **true**. The link's segment closest to the point is returned through the fourth parameter.

Diagram.GetNearestNode Method

Returns the node nearest to the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNode GetNearestNode (
    Point point,
    double maxDistance,
```

```
    DiagramNode ignored
)
```

Visual Basic Copy Code

```
Public Function GetNearestNode( _
    point As Point, _
    maxDistance As Double, _
    ignored As DiagramNode _
) As DiagramNode
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** instance identifying a diagram location.

maxDistance
The maximum distance from the point at which to look for nodes.

ignored
A node that should be ignored.

Return Value

The DiagramNode nearest to the specified point.

Remarks

The last argument is useful when calling this method from NodeCreated and NodeModified handlers and the affected node should not be included in the search.

Diagram.GetNodeAt Method (Point, Boolean, Boolean)

Finds and returns the top-most node that lies at the specified location, optionally excluding locked and/or selected nodes from the search.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNode GetNodeAt (
    Point point,
    bool excludeLocked,
    bool excludeSelected
)
```

Visual Basic Copy Code

```
Public Function GetNodeAt( _
    point As Point, _
    excludeLocked As Boolean, _
    excludeSelected As Boolean _
) As DiagramNode
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** instance identifying a diagram location.

excludeLocked
true if nodes that are locked should be omitted by searching; otherwise, **false**.

excludeSelected
true if nodes that are selected should be omitted by searching; otherwise, **false**.

Return Value

The DiagramNode found or a **null** reference (**Nothing** in Visual Basic) if no node has been found.

Remarks

This method gives you the possibility to specify search options when looking for a node occupying some location in the diagram document. The method searches starting from the top of z-order and returns the first object found.

Diagram.GetNodesInViewport Method

Returns all nodes visible in the current viewport.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNodeCollection GetNodesInViewport ()
```

Visual Basic Copy Code

```
Public Function GetNodesInViewport () As DiagramNodeCollection
```

Return Value

A DiagramNodeCollection that contains the viewport nodes.

Diagram.GetValue Method

Gets the effective value of the style property with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected Object GetValue (
    string name
)
```

Visual Basic Copy Code

```
Protected Function GetValue( _
    name As String _
) As Object
```

Parameters

name
The name of the property to get.

Return Value

An object representing the effective property value.

Diagram.HandleKeyDown Method

Propagates keyboard input to interested manipulators and components.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool HandleKeyDown (
    int keyCode,
    int modifiers
)
```

Visual Basic Copy Code

```
Public Function HandleKeyDown( _
    keyCode As Integer, _
    modifiers As Integer _
) As Boolean
```

Parameters

keyCode
An integer value representing the key that was pressed.

modifiers
An integer value representing the modifier keys that were pressed.

Return Value

true if a component or manipulator handled the event; otherwise, **false**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.HandleKeyPress Method

Propagates keyboard input to interested manipulators.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void HandleKeyPress (
    char keyChar
)
```

Visual Basic Copy Code

```
Public Sub HandleKeyPress( _
    keyChar As Char _
)
```

Parameters

keyChar
The character representation of the pressed key.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.HandleKeyUp Method

Propagates keyboard input to interested components.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void HandleKeyUp (
    int keyCode,
    int modifiers
)
```

Visual Basic Copy Code

```
Public Sub HandleKeyUp( _
    keyCode As Integer, _
    modifiers As Integer _
)
```

Parameters

keyCode
An integer value representing the key that was pressed.

modifiers
An integer value representing the modifier keys that were pressed.

See Also

Diagram Class
MindFusion.Diagramming Namespace

Diagram.HandleMouseMove Method

Propagates mouse input to interested manipulators.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CursorHint HandleMouseMove (
    Point point
)
```

Visual Basic Copy Code

```
Public Function HandleMouseMove( _
    point As Point _
) As CursorHint
```

Parameters

point

Return Value

A member of the CursorHint enumeration specifying the cursor to display at the specified point.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.HitTestComponents Method

Tests whether the specified point is within a component of a diagram item and returns this component.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ComponentBase HitTestComponents (
    Point point
)
```

Visual Basic Copy Code

```
Public Function HitTestComponents( _
    point As Point _
) As ComponentBase
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** representing the point to test, expressed in document coordinates.

Return Value

A ComponentBase instance representing the topmost component at the specified point.

Remarks

This method ignores components with any of the following properties set to **false**: IsHitTestVisible, IsEnabled, IsInteractive.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.HitTestLabels Method

Returns the item label located at specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ItemLabel HitTestLabels (
    Point point
)
```

Visual Basic Copy Code

```
Public Function HitTestLabels( _
    point As Point _
) As ItemLabel
```

Parameters

point
A Microsoft**.Maui.Graphics.Point** specifying where to look for labels.

Return Value

An ItemLabel instance, or **null** if there was no label found.

See Also

Diagram.HitTestManipulators Method

Tests whether the specified point is within the manipulator of a diagram object and triggers the manipulator.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Manipulator HitTestManipulators (
    Point point
)
```

Visual Basic Copy Code

```
Public Function HitTestManipulators( _
    point As Point _
) As Manipulator
```

Parameters

point

Return Value

true to indicate whether there is a manipulator at the specified location; otherwise, **false**.

Diagram.Invalidate Method

Invalidates the diagram or a region of the diagram, causing it to be repainted.

Overload List

Name	Description
Diagram.Invalidate ()	Invalidates the entire diagram.

Diagram.Invalidate (Boolean)	Invalidates the entire diagram and optionally repaints the back-buffer image.
Diagram.Invalidate (Object, Rect)	Invalidates the specified rectangle of the diagram, causing it to be repainted.
Diagram.Invalidate (Rect)	Invalidates the specified rectangle of the diagram, causing it to be repainted.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
DiagramView.RecreateCacheImage Method

Diagram.Invalidate Method ()

Invalidates the entire diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Invalidate ()
```

Visual Basic Copy Code

```
Public Sub Invalidate ()
```

Remarks

This method raises the Repaint event. **DiagramView** objects handle **Repaint** by redrawing the specified diagram region.

See Also

Invalidate Method Overload List
Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
DiagramView.RecreateCacheImage Method

Diagram.Invalidate Method (Boolean)

Invalidates the entire diagram and optionally repaints the back-buffer image.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Invalidate (
    bool redrawCacheImage
)
```

Visual Basic Copy Code

```
Public Sub Invalidate( _
    redrawCacheImage As Boolean _
)
```

Parameters

redrawCacheImage
A boolean value specifying whether the diagram cache image used during modification should be re-created.

Remarks

This method raises the Repaint event. **DiagramView** objects handle **Repaint** by redrawing the specified diagram region.

See Also

Invalidate Method Overload List

Diagram Class
MindFusion.Diagramming Namespace
DiagramView.RecreateCacheImage Method

Diagram.Invalidate Method (Object, Rect)

Invalidates the specified rectangle of the diagram, causing it to be repainted.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Invalidate (
    Object sender,
    Rect invalidRect
)
```

Visual Basic Copy Code

```
Public Sub Invalidate( _
    sender As Object, _
    invalidRect As Rect _
)
```

Parameters

sender
The object that causes the diagram invalidation.

invalidRect
A **Microsoft.Maui.Graphics.Rect** instance specifying the region that should be repainted. If not specified, the whole diagram will be repainted.

Remarks

This method raises the Repaint event. **DiagramView** objects handle **Repaint** by redrawing the specified diagram region.

See Also

Diagram.Invalidate Method (Rect)

Invalidates the specified rectangle of the diagram, causing it to be repainted.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Invalidate (
    Rect invalidRect
)
```

Visual Basic Copy Code

```
Public Sub Invalidate( _
    invalidRect As Rect _
)
```

Parameters

invalidRect

A **Microsoft.Maui.Graphics.Rect** instance specifying the region that should be repainted. If not specified, the whole diagram will be repainted.

Remarks

This method raises the Repaint event. **DiagramView** objects handle **Repaint** by redrawing the specified diagram region.

Diagram.IsClassRegistered Method

Checks if a class is registered for serialization support.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static bool IsClassRegistered (
    Type classType
)
```

Visual Basic

```
Public Shared Function IsClassRegistered( _
    classType As Type _
) As Boolean
```

Parameters

classType
A Type instance identifying the class.

Return Value

true if the class is registered, or **false** otherwise.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.IsClientClassRegistered Method

Checks if a class is registered for JSON serialization support.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public static bool IsClientClassRegistered (
    Type classType
)
```

Visual Basic

```
Public Shared Function IsClientClassRegistered( _
    classType As Type _
) As Boolean
```

Parameters

classType
A Type instance identifying the class.

Return Value

true if the class is registered, or **false** otherwise.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.IsItemInteractive Method

Checks if the specified item can be modified interactively.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public bool IsItemInteractive (
    DiagramItem item
```

```
)
```

Visual Basic Copy Code

```
Public Function IsItemInteractive( _
    item As DiagramItem _
) As Boolean
```

Parameters

item
The DiagramItem to check.

Return Value

true, if the item is currently visible and unlocked and it is not associated with a hidden or locked layer; otherwise, **false**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.IsItemLocked Method

Checks if the specified item is locked.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool IsItemLocked (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Function IsItemLocked( _
    item As DiagramItem _
) As Boolean
```

Parameters

item
The DiagramItem to check.

Return Value

true, if the item's Locked property is set to true or if the item is associated with a locked layer; otherwise, **false**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.IsItemVisible Method

Checks if the specified item is currently visible.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool IsItemVisible (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Function IsItemVisible( _
    item As DiagramItem _
) As Boolean
```

Parameters

item
The DiagramItem to check.

Return Value

true if the item's Visible property is set to true and the item is not associated with a hidden layer; otherwise, **false**.

Diagram.LoadFromJson Method

Loads the diagram from a JSON-formatted string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void LoadFromJson (
    string json
)
```

Visual Basic Copy Code

```
Public Overridable Sub LoadFromJson( _
    json As String _
)
```

Parameters

json
A string created by the SaveToJson method.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
SaveToJson Method

Diagram.LoadFromJsonAsync Method

Loads the diagram from a JSON-formatted string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Task LoadFromJsonAsync (
    string json
)
```

Visual Basic Copy Code

```
Public Function LoadFromJsonAsync( _
    json As String _
) As Task
```

Parameters

json

Return Value

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.LoadFromJsonFile Method

Loads the diagram from a JSON file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromJsonFile (
    string fileName
)
```

Visual Basic Copy Code

```
Public Sub LoadFromJsonFile( _
    fileName As String _
)
```

Parameters

fileName
A string specifying the file name or full path.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
SaveToJsonFile Method

Diagram.LoadFromJsonFileAsync Method

Loads the diagram from a JSON file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Task LoadFromJsonFileAsync (
    string fileName
)
```

Visual Basic Copy Code

```
Public Function LoadFromJsonFileAsync( _
    fileName As String _
) As Task
```

Parameters

fileName

Return Value

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.LoadFromJsonObject Method

Loads the diagram from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void LoadFromJsonObject (
    JsonObject diagramObj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Public Overridable Sub LoadFromJsonObject( _
    diagramObj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

diagramObj
A JsonObject containing diagram data.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

MindFusion.Diagramming Namespace

Diagram.LoadFromString Method

Decodes diagram contents from a string that was created with SaveToString.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromString (
    string str,
    SaveToStringFormat format
)
```

Visual Basic Copy Code

```
Public Sub LoadFromString( _
    str As String, _
    format As SaveToStringFormat _
)
```

Parameters

str
A string containing the serialized diagram contents.

format

Remarks

Loads a diagram document from a string. The string must have been created by the SaveToString method.

See Also

Diagram Members

LoadFromFile
SerializationBinder Property

Diagram.LoadFromXml Method

Loads the contents of an XML diagram document into the control.

Overload List

Name	Description
Diagram.LoadFromXml (Stream)	Loads the diagram from the specified XML stream.
Diagram.LoadFromXml (String)	Loads the contents of the XML diagram document from the specified file into the control.
Diagram.LoadFromXml (String, Boolean)	Loads the diagram from an XML file.
Diagram.LoadFromXml (XmlDocument)	Loads the contents of the XML diagram document represented by the specified **XmlDocument** into the control.
Diagram.LoadFromXml (XmlDocument, Boolean)	Loads the diagram from an XML document.

See Also

LoadFromFile Method
SaveToXml Method

Diagram.LoadFromXml Method (Stream)

Loads the diagram from the specified XML stream.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    Stream stream
)
```

Visual Basic Copy Code

```
Public Sub LoadFromXml( _
    stream As Stream _
)
```

Parameters

stream

See Also

LoadFromXml Method Overload List
Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.LoadFromXml Method (String)

Loads the contents of the XML diagram document from the specified file into the control.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    string fileName
)
```

Visual Basic Copy Code

```
Public Sub LoadFromXml( _
    fileName As String _
)
```

Parameters

fileName
The name of the XML file the data should be read from.

Remarks

The method reads a diagram previously saved via the SaveToXml method. This method is implemented by loading an **XmlDocument** from the specified file and calling the LoadFromXml overload.

See Also

LoadFromXml Method Overload List
Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
SaveToXml Method

Diagram.LoadFromXml Method (String, Boolean)

Loads the diagram from an XML file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    string fileName,
    bool loadDiagramProperties
)
```

Visual Basic Copy Code

```
Public Sub LoadFromXml( _
    fileName As String, _
    loadDiagramProperties As Boolean _
)
```

Parameters

fileName
The name of the XML file the data should be read from.

loadDiagramProperties
true to load values of the diagram properties; **false** to load only the diagram items.

Remarks

The method reads a diagram previously saved via the SaveToXml method. This method is implemented by loading an **XmlDocument** from the specified file and calling the LoadFromXml overload.

Diagram.LoadFromXml Method (XmlDocument)

Loads the contents of the XML diagram document represented by the specified **XmlDocument** into the control.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void LoadFromXml (
    XmlDocument document
)
```

Visual Basic Copy Code

```
Public Overridable Sub LoadFromXml( _
    document As XmlDocument _
)
```

Parameters

document
A .NET **XmlDocument** object from which to load the diagram data.

Remarks

The method reads a diagram previously saved via the SaveToXml method.

See Also

Diagram.LoadFromXml Method (XmlDocument, Boolean)

Loads the diagram from an XML document.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void LoadFromXml (
    XmlDocument document,
    bool loadDiagramProperties
)
```

Visual Basic Copy Code

```
Public Overridable Sub LoadFromXml( _
    document As XmlDocument, _
    loadDiagramProperties As Boolean _
)
```

Parameters

document
A .NET **XmlDocument** object from which to load the diagram data.

loadDiagramProperties
true to load values of the diagram properties; **false** to load only the diagram items.

Remarks

The method reads a diagram previously saved via the SaveToXml method.

Diagram.MeasureString Method (String, Font, Int32, StringFormat)

Measures the specified text when drawn with the specified font in an area with the specified width taking into consideration the current affine transform of the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Size MeasureString (
    string text,
    Font font,
    int maxWidth,
    StringFormat textFormat
)
```

Visual Basic Copy Code

```
Public Function MeasureString( _
    text As String, _
    font As Font, _
    maxWidth As Integer, _
    textFormat As StringFormat _
) As Size
```

Parameters

text
The string to measure.

font
The font of the string.

maxWidth
The maximum width of the string.

textFormat
A StringFormat object that represents formatting information, such as line spacing, for the string.

Return Value

This method returns a **Microsoft.Maui.Graphics.Size** structure that represents the size of the string *text* when drawn with the *font* parameter and the *stringFormat* parameter.

See Also

MeasureString Method Overload List

MindFusion.Diagramming Namespace

Diagram.MeasureString Method (String, Font, Rect, StringFormat, Int32@, Int32@)

Measures the specified text when drawn with the specified font in the specified rectangle area taking into consideration the current affine transform of the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Size MeasureString (
    string text,
    Font font,
    Rect layoutArea,
    StringFormat stringFormat,
```

```
    out int charactersFitted,
    out int linesFilled
)
```

Visual Basic Copy Code

```
Public Function MeasureString( _
    text As String, _
    font As Font, _
    layoutArea As Rect, _
    stringFormat As StringFormat, _
    <System.Runtime.InteropServices.Out()> ByRef charactersFitted As Integer, _
    <System.Runtime.InteropServices.Out()> ByRef linesFilled As Integer _
) As Size
```

Parameters

text

The string to measure.

font

The font of the string.

layoutArea

A **Microsoft.Maui.Graphics.Rect** that specifies the maximum layout area for the text.

stringFormat

A **StringFormat** object that represents formatting information, such as line spacing, for the string.

charactersFitted

linesFilled

Return Value

This method returns a **Microsoft.Maui.Graphics.Size** that represents the size of the string *text* when drawn with the *font* parameter and the *stringFormat* parameter.

Diagram.Navigate Method

Selects the nearest item in the specified direction.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Navigate (
    Point directionVector
)
```

Visual Basic Copy Code

```
Public Sub Navigate( _
    directionVector As Point _
)
```

Parameters

directionVector

A **Microsoft.Maui.Graphics.Point** object specifying the direction vector.

Remarks

This method can be used to let users navigate through the diagram using the keyboard keys.

Diagram.NewInstance Method

Custom Diagram classes must override this method to return an instance of their type.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Diagram NewInstance ()
```

Visual Basic Copy Code

```
Public Overridable Function NewInstance () As Diagram
```

Return Value

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.PasteSelection Method

Adds the specified items and groups to the specified diagram document.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool PasteSelection (
    SelectionCopy data,
    CompositeCmd cmd,
    double dx,
    double dy
)
```

Visual Basic Copy Code

```
Public Function PasteSelection( _
    data As SelectionCopy, _
    cmd As CompositeCmd, _
    dx As Double, _
    dy As Double _
) As Boolean
```

Parameters

data
A SelectionCopy object returned by a previous call to CopySelection.

cmd
A CompositeCmd object where the items state should be recorded for later undo or redo.

dx
Horizontal offset of pasted items from their original positions.

dy
Vertical offset of pasted items from their original positions.

Return Value

true if data contains any items; otherwise, **false**.

Remarks

This method can be used in conjunction with CopySelection to copy selected items from one Diagram instance to another.

Diagram.RaiseCellTextEdited Method

Raises the CellTextEdited event .

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RaiseCellTextEdited (
    TableNode.Cell cell,
    string oldText,
    string newText,
    int column,
    int row
)
```

Visual Basic Copy Code

```
Public Sub RaiseCellTextEdited( _
    cell As TableNode.Cell, _
    oldText As String, _
    newText As String, _
    column As Integer, _
    row As Integer _
)
```

Parameters

cell
The TableNode.Cell related to the event.

oldText
The old text of the cell.

newText
The new text of the cell.

column
The zero-based index of the table column related to the event.

row
The zero-based index of the table row related to the event.

Diagram.RaiseCellTextEditing Method

Raises the CellTextEditing event to validate entering in-place editing mode.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RaiseCellTextEditing (
    TableNode table,
    int column,
    int row
)
```

Visual Basic Copy Code

```
Public Function RaiseCellTextEditing( _
    table As TableNode, _
    column As Integer, _
    row As Integer _
) As Boolean
```

Parameters

table
The TableNode related to the event.

column
The zero-based index of the table column related to the event.

row
The zero-based index of the table row related to the event.

Return Value

true if the in-place editing operation has been confirmed; otherwise, **false**.

Diagram.RaiseClicked Method (DiagramItem, Point, MouseButton)

Raises the appropriate *Clicked event according to the type of the specified item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RaiseClicked (
    DiagramItem item,
    Point mousePosition,
    MouseButton mouseButton
)
```

Visual Basic Copy Code

```
Public Sub RaiseClicked( _
    item As DiagramItem, _
    mousePosition As Point, _
    mouseButton As MouseButton _
)
```

Parameters

item
The DiagramItem related to the event.

mousePosition
The current mouse position, in document coordinates.

mouseButton
The mouse button related to the event.

Diagram.RaiseClicked Method (MouseButton, Point)

Raises the Clicked event of the Diagram class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RaiseClicked (
    MouseButton mouseButton,
    Point mousePosition
)
```

Visual Basic Copy Code

```
Public Sub RaiseClicked( _
    mouseButton As MouseButton, _
    mousePosition As Point _
)
```

Parameters

mouseButton
The mouse button related to the event.

mousePosition
The current cursor position, in document coordinates.

Syntax

C# Copy Code

```
public void RaiseDoubleClicked (
    DiagramItem item,
    Point mousePosition,
    MouseButton mouseButton
)
```

Visual Basic Copy Code

```
Public Sub RaiseDoubleClicked( _
    item As DiagramItem, _
    mousePosition As Point, _
    mouseButton As MouseButton _
)
```

Parameters

item
The DiagramItem related to the event.

mousePosition
The current cursor position, in document coordinates.

mouseButton
The mouse button related to the event.

Diagram.RaiseLinkTextEdited Method

Raises the LinkTextEdited event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RaiseLinkTextEdited (
    DiagramLink link,
    string oldText,
    string newText,
    LinkLabel label
)
```

Visual Basic Copy Code

```
Public Sub RaiseLinkTextEdited( _
    link As DiagramLink, _
    oldText As String, _
    newText As String, _
    label As LinkLabel _
)
```

Parameters

link
The DiagramLink related to the event.

oldText
The old text of the link.

newText
The new text of the link.

label
The LinkLabel related to the event.

Diagram.RaiseLinkTextEditing Method

Raises the LinkTextEditing event to validate entering inplace edit mode.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RaiseLinkTextEditing (
    DiagramLink link,
    LinkLabel label
)
```

Visual Basic Copy Code

```
Public Function RaiseLinkTextEditing( _
    link As DiagramLink, _
    label As LinkLabel _
) As Boolean
```

Parameters

link
The DiagramLink related to the event.

label
The LinkLabel related to the event.

Return Value

true to let users edit the link's text, or **false** otherwise.

Diagram.RaiseNodeTextEdited Method

Raises the NodeTextEdited event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RaiseNodeTextEdited (
    DiagramNode node,
    string oldText,
    string newText,
    NodeLabel label
)
```

Visual Basic Copy Code

```
Public Sub RaiseNodeTextEdited( _
    node As DiagramNode, _
    oldText As String, _
    newText As String, _
    label As NodeLabel _
)
```

Parameters

node
The DiagramNode related to the event.

oldText
The old text.

newText
The new text.

label
The NodeLabel related to the event.

See Also

Diagram.RaiseNodeTextEditing Method

Raises the NodeTextEditing event to validate entering inplace edit mode.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RaiseNodeTextEditing (
    DiagramNode node,
    NodeLabel label = null
)
```

Visual Basic Copy Code

```
Public Function RaiseNodeTextEditing( _
    node As DiagramNode, _
    Optional label As NodeLabel = Nothing _
) As Boolean
```

Parameters

node
The DiagramNode related to the event.

label
Optional.
The NodeLabel related to the event.

Return Value

true if the in-place editing operation has been confirmed, or **false** otherwise.

public bool RaiseSelecting (
    DiagramItem item,
    Point mousePosition
)
```

Visual Basic Copy Code

```
Public Function RaiseSelecting( _
    item As DiagramItem, _
    mousePosition As Point _
) As Boolean
```

Parameters

item

The DiagramItem related to the event.

mousePosition
The current mouse position, in document coordinates.

Return Value

true if the operation has been confirmed; otherwise, **false**.

Diagram.RegisterClass Method (Type, String, Int32)

Registers a diagram item or lane header class for serialization support.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static void RegisterClass (
    Type classType,
    string classId,
    int classVersion
)
```

Visual Basic Copy Code

```
Public Shared Sub RegisterClass( _
    classType As Type, _
    classId As String, _
    classVersion As Integer _
)
```

Parameters

classType
A Type instance identifying the class.

classId
A class identifier to use when saving and loading objects of the specified type.

classVersion
A revision number of the serialization format.

Syntax

C# Copy Code

```
public static void RegisterClass (
    Type classType,
    string classId,
    int classVersion,
    string clientClass
)
```

Visual Basic Copy Code

```
Public Shared Sub RegisterClass( _
    classType As Type, _
    classId As String, _
    classVersion As Integer, _
    clientClass As String _
)
```

Parameters

classType
A Type instance identifying the class.

classId
A class identifier to use when saving and loading objects of the specified type.

classVersion
A revision number of the serialization format.

clientClass
A class identifier to use when serializing objects of the specified type to JSON.

MindFusion.Diagramming Namespace

Diagram.RegisterItemClass Method (Type, String, Int32)

Registers a diagram item class for serialization support.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static void RegisterItemClass (
    Type itemClass,
    string classId,
    int classVersion
)
```

Visual Basic Copy Code

```
Public Shared Sub RegisterItemClass( _
    itemClass As Type, _
    classId As String, _
    classVersion As Integer _
)
```

Parameters

itemClass
A Type instance identifying the item class.

classId
A class identifier to use when saving and loading items of the specified type.

classVersion
A revision number of the item's class serialization format.

Remarks

When using custom item types, use this method to enable saving and loading the custom item instances to/from XML or binary files. The class id string is written before each item's data, and when loading items later that string indicates what class instance to create and let it load the subsequent data. The following class identifiers are reserved and should not be used by your application: "std:DiagramLink", "std:ShapeNode", "std:TableNode", "std:ContainerNode" and "std:ControlNode".

The version identifier must be increased when the format in which items are saved changes. It can be used when loading files to let your application load items data from an older format.

Note

All custom item classes must provide a parameterless constructor, or one that takes a Diagram argument. Failing to do so would result in exceptions during the load process, since the diagram will be unable to create items from the custom type.

Syntax

C# Copy Code

```
public static void RegisterItemClass (
    Type itemClass,
    string classId,
    int classVersion,
    string clientClass
)
```

Visual Basic Copy Code

```
Public Shared Sub RegisterItemClass( _
    itemClass As Type, _
    classId As String, _
    classVersion As Integer, _
    clientClass As String _
)
```

Parameters

itemClass
A Type instance identifying the item class.

classId
A class identifier to use when saving and loading items of the specified type.

classVersion
A revision number of the item's class serialization format.

clientClass
A class identifier to use when serializing item of the specified type to JSON.

Diagram.ResizeToFitItem Method

Resizes the document extents so that the specified item is contained within.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ResizeToFitItem (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Sub ResizeToFitItem( _
    item As DiagramItem _
)
```

Parameters

item
The diagram item contained in the document area.

Remarks

Resizes the document area to fit the specified diagram item.

Diagram Class
MindFusion.Diagramming Namespace
AutoResize Property
Bounds Property

Diagram.ResizeToFitItems Method (Double)

Resizes the document scrollable area so it fits all diagram items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ResizeToFitItems (
    double borderGap
)
```

Visual Basic Copy Code

```
Public Sub ResizeToFitItems( _
    borderGap As Double _
)
```

Parameters

borderGap
A gap that should be left as a border around the diagram.

Remarks

Resizes the document area to be just as big as needed, for example, the smallest rectangle containing all diagram items. For aesthetic reasons, additional space can be left around the outmost items as a margin. Invoking the method on an empty document produces no result.

See Also

ResizeToFitItems Method Overload List
Diagram Members
Diagram Class

AutoResize Method
Bounds Property

Diagram.ResizeToFitItems Method (Double, Boolean)

Resizes the document scrollable area so it fits all diagram items, optionally considering only the visible items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ResizeToFitItems (
    double borderGap,
    bool onlyVisible
)
```

Visual Basic Copy Code

```
Public Sub ResizeToFitItems( _
    borderGap As Double, _
    onlyVisible As Boolean _
)
```

Parameters

borderGap
A gap that should be left as a border around the diagram.

onlyVisible
Specifies whether only the bounds of the Visible items should be included in the new document area.

Remarks

Resizes the document area to be just as big as needed, for example the smallest rectangle containing all diagram items. For aesthetic reasons, additional space can be left around the outmost items as a margin. Invoking the method on an empty document produces no result.

Diagram.RouteAllLinks Method

Overload List

Name	Description
Diagram.RouteAllLinks ()	Routes all links in the diagram in a way they do not cross nodes.
Diagram.RouteAllLinks (DiagramLinkCollection)	Reroutes the specified links.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.RouteAllLinks Method ()

Routes all links in the diagram in a way they do not cross nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RouteAllLinks ()
```

Visual Basic Copy Code

```
Public Sub RouteAllLinks ()
```

Remarks

Each link is routed so that it goes the shortest possible way between the nodes it links without crossing any other nodes. To do so, this method might modify the number of link segments. The value of AutoRoute is not considered when **RouteAllLinks** executes.

RoutingOptions allows tuning the routing algorithm. The most important options are the cost values exposed as LengthCost, TurnCost and CrossingCost properties. They greatly influence the shape of the generated route.

LoadFromJsonFile Method
SaveToJson Method

Diagram.SaveToJsonFileAsync Method

Saves the diagram into a JSON file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Task SaveToJsonFileAsync (
    string fileName
)
```

Visual Basic Copy Code

```
Public Function SaveToJsonFileAsync( _
    fileName As String _
) As Task
```

Parameters

fileName

Return Value

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.SaveToJsonObject Method

Saves the diagram to a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void SaveToJsonObject (
    JsonObject diagramObj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Public Overridable Sub SaveToJsonObject( _
    diagramObj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

diagramObj
A JsonObject the diagram's data should be stored into.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

Diagram Members
Diagram Class

Diagram.SaveToString Method

Encodes the diagram contents into an ASCII string using the specified format and optionally clearing the Dirty flag.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string SaveToString (
    SaveToStringFormat format,
    bool clearDirty
)
```

Visual Basic Copy Code

```
Public Function SaveToString( _
    format As SaveToStringFormat, _
    clearDirty As Boolean _
) As String
```

Parameters

format
A member of the SaveToStringFormat enumeration.

clearDirty
Indicates whether the Dirty flag should be cleared.

Return Value

A string containing the encoded diagram data.

Remarks

The Base16 and **Base64** formats represent the data returned by SaveToStream as an ASCII string. There are no special characters in the returned string, so the result can be easily stored in a database field or embedded into an XML document. That might be used also for transferring a diagram between a web page with embedded MvcDiagram and a web server, passing the string as a value of a hidden HTML field.

When using **Xml** or **CompressedXml** as the first argument, the diagram is saved in XML format. The same format is supported by the SaveToXml and LoadFromXml methods. **CompressedXml** specifies that the XML document should be further compressed in ZIP format and base-64 encoded.

Exceptions

Exception type	Condition
NotImplementedException	When saving the diagram using the CompressedXml flag under .NET Framework 1.1 or earlier.

SaveToXml Method Overload List
Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.SaveToXml Method (String)

Saves the diagram to the specified file as an XML document.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public void SaveToXml (
    string fileName
)
```

Visual Basic

```
Public Sub SaveToXml( _
    fileName As String _
)
```

Parameters

fileName
The full path and name of the disk file where the diagram should be saved.

Remarks

The first overloaded **SaveToXml** method works by creating an **XmlDocument** instance, calling the second overloaded method, and writing the document content to a file.

Diagram data can be loaded from an XML file or document using the LoadFromXml method.

See Also

SaveToXml Method Overload List
Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
SaveToFile Method

Diagram.SaveToXml Method (XmlDocument)

Saves the diagram to the specified XML document.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public virtual void SaveToXml (
    XmlDocument document
)
```

Visual Basic Copy Code

```
Public Overridable Sub SaveToXml( _
    document As XmlDocument _
)
```

Parameters

document
A .NET **XmlDocument** object where the diagram should be saved.

Remarks

Diagram data can be loaded from an XML file or document using the LoadFromXml method.

See Also

SaveToXml Method Overload List
Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
SaveToFile Method

Diagram.SaveToXml Method (XmlDocument, Boolean)

Saves the diagram to the specified XML document.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void SaveToXml (
    XmlDocument document,
    bool includeUnalteredProperties
)
```

Visual Basic Copy Code

```
Public Overridable Sub SaveToXml( _
    document As XmlDocument, _
    includeUnalteredProperties As Boolean _
)
```

Parameters

document
A .NET **XmlDocument** object where the diagram should be saved.

includeUnalteredProperties
true if properties that have their default value should be saved; otherwise, **false**.

Remarks

Diagram data can be loaded from an XML file or document using the LoadFromXml method.

Diagram.SaveToXmlAsync Method

Overload List

Name	Description
Diagram.SaveToXmlAsync (String)	Saves the diagram into an XML file.
Diagram.SaveToXmlAsync (XmlDocument)	Saves the diagram into an XML document.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.SaveToXmlAsync Method (String)

Saves the diagram into an XML file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Task SaveToXmlAsync (
    string fileName
)
```

Visual Basic Copy Code

```
Public Function SaveToXmlAsync( _
    fileName As String _
) As Task
```

Parameters

fileName

Return Value

See Also

SaveToXmlAsync Method Overload List
Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.SaveToXmlAsync Method (XmlDocument)

Saves the diagram into an XML document.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Task SaveToXmlAsync (
    XmlDocument document
)
```

Visual Basic

```
Public Function SaveToXmlAsync( _
    document As XmlDocument _
) As Task
```

Parameters

document

Return Value

See Also

SaveToXmlAsync Method Overload List
Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.SetShadowOffset Method

Sets the default offset at which items shadows are drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public void SetShadowOffset (
    double x,
    double y
)
```

Visual Basic

```
Public Sub SetShadowOffset( _
    x As Double, _
    y As Double _
)
```

Parameters

x
The horizontal offset of the item shadow.

y
The vertical offset of the item shadow.

Remarks

Use the method to draw shadows that are closer or further to the item they belong to. The values are applied respectively to the ShadowOffsetX and ShadowOffsetY properties.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
ShadowOffsetX Property
ShadowOffsetY Property
ShadowBrush

Diagram.SuspendLinkRouter Method

Called when the control starts a batch update operation that might affect many links. The diagram collects links specified through Route and RouteAllLinks calls and defers finding their paths to when ResumeLinkRouter is called.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SuspendLinkRouter ()
```

Visual Basic Copy Code

```
Public Sub SuspendLinkRouter ()
```

See Also

Diagram.UpdateMeasureTextScale Method

Gets or sets the scale to use when measuring texts. This should be effectively set to the value of DiagramView.Zoom / 100.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void UpdateMeasureTextScale (
    float measureTextScale
)
```

Visual Basic Copy Code

```
Public Sub UpdateMeasureTextScale( _
    measureTextScale As Single _
)
```

Parameters

measureTextScale

MindFusion.Diagramming Namespace

Diagram.UpdateZOrder Method

Immediately sorts the Z-order list if Z-order has been invalidated. Otherwise it will be sorted next time the diagram draws its contents.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void UpdateZOrder ()
```

Visual Basic Copy Code

```
Public Sub UpdateZOrder ()
```

Diagram Properties

Diagram.ActiveItem Property

Gets or sets the active diagram element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem ActiveItem { get; set; }
```

Visual Basic Copy Code

```
Public Property ActiveItem As DiagramItem
```

Property Value

A reference to the DiagramItem instance that is currently active.

Remarks

Use this property to get the active item - the one selected by the user or the last put in a multiple Selection. It is shown with white selection handles by default.

See Also

Diagram Members
Diagram Class

Diagram.ActiveItemHandlesStyle Property

Gets the visual style of adjustment handles of the active item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HandlesVisualStyle ActiveItemHandlesStyle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ActiveItemHandlesStyle As HandlesVisualStyle
```

Property Value

An instance of the HandlesVisualStyle class.

Remarks

This style object provides Pen and Brush attributes that let you customize the appearance of adjustment handles drawn around the active item.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
ActiveItem Property

Diagram.ActiveLayer Property

Gets or sets the zero-based index of the active layer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int ActiveLayer { get; set; }
```

Visual Basic Copy Code

```
Public Property ActiveLayer As Integer
```

Property Value

An integer value that specifies the index of the active layer.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.AdjustmentHandlesSize Property

Gets or sets the size of the handles, which appear around selected objects.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double AdjustmentHandlesSize { get; set; }
```

Visual Basic Copy Code

```
Public Property AdjustmentHandlesSize As Double
```

Property Value

A **double** value specifying the height of the selection handles. The default is 2.

Remarks

Use the property to set the size of the manipulation handles, which appear around selected items.

SelectedItemHandlesColor Property

Diagram.AlignmentGuidePen Property

Gets or sets the pen used to draw alignment guides.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen AlignmentGuidePen { get; set; }
```

Visual Basic Copy Code

```
Public Property AlignmentGuidePen As Pen
```

Property Value

An instance of the Pen class.

Remarks

This pen is used to draw alignment guides shown when AutoAlignNodes is enabled.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
AutoAlignDistance Property

Diagram.AlignToGrid Property

Gets or sets a value indicating whether the diagram items is aligned to a grid.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AlignToGrid { get; set; }
```

Visual Basic Copy Code

```
Public Property AlignToGrid As Boolean
```

Property Value

true if the grid is activated; otherwise, **false**. The default is **true**.

Remarks

When the property is set to **true**, the sides of every newly created diagram item are aligned to the nearest grid points.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
ShowGrid Property
GridColor Property
GridSizeX Property
GridSizeY Property
AlignPointToGrid Method
AutoAlignNodes Property

Diagram.AllowLinksRepeat Property

Gets or sets a value indicating whether more than one link can connect the same origin and destination diagram nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowLinksRepeat { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowLinksRepeat As Boolean
```

Property Value

true if repeated links are allowed; otherwise, **false**. The default is **true**.

Remarks

Specifies whether more than one link can connect the same origin and destination diagram nodes. If set to **false**, two diagram nodes can be connected with at most one link in a single direction.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
AllowSelfLoops Property

Diagram.AllowMultipleResize Property

Gets or sets whether multiple selected nodes can be resized simultaneously.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowMultipleResize { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowMultipleResize As Boolean
```

Property Value

true to let the user resize multiple selected nodes; otherwise, **false**. The default value is **false**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.AllowSelfLoops Property

Gets or sets a value indicating whether self-loops are allowed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowSelfLoops { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowSelfLoops As Boolean
```

Property Value

true if self loops are allowed; otherwise, **false**. The default is **true**.

Remarks

Use the property to specify whether the user is allowed to draw self loops - links that connect a node to itself.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
AllowLinksRepeat Property

Diagram.AllowSplitLinks Property

Gets or sets a value indicating whether link segments can be added and removed interactively.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowSplitLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowSplitLinks As Boolean
```

Property Value

true if interactive adding/removing of link segments allowed; **false** if not.

Remarks

You can insert new link segments interactively by clicking and dragging a point of a selected link's segment. For polyline-style links this creates one additional segment by splitting the existing one into two parts. For cascading links there are two segments inserted, keeping intact the alternating pattern of horizontal and vertical segments, each orthogonal to its neighbors.

Segments can be merged by moving their joining point until the angle between reaches certain threshold value. In case of cascading and Bezier links, segments can be merged by placing adjacent control points close to each other, as set in MergeThreshold.

This property also affects how users can change the orientation of cascading links. For more details see CascadeOrientation.

MindFusion.Diagramming Namespace
LinkSegments Property
LinkShape Property

Diagram.AllowUnanchoredLinks Property

Gets or sets a value indicating whether links can be connected to nodes to which there aren't anchor points assigned.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowUnanchoredLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowUnanchoredLinks As Boolean
```

Property Value

true to let links connect to nodes without anchor points; otherwise, **false**. The default is **true**.

Remarks

AllowUnanchoredLinks applies to nodes whose **AnchorPattern** is not set or does not contain incoming or outgoing anchor points available. If the property is enabled, users can connect links to any point of such nodes. If disabled, users cannot connect links to such nodes.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
AnchorPoint.AllowIncoming Property
AnchorPoint.AllowOutgoing Property

Diagram.AllowUnconnectedLinks Property

Gets or sets a value indicating whether users are allowed to draw links that are not connected to any node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowUnconnectedLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowUnconnectedLinks As Boolean
```

Property Value

true to allow drawing unconnected links; otherwise, **false**. The default is **false**.

Remarks

If the property is set to **true**, users will be able to draw links from or to any point of the document. Depending on which end of a link is unconnected, its Origin or Destination nodes might be of type DummyNode.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
AllowUnanchoredLinks Property

Diagram.AutoAlignDistance Property

Gets or sets the maximal horizontal or vertical distance at which a node aligns to the borders of other nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double AutoAlignDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoAlignDistance As Double
```

Property Value

A **double** value specifying the maximal alignment distance. The default value is 3.

Remarks

To enable node alignment, set AutoAlignNodes to true. When either the horizontal or vertical borders of the dragged node are within the specified distance from the respective borders of a nearby node, the dragged node snaps to a position where the borders are aligned.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
AlignmentGuidePen Property

Diagram.AutoAlignNodes Property

Gets or sets whether nodes should automatically align to the borders of other nodes during user interaction.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AutoAlignNodes { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoAlignNodes As Boolean
```

Property Value

true to align nodes, otherwise **false**. The default value is **false**.

Remarks

When either the horizontal or vertical borders of the dragged node are within AutoAlignDistance from the respective borders of a nearby node, the dragged node snaps to a position where the borders are aligned. In addition, an alignment guide that indicates which borders are aligned is drawn using the pen specified through AlignmentGuidePen.

Diagram.AutoArrangeAvoidContainers Property

Gets or sets a value indicating whether auto-arranged link labels should avoid containers.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AutoArrangeAvoidContainers { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoArrangeAvoidContainers As Boolean
```

Property Value

true to avoid containers, or **false** otherwise. The default value is **true**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.AutoArrangeAvoidSegments Property

Gets or sets a value indicating whether auto-arranged link labels should avoid link segments.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AutoArrangeAvoidSegments { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoArrangeAvoidSegments As Boolean
```

Property Value

true to avoid link segments, or **false** otherwise. The default value is **true**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.AutoCloseDistance Property

Gets or sets the maximum distance between first and last points of a FreeFormNode for which the node's outline is closed automatically.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Nullable<Double> AutoCloseDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoCloseDistance As Nullable(Of Double)
```

Property Value

An optional **double** value specifying upper limit of distance between end points where the form should close automatically. The default **null** value specifies that the form should always close.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.AutoDeleteLinks Property

Gets or sets whether links are deleted automatically when their Origin or Destination is deleted.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AutoDeleteLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoDeleteLinks As Boolean
```

Property Value

true to delete links along with the nodes they connect, or **false** otherwise. The default value is **true**.

Remarks

If this property is set to **false**, deleting a node will leave its links in the diagram as unconnected links.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.AutoHighlightRows Property

Gets or sets whether a table row should be highlighted when the user clicks on it.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AutoHighlightRows { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoHighlightRows As Boolean
```

Property Value

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.AutoResize Property

Gets or sets a value indicating whether the document area must be resized automatically so it fits the diagram contents.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AutoResize AutoResize { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoResize As AutoResize
```

Property Value

A member of the AutoResize enumeration. The default is **AutoResize.RightAndDown**.

Remarks

If automatic resizing is enabled, the size of the document scrollable area is updated each time an item is created, deleted or moved, either by end-users or by calling of methods. The following AutoResize values specify in what directions the diagram area is allowed to grow:

Member name	Description
None	Do not enlarge the diagram area automatically.
RightAndDown	Enlarge the diagram area to the right and down if an item is moved outside the boundaries in these directions.
AllDirections	Enlarge the diagram area in any direction if an item is moved outside the boundaries.

MindFusion.Diagramming Namespace
Bounds Property
ResizeToFitItems Method

Diagram.AutoSnapDistance Property

Specifies the maximum distance at which links auto-snap to nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double AutoSnapDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoSnapDistance As Double
```

Property Value

A **double** value specifying the maximum auto-snap distance. The default value is 16.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
AutoSnapLinks Property

Diagram.AutoSnapLinks Property

Gets or sets the default value for the AutoSnapToNode property of new links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AutoSnapLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoSnapLinks As Boolean
```

Property Value

true to snap links to nearest node, otherwise **false**; the default value is **false**.

Remarks

Only nodes at a distance smaller than AutoSnapDistance are considered. A link does not snap to its current origin or destination nodes if that would create a self-loop.

AutoAlignNodes Property

Diagram.BackBrush Property

Gets or sets the brush used for painting the diagram background.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush BackBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property BackBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class. The default is a solid brush initialized with Color.FromArgb(170, 170, 200).

Remarks

This property enables more spectacular background painting with effects such as gradients, textures and color patterns.

Example

The following sample paints the diagram background with a gradient brush:

C# Copy Code

```
private void Form1_Load(object sender, System.EventArgs e)
{
    diagram.BackBrush = new MindFusion.Drawing.LinearGradientBrush(
        Color.LightBlue, Color.LightCyan, 30);
}
```

Visual Basic Copy Code

```
Private Sub Form1_Load(ByVal sender As System.Object, ByVal e As System.EventArgs) Handles
MyBase.Load

    diagram.BackBrush = New MindFusion.Drawing.LinearGradientBrush( _
        Color.LightBlue, Color.LightCyan, 30)

End Sub
```

Diagram.BackgroundImage Property

Gets or sets the image displayed as background of this diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage BackgroundImage { get; set; }
```

Visual Basic Copy Code

```
Public Property BackgroundImage As IImage
```

Property Value

A **Microsoft.Maui.Graphics.IImage** instance.

Remarks

This image is painted as a background of the diagram, behind the alignment grid and all items. Its position is controlled by the BackgroundImageAlign property. To have the background image appear on printed pages, set the EnableBackgroundImage property of **DiagramView.PrintOptions** to **true**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
BackgroundImageAlign Property
BackBrush Property

Diagram.BackgroundImageAlign Property

Gets or sets a value indicating how the background image is positioned, relatively to the scrollable document area.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ImageAlign BackgroundImageAlign { get; set; }
```

Visual Basic Copy Code

```
Public Property BackgroundImageAlign As ImageAlign
```

Property Value

A member of the ImageAlign enumeration. The default is **ImageAlign.TopLeft**.

Remarks

The background image can be aligned to a corner, stretched, centered, or tiled to cover the control's area.

Example

To have a background image stretched along the drawing surface, use code like the following:

C# Copy Code

```
diagram.BackgroundImage = Image.FromFile("back.jpg");
diagram.BackgroundImageAlign = ImageAlign.Stretch;
```

Visual Basic Copy Code

```
diagram.BackgroundImage = Image.FromFile("back.jpg")
Diagram.BackgroundImageAlign = ImageAlign.Stretch
```

Diagram Class
MindFusion.Diagramming Namespace
ImageAlign Enumeration
BackgroundImage Property

Diagram.BackgroundImageUrl Property

URL of the image painted as diagram's background.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string BackgroundImageUrl { get; set; }
```

Visual Basic Copy Code

```
Public Property BackgroundImageUrl As String
```

Property Value

A string specifying the location of the image file.

Remarks

This property is used in the WebForms version of the control. Its advantage is that it allows for the diagram items to be loaded faster on the client side, while the background image is loaded asynchronously.

Diagram.BarcodeNodeStyle Property

Gets the theme-level style for barcode nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public BarcodeNodeStyle BarcodeNodeStyle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property BarcodeNodeStyle As BarcodeNodeStyle
```

Property Value

A **BarcodeNodeStyle** instance that defines the default appearance of **BarcodeNode**s.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.Bounds Property

Gets or sets a value representing the size of the diagram's scrollable area.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect Bounds { get; set; }
```

Visual Basic Copy Code

```
Public Property Bounds As Rect
```

Property Value

An instance of the **Microsoft.Maui.Graphics.Rect** structure. The default size of the document is the standard A4 size (210x297 mm).

Remarks

Use this property to specify how large a document should be, that is, how far it can be scrolled. If **ShowScrollbars** is enabled, setting the document extents also updates the scrollbar ranges. After creating a diagram programmatically, you might wish to call ResizeToFitItems to make the scrollable area just big enough to contain all diagram elements.

Diagram.BoundsPen Property

The pen with which the document bounds should be drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen BoundsPen { get; set; }
```

Visual Basic Copy Code

```
Public Property BoundsPen As Pen
```

Property Value

A Pen instance. The default value is null.

Remarks

This pen is used to draw borders around the diagram bounding rectangle, which could be useful when the **DiagramView** is larger than the diagram.

Diagram.BranchIndicatorColor Property

Gets or sets the color of link branch indicators.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Color BranchIndicatorColor { get; set; }
```

Visual Basic Copy Code

```
Public Property BranchIndicatorColor As Color
```

Property Value

A **Microsoft.Maui.Graphics.Color** instance specifying the color of branch indicators. The default value is **LightGreen**.

Diagram.CellCustomDraw Property

Gets or sets the default type of custom painting done on the cells of tables.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CustomDraw CellCustomDraw { get; set; }
```

Visual Basic Copy Code

```
Public Property CellCustomDraw As CustomDraw
```

Property Value

A member of the CustomDraw enumeration. The default is **CustomDraw.None**.

Remarks

The CellCustomDraw member of new tables is initialized from this property.

MindFusion.Diagramming Namespace

Diagram.ContainerCaption Property

Gets or sets the default value for the Caption property of containers.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ContainerCaption { get; set; }
```

Visual Basic Copy Code

```
Public Property ContainerCaption As String
```

Property Value

A string specifying the initial caption text of containers. The default is "Container".

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.ContainerCaptionHeight Property

Gets or sets the default value for the CaptionHeight property of containers.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ContainerCaptionHeight { get; set; }
```

Visual Basic Copy Code

```
Public Property ContainerCaptionHeight As Double
```

Property Value

A **double** value specifying the initial height of containers' caption bars. The default is 5.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.ContainerHighlightPen Property

Gets or sets the default value for the HighlightPen property of containers.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen ContainerHighlightPen { get; set; }
```

Visual Basic Copy Code

```
Public Property ContainerHighlightPen As Pen
```

Property Value

A Pen instance specifying the initial highlight pen of containers. The default is a pen with **Color.LightSkyBlue** color and width 0.5.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.ContainerMargin Property

Gets or sets the default value for the Margin property of containers.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ContainerMargin { get; set; }
```

Visual Basic Copy Code

```
Public Property ContainerMargin As Double
```

Property Value

A **double** value specifying the initial margin size of containers. The default is 10.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.ContainerMinimumSize Property

Gets or sets the default value for the MinimumSize property of containers.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Size ContainerMinimumSize { get; set; }
```

Visual Basic Copy Code

```
Public Property ContainerMinimumSize As Size
```

Property Value

A **Size** value specifying the initial minimum size of containers. The default is 50x40.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.ContainerNodeStyle Property

Gets the theme-level style for container nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerNodeStyle ContainerNodeStyle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ContainerNodeStyle As ContainerNodeStyle
```

Property Value

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.ContainersFoldable Property

Gets or sets the default value for the Foldable property of containers.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ContainersFoldable { get; set; }
```

Visual Basic

```
Public Property ContainersFoldable As Boolean
```

Property Value

A boolean value specifying whether containers are initially foldable. The default is **true**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.CrossingRadius Property

Gets or sets the radius length of decorations displayed at link intersection points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public double CrossingRadius { get; set; }
```

Visual Basic

```
Public Property CrossingRadius As Double
```

Property Value

A **double** value specifying the radius of the arcs drawn at link intersection points.

Remarks

If LinkCrossings is set to **Cut**, link segments are cut at intersection points and this property defines the length of the break left between adjacent cut points. If **LinkCrossings** is set to **Arcs**, this property defines the radius of the arcs drawn over intersection points.

MindFusion.Diagramming Namespace
RoundedLinksRadius Property
DiagramLink.CrossingRadius Property

Diagram.DefaultShape Property

Gets or sets the default shape of shape nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public Shape DefaultShape { get; set; }
```

Visual Basic

```
Public Property DefaultShape As Shape
```

Property Value

An instance of the Shape class. The default is the RoundRect shape.

Remarks

The Shape property of newly created shape nodes is initialized with the value of this property. It defines a series of lines, arcs and curves composed in a complex shape. There are 87 **predefined shapes** exposed as static members of the Shape class. You can also define your own shapes as shown below.

Example

The following example demonstrates how to create a custom shape and set it as a default in the diagram:

C# Copy Code

```
private void example_Click(object sender, System.EventArgs e)
{
    // Define a custom shape
    // this is the same as: fc.DefaultShape = Shape.FromId("Tape");
    diagram.DefaultShape = new Shape(
        new ElementTemplate[] {
            new LineTemplate(50, 100, 85, 100),
            new LineTemplate(85, 100, 85, 90),
            new LineTemplate(85, 90, 70, 90),
            new BezierTemplate(70, 90, 85, 90, 100, 75, 100, 50),
            new BezierTemplate(100, 50, 100, 25, 75, 0, 50, 0),
            new BezierTemplate(50, 0, 25, 0, 0, 25, 0, 50),
            new BezierTemplate(0, 50, 0, 75, 25, 100, 50, 100) },
        FillMode.Winding);
}
```

Visual Basic Copy Code

```
Private Sub example_Click(ByVal sender As Object, ByVal e As System.EventArgs)

    ' Define a custom shape
    ' this is the same as: fc.DefaultShape = Shape.FromId("Tape")
    Diagram.DefaultShape = New Shape( _
        New ElementTemplate() { _
            New LineTemplate(50, 100, 85, 100), _
            New LineTemplate(85, 100, 85, 90), _
            New LineTemplate(85, 90, 70, 90), _
            New BezierTemplate(70, 90, 85, 90, 100, 75, 100, 50), _
            New BezierTemplate(100, 50, 100, 25, 75, 0, 50, 0), _
            New BezierTemplate(50, 0, 25, 0, 0, 25, 0, 50), _
            New BezierTemplate(0, 50, 0, 75, 25, 100, 50, 100)}, _
        FillMode.Winding)

End Sub
```

Diagram.DiagramStyle Property

Gets the theme-level style for the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramStyle DiagramStyle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property DiagramStyle As DiagramStyle
```

Property Value

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.Dirty Property

Gets or sets a value indicating whether the diagram has changed since the last save.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Dirty { get; set; }
```

Visual Basic Copy Code

```
Public Property Dirty As Boolean
```

Property Value

A boolean value that indicates whether the diagram has changed.

Remarks

MvcDiagram tracks all changes that are done on the diagram contents, either programmatically or by users. If there are changes that are still not saved, the property has value of **true**. The **Dirty** flag is cleared automatically when a document is loaded from file or stream. When a document is saved, the **Dirty** flag can be cleared as specified by an argument of the Save* methods.

LoadFromFile Method

Diagram.DisabledHandlesStyle Property

Gets the visual style of disabled adjustment handles.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HandlesVisualStyle DisabledHandlesStyle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property DisabledHandlesStyle As HandlesVisualStyle
```

Property Value

An instance of the HandlesVisualStyle class.

Remarks

This style object provides Pen and Brush attributes that let you customize the appearance of disabled adjustment handles.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
DiagramNode.EnabledHandles Property

Diagram.DynamicLinks Property

Gets or sets the default value for the Dynamic property of new links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool DynamicLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property DynamicLinks As Boolean
```

Property Value

true if dynamic links are enabled; otherwise, **false**. The default is **false**.

Remarks

Use the property to specify whether links automatically reposition their end segments, so they keep pointing to the centers of connected nodes. If enabled, moving a connected node recalculates the position of link's end point, placing it at appropriate

location of the node outline. If the node has anchor points assigned to it, the end point is attached to one of them.

If the value is **false**, links do not look for the center of the origin and destination node, but keep their relative position as set when they were created - from the left corner of the first node to the top of the other node for instance.

Diagram.EffectiveBackBrush Property

Gets the currently effective background brush of the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush EffectiveBackBrush { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property EffectiveBackBrush As Brush
```

Property Value

Remarks

This property returns Brush if it is not null, or the brush from the associated style or theme otherwise.

Diagram Class
MindFusion.Diagramming Namespace

Diagram.EffectsProvider Property

Gets or sets an object used to generate visual effects for shape nodes such as embossment and shadow dispersion.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IEffectsProvider EffectsProvider { get; set; }
```

Visual Basic Copy Code

```
Public Property EffectsProvider As IEffectsProvider
```

Property Value

An object that implements the IEffectsProvider interface. The default is **null** (**Nothing** in Visual Basic).

Remarks

For performance reasons, embossment and shadow dispersion effects are implemented through code that processes large amounts of image data by directly accessing the memory allocated to the image. The .NET runtime considers such code unsafe, and the default CAS settings prevent assemblies that contain unsafe code from being loaded in Internet Explorer or IIS. In order

to keep the MvcDiagram CAS requirements low, the unsafe code resides in a separate assembly - *MindFusion.Diagramming.EffectsProvider.dll*. If you wish to use the EnableEmbossEffects and EnableShadowEffects properties, you must add to your project a reference to that assembly, instantiate an EffectsProvider object, and assign it to the **EffectsProvider** property.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.EnableEmbossEffects Property

Gets or sets a value indicating whether emboss effect for shape nodes is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableEmbossEffects { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableEmbossEffects As Boolean
```

Property Value

true to enable embossment of shape nodes; otherwise, **false**. The default is **false**.

Remarks

In order to use the shape embossment effect, you must also set the EffectsProvider property.

EnableShadowEffects Property

Diagram.EnableLanes Property

Gets or sets whether lanes are enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableLanes { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableLanes As Boolean
```

Property Value

true if lanes are enabled; otherwise, **false**. The default is **false**.

Remarks

You can customize the lane grid through the LaneGrid property.

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.EnableShadowEffects Property

Gets or sets a value indicating whether the shadow dispersion effect for nodes is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableShadowEffects { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableShadowEffects As Boolean
```

Property Value

true to enable shadow dispersion; otherwise, **false**. The default is **false**.

Remarks

In order to use the shadow dispersion effect, you must also set the EffectsProvider property.

MindFusion.Diagramming Namespace
EnableEmbossEffects Property

Diagram.EnableSpatialIndex Property

Gets or sets whether to index item positions for faster hit-testing and viewport clipping queries.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableSpatialIndex { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableSpatialIndex As Boolean
```

Property Value

true to enable spatial indexing, or **false** otherwise. The default value is **false**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.EnableStyledText Property

Gets or sets the default value for the EnableStyledText property of new nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableStyledText { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableStyledText As Boolean
```

Property Value

true to parse the text of items in order to find formatting tags; otherwise, **false**. The default is **false**.

Remarks

Styled text allows applying various attributes to the characters it contains. Attributes are specified using HTML-like formatting tags embedded in the raw text. Formatting tags are listed and described in the **Text Attributes and Formatting** section of this help file.

Diagram Class
MindFusion.Diagramming Namespace

Diagram.ExpandButtonAction Property

Gets or sets a value indicating what should happen when a user clicks the [±] button that is displayed near expandable nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ExpandButtonAction ExpandButtonAction { get; set; }
```

Visual Basic Copy Code

```
Public Property ExpandButtonAction As ExpandButtonAction
```

Property Value

A member of the ExpandButtonAction enumeration. The default is **ExpandTreeBranch**.

Remarks

The default behavior of a [±] button displayed nearby an **Expandable** node is to hide or show the children of that node. In that case, the children of a node are all nodes that can be reached from it by following recursively the **OutgoingLinks** or **IncomingLinks**, as defined by the ExpandOnIncoming property.

To implement custom expand/collapse functionality, set **ExpandButtonAction** to RaiseEvents and handle the ExpandButtonClicked event. That lets you use other criteria for what nodes should be shown or hidden, for example, containment or hierarchical grouping.

See Also

Diagram Members

MindFusion.Diagramming Namespace
ExpandButtonPosition Property

TreeCollapsed Event
TreeExpanded Event

Diagram.ExpandButtonPosition Property

Gets or sets where expand/collapse buttons are located relatively to their nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ExpandButtonPosition ExpandButtonPosition { get; set; }
```

Visual Basic Copy Code

```
Public Property ExpandButtonPosition As ExpandButtonPosition
```

Property Value

A member of the ExpandButtonPosition enumeration. The default is **OuterRight**.

Remarks

If diagram links tend to flow vertically, it would be useful to have the expand/collapse buttons stay at the left- or right-hand side of nodes. If diagram links tend to flow horizontally, choose position for expand buttons such that they stay above or below nodes. That will prevent button icons from being overlapped by links.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
NodesExpandable Property
ExpandButtonAction Property

Diagram.ExpandOnIncoming Property

Gets or sets a value, indicating in which direction object hierarchies are expanded.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ExpandOnIncoming { get; set; }
```

Visual Basic Copy Code

```
Public Property ExpandOnIncoming As Boolean
```

Property Value

true if trees are expanded in the direction of the links, which come into nodes; otherwise, **false**. The default is **false**.

Remarks

Use this property when presenting tree structures with enabled collapse/expand. If the property is set to **false**, a clicked expand button of a node expands in the direction of the node's outgoing links. That is, the nodes pointed by links going out of a node are considered children of that node.

See Also

Diagram.ExteriorBrush Property

Gets or sets the brush used for painting the area outside Bounds.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush ExteriorBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property ExteriorBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class. Default value is **null** (**Nothing** in Visual Basic).

Remarks

If **ExteriorBrush** is set to **null**, the BackBrush is used to paint the areas both inside and outside Bounds. In order to scroll the exterior filling and the background image consistently, **ExteriorBrush** can be used only with document-relative BackgroundImageAlign.

See Also

Brush and Pen Classes

Diagram.Factory Property

Gets a Factory instance that lets you add programmatically new items to the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Factory Factory { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Factory As Factory
```

Property Value

An instance of the Factory class.

Remarks

You can add a new node or link to the diagram by creating an instance of the item class by using the **new** operator and adding it to the Nodes or Links collection. This works the same way for adding both items from your custom class or ones from the MvcDiagram predefined types. The Factory class methods are just shortcuts that let you do that with a single method call, and they work only for the predefined item classes.

See Also

Diagram.FocusedComponent Property

Gets or sets the component within this diagram which currently has the input focus.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ComponentBase FocusedComponent { get; set; }
```

Visual Basic Copy Code

```
Public Property FocusedComponent As ComponentBase
```

Property Value

An instance of a ComponentBase -derived class.

ComponentBase.GotFocus Event

Diagram.FoldedContainerSize Property

Gets or sets the size of folded containers.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Size FoldedContainerSize { get; set; }
```

Visual Basic Copy Code

```
Public Property FoldedContainerSize As Size
```

Property Value

A **Size** instance specifying the size of folded containers. The default value is **Empty**.

Remarks

If this property is not set, the width of folded containers is set to their MinimumSize and the height to their CaptionHeight.

Diagram.Font Property

Gets or sets the default font for new diagram items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Font Font { get; set; }
```

Visual Basic Copy Code

```
Public Property Font As Font
```

Property Value

An instance of the **Font** class. The default is Microsoft Sans Serif, 9pt.

Remarks

The Font of new nodes and links is initialized with the value of this property.

Diagram.GridColor Property

Gets or sets the color of the grid points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Color GridColor { get; set; }
```

Visual Basic Copy Code

```
Public Property GridColor As Color
```

Property Value

A **Microsoft.Maui.Graphics.Color** instance. The default is Color.FromArgb(140, 140, 150).

Remarks

Use the property to specify the color of grid points and lines.

Diagram.GridOffsetX Property

Gets or sets the horizontal offset of the first point of the alignment grid.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double GridOffsetX { get; set; }
```

Visual Basic

```
Public Property GridOffsetX As Double
```

Property Value

A **double** value that specifies the horizontal grid offset. The default is **NaN**.

Remarks

The property specifies the offset of the first point of the alignment grid. The default value **NaN** makes the grid start at offset GridSizeX / 2.

See Also

Diagram.GridOffsetY Property

Gets or sets the vertical offset of the first point of the alignment grid.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public double GridOffsetY { get; set; }
```

Visual Basic

```
Public Property GridOffsetY As Double
```

Property Value

A **double** value that specifies the vertical grid offset. The default is **NaN**.

Remarks

The property specifies the offset of the first point of the alignment grid. The default value **NaN** makes the grid start at offset GridSizeY / 2.

Diagram.GridPatternHatch Property

Gets or sets a hatch style used to draw dense alignment grid at low zoom levels.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public HatchStyle GridPatternHatch { get; set; }
```

Visual Basic

```
Public Property GridPatternHatch As HatchStyle
```

Property Value

A member of the HatchStyle enumeration.

Remarks

GridPatternHatch is used to draw the alignment grid when its pixels get closer than GridPatternThreshold value due to small **ZoomFactor**. This improves diagram's rendering speed at low zoom levels without having to hide the grid altogether.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
ShowGrid Property

Diagram.GridPatternThreshold Property

Gets or sets the distance between grid points (in pixels) that triggers drawing using GridPatternHatch.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public double GridPatternThreshold { get; set; }
```

Visual Basic

```
Public Property GridPatternThreshold As Double
```

Property Value

A number specifying distance between zoomed grid points. The default value is **2.5**.

Remarks

GridPatternHatch is used to draw the alignment grid when its pixels get closer than **GridPatternThreshold** value due to small **ZoomFactor**. This improves diagram's rendering speed at low zoom levels without having to hide the grid altogether.

Diagram.GridStyle Property

Gets or sets the visual style of the alignment grid.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public GridStyle GridStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property GridStyle As GridStyle
```

Property Value

A member of the GridStyle enumeration. The default is **Points**.

Remarks

Specifies how the alignment grid is drawn. If the property value is set to Points, the grid is painted as a matrix of points. If set to **Lines**, the grid is represented as a series of crossing horizontal and vertical lines. Grid points or lines are painted with the color set in GridColor; the distance between them is specified by the GridSizeX and GridSizeY properties.

Diagram.Groups Property

Gets a collection of all groups in the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public GroupCollection Groups { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Groups As GroupCollection
```

Property Value

An instance of the GroupCollection class.

Remarks

Groups provides access to all groups defined in the current diagram.

Items Property
Factory.CreateGroup Method

Diagram.HitTestPriority Property

Gets or sets a value indicating the order in which items are hit-tested.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HitTestPriority HitTestPriority { get; set; }
```

Visual Basic Copy Code

```
Public Property HitTestPriority As HitTestPriority
```

Property Value

A member of the HitTestPriority enumeration. The default value is **NodesBeforeLinks**.

Remarks

For easier selection, links have a hit-detection area several pixels wider than their visible segment lines. However, if several links with higher z-index cross a node, it would be difficult to select it. The **HitTestPriority** property allows altering hit-test results in such situations. If set to NodesBeforeLinks, nodes are hit-tested before all links. **ZOrder** makes all items tested in decreasing z-order, independently of their type.

Diagram.Interaction Property

Gets an InteractionState instance representing the current action being carried out by the user.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public InteractionState Interaction { get; set; }
```

Visual Basic Copy Code

```
Public Property Interaction As InteractionState
```

Property Value

An instance of the InteractionState class.

See Also

Diagram Members
Diagram Class

Diagram.IsProEdition Property

Gets a value indicating whether the currently loaded MvcDiagram is a professional version of the control.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool IsProEdition { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property IsProEdition As Boolean
```

Property Value

true if the currently loaded MvcDiagram control is a professional version; otherwise, **false**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.Items Property

Gets a collection of all items in this diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItemCollection Items { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Items As DiagramItemCollection
```

Property Value

An instance of the DiagramItemCollection class.

Remarks

This collection gives you access to all items contained in this document. You can also use it to add new items to the diagram.

Diagram.LaneGrid Property

Gets the Grid instance that represents the lane grid.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Grid LaneGrid { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property LaneGrid As Grid
```

Property Value

An instance of the Grid class.

Remarks

The Grid object gives you full control over the lane grid. For example, it lets you set the number of rows and columns in the grid, add headers, customize the appearance, subscribe to events and so on.

Diagram.Layers Property

Gets a list of the layers in the current diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IList<Layer> Layers { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Layers As IList(Of Layer)
```

Property Value

A list with all diagram layers.

Diagram.LinkBaseShape Property

Gets or sets the shape displayed at the base of new links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape LinkBaseShape { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkBaseShape As Shape
```

Property Value

A Shape instance that represents an arrowhead shape. The default is None.

Remarks

This property specifies the default shape displayed as arrowhead at the links' origin points. The ArrowHeads class exposes several predefined shapes as static properties.

See Also

Diagram.LinkBaseShapeSize Property

Gets or sets the default size of the base of new links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double LinkBaseShapeSize { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkBaseShapeSize As Double
```

Property Value

A **double** value that specifies the size. The default is 5.

Remarks

The property specifies the size of the graphical shapes that are displayed at the start of new diagram links, for example, at the beginning of the links.

See Also

Diagram Members
Diagram Class

Diagram.LinkBranchIndicator Property

Gets or sets a value indicating what shapes to display as markers at points where overlapping Cascading links diverge.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public BranchIndicator LinkBranchIndicator { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkBranchIndicator As BranchIndicator
```

Property Value

A member of the BranchIndicator enumeration. The default value is **None**.

See Also

Diagram Members

LinkCrossings Property
LinkMergeIndicator Property
DrawBranchIndicator Event

Diagram.LinkBrush Property

Gets or sets the default value for the Brush property of links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush LinkBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

Remarks

The property provides a default value for the brush, with which an arrowhead's interior is filled. The Brush property of new links is initialized with a clone of **LinkBrush**, but after link creation the properties are independent - changing one of them does not change the other.

See Also

LinkPen Property

Diagram.LinkCascadeOrientation Property

Gets or sets the initial orientation of the first segment of new cascading links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Orientation LinkCascadeOrientation { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkCascadeOrientation As Orientation
```

Property Value

A member of the Orientation enumeration. The default value is **Auto**.

Remarks

Use this property to specify the default orientation of the first segment of DiagramLink objects whose Shape is set to LinkShape.Cascading. The default value, Auto, lets the component decide whether to draw the first segment horizontally or vertically. See **Orientation** for more details.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
DiagramLink.CascadeOrientation Property

Diagram.LinkCrossings Property

Gets or sets how to render the intersection points where links cross their paths.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkCrossings LinkCrossings { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkCrossings As LinkCrossings
```

Property Value

A member of the LinkCrossings enumeration. The default is **Straight**.

Remarks

Intersection points where links cross each other's paths can be rendered as arcs or breaks, depending on the value of this property. The z-order defines which links jump over the others or which links are cut by the others. If **LinkCrossings** is set to Arcs, links with higher ZIndex jump over those with lower **ZIndex**. If set to **Cut**, segments of links at lower z-position are cut by links at higher z-position. Radius of arcs and breaks can be set by the CrossingRadius property.

Diagram.LinkCustomDraw Property

Gets or sets the default type of custom painting done on links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CustomDraw LinkCustomDraw { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkCustomDraw As CustomDraw
```

Property Value

A member of the CustomDraw enumeration. The default is **None**.

Remarks

This property specifies whether and how custom painting of links is performed. Its value is assigned to the CustomDraw property of new links.

Diagram.LinkEndsMovable Property

Gets or sets a value indicating whether link ends can be moved by users after the link is created.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool LinkEndsMovable { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkEndsMovable As Boolean
```

Property Value

true if moving link ends is allowed; **false**, if not.

Remarks

When the property is set to **true**, users cannot move the ends of a link after the link is created. This prevents them from connecting the links to other origin and destination nodes.

Diagram.LinkHandlesStyle Property

Gets or sets the default value for the HandlesStyle property of new links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HandlesStyle LinkHandlesStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkHandlesStyle As HandlesStyle
```

Property Value

A member of the HandlesStyle enumeration. The default is **SquareHandles**.

Remarks

Default value for the HandlesStyle property of new links, created either programmatically or by a user. That property specifies how links' selection status is indicated visually.

See Also

Diagram Members
Diagram Class

Diagram.LinkHeadShape Property

Gets or sets the shape displayed as head of new links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape LinkHeadShape { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkHeadShape As Shape
```

Property Value

A Shape instance that represents an arrowhead shape. The default is Arrow.

Remarks

This property specifies the default shape displayed as arrowhead at the links' end points. The ArrowHeads class exposes several predefined shapes as static properties.

Diagram.LinkHeadShapeSize Property

Gets or sets the default size of arrowheads.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double LinkHeadShapeSize { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkHeadShapeSize As Double
```

Property Value

A **double** value that measures the size. The default is 5.

Remarks

The property specifies how big the shapes of new arrowheads are.

See Also

Diagram.LinkHitDistance Property

Gets or sets a value specifying how far from a link a click is still considered a hit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double LinkHitDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkHitDistance As Double
```

Property Value

A **double** value specifying the distance in MeasureUnit units. The default value is 0.

Remarks

If this property is set to 0, the control considers it a hit when a link is no further than five millimeters from the mouse position. This **LinkHitDistance** value is also used when hit-testing programmatically, e.g. by calling the GetItemAt method.

Diagram.LinkIntermediateShape Property

Gets or sets the default shape to be displayed in the middle of each segment of links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape LinkIntermediateShape { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkIntermediateShape As Shape
```

Property Value

A Shape instance that represents an arrowhead shape. The default is None.

Remarks

The property specifies default shape to be displayed at the middle of each segment of new links. It facilitates users by following the path of a link across the diagram, especially for longer links in large documents. The ArrowHeads class exposes several predefined shapes as static properties.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double LinkIntermediateShapeSize { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkIntermediateShapeSize As Double
```

Property Value

A **double** value that measures the size. The default is 5.

Remarks

Specifies default value for the IntermediateShapeSize property of new links.

Diagram.LinkMergeIndicator Property

Gets or sets a value indicating what shapes to display as markers at points where overlapping Cascading links merge.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public BranchIndicator LinkMergeIndicator { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkMergeIndicator As BranchIndicator
```

Property Value

A member of the BranchIndicator enumeration. The default value is **None**.

See Also

Diagram.LinkPen Property

Gets or sets the default value for the Pen and HeadPen properties of links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen LinkPen { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkPen As Pen
```

Property Value

An instance of the MindFusion.Drawing.Pen class.

Remarks

The property provides a default value for the pens, with which link's segments and arrowhead lines are painted. The Pen and HeadPen properties of new links are initialized with clones of **LinkPen**, but after link creation the properties are independent - changing one of them does not change the others.

Diagram.LinkRouter Property

Gets or sets the component used to find paths for auto-routed links when diagram nodes are added or their positions change.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ILinkRouter LinkRouter { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkRouter As ILinkRouter
```

Property Value

An instance of a class implementing the ILinkRouter interface.

Remarks

The default value is a CompositeRouter instance that chains PatternRouter and GridRouter.

Diagram.Links Property

Gets a collection of all DiagramLink objects in the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLinkCollection Links { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Links As DiagramLinkCollection
```

Property Value

An instance of the DiagramLinkCollection class.

Remarks

Links provides type-safe access to all links in the current diagram. Any diagram element can be accessed also via the Items collection.

Diagram.LinkSegments Property

Gets or sets the default number of link segments.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int LinkSegments { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkSegments As Integer
```

Property Value

An integer value specifying how many segments links consists of. The default is 1.

Remarks

This value is assigned to the SegmentCount property of new links, which together with Shape defines the number of ControlPoints. You can let users insert new link segments interactively by setting AllowSplitLinks to **true**.

See Also

Diagram.LinkShape Property

Gets or sets the default value of the Shape property of new links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkShape LinkShape { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkShape As LinkShape
```

Property Value

A member of the LinkShape enumeration. The default value is **Polyline**.

Remarks

Use this property to specify what kind of segments new links are composed of. Curved links can be created using Bezier or **Spline** styles. Straight-segment links can be created using **Polyline** and **Cascading** styles, the latter one restricting segments to horizontal and vertical direction, orienting each segment orthogonally to its neighbor.

DiagramLink.Shape Property
RoundedLinks Property
LinkBranchIndicator Property

Diagram.LinksRetainForm Property

Gets or sets whether links should maintain their forms if the nodes linked with those links are moved around.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool LinksRetainForm { get; set; }
```

Visual Basic Copy Code

```
Public Property LinksRetainForm As Boolean
```

Property Value

true to retain links' forms; otherwise, **false**. The default is **false**.

Remarks

LinksRetainForm value is used to initialize the RetainForm property of new links. It has effect on links that have more than two control points. If the nodes that a link connects are moved around, usually only the segments at the ends of that link are updated, so that they stay connected to their respective nodes. In that case all intermediate control points stay where they are. However, if

RetainForm is enabled, all control points will move simultaneously in a way they preserve their relative position to each other, and thus preserving the overall form of the link.

Diagram.LinkText Property

Gets or sets the default text of links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string LinkText { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkText As String
```

Property Value

A string specifying the initial text of links. The default is an empty string.

Remarks

The value of this property is assigned to the Text property of new links.

Diagram.MeasureTextRenderingHint Property

Gets or sets the TextRenderingHint to use when measuring texts. This should be effectively set to the value of DiagramView.TextRenderingHint.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static TextRenderingHint MeasureTextRenderingHint { get; set; }
```

Visual Basic Copy Code

```
Public Shared Property MeasureTextRenderingHint As TextRenderingHint
```

Property Value

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.MeasureUnit Property

Gets or sets the unit of measure used for logical coordinates in this diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public MeasureUnit MeasureUnit { get; set; }
```

Visual Basic Copy Code

```
Public Property MeasureUnit As MeasureUnit
```

Property Value

An instance of the MeasureUnit class. The default value is Millimeter.

Remarks

Many properties in the MvcDiagram API are used to specify the dimensions of diagram items or the size of various visual elements, for example, selection handles, arrowhead shapes, frame widths, and so on. **MeasureUnit** specifies the measure of length in which these size values are defined.

Changing the measure unit does not automatically rescale the size-related property values. Your application must set appropriate values to: Bounds, GridSizeX, GridSizeY, GridOffsetX, GridOffsetY, AdjustmentHandlesSize, LinkBaseShapeSize, LinkHeadShapeSize, LinkIntermediateShapeSize, TableCaptionHeight, TableColumnWidth, TableRowHeight, CrossingRadius, ShadowOffsetX, ShadowOffsetY and to the size-related members of RoutingOptions.

Changing the measure unit resets **RoutingOptions** to default values for the new unit, because performance might suffer greatly if the routing algorithm uses too big or too small GridSize.

The arguments passed to some methods depend on the measure unit too, for example, CreateShapeNode, CreateTableNode, GetNodeAt, GetLinkAt, **ZoomToRect**.

The following MeasureUnit members provide ready-to-use measure units:

Member name	Description
Centimeter	Specifies centimeters as the unit of measure.
Document	Specifies the document unit (1/300 inch) as the unit of measure.
Inch	Specifies the inch as the unit of measure.
Millimeter	Specifies the millimeter as the unit of measure.
Pixel	Specifies a device pixel as the unit of measure. Note that print and on-screen output will differ greatly in size when using pixels because printer pixels are much smaller than screen ones.
Point	Specifies a printer's point (1/72 inch) as the unit of measure.
WpfPoint	Specifies device-independent pixels (1/96 inch) as the unit of measure.

Diagram.MergeIndicatorColor Property

Gets or sets the color of link merge indicators.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Color MergeIndicatorColor { get; set; }
```

Visual Basic Copy Code

```
Public Property MergeIndicatorColor As Color
```

Property Value

A **Microsoft.Maui.Graphics.Color** instance specifying the color of branch indicators. The default value is **LightGreen**.

MergeIndicatorSize Property

Diagram.MergeIndicatorSize Property

Gets or sets the size of link merge indicators.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double MergeIndicatorSize { get; set; }
```

Visual Basic Copy Code

```
Public Property MergeIndicatorSize As Double
```

Property Value

A **double** value specifying the size of branch indicators. The default value is 4.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
LinkMergeIndicator Property
MergeIndicatorColor Property

Diagram.MergeThreshold Property

Gets or sets the maximum distance between adjacent control points of a link at which the respective segments can be merged.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double MergeThreshold { get; set; }
```

Visual Basic Copy Code

```
Public Property MergeThreshold As Double
```

Property Value

A **double** value Specifying the maximum distance in the current MeasureUnit. The default is 0.

Remarks

A user may add or remove links' segments interactively when the AllowSplitLinks property is enabled. They can drag a link's control point over the next one in order to merge two adjacent segments. Usually the two points must be placed exactly at the same coordinates in order to merge the respective segments of the link. Assign a larger value to this property if you wish to make it easier for users to merge segments by just moving link's control point close to each other.

Diagram.MinimumNodeSize Property

Gets or sets the minimum node size that the user is allowed to set.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Size MinimumNodeSize { get; set; }
```

Visual Basic Copy Code

```
Public Property MinimumNodeSize As Size
```

Property Value

A **Size** instance specifying the minimum size allowed for nodes.

Remarks

If the user releases the mouse button while creating or modifying a node and the node size is smaller than this value, the operation is cancelled.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.ModificationEffect Property

Gets or sets the visual effect to apply during interactive modification of items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ModificationEffect ModificationEffect { get; set; }
```

Visual Basic Copy Code

```
Public Property ModificationEffect As ModificationEffect
```

Property Value

A member of the ModificationEffect enumeration. The default value is **None**.

Diagram.NodeEffects Property

Gets a collection with all effects applied to the nodes of this diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IList<NodeEffect> NodeEffects { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property NodeEffects As IList(Of NodeEffect)
```

Property Value

A list with all currently active node effects.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.Nodes Property

Gets a collection of all DiagramNode objects in the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNodeCollection Nodes { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Nodes As DiagramNodeCollection
```

Property Value

An instance of the DiagramNodeCollection class.

Remarks

Nodes provides type-safe access to all nodes in the current diagram. Any diagram element can be accessed also by using the Items collection.

Example

The following code adds a new ShapeNode to the diagram:

C# Copy Code

```
var node = new ShapeNode(diagram);
node.Bounds = new Rect(10, 10, 30, 30);
diagram.Nodes.Add(node);
```

Factory.CreateShapeNode Method

Diagram.NodesExpandable Property

Gets or sets a value indicating whether newly created nodes can be expanded.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool NodesExpandable { get; set; }
```

Visual Basic Copy Code

```
Public Property NodesExpandable As Boolean
```

Property Value

true if new nodes can be expanded; otherwise, **false**. The default is **false**.

Remarks

If using MvcDiagram to present tree/hierarchical diagrams, you might set **NodesExpandable** to **true**. If enabled, the property makes each newly created node appear with a [±] sign next to it, which expands or collapses the node's descendants.

Diagram.PolygonalTextLayout Property

Gets or sets a value indicating whether to enable the formatting of text inside non-rectangular shape node outlines.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool PolygonalTextLayout { get; set; }
```

Visual Basic Copy Code

```
Public Property PolygonalTextLayout As Boolean
```

Property Value

true to enable polygonal formatting; **false** to disable it.

Remarks

Specifies a default value for the PolygonalTextLayout property of shape nodes.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
DefaultShape Property

Diagram.RecursiveExpand Property

Gets or sets value indicating how a tree is expanded.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RecursiveExpand { get; set; }
```

Visual Basic Copy Code

```
Public Property RecursiveExpand As Boolean
```

Property Value

true if a tree is recursively expanded; otherwise, **false**. The default is **false**.

Remarks

Use the property when representing tree structures, which hide some of their elements. When the property is set to **true**, clicking on a certain node in the tree, expands not only its descendants, but all descendants of the descendants, and so on, till the whole tree is expanded.

Syntax

C# Copy Code

```
public RestrictToBounds RestrictItemsToBounds { get; set; }
```

Visual Basic Copy Code

```
Public Property RestrictItemsToBounds As RestrictToBounds
```

Property Value

A member of the RestrictToBounds enumeration. The default is **Intersection**.

Remarks

Use this property to specify whether diagram elements can be drawn or moved outside the document area. It is possible to specify that items have to be entirely inside, partly outside or there is no restriction.

If there is no restriction and AutoResize is disabled, users could place an item to a position where they cannot reach it by scrolling. That might be interpreted as an item deletion operation by handling the NodeModified event and deleting the item if it is outside the document boundaries.

Diagram.RoundedLinks Property

Gets or sets a value indicating whether the joins between segments of Polyline and **Cascading** links should be rounded.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RoundedLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property RoundedLinks As Boolean
```

Property Value

true to use rounded segment joins; otherwise, **false**. The default is **false**.

Remarks

The value of this property is considered when drawing links whose Shape is set to Polyline or **Cascading**. If the property is enabled, the joins between the segments of all such links are drawn as arcs, whose radius equals the value of RoundedLinksRadius.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
DiagramLink.Shape Property
LinkCrossings Property

Diagram.RoundedLinksRadius Property

Gets or sets the radius of arc joins of rounded links' segments.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double RoundedLinksRadius { get; set; }
```

Visual Basic Copy Code

```
Public Property RoundedLinksRadius As Double
```

Property Value

A **double** value specifying the radius length. The default is 2.

Remarks

The value of this property is used when RoundedLinks is enabled. It specifies the radius of the arcs drawn as joins between link segments.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
CrossingRadius Property

Diagram.RoundRectFactor Property

Gets or sets the relative size of arcs displayed at the corners of rounded rectangles.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double RoundRectFactor { get; set; }
```

Visual Basic Copy Code

```
Public Property RoundRectFactor As Double
```

Property Value

A multiplier applied to the radius of the arcs used as corners of rounded rectangles. The default is 1.

Remarks

The default length of the radius of rounded-corner arcs is 7. This property lets you increase or decrease that value by multiplying it by the specified factor.

See Also

MindFusion.Diagramming Namespace
TableShape Property

Diagram.RouteLinks Property

Gets or sets a value indicating whether links should avoid nodes by going the shortest path from their origin to their destination without crossing any other nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RouteLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property RouteLinks As Boolean
```

Property Value

true to route links; otherwise, **false**. The default is **false**.

Remarks

The value of **RouteLinks** is used to initialize the AutoRoute property of new links. If a node is moved or resized, all links that intersect with its new position and have **AutoRoute** enabled are rerouted. Keep in mind that number of link segments will probably change when routing is enabled.

RoutingOptions allows tuning the routing algorithm. The most important options are the cost values exposed as LengthCost, TurnCost and CrossingCost properties. They greatly influence the shape of the generated route.

Diagram.RoutingOptions Property

Gets an object, which allows customizing various parameters of the link routing algorithm.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public RoutingOptions RoutingOptions { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property RoutingOptions As RoutingOptions
```

Property Value

An instance of the RoutingOptions class.

Diagram.ScriptHelper Property

Gets a ScriptHelper object which can be used in html scripts to instantiate various objects and to call static methods.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ScriptHelper ScriptHelper { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ScriptHelper As ScriptHelper
```

Property Value

An instance of the ScriptHelper class.

Diagram.SelectAfterCreate Property

Gets or sets a value indicating whether newly created objects are automatically selected.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool SelectAfterCreate { get; set; }
```

Visual Basic Copy Code

```
Public Property SelectAfterCreate As Boolean
```

Property Value

true if items are selected after being created; otherwise, **false**. The default is **true**.

Remarks

Use the property to specify if the items that are drawn are selecting, which allows immediate modification actions to be performed over them.

Diagram.SelectedItemHandlesStyle Property

Gets the visual style of adjustment handles of selected items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HandlesVisualStyle SelectedItemHandlesStyle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property SelectedItemHandlesStyle As HandlesVisualStyle
```

Property Value

An instance of the HandlesVisualStyle class.

Remarks

This style object provides Pen and Brush attributes that let you customize the appearance of adjustment handles drawn around selected items.

See Also

Diagram.Selection Property

Gets a Selection instance that represents the selection of items in this diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Selection Selection { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Selection As Selection
```

Property Value

An instance of the Selection class representing the current selection.

Remarks

Use this property to get the items currently selected by a user. Items can be enumerated by the Items member of the Selection class. An item from the selection is considered the active one and can be accessed by using ActiveItem. To prevent users from selecting multiple items, set AllowMultipleSelection to **false**.

Diagram.SelectionOnTop Property

Gets or sets a value indicating whether selected items should be painted on top of other items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool SelectionOnTop { get; set; }
```

Visual Basic Copy Code

```
Public Property SelectionOnTop As Boolean
```

Property Value

true if selected items should be painted on top; otherwise, **false**. The default is **true**.

Remarks

If **SelectionOnTop** is enabled, selected items are painted over non-selected ones, ignoring the z-order position specified in ZIndex. If disabled, the items are painted as set in the z-order.

Diagram.SerializationBinder Property

Gets or sets a SerializationBinder object used to control class loading.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SerializationBinder SerializationBinder { get; set; }
```

Visual Basic Copy Code

```
Public Property SerializationBinder As SerializationBinder
```

Property Value

An instance of **System.Runtime.Serialization.SerializationBinder** -derived class. The default value is **null** (**Nothing** in VB.NET).

Remarks

You can use a custom serialization binder when serializable classes used in your application have been renamed or moved to a different namespace. Objects from such classes cannot be deserialized, unless the **BindToType** method of **SerializationBinder** maps the old class names to their corresponding types. Return **null** from your **BindToType** implementation for types you don't recognize, to let the diagram control process its own obsolete types.

Diagram.ShadowBrush Property

Gets or sets the default brush used to paint the shadows cast by diagram items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush ShadowBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property ShadowBrush As Brush
```

Property Value

An instance of a Brush -derived class. The default is SolidBrush(Color.FromArgb(150, Color.DarkGray)).

Remarks

Use the property to specify an initial value for the ShadowBrush property of new diagram elements.

See Also

Diagram.ShadowOffsetX Property

Gets or sets the horizontal offset of item shadows.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ShadowOffsetX { get; set; }
```

Visual Basic Copy Code

```
Public Property ShadowOffsetX As Double
```

Property Value

A **double** value that specifies the X shadow offset.

Remarks

Use the property to specify how distant the shadow of the item should be drawing as to the x-coordinate axis. You can set both X and Y offset values with the SetShadowOffset method.

See Also

Diagram.ShadowOffsetY Property

Gets or sets the vertical offset of item shadows.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ShadowOffsetY { get; set; }
```

Visual Basic Copy Code

```
Public Property ShadowOffsetY As Double
```

Property Value

A **double** value that specifies the Y shadow offset.

Remarks

Use the property to specify how distant the shadow of the item should be drawing as to the y-coordinate axis. You can set both X and Y offset values with the SetShadowOffset method.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

SetShadowOffset Method
DiagramItem.ShadowOffsetX Property

Diagram.ShadowsStyle Property

Gets or sets the style for rendering shadows.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShadowsStyle ShadowsStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property ShadowsStyle As ShadowsStyle
```

Property Value

A member of the ShadowsStyle enumeration.

Remarks

This property specifies how the shadows of diagram items are drawn. If its value is None no shadows are painted. **OneLevel** makes all shadows paint on the lowest z-level, not covering any items. Thus the diagram items will seem to appear on the same z-level. **ZOrder** makes the shadow paint immediately under their items, possibly covering other items. This style gives more 3D-like outlook to the diagram.

Diagram.ShapeBrush Property

Gets or sets the default value for the Brush property of shape nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush ShapeBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property ShapeBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

Remarks

The property provides a default value for the brush, with which a node' interior is filled. The Brush property of new shape nodes is initialized with a clone of **ShapeBrush**, but after the node creation the properties are independent - changing one of them does not change the other.

In **ImageMap** mode of NetDiagram, this property also specifies the color that fills the DIV element representing the new node being drawn.

Diagram.ShapeCustomDraw Property

Gets or sets the default type of custom painting done for shape nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CustomDraw ShapeCustomDraw { get; set; }
```

Visual Basic Copy Code

```
Public Property ShapeCustomDraw As CustomDraw
```

Property Value

A member of the CustomDraw enumeration. The default is **None**.

Remarks

This property specifies whether and how custom painting of shape nodes is performed. Its value is assigned to the CustomDraw property of new shape nodes.

Diagram.ShapeHandlesStyle Property

Gets or sets the default value for the **HandlesStyle** property of new shape nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HandlesStyle ShapeHandlesStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property ShapeHandlesStyle As HandlesStyle
```

Property Value

A member of the HandlesStyle enumeration.

Remarks

This property provides default value for the **HandlesStyle** property of new shape nodes, created either programmatically or by the user. That property specifies how selected nodes are indicated visually, and how they can be moved, resized or connected to other objects.

Diagram.ShapeOrientation Property

Gets or sets the default value for the ShapeOrientation property of shape nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ShapeOrientation { get; set; }
```

Visual Basic Copy Code

```
Public Property ShapeOrientation As Double
```

Property Value

A **double** value specifying an angle in degrees. Allowed values are 0, 90, 180 and 270.

Remarks

Use this property in conjunction with DefaultShape to define what shape will be assigned to new nodes that end-users draw.

Diagram.ShapePen Property

Gets or sets the default value for the Pen property of shape nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen ShapePen { get; set; }
```

Visual Basic Copy Code

```
Public Property ShapePen As Pen
```

Property Value

An instance of the MindFusion.Drawing.Pen class.

Remarks

The property provides a default value for the pen, with which a shape node's frame is painted. The Pen property of new shape nodes is initialized with a clone of **ShapePen**, but after the node creation the properties are independent - changing one of them does not change the other.

Diagram.ShapeText Property

Gets or sets the default text of shape nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ShapeText { get; set; }
```

Visual Basic Copy Code

```
Public Property ShapeText As String
```

Property Value

A string specifying the initial text of shape nodes. The default is an empty string.

Remarks

The value of this property is assigned to the Text property of new nodes.

Diagram.ShowAnchors Property

Gets or sets a value indicating whether and when node anchor points should be displayed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShowAnchors ShowAnchors { get; set; }
```

Visual Basic Copy Code

```
Public Property ShowAnchors As ShowAnchors
```

Property Value

A member of the ShowAnchors enumeration. The default value is **Auto**.

Diagram.ShowDisabledHandles Property

Gets or sets a value indicating whether manipulation handles are painted when they are disabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ShowDisabledHandles { get; set; }
```

Visual Basic Copy Code

```
Public Property ShowDisabledHandles As Boolean
```

Property Value

true to display disabled manipulation handles; otherwise, **false**. The default is **true**.

Remarks

Individual handles can be disabled or enabled by clearing or setting their correspondent bits in node's **EnabledHandles**. If disabled handles are displayed, they are painted using the HandleBrush specified through DisabledHandlesStyle.

See Also

Diagram.ShowGrid Property

Gets or sets a value indicating whether the alignment grid is visible.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ShowGrid { get; set; }
```

Visual Basic Copy Code

```
Public Property ShowGrid As Boolean
```

Property Value

true if the grid is visible; otherwise, **false**. The default is **false**.

Remarks

If it is visible, the grid is painted as either a matrix of points or crossing horizontal and vertical lines. That depends on the value of GridStyle.

Diagram.ShowHandlesOnDrag Property

Gets or sets a value indicating whether to display selection handles of objects under the mouse while another object is being modified.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ShowHandlesOnDrag { get; set; }
```

Visual Basic Copy Code

```
Public Property ShowHandlesOnDrag As Boolean
```

Property Value

true to display the selection handles of an item while it is being modified; **false** to hide them.

See Also

Diagram.SnapToAnchor Property

Gets or sets when link end points should be aligned to the nearest anchor points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SnapToAnchor SnapToAnchor { get; set; }
```

Visual Basic Copy Code

```
Public Property SnapToAnchor As SnapToAnchor
```

Property Value

A member of the SnapToAnchor enumeration. The default is **OnCreate**.

Remarks

The default value OnCreate, specifies that links are snapped to anchor points when they are created, but allows the user to move the link ends to different locations of a node. The **OnCreateOrModify** value makes link ends points connect to node anchors both if links are created or modified.

ShowAnchors Property

Diagram.SortGroupsByZ Property

Gets or sets a value indicating whether grouped items should be drawn sorted by their z-order while the whole group is being moved.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool SortGroupsByZ { get; set; }
```

Visual Basic Copy Code

```
Public Property SortGroupsByZ As Boolean
```

Property Value

true if grouped items should be painted according to their z-order; otherwise, **false**. The default is **false**.

Remarks

By default, while a group of nodes is being modified with the mouse, the grouped items are drawn in the order defined by the group hierarchy. For example, the group MainItem is drawn bellow all attached items, and if an attached item is the main item in another group, it is drawn below the next groups in the hierarchy. During this process, the ZIndex of items is ignored and the group appearance while it is being modified might differ from how it looks usually. The **SortGroupsByZ** property lets you override the default behavior and display items sorted by their z-order. Take heed if your application creates large hierarchies of groups - enabling that property might slow down the modification process.

Gets or sets the default value for the Brush property of tables.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush TableBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property TableBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush -derived class.

Remarks

The property provides a default value for the brush, with which a table' interior is filled. The Brush property of new tables is initialized with a clone of **TableBrush**, but after table creation the properties are independent - changing one of them does not change the other.

TableRowHeight Property

Diagram.TableConnectionStyle Property

Gets or sets a value indicating whether drawing a link between tables should connect the rows of those tables, or the tables as whole entities.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableConnectionStyle TableConnectionStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property TableConnectionStyle As TableConnectionStyle
```

Property Value

A member of the TableConnectionStyle enumeration. The default is **Rows**.

Remarks

The value of **TableConnectionStyle** is used to initialize the ConnectionStyle property of new tables. There are three possible ways to relate tables to other nodes. This property specifies how users are allowed to create such relations:

- Rows - relation ends are the rows of a table. A link connected to the table is connected to a particular row. This mode is convenient for database diagrams.
- **Table** - relations target tables as whole entities, and not any particular row. This mode is convenient for class diagrams.
- **Both** - a mixed mode where links can target either a row of a table or the table itself.

Programmatically, links can be connected to a table in any way, regardless of the table's **ConnectionStyle**. The value of **ConnectionStyle** is considered only when end-users draw links to or from a table. To link to a table as an entity and not to a specific row, pass -1 as row argument of the CreateDiagramLink method.

Diagram.TableHandlesStyle Property

Gets or sets the default value for the **HandlesStyle** property of new tables.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HandlesStyle TableHandlesStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property TableHandlesStyle As HandlesStyle
```

Property Value

One of the HandlesStyle enumeration values.

Remarks

Default value for the **HandlesStyle** property of new tables, created either programmatically or by the user. That property specifies how selected tables are indicated visually, and how they can be moved, resized or connected to other objects.

C# Copy Code

```
public SimpleShape TableShape { get; set; }
```

Visual Basic Copy Code

```
Public Property TableShape As SimpleShape
```

Property Value

A member of the SimpleShape enumeration. The default value is **Rectangle**.

Diagram Class
MindFusion.Diagramming Namespace

Diagram.TablesScrollable Property

Gets or sets the default value for the Scrollable property of new tables.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool TablesScrollable { get; set; }
```

Visual Basic Copy Code

```
Public Property TablesScrollable As Boolean
```

Property Value

true if the scrolling is possible; otherwise, **false**. The default is **false**.

Remarks

The Scrollable property of each new table is initialized with the value of **TablesScrollable**. Small up/down scroll buttons appear in the caption of scrollable tables. With the help of the buttons users can scroll table rows.

TableRowCount Property
TableNode.Scrollable Property

Diagram.Tag Property

Gets or sets custom data associated with this diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Tag { get; set; }
```

Visual Basic Copy Code

```
Public Property Tag As Object
```

Property Value

An instance of any class derived from **System.Object**.

Remarks

Any type derived from the **Object** class can be assigned to this property. If the **Tag** property is set through the Windows Forms designer, only text can be assigned. A common use for the **Tag** property is to store data that is closely associated with diagrams and often must be accessed when processing a diagram instance.

If the tag is an instance of a value type, it will be serialized together with the diagram when saving or loading the diagram document. Reference types are serialized if marked with the **[Serializable]** attribute and implement the **ISerializable** interface.

Diagram.TextColor Property

Gets or sets the default color of text displayed inside diagram items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Color TextColor { get; set; }
```

Visual Basic Copy Code

```
Public Property TextColor As Color
```

Property Value

A **Microsoft.Maui.Graphics.Color** instance. The default is **Black**.

Remarks

Use the property to specify the default color of the text of diagram items.

MindFusion.Diagramming Namespace
TextFormat Property

Diagram.TextFormat Property

Gets or sets the default alignment and formatting style for text displayed inside nodes and table cells.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public StringFormat TextFormat { get; set; }
```

Visual Basic Copy Code

```
Public Property TextFormat As StringFormat
```

Property Value

An instance of the StringFormat class. The default value for both **Alignment** and **LineAlignment** properties is **StringAlignment.Center**.

Remarks

When a new node is created, its TextFormat is initialized with the value of this property. The same applies for the TextFormat of the cells of a new table.

Diagram.Theme Property

Gets or sets the theme associated with the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Theme Theme { get; set; }
```

Visual Basic Copy Code

```
Public Property Theme As Theme
```

Property Value

An instance of the Theme class.

MindFusion.Diagramming Namespace

Diagram.ToolTip Property

Gets or sets a short text message displayed when the mouse pointer rests over the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ToolTip { get; set; }
```

Visual Basic Copy Code

```
Public Property ToolTip As String
```

Property Value

The tool-tip text displayed for this diagram. The default is an empty string.

Remarks

This tool-tip is displayed when the mouse rests over an unoccupied document area. If the mouse points to an item, the ToolTip of that item will appear. Tool-tips can be enabled or disabled using the **ShowToolTips** property.

Diagram.TouchHitDistance Property

Specifies distance from adjustment handles at which they are still considered as hit when processing touch input.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Nullable<Double> TouchHitDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property TouchHitDistance As Nullable(Of Double)
```

Property Value

An optional **double** value specifying max touch distance from adjustment handles.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.TouchThreshold Property

Gets or sets the threshold value for easier touch interaction through adjustment handles.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public float TouchThreshold { get; set; }
```

Visual Basic Copy Code

```
Public Property TouchThreshold As Single
```

Property Value

A **float** value added to the hit-test area of adjustment handles. The default value is 0.

Diagram.TreeViewNodeStyle Property

Gets the theme-level style for tree view nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TreeViewNodeStyle TreeViewNodeStyle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property TreeViewNodeStyle As TreeViewNodeStyle
```

Property Value

See Also

Diagram Members

Diagram.UndoManager Property

Gets a reference to the diagram's UndoManager instance.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public UndoManager UndoManager { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property UndoManager As UndoManager
```

Property Value

A reference to UndoManager instance.

Remarks

Use this property to control the undo manager operations, Undo or Redo commands, and access the command History.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
Undo Manager

Diagram.ValidityChecks Property

Gets or sets a value indicating whether validity checks are performed each time an item is added to the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ValidityChecks { get; set; }
```

Visual Basic Copy Code

```
Public Property ValidityChecks As Boolean
```

Property Value

true to perform validity checks; otherwise, **false**. The default is **true**.

Remarks

If enabled, validity checks are performed each time an item is added to the diagram. That involves enumerating the Items collection and can slow up the process considerably for large diagrams. You can disable this property in order to skip the validity checks, however be sure that you don't add an item twice to the diagram and that links are created only between items in the same diagram.

Diagram.VisioNodeStyle Property

Gets the theme-level style for Visio nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public VisioNodeStyle VisioNodeStyle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property VisioNodeStyle As VisioNodeStyle
```

Property Value

An instance of the **VisioNodeStyle** class.

DiagramBase Members

The base class of the Diagram and DiagramDocument classes.

The following tables list the members exposed by the DiagramBase type.

Protected Constructors

	Name	Description
	DiagramBase	Initializes a new instance of the **DiagramBase** class.

Public Properties

	Name	Description
	XmlOptions	An XmlOptions object providing properties for customizing the XML serialization process.

Public Methods

	Name	Description
	RaiseNodeModifying	Raises the NodeModifying event.
	TrackMouseHover	Specifies whether the diagram view should track mouse hover events.

Protected Methods

	Name	Description
	OnActionRecorded	Raises the ActionRecorded event.
	OnActionRecording	Raises the ActionRecording event.
	OnActionRedone	Raises the ActionRedone event.
	OnActionUndone	Raises the ActionUndone event.
	OnBeginLoad	Raises the BeginLoad event.
	OnBoundsChanged	Raises the BoundsChanged event.
	OnCellClicked	Raises the CellClicked event.
	OnCellDoubleClicked	Raises the CellDoubleClicked event.
	OnCellTextEdited	Raises the CellTextEdited event.
	OnCellTextEditing	Raises the CellTextEditing event to validate entering inplace edit mode.
	OnClicked	Raises the Clicked event.
	OnContainerChildAdded	Raises the ContainerChildAdded event.
	OnContainerChildRemoved	Raises the ContainerChildRemoved event.
	OnContainerFolded	Raises the ContainerFolded event.
	OnContainerPageChanged	Raises the ContainerPageChanged event.
	OnContainerUnfolded	Raises the ContainerUnfolded event.
	OnContentVisibilityChanged	Raises the ContentVisibilityChanged event.

	OnDefaultShapeChanged	Raises the DefaultShapeChanged event.
	OnDeserializeTag	Raises the DeserializeTag event.
	OnDestinationAnchorChanged	Raises the DestinationAnchorChanged event.
	OnDirtyChanged	Raises the DirtyChanged event.
	OnDoubleClicked	Raises the DoubleClicked event.
	OnDrawAdjustmentHandles	Raises the DrawAdjustmentHandles event.
	OnDrawAnchorPoint	Raises the DrawAnchorPoint event.
	OnDrawBackground	Raises the DrawBackground event.
	OnDrawBranchIndicator	Raises the DrawBranchIndicator event.
	OnDrawCell	Raises the DrawCell event.
	OnDrawForeground	Raises the DrawForeground event.
	OnDrawLink	Raises the DrawLink event.
	OnDrawNode	Raises the DrawNode event.
	OnEndLoad	Raises the EndLoad event.
	OnExpandButtonClicked	Raises the ExpandButtonClicked event.
	OnGroupDestroyed	Raises the GroupDestroyed event.
	OnHitTestAdjustmentHandles	Raises the HitTestAdjustmentHandles event.
	OnInitializeLasso	Raises the InitializeLasso event.
	OnInitializeLink	Raises the InitializeLink event.
	OnInitializeNode	Raises the InitializeNode event.
	OnItemAdded	Raises the ItemAdded event.
	OnItemRemoved	Raises the ItemRemoved event.
	OnJsonDeserializeTag	Raises the JsonDeserializeTag event.
	OnJsonSerializeTag	Raises the JsonSerializeTag event.
	OnLayerVisibilityChanged	Raises the LayerVisibilityChanged event.
	OnLinkActivated	Raises the LinkActivated event.
	OnLinkClicked	Raises the LinkClicked event.
	OnLinkCreateCancelled	Raises the LinkCreateCancelled event.
	OnLinkCreated	Raises the LinkCreated event.
	OnLinkCreating	Raises the LinkCreating event.
	OnLinkDeactivated	Raises the LinkDeactivated event.
	OnLinkDeleted	Raises the LinkDeleted event.
	OnLinkDeleting	Raises the LinkDeleting event.
	OnLinkDeselected	Raises the LinkDeselected event.
	OnLinkDoubleClicked	Raises the LinkDoubleClicked event.
	OnLinkHovered	Raises the LinkHovered event.
	OnLinkModified	Raises the LinkModified event.

	OnLinkModifyCancelled	Raises the LinkModifyCancelled event.
	OnLinkModifying	Raises the LinkModifying event.
	OnLinkPasted	Raises the LinkPasted event.
	OnLinkRouted	Raises the LinkRouted event.
	OnLinkSelected	Raises the LinkSelected event.
	OnLinkSelecting	Raises the LinkSelecting event.
	OnLinkSplit	Raises the LinkSplit event.
	OnLinkStartModifying	Raises the LinkStartModifying event.
	OnLinkTextEdited	Raises the LinkTextEdited event.
	OnLinkTextEditing	Raises the LinkTextEditing event to validate entering inplace edit mode.
	OnMeasureUnitChanged	Raises the MeasureUnitChanged event.
	OnNodeActivated	Raises the NodeActivated event.
	OnNodeClicked	Raises the NodeClicked event.
	OnNodeCreateCancelled	Raises the NodeCreateCancelled event.
	OnNodeCreated	Raises the NodeCreated event.
	OnNodeCreating	Raises the NodeCreating event.
	OnNodeDeactivated	Raises the NodeDeactivated event.
	OnNodeDeleted	Raises the NodeDeleted event.
	OnNodeDeleting	Raises the NodeDeleting event.
	OnNodeDeselected	Raises the NodeDeselected event.
	OnNodeDoubleClicked	Raises the NodeDoubleClicked event.
	OnNodeHovered	Raises the NodeHovered event.
	OnNodeModified	Raises the NodeModified event.
	OnNodeModifyCancelled	Raises the NodeModifyCancelled event.
	OnNodeModifying	Raises the NodeModifying event.
	OnNodePasted	Raises the NodePasted event.
	OnNodeSelected	Raises the NodeSelected event.
	OnNodeSelecting	Raises the NodeSelecting event.
	OnNodeStartModifying	Raises the NodeStartModifying event.
	OnNodeTextEdited	Raises the NodeTextEdited event.
	OnNodeTextEditing	Raises the NodeTextEditing event to validate entering inplace edit mode.
	OnOriginAnchorChanged	Raises the OriginAnchorChanged event.
	OnPropertyChanged	Raises the PropertyChanged event.
	OnQueryAlignTarget	Raises the QueryAlignTarget event.
	OnRepaint	Raises the Repaint event.
	OnRequestClipboard	Raises the RequestClipboard event.
	OnRequestDrawInteractions	Raises the RequestDrawInteractions event.

	OnRequestTimer	Raises the RequestTimer event.
	OnSelectionChanged	Raises the SelectionChanged event.
	OnSelectionModified	Raises the SelectionModified event.
	OnSelectionModifying	Raises the SelectionModifying event.
	OnSerializeTag	Raises the SerializeTag event.
	OnSetSelfLoopShape	Raises the SetSelfLoopShape event.
	OnShapeModified	Raises the ShapeModified event.
	OnShapeNotDefined	Raises the ShapeNotDefined event.
	OnTableColumnResized	Raises the TableColumnResized event.
	OnTableColumnResizing	Raises the TableColumnResizing event.
	OnTableRowResized	Raises the TableRowResized event.
	OnTableRowResizing	Raises the TableRowResizing event.
	OnTableSectionCollapsed	Raises the TableSectionCollapsed event.
	OnTableSectionExpanded	Raises the TableSectionExpanded event.
	OnTreeCollapsed	Raises the TreeCollapsed event.
	OnTreeExpanded	Raises the TreeExpanded event.
	OnTreeItemTextEditing	Raises the TreeItemTextEditing event.
	OnValidateAnchorPoint	Raises the ValidateAnchorPoint event.
	OnValidateLinkCrossing	Raises the ValidateLinkCrossing event.
	OnViewRemoved	Raises the ViewRemoved event.

Public Events

	Name	Description
	ActionRecorded	Raised when an action is recorded in the undo buffer.
	ActionRecording	A validation event raised before an action is recorded in the undo buffer.
	ActionRedone	Raised when an action is redone.
	ActionUndone	Raised when an action is undone.
	ActiveLayerChanged	Raised when the diagram's active layer has changed.
	BeginLoad	Raised when the component starts loading diagram data from a file or memory stream.
	BoundsChanged	Raised when the Bounds property value has changed.
	CellClicked	Raised when the user clicks a table's cell.
	CellDoubleClicked	Raised when the user double-clicks a table's cell.
	CellTextEdited	Raised when the user edits the text of a table's cell.
	CellTextEditing	A validation event that lets you approve or reject changes made to the text of a table's cell.
	Clicked	Raised when the user clicks the diagram at a point where no items are located.

	ContainerChildAdded	Raised when a node is added to a ContainerNode, either programmatically or by the user.
	ContainerChildRemoved	Raised when a node is removed from a **ContainerNode**, either programmatically or by the user.
	ContainerFolded	Raised when the user folds a container by clicking the arrow-up button in the container's caption bar.
	ContainerPageChanged	Raised when the user changes current page of a PagedContainerNode.
	ContainerUnfolded	Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar.
	ContentVisibilityChanged	Raised when the visibility of container's content changes.
	DefaultShapeChanged	Raised when the DefaultShape property value has changed.
	DeserializeTag	Raised when the Tag of a diagram item must be deserialized from XML format.
	DestinationAnchorChanged	Raised when the DestinationAnchor property value of a link has changed.
	DirtyChanged	Raised when the **Dirty** property value has changed.
	DoubleClicked	Raised when the user double-clicks the diagram at a point where no items are located.
	DrawAdjustmentHandles	Raised when item's adjustment handles must be custom-drawn.
	DrawAnchorPoint	Raised when an anchor point must be custom-drawn.
	DrawBackground	Raised to let you custom draw the diagram background.
	DrawBranchIndicator	Raised when a branch indicator must be custom-drawn.
	DrawCell	Raised when a table's cell must be custom drawn.
	DrawForeground	Raised to let you custom draw the diagram foreground.
	DrawLink	Raised when a diagram link must be custom drawn.
	DrawNode	Raised when a diagram node must be custom drawn.
	EndLoad	Raised when the component ends loading diagram data from a file or memory stream.
	ExpandButtonClicked	Raised when the user clicks the [±] button of an Expandable node.
	GroupDestroyed	Raised when a Group object is destroyed.
	HitTestAdjustmentHandles	Raised when custom hit testing of item's adjustment handles must be performed.
	InitializeLasso	Raised when the user starts drawing a selection lasso, before it is rendered on screen.
	InitializeLink	Raised when the user starts drawing a new link, just after the DiagramLink instance is created.
	InitializeNode	Raised when the user starts drawing a new node, just after the DiagramNode instance is created.
	ItemAdded	Raised when an item is added to the diagram, either programmatically or interactively.
	ItemRemoved	Raised when an item is removed from the diagram, either programmatically or interactively.
	JsonDeserializeTag	Raised when the **Tag** of a diagram item must be deserialized from JSON.
	JsonSerializeTag	Raised when the **Tag** of a diagram item must be serialized to JSON.
	LayerVisibilityChanged	Raised when the visibility of a Layer changes.

	LinkActivated	Raised when a link becomes the ActiveItem.
	LinkClicked	Raised when the user clicks a link.
	LinkCreateCancelled	Raised when the user cancels link creation.
	LinkCreated	Raised when the user draws a new link.
	LinkCreating	A validation event raised while the user is drawing a new link.
	LinkDeactivated	Raised when a link is no longer the **ActiveItem**.
	LinkDeleted	Raised when a link is deleted, either programmatically or by the user.
	LinkDeleting	Raised when the user tries to delete a link, this event lets you cancel the operation.
	LinkDeselected	Raised when a link is deselected, either programmatically or by the user.
	LinkDoubleClicked	Raised when the user double-clicks a link.
	LinkHovered	Raised when the mouse pointer hovers over a link.
	LinkModified	Raised when the user moves any control point of a link.
	LinkModifyCancelled	Raised when the user cancels move or resize operation being done on a link.
	LinkModifying	A validation event raised while the user is modifying a link.
	LinkPasted	Raised when a link has been pasted from the clipboard.
	LinkRouted	Raised when a link is routed by the auto-routing algorithm.
	LinkSelected	Raised when a link is selected, either programmatically or by the user.
	LinkSelecting	Raised when the user tries to select a link, this event lets you cancel the operation.
	LinkSplit	Raised when the user splits a link interactively.
	LinkStartModifying	A validation event raised when the user starts modifying a link.
	LinkTextEdited	Raised when the user edits the text of a link.
	LinkTextEditing	A validation event that lets you approve or reject changes made to the text of a link.
	MeasureUnitChanged	Raised when the MeasureUnit property value has changed.
	NodeActivated	Raised when a node becomes the **ActiveItem**.
	NodeClicked	Raised when the user clicks a node.
	NodeCreateCancelled	Raised when the user cancels node creation.
	NodeCreated	Raised when the user draws a new node.
	NodeCreating	A validation event raised while the user is drawing a new node.
	NodeDeactivated	Raised when a node is no longer the **ActiveItem**.
	NodeDeleted	Raised when a node is deleted, either programmatically or by the user.
	NodeDeleting	Raised when the user tries to delete a node, this event lets you cancel the operation.
	NodeDeselected	Raised when a node is deselected, either programmatically or by the user.
	NodeDoubleClicked	Raised when the user double-clicks a node.
	NodeHovered	Raised when the mouse pointer hovers over a node.

	NodeModified	Raised when the user moves or resizes a node.
	NodeModifyCancelled	Raised when the user cancels move or resize operation being done on a node.
	NodeModifying	A validation event raised while the user is moving or resizing a node.
	NodePasted	Raised when a node has been pasted from the clipboard.
	NodeSelected	Raised when a node is selected, either programmatically or by the user.
	NodeSelecting	Raised when the user tries to select a node, this event lets you cancel the operation.
	NodeStartModifying	A validation event raised when the user starts modifying a node.
	NodeTextEdited	Raised when the user edits the text of a node.
	NodeTextEditing	A validation event that lets you approve or reject changes made to the text of a node.
	OriginAnchorChanged	Raised when the OriginAnchor property value of a link has changed.
	PropertyChanged	INotifyPropertyChanged.PropertyChanged implementation.
	QueryAlignTarget	Raised to validate a node as target for alignment guides when AutoAlignNodes is enabled.
	Repaint	Raised when the diagram views should be repainted.
	RequestCacheReset	Raised when an object within the diagram requests a reset of the cached bitmap.
	RequestClipboard	Raised when an object within the diagram requests an operation with the clipboard.
	RequestDrawInteractions	For internal use.
	RequestTimer	Raised when an object within the diagram needs to start or stop a timer.
	SelectionChanged	Raised when an item is added to or removed from the selection
	SelectionModified	Raised when the user moves multiple selected items.
	SelectionModifying	Raised while the user is moving multiple selected items, this event lets you cancel the modification.
	SerializeTag	Raised when the **Tag** of a diagram item must be serialized into an XML document.
	SetSelfLoopShape	Raised when a link becomes a self-loop, giving you a chance to override the default look shape.
	ShapeModified	Raised when the user modifies the shape of a ShapeNode by moving one of the control points corresponding to shape formula parameters.
	ShapeNotDefined	Raised when the diagram being loaded contains nodes with an undefined shape.
	TableColumnResized	Raised when the user finishes resizing a column in a table.
	TableColumnResizing	Raised when the user resizes a column in a table interactively.
	TableRowResized	Raised when the user finishes resizing a row in a table.
	TableRowResizing	Raised when the user resizes a row in a table interactively.
	TableSectionCollapsed	Raised when the user collapses the rows of a table's section by clicking the [-] button in the section's header row.
	TableSectionExpanded	Raised when the user expands the rows of a table's section by clicking the [+] button in the section's header row.

	TreeCollapsed	Raised when a user collapses a tree branch by clicking the [-] button of an **Expandable** node.
	TreeExpanded	Raised when a user expands a tree branch by clicking the [+] button of an **Expandable** node.
	TreeItemTextEditing	A validation event that lets you approve or reject changes made to the text of a TreeViewNode's item.
	ValidateAnchorPoint	A validation event that lets you approve or reject connecting a link to an anchor point.
	ValidateLinkCrossing	A validation event that lets you approve or reject displaying a decoration at the intersection point of links.
	ViewRemoved	Raised when a DiagramView is detached from this diagram.

DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnClicked Method

Raises the Clicked event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnClicked (
    DiagramEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnClicked( _
    e As DiagramEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnContainerChildAdded Method

Raises the ContainerChildAdded event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnContainerChildAdded (
    ContainerChildEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnContainerChildAdded( _
    e As ContainerChildEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnContainerChildRemoved Method

Raises the ContainerChildRemoved event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnContainerChildRemoved (
    ContainerChildEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnContainerChildRemoved( _
    e As ContainerChildEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnContainerFolded Method

Raises the ContainerFolded event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnContainerFolded (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnContainerFolded( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnContainerPageChanged Method

Raises the ContainerPageChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnContainerPageChanged (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnContainerPageChanged( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnContainerUnfolded Method

Raises the ContainerUnfolded event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnContainerUnfolded (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnContainerUnfolded( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnContentVisibilityChanged Method

Raises the ContentVisibilityChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnContentVisibilityChanged (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnContentVisibilityChanged( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDefaultShapeChanged Method

Raises the DefaultShapeChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDefaultShapeChanged (
    EventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDefaultShapeChanged( _
    e As EventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDeserializeTag Method

Raises the DeserializeTag event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDeserializeTag (
    SerializeTagEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDeserializeTag( _
    e As SerializeTagEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDestinationAnchorChanged Method

Raises the DestinationAnchorChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDestinationAnchorChanged (
    AnchorPointEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDestinationAnchorChanged( _
    e As AnchorPointEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDirtyChanged Method

Raises the DirtyChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDirtyChanged (
    EventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDirtyChanged( _
    e As EventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDoubleClicked Method

Raises the DoubleClicked event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDoubleClicked (
    DiagramEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDoubleClicked( _
    e As DiagramEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDrawAdjustmentHandles Method

Raises the DrawAdjustmentHandles event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDrawAdjustmentHandles (
    DrawItemEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDrawAdjustmentHandles( _
    e As DrawItemEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDrawAnchorPoint Method

Raises the DrawAnchorPoint event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDrawAnchorPoint (
    DrawAnchorPointEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDrawAnchorPoint( _
    e As DrawAnchorPointEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDrawBackground Method

Raises the DrawBackground event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDrawBackground (
    DiagramEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDrawBackground( _
    e As DiagramEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDrawBranchIndicator Method

Raises the DrawBranchIndicator event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDrawBranchIndicator (
    DrawBranchIndicatorEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDrawBranchIndicator( _
    e As DrawBranchIndicatorEventArgs _
)
```

Parameters

e
A DrawBranchIndicatorEventArgs that contains the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDrawCell Method

Raises the DrawCell event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDrawCell (
    DrawCellEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDrawCell( _
    e As DrawCellEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDrawForeground Method

Raises the DrawForeground event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDrawForeground (
    DiagramEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDrawForeground( _
    e As DiagramEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDrawLink Method

Raises the DrawLink event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDrawLink (
    DrawLinkEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDrawLink( _
    e As DrawLinkEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnDrawNode Method

Raises the DrawNode event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDrawNode (
    DrawNodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDrawNode( _
    e As DrawNodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnEndLoad Method

Raises the EndLoad event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnEndLoad (
    EventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnEndLoad( _
    e As EventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnExpandButtonClicked Method

Raises the ExpandButtonClicked event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnExpandButtonClicked (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnExpandButtonClicked( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnGroupDestroyed Method

Raises the GroupDestroyed event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnGroupDestroyed (
    GroupEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnGroupDestroyed( _
    e As GroupEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnHitTestAdjustmentHandles Method

Raises the HitTestAdjustmentHandles event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnHitTestAdjustmentHandles (
    HitTestEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnHitTestAdjustmentHandles( _
    e As HitTestEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnInitializeLasso Method

Raises the InitializeLasso event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnInitializeLasso (
    SelectionEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnInitializeLasso( _
    e As SelectionEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnInitializeLink Method

Raises the InitializeLink event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnInitializeLink (
    LinkEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnInitializeLink( _
    e As LinkEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnInitializeNode Method

Raises the InitializeNode event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnInitializeNode (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnInitializeNode( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnItemAdded Method

Raises the ItemAdded event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnItemAdded (
    ItemEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnItemAdded( _
    e As ItemEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnItemRemoved Method

Raises the ItemRemoved event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnItemRemoved (
    ItemEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnItemRemoved( _
    e As ItemEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnJsonDeserializeTag Method

Raises the JsonDeserializeTag event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnJsonDeserializeTag (
    JsonSerializeTagEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnJsonDeserializeTag( _
    e As JsonSerializeTagEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnJsonSerializeTag Method

Raises the JsonSerializeTag event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnJsonSerializeTag (
    JsonSerializeTagEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnJsonSerializeTag( _
    e As JsonSerializeTagEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members

DiagramBase.OnLayerVisibilityChanged Method

Raises the LayerVisibilityChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnLayerVisibilityChanged (
    LayerEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnLayerVisibilityChanged( _
    e As LayerEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnLinkActivated Method

Raises the LinkActivated event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnLinkActivated (
    LinkEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnLinkActivated( _
    e As LinkEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members

DiagramBase.OnLinkClicked Method

Raises the LinkClicked event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnLinkClicked (
    LinkEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnLinkClicked( _
    e As LinkEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnLinkCreateCancelled Method

Raises the LinkCreateCancelled event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnLinkCreateCancelled (
    LinkEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnLinkCreateCancelled( _
    e As LinkEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnLinkCreated Method

Raises the LinkCreated event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnLinkCreated (
    LinkEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnLinkCreated( _
    e As LinkEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnLinkCreating Method

Raises the LinkCreating event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnLinkCreating (
    LinkValidationEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnLinkCreating( _
    e As LinkValidationEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members

DiagramBase.OnLinkDeactivated Method

Raises the LinkDeactivated event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnLinkDeactivated (
    LinkEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnLinkDeactivated( _
    e As LinkEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members

DiagramBase.OnLinkDeleted Method

Raises the LinkDeleted event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnLinkDeleted (
    LinkEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnLinkDeleted( _
    e As LinkEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members

DiagramBase.OnLinkDeleting Method

Raises the LinkDeleting event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnLinkDeleting (
    LinkValidationEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnLinkDeleting( _
    e As LinkValidationEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnLinkDeselected Method

Raises the LinkDeselected event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnLinkDeselected (
    LinkEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnLinkDeselected( _
    e As LinkEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members

DiagramBase.OnMeasureUnitChanged Method

Raises the MeasureUnitChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnMeasureUnitChanged (
    EventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnMeasureUnitChanged( _
    e As EventArgs _
)
```

Parameters

e
An object providing the event data.

DiagramBase.OnNodeActivated Method

Raises the NodeActivated event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeActivated (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeActivated( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnNodeClicked Method

Raises the NodeClicked event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeClicked (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeClicked( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnNodeCreateCancelled Method

Raises the NodeCreateCancelled event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeCreateCancelled (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeCreateCancelled( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnNodeCreated Method

Raises the NodeCreated event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeCreated (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeCreated( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnNodeCreating Method

Raises the NodeCreating event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeCreating (
    NodeValidationEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeCreating( _
    e As NodeValidationEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnNodeDeactivated Method

Raises the NodeDeactivated event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeDeactivated (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeDeactivated( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnNodeDeleted Method

Raises the NodeDeleted event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeDeleted (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeDeleted( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnNodeDeleting Method

Raises the NodeDeleting event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeDeleting (
    NodeValidationEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeDeleting( _
    e As NodeValidationEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnNodeDeselected Method

Raises the NodeDeselected event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeDeselected (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeDeselected( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnNodeDoubleClicked Method

Raises the NodeDoubleClicked event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeDoubleClicked (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeDoubleClicked( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnNodeHovered Method

Raises the NodeHovered event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeHovered (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeHovered( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members

DiagramBase.OnNodeModified Method

Raises the NodeModified event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeModified (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeModified( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnNodeModifyCancelled Method

Raises the NodeModifyCancelled event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeModifyCancelled (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeModifyCancelled( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnNodeModifying Method

Raises the NodeModifying event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeModifying (
    NodeValidationEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeModifying( _
    e As NodeValidationEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnNodePasted Method

Raises the NodePasted event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodePasted (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodePasted( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

DiagramBase.OnNodeSelected Method

Raises the NodeSelected event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeSelected (
    NodeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeSelected( _
    e As NodeEventArgs _
)
```

Parameters

e
An object providing the event data.

DiagramBase.OnNodeSelecting Method

Raises the NodeSelecting event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeSelecting (
    NodeValidationEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeSelecting( _
    e As NodeValidationEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnNodeStartModifying Method

Raises the NodeStartModifying event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeStartModifying (
    NodeValidationEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeStartModifying( _
    e As NodeValidationEventArgs _
)
```

Parameters

e
An object providing the event data.

DiagramBase.OnNodeTextEdited Method

Raises the NodeTextEdited event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeTextEdited (
    EditNodeTextEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeTextEdited( _
    e As EditNodeTextEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnNodeTextEditing Method

Raises the NodeTextEditing event to validate entering inplace edit mode.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnNodeTextEditing (
    NodeValidationEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnNodeTextEditing( _
    e As NodeValidationEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnOriginAnchorChanged Method

Raises the OriginAnchorChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnOriginAnchorChanged (
    AnchorPointEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnOriginAnchorChanged( _
    e As AnchorPointEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnPropertyChanged Method

Raises the PropertyChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnPropertyChanged (
    PropertyChangedEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnPropertyChanged( _
    e As PropertyChangedEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.OnQueryAlignTarget Method

Raises the QueryAlignTarget event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnQueryAlignTarget (
    NodeValidationEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnQueryAlignTarget( _
    e As NodeValidationEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members

DiagramBase.OnRepaint Method

Raises the Repaint event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnRepaint (
    RepaintEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnRepaint( _
    e As RepaintEventArgs _
)
```

Parameters

e
An object providing the event data.

DiagramBase.OnRequestClipboard Method

Raises the RequestClipboard event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnRequestClipboard (
    ClipboardEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnRequestClipboard( _
    e As ClipboardEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.OnRequestDrawInteractions Method

Raises the RequestDrawInteractions event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnRequestDrawInteractions (
    DiagramEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnRequestDrawInteractions( _
    e As DiagramEventArgs _
)
```

Parameters

e
DiagramEventArgs instance.

MindFusion.Diagramming Namespace

DiagramBase.OnRequestTimer Method

Raises the RequestTimer event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnRequestTimer (
    TimerEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnRequestTimer( _
    e As TimerEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase.OnSelectionChanged Method

Raises the SelectionChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnSelectionChanged (
    EventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnSelectionChanged( _
    e As EventArgs _
)
```

Parameters

e
An object providing the event data.

MindFusion.Diagramming Namespace

DiagramBase.OnSelectionModified Method

Raises the SelectionModified event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnSelectionModified (
    SelectionEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnSelectionModified( _
    e As SelectionEventArgs _
)
```

Parameters

e
An object providing the event data.

DiagramBase.OnSerializeTag Method

Raises the SerializeTag event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnSerializeTag (
    SerializeTagEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnSerializeTag( _
    e As SerializeTagEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members

DiagramBase.OnSetSelfLoopShape Method

Raises the SetSelfLoopShape event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnSetSelfLoopShape (
    LinkShapeEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnSetSelfLoopShape( _
    e As LinkShapeEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

DiagramBase Members

DiagramBase.RaiseNodeModifying Method

Raises the NodeModifying event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RaiseNodeModifying (
    NodeValidationEventArgs e
)
```

Visual Basic Copy Code

```
Public Sub RaiseNodeModifying( _
    e As NodeValidationEventArgs _
)
```

Parameters

e
NodeValidationEventArgs instance.

DiagramBase Properties

DiagramBase.XmlOptions Property

An XmlOptions object providing properties for customizing the XML serialization process.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlOptions XmlOptions { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property XmlOptions As XmlOptions
```

Property Value

DiagramBase Events

DiagramDocument Class

Represents a collection of diagram pages.

Syntax

C# Copy Code

```
public class DiagramDocument : DiagramBase
```

Visual Basic Copy Code

```
Public Class DiagramDocument
    Inherits DiagramBase
```

Inheritance Hierarchy

System.Object
  System.MarshalByRefObject
    System.ComponentModel.Component
      MindFusion.Diagramming.DiagramBase
        MindFusion.Diagramming.DiagramDocument

See Also

DiagramDocument Members

Represents a collection of diagram pages.

The following tables list the members exposed by the DiagramDocument type.

Public Constructors

	Name	Description
	DiagramDocument	Initializes a new instance of the **DiagramDocument** class.

Public Properties

	Name	Description
	Dirty	Gets a value indicating whether the document has changed since the last save.
	Pages	Gets a list of the diagram pages contained in this document.
	XmlOptions	An XmlOptions object providing properties for customizing the XML serialization process. (Inherited from DiagramBase.)

Public Methods

	Name	Description
	Clone	Creates a copy of this DiagramDocument.
	CopyTo	Copies this document's pages to specified target document.
	LoadFromJson	Loads the diagram document from a JSON-formatted string.
	LoadFromJsonAsync	Loads the diagram document from a JSON-formatted string.
	LoadFromJsonFile	Loads the diagram document from a JSON file.
	LoadFromJsonFileAsync	Loads the diagram document from a JSON file.
	LoadFromJsonObject	Loads the diagram document from a JSON object.
	LoadFromString	Loads the document from the specified string.
	LoadFromXml	Overloaded. Loads the document from an XML document or file.
	LoadFromXmlAsync	Overloaded.
	RaiseNodeModifying	Raises the NodeModifying event. (Inherited from DiagramBase.)
	SaveToJson	Saves the diagram document to a JSON-formatted string.
	SaveToJsonAsync	Saves the diagram document to a JSON-formatted string.
	SaveToJsonFile	Saves the diagram document into a JSON file.
	SaveToJsonFileAsync	Saves the diagram document into a JSON file.
	SaveToJsonObject	Saves the diagram document to a JSON object.
	SaveToString	Saves the document as an ASCII string.
	SaveToXml	Overloaded. Saves the document to an XML document or file.
	SaveToXmlAsync	Overloaded.

	TrackMouseHover	Specifies whether the diagram view should track mouse hover events. (Inherited from DiagramBase.)

Protected Methods

	Name	Description
	OnActionRecorded	Raises the ActionRecorded event. (Inherited from DiagramBase.)
	OnActionRecording	Raises the ActionRecording event. (Inherited from DiagramBase.)
	OnActionRedone	Raises the ActionRedone event. (Inherited from DiagramBase.)
	OnActionUndone	Raises the ActionUndone event. (Inherited from DiagramBase.)
	OnBeginLoad	Raises the BeginLoad event. (Inherited from DiagramBase.)
	OnBoundsChanged	Raises the BoundsChanged event. (Inherited from DiagramBase.)
	OnCellClicked	Raises the CellClicked event. (Inherited from DiagramBase.)
	OnCellDoubleClicked	Raises the CellDoubleClicked event. (Inherited from DiagramBase.)
	OnCellTextEdited	Raises the CellTextEdited event. (Inherited from DiagramBase.)
	OnCellTextEditing	Raises the CellTextEditing event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnClicked	Raises the Clicked event. (Inherited from DiagramBase.)
	OnContainerChildAdded	Raises the ContainerChildAdded event. (Inherited from DiagramBase.)
	OnContainerChildRemoved	Raises the ContainerChildRemoved event. (Inherited from DiagramBase.)
	OnContainerFolded	Raises the ContainerFolded event. (Inherited from DiagramBase.)
	OnContainerPageChanged	Raises the ContainerPageChanged event. (Inherited from DiagramBase.)
	OnContainerUnfolded	Raises the ContainerUnfolded event. (Inherited from DiagramBase.)
	OnContentVisibilityChanged	Raises the ContentVisibilityChanged event. (Inherited from DiagramBase.)
	OnDefaultShapeChanged	Raises the DefaultShapeChanged event. (Inherited from DiagramBase.)
	OnDeserializeTag	Raises the DeserializeTag event. (Inherited from DiagramBase.)
	OnDestinationAnchorChanged	Raises the DestinationAnchorChanged event. (Inherited from DiagramBase.)
	OnDirtyChanged	Raises the DirtyChanged event. (Inherited from DiagramBase.)
	OnDoubleClicked	Raises the DoubleClicked event. (Inherited from DiagramBase.)
	OnDrawAdjustmentHandles	Raises the DrawAdjustmentHandles event. (Inherited from DiagramBase.)
	OnDrawAnchorPoint	Raises the DrawAnchorPoint event. (Inherited from DiagramBase.)
	OnDrawBackground	Raises the DrawBackground event. (Inherited from DiagramBase.)
	OnDrawBranchIndicator	Raises the DrawBranchIndicator event. (Inherited from DiagramBase.)
	OnDrawCell	Raises the DrawCell event. (Inherited from DiagramBase.)
	OnDrawForeground	Raises the DrawForeground event. (Inherited from DiagramBase.)
	OnDrawLink	Raises the DrawLink event. (Inherited from DiagramBase.)
	OnDrawNode	Raises the DrawNode event. (Inherited from DiagramBase.)
	OnEndLoad	Raises the EndLoad event. (Inherited from DiagramBase.)
	OnExpandButtonClicked	Raises the ExpandButtonClicked event. (Inherited from DiagramBase.)

	OnGroupDestroyed	Raises the GroupDestroyed event. (Inherited from DiagramBase.)
	OnHitTestAdjustmentHandles	Raises the HitTestAdjustmentHandles event. (Inherited from DiagramBase.)
	OnInitializeLasso	Raises the InitializeLasso event. (Inherited from DiagramBase.)
	OnInitializeLink	Raises the InitializeLink event. (Inherited from DiagramBase.)
	OnInitializeNode	Raises the InitializeNode event. (Inherited from DiagramBase.)
	OnItemAdded	Raises the ItemAdded event. (Inherited from DiagramBase.)
	OnItemRemoved	Raises the ItemRemoved event. (Inherited from DiagramBase.)
	OnJsonDeserializeTag	Raises the JsonDeserializeTag event. (Inherited from DiagramBase.)
	OnJsonSerializeTag	Raises the JsonSerializeTag event. (Inherited from DiagramBase.)
	OnLayerVisibilityChanged	Raises the LayerVisibilityChanged event. (Inherited from DiagramBase.)
	OnLinkActivated	Raises the LinkActivated event. (Inherited from DiagramBase.)
	OnLinkClicked	Raises the LinkClicked event. (Inherited from DiagramBase.)
	OnLinkCreateCancelled	Raises the LinkCreateCancelled event. (Inherited from DiagramBase.)
	OnLinkCreated	Raises the LinkCreated event. (Inherited from DiagramBase.)
	OnLinkCreating	Raises the LinkCreating event. (Inherited from DiagramBase.)
	OnLinkDeactivated	Raises the LinkDeactivated event. (Inherited from DiagramBase.)
	OnLinkDeleted	Raises the LinkDeleted event. (Inherited from DiagramBase.)
	OnLinkDeleting	Raises the LinkDeleting event. (Inherited from DiagramBase.)
	OnLinkDeselected	Raises the LinkDeselected event. (Inherited from DiagramBase.)
	OnLinkDoubleClicked	Raises the LinkDoubleClicked event. (Inherited from DiagramBase.)
	OnLinkHovered	Raises the LinkHovered event. (Inherited from DiagramBase.)
	OnLinkModified	Raises the LinkModified event. (Inherited from DiagramBase.)
	OnLinkModifyCancelled	Raises the LinkModifyCancelled event. (Inherited from DiagramBase.)
	OnLinkModifying	Raises the LinkModifying event. (Inherited from DiagramBase.)
	OnLinkPasted	Raises the LinkPasted event. (Inherited from DiagramBase.)
	OnLinkRouted	Raises the LinkRouted event. (Inherited from DiagramBase.)
	OnLinkSelected	Raises the LinkSelected event. (Inherited from DiagramBase.)
	OnLinkSelecting	Raises the LinkSelecting event. (Inherited from DiagramBase.)
	OnLinkSplit	Raises the LinkSplit event. (Inherited from DiagramBase.)
	OnLinkStartModifying	Raises the LinkStartModifying event. (Inherited from DiagramBase.)
	OnLinkTextEdited	Raises the LinkTextEdited event. (Inherited from DiagramBase.)
	OnLinkTextEditing	Raises the LinkTextEditing event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnMeasureUnitChanged	Raises the MeasureUnitChanged event. (Inherited from DiagramBase.)
	OnNodeActivated	Raises the NodeActivated event. (Inherited from DiagramBase.)
	OnNodeClicked	Raises the NodeClicked event. (Inherited from DiagramBase.)
	OnNodeCreateCancelled	Raises the NodeCreateCancelled event. (Inherited from DiagramBase.)

	OnNodeCreated	Raises the NodeCreated event. (Inherited from DiagramBase.)
	OnNodeCreating	Raises the NodeCreating event. (Inherited from DiagramBase.)
	OnNodeDeactivated	Raises the NodeDeactivated event. (Inherited from DiagramBase.)
	OnNodeDeleted	Raises the NodeDeleted event. (Inherited from DiagramBase.)
	OnNodeDeleting	Raises the NodeDeleting event. (Inherited from DiagramBase.)
	OnNodeDeselected	Raises the NodeDeselected event. (Inherited from DiagramBase.)
	OnNodeDoubleClicked	Raises the NodeDoubleClicked event. (Inherited from DiagramBase.)
	OnNodeHovered	Raises the NodeHovered event. (Inherited from DiagramBase.)
	OnNodeModified	Raises the NodeModified event. (Inherited from DiagramBase.)
	OnNodeModifyCancelled	Raises the NodeModifyCancelled event. (Inherited from DiagramBase.)
	OnNodeModifying	Raises the NodeModifying event. (Inherited from DiagramBase.)
	OnNodePasted	Raises the NodePasted event. (Inherited from DiagramBase.)
	OnNodeSelected	Raises the NodeSelected event. (Inherited from DiagramBase.)
	OnNodeSelecting	Raises the NodeSelecting event. (Inherited from DiagramBase.)
	OnNodeStartModifying	Raises the NodeStartModifying event. (Inherited from DiagramBase.)
	OnNodeTextEdited	Raises the NodeTextEdited event. (Inherited from DiagramBase.)
	OnNodeTextEditing	Raises the NodeTextEditing event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnOriginAnchorChanged	Raises the OriginAnchorChanged event. (Inherited from DiagramBase.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from DiagramBase.)
	OnQueryAlignTarget	Raises the QueryAlignTarget event. (Inherited from DiagramBase.)
	OnRepaint	Raises the Repaint event. (Inherited from DiagramBase.)
	OnRequestClipboard	Raises the RequestClipboard event. (Inherited from DiagramBase.)
	OnRequestDrawInteractions	Raises the RequestDrawInteractions event. (Inherited from DiagramBase.)
	OnRequestTimer	Raises the RequestTimer event. (Inherited from DiagramBase.)
	OnSelectionChanged	Raises the SelectionChanged event. (Inherited from DiagramBase.)
	OnSelectionModified	Raises the SelectionModified event. (Inherited from DiagramBase.)
	OnSelectionModifying	Raises the SelectionModifying event. (Inherited from DiagramBase.)
	OnSerializeTag	Raises the SerializeTag event. (Inherited from DiagramBase.)
	OnSetSelfLoopShape	Raises the SetSelfLoopShape event. (Inherited from DiagramBase.)
	OnShapeModified	Raises the ShapeModified event. (Inherited from DiagramBase.)
	OnShapeNotDefined	Raises the ShapeNotDefined event. (Inherited from DiagramBase.)
	OnTableColumnResized	Raises the TableColumnResized event. (Inherited from DiagramBase.)
	OnTableColumnResizing	Raises the TableColumnResizing event. (Inherited from DiagramBase.)
	OnTableRowResized	Raises the TableRowResized event. (Inherited from DiagramBase.)
	OnTableRowResizing	Raises the TableRowResizing event. (Inherited from DiagramBase.)
	OnTableSectionCollapsed	Raises the TableSectionCollapsed event. (Inherited from DiagramBase.)

	OnTableSectionExpanded	Raises the TableSectionExpanded event. (Inherited from DiagramBase.)
	OnTreeCollapsed	Raises the TreeCollapsed event. (Inherited from DiagramBase.)
	OnTreeExpanded	Raises the TreeExpanded event. (Inherited from DiagramBase.)
	OnTreeItemTextEditing	Raises the TreeItemTextEditing event. (Inherited from DiagramBase.)
	OnValidateAnchorPoint	Raises the ValidateAnchorPoint event. (Inherited from DiagramBase.)
	OnValidateLinkCrossing	Raises the ValidateLinkCrossing event. (Inherited from DiagramBase.)
	OnViewRemoved	Raises the ViewRemoved event. (Inherited from DiagramBase.)

Public Events

	Name	Description
	ActionRecorded	Raised when an action is recorded in the undo buffer. (Inherited from DiagramBase.)
	ActionRecording	A validation event raised before an action is recorded in the undo buffer. (Inherited from DiagramBase.)
	ActionRedone	Raised when an action is redone. (Inherited from DiagramBase.)
	ActionUndone	Raised when an action is undone. (Inherited from DiagramBase.)
	ActiveLayerChanged	Raised when the diagram's active layer has changed. (Inherited from DiagramBase.)
	BeginLoad	Raised when the component starts loading diagram data from a file or memory stream. (Inherited from DiagramBase.)
	BoundsChanged	Raised when the Bounds property value has changed. (Inherited from DiagramBase.)
	CellClicked	Raised when the user clicks a table's cell. (Inherited from DiagramBase.)
	CellDoubleClicked	Raised when the user double-clicks a table's cell. (Inherited from DiagramBase.)
	CellTextEdited	Raised when the user edits the text of a table's cell. (Inherited from DiagramBase.)
	CellTextEditing	A validation event that lets you approve or reject changes made to the text of a table's cell. (Inherited from DiagramBase.)
	Clicked	Raised when the user clicks the diagram at a point where no items are located. (Inherited from DiagramBase.)
	ContainerChildAdded	Raised when a node is added to a ContainerNode, either programmatically or by the user. (Inherited from DiagramBase.)
	ContainerChildRemoved	Raised when a node is removed from a **ContainerNode**, either programmatically or by the user. (Inherited from DiagramBase.)
	ContainerFolded	Raised when the user folds a container by clicking the arrow-up button in the container's caption bar. (Inherited from DiagramBase.)
	ContainerPageChanged	Raised when the user changes current page of a PagedContainerNode. (Inherited from DiagramBase.)
	ContainerUnfolded	Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar. (Inherited from DiagramBase.)
	ContentVisibilityChanged	Raised when the visibility of container's content changes. (Inherited from DiagramBase.)
	DefaultShapeChanged	Raised when the DefaultShape property value has changed. (Inherited from DiagramBase.)

	DeserializeTag	Raised when the Tag of a diagram item must be deserialized from XML format. (Inherited from DiagramBase.)
	DestinationAnchorChanged	Raised when the DestinationAnchor property value of a link has changed. (Inherited from DiagramBase.)
	DirtyChanged	Raised when the **Dirty** property value has changed. (Inherited from DiagramBase.)
	DoubleClicked	Raised when the user double-clicks the diagram at a point where no items are located. (Inherited from DiagramBase.)
	DrawAdjustmentHandles	Raised when item's adjustment handles must be custom-drawn. (Inherited from DiagramBase.)
	DrawAnchorPoint	Raised when an anchor point must be custom-drawn. (Inherited from DiagramBase.)
	DrawBackground	Raised to let you custom draw the diagram background. (Inherited from DiagramBase.)
	DrawBranchIndicator	Raised when a branch indicator must be custom-drawn. (Inherited from DiagramBase.)
	DrawCell	Raised when a table's cell must be custom drawn. (Inherited from DiagramBase.)
	DrawForeground	Raised to let you custom draw the diagram foreground. (Inherited from DiagramBase.)
	DrawLink	Raised when a diagram link must be custom drawn. (Inherited from DiagramBase.)
	DrawNode	Raised when a diagram node must be custom drawn. (Inherited from DiagramBase.)
	EndLoad	Raised when the component ends loading diagram data from a file or memory stream. (Inherited from DiagramBase.)
	ExpandButtonClicked	Raised when the user clicks the [±] button of an Expandable node. (Inherited from DiagramBase.)
	GroupDestroyed	Raised when a Group object is destroyed. (Inherited from DiagramBase.)
	HitTestAdjustmentHandles	Raised when custom hit testing of item's adjustment handles must be performed. (Inherited from DiagramBase.)
	InitializeLasso	Raised when the user starts drawing a selection lasso, before it is rendered on screen. (Inherited from DiagramBase.)
	InitializeLink	Raised when the user starts drawing a new link, just after the DiagramLink instance is created. (Inherited from DiagramBase.)
	InitializeNode	Raised when the user starts drawing a new node, just after the DiagramNode instance is created. (Inherited from DiagramBase.)
	ItemAdded	Raised when an item is added to the diagram, either programmatically or interactively. (Inherited from DiagramBase.)
	ItemRemoved	Raised when an item is removed from the diagram, either programmatically or interactively. (Inherited from DiagramBase.)
	JsonDeserializeTag	Raised when the **Tag** of a diagram item must be deserialized from JSON. (Inherited from DiagramBase.)
	JsonSerializeTag	Raised when the **Tag** of a diagram item must be serialized to JSON. (Inherited from DiagramBase.)
	LayerVisibilityChanged	Raised when the visibility of a Layer changes. (Inherited from DiagramBase.)
	LinkActivated	Raised when a link becomes the ActiveItem. (Inherited from DiagramBase.)
	LinkClicked	Raised when the user clicks a link. (Inherited from DiagramBase.)

	LinkCreateCancelled	Raised when the user cancels link creation. (Inherited from DiagramBase.)
	LinkCreated	Raised when the user draws a new link. (Inherited from DiagramBase.)
	LinkCreating	A validation event raised while the user is drawing a new link. (Inherited from DiagramBase.)
	LinkDeactivated	Raised when a link is no longer the **ActiveItem**. (Inherited from DiagramBase.)
	LinkDeleted	Raised when a link is deleted, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkDeleting	Raised when the user tries to delete a link, this event lets you cancel the operation. (Inherited from DiagramBase.)
	LinkDeselected	Raised when a link is deselected, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkDoubleClicked	Raised when the user double-clicks a link. (Inherited from DiagramBase.)
	LinkHovered	Raised when the mouse pointer hovers over a link. (Inherited from DiagramBase.)
	LinkModified	Raised when the user moves any control point of a link. (Inherited from DiagramBase.)
	LinkModifyCancelled	Raised when the user cancels move or resize operation being done on a link. (Inherited from DiagramBase.)
	LinkModifying	A validation event raised while the user is modifying a link. (Inherited from DiagramBase.)
	LinkPasted	Raised when a link has been pasted from the clipboard. (Inherited from DiagramBase.)
	LinkRouted	Raised when a link is routed by the auto-routing algorithm. (Inherited from DiagramBase.)
	LinkSelected	Raised when a link is selected, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkSelecting	Raised when the user tries to select a link, this event lets you cancel the operation. (Inherited from DiagramBase.)
	LinkSplit	Raised when the user splits a link interactively. (Inherited from DiagramBase.)
	LinkStartModifying	A validation event raised when the user starts modifying a link. (Inherited from DiagramBase.)
	LinkTextEdited	Raised when the user edits the text of a link. (Inherited from DiagramBase.)
	LinkTextEditing	A validation event that lets you approve or reject changes made to the text of a link. (Inherited from DiagramBase.)
	MeasureUnitChanged	Raised when the MeasureUnit property value has changed. (Inherited from DiagramBase.)
	NodeActivated	Raised when a node becomes the **ActiveItem**. (Inherited from DiagramBase.)
	NodeClicked	Raised when the user clicks a node. (Inherited from DiagramBase.)
	NodeCreateCancelled	Raised when the user cancels node creation. (Inherited from DiagramBase.)
	NodeCreated	Raised when the user draws a new node. (Inherited from DiagramBase.)
	NodeCreating	A validation event raised while the user is drawing a new node. (Inherited from DiagramBase.)
	NodeDeactivated	Raised when a node is no longer the **ActiveItem**. (Inherited from DiagramBase.)

	NodeDeleted	Raised when a node is deleted, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeDeleting	Raised when the user tries to delete a node, this event lets you cancel the operation. (Inherited from DiagramBase.)
	NodeDeselected	Raised when a node is deselected, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeDoubleClicked	Raised when the user double-clicks a node. (Inherited from DiagramBase.)
	NodeHovered	Raised when the mouse pointer hovers over a node. (Inherited from DiagramBase.)
	NodeModified	Raised when the user moves or resizes a node. (Inherited from DiagramBase.)
	NodeModifyCancelled	Raised when the user cancels move or resize operation being done on a node. (Inherited from DiagramBase.)
	NodeModifying	A validation event raised while the user is moving or resizing a node. (Inherited from DiagramBase.)
	NodePasted	Raised when a node has been pasted from the clipboard. (Inherited from DiagramBase.)
	NodeSelected	Raised when a node is selected, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeSelecting	Raised when the user tries to select a node, this event lets you cancel the operation. (Inherited from DiagramBase.)
	NodeStartModifying	A validation event raised when the user starts modifying a node. (Inherited from DiagramBase.)
	NodeTextEdited	Raised when the user edits the text of a node. (Inherited from DiagramBase.)
	NodeTextEditing	A validation event that lets you approve or reject changes made to the text of a node. (Inherited from DiagramBase.)
	OriginAnchorChanged	Raised when the OriginAnchor property value of a link has changed. (Inherited from DiagramBase.)
	PropertyChanged	INotifyPropertyChanged.PropertyChanged implementation. (Inherited from DiagramBase.)
	QueryAlignTarget	Raised to validate a node as target for alignment guides when AutoAlignNodes is enabled. (Inherited from DiagramBase.)
	Repaint	Raised when the diagram views should be repainted. (Inherited from DiagramBase.)
	RequestCacheReset	Raised when an object within the diagram requests a reset of the cached bitmap. (Inherited from DiagramBase.)
	RequestClipboard	Raised when an object within the diagram requests an operation with the clipboard. (Inherited from DiagramBase.)
	RequestDrawInteractions	For internal use. (Inherited from DiagramBase.)
	RequestTimer	Raised when an object within the diagram needs to start or stop a timer. (Inherited from DiagramBase.)
	SelectionChanged	Raised when an item is added to or removed from the selection (Inherited from DiagramBase.)
	SelectionModified	Raised when the user moves multiple selected items. (Inherited from DiagramBase.)
	SelectionModifying	Raised while the user is moving multiple selected items, this event lets you cancel the modification. (Inherited from DiagramBase.)

	SerializeTag	Raised when the **Tag** of a diagram item must be serialized into an XML document. (Inherited from DiagramBase.)
	SetSelfLoopShape	Raised when a link becomes a self-loop, giving you a chance to override the default look shape. (Inherited from DiagramBase.)
	ShapeModified	Raised when the user modifies the shape of a ShapeNode by moving one of the control points corresponding to shape formula parameters. (Inherited from DiagramBase.)
	ShapeNotDefined	Raised when the diagram being loaded contains nodes with an undefined shape. (Inherited from DiagramBase.)
	TableColumnResized	Raised when the user finishes resizing a column in a table. (Inherited from DiagramBase.)
	TableColumnResizing	Raised when the user resizes a column in a table interactively. (Inherited from DiagramBase.)
	TableRowResized	Raised when the user finishes resizing a row in a table. (Inherited from DiagramBase.)
	TableRowResizing	Raised when the user resizes a row in a table interactively. (Inherited from DiagramBase.)
	TableSectionCollapsed	Raised when the user collapses the rows of a table's section by clicking the [-] button in the section's header row. (Inherited from DiagramBase.)
	TableSectionExpanded	Raised when the user expands the rows of a table's section by clicking the [+] button in the section's header row. (Inherited from DiagramBase.)
	TreeCollapsed	Raised when a user collapses a tree branch by clicking the [-] button of an **Expandable** node. (Inherited from DiagramBase.)
	TreeExpanded	Raised when a user expands a tree branch by clicking the [+] button of an **Expandable** node. (Inherited from DiagramBase.)
	TreeItemTextEditing	A validation event that lets you approve or reject changes made to the text of a TreeViewNode's item. (Inherited from DiagramBase.)
	ValidateAnchorPoint	A validation event that lets you approve or reject connecting a link to an anchor point. (Inherited from DiagramBase.)
	ValidateLinkCrossing	A validation event that lets you approve or reject displaying a decoration at the intersection point of links. (Inherited from DiagramBase.)
	ViewRemoved	Raised when a DiagramView is detached from this diagram. (Inherited from DiagramBase.)

MindFusion.Diagramming Namespace

DiagramDocument Constructor

Initializes a new instance of the DiagramDocument class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramDocument ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

DiagramDocument Class
MindFusion.Diagramming Namespace

DiagramDocument Methods

DiagramDocument.Clone Method

Creates a copy of this DiagramDocument.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual DiagramDocument Clone ()
```

Visual Basic Copy Code

```
Public Overridable Function Clone () As DiagramDocument
```

Return Value

See Also

DiagramDocument Members
DiagramDocument Class
MindFusion.Diagramming Namespace

DiagramDocument.CopyTo Method

Copies this document's pages to specified target document.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void CopyTo (
    DiagramDocument target
)
```

Visual Basic Copy Code

```
Public Overridable Sub CopyTo( _
    target As DiagramDocument _
)
```

Parameters

target
The target document.

See Also

DiagramDocument Members
DiagramDocument Class
MindFusion.Diagramming Namespace

DiagramDocument.LoadFromJson Method

Loads the diagram document from a JSON-formatted string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void LoadFromJson (
    string json
)
```

Visual Basic Copy Code

```
Public Overridable Sub LoadFromJson( _
    json As String _
)
```

Parameters

json

DiagramDocument Members
DiagramDocument Class
MindFusion.Diagramming Namespace

DiagramDocument.LoadFromJsonAsync Method

Loads the diagram document from a JSON-formatted string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Task LoadFromJsonAsync (
    string json
)
```

Visual Basic Copy Code

```
Public Function LoadFromJsonAsync( _
    json As String _
) As Task
```

Parameters

json

Return Value

DiagramDocument.LoadFromJsonFile Method

Loads the diagram document from a JSON file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromJsonFile (
    string fileName
)
```

Visual Basic Copy Code

```
Public Sub LoadFromJsonFile( _
    fileName As String _
)
```

Parameters

fileName

DiagramDocument.LoadFromJsonFileAsync Method

Loads the diagram document from a JSON file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Task LoadFromJsonFileAsync (
    string fileName
)
```

Visual Basic Copy Code

```
Public Function LoadFromJsonFileAsync( _
    fileName As String _
) As Task
```

Parameters

fileName

Return Value

DiagramDocument.LoadFromJsonObject Method

Loads the diagram document from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void LoadFromJsonObject (
    JsonObject documentObj
)
```

Visual Basic Copy Code

```
Public Overridable Sub LoadFromJsonObject( _
    documentObj As JsonObject _
)
```

Parameters

documentObj
A JsonObject representing the document.

DiagramDocument.LoadFromString Method

Loads the document from the specified string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromString (
    string str,
    SaveToStringFormat format
)
```

Visual Basic Copy Code

```
Public Sub LoadFromString( _
    str As String, _
    format As SaveToStringFormat _
)
```

Parameters

str
The string to load from.

format

DiagramDocument.LoadFromXml Method

Loads the document from an XML document or file.

Overload List

Name	Description
DiagramDocument.LoadFromXml (String)	Loads the document from the specified XML file.
DiagramDocument.LoadFromXml (String, Boolean)	Loads the document from the specified XML file.
DiagramDocument.LoadFromXml (XmlDocument)	Loads the document from the specified **XmlDocument** object.
DiagramDocument.LoadFromXml (XmlDocument, Boolean)	Loads the document from the specified **XmlDocument** object.

DiagramDocument.LoadFromXml Method (String)

Loads the document from the specified XML file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    string fileName
)
```

Visual Basic Copy Code

```
Public Sub LoadFromXml( _
    fileName As String _
)
```

Parameters

fileName
The name of the XML file the data should be read from.

DiagramDocument.LoadFromXml Method (String, Boolean)

Loads the document from the specified XML file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    string fileName,
    bool loadDiagramProperties
)
```

Visual Basic Copy Code

```
Public Sub LoadFromXml( _
    fileName As String, _
    loadDiagramProperties As Boolean _
)
```

Parameters

fileName
The name of the XML file the data should be read from.

loadDiagramProperties
true to load values of diagram properties; **false** to load only diagram items.

DiagramDocument.LoadFromXml Method (XmlDocument)

Loads the document from the specified **XmlDocument** object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    XmlDocument document
)
```

Visual Basic Copy Code

```
Public Sub LoadFromXml( _
    document As XmlDocument _
)
```

Parameters

document
A .NET **XmlDocument** object from which to load the diagram data.

See Also

DiagramDocument.LoadFromXml Method (XmlDocument, Boolean)

Loads the document from the specified **XmlDocument** object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    XmlDocument document,
    bool loadDiagramProperties
)
```

Visual Basic Copy Code

```
Public Sub LoadFromXml( _
    document As XmlDocument, _
    loadDiagramProperties As Boolean _
)
```

Parameters

document
A .NET **XmlDocument** object from which to load the diagram data.

loadDiagramProperties
true to load values of diagram properties; **false** to load only diagram items.

DiagramDocument.LoadFromXmlAsync Method (String)

Loads the document from the specified XML file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Task LoadFromXmlAsync (
    string fileName
)
```

Visual Basic Copy Code

```
Public Function LoadFromXmlAsync( _
    fileName As String _
) As Task
```

Parameters

fileName
The name of the XML file the data should be read from.

Return Value

C# Copy Code

```
public void SaveToJsonFile (
    string fileName
)
```

Visual Basic Copy Code

```
Public Sub SaveToJsonFile( _
    fileName As String _
)
```

Parameters

fileName

DiagramDocument.SaveToJsonFileAsync Method

Saves the diagram document into a JSON file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Task SaveToJsonFileAsync (
    string fileName
)
```

Visual Basic Copy Code

```
Public Function SaveToJsonFileAsync( _
    fileName As String _
) As Task
```

Parameters

fileName

Return Value

DiagramDocument Members
DiagramDocument Class
MindFusion.Diagramming Namespace

DiagramDocument.SaveToJsonObject Method

Saves the diagram document to a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void SaveToJsonObject (
    JsonObject documentObj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Public Overridable Sub SaveToJsonObject( _
    documentObj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

documentObj
A JsonObject representing the document.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

DiagramDocument.SaveToString Method

Saves the document as an ASCII string.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string SaveToString (
    SaveToStringFormat format,
    bool clearDirty
)
```

Visual Basic Copy Code

```
Public Function SaveToString( _
    format As SaveToStringFormat, _
    clearDirty As Boolean _
) As String
```

Parameters

format
One of the SaveToStringFormat values.

clearDirty
Indicates whether the 'dirty' flag should be cleared.

Return Value

A string value.

DiagramDocument.SaveToXml Method (XmlDocument, Boolean)

Saves the document to the specified **XmlDocument** object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SaveToXml (
    XmlDocument document,
    bool includeUnalteredProperties
)
```

Visual Basic Copy Code

```
Public Sub SaveToXml( _
    document As XmlDocument, _
    includeUnalteredProperties As Boolean _
)
```

Parameters

document
A .NET **XmlDocument** object where the document should be saved.

includeUnalteredProperties
true if properties that have their default value should be saved; otherwise, **false**.

DiagramEventArgs Members

Contains the arguments passed to event handlers, such as Clicked and DoubleClicked.

The following tables list the members exposed by the DiagramEventArgs type.

Public Constructors

	Name	Description
	DiagramEventArgs	Overloaded.

Public Properties

	Name	Description
	ClipRect	Gets the current clipping rectangle.
	Graphics	Gets an object implementing the IGraphics interface whose methods should be used to draw the custom graphics.
	MouseButton	Gets or sets which mouse button has been pressed.
	MousePosition	Gets or sets the current mouse pointer position.
	VisibleRect	Specifies what part of the diagram is currently visible.

DiagramEventArgs Constructor (IGraphics, Rect, Rect)

Initializes a new instance of the DiagramEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramEventArgs (
    IGraphics graphics,
    Rect visibleRect,
    Rect clipRect
)
```

Visual Basic Copy Code

```
Public New ( _
    graphics As IGraphics, _
    visibleRect As Rect, _
    clipRect As Rect _
)
```

Parameters

graphics

visibleRect

clipRect
A **Microsoft.Maui.Graphics.Rect** specifying the current clipping rectangle.

See Also

DiagramEventArgs Constructor Overload List
DiagramEventArgs Class
MindFusion.Diagramming Namespace

DiagramEventArgs Constructor (MouseButton, Point)

Initializes a new instance of the DiagramEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramEventArgs (
    MouseButton mouseButton,
    Point mousePosition
)
```

Visual Basic Copy Code

```
Public New ( _
    mouseButton As MouseButton, _
    mousePosition As Point _
)
```

Parameters

mouseButton
The mouse button related to the event.

mousePosition
The cursor location at the time the event is raised, expressed in document coordinates.

DiagramEventArgs Properties

DiagramEventArgs.ClipRect Property

Gets the current clipping rectangle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect ClipRect { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ClipRect As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** instance.

Remarks

This property is used as an argument to DrawBackground event handlers.

DiagramEventArgs.Graphics Property

Gets an object implementing the IGraphics interface whose methods should be used to draw the custom graphics.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IGraphics Graphics { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Graphics As IGraphics
```

Property Value

An instance of a class implementing the IGraphics interface.

Remarks

This property is used as an argument to DrawBackground event handlers.

Specifies what part of the diagram is currently visible.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect VisibleRect { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property VisibleRect As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** instance.

Remarks

This property is used as an argument to DrawBackground event handlers.

DiagramItem Class

Represents an item in the diagram document. All classes representing diagram elements derive from **DiagramItem**.

Syntax

C# Copy Code

```
public abstract class DiagramItem : IDisposable, InplaceEditable
```

Visual Basic Copy Code

```
Public MustInherit Class DiagramItem
    Implements IDisposable, InplaceEditable
```

Remarks

All items in the diagram document - links and nodes - share common base class called **DiagramItem**. Its main function is to provide interface for the most common methods and properties of every diagram element.

MvcDiagram invokes the Draw method when an item must be drawn on screen. You can call **Draw** if you need to draw an item on your own graphics surface. Override the method when implementing custom item types to provide your own rendering functionality. The standard item types draw their interior and borders using the objects assigned to the Brush and Pen properties. The font of the item's text is set by the Font property.

The order in which items are painted from bottom to top is called the z-order. Moving items up or down the z-order can be done by means of the ZBottom, ZTop, ZLevelUp and ZLevelDown methods. Accessing and setting the index of an item in the z-order can be done using the ZIndex property.

A hierarchy of items can be built, so that moving an item that is higher in the hierarchy moves all subordinated items too. The immediate subordinates of an item are represented by a Group instance. The group of items attached to another item is accessed through the SubordinateGroup property of the latter. MasterGroup gets the group in which an item is subordinate.

Every item can cast a shadow, whose offset from the item is specified by the ShadowOffsetX and ShadowOffsetY properties. The shadow is painted using the color set in ShadowBrush.

An application can associate custom data with an item by means of the Tag property. The tags are only meant to hold data related to the entities represented by the chart items. They are not used or modified by MvcDiagram in any way. The tags are saved and loaded together with the diagram elements when serializing the document to a disk file or a stream.

Items can be locked for interactive modification through the Locked property. Locked items can still be modified programmatically. Items can also be marked as locked for automatic layout methods through the IgnoreLayout property.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.DiagramItem
    MindFusion.Diagramming.DiagramLink
    MindFusion.Diagramming.DiagramNode
    MindFusion.Diagramming.Selection
    MindFusion.Diagramming.DiagramLink
    MindFusion.Diagramming.DiagramNode
    MindFusion.Diagramming.Selection

DiagramItem Members

Represents an item in the diagram document. All classes representing diagram elements derive from DiagramItem.

The following tables list the members exposed by the **DiagramItem** type.

Protected Constructors

	Name	Description
	DiagramItem	Overloaded. Initializes a new instance of the **DiagramItem** class.

Protected Fields

	Name	Description
	disposed	For internal use.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the interior of this item.
	CssClass	Gets or sets the CSS class associated with this item.
	EffectiveBrush	Gets the effective brush of the item.
	EffectiveFont	Gets the currently effective font of the item.
	EffectivePen	Gets the effective pen of the item.
	EffectiveShadowBrush	Gets the effective shadow brush of the item.
	EffectiveTextBrush	Gets the effective text brush of the item.
	Font	Gets or sets the font used to render the item's text.
	HyperLink	Gets or sets the hyperlink associated with this diagram item.
	Id	Gets or sets user-defined identifier associated with this item.
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods.
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer.
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**.
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item.
	Opacity	Gets or sets the opacity of this item.
	Parent	Gets the diagram that contains this item.
	Pen	Gets or sets the pen used to paint the frame of the item.
	Printable	Gets or sets a value indicating whether to print the item.
	RuntimeIndex	For internal use.
	Selected	Gets or sets a value indicating whether a diagram item is selected.

	ShadowBrush	Gets or sets the brush used to paint the item's shadow.
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item.
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item.
	Style	Gets or sets the style associated with the item.
	SubordinateGroup	Gets a reference to the group of items that are attached to this one.
	Tag	Gets or sets user-defined data associated with this item.
	Text	Gets or sets the text displayed by this item.
	TextBrush	Gets or sets the brush used to paint texts inside the item.
	TextFormat	Gets or sets the alignment of text displayed inside this item.
	TextPadding	Gets or sets the spacing between the item boundaries and its text.
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element.
	TopLevel	True if this is a top-level item in the diagram, or false if it is inside a container.
	Visible	Gets or sets a value indicating whether this item is visible.
	Weight	Gets or sets a weight value used in layout and path-finding algorithms.
	ZIndex	Gets or sets the z-order position of this item.

Protected Properties

	Name	Description
	MeasureUnit	Returns the diagram measure unit.

Public Methods

	Name	Description
	Animate	Animates the item.
	Clone	Creates a copy of this item.
	ContainsPoint	Overloaded. Determines whether this item contains the specified point.
	Dispose	Overloaded.
	DoModify	For internal use.
	Draw	Draws the item on the specified IGraphics surface.
	DrawHandles	Renders the adjustment handles of this item.
	DrawInRect	
	DrawShadow	Draws the shadow of this item on the specified IGraphics surface.
	GetBounds	Gets the bounding rectangle of this item.
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item.
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item.
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item.

	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item.
	GetOutlinePoly	Gets a polygon approximating the outline of this object.
	GetRepaintRect	Gets the repaint region for this item, taking into account factors such as pen, selection handles and shadow.
	GetRotatedBounds	Gets the bounding rectangle of this item when it is rotated.
	GetToolTip	Gets the tooltip that should be displayed for this item at the specified point.
	HitTest	Returns the diagram item that contains the specified point.
	HitTestHandle	Determines whether a selection handle of this item is located at the specified point.
	HitTestManipulators	Finds the **Manipulator** object located at the specified point.
	LabelFromPoint	Returns the ItemLabel located at specified point.
	NotInteractive	Gets whether the user is prevented from manipulating this item.
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user.
	OnLoad	Called after successful deserialization.
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression.
	RestoreItemProperties	For internal use.
	SaveItemProperties	For internal use.
	ZBottom	Moves the item to the bottom of the z-order.
	ZLevelDown	Moves the item one level down in the z-order.
	ZLevelUp	Moves the item one level up in the z-order.
	ZTop	Moves the item to the top of the z-order.

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object.
	AllowCreate	Invoked during interactive creation of items to test whether the operation can be completed in the current context.
	AllowModify	Invoked during interactive modification of items to test whether the operation can be completed in the current context.
	CancelModify	Invoked when the interactive modification of this object has been canceled.
	CompleteCreate	Invoked when the item creation has been completed.
	CompleteModify	Invoked when the item modification has been completed.
	CreateProperties	Creates an item property set corresponding to the type of this diagram item.
	CreateState	Creates an item state corresponding to the type of this diagram item.
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics.
	Finalize	DiagramItem finalizer.

	FreeResources	Called when the item is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history.
	GetValue	Gets the effective value of the style property with the specified name.
	LoadFromJson	Loads the item from a JSON object.
	LoadFromXml	Loads the item content from an XML element.
	LoadObsolete	For internal use.
	OnAdd	Called when the item is added to a Diagram, either by the user, programmatically or via undo / redo.
	OnChildModified	Called when a group child node has been modified.
	OnClick	Invoked when the user clicks this item.
	OnDoubleClick	Invoked when the user double-clicks this item.
	OnMeasureUnitChanged	Called when the diagram's MeasureUnit changes.
	OnRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or via undo / redo.
	OnStyleChanged	Invoked when the associated style or theme have changed.
	OnTextChanged	Called when the value of the Text property changes.
	OnTextFormatChanged	Called when the value of the TextFormat property changes.
	OnZoomChanged	Called when the diagram's **ZoomFactor** changes.
	RemoveManipulator	Removes the specified manipulator from the object.
	Repaint	Overloaded.
	RestoreProperties	Restores the properties of this diagram item.
	RestoreState	Restores the state of this diagram item.
	SaveProperties	Saves the properties of this diagram item.
	SaveState	Saves the state of this diagram item.
	SaveToJson	Saves the item as a JSON object.
	SaveToXml	Saves the item content into an XML element.
	SetDiagramDirty	Marks the diagram as changed.
	SetExpanded	Sets whether the item is in expanded or collapsed state.
	ShouldRender	Determines whether the item should be rendered in the current context.
	StartCreate	Invoked once when the user starts creating a new item interactively.
	StartModify	Invoked when the user starts modifying this item interactively.
	UpdateCreate	Invoked during interactive creation of this item.
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster.
	UpdateModify	Invoked during interactive modification of this item.

DiagramItem Fields

DiagramItem.disposed Field

For internal use.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected bool disposed
```

Visual Basic Copy Code

```
Protected disposed As Boolean
```

Remarks

This field is used in the implementation of the IDisposable pattern.

DiagramItem Constructor

Initializes a new instance of the DiagramItem class.

Overload List

Name	Description
DiagramItem ()	Initializes a new instance of the **DiagramItem** class.
DiagramItem (Diagram)	Initializes a new instance of the **DiagramItem** class with default values supplied form the specified Diagram.
DiagramItem (DiagramItem)	Initializes a new instance of the **DiagramItem** class using the specified diagram item as a prototype.

See Also

DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem Constructor ()

Initializes a new instance of the DiagramItem class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected DiagramItem ()
```

Visual Basic

```
Protected Sub New ()
```

Remarks

This constructor sets the DiagramItem properties to their default values.

See Also

DiagramItem Constructor Overload List
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem Constructor (Diagram)

Initializes a new instance of the DiagramItem class with default values supplied form the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected DiagramItem (
    Diagram parent
)
```

Visual Basic

```
Protected New ( _
    parent As Diagram _
)
```

Parameters

parent
The Diagram from which to obtain default values for the item properties.

Remarks

This constructor initializes the DiagramItem properties with the values specified in the respective default-value properties of the Diagram object. For more information see **Initial Values of Item Properties**.

See Also

DiagramItem Constructor Overload List
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem Constructor (DiagramItem)

Initializes a new instance of the DiagramItem class using the specified diagram item as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected DiagramItem (
    DiagramItem prototype
)
```

Visual Basic

```
Protected New ( _
    prototype As DiagramItem _
)
```

Parameters

prototype
The item to use as a prototype. The properties of the new item are initialized from the property values of this item.

Remarks

This constructor copies the DiagramItem property values from the specified prototype item.

See Also

DiagramItem Constructor Overload List
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem Methods

DiagramItem.AddManipulator Method

Adds the specified manipulator to this object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void AddManipulator (
    Manipulator mnp
)
```

Visual Basic Copy Code

```
Protected Sub AddManipulator( _
    mnp As Manipulator _
)
```

Parameters

mnp
An instance of **Manipulator** -derived class.

Remarks

Use this method to add custom manipulators to diagram elements. Manipulators are interactive widgets associated with an item that let users change aspects of the item different from its position and size. Some built-in manipulators are the +/- icons displayed for Expandable nodes and the scrollbar of a TreeViewNode.

MindFusion.Diagramming Namespace
RemoveManipulator Method

DiagramItem.AllowCreate Method

Invoked during interactive creation of items to test whether the operation can be completed in the current context.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected abstract bool AllowCreate (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected MustOverride Function AllowCreate( _
    current As Point, _
    ist As InteractionState _
) As Boolean
```

Parameters

current

The current mouse pointer position.

ist

An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the creation of this item; otherwise, **false**.

Remarks

This method is invoked after each mouse movement in order to update the mouse pointer icon, so do not perform any time-consuming operations in its implementation.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.AllowModify Method

Invoked during interactive modification of items to test whether the operation can be completed in the current context.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected abstract bool AllowModify (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected MustOverride Function AllowModify( _
    current As Point, _
    ist As InteractionState _
) As Boolean
```

Parameters

current

The current mouse pointer position.

ist

An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the modification of this item; otherwise, **false**.

Remarks

This method is invoked after each mouse movement in order to update the mouse pointer icon, so do not perform any time-consuming operations in its implementation.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.Animate Method

Animates the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Animate (
    ItemAnimation animation
)
```

Visual Basic Copy Code

```
Public Sub Animate( _
    animation As ItemAnimation _
)
```

Parameters

animation
An ItemAnimation -derived object.

Remarks

Item's animated values are considered transient and do not change actual property values. If you want to assign last value from animation to actual property such as Bounds or Opacity, set the KeepLastValue flag in AnimationOptions as in example below.

Example

C# Copy Code

```
node.Animate(
    new PathAnimation(
        new List<Point>
        {
            new Point(30, 30),
            new Point(50, 30),
            new Point(75, 66),
            new Point(125, 88)
        },
        new AnimationOptions
        {
            KeepLastValue = true
        }));
```

DiagramItem.CancelModify Method

Invoked when the interactive modification of this object has been canceled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void CancelModify (
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overridable Sub CancelModify( _
    ist As InteractionState _
)
```

Parameters

ist
An InteractionState object containing more information about the current state of the operation.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.Clone Method

Creates a copy of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual DiagramItem Clone (
    bool clipboard
)
```

Visual Basic Copy Code

```
Public Overridable Function Clone( _
    clipboard As Boolean _
) As DiagramItem
```

Parameters

clipboard
true if the copy will be stored in the Windows clipboard; otherwise, **false**.

Return Value

The copy of this item.

Remarks

The default implementation of this item invokes the item's class copy constructor through reflection. If your custom type does not provide a copy constructor, you must implement this method to provide for clipboard operations support.

DiagramItem.CompleteCreate Method

Invoked when the item creation has been completed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void CompleteCreate (
    Point end
)
```

Visual Basic Copy Code

```
Protected Overridable Sub CompleteCreate( _
    end As Point _
)
```

Parameters

end
The mouse pointer position.

Remarks

This method is invoked when the user releases the mouse button while drawing a new item.

See Also

DiagramItem Members

DiagramItem.CompleteModify Method

Invoked when the item modification has been completed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void CompleteModify (
    Point end,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overridable Sub CompleteModify( _
    end As Point, _
    ist As InteractionState _
)
```

Parameters

end
The mouse pointer position.

ist
An InteractionState object containing more information about the current state of the operation.

Remarks

This method is invoked when the user releases the mouse button while modifying an item.

DiagramItem.ContainsPoint Method (Point)

Determines whether this item contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public abstract bool ContainsPoint (
    Point point
)
```

Visual Basic Copy Code

```
Public MustOverride Function ContainsPoint( _
    point As Point _
) As Boolean
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** specifying the logical coordinates of a diagram point.

Return Value

true it this item contains the specified point; otherwise, **false**.

Remarks

This method is used during hit-testing to see if the mouse is inside the item.

See Also

ContainsPoint Method Overload List
DiagramItem Members
DiagramItem Class

DiagramItem.ContainsPoint Method (Point, Double)

Determines whether this item contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public abstract bool ContainsPoint (
    Point point,
    double threshold
)
```

Visual Basic Copy Code

```
Public MustOverride Function ContainsPoint( _
    point As Point, _
    threshold As Double _
) As Boolean
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** specifying the logical coordinates of a diagram point.

threshold
Specifies the size of the area around the item outlines where the point is still considered inside the item.

Return Value

true it this item contains the specified point; otherwise, **false**.

HitTest Method

DiagramItem.CreateProperties Method

Creates an item property set corresponding to the type of this diagram item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual DiagramItemProperties CreateProperties ()
```

Visual Basic Copy Code

```
Protected Overridable Function CreateProperties () As DiagramItemProperties
```

Return Value

A DiagramItemProperties -derived object containing a snapshot of the item's properties.

Remarks

This method is invoked by the undo/redo subsystem when creating a ChangeItemCmd instance.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.CreateState Method

Creates an item state corresponding to the type of this diagram item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual DiagramItemState CreateState ()
```

Visual Basic Copy Code

```
Protected Overridable Function CreateState () As DiagramItemState
```

Return Value

An instance of a class derived from DiagramItemState.

DiagramItem.Dispose Method

Overload List

Name	Description
DiagramItem.Dispose ()	Disposes the resources managed by this item.
DiagramItem.Dispose (Boolean)	Disposes any disposable resources managed by this item.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.Dispose Method ()

Disposes the resources managed by this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Dispose ()
```

Visual Basic Copy Code

```
Public Sub Dispose ()
```

Remarks

This method is used in the implementation of the IDisposable pattern.

See Also

DiagramItem.Dispose Method (Boolean)

Disposes any disposable resources managed by this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void Dispose (
    bool disposing
)
```

Visual Basic Copy Code

```
Protected Overridable Sub Dispose( _
    disposing As Boolean _
)
```

Parameters

disposing
Specifies whether the method is called explicitly or from the garbage collector.

Remarks

This method is used in the implementation of the IDisposable pattern.

See Also

Dispose Method Overload List
DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.DoModify Method

For internal use.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool DoModify (
    Point start,
```

```
    Point end,
    AdjustmentHandle handle
)
```

Visual Basic Copy Code

```
Public Function DoModify( _
    start As Point, _
    end As Point, _
    handle As AdjustmentHandle _
) As Boolean
```

Parameters

start

end

handle

Return Value

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.Draw Method

Draws the item on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public abstract void Draw (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public MustOverride Sub Draw( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
The IGraphics surface to draw the item on.

options
A RenderOptions object specifying options for the drawing operation.

Remarks

MvcDiagram calls this method to draw a representation of the diagram item onto the specified graphics surface. Implement this method in custom node or link types if you need to provide your own drawing functionality. The method is called when rendering the diagram on screen, or exporting it to PDF or SVG files. The IGraphics methods call the respective Microsoft.Maui.Graphics API methods when drawing on screen, or generate PDF of SVG tags when using PdfExporter and SvgExporter to export diagram files.

DiagramItem.DrawHandles Method

Renders the adjustment handles of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public abstract void DrawHandles (
    IGraphics graphics,
    HandlesVisualStyle style,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public MustOverride Sub DrawHandles( _
    graphics As IGraphics, _
    style As HandlesVisualStyle, _
    options As RenderOptions _
)
```

Parameters

graphics
The IGraphics surface on which the handles should be drawn.

style
A HandlesVisualStyle instance containing brush and pen objects that should be used when drawing handles.

options
Provides options for the drawing operation.

Remarks

This method is invoked when the item's adjustment handles must be rendered.

DiagramItem.DrawInRect Method

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void DrawInRect (
    IGraphics graphics,
    RenderOptions options,
    Rect target
)
```

Visual Basic Copy Code

```
Public Overridable Sub DrawInRect( _
    graphics As IGraphics, _
    options As RenderOptions, _
    target As Rect _
)
```

Parameters

graphics

options

target

DiagramItem.DrawManipulators Method (IGraphics, Boolean)

Draws the associated manipulators on the specified graphics.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void DrawManipulators (
    IGraphics graphics,
    bool clip
)
```

Visual Basic Copy Code

```
Protected Sub DrawManipulators( _
    graphics As IGraphics, _
    clip As Boolean _
)
```

Parameters

graphics
The IGraphics surface to draw the manipulators on.

clip
true to render only inside the item's bounds; otherwise, **false**.

Remarks

This method is invoked to render the item's manipulators, for example, collapse/expand buttons, scrollbars, and so on.

See Also

DrawManipulators Method Overload List
DiagramItem Members
DiagramItem Class

DiagramItem.DrawManipulators Method (IGraphics, Boolean, Boolean)

Draws the associated manipulators in the specified graphics.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void DrawManipulators (
    IGraphics graphics,
    bool clip,
    bool inLocal
)
```

Visual Basic Copy Code

```
Protected Sub DrawManipulators( _
    graphics As IGraphics, _
    clip As Boolean, _
    inLocal As Boolean _
)
```

Parameters

graphics
The IGraphics surface to draw the manipulators on.

clip
true to render only inside the item's bounds; otherwise, **false**.

inLocal
true if current graphics are in local coordinates; otherwise, **false**.

Remarks

This method is invoked to render the item's manipulators, for example, collapse/expand buttons, scrollbars, and so on.

See Also

DrawManipulators Method Overload List
DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.DrawShadow Method

Draws the shadow of this item on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public abstract void DrawShadow (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public MustOverride Sub DrawShadow( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
The IGraphics surface to draw the shadow on.

options
A RenderOptions object specifying options for the drawing operation.

DiagramItem.Finalize Method

DiagramItem finalizer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void Finalize ()
```

Visual Basic Copy Code

```
Protected Overrides Sub Finalize ()
```

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.FreeResources Method

Called when the item is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void FreeResources ()
```

Visual Basic Copy Code

```
Protected Overridable Sub FreeResources ()
```

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.GetBounds Method

Gets the bounding rectangle of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Rect GetBounds ()
```

Visual Basic Copy Code

```
Public Overridable Function GetBounds () As Rect
```

Return Value

The rectangle that bounds this item.

Remarks

The Bounds property getter returns the result of this method. MvcDiagram treats the returned value as the logical coordinates of the item and uses it in many situations when comparing items geometrically, when looking for items intersections, and so on.

DiagramItem.GetEffectiveBrush Method

Creates a Brush object representing the currently effective brush of the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush GetEffectiveBrush ()
```

Visual Basic Copy Code

```
Public Function GetEffectiveBrush () As Brush
```

Return Value

A Brush instance.

Remarks

This method returns either the item's Brush if the item's **Brush** is not **null**, or the Brush value of the item's style.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.GetEffectivePen Method

Returns a Pen object representing the currently effective pen of the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen GetEffectivePen (
    IGraphics graphics
)
```

Visual Basic Copy Code

```
Public Function GetEffectivePen( _
    graphics As IGraphics _
) As Pen
```

Parameters

graphics

Return Value

Remarks

This method returns either the item's Pen if the item's Pen is not null, or a pen with the Stroke and StrokeThickness properties of the item's style.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.GetEffectiveShadowBrush Method

Returns a Brush object representing the currently effective shadow brush of the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush GetEffectiveShadowBrush ()
```

Visual Basic Copy Code

```
Public Function GetEffectiveShadowBrush () As Brush
```

Return Value

A Brush instance.

Remarks

This method returns either the item's ShadowBrush if the item's **ShadowBrush** is not **null**, or the ShadowBrush property of the item's style.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.GetEffectiveTextBrush Method

Returns a Brush object representing the currently effective text brush of the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush GetEffectiveTextBrush ()
```

Visual Basic Copy Code

```
Public Function GetEffectiveTextBrush () As Brush
```

Return Value

A Brush instance.

Remarks

This method returns either the item's TextBrush if the item's **TextBrush** is not **null**, or the TextBrush property of the item's style.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.GetOutlinePoly Method

Gets a polygon approximating the outline of this object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual PointCollection GetOutlinePoly (
    bool rendering
)
```

Visual Basic Copy Code

```
Public Overridable Function GetOutlinePoly( _
    rendering As Boolean _
) As PointCollection
```

Parameters

rendering
Specifies whether the outline will be used for rendering (true) or hit-testing (false).

Return Value

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.GetRepaintRect Method

Gets the repaint region for this item, taking into account factors such as pen, selection handles and shadow.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Rect GetRepaintRect (
    bool includeConnected
)
```

Visual Basic Copy Code

```
Public Overridable Function GetRepaintRect( _
    includeConnected As Boolean _
) As Rect
```

Parameters

includeConnected
true if related items should be considered too; otherwise, **false**.

Return Value

A rectangular region that should be repainted when this item is modified.

Remarks

This method is invoked when an item is modified by the user, or when an appearance property of the item changes. The returned region is invalidated and redrawn at the next paint operation.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.GetRotatedBounds Method

Gets the bounding rectangle of this item when it is rotated.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Rect GetRotatedBounds ()
```

Visual Basic Copy Code

```
Public Overridable Function GetRotatedBounds () As Rect
```

Return Value

A rectangle that bounds the rotated shape of the item.

Remarks

This method is invoked during hit-testing to do a quick test whether a point is within the item's bounds, before calling the possibly more time-consuming ContainsPoint method.

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.GetToolTip Method

Gets the tooltip that should be displayed for this item at the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual string GetToolTip (
    Point point
)
```

Visual Basic Copy Code

```
Public Overridable Function GetToolTip( _
    point As Point _
) As String
```

Parameters

point
The mouse pointer position.

Return Value

A string specifying the tooltip text.

Remarks

You can override this method to return different tooltips for different regions of the item.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.GetValue Method

Gets the effective value of the style property with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected Object GetValue (
    string name
)
```

Visual Basic Copy Code

```
Protected Function GetValue( _
    name As String _
) As Object
```

Parameters

name
The name of the property to get.

Return Value

An object representing the effective property value.

See Also

DiagramItem Members

DiagramItem.HitTest Method

Returns the diagram item that contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual DiagramItem HitTest (
    Point point,
    double threshold,
    bool onlyNodes,
    bool onlyInteractive,
    bool includeHandles,
    bool includeLabels
)
```

Visual Basic Copy Code

```
Public Overridable Function HitTest( _
    point As Point, _
    threshold As Double, _
    onlyNodes As Boolean, _
    onlyInteractive As Boolean, _
    includeHandles As Boolean, _
    includeLabels As Boolean _
) As DiagramItem
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** value specifying the logical coordinates of a diagram point.

threshold
Specifies the size of the area around the item outlines where the point is still considered inside the item.

onlyNodes
true to exclude child links from the search, or **false** otherwise.

onlyInteractive
true to exclude Locked items from the search, or **false** otherwise.

includeHandles
true to also consider adjustment handle locations (possibly outside of node's bounds), or **false** otherwise.

includeLabels
true to also consider item label locations (possibly outside of item's bounds).

Return Value

The item that contains the specified point, or **null** if none found.

Remarks

This method performs recursive search if items contain child items.

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace
ContainsPoint Method

DiagramItem.HitTestHandle Method

Determines whether a selection handle of this item is located at the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public abstract AdjustmentHandle HitTestHandle (
    Point point,
    double distance
)
```

Visual Basic Copy Code

```
Public MustOverride Function HitTestHandle( _
    point As Point, _
    distance As Double _
) As AdjustmentHandle
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** value specifying where to look for a selection handle.

distance
Maximum distance from a handle at which it is still considered as hit.

Return Value

Returns an AdjustmentHandle instance representing the adjustment handle found at the specified location, or **null** if there is none.

DiagramItem.HitTestManipulators Method

Finds the **Manipulator** object located at the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Manipulator HitTestManipulators (
    Point point
)
```

Visual Basic

```
Public Overridable Function HitTestManipulators( _
    point As Point _
) As Manipulator
```

Parameters

point

Return Value

An instance of **Manipulator** -derived class, or **null** if there isn't one found at specified location.

DiagramItem.LabelFromPoint Method

Returns the ItemLabel located at specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public virtual ItemLabel LabelFromPoint (
    Point point
)
```

Visual Basic

```
Public Overridable Function LabelFromPoint( _
    point As Point _
) As ItemLabel
```

Parameters

point

Return Value

An ItemLabel instance.

DiagramItem.LoadFromJson Method

Loads the item from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected virtual void LoadFromJson (
    JsonObject obj,
```

```
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject containing the item's data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

Remarks

This method is invoked when an item is being deserialized from a diagram file saved in JSON format.

See Also

DiagramItem Members
DiagramItem Class

DiagramItem.LoadFromXml Method

Loads the item content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** containing the item's data.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

Remarks

This method is invoked when an item is being deserialized from a diagram file saved in XML format.

DiagramItem.LoadObsolete Method

For internal use.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void LoadObsolete (
    XmlReader reader,
    SortedList brushes,
    Object extra
)
```

Visual Basic Copy Code

```
Protected Overridable Sub LoadObsolete( _
    reader As XmlReader, _
    brushes As SortedList, _
    extra As Object _
)
```

Parameters

reader

brushes

extra

Remarks

Invoked for control hosts when they are loaded from a pre-5.0 Xml file.

DiagramItem.NotInteractive Method

Gets whether the user is prevented from manipulating this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool NotInteractive ()
```

Visual Basic Copy Code

```
Public Overridable Function NotInteractive () As Boolean
```

Return Value

true to prevent user interaction with this item; otherwise, **false**.

Remarks

The default implementation prevents manipulation of invisible or locked items.

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace
OnLoad Method

DiagramItem.OnChildModified Method

Called when a group child node has been modified.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnChildModified (
    DiagramNode node,
    AdjustmentHandles handle
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnChildModified( _
    node As DiagramNode, _
    handle As AdjustmentHandles _
)
```

Parameters

node
The node that has been modified.

handle
The adjustment handle used to modify the node.

Remarks

Override this method if you need to know when a node from the SubordinateGroup is modified.

See Also

DiagramItem Members
DiagramItem Class

DiagramItem.OnClick Method

Invoked when the user clicks this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnClick (
    MouseButton mouseButton,
    Point mousePosition
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnClick( _
    mouseButton As MouseButton, _
    mousePosition As Point _
)
```

Parameters

mouseButton
Specifies the mouse button used to click the item.

mousePosition
Specifies the mouse position.

Remarks

Implement this method in a custom item class if you need to detect clicks without handling events of the Diagram class.

See Also

DiagramItem Members

DiagramItem.OnDoubleClick Method

Invoked when the user double-clicks this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnDoubleClick (
    MouseButton mouseButton,
    Point mousePosition
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnDoubleClick( _
    mouseButton As MouseButton, _
    mousePosition As Point _
)
```

Parameters

mouseButton
Specifies the mouse button used to click the item.

mousePosition
Specifies the mouse position.

Remarks

Implement this method in a custom item class if you need to detect double-clicks without handling events of the Diagram class.

DiagramItem.Query Method

Returns the items that can be reached from this item by following the path specified in the given query expression.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItemCollection Query (
    string query
)
```

Visual Basic Copy Code

```
Public Function Query( _
    query As String _
) As DiagramItemCollection
```

Parameters

query
A query expression consisting of selectors and boolean predicates.

Return Value

A collection of the found items.

Remarks

The query string consists of selectors, where each selector specifies the next items that should be selected starting from the current one.

The following selectors can be applied to a node:

links	Selects all links connected to the current node
inlinks	Selects the incoming links of the current node
outlinks	Selects the outgoing links of the current node
parent	Selects the parent item of the current node if it is in a group
children	Selects the child nodes of the current node if it is in a group

The following selectors can be applied to a link:

nodes	Selects the two nodes connected by the current link
origin	Selects the Origin node of the current link
destination	Selects the Destination node of the current link

children	Selects the child nodes of the current link if it is in a group.

Selectors must be separated by the / character. The results returned by a selector can be also filtered using a predicate expression, enclosed in square brackets after the selector name. The predicate expression can include C# like boolean and arithmetic operators, and one of the following property identifiers:

tag	Returns the value of the Tag property.
text	Returns the value of the Text property.
weight	Returns the value of the Weight property.

Example

The following code selects nodes two levels below the current one in a tree or layered graph.

C# Copy Code

```
DiagramItemCollection items = diagram.ActiveItem.Query(
    "outlinks/destination/outlinks/destination");
diagram.Selection.Clear();
foreach (DiagramItem item in items)
    item.Selected = true;
```

The following code finds the neighbors of the currently selected node that can be reached from it by following links with Weight greater than 3.

C# Copy Code

```
DiagramItemCollection items = diagram.ActiveItem.Query(
 "outlinks[weight>3]/destination");
```

The following example finds the destination nodes of links labeled "exception" going out of children of the current node's group.

C# Copy Code

```
DiagramItemCollection items = diagram.ActiveItem.Query(
    "children/outlinks[text==\"exception\"]/destination");
```

DiagramItem.RemoveManipulator Method

Removes the specified manipulator from the object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void RemoveManipulator (
    Manipulator manipulator
)
```

Visual Basic Copy Code

```
Protected Sub RemoveManipulator( _
    manipulator As Manipulator _
)
```

Parameters

manipulator
An instance of **Manipulator** -derived class.

Remarks

Invoke this method to remove manipulators previously added using AddManipulator.

DiagramItem.Repaint Method (Rect)

Repaints the specified region of the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void Repaint (
    Rect invalidRect
)
```

Visual Basic Copy Code

```
Protected Sub Repaint( _
    invalidRect As Rect _
)
```

Parameters

invalidRect
The region to repaint.

Remarks

Call this method to repaint a part of the item after changing its appearance attributes.

DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.RestoreProperties Method

Restores the properties of this diagram item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void RestoreProperties (
    DiagramItemProperties props
)
```

Visual Basic Copy Code

```
Protected Overridable Sub RestoreProperties( _
    props As DiagramItemProperties _
)
```

Parameters

props
A DiagramItemProperties -derived object containing a snapshot of the item's properties.

Remarks

This method is invoked by the undo/redo subsystem when undoing or redoing a ChangeItemCmd instance.

See Also

DiagramItem Members

DiagramItem.RestoreState Method

Restores the state of this diagram item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void RestoreState (
    DiagramItemState state
)
```

Visual Basic Copy Code

```
Protected Overridable Sub RestoreState( _
    state As DiagramItemState _
)
```

Parameters

state
A DiagramItemState object.

Remarks

This method is called when an item should be restored to the state it had before user interaction.

DiagramItem.SaveProperties Method

Saves the properties of this diagram item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void SaveProperties (
    DiagramItemProperties props
)
```

Visual Basic Copy Code

```
Protected Overridable Sub SaveProperties( _
    props As DiagramItemProperties _
)
```

Parameters

props
A DiagramItemProperties -derived object where the item's properties should be saved.

Remarks

This method is invoked by the undo/redo subsystem when saving a ChangeItemCmd instance.

See Also

DiagramItem.SaveState Method

Saves the state of this diagram item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void SaveState (
    DiagramItemState state
)
```

Visual Basic Copy Code

```
Protected Overridable Sub SaveState( _
    state As DiagramItemState _
)
```

Parameters

state
A DiagramItemState object.

Remarks

This method is called to save undo information when the users starts modifying an item.

See Also

DiagramItem Members
DiagramItem Class

DiagramItem.SaveToJson Method

Saves the item as a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject instance to contain the serialized data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

Remarks

This method is invoked when an item is being serialized into a JSON-format diagram file.

See Also

DiagramItem.SaveToXml Method

Saves the item content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** the item's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

Remarks

This method is invoked when an item is being serialized into an XML-format diagram file.

DiagramItem.StartCreate Method

Invoked once when the user starts creating a new item interactively.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void StartCreate (
    Point org
)
```

Visual Basic Copy Code

```
Protected Overridable Sub StartCreate( _
    org As Point _
)
```

Parameters

org
Position of the mouse pointer.

Remarks

This method is invoked in response to the **MouseDown** event, just after an item has been instantiated.

See Also

DiagramItem.StartModify Method

Invoked when the user starts modifying this item interactively.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void StartModify (
    Point org,
    AdjustmentHandle handle,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overridable Sub StartModify( _
    org As Point, _
    handle As AdjustmentHandle, _
    ist As InteractionState _
)
```

Parameters

org
Position of the mouse pointer.

handle
The adjustment handle used to modify this item.

ist
An InteractionState object containing more information about the current state of the operation.

See Also

DiagramItem.UpdateCreate Method

Invoked during interactive creation of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void UpdateCreate (
    Point current
)
```

Visual Basic Copy Code

```
Protected Overridable Sub UpdateCreate( _
    current As Point _
)
```

Parameters

current
Position of the mouse pointer.

Remarks

This methods is invoked after each mouse movement in order to update the item's state in accordance with the new mouse position.

See Also

DiagramItem Members

Syntax

C# Copy Code

```
protected virtual void UpdateModify (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overridable Sub UpdateModify( _
    current As Point, _
    ist As InteractionState _
)
```

Parameters

current
Position of the mouse pointer.

ist
An InteractionState object containing more information about the current state of the operation.

Remarks

This methods is invoked after each mouse movement in order to update the item's state in accordance with the new mouse position.

DiagramItem Properties

DiagramItem.Brush Property

Gets or sets the brush used to fill the interior of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush Brush { get; set; }
```

Visual Basic Copy Code

```
Public Property Brush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class. The default value is **null**.

Remarks

This property refers to a brush with which an item is painted. You can assign to it an instance of one of the following classes: HatchBrush, LinearGradientBrush, PathGradientBrush, SolidBrush or TextureBrush, located in the MindFusion.Drawing namespace. When applied to links, the property defines how arrowheads interior is painted.

When set to **null**, the brush object used to paint this item is derived from the item's Style, or from the diagram's Theme.

Example

The following example demonstrates how to create a **LinearGradientBrush** and assign it to the first node of a diagram:

C# Copy Code

```
diagram.Nodes[0].Brush = new MindFusion.Drawing.LinearGradientBrush(
    Color.Yellow, Color.BurlyWood, 20);
```

Visual Basic Copy Code

```
Diagram.Nodes(0).Brush = New MindFusion.Drawing.LinearGradientBrush( _
    Color.Yellow, Color.BurlyWood, 20)
```

DiagramItem.CssClass Property

Gets or sets the CSS class associated with this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string CssClass { get; set; }
```

Visual Basic Copy Code

```
Public Property CssClass As String
```

Property Value

A string containing the CSS class.

Remarks

At this time **CssClass** is considered only by ASP.NET MVC version of the library.

DiagramItem.EffectiveBrush Property

Gets the effective brush of the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush EffectiveBrush { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property EffectiveBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

Remarks

Returns a Brush instance used to paint this item. This value comes from the Brush property if it is set, or is derived from either the item's Style or the current diagram Theme.

See Also

DiagramItem.EffectiveFont Property

Gets the currently effective font of the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Font EffectiveFont { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property EffectiveFont As Font
```

Property Value

A Font instance.

Remarks

This property returns Font if it is not **null**, or a font with the FontFamily, FontSize, FontStyle and FontUnit properties of the item's style.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.EffectivePen Property

Gets the effective pen of the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen EffectivePen { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property EffectivePen As Pen
```

Property Value

An instance of the MindFusion.Drawing.Pen class.

Remarks

Returns a Pen instance used to draw this item's border or segment lines. This value comes from the Pen property if it is set, or is derived from either the item's Style or the current diagram Theme.

See Also

DiagramItem Members
DiagramItem Class

DiagramItem.EffectiveShadowBrush Property

Gets the effective shadow brush of the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush EffectiveShadowBrush { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property EffectiveShadowBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

Remarks

Returns a Brush instance used to paint the item's shadow. This value comes from the ShadowBrush property if it is set, or is derived from either the item's Style or the current diagram Theme.

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.EffectiveTextBrush Property

Gets the effective text brush of the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush EffectiveTextBrush { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property EffectiveTextBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

Remarks

Returns a Brush instance used to paint the item's text. This value comes from the TextBrush property if it is set, or is derived from either the item's Style or the current diagram Theme.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.Font Property

Gets or sets the font used to render the item's text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Font Font { get; set; }
```

Visual Basic Copy Code

```
Public Overridable Property Font As Font
```

Property Value

An instance of the Font class. The default value is **null**.

Remarks

Items derived from DiagramItem use this font to draw their text. Tables for example render their captions and text in cells using this font. Initially the font is set to the value of Font.

When set to **null**, the font object used to render the item's text is derived from the item's Style, or from the diagram's current Theme.

DiagramItem.HyperLink Property

Gets or sets the hyperlink associated with this diagram item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string HyperLink { get; set; }
```

Visual Basic Copy Code

```
Public Property HyperLink As String
```

Property Value

A string value containing the hyperlink URL.

Remarks

This property is used by the CreateImageMap method of the HtmlBuilder class. Its value is assigned to the HREF attribute of the <AREA> tag that corresponds to the diagram item.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.Id Property

Gets or sets user-defined identifier associated with this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Id { get; set; }
```

Visual Basic Copy Code

```
Public Property Id As Object
```

Property Value

An instance of any class derived from **System.Object**.

Remarks

This property contains data that you define and is not used by the component in any way. You can associate with the item any value of a primitive data type, an object from the .NET class library or a custom class.

If the id is a value of primitive type, it is serialized directly by the component along with item containing it when saving / loading the diagram. Reference types are serialized using **System.Xml.Serialization.XmlSerializer** when saving diagrams to XML, or using **System.Text.Json.JsonSerializer** when saving to JSON.

You can implement custom serialization code using .NET XML API by handling SerializeTag and DeserializeTag events, or Json API using JsonSerializeTag and JsonDeserializeTag events

DiagramItem.IgnoreLayout Property

Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool IgnoreLayout { get; set; }
```

Visual Basic Copy Code

```
Public Property IgnoreLayout As Boolean
```

Property Value

true if the item must stay at its place nevertheless an automatic layout is performed; otherwise, **false**. The default is **false**.

Remarks

Enable **IgnoreLayout** to specify that the Arrange method of layout classes should ignore an item. If enabled, the position of an item won't be changed. This property applies to visible nodes. Invisible nodes are always ignored by automatic layout methods.

DiagramItem.LayerIndex Property

Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int LayerIndex { get; set; }
```

Visual Basic Copy Code

```
Public Property LayerIndex As Integer
```

Property Value

An integer value that specifies the index of the layer.

Remarks

This property specifies the index of a Layer instance within the Layers collection of the Diagram.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace
ZIndex Property

DiagramItem.LayoutTraits Property

Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IDictionary LayoutTraits { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property LayoutTraits As IDictionary
```

Property Value

A hashtable of key-value pairs that define layout-specific properties for this item.

Remarks

This property is used by some Layout classes and the DiagramView3D class:

- **FlowLayout** looks for values assigned to keys from the FlowLayoutTraits enumeration.
- SpringLayout looks for values associated with SpringLayoutTraits members.
- TreeLayout looks for values associated with TreeLayoutTraits members.
- SwimlaneLayout looks for values associated with SwimlaneLayoutTraits members.
- LayeredLayout looks for values associated with LayeredLayoutTraits members.
- HierarchicalLayout looks for values associated with HierarchicalLayoutTraits members.

- The **DiagramView3D** class seeks keys values from the View3D enumeration.

DiagramItem.Locked Property

Gets or sets a value indicating whether users are allowed to edit the diagram item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Locked { get; set; }
```

Visual Basic Copy Code

```
Public Property Locked As Boolean
```

Property Value

true to prevent users from editing a diagram element; otherwise, **false**. The default is **false**.

Remarks

A locked item cannot be selected, moved or resized interactively. Additionally, its text cannot be edited in-place.

Locked nodes still can be moved or resized programmatically through the Bounds property and the Move / Resize methods. Positions of locked links' control points can be changed programmatically too - through their ControlPoints collections.

Locked items positions can be changed also by the automatic layout algorithms. To prevent automatic layout methods from changing positions of individual items, set the IgnoreLayout property of DiagramItem to **false**.

DiagramItem.MeasureUnit Property

Returns the diagram measure unit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected MeasureUnit MeasureUnit { get; }
```

Visual Basic Copy Code

```
Protected ReadOnly Property MeasureUnit As MeasureUnit
```

Property Value

An instance of the MeasureUnit class.

DiagramItem.Opacity Property

Gets or sets the opacity of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Opacity { get; set; }
```

Visual Basic Copy Code

```
Public Property Opacity As Double
```

Property Value

A value between 0 and 1 specifying the item's opacity.

Remarks

This value is applied as a factor multiplying the alpha channel of all colors in the item's graphics.

DiagramItem.Parent Property

Gets the diagram that contains this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Diagram Parent { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Parent As Diagram
```

Property Value

A reference to a Diagram instance.

See Also

DiagramItem Members

DiagramItem.Pen Property

Gets or sets the pen used to paint the frame of the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen Pen { get; set; }
```

Visual Basic Copy Code

```
Public Property Pen As Pen
```

Property Value

An instance of the MindFusion.Drawing.Pen class. The default value is **null**.

Remarks

The property refers to a pen, with which the item frame is painted. When applied to links, the property specifies how their segments are painted.

When set to **null**, the pen object used to draw the item borders is derived from the item's Style, or from the diagram's current Theme.

Example

The following example demonstrates how to create a pen with a linear gradient and assign it to the first node of a diagram:

C# Copy Code

```
MindFusion.Drawing.Brush penBrush = new MindFusion.Drawing.LinearGradientBrush(
    Color.Bisque, Color.Blue, 0);
diagram.Nodes[0].Pen = new MindFusion.Drawing.Pen(penBrush);
```

Visual Basic Copy Code

```
Dim penBrush As New MindFusion.Drawing.LinearGradientBrush( _
    Color.Bisque, Color.Blue, 0)
diagram.Nodes(0).Pen = New MindFusion.Drawing.Pen(penBrush)
```

DiagramItem.Printable Property

Gets or sets a value indicating whether to print the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Printable { get; set; }
```

Visual Basic Copy Code

```
Public Property Printable As Boolean
```

Property Value

true to print this item; otherwise, **false**.

DiagramItem.RuntimeIndex Property

For internal use.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int RuntimeIndex { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property RuntimeIndex As Integer
```

Property Value

A sequential integer id for this item.

Remarks

Valid only after calling UpdateRuntimeIndices.

See Also

DiagramItem Members

DiagramItem.Selected Property

Gets or sets a value indicating whether a diagram item is selected.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Selected { get; set; }
```

Visual Basic Copy Code

```
Public Property Selected As Boolean
```

Property Value

true if the item is selected; otherwise, **false**.

Remarks

Use the property to check which items are selected by the user, or to programmatically select items if needed. Selected items adjustment handles are painted using the pen and brush specified through the SelectedItemHandlesStyle property. You can specify if users first have to select items in order to modify them with the **ModificationStart** property.

See Also

DiagramItem.ShadowBrush Property

Gets or sets the brush used to paint the item's shadow.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush ShadowBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property ShadowBrush As Brush
```

Property Value

An instance of a Brush -derived class. The default value is **null**.

Remarks

The shadow of an item has the same shape as the item, but is painted with a different brush and with some offset from the item position. This property specifies the brush used to paint the item's shadow.

When set to **null**, the brush object used to paint the shadow is derived from the item's Style, or from the current diagram Theme.

Example

The following code creates a shadow with fuzzy edges for the newly created node.

C# Copy Code

```
private void diagram_InitializeNode(object sender, NodeEventArgs e)
{
    ColorBlend blend = new ColorBlend(3);
    blend.Colors = new Color[] {
        Color.Transparent,
        Color.FromArgb(128, Color.Black),
        Color.FromArgb(128, Color.Black) };
    blend.Positions = new float[] { 0f, 0.1f, 1f };

    PathGradientBrush brush = new PathGradientBrush(Color.White, Color.White);
    brush.InterpolationColors = blend;

    e.Node.ShadowBrush = brush;
    e.Node.ShadowOffsetY = 2;
    e.Node.ShadowOffsetX = 1.5f;
}
```

DiagramItem.ShadowOffsetX Property

Gets or sets the horizontal offset of the shadow of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ShadowOffsetX { get; set; }
```

Visual Basic Copy Code

```
Public Property ShadowOffsetX As Double
```

Property Value

A **double** value specifying the horizontal offset of this item's shadow. Initialized with the value of ShadowOffsetX.

Remarks

The shadow of an item has the same shape as the item itself, but with a different color and with some offset from the item position. This property specifies the horizontal offset of the shadow.

Diagram.ShadowsStyle Property

DiagramItem.ShadowOffsetY Property

Gets or sets the vertical offset of the shadow of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ShadowOffsetY { get; set; }
```

Visual Basic Copy Code

```
Public Property ShadowOffsetY As Double
```

Property Value

A **double** value specifying the vertical offset of this item's shadow. Initialized with the value of ShadowOffsetY.

Remarks

The shadow of an item has the same shape as the item itself, but with a different color and with some offset from the item position. This property specifies the vertical offset of the shadow.

Diagram.ShadowsStyle Property

DiagramItem.Style Property

Gets or sets the style associated with the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItemStyle Style { get; set; }
```

Visual Basic Copy Code

```
Public Property Style As DiagramItemStyle
```

Property Value

An instance of a DiagramItemStyle-derived class.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.SubordinateGroup Property

Gets a reference to the group of items that are attached to this one.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Group SubordinateGroup { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property SubordinateGroup As Group
```

Property Value

A reference to a Group object or **null** (**Nothing** in Visual Basic) if the item is not master of a group.

Remarks

Diagram items can be grouped hierarchically in such a manner, that if an item is moved all of its subordinated items in the hierarchy move too. The immediate subordinates of an item are contained and represented by a Group instance. **SubordinateGroup** provides access to the group of items that are attached to this one. If there are no attached items, the property returns **null** (**Nothing** in Visual Basic).

DiagramItem.Tag Property

Gets or sets user-defined data associated with this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Tag { get; set; }
```

Visual Basic Copy Code

```
Public Property Tag As Object
```

Property Value

An instance of any class derived from **System.Object**.

Remarks

This property contains data that you define and is not used by the component in any way. You can associate with the item any value of a primitive data type, an object from the .NET class library or a custom class.

If the tag is a value of primitive type, it is serialized directly by the component along with item containing it when saving / loading the diagram. Reference types are serialized using **System.Xml.Serialization.XmlSerializer** when saving diagrams to XML, or using **System.Text.Json.JsonSerializer** when saving to JSON.

You can implement custom serialization code using .NET XML API by handling SerializeTag and DeserializeTag events, or Json API using JsonSerializeTag and JsonDeserializeTag events

DiagramItem.Text Property

Gets or sets the text displayed by this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Text { get; set; }
```

Visual Basic Copy Code

```
Public Property Text As String
```

Property Value

A string containing the item's text. The default value is empty string "".

Remarks

This property defines item's main text content. You can add more text labels by calling the AddLabel method, and customize their position and appearance via the various members of returned ItemLabel object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush TextBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property TextBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class. The default value is **null**.

Remarks

When set to **null**, the brush object used to draw text is derived from either the item's Style or the current diagram Theme.

DiagramItem.ToolTip Property

Gets or sets a short text message displayed when the mouse pointer rests over the diagram element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ToolTip { get; set; }
```

Visual Basic Copy Code

```
Public Property ToolTip As String
```

Property Value

The tool-tip text displayed for this item. The default value is an empty string.

Remarks

When the mouse rests for a while over an item, the item's tool-tip text is displayed. If it is an empty string, the diagram's ToolTip is displayed instead.

The tool-tip text is also used as a value of the ALT attribute of the image map AREA corresponding to the item; see HtmlBuilder for further information.

DiagramItem.TopLevel Property

True if this is a top-level item in the diagram, or false if it is inside a container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool TopLevel { get; }
```

Visual Basic Copy Code

```
Public Overridable ReadOnly Property TopLevel As Boolean
```

Property Value

true if this is a top-level item in the diagram; **false** otherwise.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.Visible Property

Gets or sets a value indicating whether this item is visible.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool Visible { get; set; }
```

Visual Basic Copy Code

```
Public Overridable Property Visible As Boolean
```

Property Value

true if the item is visible; otherwise, **false**.

Remarks

Invisible items are not drawn at all. You might use the property to hide or show items temporarily, or to construct complex group hierarchies in which intermediate helper items are invisible.

Invisible nodes are ignored by automatic layout methods. The position of such nodes won't change when the Arrange method of a layout class is called. Visible items can be ignored too by enabling their IgnoreLayout property.

MindFusion.Diagramming Namespace
Printable Property
Locked Property

DiagramItem.Weight Property

Gets or sets a weight value used in layout and path-finding algorithms.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Weight { get; set; }
```

Visual Basic Copy Code

```
Public Property Weight As Double
```

Property Value

A **double** value specifying the weight of this item. The default value is 1.

Remarks

Currently **Weight** is used in the implementations of:

- The SpringLayout class: the weight of a link connecting two nodes is multiplied by the desired NodeDistance to determine the final distance between the nodes.
- The PathFinder class: an override of the FindShortestPath method uses the **Weight** values of nodes and/or links to find the path with smallest total weight.

DiagramItem.ZIndex Property

Gets or sets the z-order position of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int ZIndex { get; set; }
```

Visual Basic Copy Code

```
Public Property ZIndex As Integer
```

Property Value

An integer value specifying the position of the diagram item within the z-order. The default value is -1.

Remarks

Use this property to arrange items in z-order. Items with lower **ZIndex** appear behind items with higher **ZIndex**.

If the ZIndex property of newly added items is equal to -1, the control will automatically assign consecutively increasing values to it. If you set ZIndex to a value greater then -1 before adding an item, the control will preserve it.

DiagramItemCollection Members

Represents a strongly typed collection of DiagramItem objects.

The following tables list the members exposed by the DiagramItemCollection type.

Public Constructors

	Name	Description
	DiagramItemCollection	Initializes a new instance of the **DiagramItemCollection** class.

Protected Fields

	Name	Description
	InnerList	Gets a **List<T>** containing the list of elements in the collection instance. (Inherited from CollectionBase.)
	itemEventArgs	A ItemEventArgs instance used for passing arguments to the event handlers for the events of this collection. Used to avoid creating many small objects that would burden the garbage collector. (Inherited from ItemCollectionBase.)
	notifyParent	If enabled, the collection raises events to let their containing objects handle the addition or removal of items. (Inherited from ItemCollectionBase.)

Public Properties

	Name	Description
	Count	Gets the number of elements actually contained in the collection. (Inherited from CollectionBase.)
	IsReadOnly	Gets a value indicating whether the collection is read-only. (Inherited from CollectionBase.)
	Item	Gets or sets the element at the specified index. (Inherited from CollectionBase.)

Public Methods

	Name	Description
	Add	Adds the specified diagram item to the collection. (Inherited from ItemCollectionBase.)
	Clear	Removes all diagram items from the collection. (Inherited from ItemCollectionBase.)
	Clone	Creates a shallow copy of this collection.
	Contains	Determines whether an element is in the collection. (Inherited from CollectionBase.)
	CopyTo	Copies the entire collection to a compatible one-dimensional array, starting at the specified index of the target array. (Inherited from CollectionBase.)
	GetAt	Gets the diagram item at the specified position. (Inherited from ItemCollectionBase.)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from CollectionBase.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire collection. (Inherited from CollectionBase.)
	Insert	Inserts the specified diagram item into the collection at the specified position. (Inherited from ItemCollectionBase.)
	Remove	Removes the diagram item from the collection. (Inherited from ItemCollectionBase.)
	RemoveAt	Removes the diagram item from the collection. (Inherited from ItemCollectionBase.)
	Sort	Overloaded. (Inherited from CollectionBase.)

Protected Methods

	Name	Description
	RaiseAdding	Raises the **Adding** event. (Inherited from ItemCollectionBase.)
	RaiseInserting	Raises the **Inserting** event. (Inherited from ItemCollectionBase.)
	RaiseRemoving	Raises the **Removing** event. (Inherited from ItemCollectionBase.)

DiagramItemStyle Members

Represents a reusable set of properties that define the appearance of diagram items.

The following tables list the members exposed by the DiagramItemStyle type.

Protected Constructors

	Name	Description
	DiagramItemStyle	Initializes a new instance of the **DiagramItemStyle** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the interior of the item.

	FontFamily	Gets or sets the font family of the item text.
	FontSize	Gets or sets the font size of the item text.
	FontStyle	Gets or sets the font style of the item text.
	FontUnit	Gets or sets the font unit of the item text.
	ShadowBrush	Gets or sets the brush used to paint the shadow of the item.
	Stroke	Gets or sets the brush used to paint the outline of the item.
	StrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline items.
	StrokeThickness	Gets or sets the thickness of the item's outline, expressed in the current units of measure.
	TextBrush	Gets or sets the brush used to paint texts inside the item.

Public Methods

	Name	Description
	GetProperties	Gets all properties in the style. (Inherited from Style.)
	GetProperty	Returns the property with the specified name, if any. (Inherited from Style.)
S	RegisterType	Associates a type with an alias. (Inherited from Style.)

Protected Methods

	Name	Description
	GetValue	Gets the value of the specified property. (Inherited from Style.)
	IsPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	LoadFromJson	Loads the style content from a JsonObject.
	LoadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from Style.)
	RegisterProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	SaveToJson	Saves the style content into a **JsonObject**.
	SaveToXml	Saves the style content into an XML element. (Inherited from Style.)
	SetValue	Sets the value of the specified property. (Inherited from Style.)
	UnsetValue	Clears the value of the specified property. (Inherited from Style.)

Public Events

	Name	Description
	PropertyChanged	Raised when any of the registered style properties has changed. (Inherited from Style.)

DiagramItemStyle Methods

DiagramItemStyle.LoadFromJson Method

Loads the style content from a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the style's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

DiagramItemStyle Members

DiagramItemStyle.SaveToJson Method

Saves the style content into a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject the style's data should be stored into.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

DiagramLink Class

Represents a link between two diagram nodes.

Syntax

C#

```
public class DiagramLink : DiagramItem, Routable, IAnimationItem
```

Visual Basic

```
Public Class DiagramLink
    Inherits DiagramItem
    Implements Routable, IAnimationItem
```

Remarks

Links between nodes in MvcDiagram diagrams are represented by instances of the **DiagramLink** class. Links connect at most two nodes, which can be accessed via the Origin and Destination properties. If connected to node anchor points, the point indices can be accessed using the OriginAnchor and DestinationAnchor properties. To control whether users are allowed to move link end points, set AllowMoveStart and AllowMoveEnd.

Links are built of smaller parts called segments, which can be straight lines, cascading orthogonal lines, Bézier or spline curves. The type of segments is set through the Shape property. The number of link's segments is specified by the SegmentCount property. Access to control point locations is provided by the ControlPoints collection.

Typically, only the start and end segments of a link are updated when the nodes it connects are moved. Number, orientation and/or position of link segments can change dynamically in various ways depending on the values of AutoRoute and Dynamic properties.

If AutoSnapToNode is enabled, a link automatically aligns its end points to the border of the origin or destination nodes when a user moves the first or last control points. This has a higher priority than aligning to the grid, but a lower priority than aligning to an anchor point.

Links can display distinct arrowhead shapes at their ends. These shapes are configured using the HeadShape and BaseShape properties. The sizes of the base and arrowhead images are specified with the HeadShapeSize and BaseShapeSize properties. Arrowhead shapes can also be displayed at the midpoint of each segment to help distinguish between different links. The type and size of these shapes are controlled by the IntermediateShape and IntermediateShapeSize properties. The outlines of the arrowhead shapes are rendered using the HeadPen pen.

The color of link segments is specified by the Pen property, while the fill color of the base and head shapes is controlled by the BaseBrush and HeadBrush properties. The appearance of link's selection handles can be changed using HandlesStyle.

Links can have associated text, displayed according to the Text, TextBrush and TextStyle properties. The AddLabel method allows multiple labels to be displayed per link. Labels can automatically avoid overlapping nodes or other labels when their AutoArrange property is enabled.

Bounds and Length are informative properties returning respectively link's location and total length.

DiagramNode Class

DiagramLink Members

Represents a link between two diagram nodes.

The following tables list the members exposed by the DiagramLink type.

Public Constructors

	Name	Description
	DiagramLink	Overloaded. Initializes a new instance of the **DiagramLink** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowMoveEnd	Gets or sets a value indicating whether the user is allowed to move the end point of a link.
	AllowMoveStart	Gets or sets a value indicating whether the user is allowed to move the first control point of a link.
	AutoRoute	Gets or sets a value indicating whether a link should avoid nodes by going the shortest path from its origin to its destination without crossing any other nodes.

	AutoSnapToNode	Specifies whether a link end point should automatically snap to the nearest diagram node while the user moves the point's adjustment handle.
	BaseBrush	Gets or sets a brush used to fill the arrowhead drawn at the link base.
	BaseShape	Gets or sets what shape to display at the beginning of a link.
	BaseShapeSize	Gets or sets the size of the **BaseShape** shape.
	Bounds	Gets the size of the rectangle that bounds this link.
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	CascadeOrientation	Gets or sets the orientation of the first segment of a cascading link.
	ControlPoints	Gets a collection of the control points of this link.
	CrossingRadius	Gets or sets the radius length of decorations displayed at intersection points of this link.
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	CustomDraw	Gets or sets the type of custom drawing performed on this link.
	Destination	Gets or sets the destination node of this link.
	DestinationAnchor	Gets or sets the index of the destination anchor point within the AnchorPattern that contains it.
	DestinationConnection	Gets or sets the ConnectionPoint object representing the link connection to its destination node. This allows connecting the link to a constituent part of a node, such as a TableNode row or a TreeViewItem.
	DestinationIndex	Gets or sets the index of link's destination anchor point or table row.
	DrawCrossings	Gets or sets a value indicating whether the points where this link crosses other links should be drawn as arcs or dashes.
	Dynamic	Gets or sets a value indicating whether a link automatically adjusts its end points positions in order to keep pointing to the centers of nodes that it connects.
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectiveHeadPen	Gets the effective head pen of the link.
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	EndPoint	Gets or sets the last control point of a link.
	Font	DiagramItem.Font override.
	HandlesStyle	Gets or sets the appearance of the link's selection handles.
	HeadBrush	Gets or sets a brush used to fill the arrowhead drawn at the link's destination.
	HeadPen	Gets or sets the pen to use when painting arrowheads lines.
	HeadShape	Gets or sets the shape of this link's arrowhead.
	HeadShapeSize	Gets or sets the size of the arrowhead shape.
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)

	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IntermediateBrush	Gets or sets a brush used to fill the arrowheads drawn at the middle of link segments.
	IntermediateShape	Gets or sets the shape displayed at the middle of each segment of the link.
	IntermediateShapeSize	Gets or sets the size of the **IntermediateShape** shape.
	IsConnected	Gets a value indicating whether the link is connected to nodes at both its ends.
	Labels	Returns the list of all labels displayed by this link.
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Length	Gets the length of the link.
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	Origin	Gets or sets the origin node of the link.
	OriginAnchor	Gets or sets the index of the origin anchor point within the **AnchorPattern** that contains it.
	OriginConnection	Gets or sets the **ConnectionPoint** object representing the link connection to its origin node. This allows connecting the link to a constituent part of a node, such as a **TableNode** row or a **TreeViewItem**.
	OriginIndex	Gets or sets the index of link's origin anchor point or table row.
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RetainForm	Gets or sets a value indicating whether a link should maintain its form if the nodes connected with that link are moved around.
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	SegmentCount	Gets or sets the number of segments of this link.
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Shape	Gets or sets the type of link segments and how they are positioned relatively to each other.

	StartPoint	Gets or sets the first control point of a link.
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed over a link.
	TextAlignment	Gets or sets the link's text placement and orientation.
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	TextStyle	Gets or sets the link's text placement and orientation.
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override.
	Visible	DiagramItem.Visible override.
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AddLabel	Overloaded. Adds a label to this link.
	Animate	Animates the item. (Inherited from DiagramItem.)
	Clone	Creates a copy of this link.
	ContainsPoint	Overloaded.
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	Draws the link on the specified IGraphics surface.
S	DrawArrowhead	Draws an arrowhead shape.
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item.
	DrawInRect	
	DrawShadow	Draws the shadow of this link on the specified IGraphics surface.

	GetBounds	Overloaded.
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectiveHeadPen	Returns a Pen object representing the currently effective head pen of the link.
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetLongestHSegment	Returns the index of the longest horizontal segment of this link.
	GetOutlinePoly	DiagramItem.GetOutlinePoly override.
	GetRepaintRect	DiagramItem.GetRepaintRect override.
	GetRotatedBounds	DiagramItem.GetRotatedBounds override.
	GetToolTip	Gets the tooltip that should be displayed for this item at the specified point. (Inherited from DiagramItem.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point.
	HitTestManipulators	Finds the **Manipulator** object located at the specified point. (Inherited from DiagramItem.)
	Intersects	Overloaded.
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point.
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnLoad	DiagramItem.OnLoad override.
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Attaches the link end points to the anchor points defined for the link's origin and destination nodes.
	RemoveLabel	Removes the specified label from this link.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	Route	Routes this link, regardless of whether the link's AutoRoute flag is enabled.
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetOrgAndDest	Sets the origin and destination links of this link.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress.
	UpdateFromPoints	Overloaded. Updates the link's internal state after the link's control points have been changed.
	UpdateIntersections	Aligns the link ends to the contour of the nodes it connects.

	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override.
	AllowModify	DiagramItem.AllowModify override.
	CancelModify	DiagramItem.CancelModify override.
	CompleteCreate	DiagramItem.CompleteCreate override.
	CompleteModify	DiagramItem.CompleteModify override.
	CreateProperties	DiagramItem.CreateProperties override.
	CreateState	DiagramItem.CreateState override.
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the item is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramItem.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	LoadFromJson	Loads the link from a JSON object.
	LoadFromXml	Loads the link content from an XML element.
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	Called when the item is added to a Diagram, either by the user, programmatically or via undo / redo. (Inherited from DiagramItem.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	Called when the Diagram's MeasureUnit changes.
	OnModify	Invoked when the user moves any control point of the link.
	OnRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or via undo / redo. (Inherited from DiagramItem.)
	OnStyleChanged	Diagramitem.OnStyleChanged override.
	OnTextChanged	DiagramItem.OnTextChanged override.

	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnZoomChanged	Called when the diagram's **ZoomFactor** changes. (Inherited from DiagramItem.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override.
	RestoreState	DiagramItem.RestoreState override.
	SaveProperties	DiagramItem.SaveProperties override.
	SaveState	DiagramItem.SaveState override.
	SaveToJson	Saves the link as a JSON object.
	SaveToXml	Saves the link content into an XML element.
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpanded	Sets whether the item is in expanded or collapsed state. (Inherited from DiagramItem.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	StartCreate	DiagramItem.StartCreate override.
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively.
	UpdateCreate	DiagramItem.UpdateCreate override.
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateModify	DiagramItem.UpdateModify override.

DiagramLink Constructor

Initializes a new instance of the DiagramLink class.

Overload List

Name	Description
DiagramLink ()	Initializes a new instance of the DiagramLink class.
DiagramLink (Diagram)	Initializes a new instance of the **DiagramLink** class with default values supplied form the specified Diagram.
DiagramLink (Diagram, DiagramNode, DiagramNode)	Initializes a new instance of the **DiagramLink** class between the specified node with default values supplied form the specified **Diagram**.
DiagramLink (Diagram, DiagramNode, Point)	Initializes a new instance of the **DiagramLink** class between the specified node and the specified point with default values supplied form the specified **Diagram**.

DiagramLink (Diagram, Point, DiagramNode)	Initializes a new instance of the **DiagramLink** class between the specified point and the specified node with default values supplied form the specified **Diagram**.
DiagramLink (Diagram, Point, Point)	Initializes a new instance of the **DiagramLink** class between the specified points with default values supplied form the specified **Diagram**.
DiagramLink (DiagramLink, DiagramNode, DiagramNode)	Initializes a new instance of the **DiagramLink** class between the specified nodes using the specified diagram link as a prototype.

DiagramLink Constructor (Diagram)

Initializes a new instance of the DiagramLink class with default values supplied form the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink (
    Diagram parent
)
```

Visual Basic Copy Code

```
Public New ( _
    parent As Diagram _
)
```

Parameters

parent
The Diagram from which to obtain default values for the link properties.

DiagramLink Constructor (Diagram, DiagramNode, DiagramNode)

Initializes a new instance of the DiagramLink class between the specified node with default values supplied form the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink (
    Diagram parent,
    DiagramNode origin,
    DiagramNode destination
)
```

Visual Basic Copy Code

```
Public New ( _
    parent As Diagram, _
    origin As DiagramNode, _
    destination As DiagramNode _
)
```

Parameters

parent
The Diagram from which to obtain default values for the link properties.

origin
The origin node of the new link.

destination
The destination node of the new link.

DiagramLink Constructor (Diagram, DiagramNode, Point)

Initializes a new instance of the DiagramLink class between the specified node and the specified point with default values supplied form the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink (
    Diagram parent,
    DiagramNode origin,
    Point destination
)
```

Visual Basic Copy Code

```
Public New ( _
    parent As Diagram, _
    origin As DiagramNode, _
    destination As Point _
)
```

Parameters

parent
The Diagram from which to obtain default values for the link properties.

origin
The origin node of the new link.

destination
The destination point of the new link.

DiagramLink Constructor (DiagramLink, DiagramNode, DiagramNode)

Initializes a new instance of the DiagramLink class between the specified nodes using the specified diagram link as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink (
    DiagramLink prototype,
    DiagramNode src,
    DiagramNode dest
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As DiagramLink, _
    src As DiagramNode, _
    dest As DiagramNode _
)
```

Parameters

prototype
The link to use as a prototype. The properties of the new link are initialized from the property values of this link.

src
The origin node of the new link.

dest
The destination node of the new link.

DiagramLink Methods

DiagramLink.AddLabel Method

Adds a label to this link.

Overload List

Name	Description
DiagramLink.AddLabel (LinkLabel)	Adds the specified label to this link.
DiagramLink.AddLabel (String)	Adds a new label to this link.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.AddLabel Method (LinkLabel)

Adds the specified label to this link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void AddLabel (
    LinkLabel label
)
```

Visual Basic Copy Code

```
Public Sub AddLabel( _
    label As LinkLabel _
)
```

Parameters

label
A LinkLabel instance.

See Also

AddLabel Method Overload List
DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.AddLabel Method (String)

Adds a new label to this link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkLabel AddLabel (
    string text
)
```

Visual Basic Copy Code

```
Public Function AddLabel( _
    text As String _
) As LinkLabel
```

Parameters

text
The label's text.

Return Value

A LinkLabel instance.

See Also

AddLabel Method Overload List
DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.AllowCreate Method

DiagramItem.AllowCreate override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override bool AllowCreate (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Function AllowCreate( _
    current As Point, _
    ist As InteractionState _
) As Boolean
```

Parameters

current
The current mouse pointer position.

ist

An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the creation of this link; otherwise, **false**.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.AllowModify Method

DiagramItem.AllowModify override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override bool AllowModify (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Function AllowModify( _
    current As Point, _
    ist As InteractionState _
) As Boolean
```

Parameters

current

The current mouse pointer position.

ist

An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the modification of this link; otherwise, **false**.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.CancelModify Method

DiagramItem.CancelModify override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void CancelModify (
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub CancelModify( _
    ist As InteractionState _
)
```

Parameters

ist

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.Clone Method

Creates a copy of this link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override DiagramItem Clone (
    bool clipboard
)
```

Visual Basic Copy Code

```
Public Overrides Function Clone( _
    clipboard As Boolean _
) As DiagramItem
```

Parameters

clipboard
true if the copy will be stored in the Windows clipboard; otherwise, **false**.

Return Value

An instance of the DiagramItem class.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.CompleteCreate Method

DiagramItem.CompleteCreate override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void CompleteCreate (
    Point end
)
```

Visual Basic Copy Code

```
Protected Overrides Sub CompleteCreate( _
    end As Point _
)
```

Parameters

end
The mouse pointer position.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.CompleteModify Method

DiagramItem.CompleteModify override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void CompleteModify (
    Point end,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub CompleteModify( _
    end As Point, _
    ist As InteractionState _
)
```

Parameters

end
The mouse pointer position.

ist
An InteractionState object containing more information about the current state of the operation.

DiagramLink.ContainsPoint Method

Overload List

Name	Description
DiagramLink.ContainsPoint (Point)	DiagramItem.ContainsPoint override.
DiagramLink.ContainsPoint (Point, Double)	DiagramItem.ContainsPoint override.

See Also

DiagramLink.ContainsPoint Method (Point)

DiagramItem.ContainsPoint override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool ContainsPoint (
    Point point
)
```

Visual Basic Copy Code

```
Public Overrides Function ContainsPoint( _
    point As Point _
) As Boolean
```

Parameters

point
The point to check.

Return Value

true it this link contains the specified point; otherwise, **false**.

See Also

ContainsPoint Method Overload List
DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.ContainsPoint Method (Point, Double)

DiagramItem.ContainsPoint override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool ContainsPoint (
    Point point,
    double threshold
)
```

Visual Basic Copy Code

```
Public Overrides Function ContainsPoint( _
    point As Point, _
    threshold As Double _
) As Boolean
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** specifying the logical coordinates of a diagram point.

threshold
Specifies the size of the area around the item outlines where the point is still considered inside the item.

Return Value

true it this item contains the specified point; otherwise, **false**.

See Also

ContainsPoint Method Overload List
DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.CreateProperties Method

DiagramItem.CreateProperties override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override DiagramItemProperties CreateProperties ()
```

Visual Basic Copy Code

```
Protected Overrides Function CreateProperties () As DiagramItemProperties
```

Return Value

A DiagramItemProperties -derived object containing a snapshot of the item's properties.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.CreateState Method

DiagramItem.CreateState override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override DiagramItemState CreateState ()
```

Visual Basic Copy Code

```
Protected Overrides Function CreateState () As DiagramItemState
```

Return Value

A DiagramLinkState instance.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.Draw Method

Draws the link on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void Draw (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub Draw( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
An IGraphics object where the link should be rendered.

options
Provides options for the drawing operation.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.DrawArrowhead Method

Draws an arrowhead shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static void DrawArrowhead (
    IGraphics graphics,
    Pen pen,
    Brush brush,
    Shape shape,
    Point pivot,
    Point position,
    Point segmentStart,
    double size,
    bool shadow
)
```

Visual Basic Copy Code

```
Public Shared Sub DrawArrowhead( _
    graphics As IGraphics, _
    pen As Pen, _
    brush As Brush, _
    shape As Shape, _
    pivot As Point, _
    position As Point, _
    segmentStart As Point, _
```

```
    size As Double, _
    shadow As Boolean _
)
```

Parameters

graphics
The graphics surface to draw the shape on.

pen
A Pen instance used to draw the shape outline.

brush
A Brush instance used to fill the shape.

shape
A Shape instance that defines the arrowhead geometry.

pivot
A **Microsoft.Maui.Graphics.Point** specified as percentage that corresponds to the arrowhead tip position within the **Shape** geometry.

position
A point on the drawing surface where the arrowhead tip should be located.

segmentStart
A point specifying the arrowhead direction.

size
A double value that specifies the arrowhead size.

shadow
A bool value that specifies if drawing shadow, which causes the passed brush and pen to be used instead of those provided by the shape.

Remarks

This method lets you draw any Shape object at arbitrary position and angle, and is useful for rendering arrowhead shapes when custom-drawing links.

Diagram.DrawLink Event

DiagramLink.DrawHandles Method

DiagramItem.DrawHandles override. Renders the adjustment handles of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawHandles (
    IGraphics graphics,
    HandlesVisualStyle style,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawHandles( _
    graphics As IGraphics, _
    style As HandlesVisualStyle, _
    options As RenderOptions _
)
```

Parameters

graphics

The IGraphics surface on which the handles should be drawn.

style

A HandlesVisualStyle instance containing brush and pen objects that should be used when drawing handles.

options

Provides options for the drawing operation.

HandlesStyle Property

DiagramLink.DrawInRect Method

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawInRect (
    IGraphics graphics,
    RenderOptions options,
    Rect target
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawInRect( _
    graphics As IGraphics, _
    options As RenderOptions, _
    target As Rect _
)
```

Parameters

graphics

options

target

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.DrawShadow Method

Draws the shadow of this link on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawShadow (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawShadow( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
An IGraphics object where the shadow should be rendered.

options
A RenderOptions object specifying options for the drawing operation.

DiagramLink.GetBounds Method

Overload List

Name	Description
DiagramLink.GetBounds ()	DiagramItem.GetBounds override.
DiagramLink.GetBounds (Boolean)	Gets the bounding rectangle of this link.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.GetBounds Method ()

DiagramItem.GetBounds override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Rect GetBounds ()
```

Visual Basic Copy Code

```
Public Overrides Function GetBounds () As Rect
```

Return Value

The rectangle that bounds this link's control points.

See Also

GetBounds Method Overload List
DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.GetBounds Method (Boolean)

Gets the bounding rectangle of this link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect GetBounds (
    bool withStrokeThickness
)
```

Visual Basic Copy Code

```
Public Function GetBounds( _
    withStrokeThickness As Boolean _
) As Rect
```

Parameters

withStrokeThickness
true to consider link's pen width when calculating the bounding rectangle, or **false** otherwise.

Return Value

A **Microsoft.Maui.Graphics.Rect** instance containing the coordinates of link's bounding rectangle.

See Also

GetBounds Method Overload List
DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.GetEffectiveHeadPen Method

Returns a Pen object representing the currently effective head pen of the link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen GetEffectiveHeadPen (
    IGraphics graphics
)
```

Visual Basic Copy Code

```
Public Function GetEffectiveHeadPen( _
    graphics As IGraphics _
) As Pen
```

Parameters

graphics

Return Value

Remarks

This method returns the link's HeadPen if the link's HeadPen is not null, or a pen with the HeadStroke and HeadStrokeThickness properties of the link's style.

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.GetLongestHSegment Method

Returns the index of the longest horizontal segment of this link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int GetLongestHSegment ()
```

Visual Basic Copy Code

```
Public Function GetLongestHSegment () As Integer
```

Return Value

DiagramLink.GetOutlinePoly Method

DiagramItem.GetOutlinePoly override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override PointCollection GetOutlinePoly (
    bool rendering
)
```

Visual Basic Copy Code

```
Public Overrides Function GetOutlinePoly( _
    rendering As Boolean _
) As PointCollection
```

Parameters

rendering

Return Value

See Also

DiagramLink.GetRepaintRect Method

DiagramItem.GetRepaintRect override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Rect GetRepaintRect (
    bool includeConnected
)
```

Visual Basic Copy Code

```
Public Overrides Function GetRepaintRect( _
    includeConnected As Boolean _
) As Rect
```

Parameters

includeConnected
true if related items should be considered too; otherwise, **false**.

Return Value

See Also

DiagramLink Members

DiagramLink.HitTestHandle Method

DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override AdjustmentHandle HitTestHandle (
    Point point,
    double distance
)
```

Visual Basic Copy Code

```
Public Overrides Function HitTestHandle( _
    point As Point, _
    distance As Double _
) As AdjustmentHandle
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** value specifying where to look for a selection handle.

distance

Return Value

A LinkAdjustmentHandle instance if there is a control point at the specified location, otherwise **null**.

DiagramLink.Intersects Method

Overload List

Name	Description
DiagramLink.Intersects (DiagramLink)	Checks whether this link intersects with the specified link.
DiagramLink.Intersects (DiagramNode)	Checks whether the link contour intersects with the outline of the specified node.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.Intersects Method (DiagramLink)

Checks whether this link intersects with the specified link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Intersects (
    DiagramLink link
)
```

Visual Basic Copy Code

```
Public Function Intersects( _
    link As DiagramLink _
) As Boolean
```

Parameters

link

Return Value

See Also

Intersects Method Overload List
DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.Intersects Method (DiagramNode)

Checks whether the link contour intersects with the outline of the specified node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Intersects (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public Function Intersects( _
    node As DiagramNode _
) As Boolean
```

Parameters

node
A DiagramNode object for which to determine whether the link intersects it.

Return Value

true if the link intersects the node; otherwise, **false**.

See Also

Intersects Method Overload List
DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.LabelFromPoint Method

Returns the label whose layout rectangle contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override ItemLabel LabelFromPoint (
    Point point
)
```

Visual Basic Copy Code

```
Public Overrides Function LabelFromPoint( _
    point As Point _
) As ItemLabel
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** instance.

Return Value

The LinkLabel that contains the specified point.

See Also

DiagramLink.LoadFromJson Method

Loads the link from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the link's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.LoadFromXml Method

Loads the link content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** containing the item's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.OnLoad Method

DiagramItem.OnLoad override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void OnLoad ()
```

Visual Basic Copy Code

```
Public Overrides Sub OnLoad ()
```

DiagramLink.OnMeasureUnitChanged Method

Called when the Diagram's MeasureUnit changes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void OnMeasureUnitChanged ()
```

Visual Basic Copy Code

```
Protected Overrides Sub OnMeasureUnitChanged ()
```

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.OnModify Method

Invoked when the user moves any control point of the link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnModify (
    Point mousePosition,
    int adjustmentHandle
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnModify( _
    mousePosition As Point, _
    adjustmentHandle As Integer _
)
```

Parameters

mousePosition
Specifies the mouse position.

adjustmentHandle
Specifies the adjustment handle used to modify the link.

Remarks

Implement this method in a custom link class if you need to detect modifications done by the user without handling events of the Diagram class.

DiagramLink.RemoveLabel Method

Removes the specified label from this link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RemoveLabel (
    LinkLabel label
)
```

Visual Basic Copy Code

```
Public Sub RemoveLabel( _
    label As LinkLabel _
)
```

Parameters

label
A LinkLabel instance.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.RestoreProperties Method

DiagramItem.RestoreProperties override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void RestoreProperties (
    DiagramItemProperties props
)
```

Visual Basic Copy Code

```
Protected Overrides Sub RestoreProperties( _
    props As DiagramItemProperties _
)
```

Parameters

props
A DiagramItemProperties -derived object containing a snapshot of the item's properties.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.RestoreState Method

DiagramItem.RestoreState override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void RestoreState (
    DiagramItemState state
)
```

Visual Basic Copy Code

```
Protected Overrides Sub RestoreState( _
    state As DiagramItemState _
)
```

Parameters

state
A DiagramLinkState instance.

Remarks

This method is called when a link should be restored to the state it had before user interaction.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.Route Method

Routes this link, regardless of whether the link's AutoRoute flag is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Route ()
```

Visual Basic Copy Code

```
Public Function Route () As Boolean
```

Return Value

true is a route has been successfully found; otherwise, **false**.

Remarks

Routing may fail if there is a large background node whose **Obstacle** property is enabled, or if the value of RoutingOptions.GridSize is too big for the average distance between adjacent nodes in the diagram.

MindFusion.Diagramming Namespace

DiagramLink.SaveState Method

DiagramItem.SaveState override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveState (
    DiagramItemState state
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveState( _
    state As DiagramItemState _
)
```

Parameters

state
A DiagramLinkState instance.

Remarks

This method is called to save undo information when the users starts modifying a link.

See Also

DiagramLink Members

MindFusion.Diagramming Namespace

DiagramLink.SaveToJson Method

Saves the link as a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject instance to contain the serialized data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.SaveToXml Method

Saves the link content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** the link's data should be stored into.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

DiagramLink.StartCreate Method

DiagramItem.StartCreate override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void StartCreate (
    Point org
)
```

Visual Basic Copy Code

```
Protected Overrides Sub StartCreate( _
    org As Point _
)
```

Parameters

org
Position of the mouse pointer.

DiagramLink.StartModify Method

DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void StartModify (
    Point org,
    AdjustmentHandle handle,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub StartModify( _
    org As Point, _
    handle As AdjustmentHandle, _
    ist As InteractionState _
)
```

Parameters

org
Position of the mouse pointer.

handle
The adjustment handle used to modify this link.

ist
An InteractionState object containing more information about the current state of the operation.

DiagramLink.UpdateAnimation Method

Invoked by running animations to update an item according to current animation progress.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void UpdateAnimation (
    Animation animation,
    double animationDelta
)
```

Visual Basic Copy Code

```
Public Overridable Sub UpdateAnimation( _
    animation As Animation, _
    animationDelta As Double _
)
```

Parameters

animation
The Animation object used to animate this link.

animationDelta

A value representing the current animation progress

DiagramLink.UpdateCreate Method

DiagramItem.UpdateCreate override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void UpdateCreate (
    Point current
)
```

Visual Basic Copy Code

```
Protected Overrides Sub UpdateCreate( _
    current As Point _
)
```

Parameters

current
Position of the mouse pointer.

DiagramLink.UpdateFromPoints Method (Boolean)

Updates the link's internal state after the link's control points have been changed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void UpdateFromPoints (
    bool updateGroups
)
```

Visual Basic Copy Code

```
Public Sub UpdateFromPoints( _
    updateGroups As Boolean _
)
```

Parameters

updateGroups
true to update the positions of nodes attached to the link; otherwise, **false**.

Syntax

C# Copy Code

```
protected override void UpdateModify (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub UpdateModify( _
    current As Point, _
    ist As InteractionState _
)
```

Parameters

current
Position of the mouse pointer.

ist
An InteractionState object containing more information about the current state of the operation.

DiagramLink Properties

DiagramLink.AllowMoveEnd Property

Gets or sets a value indicating whether the user is allowed to move the end point of a link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowMoveEnd { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowMoveEnd As Boolean
```

Property Value

true to enable users to move the end point of the link; otherwise, **false**. Initialized with the value of LinkEndsMovable.

Remarks

Set the property to **false** to prevent the link destination to be changed interactively. Alternatively, you might handle the LinkModifying event to implement selective validation of attaching a link to different diagram nodes.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace
AllowMoveStart Property
Diagram.LinkEndsMovable Property

DiagramLink.AllowMoveStart Property

Gets or sets a value indicating whether the user is allowed to move the first control point of a link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowMoveStart { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowMoveStart As Boolean
```

Property Value

true to enable users to move the start point of the link; otherwise **false**. Initialized with the value of LinkEndsMovable.

Remarks

Set the property to **false** to prevent the link origin to be changed interactively. Alternatively, you might handle the LinkModifying event to implement selective validation of attaching a link to different diagram nodes.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

Diagram.LinkEndsMovable Property

DiagramLink.AutoRoute Property

Gets or sets a value indicating whether a link should avoid nodes by going the shortest path from its origin to its destination without crossing any other nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AutoRoute { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoRoute As Boolean
```

Property Value

true to route this link; otherwise, **false**. Initialized with the value of RouteLinks.

Remarks

If **AutoRoute** is enabled, a link automatically finds the shortest possible path between its origin and destination that doesn't intersect **Obstacle** nodes. The number and orientation of the link's segments are updated when the nodes it links are moved around. The positions of end points of a routed link are not changed, unless the link is also set to Dynamic.

It is best to use **AutoRoute** with links of the Cascading style. Note that automatic routing overrides the RetainForm behavior.

Performance note

Links whose **AutoRoute** property is enabled are re-routed if they intersect with newly created nodes. Thus when constructing a large diagram programmatically, each link might be re-routed many times, once for each newly added node whose location arguments collide with link's bounding rectangle. That might slow down diagram creation a lot. To avoid it, first create all nodes, and afterwards the link; that requires a single calculation for each link's route.

See Also

DiagramLink Members

Dynamic Property
SegmentCount Property
LinkRouter Property

DiagramLink.AutoSnapToNode Property

Specifies whether a link end point should automatically snap to the nearest diagram node while the user moves the point's adjustment handle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AutoSnapToNode { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoSnapToNode As Boolean
```

Property Value

true to snap links to nearest node; otherwise, **false**. Initialized with the value of AutoSnapLinks.

Remarks

Only nodes at a distance smaller than AutoSnapDistance are considered. A link does not snap to its current origin or destination nodes if that would create a self-loop. If there is an **AnchorPattern** assigned to a node, the link snaps to an anchor point instead of a border point.

DiagramLink.BaseBrush Property

Gets or sets a brush used to fill the arrowhead drawn at the link base.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush BaseBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property BaseBrush As Brush
```

Property Value

An instance of a Brush -derived class. The default value is **null** (**Nothing** in Visual Basic).

Remarks

If this property is not set, the arrowhead is filled using the link's Brush.

BaseShape Property

DiagramLink.BaseShape Property

Gets or sets what shape to display at the beginning of a link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape BaseShape { get; set; }
```

Visual Basic Copy Code

```
Public Property BaseShape As Shape
```

Property Value

A Shape instance that represents an arrowhead shape. Initialized with the value of LinkBaseShape.

Remarks

The property specifies the shape that is displayed at the beginning of a link, that is, the point where it is connected with its Origin node. This shape is rotated simultaneously with the first segment of the link so that it follows the overall link direction.

The ArrowHeads class exposes several predefined shapes as static properties.

See Also

HeadShape Property
IntermediateShape Property
BaseBrush Property
BaseShapeSize Property

DiagramLink.BaseShapeSize Property

Gets or sets the size of the BaseShape shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double BaseShapeSize { get; set; }
```

Visual Basic Copy Code

```
Public Property BaseShapeSize As Double
```

Property Value

A **double** value that specifies the shape size. Initialized with the value of LinkBaseShapeSize.

Remarks

The property specifies how big is the shape that is displayed at the origin of a link.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.Bounds Property

Gets the size of the rectangle that bounds this link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect Bounds { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Bounds As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** that represents the bounding rectangle.

Remarks

Use the property to get the smallest rectangle that bounds all link points.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.CascadeOrientation Property

Gets or sets the orientation of the first segment of a cascading link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Orientation CascadeOrientation { get; set; }
```

Visual Basic Copy Code

```
Public Property CascadeOrientation As Orientation
```

Property Value

A member of the Orientation enumeration.

Remarks

Use this property to specify the orientation of the first segment of a link whose Shape is set to Cascading. See Orientation for more details. The orientation of the first segment defines the orientation of all other segments in the cascade, because each next segment changes its orientation alternately to the previous one.

If the property is set to Auto, users may change the orientation of a cascading link interactively. That can be done by dragging the control point next to the first or last one to its opposite corner in the rectangle defined by its two adjacent segments. Depending on the value of AllowSplitLinks, the link orientation is changed by either inserting a new segment and changing only the orientation of the first or last segment (**AllowSplitLinks** is **true**), or by changing the orientation of all segments of the link (**AllowSplitLinks** is **false**).

Shape Property

DiagramLink.ControlPoints Property

Gets a collection of the control points of this link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PointCollection ControlPoints { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ControlPoints As PointCollection
```

Property Value

A collection of control points that specify the link's shape.

Remarks

You can specify new positions of a link's points through that property. The number of points in the collection depends on the Shape and SegmentCount of the link. Links made of Bézier-splines has four control points for each segment. Links of the other styles have two control points per segment. Adjacent segments share a common control point. Check the Count property of the collection to get the number of points. After setting new positions of control points you must call the UpdateFromPoints method.

Example

The following example demonstrates how to programmatically setup the control points of a link:

C# Copy Code

```
DiagramLink link;
Point cpt;

link = Diagram.Links[0];

// Move the second and the third points
cpt = link.ControlPoints[1];
link.ControlPoints[1] = new Point(cpt.X + 5, cpt.Y);
link.ControlPoints[2] = new Point(22.2, 33.3);

// Update state and redraw
link.UpdateFromPoints();
```

DiagramLink.CrossingRadius Property

Gets or sets the radius length of decorations displayed at intersection points of this link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double CrossingRadius { get; set; }
```

Visual Basic Copy Code

```
Public Property CrossingRadius As Double
```

Property Value

A **double** value specifying the radius of arcs or cuts displayed at the intersection points of this link. The default is 0.

Remarks

If this property is set to 0, the control uses the value of the Diagram.CrossingRadius property.

See Also

DiagramLink Members
DiagramLink Class

DiagramLink.CustomDraw Property

Gets or sets the type of custom drawing performed on this link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CustomDraw CustomDraw { get; set; }
```

Visual Basic Copy Code

```
Public Property CustomDraw As CustomDraw
```

Property Value

A member of the CustomDraw enumeration. Initialized with the value of LinkCustomDraw.

Remarks

This property allows invoking custom painting code for a link. That code must execute in response to the DrawLink event. There are several modes of custom painting, allowing the custom code to paint the link entirely, or do that in addition to what MvcDiagram paints by default. The following CustomDraw members can be assigned to this property to specify the custom painting mode:

Member name	Description
None	Do not perform custom drawing, let all painting be done by MvcDiagram.
Additional	The custom painting code executes after the link segments and arrowhead shapes are painted by MvcDiagram, but before text is rendered.
Full	The component does not do any standard drawing, the entire painting of the link is done by the application.
ShadowOnly	Only the shadow of the link is painted by custom code, the link itself is drawn by the component.

DiagramLink.Destination Property

Gets or sets the destination node of this link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNode Destination { get; set; }
```

Visual Basic Copy Code

```
Public Property Destination As DiagramNode
```

Property Value

A reference to the destination DiagramNode of the link.

Remarks

The link's destination can be changed programmatically with this property. If any of the connected nodes has an **AnchorPattern** defined, links ends are placed at the nearest anchor points of the two nodes. If AutoRoute is enabled, the link is routed when changing its origin or destination.

Origin Property

DestinationAnchor Property
Query Method

DiagramLink.DestinationAnchor Property

Gets or sets the index of the destination anchor point within the AnchorPattern that contains it.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int DestinationAnchor { get; set; }
```

Visual Basic Copy Code

```
Public Property DestinationAnchor As Integer
```

Property Value

An integer index of an anchor point within the AnchorPattern containing it.

Remarks

Specifies the index of an anchor point contained within the Destination anchor pattern. The link is docked and stay connected to that point if the node is moved or resized.

See Also

Diagram.DestinationAnchorChanged Event

DiagramLink.DestinationConnection Property

Gets or sets the ConnectionPoint object representing the link connection to its destination node. This allows connecting the link to a constituent part of a node, such as a TableNode row or a TreeViewItem.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ConnectionPoint DestinationConnection { get; set; }
```

Visual Basic Copy Code

```
Public Property DestinationConnection As ConnectionPoint
```

Property Value

An instance of ConnectionPoint or a derived class.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace
Destination Property

DiagramLink.DestinationIndex Property

Gets or sets the index of link's destination anchor point or table row.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int DestinationIndex { get; set; }
```

Visual Basic Copy Code

```
Public Property DestinationIndex As Integer
```

Property Value

An integer value specifying the index of table's row or the index of an anchor point within its containing AnchorPattern.

Remarks

If a link's destination is a shape node, this property lets you get or set the index of an anchor point at which the link docks to the node. If there is no AnchorPattern defined for the destination node, the property returns -1. If the link is connected to a table, the property returns or changes the related row of that table.

See Also

DiagramLink Members

MindFusion.Diagramming Namespace
OriginIndex Property

DiagramLink.DrawCrossings Property

Gets or sets a value indicating whether the points where this link crosses other links should be drawn as arcs or dashes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool DrawCrossings { get; set; }
```

Visual Basic Copy Code

```
Public Property DrawCrossings As Boolean
```

Property Value

true if crossing points should be drawn as arcs or dashes; otherwise, **false**. The default is **true**.

Remarks

The LinkCrossings property of the Diagram class specifies what shapes are drawn at link crossing points. Individual links cannot display shapes different from the ones drawn for other links, but the crossing points shapes can be shown or hidden for a link through this property.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace
CrossingRadius Property

DiagramLink.Dynamic Property

Gets or sets a value indicating whether a link automatically adjusts its end points positions in order to keep pointing to the centers of nodes that it connects.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Dynamic { get; set; }
```

Visual Basic Copy Code

```
Public Property Dynamic As Boolean
```

Property Value

true to make the link automatically adjust its end points; otherwise, **false**. Initialized with the value of DynamicLinks.

Remarks

Use the property to specify whether a link automatically repositions its end segments, so they keep pointing to the centers of nodes connected by that link. If enabled, moving a connected node recalculates the position of link's end point, placing it at appropriate location of the node outline. If the node has anchor points assigned to it, the end point is attached to one of them. End points are realigned also when moving the points next to them.

Gets or sets the last control point of a link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point EndPoint { get; set; }
```

Visual Basic Copy Code

```
Public Property EndPoint As Point
```

Property Value

A **Microsoft.Maui.Graphics.Point** object.

Remarks

This property is a shortcut for getting or setting the last element of ControlPoints.

DiagramLink.HandlesStyle Property

Gets or sets the appearance of the link's selection handles.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HandlesStyle HandlesStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property HandlesStyle As HandlesStyle
```

Property Value

A member of the HandlesStyle enumeration. Initialized with the value of LinkHandlesStyle.

Remarks

Specifies how link's selection status is indicated visually. You can choose between the following styles:

Member name	Description
SquareHandles	The selection is indicated by drawing square handles at the position of each control point.
DashFrame	The selection is indicated by drawing dashed line segments along the link's segments. In addition, there are square selection handles drawn at the location of each control point of the link.
Custom	MvcDiagram raises the DrawAdjustmentHandles events to let your application perform custom drawing of link's selection handles.

DiagramLink.HeadBrush Property

Gets or sets a brush used to fill the arrowhead drawn at the link's destination.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush HeadBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property HeadBrush As Brush
```

Property Value

An instance of a Brush -derived class. The default value is **null** (**Nothing** in Visual Basic).

Remarks

If this property is not set, the arrowhead is filled using the link's Brush.

DiagramLink.HeadShape Property

Gets or sets the shape of this link's arrowhead.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape HeadShape { get; set; }
```

Visual Basic Copy Code

```
Public Property HeadShape As Shape
```

Property Value

A Shape instance that represents an arrowhead shape. Initialized with the value of LinkHeadShape.

Remarks

The property specifies what shape is displayed as an arrowhead. This shape is rotated simultaneously with the last segment of the link so that it follows the overall link direction.

The ArrowHeads class exposes several predefined shapes as static properties.

Syntax

C# Copy Code

```
public Shape IntermediateShape { get; set; }
```

Visual Basic Copy Code

```
Public Property IntermediateShape As Shape
```

Property Value

A Shape instance that represents an arrowhead shape. Initialized with the value of LinkIntermediateShape.

Remarks

The property specifies what shape to display at the middle of each segment of a link. This could help users to see more easily the direction of long links. The ArrowHeads class exposes several predefined shapes as static properties.

DiagramLink.Length Property

Gets the length of the link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Length { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Length As Double
```

Property Value

A **double** value that represents the total length of the link, sum of the lengths of all its segments.

Remarks

If the link's Shape is set to Bezier, an approximate length is calculated. In that case, the approximate value is almost always slightly smaller than the real length of Bézier segments.

Destination Property
OriginAnchor Property
Query Method

DiagramLink.OriginAnchor Property

Gets or sets the index of the origin anchor point within the AnchorPattern that contains it.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int OriginAnchor { get; set; }
```

Visual Basic Copy Code

```
Public Property OriginAnchor As Integer
```

Property Value

An integer index of an anchor point within its the AnchorPattern containing it.

Remarks

Specifies the index of an anchor point contained within the Origin anchor pattern. The link is docked and stay connected to that point if the node is moved or resized.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace
DestinationAnchor Property
Diagram.OriginAnchorChanged Event

DiagramLink.OriginConnection Property

Gets or sets the ConnectionPoint object representing the link connection to its origin node. This allows connecting the link to a constituent part of a node, such as a TableNode row or a TreeViewItem.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ConnectionPoint OriginConnection { get; set; }
```

Visual Basic Copy Code

```
Public Property OriginConnection As ConnectionPoint
```

Property Value

An instance of ConnectionPoint or derived class.

Origin Property

DiagramLink.OriginIndex Property

Gets or sets the index of link's origin anchor point or table row.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int OriginIndex { get; set; }
```

Visual Basic Copy Code

```
Public Property OriginIndex As Integer
```

Property Value

An integer value specifying the index of table's row or index of an anchor point within its containing AnchorPattern.

Remarks

If a link's origin is a shape node, this property lets you get or set the index of an anchor point at which the link docks to the node. If there is no AnchorPattern defined for the origin node, the property returns -1. If the link is connected to a table, the property returns or changes the related row of that table.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace
DestinationIndex Property

DiagramLink.RetainForm Property

Gets or sets a value indicating whether a link should maintain its form if the nodes connected with that link are moved around.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RetainForm { get; set; }
```

Visual Basic Copy Code

```
Public Property RetainForm As Boolean
```

Property Value

true to retain the form of this link; otherwise, **false**. Initialized with the value of LinksRetainForm.

Remarks

RetainForm is useful for links that have more than two control points. If the nodes that a link connects are moved around, usually only the segments at the ends of that link are updated, so that they stay connected to their respective nodes. In that case all intermediate control points stay where they are. However, if **RetainForm** is enabled, all control points will move simultaneously in a way they preserve their relative position to each other, and thus preserving the overall form of the link.

AutoRoute Property
Dynamic Property

DiagramLink.SegmentCount Property

Gets or sets the number of segments of this link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int SegmentCount { get; set; }
```

Visual Basic Copy Code

```
Public Property SegmentCount As Integer
```

Property Value

An integer value specifying how many segments the link consists of. Initialized with the value of LinkSegments.

Remarks

Use this property to make a link more indented when necessary. Its value, together with Shape, specifies the number of points in the link's ControlPoints collection. You can let users insert new link segments interactively by setting AllowSplitLinks to **true**.

DiagramLink Class
MindFusion.Diagramming Namespace
ControlPoints Property
Length Property

DiagramLink.Shape Property

Gets or sets the type of link segments and how they are positioned relatively to each other.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkShape Shape { get; set; }
```

Visual Basic Copy Code

```
Public Property Shape As LinkShape
```

Property Value

A member of the LinkShape enumeration. Initialized with the value of LinkShape.

Remarks

This property specifies whether the segments of a link are straight lines or curves. Its value together with SegmentCount also specifies the number of ControlPoints. Each Bezier segment is defined by four control points, where the second and third ones do not lie on the segment but specify its curvature. All other **LinkShape** types are defined by two control points per segment. Adjacent segments share a control point, and when moved it will modify both of them.

Cascading links consist of straight lines whose orientation is constrained to strictly horizontal or vertical, where adjacent segments are orthogonal to each other. The orientation of the first segment of a cascading link depends on the value of CascadeOrientation. If that property is set to Auto, users may change the cascade orientation interactively.

Each control point of a **Spline** or **Polyline** link can be moved freely, independently from each other, and the link will pass through all control points drawn respectively as an interpolating spline curve or as a polygonal chain.

AutoRoute Property

DiagramLink.StartPoint Property

Gets or sets the first control point of a link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point StartPoint { get; set; }
```

Visual Basic Copy Code

```
Public Property StartPoint As Point
```

Property Value

A **Microsoft.Maui.Graphics.Point** object.

Remarks

This property is a shortcut for getting or setting ControlPoints[0].

DiagramLink.Text Property

Gets or sets the text displayed over a link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Text { get; set; }
```

Visual Basic Copy Code

```
Public Property Text As String
```

Property Value

A string containing the text. Initialized with the value of LinkText.

Remarks

Gets or sets the text that should be drawn over a link. Use this to provide to end-users a short description of the relation's purpose. The text appearance can be customized through the TextBrush and TextStyle properties.

Version 6 of the control adds the capability to display multiple labels per link via the LinkLabel class. Labels can automatically avoid overlapping nodes or other labels when their AutoArrange property is set.

DiagramLink.TextAlignment Property

Gets or sets the link's text placement and orientation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public StringAlignment TextAlignment { get; set; }
```

Visual Basic Copy Code

```
Public Property TextAlignment As StringAlignment
```

Property Value

A member of the **StringAlignment** enumeration. The default value is **Center**.

Remarks

Currently this property is considered only when TextStyle is set to OverLongestSegment.

DiagramLinkCollection Members

Represents a strongly typed collection of DiagramLink objects.

The following tables list the members exposed by the DiagramLinkCollection type.

Public Constructors

	Name	Description
	DiagramLinkCollection	Initializes a new instance of the **DiagramLinkCollection** class.

Protected Fields

	Name	Description
	InnerList	Gets a **List<T>** containing the list of elements in the collection instance. (Inherited from CollectionBase.)
	itemEventArgs	A ItemEventArgs instance used for passing arguments to the event handlers for the events of this collection. Used to avoid creating many small objects that would burden the garbage collector. (Inherited from ItemCollectionBase.)
	notifyParent	If enabled, the collection raises events to let their containing objects handle the addition or removal of items. (Inherited from ItemCollectionBase.)

Public Properties

	Name	Description
	Count	Gets the number of elements actually contained in the collection. (Inherited from CollectionBase.)
	IsReadOnly	Gets a value indicating whether the collection is read-only. (Inherited from CollectionBase.)
	Item	Gets or sets the element at the specified index. (Inherited from CollectionBase.)

Public Methods

	Name	Description
	Add	Adds the specified diagram item to the collection. (Inherited from ItemCollectionBase.)
	Clear	Removes all diagram items from the collection. (Inherited from ItemCollectionBase.)
	Clone	Creates a shallow copy of this collection.
	Contains	Determines whether an element is in the collection. (Inherited from CollectionBase.)
	CopyTo	Copies the entire collection to a compatible one-dimensional array, starting at the specified index of the target array. (Inherited from CollectionBase.)
	GetAt	Gets the diagram item at the specified position. (Inherited from ItemCollectionBase.)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from CollectionBase.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire collection. (Inherited from CollectionBase.)
	Insert	Inserts the specified diagram item into the collection at the specified position. (Inherited from ItemCollectionBase.)
	Remove	Removes the diagram item from the collection. (Inherited from ItemCollectionBase.)

	RemoveAt	Removes the diagram item from the collection. (Inherited from ItemCollectionBase.)
	Sort	Overloaded. (Inherited from CollectionBase.)

Protected Methods

	Name	Description
	RaiseAdding	Raises the **Adding** event. (Inherited from ItemCollectionBase.)
	RaiseInserting	Raises the **Inserting** event. (Inherited from ItemCollectionBase.)
	RaiseRemoving	Raises the **Removing** event. (Inherited from ItemCollectionBase.)

DiagramLinkProperties Class

Stores the values of DiagramLink properties during undo / redo operations.

Syntax

C# Copy Code

```
public class DiagramLinkProperties : DiagramItemProperties
```

Visual Basic Copy Code

```
Public Class DiagramLinkProperties
    Inherits DiagramItemProperties
```

Remarks

If you need to implement undo support for the additional properties defined by a class derived from DiagramLink, do so by deriving from **DiagramLinkProperties** and overriding the SaveProperties, RestoreProperties and CreateProperties methods of **DiagramLink**.

Inheritance Hierarchy

DiagramLinkStyle Members

Represents a reusable set of properties that define the appearance of diagram links.

The following tables list the members exposed by the DiagramLinkStyle type.

Public Constructors

	Name	Description
	DiagramLinkStyle	Initializes a new instance of the **DiagramLinkStyle** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	FontFamily	Gets or sets the font family of the item text. (Inherited from DiagramItemStyle.)
	FontSize	Gets or sets the font size of the item text. (Inherited from DiagramItemStyle.)
	FontStyle	Gets or sets the font style of the item text. (Inherited from DiagramItemStyle.)
	FontUnit	Gets or sets the font unit of the item text. (Inherited from DiagramItemStyle.)
	HeadStroke	Gets or sets the brush used to paint the arrowhead outlines of this brush.
	HeadStrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline arrowheads.
	HeadStrokeThickness	Gets or sets the outline thickness of the arrowheads of this brush, expressed in the current units of measure.
	ShadowBrush	Gets or sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	Stroke	Gets or sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	StrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline items. (Inherited from DiagramItemStyle.)
	StrokeThickness	Gets or sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)

Public Methods

	Name	Description
	GetProperties	Gets all properties in the style. (Inherited from Style.)
	GetProperty	Returns the property with the specified name, if any. (Inherited from Style.)
S	RegisterType	Associates a type with an alias. (Inherited from Style.)

Protected Methods

	Name	Description
	GetValue	Gets the value of the specified property. (Inherited from Style.)
	IsPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	LoadFromJson	Loads the style content from a JsonObject.
	LoadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from Style.)
	RegisterProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	SaveToJson	Saves the style content into a JsonObject.

	SaveToXml	Saves the style content into an XML element. (Inherited from Style.)
	SetValue	Sets the value of the specified property. (Inherited from Style.)
	UnsetValue	Clears the value of the specified property. (Inherited from Style.)

Public Events

	Name	Description
	PropertyChanged	Raised when any of the registered style properties has changed. (Inherited from Style.)

DiagramLinkStyle Methods

DiagramLinkStyle.LoadFromJson Method

Loads the style content from a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
```

```
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the style's data.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

DiagramLinkStyle Members

MindFusion.Diagramming Namespace

DiagramLinkStyle.SaveToJson Method

Saves the style content into a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject the style's data should be stored into.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

DiagramLinkStyle Properties

DiagramLinkStyle.HeadStroke Property

Gets or sets the brush used to paint the arrowhead outlines of this brush.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush HeadStroke { get; set; }
```

Visual Basic Copy Code

```
Public Property HeadStroke As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

DiagramLinkStyle.HeadStrokeThickness Property

Gets or sets the outline thickness of the arrowheads of this brush, expressed in the current units of measure.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double HeadStrokeThickness { get; set; }
```

Visual Basic Copy Code

```
Public Property HeadStrokeThickness As Double
```

Property Value

A double value.

See Also

DiagramLinkStyle Events

DiagramNode Class

Represents a diagram node.

Syntax

C# Copy Code

```
public abstract class DiagramNode : DiagramItem, IAnimationItem
```

Visual Basic Copy Code

```
Public MustInherit Class DiagramNode
    Inherits DiagramItem
    Implements IAnimationItem
```

Remarks

DiagramNode objects can represent graph vertices, nodes in organizational or flow diagrams, entities in ER diagrams, and so on. **DiagramNode** is an abstract class. You cannot instantiate it directly, but instead use objects from specific classes such as ShapeNode, TableNode, ContainerNode, CompositeNode. You can also create your own node class by deriving from **DiagramNode** or its descendants.

Use the **Bounds** property to get or change the location and size of a node. To move a node without changing its size, call the Move method. To change only the size of a node, invoke the Resize method.

The main textual content of a node is set using its Text property and can be customized by setting Font and TextFormat. Supplementary labels can be created by calling AddLabel.

Constraints upon how users are allowed to modify a node are set through the **Constraints** and **EnabledHandles** properties. The former specifies constraints on move direction and node size. The latter enables or disables specific manipulation handles of a node.

Relations between nodes are indicated by connecting the nodes with DiagramLink instances. Links are considered directed graph edges, so each node has two collections referring to links: **IncomingLinks** and **OutgoingLinks**. **AnchorPattern** defines to which points of a node incoming or outgoing links can be connected. The **AllowIncomingLinks** property lets you specify whether incoming links can be drawn to a node. The **AllowOutgoingLinks** property lets you do that for outgoing links.

A user is allowed to expand or collapse the tree starting from a node if **Expandable** is set to **true**. The **Expanded** property gets or sets whether the subtree starting from a node is expanded or not.

Nodes can be attached to other items, and be used as simple labels, image-holders or other kinds of UI elements. The AttachTo method creates a Group instance if necessary, and calls the group's appropriate AttachTo* method.

Nodes can be rotated, either interactively using the rotation handle above the node, or programmatically using the RotationAngle property.

Inheritance Hierarchy

DiagramNode Members

Represents a diagram node.

The following tables list the members exposed by the DiagramNode type.

Protected Constructors

	Name	Description
	DiagramNode	Overloaded. Initializes a new instance of the **DiagramNode** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node.
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node.
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node.
	Bounds	Gets or sets the rectangle that defines the position of the diagram node.
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Constraints	Allows applying constraints to the location and size of the node.
	Container	Gets the parent ContainerNode containing this node.
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node.
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node.

	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node.
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded.
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like.
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node.
	Labels	Returns the list of supplementary labels displayed by this node.
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached.
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**.
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm.
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node.
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node.
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)

	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override.
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements.
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type.
	AddLabel	Overloaded. Adds a new label to this node.
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node.
	AttachTo	Overloaded. Attaches this node to another diagram item.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node.
	ContainsPoint	Overloaded.
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point.
	Detach	Detaches this node from its master item.
	DetachManipulator	Removes the specified manipulator from this node.
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)

	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface.
	DrawAnchors	Draws the anchor points of this node.
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item.
	DrawInRect	
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node.
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface.
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node.
	Expand	Shows all nodes and links in the subtree starting from this node.
	GetAllIncomingLinks	Overloaded.
	GetAllLinks	Gets all links connected to this node.
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle.
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point.
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline.
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point.
	GetOutlinePoly	DiagramItem.GetOutlinePoly override.
	GetRepaintRect	DiagramItem.GetRepaintRect override.
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point.
	GetRotationAngle	Gets the rotation angle of this node.
	GetToolTip	DiagramItem.GetToolTip override.
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point.
	HitTestManipulators	DiagramItem.HitTestManipulators override.
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes.
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point.

	Move	Moves the node to the specified location.
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node.
	OnDragOver	Invoked when a diagram item is being dragged over this node.
	OnDropOver	Invoked when a diagram item is dropped over this node.
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed.
	ReassignUnanchoredLinks	Reassigns unanchored links
	RemoveLabel	Removes the specified label from this node.
	Resize	Resizes the node.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetBounds	Sets the location and size of this node.
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node.
	SetPos	Sets the bounding rectangle of this node without updating connected arrows.
	SetRect	This method is used internally by the **Ruler** control to align nodes.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress.
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override.
	AllowModify	DiagramItem.AllowModify override.
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled.
	CompleteCreate	DiagramItem.CompleteCreate override.
	CompleteModify	DiagramItem.CompleteModify override.
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed.

	CreateProperties	DiagramItem.CreateProperties override.
	CreateState	DiagramItem.CreateState override.
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history.
	GetAllOutgoingLinks	Overloaded.
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates.
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle.
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy.
	LoadFromJson	Loads the node from a JSON object.
	LoadFromXml	DiagramItem.LoadFromXml override.
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override.
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override.
	OnModify	Invoked when the user moves or resizes this node.
	OnRemove	DiagramItem.OnRemove override.
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively.
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	Overloaded.
	OnZoomChanged	DiagramItem.OnZoomChanged override.
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override.
	RestoreState	DiagramItem.RestoreState override.
	SaveProperties	DiagramItem.SaveProperties override.

	SaveState	DiagramItem.SaveState override.
	SaveToJson	Saves the node as a JSON object.
	SaveToXml	Saves the item content into an XML element.
	ScaleElements	Scales the node's elements by specified amount.
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary.
	SetExpanded	DiagramItem.SetExpanded override.
	SetIncomingLinks	Sets the incoming links collection of this node.
	SetOutgoingLinks	Sets the outgoing links collection of this node.
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it.
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points.
	StartCreate	DiagramItem.StartCreate override.
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively.
	UpdateCreate	DiagramItem.UpdateCreate override.
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape.
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape.
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item.

DiagramNode Constructor

Initializes a new instance of the DiagramNode class.

Overload List

Name	Description
DiagramNode ()	Initializes a new instance of the **DiagramNode** class.
DiagramNode (Diagram)	Initializes a new instance of the **DiagramNode** class with default values supplied form the specified Diagram.
DiagramNode (DiagramNode)	Initializes a new instance of the **DiagramNode** class using the specified diagram item as a prototype.

See Also

DiagramNode Constructor ()

Initializes a new instance of the DiagramNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected DiagramNode ()
```

Visual Basic Copy Code

```
Protected Sub New ()
```

Remarks

This constructor sets the DiagramNode properties to their default values.

See Also

DiagramNode Constructor Overload List
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode Constructor (Diagram)

Initializes a new instance of the DiagramNode class with default values supplied form the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected DiagramNode (
    Diagram parent
)
```

Visual Basic Copy Code

```
Protected New ( _
    parent As Diagram _
)
```

Parameters

parent
The Diagram from which to obtain default values for the item properties.

Remarks

This constructor initializes the DiagramNode properties with the values specified in the respective default-value properties of the Diagram object. For more information see **Initial Values of Item Properties**.

See Also

DiagramNode Constructor Overload List
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode Constructor (DiagramNode)

Initializes a new instance of the DiagramNode class using the specified diagram item as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected DiagramNode (
    DiagramNode prototype
)
```

Visual Basic Copy Code

```
Protected New ( _
    prototype As DiagramNode _
)
```

Parameters

prototype
The item to use as a prototype. The properties of the new item are initialized from the property values of this item.

Remarks

This constructor copies the DiagramNode property values from the specified prototype node.

See Also

DiagramNode Constructor Overload List
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode Methods

DiagramNode.AcceptLinks Method

Determines whether the node can be connected with links of the specified type.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool AcceptLinks (
    bool outgoing
)
```

Visual Basic Copy Code

```
Public Overridable Function AcceptLinks( _
    outgoing As Boolean _
) As Boolean
```

Parameters

outgoing
true to check for outgoing links; otherwise, **false**.

Return Value

true if the node accepts connections of the specified type; otherwise, **false**.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.AddLabel Method

Adds a new label to this node.

Overload List

Name	Description
DiagramNode.AddLabel (NodeLabel)	Adds the specified label to this node.
DiagramNode.AddLabel (String)	Adds a new label to this node.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.AddLabel Method (NodeLabel)

Adds the specified label to this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void AddLabel (
    NodeLabel label
)
```

Visual Basic Copy Code

```
Public Sub AddLabel( _
    label As NodeLabel _
)
```

Parameters

label

A NodeLabel instance.

Remarks

An item's main text content is specified via its Text property. Call AddLabel if you need to display additional text labels, such as identifiers or hints to the user.

Position of labels can be specified by calling methods such as SetCornerPosition. You can let users move labels interactively by setting the **Behavior** property of **DiagramView** to MoveLabels.

See Also

AddLabel Method Overload List
DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
RemoveLabel Method

DiagramNode.AddLabel Method (String)

Adds a new label to this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeLabel AddLabel (
    string text
)
```

Visual Basic Copy Code

```
Public Function AddLabel( _
    text As String _
) As NodeLabel
```

Parameters

text
The label's text.

Return Value

A NodeLabel instance.

Remarks

An item's main text content is specified via its Text property. Call AddLabel if you need to display additional text labels, such as identifiers or hints to the user.

Position of labels can be specified by calling methods such as SetCornerPosition. You can let users move labels interactively by setting the **Behavior** property of **DiagramView** to MoveLabels.

RemoveLabel Method

DiagramNode.AllowCreate Method

DiagramItem.AllowCreate override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override bool AllowCreate (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Function AllowCreate( _
    current As Point, _
    ist As InteractionState _
) As Boolean
```

Parameters

current
The current mouse pointer position.

ist
An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the creation of this node; otherwise, **false**.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.AllowModify Method

DiagramItem.AllowModify override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override bool AllowModify (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Function AllowModify( _
    current As Point, _
    ist As InteractionState _
) As Boolean
```

Parameters

current
The current mouse pointer position.

ist
An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the modification of this node; otherwise, **false**.

DiagramNode.AttachManipulator Method

Adds the specified manipulator to this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void AttachManipulator (
    Manipulator manipulator
)
```

Visual Basic

```
Public Sub AttachManipulator( _
    manipulator As Manipulator _
)
```

Parameters

manipulator
A **Manipulator** object representing the manipulator to add.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.AttachTo Method

Attaches this node to another diagram item.

Overload List

Name	Description
DiagramNode.AttachTo (DiagramLink, AttachToLink, Int32)	Attaches this node to the specified link using the specified attaching type.
DiagramNode.AttachTo (DiagramNode, AttachToNode)	Attaches this node to the specified node using the specified attaching type.
DiagramNode.AttachTo (DiagramNode, Double, Double)	Attaches this node to the specified main node, keeping original size intact and maintaining original distance to point specified as fraction of main node's size.
DiagramNode.AttachTo (DiagramNode, Double, Double, Double, Double)	Proportionally attaches this node to the specified node.
DiagramNode.AttachTo (DiagramNode, GroupAnchorStyles)	Attaches this node to one or more edges of the specified node.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.AttachTo Method (DiagramLink, AttachToLink, Int32)

Attaches this node to the specified link using the specified attaching type.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public void AttachTo (
    DiagramLink link,
    AttachToLink attType,
    int index
)
```

Visual Basic

```
Public Sub AttachTo( _
    link As DiagramLink, _
    attType As AttachToLink, _
    index As Integer _
)
```

Parameters

link
A DiagramLink to whose control point or segment to attach this node.

attType
A value of the AttachToLink enumeration specifying whether to attach the node to a segment or to a control point of the link.

index
An index of link's control point or segment, depending on the *attType* value.

Remarks

This method attaches the node to a control point or segment of the specified link. If there isn't a Group instance already associated with the master item, one is created automatically by this method. The group is then accessible through the master's SubordinateGroup property, or this node's MasterGroup property.

The node is attached by calling the AttachToLinkPoint or AttachToLinkSegment methods of **Group**, depending on the value of the *attType* argument. The attached node then maintains its original offset from a link's point or segment when link's shape changes.

See Also

AttachTo Method Overload List
DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
Detach Method

DiagramNode.AttachTo Method (DiagramNode, AttachToNode)

Attaches this node to the specified node using the specified attaching type.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void AttachTo (
    DiagramNode node,
    AttachToNode attType
)
```

Visual Basic Copy Code

```
Public Sub AttachTo( _
    node As DiagramNode, _
    attType As AttachToNode _
)
```

Parameters

node
A reference to the node to whose corner to attach this node.

attType
A member of the AttachToNode enumeration specifying to which corner of a node to attach this node.

Remarks

This method attaches the current node to the corner of another node. If there isn't a Group instance already associated with the master item, one is created automatically by this method. The group is then accessible by the master's SubordinateGroup property, or this node's MasterGroup property.

The node is attached by calling the AttachToCorner method of **Group**. The attached node then maintains its original offset from another node's corner point.

See Also

AttachTo Method Overload List
DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
Detach Method

DiagramNode.AttachTo Method (DiagramNode, Double, Double)

Attaches this node to the specified main node, keeping original size intact and maintaining original distance to point specified as fraction of main node's size.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void AttachTo (
    DiagramNode node,
    float percentX,
    float percentY
)
```

Visual Basic Copy Code

```
Public Sub AttachTo( _
    node As DiagramNode, _
    percentX As Single, _
    percentY As Single _
)
```

Parameters

node
A reference to the node to which to attach this node.

percentX
Percentage of main node's width.

percentY
Percentage of main node's height.

See Also

AttachTo Method Overload List
DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.AttachTo Method (DiagramNode, Double, Double, Double, Double)

Proportionally attaches this node to the specified node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void AttachTo (
    DiagramNode node,
    double percentX1,
    double percentY1,
```

```
    double percentX2,
    double percentY2
)
```

Visual Basic Copy Code

```
Public Sub AttachTo( _
    node As DiagramNode, _
    percentX1 As Double, _
    percentY1 As Double, _
    percentX2 As Double, _
    percentY2 As Double _
)
```

Parameters

node
A reference to the node to which to attach this node.

percentX1
Left-hand side coordinate of the node, expressed as percentage of main node's width.

percentY1
Top side coordinate of the node, expressed as percentage of main node's height.

percentX2
Right-hand side coordinate of the node, expressed as percentage of main node's width.

percentY2
Bottom side coordinate of the node, expressed as percentage of main node's height.

Remarks

This method attaches proportionally the current node to another node. If there isn't a Group instance already associated with the master item, one is created automatically by this method. The group is then accessible through the master's SubordinateGroup property, or this node's MasterGroup property.

The node is attached by calling the AttachProportional method of **Group**. The attached node maintains its size and position so that it always covers the specified rectangular area of the master node.

Detach Method

DiagramNode.AttachTo Method (DiagramNode, GroupAnchorStyles)

Attaches this node to one or more edges of the specified node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void AttachTo (
    DiagramNode node,
    GroupAnchorStyles anchorStyles
)
```

Visual Basic Copy Code

```
Public Sub AttachTo( _
    node As DiagramNode, _
    anchorStyles As GroupAnchorStyles _
)
```

Parameters

node
A reference to the node to which to attach this node.

anchorStyles
A member of the GroupAnchorStyles enumeration specifying the master node's edges to which this node must be anchored.

Remarks

This method attaches the current node to the corner of another node. If there isn't a Group instance already associated with the master item, one is created automatically by this method. The group is then accessible by the master's SubordinateGroup property, or this node's MasterGroup property.

The node is attached by calling the AttachToEdges method of **Group**, which mimics the anchoring of child controls in a form to the form edges, as implemented in Windows Forms.

Detach Method

DiagramNode.CancelModify Method

DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void CancelModify (
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub CancelModify( _
    ist As InteractionState _
)
```

Parameters

ist
An InteractionState object containing more information about the current state of the operation.

DiagramNode.Collapse Method

Hides all nodes and links in the subtree starting from this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Collapse ()
```

Visual Basic

```
Public Sub Collapse ()
```

Remarks

This method is useful mostly when nodes form a tree-like hierarchical structure. Invoking **Collapse** on a node makes all its children in the tree invisible. It depends on the diagram's ExpandOnIncoming property which items connected to the node are considered its children.

Collapse is meant for use with tree structures and it is your responsibility to ensure that your chart is really a tree. A graph is a tree if every node has no more than one parent and there's one root node that can be reached from all nodes going in child-to-parent direction. The tree can be expanded again by calling the Expand method.

DiagramNode.CompleteModify Method

DiagramItem.CompleteModify override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected override void CompleteModify (
    Point end,
```

```
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub CompleteModify( _
    end As Point, _
    ist As InteractionState _
)
```

Parameters

end

The mouse pointer position.

ist

An InteractionState object containing more information about the current state of the operation.

DiagramNode.ContainsPoint Method

Overload List

Name	Description
DiagramNode.ContainsPoint (Point)	DiagramItem.ContainsPoint override.
DiagramNode.ContainsPoint (Point, Double)	Tests whether the specified point is contained within the outline of this node, relaxed with the specified threshold.

See Also

DiagramNode.ContainsPoint Method (Point)

DiagramItem.ContainsPoint override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool ContainsPoint (
    Point point
)
```

Visual Basic Copy Code

```
Public Overrides Function ContainsPoint( _
    point As Point _
) As Boolean
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** value specifying the logical coordinates of a diagram point.

Return Value

true if this node contains the specified point; otherwise, **false**.

See Also

ContainsPoint Method Overload List
DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.ContainsPoint Method (Point, Double)

Tests whether the specified point is contained within the outline of this node, relaxed with the specified threshold.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool ContainsPoint (
    Point point,
    double threshold
)
```

Visual Basic Copy Code

```
Public Overrides Function ContainsPoint( _
    point As Point, _
    threshold As Double _
) As Boolean
```

Parameters

point
The point to check.

threshold

Specifies the size of the area around the node outlines where the point is still considered inside the node.

Return Value

true if this node contains the specified point; otherwise, **false**.

See Also

ContainsPoint Method Overload List
DiagramNode Members

DiagramNode.CreateConnectionPoint Method

Creates a connection point between this node and the specified link at the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual ConnectionPoint CreateConnectionPoint (
    DiagramLink link,
    Point point,
    bool incoming
)
```

Visual Basic Copy Code

```
Public Overridable Function CreateConnectionPoint( _
    link As DiagramLink, _
    point As Point, _
    incoming As Boolean _
) As ConnectionPoint
```

Parameters

link

A DiagramLink that should be connected to this node.

point

The point at which the link should be connected.

incoming

true if *link* is an incoming link, otherwise, **false**.

Return Value

A ConnectionPoint instance representing the connection.

DiagramNode.CreateProperties Method

DiagramItem.CreateProperties override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override DiagramItemProperties CreateProperties ()
```

Visual Basic Copy Code

```
Protected Overrides Function CreateProperties () As DiagramItemProperties
```

Return Value

A DiagramNodeProperties object that will be used to store the properties of this node.

Remarks

This method is invoked by the undo/redo subsystem when creating a ChangeItemCmd instance.

DiagramNode.DetachManipulator Method

Removes the specified manipulator from this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void DetachManipulator (
    Manipulator manipulator
)
```

Visual Basic Copy Code

```
Public Sub DetachManipulator( _
    manipulator As Manipulator _
)
```

Parameters

manipulator
A **Manipulator** object representing the manipulator to remove.

DiagramNode.Draw Method

DiagramItem.Draw override. Draws the item on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void Draw (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub Draw( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
The IGraphics surface to draw the node on.

options
Provides options for the drawing operation.

DiagramNode.DrawHandles Method

DiagramItem.DrawHandles override. Renders the adjustment handles of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawHandles (
    IGraphics graphics,
    HandlesVisualStyle style,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawHandles( _
    graphics As IGraphics, _
    style As HandlesVisualStyle, _
    options As RenderOptions _
)
```

Parameters

graphics
The IGraphics surface on which the handles should be drawn.

style
A HandlesVisualStyle instance containing brush and pen objects that should be used when drawing handles.

options
Provides options for the drawing operation.

DiagramNode.DrawLocal Method

Override in a derived class to provide implementation specific drawing for the node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void DrawLocal (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overridable Sub DrawLocal( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
The IGraphics surface to draw the node on.

options
Provides options for the drawing operation.

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.DrawShadow Method

DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawShadow (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawShadow( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
An IGraphics object where the shadow should be rendered.

options
Provides options for the drawing operation.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.DrawShadowLocal Method

Override in a derived class to provide implementation specific drawing for the shadow of the node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void DrawShadowLocal (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overridable Sub DrawShadowLocal( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
An IGraphics object where the shadow should be rendered.

options
Provides options for the drawing operation.

DiagramNode.Expand Method

Shows all nodes and links in the subtree starting from this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Expand ()
```

Visual Basic Copy Code

```
Public Sub Expand ()
```

Remarks

This method is useful mostly when nodes form a tree-like hierarchical structure. Use **Expand** to show a subtree of nodes that was previously collapsed, either interactively or by calling Collapse. If the RecursiveExpand property is enabled, all tree levels are expanded recursively.

DiagramNode.GetCenter Method

Gets the center of this node's bounding rectangle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point GetCenter ()
```

Visual Basic Copy Code

```
Public Function GetCenter () As Point
```

Return Value

A **Microsoft.Maui.Graphics.Point** representing the center point of this node.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.GetClosestAnchorPoint Method

Returns the index of the anchor point that lies at the shortest distance from the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int GetClosestAnchorPoint (
    Point point,
    bool incoming
)
```

Visual Basic Copy Code

```
Public Function GetClosestAnchorPoint( _
    point As Point, _
    incoming As Boolean _
) As Integer
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** specifying a location in the diagram.

incoming
true to look for anchor points that allow incoming links; false to look for ones that allow outgoing links.

Return Value

The index of the found point within the AnchorPattern definition.

See Also

DiagramNode Members

DiagramNode.GetIntersection Method

Calculates the intersection point between the segment defined by the specified point pair and the node's outline.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Point GetIntersection (
    Point segmentStart,
    Point segmentEnd
)
```

Visual Basic Copy Code

```
Public Overridable Function GetIntersection( _
    segmentStart As Point, _
    segmentEnd As Point _
) As Point
```

Parameters

segmentStart
The first point of the segment.

segmentEnd
The second point of the segment.

Return Value

A **Microsoft.Maui.Graphics.Point** representing the intersection point.

DiagramNode.GetNearestBorderPoint Method

Returns a point that lies on the outline of this node, at the shortest distance from the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual Point GetNearestBorderPoint (
    Point point
)
```

Visual Basic Copy Code

```
Public Overridable Function GetNearestBorderPoint( _
    point As Point _
) As Point
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** specifying a point in the diagram.

Return Value

A **Point** specifying the point from the node's outline closest to the point specified as argument.

```
public override Rect GetRepaintRect (
    bool includeConnected
)
```

Visual Basic Copy Code

```
Public Overrides Function GetRepaintRect( _
    includeConnected As Boolean _
) As Rect
```

Parameters

includeConnected
true if related items should be considered too; otherwise, **false**.

Return Value

A rectangular region that should be repainted when this node is modified.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.GetRgnInRect Method

Creates and returns a **Region** object for this node as though it is contained in the specified rectangle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual IGraphicsPath GetRgnInRect (
    Rect rc,
    bool inLocal
)
```

Visual Basic Copy Code

```
Protected Overridable Function GetRgnInRect( _
    rc As Rect, _
    inLocal As Boolean _
) As IGraphicsPath
```

Parameters

rc

inLocal

Return Value

DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.GetRotatedBounds Method (Rect, Point, Double)

Gets the bounding rectangle of this node, when it is rotated at the specified angle around the specified pivot.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected static Rect GetRotatedBounds (
    Rect rect,
    Point center,
    double angle
)
```

Visual Basic Copy Code

```
Protected Shared Function GetRotatedBounds( _
    rect As Rect, _
    center As Point, _
    angle As Double _
) As Rect
```

Parameters

rect
The rectangle that will be rotated.

center
The pivot point.

angle
The rotation angle.

Return Value

A **Microsoft.Maui.Graphics.Rect** representing the new bounding rectangle.

See Also

GetRotatedBounds Method Overload List

DiagramNode.GroupContains Method

Determines whether this node is a predecessor of the specified node in the group hierarchy.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected bool GroupContains (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Protected Function GroupContains( _
    node As DiagramNode _
) As Boolean
```

Parameters

node
The node to check.

Return Value

true if the specified node is subordinate to this one; otherwise, **false**.

See Also

DiagramNode.HitTestHandle Method

DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override AdjustmentHandle HitTestHandle (
    Point point,
    double distance
)
```

Visual Basic Copy Code

```
Public Overrides Function HitTestHandle( _
    point As Point, _
    distance As Double _
) As AdjustmentHandle
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** specifying where to look for a selection handle.

distance
Maximum distance from a handle at which it is still considered as hit.

Return Value

Returns an AdjustmentHandle instance representing the adjustment handle found at the specified location, or **null** if there is none.

DiagramNode.Intersects Method

Determines whether the node intersects another one, taking into account the outlines of node shapes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Intersects (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public Function Intersects( _
    node As DiagramNode _
) As Boolean
```

Parameters

node
A reference to the node to test for intersections with this one.

Return Value

true if the current node intersects with the specified node; otherwise, **false**.

DiagramNode.LabelFromPoint Method

Returns the label whose layout rectangle contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override ItemLabel LabelFromPoint (
    Point point
)
```

Visual Basic Copy Code

```
Public Overrides Function LabelFromPoint( _
    point As Point _
```

```
) As ItemLabel
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** instance.

Return Value

The NodeLabel that contains the specified point.

DiagramNode.LoadFromJson Method

Loads the node from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

Remarks

This method is invoked when an item is being deserialized from a diagram file saved in JSON format.

DiagramNode.LoadFromXml Method

DiagramItem.LoadFromXml override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** containing the item's data.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

DiagramNode.Move Method

Moves the node to the specified location.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Move (
    double x,
    double y
)
```

Visual Basic Copy Code

```
Public Sub Move( _
    x As Double, _
    y As Double _
)
```

Parameters

x

A **double** value specifying the new X-coordinate of node's location.

y

A **double** value specifying the new Y-coordinate of node's location.

Remarks

This method moves a node to the specified position, without changing the node's size. Moving a node also updates the control points coordinates of all links connected to the node.

DiagramNode.OnDragOver Method

Invoked when a diagram item is being dragged over this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool OnDragOver (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Overridable Function OnDragOver( _
    item As DiagramItem _
) As Boolean
```

Parameters

item

The DiagramItem that is dragged over the node.

Return Value

false if the diagram should notify nodes below this one; otherwise, **true**.

See Also

DiagramNode Members

DiagramNode.OnDropOver Method

Invoked when a diagram item is dropped over this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual bool OnDropOver (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Overridable Function OnDropOver( _
    item As DiagramItem _
) As Boolean
```

Parameters

item

The DiagramItem that is dropped over the node.

Return Value

false if the diagram should notify nodes below this one; otherwise, **true**.

DiagramNode.OnModify Method

Invoked when the user moves or resizes this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected virtual void OnModify (
    Point mousePosition,
    AdjustmentHandles adjustmentHandle
)
```

Visual Basic

```
Protected Overridable Sub OnModify( _
    mousePosition As Point, _
    adjustmentHandle As AdjustmentHandles _
)
```

Parameters

mousePosition
Specifies the mouse position.

adjustmentHandle
Specifies the adjustment handle used to modify the node.

Remarks

Implement this method in a custom node class if you need to detect modifications done by the user without handling events of the Diagram class.

DiagramNode.ReassignAnchorPoints Method

Reassigns links to anchor points so that they are evenly distributed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ReassignAnchorPoints ()
```

Visual Basic Copy Code

```
Public Sub ReassignAnchorPoints ()
```

Remarks

If there are more anchor points defined for this node than links connected to it, this method ensures that each point has at most one link attached to it. **ReassignAnchorPoints** also tries to assign links to points that are close to their opposite end points.

DiagramNode.RemoveLabel Method

Removes the specified label from this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RemoveLabel (
    NodeLabel label
)
```

Visual Basic Copy Code

```
Public Sub RemoveLabel( _
    label As NodeLabel _
)
```

Parameters

label

A NodeLabel instance.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
AddLabel Method

DiagramNode.Resize Method

Resizes the node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Resize (
    double width,
    double height
)
```

Visual Basic Copy Code

```
Public Sub Resize( _
    width As Double, _
    height As Double _
)
```

Parameters

width

A **double** value specifying new width of the node.

height

A **double** value specifying new height of the node.

Remarks

This method resizes a node, without changing the node's top-left corner location. Resizing a node also updates the control points coordinates of all links connected to the node.

DiagramNode.SaveToJson Method

Saves the node as a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject instance to contain the serialized data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

Remarks

This method is invoked when an item is being serialized into a JSON-format diagram file.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.SaveToXml Method

Saves the item content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** the item's data should be stored into.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

DiagramNode.ScaleElements Method

Scales the node's elements by specified amount.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void ScaleElements (
    double scale
)
```

Visual Basic Copy Code

```
Protected Overridable Sub ScaleElements( _
    scale As Double _
)
```

Parameters

scale
The value by which to multiply node elements' sizes.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.SetBounds Method

Sets the location and size of this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetBounds (
    Rect rect,
    bool updateGroups,
    bool updateLinks
)
```

Visual Basic Copy Code

```
Public Sub SetBounds( _
    rect As Rect, _
    updateGroups As Boolean, _
    updateLinks As Boolean _
)
```

Parameters

rect
A **Microsoft.Maui.Graphics.Rect** specifying the node position.

updateGroups
Specifies whether the position of child nodes attached to this one should be updated too.

updateLinks
Specifies whether the position of links connected to this node should be updated too.

Remarks

This method lets you set the position of a node without affecting items related to it, such as its incoming and outgoing links, or nodes set as its children using AttachTo. Assigning to the **Bounds** property or calling the Move and Resize methods always updates the related items.

DiagramNode.SetExpandable Method

Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void SetExpandable (
    bool exp
)
```

Visual Basic Copy Code

```
Protected Sub SetExpandable( _
    exp As Boolean _
)
```

Parameters

exp
true if a collapse/expand button should be added to this node; otherwise, **false**.

DiagramNode.SetOutgoingLinks Method

Sets the outgoing links collection of this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void SetOutgoingLinks (
    DiagramLinkCollection links
)
```

Visual Basic Copy Code

```
Protected Sub SetOutgoingLinks( _
    links As DiagramLinkCollection _
)
```

Parameters

links
A DiagramLinkCollection containing the node's outgoing links.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.SetPos Method

Sets the bounding rectangle of this node without updating connected arrows.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void SetPos (
    Nullable<Single> x,
    Nullable<Single> y,
    Nullable<Single> w,
    Nullable<Single> h
)
```

Visual Basic Copy Code

```
Public Overridable Sub SetPos( _
    x As Nullable(Of Single), _
    y As Nullable(Of Single), _
    w As Nullable(Of Single), _
    h As Nullable(Of Single) _
)
```

Parameters

x

y

w

h

Remarks

For internal use.

DiagramNode.SetRect Method

This method is used internally by the **Ruler** control to align nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetRect (
    Rect rect,
    bool raiseModfEvent
)
```

Visual Basic Copy Code

```
Public Sub SetRect( _
    rect As Rect, _
    raiseModfEvent As Boolean _
)
```

Parameters

rect
The new location of the node.

raiseModfEvent
A flag specifying whether to raise the NodeModified event.

Determines whether the node should render its anchor points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected bool ShouldRenderAnchors (
    RenderOptions options
)
```

Visual Basic Copy Code

```
Protected Function ShouldRenderAnchors( _
    options As RenderOptions _
) As Boolean
```

Parameters

options
A RenderOptions object providing more information about the current drawing context.

Return Value

true if anchor points should be rendered; otherwise, **false**.

DiagramNode.StartModify Method

DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void StartModify (
    Point org,
    AdjustmentHandle handle,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub StartModify( _
    org As Point, _
    handle As AdjustmentHandle, _
    ist As InteractionState _
)
```

Parameters

org
Position of the mouse pointer.

handle
The adjustment handle used to modify this node.

ist
An InteractionState object containing more information about the current state of the operation.

Syntax

C# Copy Code

```
protected override void UpdateModify (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub UpdateModify( _
    current As Point, _
    ist As InteractionState _
)
```

Parameters

current

Position of the mouse pointer.

ist

An InteractionState object containing more information about the current state of the operation.

DiagramNode Properties

DiagramNode.AllowIncomingLinks Property

Gets or sets a value indicating whether users are allowed to draw incoming links to this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowIncomingLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowIncomingLinks As Boolean
```

Property Value

true to let users draw incoming links to this node; otherwise, **false**. The default is **true**.

Remarks

Links to a node can be created programmatically regardless of the value of this property.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
IncomingLinks Property
AllowOutgoingLinks Property

DiagramNode.AllowOutgoingLinks Property

Gets or sets a value indicating whether users are allowed to draw outgoing links from this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowOutgoingLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowOutgoingLinks As Boolean
```

Property Value

true to let users draw outgoing links from this node; otherwise, **false**. The default is **true**.

Remarks

Links from a node can be created programmatically regardless of the value of this property.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
OutgoingLinks Property
AllowIncomingLinks Property

DiagramNode.AnchorPattern Property

Gets or sets the anchor points to which links are attached when connected to the node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPattern AnchorPattern { get; set; }
```

Visual Basic Copy Code

```
Public Property AnchorPattern As AnchorPattern
```

Property Value

An instance of the AnchorPattern class.

Remarks

This property specifies a set of points to which links can be attached. Each anchor point can accept either incoming links, outgoing links or both. If a node does not have any anchor points defined, links can be connected to any part of the node.

A ShapeNode whose **AnchorPattern** is not explicitly set uses the AnchorPattern from the Shape definition.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
Diagram.SnapToAnchor Property
ReassignAnchorPoints Method

DiagramNode.Bounds Property

Gets or sets the rectangle that defines the position of the diagram node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect Bounds { get; set; }
```

Visual Basic Copy Code

```
Public Property Bounds As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** instance.

Remarks

Use this property to set or get the size and/or location of a node. Moving a node also updates the control points coordinates of all links connected to the node. If there are subordinate items attached to it, they are moved too by the translation vector defined by the **Bounds** change. To change the bounding rectangle of a node without affecting related items, call the SetBounds method.

See Also

MindFusion.Diagramming Namespace
Move Method
Resize Method
Intersects Method

DiagramNode.Constraints Property

Allows applying constraints to the location and size of the node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeConstraints Constraints { get; set; }
```

Visual Basic Copy Code

```
Public Property Constraints As NodeConstraints
```

Property Value

An instance of the NodeConstraints class.

Remarks

These constraints are considered when a user modifies the node interactively. They are ignored if node placement is changed programmatically by using methods and properties.

Example

This sample code disables moving or resizing a node vertically:

C# Copy Code

```
DiagramNode node = diagram.ActiveItem as DiagramNode;

// Allow moving the node only horizontally
node.Constraints.MoveDirection = DirectionConstraint.Horizontal;

// Disable handles that can be used to resize the node vertically
node.EnabledHandles = AdjustmentHandles.Move |
    AdjustmentHandles.ResizeMiddleLeft | AdjustmentHandles.ResizeMiddleRight;
```

Visual Basic Copy Code

```
Dim node As DiagramNode = diagram.ActiveItem

' Allow moving the node only horizontally
node.Constraints.MoveDirection = DirectionConstraint.Horizontal

' Disable handles that can be used to resize the node vertically
node.EnabledHandles = AdjustmentHandles.Move + _
    AdjustmentHandles.ResizeMiddleLeft + AdjustmentHandles.ResizeMiddleRight
```

See Also

DiagramNode.Container Property

Gets the parent ContainerNode containing this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerNode Container { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Container As ContainerNode
```

Property Value

The parent ContainerNode of this node.

Remarks

Call the Add method of ContainerNode to add a child node to the container. Call Remove to remove a child node.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
MasterItem Property
ContainerNode.Children Property

DiagramNode.Effects Property

Gets a collection with all effects applied to this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IList<NodeEffect> Effects { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Effects As IList(Of NodeEffect)
```

Property Value

A list with all node effects.

Remarks

The local node effects are applied after the diagram-wide node effects defined in NodeEffects. However, if the first effect in this list is **null** (**Nothing** in Visual Basic), the diagram effects are ignored.

See Also

DiagramNode Members
DiagramNode Class

DiagramNode.EnabledHandles Property

Gets or sets the kinds of modifications that end-users are permitted to perform on the node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AdjustmentHandles EnabledHandles { get; set; }
```

Visual Basic Copy Code

```
Public Property EnabledHandles As AdjustmentHandles
```

Property Value

A combination of the AdjustmentHandles enumeration members. The default is **AdjustmentHandles.All**.

Remarks

Disabling some selection handles allows restricting the types of modifications that users can perform on a node. Each manipulation handle can be enabled or disabled by setting or clearing the respective flag in the combination.

For example, to make a node resizable only horizontally, set this property to a combination of the Move, **ResizeMiddleLeft** and **ResizeMiddleRight** flags. That will disable all manipulation handles, except the left and right ones, which allow horizontal resizing, and the central one allowing movement of the node.

Example

The following code disables the rotation handle of a shape node:

C# Copy Code

```
node.EnabledHandles = AdjustmentHandles.All & ~ AdjustmentHandles.Rotate;
```

Visual Basic Copy Code

```
node.EnabledHandles = AdjustmentHandles.All And Not AdjustmentHandles.Rotate
```

Diagram.DisabledHandlesColor Property
Diagram.ShowDisabledHandles Property

DiagramNode.Expandable Property

Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Expandable { get; set; }
```

Visual Basic

```
Public Property Expandable As Boolean
```

Property Value

true if users are allowed to expand / collapse the tree starting from this node; otherwise, **false**. The default is **false**.

Remarks

This property is useful mostly when nodes form a tree-like hierarchical structure. If it is enabled, a small [±] button is drawn beside the node. Clicking that button either shows or hides all children of this node in the tree. It depends on the diagram's ExpandOnIncoming property which items connected to a node are considered its children. The tree expansion continues recursively down the child nodes if the RecursiveExpand property is enabled.

A tree can be collapsed or expanded programmatically by invoking the Collapse or Expand methods on the tree root node.

The appearance of the collapse / expand icon can be customized by setting **Renderers.ExpandIconRenderer**.

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
Expanded Property
Diagram.NodesExpandable Property
HtmlBuilder.ExpandBtnHyperLink Property

DiagramNode.Expanded Property

Gets or sets a value indicating whether the subtree starting from this node is expanded.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public virtual bool Expanded { get; set; }
```

Visual Basic

```
Public Overridable Property Expanded As Boolean
```

Property Value

true if the tree starting from this node is expanded; otherwise, **false**.

Remarks

This property is useful mostly when nodes form a tree-like hierarchical structure. Set it to **false** to make the subtree starting from a node collapse, with all its child nodes and links becoming invisible. Set it to **true** to show the child nodes and links again.

A user is allowed to expand or collapse the tree that starts from a node interactively if the **Expandable** property of that node is enabled.

DiagramNode.HandlesStyle Property

Gets or sets a value indicating how the node adjustment handles behave and what do they look like.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HandlesStyle HandlesStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property HandlesStyle As HandlesStyle
```

Property Value

A member of the HandlesStyle enumeration.

Remarks

Specifies how node selection status is indicated visually. In addition, this property defines how manipulation of the node can be done, that is, how to move it, resize it or link it to other nodes. You can assign any of the HandlesStyle values to this property.

HitTestHandle Method

DiagramNode.HasItems Property

Determines whether the node supports connections to its constituent elements.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual bool HasItems { get; }
```

Visual Basic Copy Code

```
Protected Overridable ReadOnly Property HasItems As Boolean
```

Property Value

See Also

DiagramNode Members
DiagramNode Class

DiagramNode.IncomingLinks Property

Gets a collection of links that point to the node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLinkCollection IncomingLinks { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property IncomingLinks As DiagramLinkCollection
```

Property Value

A reference to a DiagramLinkCollection object.

Remarks

Use this collection to get access to every link pointing to the node, as well as get the number of such links. If the node is a table, links that connect to it as a whole entity are included in the collection, and links that connect to particular row of the table are included in IncomingLinks.

DiagramNode.Labels Property

Returns the list of supplementary labels displayed by this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public List<NodeLabel> Labels { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Labels As List(Of NodeLabel)
```

Property Value

A list of NodeLabel objects.

Remarks

Call the AddLabel and RemoveLabel methods to add or remove labels.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
Text Property

DiagramNode.MasterGroup Property

Gets a reference to the group to which this node is attached.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Group MasterGroup { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property MasterGroup As Group
```

Property Value

A reference to a Group object or **null** (**Nothing** in Visual Basic) if the node is not attached to a group.

Remarks

Diagram items can be grouped hierarchically in such a manner, that if an item is moved all of its subordinated items in the hierarchy move too. The immediate subordinates of an item are contained and represented by a Group instance. This property provides access to the group that contains the item as a subordinate. If the item is not a subordinate of another, the property returns **null** (**Nothing** in Visual Basic).

DiagramNode.MasterItem Property

Returns the node's Container or main item of MasterGroup.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem MasterItem { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property MasterItem As DiagramItem
```

Property Value

A DiagramItem reference indicating master item in containment or group hierarchy.

DiagramNode.Obstacle Property

Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Obstacle { get; set; }
```

Visual Basic Copy Code

```
Public Property Obstacle As Boolean
```

Property Value

true makes routed links look for a path going around this node; **false** lets links cross the node. The default is **true**.

Remarks

It is useful to set this property to **false** for nodes used as decorative containers or labels.

DiagramNode.OutgoingLinks Property

Gets a collection of links that start from this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLinkCollection OutgoingLinks { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property OutgoingLinks As DiagramLinkCollection
```

Property Value

A reference to a DiagramLinkCollection object.

Remarks

Use this collection to get access to every link starting from the node, as well as get the number of such links. If the node is a table, links that connect to it as a whole entity are included in the collection, and links that connect to particular row of the table are included in OutgoingLinks.

DiagramNodeCollection Members

Represents a strongly typed collection of diagram nodes.

The following tables list the members exposed by the DiagramNodeCollection type.

Public Constructors

	Name	Description
	DiagramNodeCollection	Initializes a new instance of the **DiagramNodeCollection** class.

Protected Fields

	Name	Description
	InnerList	Gets a **List<T>** containing the list of elements in the collection instance. (Inherited from CollectionBase.)
	itemEventArgs	A ItemEventArgs instance used for passing arguments to the event handlers for the events of this collection. Used to avoid creating many small objects that would burden the garbage collector. (Inherited from ItemCollectionBase.)
	notifyParent	If enabled, the collection raises events to let their containing objects handle the addition or removal of items. (Inherited from ItemCollectionBase.)

Public Properties

	Name	Description
	Count	Gets the number of elements actually contained in the collection. (Inherited from CollectionBase.)
	IsReadOnly	Gets a value indicating whether the collection is read-only. (Inherited from CollectionBase.)
	Item	Gets or sets the element at the specified index. (Inherited from CollectionBase.)

Public Methods

	Name	Description
	Add	Adds the specified diagram item to the collection. (Inherited from ItemCollectionBase.)
	Clear	Removes all diagram items from the collection. (Inherited from ItemCollectionBase.)
	Clone	Creates a shallow copy of this collection.
	Contains	Determines whether an element is in the collection. (Inherited from CollectionBase.)
	CopyTo	Copies the entire collection to a compatible one-dimensional array, starting at the specified index of the target array. (Inherited from CollectionBase.)
	GetAt	Gets the diagram item at the specified position. (Inherited from ItemCollectionBase.)

	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from CollectionBase.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire collection. (Inherited from CollectionBase.)
	Insert	Inserts the specified diagram item into the collection at the specified position. (Inherited from ItemCollectionBase.)
	Remove	Removes the diagram item from the collection. (Inherited from ItemCollectionBase.)
	RemoveAt	Removes the diagram item from the collection. (Inherited from ItemCollectionBase.)
	Sort	Overloaded. (Inherited from CollectionBase.)

Protected Methods

	Name	Description
	RaiseAdding	Raises the **Adding** event. (Inherited from ItemCollectionBase.)
	RaiseInserting	Raises the **Inserting** event. (Inherited from ItemCollectionBase.)
	RaiseRemoving	Raises the **Removing** event. (Inherited from ItemCollectionBase.)

Initializes a new instance of the DiagramNodeEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNodeEventArgs (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public New ( _
    node As DiagramNode _
)
```

Parameters

node
The node related to the event.

See Also

DiagramNodeEventArgs Constructor Overload List
DiagramNodeEventArgs Class
MindFusion.Diagramming Namespace

DiagramNodeEventArgs Constructor (DiagramNode, Int32)

Initializes a new instance of the DiagramNodeEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNodeEventArgs (
    DiagramNode node,
    int index
)
```

Visual Basic Copy Code

```
Public New ( _
    node As DiagramNode, _
    index As Integer _
)
```

Parameters

node
The node related to the event.

index
The zero-based index of the node within its containing collection.

See Also

DiagramNodeEventArgs Constructor Overload List
DiagramNodeEventArgs Class
MindFusion.Diagramming Namespace

DiagramNodeEventArgs Properties

DiagramNodeEventArgs.Index Property

Gets or sets the index of the node within its containing collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Index { get; set; }
```

Visual Basic Copy Code

```
Public Property Index As Integer
```

Property Value

An integer value.

See Also

DiagramNodeEventArgs Members
DiagramNodeEventArgs Class
MindFusion.Diagramming Namespace

DiagramNodeEventArgs.Node Property

Gets the node related to the event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNode Node { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Node As DiagramNode
```

Property Value

A DiagramNode object.

DiagramNodeProperties Class

The base class for classes that store the properties for a DiagramNode-derived items during undo / redo operations.

Syntax

C# Copy Code

```
public class DiagramNodeProperties : DiagramItemProperties
```

Visual Basic Copy Code

```
Public Class DiagramNodeProperties
    Inherits DiagramItemProperties
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.DiagramItemProperties
    MindFusion.Diagramming.DiagramNodeProperties
      MindFusion.Diagramming.ContainerNodeProperties
      MindFusion.Diagramming.ShapeNodeProperties
      MindFusion.Diagramming.TableNodeProperties

See Also

DiagramNodeProperties Members
MindFusion.Diagramming Namespace

DiagramNodeProperties Members

The base class for classes that store the properties for a DiagramNode-derived items during undo / redo operations.

The following tables list the members exposed by the DiagramNodeProperties type.

Public Constructors

	Name	Description
	DiagramNodeProperties	Initializes a new instance of the **DiagramNodeProperties** class.

Public Fields

	Name	Description

	ItemClass	For internal use. (Inherited from DiagramItemProperties.)
	labels	For internal use.
	Selected	For internal use. (Inherited from DiagramItemProperties.)
	Text	For internal use. (Inherited from DiagramItemProperties.)
	TextPadding	For internal use. (Inherited from DiagramItemProperties.)
	ZIndex	For internal use. (Inherited from DiagramItemProperties.)

Public Methods

	Name	Description
	FreeResources	Frees stored resources which will no longer be used. (Inherited from DiagramItemProperties.)

See Also

DiagramNodeProperties Class
MindFusion.Diagramming Namespace

DiagramNodeProperties Fields

DiagramNodeProperties.labels Field

For internal use.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public List<NodeLabel> labels
```

Visual Basic Copy Code

```
Public labels As List(Of NodeLabel)
```

DiagramNodeProperties Constructor

Initializes a new instance of the DiagramNodeProperties class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNodeProperties ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

DiagramNodeProperties Class
MindFusion.Diagramming Namespace

DiagramNodeState Class

Contains a snapshot of the internal state of a DiagramNode.

Syntax

C# Copy Code

```
public class DiagramNodeState : DiagramItemState
```

Visual Basic Copy Code

```
Public Class DiagramNodeState
    Inherits DiagramItemState
```

Remarks

Instances of this class are used to store the state of nodes for later undo or redo operations. If you derive from DiagramNode and need to implement undo support for the additional internal state defined by your class, do so by deriving from **DiagramNodeState** and overriding the DiagramNode.CreateState, DiagramNode.SaveState and DiagramNode.RestoreState methods.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.DiagramItemState
    MindFusion.Diagramming.DiagramNodeState
      MindFusion.Diagramming.ShapeNodeState

MindFusion.Diagramming Namespace

DiagramNodeStyle Members

Represents a reusable set of properties that define the appearance of diagram nodes.

The following tables list the members exposed by the DiagramNodeStyle type.

Protected Constructors

	Name	Description
	DiagramNodeStyle	Initializes a new instance of the **DiagramNodeStyle** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	Effects	Gets a list of the effects applied to the node.
	FontFamily	Gets or sets the font family of the item text. (Inherited from DiagramItemStyle.)
	FontSize	Gets or sets the font size of the item text. (Inherited from DiagramItemStyle.)
	FontStyle	Gets or sets the font style of the item text. (Inherited from DiagramItemStyle.)
	FontUnit	Gets or sets the font unit of the item text. (Inherited from DiagramItemStyle.)
	ShadowBrush	Gets or sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	Stroke	Gets or sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	StrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline items. (Inherited from DiagramItemStyle.)
	StrokeThickness	Gets or sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)

Public Methods

	Name	Description
	GetProperties	Gets all properties in the style. (Inherited from Style.)
	GetProperty	Returns the property with the specified name, if any. (Inherited from Style.)
S	RegisterType	Associates a type with an alias. (Inherited from Style.)

Protected Methods

	Name	Description
	GetValue	Gets the value of the specified property. (Inherited from Style.)
	IsPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	LoadFromJson	Loads the style content from a JsonObject.
	LoadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from Style.)
	RegisterProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	SaveToJson	Saves the style content into a JsonObject.
	SaveToXml	Saves the style content into an XML element. (Inherited from Style.)
	SetValue	Sets the value of the specified property. (Inherited from Style.)
	UnsetValue	Clears the value of the specified property. (Inherited from Style.)

Public Events

	Name	Description
	PropertyChanged	Raised when any of the registered style properties has changed. (Inherited from Style.)

DiagramNodeStyle.LoadFromJson Method

Loads the style content from a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the style's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

DiagramNodeStyle Members
DiagramNodeStyle Class
MindFusion.Diagramming Namespace

DiagramNodeStyle.SaveToJson Method

Saves the style content into a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject the style's data should be stored into.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

DiagramPage Members

Represents a single page in a DiagramDocument object.

The following tables list the members exposed by the DiagramPage type.

Public Constructors

	Name	Description
	DiagramPage	Initializes a new instance of the **DiagramPage** class.

Public Fields

	Name	Description
	Dummy	A shared DummyNode instance. (Inherited from Diagram.)

Public Properties

	Name	Description

	ActiveItem	Gets or sets the active diagram element. (Inherited from Diagram.)
	ActiveItemHandlesStyle	Gets the visual style of adjustment handles of the active item. (Inherited from Diagram.)
	ActiveLayer	Gets or sets the zero-based index of the active layer. (Inherited from Diagram.)
	AdjustmentHandlesSize	Gets or sets the size of the handles, which appear around selected objects. (Inherited from Diagram.)
	AlignmentGuidePen	Gets or sets the pen used to draw alignment guides. (Inherited from Diagram.)
	AlignToGrid	Gets or sets a value indicating whether the diagram items is aligned to a grid. (Inherited from Diagram.)
	AllowLinksRepeat	Gets or sets a value indicating whether more than one link can connect the same origin and destination diagram nodes. (Inherited from Diagram.)
	AllowMultipleResize	Gets or sets whether multiple selected nodes can be resized simultaneously. (Inherited from Diagram.)
	AllowSelfLoops	Gets or sets a value indicating whether self-loops are allowed. (Inherited from Diagram.)
	AllowSplitLinks	Gets or sets a value indicating whether link segments can be added and removed interactively. (Inherited from Diagram.)
	AllowUnanchoredLinks	Gets or sets a value indicating whether links can be connected to nodes to which there aren't anchor points assigned. (Inherited from Diagram.)
	AllowUnconnectedLinks	Gets or sets a value indicating whether users are allowed to draw links that are not connected to any node. (Inherited from Diagram.)
	AutoAlignDistance	Gets or sets the maximal horizontal or vertical distance at which a node aligns to the borders of other nodes. (Inherited from Diagram.)
	AutoAlignNodes	Gets or sets whether nodes should automatically align to the borders of other nodes during user interaction. (Inherited from Diagram.)
	AutoArrangeAvoidContainers	Gets or sets a value indicating whether auto-arranged link labels should avoid containers. (Inherited from Diagram.)
	AutoArrangeAvoidSegments	Gets or sets a value indicating whether auto-arranged link labels should avoid link segments. (Inherited from Diagram.)
	AutoCloseDistance	Gets or sets the maximum distance between first and last points of a FreeFormNode for which the node's outline is closed automatically. (Inherited from Diagram.)
	AutoDeleteLinks	Gets or sets whether links are deleted automatically when their Origin or Destination is deleted. (Inherited from Diagram.)
	AutoHighlightRows	Gets or sets whether a table row should be highlighted when the user clicks on it. (Inherited from Diagram.)
	AutoResize	Gets or sets a value indicating whether the document area must be resized automatically so it fits the diagram contents. (Inherited from Diagram.)
	AutoSnapDistance	Specifies the maximum distance at which links auto-snap to nodes. (Inherited from Diagram.)
	AutoSnapLinks	Gets or sets the default value for the AutoSnapToNode property of new links. (Inherited from Diagram.)
	BackBrush	Gets or sets the brush used for painting the diagram background. (Inherited from Diagram.)
	BackgroundImage	Gets or sets the image displayed as background of this diagram. (Inherited from Diagram.)

	BackgroundImageAlign	Gets or sets a value indicating how the background image is positioned, relatively to the scrollable document area. (Inherited from Diagram.)
	BackgroundImageUrl	URL of the image painted as diagram's background. (Inherited from Diagram.)
	BarcodeNodeStyle	Gets the theme-level style for barcode nodes. (Inherited from Diagram.)
	Bounds	Gets or sets a value representing the size of the diagram's scrollable area. (Inherited from Diagram.)
	BoundsPen	The pen with which the document bounds should be drawn. (Inherited from Diagram.)
	BranchIndicatorColor	Gets or sets the color of link branch indicators. (Inherited from Diagram.)
	BranchIndicatorSize	Gets or sets the size of link branch indicators. (Inherited from Diagram.)
	CellCustomDraw	Gets or sets the default type of custom painting done on the cells of tables. (Inherited from Diagram.)
	CellFrameStyle	Gets or sets the default cell border style of new tables. (Inherited from Diagram.)
	CompositeNodeStyle	Gets the theme-level style for composite nodes. (Inherited from Diagram.)
	ContainerCaption	Gets or sets the default value for the Caption property of containers. (Inherited from Diagram.)
	ContainerCaptionHeight	Gets or sets the default value for the CaptionHeight property of containers. (Inherited from Diagram.)
	ContainerHighlightPen	Gets or sets the default value for the HighlightPen property of containers. (Inherited from Diagram.)
	ContainerMargin	Gets or sets the default value for the Margin property of containers. (Inherited from Diagram.)
	ContainerMinimumSize	Gets or sets the default value for the MinimumSize property of containers. (Inherited from Diagram.)
	ContainerNodeStyle	Gets the theme-level style for container nodes. (Inherited from Diagram.)
	ContainersFoldable	Gets or sets the default value for the Foldable property of containers. (Inherited from Diagram.)
	CrossingRadius	Gets or sets the radius length of decorations displayed at link intersection points. (Inherited from Diagram.)
	DefaultShape	Gets or sets the default shape of shape nodes. (Inherited from Diagram.)
	DiagramLinkStyle	Gets the theme-level style for diagram links. (Inherited from Diagram.)
	DiagramStyle	Gets the theme-level style for the diagram. (Inherited from Diagram.)
	Dirty	Gets or sets a value indicating whether the diagram has changed since the last save. (Inherited from Diagram.)
	DisabledHandlesStyle	Gets the visual style of disabled adjustment handles. (Inherited from Diagram.)
	DynamicLinks	Gets or sets the default value for the Dynamic property of new links. (Inherited from Diagram.)
	EffectiveBackBrush	Gets the currently effective background brush of the diagram. (Inherited from Diagram.)
	EffectsProvider	Gets or sets an object used to generate visual effects for shape nodes such as embossment and shadow dispersion. (Inherited from Diagram.)
	EnableEmbossEffects	Gets or sets a value indicating whether emboss effect for shape nodes is enabled. (Inherited from Diagram.)

	EnableLanes	Gets or sets whether lanes are enabled. (Inherited from Diagram.)
	EnableShadowEffects	Gets or sets a value indicating whether the shadow dispersion effect for nodes is enabled. (Inherited from Diagram.)
	EnableSpatialIndex	Gets or sets whether to index item positions for faster hit-testing and viewport clipping queries. (Inherited from Diagram.)
	EnableStyledText	Gets or sets the default value for the EnableStyledText property of new nodes. (Inherited from Diagram.)
	ExpandButtonAction	Gets or sets a value indicating what should happen when a user clicks the [±] button that is displayed near expandable nodes. (Inherited from Diagram.)
	ExpandButtonPosition	Gets or sets where expand/collapse buttons are located relatively to their nodes. (Inherited from Diagram.)
	ExpandOnIncoming	Gets or sets a value, indicating in which direction object hierarchies are expanded. (Inherited from Diagram.)
	ExteriorBrush	Gets or sets the brush used for painting the area outside **Bounds**. (Inherited from Diagram.)
	Factory	Gets a Factory instance that lets you add programmatically new items to the diagram. (Inherited from Diagram.)
	FocusedComponent	Gets or sets the component within this diagram which currently has the input focus. (Inherited from Diagram.)
	FoldedContainerSize	Gets or sets the size of folded containers. (Inherited from Diagram.)
	Font	Gets or sets the default font for new diagram items. (Inherited from Diagram.)
	FreeFormAttractDistance	Gets or sets the radius around dragged free-form adjustment handle in which other points of FreeFormNode are modified too. (Inherited from Diagram.)
	FreeFormTargets	An array of Shape objects used to replace FreeFormNode instances with ShapeNode ones when Behavior is set to LinkFreeShapes or DrawFreeShapes. (Inherited from Diagram.)
	GridColor	Gets or sets the color of the grid points. (Inherited from Diagram.)
	GridOffsetX	Gets or sets the horizontal offset of the first point of the alignment grid. (Inherited from Diagram.)
	GridOffsetY	Gets or sets the vertical offset of the first point of the alignment grid. (Inherited from Diagram.)
	GridPatternHatch	Gets or sets a hatch style used to draw dense alignment grid at low zoom levels. (Inherited from Diagram.)
	GridPatternThreshold	Gets or sets the distance between grid points (in pixels) that triggers drawing using **GridPatternHatch**. (Inherited from Diagram.)
	GridSizeX	Gets or sets the horizontal distance between adjacent grid points. (Inherited from Diagram.)
	GridSizeY	Gets or sets the vertical distance between adjacent grid points. (Inherited from Diagram.)
	GridStyle	Gets or sets the visual style of the alignment grid. (Inherited from Diagram.)
	Groups	Gets a collection of all groups in the diagram. (Inherited from Diagram.)
	HitTestPriority	Gets or sets a value indicating the order in which items are hit-tested. (Inherited from Diagram.)
	Icon	Gets or sets an image associated with the page.
	IconUrl	Gets or sets the URL of the image associated with the page.

	Interaction	Gets an InteractionState instance representing the current action being carried out by the user. (Inherited from Diagram.)
	IsProEdition	Gets a value indicating whether the currently loaded MvcDiagram is a professional version of the control. (Inherited from Diagram.)
	Items	Gets a collection of all items in this diagram. (Inherited from Diagram.)
	LaneGrid	Gets the Grid instance that represents the lane grid. (Inherited from Diagram.)
	Layers	Gets a list of the layers in the current diagram. (Inherited from Diagram.)
	LinkBaseShape	Gets or sets the shape displayed at the base of new links. (Inherited from Diagram.)
	LinkBaseShapeSize	Gets or sets the default size of the base of new links. (Inherited from Diagram.)
	LinkBranchIndicator	Gets or sets a value indicating what shapes to display as markers at points where overlapping Cascading links diverge. (Inherited from Diagram.)
	LinkBrush	Gets or sets the default value for the Brush property of links. (Inherited from Diagram.)
	LinkCascadeOrientation	Gets or sets the initial orientation of the first segment of new cascading links. (Inherited from Diagram.)
	LinkCrossings	Gets or sets how to render the intersection points where links cross their paths. (Inherited from Diagram.)
	LinkCustomDraw	Gets or sets the default type of custom painting done on links. (Inherited from Diagram.)
	LinkEndsMovable	Gets or sets a value indicating whether link ends can be moved by users after the link is created. (Inherited from Diagram.)
	LinkHandlesStyle	Gets or sets the default value for the HandlesStyle property of new links. (Inherited from Diagram.)
	LinkHeadShape	Gets or sets the shape displayed as head of new links. (Inherited from Diagram.)
	LinkHeadShapeSize	Gets or sets the default size of arrowheads. (Inherited from Diagram.)
	LinkHitDistance	Gets or sets a value specifying how far from a link a click is still considered a hit. (Inherited from Diagram.)
	LinkIntermediateShape	Gets or sets the default shape to be displayed in the middle of each segment of links. (Inherited from Diagram.)
	LinkIntermediateShapeSize	Gets or sets the default size of the shapes at middles of link segments. (Inherited from Diagram.)
	LinkMergeIndicator	Gets or sets a value indicating what shapes to display as markers at points where overlapping **Cascading** links merge. (Inherited from Diagram.)
	LinkPen	Gets or sets the default value for the Pen and HeadPen properties of links. (Inherited from Diagram.)
	LinkRouter	Gets or sets the component used to find paths for auto-routed links when diagram nodes are added or their positions change. (Inherited from Diagram.)
	Links	Gets a collection of all DiagramLink objects in the diagram. (Inherited from Diagram.)
	LinkSegments	Gets or sets the default number of link segments. (Inherited from Diagram.)
	LinkShape	Gets or sets the default value of the Shape property of new links. (Inherited from Diagram.)

	LinksRetainForm	Gets or sets whether links should maintain their forms if the nodes linked with those links are moved around. (Inherited from Diagram.)
	LinkText	Gets or sets the default text of links. (Inherited from Diagram.)
	LinkTextStyle	Gets or sets default placement and orientation for links' text. (Inherited from Diagram.)
	MeasureTextRenderingHint	Gets or sets the TextRenderingHint to use when measuring texts. This should be effectively set to the value of DiagramView.TextRenderingHint. (Inherited from Diagram.)
	MeasureUnit	Gets or sets the unit of measure used for logical coordinates in this diagram. (Inherited from Diagram.)
	MergeIndicatorColor	Gets or sets the color of link merge indicators. (Inherited from Diagram.)
	MergeIndicatorSize	Gets or sets the size of link merge indicators. (Inherited from Diagram.)
	MergeThreshold	Gets or sets the maximum distance between adjacent control points of a link at which the respective segments can be merged. (Inherited from Diagram.)
	MinimumNodeSize	Gets or sets the minimum node size that the user is allowed to set. (Inherited from Diagram.)
	ModificationEffect	Gets or sets the visual effect to apply during interactive modification of items. (Inherited from Diagram.)
	NodeEffects	Gets a collection with all effects applied to the nodes of this diagram. (Inherited from Diagram.)
	Nodes	Gets a collection of all DiagramNode objects in the diagram. (Inherited from Diagram.)
	NodesExpandable	Gets or sets a value indicating whether newly created nodes can be expanded. (Inherited from Diagram.)
	NowLoading	Gets a value indicating whether the diagram data is now being loaded from a file. (Inherited from Diagram.)
	PolygonalTextLayout	Gets or sets a value indicating whether to enable the formatting of text inside non-rectangular shape node outlines. (Inherited from Diagram.)
	RecursiveExpand	Gets or sets value indicating how a tree is expanded. (Inherited from Diagram.)
	RenderOptions	Gets the current rendering options for this diagram. (Inherited from Diagram.)
	RestrictItemsToBounds	Gets or sets a value indicating whether users are allowed to place items outside the scrollable area of the diagram. (Inherited from Diagram.)
	RoundedLinks	Gets or sets a value indicating whether the joins between segments of **Polyline** and **Cascading** links should be rounded. (Inherited from Diagram.)
	RoundedLinksRadius	Gets or sets the radius of arc joins of rounded links' segments. (Inherited from Diagram.)
	RoundRectFactor	Gets or sets the relative size of arcs displayed at the corners of rounded rectangles. (Inherited from Diagram.)
	RouteLinks	Gets or sets a value indicating whether links should avoid nodes by going the shortest path from their origin to their destination without crossing any other nodes. (Inherited from Diagram.)
	RoutingOptions	Gets an object, which allows customizing various parameters of the link routing algorithm. (Inherited from Diagram.)
	RowHighlightBrush	Gets or sets the Brush used to fill highlighted table rows. (Inherited from Diagram.)
	ScriptHelper	Gets a ScriptHelper object which can be used in html scripts to instantiate various objects and to call static methods. (Inherited from

		Diagram.)
	SelectAfterCreate	Gets or sets a value indicating whether newly created objects are automatically selected. (Inherited from Diagram.)
	SelectedItemHandlesStyle	Gets the visual style of adjustment handles of selected items. (Inherited from Diagram.)
	Selection	Gets a Selection instance that represents the selection of items in this diagram. (Inherited from Diagram.)
	SelectionOnTop	Gets or sets a value indicating whether selected items should be painted on top of other items. (Inherited from Diagram.)
	SerializationBinder	Gets or sets a SerializationBinder object used to control class loading. (Inherited from Diagram.)
	ShadowBrush	Gets or sets the default brush used to paint the shadows cast by diagram items. (Inherited from Diagram.)
	ShadowOffsetX	Gets or sets the horizontal offset of item shadows. (Inherited from Diagram.)
	ShadowOffsetY	Gets or sets the vertical offset of item shadows. (Inherited from Diagram.)
	ShadowsStyle	Gets or sets the style for rendering shadows. (Inherited from Diagram.)
	ShapeBrush	Gets or sets the default value for the **Brush** property of shape nodes. (Inherited from Diagram.)
	ShapeCustomDraw	Gets or sets the default type of custom painting done for shape nodes. (Inherited from Diagram.)
	ShapeHandlesStyle	Gets or sets the default value for the **HandlesStyle** property of new shape nodes. (Inherited from Diagram.)
	ShapeNodeStyle	Gets the theme-level style for shape nodes. (Inherited from Diagram.)
	ShapeOrientation	Gets or sets the default value for the ShapeOrientation property of shape nodes. (Inherited from Diagram.)
	ShapePen	Gets or sets the default value for the **Pen** property of shape nodes. (Inherited from Diagram.)
	ShapeText	Gets or sets the default text of shape nodes. (Inherited from Diagram.)
	ShowAnchors	Gets or sets a value indicating whether and when node anchor points should be displayed. (Inherited from Diagram.)
	ShowDisabledHandles	Gets or sets a value indicating whether manipulation handles are painted when they are disabled. (Inherited from Diagram.)
	ShowGrid	Gets or sets a value indicating whether the alignment grid is visible. (Inherited from Diagram.)
	ShowHandlesOnDrag	Gets or sets a value indicating whether to display selection handles of objects under the mouse while another object is being modified. (Inherited from Diagram.)
	SnapToAnchor	Gets or sets when link end points should be aligned to the nearest anchor points. (Inherited from Diagram.)
	SortGroupsByZ	Gets or sets a value indicating whether grouped items should be drawn sorted by their z-order while the whole group is being moved. (Inherited from Diagram.)
	Style	Gets or sets the style associated with the diagram. (Inherited from Diagram.)
	SvgNodeStyle	Gets the theme-level style for SVG nodes. (Inherited from Diagram.)
	TableBrush	Gets or sets the default value for the **Brush** property of tables. (Inherited from Diagram.)

	TableCaption	Gets or sets the default text for tables' captions. (Inherited from Diagram.)
	TableCaptionHeight	Gets or sets the default height of table captions. (Inherited from Diagram.)
	TableColumnCount	Gets or sets the default number of table columns. (Inherited from Diagram.)
	TableColumnWidth	Gets or sets the default width of tables' columns. (Inherited from Diagram.)
	TableConnectionStyle	Gets or sets a value indicating whether drawing a link between tables should connect the rows of those tables, or the tables as whole entities. (Inherited from Diagram.)
	TableCustomDraw	Gets or sets the default type of custom painting done on tables. (Inherited from Diagram.)
	TableHandlesStyle	Gets or sets the default value for the **HandlesStyle** property of new tables. (Inherited from Diagram.)
	TableNodeStyle	Gets the theme-level style for table nodes. (Inherited from Diagram.)
	TablePen	Gets or sets the default value for the **Pen** property of tables. (Inherited from Diagram.)
	TableRowCount	Gets or sets the default number of table rows. (Inherited from Diagram.)
	TableRowHeight	Gets or sets the default height of tables' rows. (Inherited from Diagram.)
	TableShape	Gets or sets the default value of the Shape property of new tables. (Inherited from Diagram.)
	TablesScrollable	Gets or sets the default value for the Scrollable property of new tables. (Inherited from Diagram.)
	Tag	Gets or sets custom data associated with this diagram. (Inherited from Diagram.)
	TextColor	Gets or sets the default color of text displayed inside diagram items. (Inherited from Diagram.)
	TextFormat	Gets or sets the default alignment and formatting style for text displayed inside nodes and table cells. (Inherited from Diagram.)
	Theme	Gets or sets the theme associated with the diagram. (Inherited from Diagram.)
	Title	Gets or sets the page title.
	TitleColor	Gets or sets the color of the title when the title is displayed.
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram. (Inherited from Diagram.)
	TouchHitDistance	Specifies distance from adjustment handles at which they are still considered as hit when processing touch input. (Inherited from Diagram.)
	TouchThreshold	Gets or sets the threshold value for easier touch interaction through adjustment handles. (Inherited from Diagram.)
	TreeViewNodeStyle	Gets the theme-level style for tree view nodes. (Inherited from Diagram.)
	UndoManager	Gets a reference to the diagram's UndoManager instance. (Inherited from Diagram.)
	ValidityChecks	Gets or sets a value indicating whether validity checks are performed each time an item is added to the diagram. (Inherited from Diagram.)
	VisioNodeStyle	Gets the theme-level style for Visio nodes. (Inherited from Diagram.)
	XmlOptions	An XmlOptions object providing properties for customizing the XML serialization process. (Inherited from DiagramBase.)

Public Methods

	Name	Description
	AlignPointToGrid	Returns a point of the alignment grid nearest to the one passed as an argument. (Inherited from Diagram.)
	AllowNodeBounds	Determines whether node can be placed at specified coordinates. (Inherited from Diagram.)
	Arrange	Arranges the diagram using the specified graph layout algorithm. (Inherited from Diagram.)
	ArrangeAnimated	Arranges the diagram using the specified graph layout algorithm, and animates items moving to their new positions. (Inherited from Diagram.)
	ArrangeAsync	Arranges the diagram asynchronously using the specified graph layout algorithm. (Inherited from Diagram.)
	ArrangeLinkLabels	Rearranges link labels whose AutoArrange property is enabled. (Inherited from Diagram.)
	ChangeUnit	Sets new **MeasureUnit** value and scales the coordinates of diagram items so that their absolute size remains unchanged. (Inherited from Diagram.)
	ClearAll	Removes all items from the diagram. (Inherited from Diagram.)
	Clone	Creates a copy of this diagram page.
	CopySelection	Overloaded. Creates a copy of specified diagram elements. (Inherited from Diagram.)
	CopyTo	Copies this page's properties and items to specified target diagram.
	CreateImage	Overloaded. Creates a bitmap containing an image of the diagram. (Inherited from Diagram.)
	CreateMeasureGraphics	Creates an IGraphics object that can be used to obtain various string size measurements. (Inherited from Diagram.)
	CreateThemeFromDefaults	Creates a Theme object representing the default properties of the diagram. (Inherited from Diagram.)
	Draw	Renders the diagram on the specified **IGraphics** object. (Inherited from Diagram.)
	DrawAlignmentGuides	Draws the current alignment guides. (Inherited from Diagram.)
	DrawInteraction	Draws the items that the user is currently modifying. (Inherited from Diagram.)
	DrawInteractions	For internal use. (Inherited from Diagram.)
	DrawLayer	Renders all diagram items to the specified graphics. (Inherited from Diagram.)
S	DrawStyledText	Draws a formatted text string, the same way text is drawn in shape nodes whose **EnableStyledText** property is set to **true**. This method lets you display styled text in custom-drawn nodes or links. (Inherited from Diagram.)
	EffectiveTouchHitDistance	Returns **TouchHitDistance** or a default value. (Inherited from Diagram.)
	EnumByReverseZ	Hit-tests diagram items in reverse Z order. (Inherited from Diagram.)
	EnumTopLevelByReverseZ	Hit-tests diagram top-level items in reverse Z order. (Inherited from Diagram.)
	ExecuteCommand	Executes the specified command on this diagram. (Inherited from Diagram.)
	FindGroup	Finds the group that has the specified tag value. (Inherited from Diagram.)

	FindLink	Finds the link that has the specified tag value. (Inherited from Diagram.)
	FindLinkById	Finds the link that has the specified id value. (Inherited from Diagram.)
	FindNode	Finds the node that has the specified tag value. (Inherited from Diagram.)
	FindNodeById	Finds the node that has the specified id value. (Inherited from Diagram.)
	GetContentBounds	Returns the smallest rectangle that bounds all diagram objects. (Inherited from Diagram.)
	GetItemAt	Overloaded. (Inherited from Diagram.)
	GetLinkAt	Overloaded. Finds and returns the link that lies at the specified location. (Inherited from Diagram.)
	GetLinksAt	Returns the links that contain the specified point. (Inherited from Diagram.)
	GetNearestNode	Returns the node nearest to the specified point. (Inherited from Diagram.)
	GetNodeAt	Overloaded. Gets the node that lies at the specified location. (Inherited from Diagram.)
	GetNodesAt	Returns the nodes that contain the specified point. (Inherited from Diagram.)
	GetNodesInViewport	Returns all nodes visible in the current viewport. (Inherited from Diagram.)
	HandleKeyDown	Propagates keyboard input to interested manipulators and components. (Inherited from Diagram.)
	HandleKeyPress	Propagates keyboard input to interested manipulators. (Inherited from Diagram.)
	HandleKeyUp	Propagates keyboard input to interested components. (Inherited from Diagram.)
	HandleMouseMove	Propagates mouse input to interested manipulators. (Inherited from Diagram.)
	HitTestComponents	Tests whether the specified point is within a component of a diagram item and returns this component. (Inherited from Diagram.)
	HitTestLabels	Returns the item label located at specified position. (Inherited from Diagram.)
	HitTestManipulators	Tests whether the specified point is within the manipulator of a diagram object and triggers the manipulator. (Inherited from Diagram.)
	Invalidate	Overloaded. Invalidates the diagram or a region of the diagram, causing it to be repainted. (Inherited from Diagram.)
	InvalidateZOrder	Forces a new sort of the Z order list before next redraw. (Inherited from Diagram.)
	IsClassRegistered	Checks if a class is registered for serialization support. (Inherited from Diagram.)
	IsClientClassRegistered	Checks if a class is registered for JSON serialization support. (Inherited from Diagram.)
	IsItemInteractive	Checks if the specified item can be modified interactively. (Inherited from Diagram.)
	IsItemLocked	Checks if the specified item is locked. (Inherited from Diagram.)
	IsItemVisible	Checks if the specified item is currently visible. (Inherited from Diagram.)
	LoadFromJson	Loads the diagram from a JSON-formatted string. (Inherited from Diagram.)

	LoadFromJsonAsync	Loads the diagram from a JSON-formatted string. (Inherited from Diagram.)
	LoadFromJsonFile	Loads the diagram from a JSON file. (Inherited from Diagram.)
	LoadFromJsonFileAsync	Loads the diagram from a JSON file. (Inherited from Diagram.)
	LoadFromJsonObject	Loads the diagram from a JSON object. (Inherited from Diagram.)
	LoadFromString	Decodes diagram contents from a string that was created with SaveToString. (Inherited from Diagram.)
	LoadFromXml	Overloaded. Loads the contents of an XML diagram document into the control. (Inherited from Diagram.)
	LoadFromXmlAsync	Overloaded. (Inherited from Diagram.)
	LoadSelectionFromJson	(Inherited from Diagram.)
	MeasureString	Overloaded. Measures a text taking into consideration the current affine transform of the diagram. (Inherited from Diagram.)
	Navigate	Selects the nearest item in the specified direction. (Inherited from Diagram.)
	NewInstance	Custom Diagram classes must override this method to return an instance of their type. (Inherited from Diagram.)
	PasteSelection	Adds the specified items and groups to the specified diagram document. (Inherited from Diagram.)
	RaiseCellTextEdited	Raises the CellTextEdited event . (Inherited from Diagram.)
	RaiseCellTextEditing	Raises the CellTextEditing event to validate entering in-place editing mode. (Inherited from Diagram.)
	RaiseClicked	Overloaded. Raises the Clicked event of the diagram or one of the *Clicked events related to diagram items. (Inherited from Diagram.)
	RaiseCreated	Raises the appropriate *Created event according to the type of the specified item. (Inherited from Diagram.)
	RaiseDeleting	Raises the appropriate *Deleting event according to the type of the specified item. (Inherited from Diagram.)
	RaiseDoubleClicked	Overloaded. Raises the DoubleClicked event of the diagram or one of the *DoubleClicked events related to diagram items. (Inherited from Diagram.)
	RaiseLinkTextEdited	Raises the LinkTextEdited event. (Inherited from Diagram.)
	RaiseLinkTextEditing	Raises the LinkTextEditing event to validate entering inplace edit mode. (Inherited from Diagram.)
	RaiseModified	Raises the NodeModified event. (Inherited from Diagram.)
	RaiseMouseHover	Raises the appropriate Pointed event. (Inherited from Diagram.)
	RaiseNodeModifying	Raises the NodeModifying event. (Inherited from DiagramBase.)
	RaiseNodeTextEdited	Raises the NodeTextEdited event. (Inherited from Diagram.)
	RaiseNodeTextEditing	Raises the NodeTextEditing event to validate entering inplace edit mode. (Inherited from Diagram.)
	RaisePasted	Raises the appropriate Pasted event. (Inherited from Diagram.)
	RaiseSelecting	Raises the appropriate Selecting event. (Inherited from Diagram.)
	RaiseTreeItemTextEditing	Raises the TreeItemTextEditing event to validate entering inplace edit mode. (Inherited from Diagram.)
	RaiseViewRemoved	Raises the ViewRemoved event. (Inherited from Diagram.)

	RegisterClass	Overloaded. (Inherited from Diagram.)
	RegisterDefaultStyle	Registers a default style for the objects of the specified type. (Inherited from Diagram.)
	RegisterItemClass	Overloaded. (Inherited from Diagram.)
	ResetAlignmentGuides	For internal use. (Inherited from Diagram.)
	ResizeToFitItem	Resizes the document extents so that the specified item is contained within. (Inherited from Diagram.)
	ResizeToFitItems	Overloaded. Resizes the document scrollable area so it fits all diagram items. (Inherited from Diagram.)
	ResumeLinkRouter	Called when the control ends a batch update operation that might affect many links. (Inherited from Diagram.)
	RouteAllLinks	Overloaded. (Inherited from Diagram.)
	SaveSelectionToJson	Saves the diagram selection to a JSON object. (Inherited from Diagram.)
	SaveToJson	Saves the diagram to a JSON-formatted string. (Inherited from Diagram.)
	SaveToJsonAsync	Saves the diagram to a JSON-formatted string. (Inherited from Diagram.)
	SaveToJsonFile	Saves the diagram into a JSON file. (Inherited from Diagram.)
	SaveToJsonFileAsync	Saves the diagram into a JSON file. (Inherited from Diagram.)
	SaveToJsonObject	Saves the diagram to a JSON object. (Inherited from Diagram.)
	SaveToString	Encodes the diagram contents into an ASCII string using the specified format and optionally clearing the **Dirty** flag. (Inherited from Diagram.)
	SaveToXml	Overloaded. Saves the diagram to an XML document. (Inherited from Diagram.)
	SaveToXmlAsync	Overloaded. (Inherited from Diagram.)
	SetShadowOffset	Sets the default offset at which items shadows are drawn. (Inherited from Diagram.)
	SuspendLinkRouter	Called when the control starts a batch update operation that might affect many links. The diagram collects links specified through Route and RouteAllLinks calls and defers finding their paths to when **ResumeLinkRouter** is called. (Inherited from Diagram.)
	TrackMouseHover	Specifies whether the diagram view should track mouse hover events. (Inherited from DiagramBase.)
	UpdateMeasureTextScale	Gets or sets the scale to use when measuring texts. This should be effectively set to the value of DiagramView.Zoom / 100. (Inherited from Diagram.)
	UpdateRuntimeIndices	For internal use. (Inherited from Diagram.)
	UpdateZOrder	Immediately sorts the Z-order list if Z-order has been invalidated. Otherwise it will be sorted next time the diagram draws its contents. (Inherited from Diagram.)

Protected Methods

	Name	Description
	AddItem	Invoked by the AddItemCmd and RemoveItemCmd classes to effectively add the specified item to the diagram. (Inherited from Diagram.)
	CreateAddItemCmd	Creates an **AddItemCmd** instance that implements undo/redo of adding an item to the diagram. (Inherited from Diagram.)
	CreateModifyItemCmd	Creates a ModifyItemCmd instance that implements undo/redo of item move and resize operations. (Inherited from Diagram.)

	CreateRemoveItemCmd	Creates a **RemoveItemCmd** instance that implements undo/redo of removing an item from the diagram. (Inherited from Diagram.)
	DeleteGroup	Removes the specified group from the group collection. (Inherited from Diagram.)
	Dispose	Clean up any resources being used. (Inherited from Diagram.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from Diagram.)
	OnActionRecorded	Raises the ActionRecorded event. (Inherited from DiagramBase.)
	OnActionRecording	Raises the ActionRecording event. (Inherited from DiagramBase.)
	OnActionRedone	Raises the ActionRedone event. (Inherited from DiagramBase.)
	OnActionUndone	Raises the ActionUndone event. (Inherited from DiagramBase.)
	OnBeginLoad	Raises the BeginLoad event. (Inherited from DiagramBase.)
	OnBoundsChanged	Raises the BoundsChanged event. (Inherited from DiagramBase.)
	OnCellClicked	Raises the CellClicked event. (Inherited from DiagramBase.)
	OnCellDoubleClicked	Raises the CellDoubleClicked event. (Inherited from DiagramBase.)
	OnCellTextEdited	Raises the **CellTextEdited** event. (Inherited from DiagramBase.)
	OnCellTextEditing	Raises the **CellTextEditing** event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnClicked	Raises the **Clicked** event. (Inherited from DiagramBase.)
	OnContainerChildAdded	Raises the ContainerChildAdded event. (Inherited from DiagramBase.)
	OnContainerChildRemoved	Raises the ContainerChildRemoved event. (Inherited from DiagramBase.)
	OnContainerFolded	Raises the ContainerFolded event. (Inherited from DiagramBase.)
	OnContainerPageChanged	Raises the ContainerPageChanged event. (Inherited from DiagramBase.)
	OnContainerUnfolded	Raises the ContainerUnfolded event. (Inherited from DiagramBase.)
	OnContentVisibilityChanged	Raises the ContentVisibilityChanged event. (Inherited from DiagramBase.)
	OnDefaultShapeChanged	Raises the DefaultShapeChanged event. (Inherited from DiagramBase.)
	OnDeserializeTag	Raises the DeserializeTag event. (Inherited from DiagramBase.)
	OnDestinationAnchorChanged	Raises the DestinationAnchorChanged event. (Inherited from DiagramBase.)
	OnDirtyChanged	Raises the DirtyChanged event. (Inherited from DiagramBase.)
	OnDoubleClicked	Raises the **DoubleClicked** event. (Inherited from DiagramBase.)
	OnDrawAdjustmentHandles	Raises the DrawAdjustmentHandles event. (Inherited from DiagramBase.)
	OnDrawAnchorPoint	Raises the DrawAnchorPoint event. (Inherited from DiagramBase.)
	OnDrawBackground	Raises the DrawBackground event. (Inherited from DiagramBase.)
	OnDrawBranchIndicator	Raises the DrawBranchIndicator event. (Inherited from DiagramBase.)
	OnDrawCell	Raises the DrawCell event. (Inherited from DiagramBase.)
	OnDrawForeground	Raises the DrawForeground event. (Inherited from DiagramBase.)
	OnDrawLink	Raises the DrawLink event. (Inherited from DiagramBase.)
	OnDrawNode	Raises the DrawNode event. (Inherited from DiagramBase.)

	OnEndLoad	Raises the EndLoad event. (Inherited from DiagramBase.)
	OnExpandButtonClicked	Raises the ExpandButtonClicked event. (Inherited from DiagramBase.)
	OnGroupDestroyed	Raises the GroupDestroyed event. (Inherited from DiagramBase.)
	OnHitTestAdjustmentHandles	Raises the HitTestAdjustmentHandles event. (Inherited from DiagramBase.)
	OnInitializeLasso	Raises the InitializeLasso event. (Inherited from DiagramBase.)
	OnInitializeLink	Raises the InitializeLink event. (Inherited from DiagramBase.)
	OnInitializeNode	Raises the InitializeNode event. (Inherited from DiagramBase.)
	OnItemAdded	Raises the ItemAdded event. (Inherited from DiagramBase.)
	OnItemRemoved	Raises the ItemRemoved event. (Inherited from DiagramBase.)
	OnJsonDeserializeTag	Raises the JsonDeserializeTag event. (Inherited from DiagramBase.)
	OnJsonSerializeTag	Raises the JsonSerializeTag event. (Inherited from DiagramBase.)
	OnLayerVisibilityChanged	Raises the LayerVisibilityChanged event. (Inherited from DiagramBase.)
	OnLinkActivated	Raises the LinkActivated event. (Inherited from DiagramBase.)
	OnLinkClicked	Raises the LinkClicked event. (Inherited from DiagramBase.)
	OnLinkCreateCancelled	Raises the LinkCreateCancelled event. (Inherited from DiagramBase.)
	OnLinkCreated	Raises the LinkCreated event. (Inherited from DiagramBase.)
	OnLinkCreating	Raises the LinkCreating event. (Inherited from DiagramBase.)
	OnLinkDeactivated	Raises the LinkDeactivated event. (Inherited from DiagramBase.)
	OnLinkDeleted	Raises the LinkDeleted event. (Inherited from DiagramBase.)
	OnLinkDeleting	Raises the LinkDeleting event. (Inherited from DiagramBase.)
	OnLinkDeselected	Raises the LinkDeselected event. (Inherited from DiagramBase.)
	OnLinkDoubleClicked	Raises the LinkDoubleClicked event. (Inherited from DiagramBase.)
	OnLinkHovered	Raises the LinkHovered event. (Inherited from DiagramBase.)
	OnLinkModified	Raises the LinkModified event. (Inherited from DiagramBase.)
	OnLinkModifyCancelled	Raises the LinkModifyCancelled event. (Inherited from DiagramBase.)
	OnLinkModifying	Raises the LinkModifying event. (Inherited from DiagramBase.)
	OnLinkPasted	Raises the LinkPasted event. (Inherited from DiagramBase.)
	OnLinkRouted	Raises the LinkRouted event. (Inherited from DiagramBase.)
	OnLinkSelected	Raises the LinkSelected event. (Inherited from DiagramBase.)
	OnLinkSelecting	Raises the LinkSelecting event. (Inherited from DiagramBase.)
	OnLinkSplit	Raises the LinkSplit event. (Inherited from DiagramBase.)
	OnLinkStartModifying	Raises the LinkStartModifying event. (Inherited from DiagramBase.)
	OnLinkTextEdited	Raises the **LinkTextEdited** event. (Inherited from DiagramBase.)
	OnLinkTextEditing	Raises the **LinkTextEditing** event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnMeasureUnitChanged	Raises the MeasureUnitChanged event. (Inherited from DiagramBase.)
	OnNodeActivated	Raises the NodeActivated event. (Inherited from DiagramBase.)

	OnNodeClicked	Raises the NodeClicked event. (Inherited from DiagramBase.)
	OnNodeCreateCancelled	Raises the NodeCreateCancelled event. (Inherited from DiagramBase.)
	OnNodeCreated	Raises the NodeCreated event. (Inherited from DiagramBase.)
	OnNodeCreating	Raises the NodeCreating event. (Inherited from DiagramBase.)
	OnNodeDeactivated	Raises the NodeDeactivated event. (Inherited from DiagramBase.)
	OnNodeDeleted	Raises the NodeDeleted event. (Inherited from DiagramBase.)
	OnNodeDeleting	Raises the NodeDeleting event. (Inherited from DiagramBase.)
	OnNodeDeselected	Raises the NodeDeselected event. (Inherited from DiagramBase.)
	OnNodeDoubleClicked	Raises the NodeDoubleClicked event. (Inherited from DiagramBase.)
	OnNodeHovered	Raises the NodeHovered event. (Inherited from DiagramBase.)
	OnNodeModified	Raises the **NodeModified** event. (Inherited from DiagramBase.)
	OnNodeModifyCancelled	Raises the NodeModifyCancelled event. (Inherited from DiagramBase.)
	OnNodeModifying	Raises the NodeModifying event. (Inherited from DiagramBase.)
	OnNodePasted	Raises the NodePasted event. (Inherited from DiagramBase.)
	OnNodeSelected	Raises the NodeSelected event. (Inherited from DiagramBase.)
	OnNodeSelecting	Raises the NodeSelecting event. (Inherited from DiagramBase.)
	OnNodeStartModifying	Raises the NodeStartModifying event. (Inherited from DiagramBase.)
	OnNodeTextEdited	Raises the **NodeTextEdited** event. (Inherited from DiagramBase.)
	OnNodeTextEditing	Raises the NodeTextEditing event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnOriginAnchorChanged	Raises the OriginAnchorChanged event. (Inherited from DiagramBase.)
	OnPropertyChanged	Raises the PropertyChanged event.
	OnQueryAlignTarget	Raises the QueryAlignTarget event. (Inherited from DiagramBase.)
	OnRepaint	Raises the Repaint event. (Inherited from DiagramBase.)
	OnRequestClipboard	Raises the RequestClipboard event. (Inherited from DiagramBase.)
	OnRequestDrawInteractions	Raises the RequestDrawInteractions event. (Inherited from DiagramBase.)
	OnRequestTimer	Raises the RequestTimer event. (Inherited from DiagramBase.)
	OnSelectionChanged	Raises the SelectionChanged event. (Inherited from DiagramBase.)
	OnSelectionModified	Raises the SelectionModified event. (Inherited from DiagramBase.)
	OnSelectionModifying	Raises the SelectionModifying event. (Inherited from DiagramBase.)
	OnSerializeTag	Raises the SerializeTag event. (Inherited from DiagramBase.)
	OnSetSelfLoopShape	Raises the SetSelfLoopShape event. (Inherited from DiagramBase.)
	OnShapeModified	Raises the ShapeModified event. (Inherited from DiagramBase.)
	OnShapeNotDefined	Raises the ShapeNotDefined event. (Inherited from DiagramBase.)
	OnTableColumnResized	Raises the TableColumnResized event. (Inherited from DiagramBase.)
	OnTableColumnResizing	Raises the TableColumnResizing event. (Inherited from DiagramBase.)
	OnTableRowResized	Raises the TableRowResized event. (Inherited from DiagramBase.)

	OnTableRowResizing	Raises the TableRowResizing event. (Inherited from DiagramBase.)
	OnTableSectionCollapsed	Raises the TableSectionCollapsed event. (Inherited from DiagramBase.)
	OnTableSectionExpanded	Raises the TableSectionExpanded event. (Inherited from DiagramBase.)
	OnTreeCollapsed	Raises the TreeCollapsed event. (Inherited from DiagramBase.)
	OnTreeExpanded	Raises the TreeExpanded event. (Inherited from DiagramBase.)
	OnTreeItemTextEditing	Raises the **TreeItemTextEditing** event. (Inherited from DiagramBase.)
	OnValidateAnchorPoint	Raises the ValidateAnchorPoint event. (Inherited from DiagramBase.)
	OnValidateLinkCrossing	Raises the ValidateLinkCrossing event. (Inherited from DiagramBase.)
	OnViewRemoved	Raises the **ViewRemoved** event. (Inherited from DiagramBase.)
	RemoveItem	Invoked by the **AddItemCmd** and **RemoveItemCmd** classes to effectively remove the specified item from the diagram. (Inherited from Diagram.)

Public Events

	Name	Description
	ActionRecorded	Raised when an action is recorded in the undo buffer. (Inherited from DiagramBase.)
	ActionRecording	A validation event raised before an action is recorded in the undo buffer. (Inherited from DiagramBase.)
	ActionRedone	Raised when an action is redone. (Inherited from DiagramBase.)
	ActionUndone	Raised when an action is undone. (Inherited from DiagramBase.)
	ActiveLayerChanged	Raised when the diagram's active layer has changed. (Inherited from DiagramBase.)
	BeginLoad	Raised when the component starts loading diagram data from a file or memory stream. (Inherited from DiagramBase.)
	BoundsChanged	Raised when the **Bounds** property value has changed. (Inherited from DiagramBase.)
	CellClicked	Raised when the user clicks a table's cell. (Inherited from DiagramBase.)
	CellDoubleClicked	Raised when the user double-clicks a table's cell. (Inherited from DiagramBase.)
	CellTextEdited	Raised when the user edits the text of a table's cell. (Inherited from DiagramBase.)
	CellTextEditing	A validation event that lets you approve or reject changes made to the text of a table's cell. (Inherited from DiagramBase.)
	Clicked	Raised when the user clicks the diagram at a point where no items are located. (Inherited from DiagramBase.)
	ContainerChildAdded	Raised when a node is added to a ContainerNode, either programmatically or by the user. (Inherited from DiagramBase.)
	ContainerChildRemoved	Raised when a node is removed from a **ContainerNode**, either programmatically or by the user. (Inherited from DiagramBase.)
	ContainerFolded	Raised when the user folds a container by clicking the arrow-up button in the container's caption bar. (Inherited from DiagramBase.)
	ContainerPageChanged	Raised when the user changes current page of a PagedContainerNode. (Inherited from DiagramBase.)
	ContainerUnfolded	Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar. (Inherited from DiagramBase.)

	ContentVisibilityChanged	Raised when the visibility of container's content changes. (Inherited from DiagramBase.)
	DefaultShapeChanged	Raised when the **DefaultShape** property value has changed. (Inherited from DiagramBase.)
	DeserializeTag	Raised when the Tag of a diagram item must be deserialized from XML format. (Inherited from DiagramBase.)
	DestinationAnchorChanged	Raised when the DestinationAnchor property value of a link has changed. (Inherited from DiagramBase.)
	DirtyChanged	Raised when the **Dirty** property value has changed. (Inherited from DiagramBase.)
	DoubleClicked	Raised when the user double-clicks the diagram at a point where no items are located. (Inherited from DiagramBase.)
	DrawAdjustmentHandles	Raised when item's adjustment handles must be custom-drawn. (Inherited from DiagramBase.)
	DrawAnchorPoint	Raised when an anchor point must be custom-drawn. (Inherited from DiagramBase.)
	DrawBackground	Raised to let you custom draw the diagram background. (Inherited from DiagramBase.)
	DrawBranchIndicator	Raised when a branch indicator must be custom-drawn. (Inherited from DiagramBase.)
	DrawCell	Raised when a table's cell must be custom drawn. (Inherited from DiagramBase.)
	DrawForeground	Raised to let you custom draw the diagram foreground. (Inherited from DiagramBase.)
	DrawLink	Raised when a diagram link must be custom drawn. (Inherited from DiagramBase.)
	DrawNode	Raised when a diagram node must be custom drawn. (Inherited from DiagramBase.)
	EndLoad	Raised when the component ends loading diagram data from a file or memory stream. (Inherited from DiagramBase.)
	ExpandButtonClicked	Raised when the user clicks the [±] button of an Expandable node. (Inherited from DiagramBase.)
	GroupDestroyed	Raised when a Group object is destroyed. (Inherited from DiagramBase.)
	HitTestAdjustmentHandles	Raised when custom hit testing of item's adjustment handles must be performed. (Inherited from DiagramBase.)
	InitializeLasso	Raised when the user starts drawing a selection lasso, before it is rendered on screen. (Inherited from DiagramBase.)
	InitializeLink	Raised when the user starts drawing a new link, just after the **DiagramLink** instance is created. (Inherited from DiagramBase.)
	InitializeNode	Raised when the user starts drawing a new node, just after the **DiagramNode** instance is created. (Inherited from DiagramBase.)
	ItemAdded	Raised when an item is added to the diagram, either programmatically or interactively. (Inherited from DiagramBase.)
	ItemRemoved	Raised when an item is removed from the diagram, either programmatically or interactively. (Inherited from DiagramBase.)
	JsonDeserializeTag	Raised when the **Tag** of a diagram item must be deserialized from JSON. (Inherited from DiagramBase.)
	JsonSerializeTag	Raised when the **Tag** of a diagram item must be serialized to JSON. (Inherited from DiagramBase.)

	LayerVisibilityChanged	Raised when the visibility of a Layer changes. (Inherited from DiagramBase.)
	LinkActivated	Raised when a link becomes the **ActiveItem**. (Inherited from DiagramBase.)
	LinkClicked	Raised when the user clicks a link. (Inherited from DiagramBase.)
	LinkCreateCancelled	Raised when the user cancels link creation. (Inherited from DiagramBase.)
	LinkCreated	Raised when the user draws a new link. (Inherited from DiagramBase.)
	LinkCreating	A validation event raised while the user is drawing a new link. (Inherited from DiagramBase.)
	LinkDeactivated	Raised when a link is no longer the **ActiveItem**. (Inherited from DiagramBase.)
	LinkDeleted	Raised when a link is deleted, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkDeleting	Raised when the user tries to delete a link, this event lets you cancel the operation. (Inherited from DiagramBase.)
	LinkDeselected	Raised when a link is deselected, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkDoubleClicked	Raised when the user double-clicks a link. (Inherited from DiagramBase.)
	LinkHovered	Raised when the mouse pointer hovers over a link. (Inherited from DiagramBase.)
	LinkModified	Raised when the user moves any control point of a link. (Inherited from DiagramBase.)
	LinkModifyCancelled	Raised when the user cancels move or resize operation being done on a link. (Inherited from DiagramBase.)
	LinkModifying	A validation event raised while the user is modifying a link. (Inherited from DiagramBase.)
	LinkPasted	Raised when a link has been pasted from the clipboard. (Inherited from DiagramBase.)
	LinkRouted	Raised when a link is routed by the auto-routing algorithm. (Inherited from DiagramBase.)
	LinkSelected	Raised when a link is selected, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkSelecting	Raised when the user tries to select a link, this event lets you cancel the operation. (Inherited from DiagramBase.)
	LinkSplit	Raised when the user splits a link interactively. (Inherited from DiagramBase.)
	LinkStartModifying	A validation event raised when the user starts modifying a link. (Inherited from DiagramBase.)
	LinkTextEdited	Raised when the user edits the text of a link. (Inherited from DiagramBase.)
	LinkTextEditing	A validation event that lets you approve or reject changes made to the text of a link. (Inherited from DiagramBase.)
	MeasureUnitChanged	Raised when the **MeasureUnit** property value has changed. (Inherited from DiagramBase.)
	NodeActivated	Raised when a node becomes the **ActiveItem**. (Inherited from DiagramBase.)
	NodeClicked	Raised when the user clicks a node. (Inherited from DiagramBase.)
	NodeCreateCancelled	Raised when the user cancels node creation. (Inherited from DiagramBase.)

	NodeCreated	Raised when the user draws a new node. (Inherited from DiagramBase.)
	NodeCreating	A validation event raised while the user is drawing a new node. (Inherited from DiagramBase.)
	NodeDeactivated	Raised when a node is no longer the **ActiveItem**. (Inherited from DiagramBase.)
	NodeDeleted	Raised when a node is deleted, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeDeleting	Raised when the user tries to delete a node, this event lets you cancel the operation. (Inherited from DiagramBase.)
	NodeDeselected	Raised when a node is deselected, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeDoubleClicked	Raised when the user double-clicks a node. (Inherited from DiagramBase.)
	NodeHovered	Raised when the mouse pointer hovers over a node. (Inherited from DiagramBase.)
	NodeModified	Raised when the user moves or resizes a node. (Inherited from DiagramBase.)
	NodeModifyCancelled	Raised when the user cancels move or resize operation being done on a node. (Inherited from DiagramBase.)
	NodeModifying	A validation event raised while the user is moving or resizing a node. (Inherited from DiagramBase.)
	NodePasted	Raised when a node has been pasted from the clipboard. (Inherited from DiagramBase.)
	NodeSelected	Raised when a node is selected, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeSelecting	Raised when the user tries to select a node, this event lets you cancel the operation. (Inherited from DiagramBase.)
	NodeStartModifying	A validation event raised when the user starts modifying a node. (Inherited from DiagramBase.)
	NodeTextEdited	Raised when the user edits the text of a node. (Inherited from DiagramBase.)
	NodeTextEditing	A validation event that lets you approve or reject changes made to the text of a node. (Inherited from DiagramBase.)
	OriginAnchorChanged	Raised when the OriginAnchor property value of a link has changed. (Inherited from DiagramBase.)
	PropertyChanged	**INotifyPropertyChanged.PropertyChanged** implementation.
	QueryAlignTarget	Raised to validate a node as target for alignment guides when **AutoAlignNodes** is enabled. (Inherited from DiagramBase.)
	Repaint	Raised when the diagram views should be repainted. (Inherited from DiagramBase.)
	RequestCacheReset	Raised when an object within the diagram requests a reset of the cached bitmap. (Inherited from DiagramBase.)
	RequestClipboard	Raised when an object within the diagram requests an operation with the clipboard. (Inherited from DiagramBase.)
	RequestDrawInteractions	For internal use. (Inherited from DiagramBase.)
	RequestTimer	Raised when an object within the diagram needs to start or stop a timer. (Inherited from DiagramBase.)
	SelectionChanged	Raised when an item is added to or removed from the selection (Inherited from DiagramBase.)

	SelectionModified	Raised when the user moves multiple selected items. (Inherited from DiagramBase.)
	SelectionModifying	Raised while the user is moving multiple selected items, this event lets you cancel the modification. (Inherited from DiagramBase.)
	SerializeTag	Raised when the **Tag** of a diagram item must be serialized into an XML document. (Inherited from DiagramBase.)
	SetSelfLoopShape	Raised when a link becomes a self-loop, giving you a chance to override the default look shape. (Inherited from DiagramBase.)
	ShapeModified	Raised when the user modifies the shape of a ShapeNode by moving one of the control points corresponding to shape formula parameters. (Inherited from DiagramBase.)
	ShapeNotDefined	Raised when the diagram being loaded contains nodes with an undefined shape. (Inherited from DiagramBase.)
	TableColumnResized	Raised when the user finishes resizing a column in a table. (Inherited from DiagramBase.)
	TableColumnResizing	Raised when the user resizes a column in a table interactively. (Inherited from DiagramBase.)
	TableRowResized	Raised when the user finishes resizing a row in a table. (Inherited from DiagramBase.)
	TableRowResizing	Raised when the user resizes a row in a table interactively. (Inherited from DiagramBase.)
	TableSectionCollapsed	Raised when the user collapses the rows of a table's section by clicking the [-] button in the section's header row. (Inherited from DiagramBase.)
	TableSectionExpanded	Raised when the user expands the rows of a table's section by clicking the [+] button in the section's header row. (Inherited from DiagramBase.)
	TreeCollapsed	Raised when a user collapses a tree branch by clicking the [-] button of an **Expandable** node. (Inherited from DiagramBase.)
	TreeExpanded	Raised when a user expands a tree branch by clicking the [+] button of an **Expandable** node. (Inherited from DiagramBase.)
	TreeItemTextEditing	A validation event that lets you approve or reject changes made to the text of a TreeViewNode's item. (Inherited from DiagramBase.)
	ValidateAnchorPoint	A validation event that lets you approve or reject connecting a link to an anchor point. (Inherited from DiagramBase.)
	ValidateLinkCrossing	A validation event that lets you approve or reject displaying a decoration at the intersection point of links. (Inherited from DiagramBase.)
	ViewRemoved	Raised when a DiagramView is detached from this diagram. (Inherited from DiagramBase.)

DiagramPage Constructor

Initializes a new instance of the DiagramPage class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramPage ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

DiagramPage Class
MindFusion.Diagramming Namespace

DiagramPage Methods

DiagramPage.Clone Method

Creates a copy of this diagram page.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Diagram Clone ()
```

Visual Basic Copy Code

```
Public Overrides Function Clone () As Diagram
```

Return Value

See Also

DiagramPage Members
DiagramPage Class
MindFusion.Diagramming Namespace

DiagramPage.CopyTo Method

Copies this page's properties and items to specified target diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void CopyTo (
    Diagram target
)
```

Visual Basic Copy Code

```
Public Overrides Sub CopyTo( _
    target As Diagram _
)
```

Parameters

target
The target diagram.

DiagramPage.OnPropertyChanged Method

Raises the PropertyChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnPropertyChanged (
    PropertyChangedEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnPropertyChanged( _
    e As PropertyChangedEventArgs _
)
```

Parameters

e
An object providing the event data.

DiagramPage Properties

DiagramPage.Icon Property

Gets or sets an image associated with the page.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage Icon { get; set; }
```

Visual Basic Copy Code

```
Public Property Icon As IImage
```

Property Value

A **Microsoft.Maui.Graphics.IImage** object.

DiagramPage.Title Property

Gets or sets the page title.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Title { get; set; }
```

Visual Basic Copy Code

```
Public Property Title As String
```

Property Value

A string value.

DiagramPage.TitleColor Property

Gets or sets the color of the title when the title is displayed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Color TitleColor { get; set; }
```

Visual Basic Copy Code

```
Public Property TitleColor As Color
```

Property Value

A **Microsoft.Maui.Graphics.Color** instance.

DiagramPage Events

DiagramPage.PropertyChanged Event

INotifyPropertyChanged.PropertyChanged implementation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event PropertyChangedEventHandler PropertyChanged
```

Visual Basic Copy Code

```
Public Event PropertyChanged As PropertyChangedEventHandler
```

Event Data

PropertyChanged event handlers receive an argument of type **PropertyChangedEventArgs**.

DiagramPageEventArgs Constructor

Initializes a new instance of the DiagramPageEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramPageEventArgs (
    DiagramPage diagramPage
)
```

Visual Basic Copy Code

```
Public New ( _
    diagramPage As DiagramPage _
)
```

Parameters

diagramPage
The DiagramPage related to the event.

DiagramPageValidationEventArgs Members

Contains the arguments passed to handlers of DiagramPage validation events.

The following tables list the members exposed by the DiagramPageValidationEventArgs type.

Public Constructors

	Name	Description
	DiagramPageValidationEventArgs	Initializes a new instance of the **DiagramPageValidationEventArgs** class.

Public Properties

	Name	Description
	Cancel	Gets or sets a value indicating whether to cancel the current operation.
	DiagramPage	Gets the **DiagramPage** related to the event. (Inherited from DiagramPageEventArgs.)

DiagramPageValidationEventArgs Class
MindFusion.Diagramming Namespace

DiagramPageValidationEventArgs Constructor

Initializes a new instance of the DiagramPageValidationEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramPageValidationEventArgs (
    DiagramPage diagramPage
)
```

Visual Basic Copy Code

```
Public New ( _
    diagramPage As DiagramPage _
)
```

Parameters

diagramPage
The DiagramPage related to the event.

DiagramPageValidationEventArgs Properties

DiagramPageValidationEventArgs.Cancel Property

Gets or sets a value indicating whether to cancel the current operation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Cancel { get; set; }
```

Visual Basic — Copy Code

```
Public Property Cancel As Boolean
```

Property Value

true to cancel the operation; **false** to confirm it.

Remarks

Set this property to **true** to prevent the user from completing the operation.

DiagramStyle Members

Represents a reusable set of properties that define the appearance of diagrams.

The following tables list the members exposed by the DiagramStyle type.

Public Constructors

	Name	Description
	DiagramStyle	Initializes a new instance of the **DiagramStyle** class.

Public Properties

	Name	Description
	BackBrush	Gets or sets the brush used for painting the diagram background.
	Brush	Gets or sets the brush used to fill the interior of items.
	FontFamily	Gets or sets the font family of the item texts.

	FontSize	Gets or sets the font size of the item texts.
	FontStyle	Gets or sets the font style of the item texts.
	FontUnit	Gets or sets the font unit of the item texts.
	NodeEffects	Gets a list with all effects applied to the nodes of this diagram.
	ShadowBrush	Gets or sets the brush used to paint the shadow of the items.
	Stroke	Gets or sets the brush used to paint the outline of the items.
	StrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline items.
	StrokeThickness	Gets or sets the thickness of the items' outline, expressed in the current units of measure.
	TextBrush	Gets or sets the brush used to paint texts inside the items.

Public Methods

	Name	Description
	GetProperties	Gets all properties in the style. (Inherited from Style.)
	GetProperty	Returns the property with the specified name, if any. (Inherited from Style.)
S	RegisterType	Associates a type with an alias. (Inherited from Style.)

Protected Methods

	Name	Description
	GetValue	Gets the value of the specified property. (Inherited from Style.)
	IsPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	LoadFromJson	Loads the style content from a JSON object.
	LoadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from Style.)
	RegisterProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	SaveToJson	Saves the style content into a JsonObject.
	SaveToXml	Saves the style content into an XML element. (Inherited from Style.)
	SetValue	Sets the value of the specified property. (Inherited from Style.)
	UnsetValue	Clears the value of the specified property. (Inherited from Style.)

Public Events

	Name	Description
	PropertyChanged	Raised when any of the registered style properties has changed. (Inherited from Style.)

```
protected virtual void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the style's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

DiagramStyle Members
DiagramStyle Class
MindFusion.Diagramming Namespace

DiagramStyle.SaveToJson Method

Saves the style content into a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject the style's data should be stored into.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

DiagramStyle Properties

DiagramStyle.BackBrush Property

Gets or sets the brush used for painting the diagram background.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush BackBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property BackBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

See Also

DiagramStyle Members
DiagramStyle Class
MindFusion.Diagramming Namespace

DiagramStyle.Brush Property

Gets or sets the brush used to fill the interior of items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush Brush { get; set; }
```

Visual Basic Copy Code

```
Public Property Brush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

See Also

DiagramStyle Members
DiagramStyle Class
MindFusion.Diagramming Namespace

DiagramStyle.FontFamily Property

Gets or sets the font family of the item texts.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string FontFamily { get; set; }
```

Visual Basic Copy Code

```
Public Property FontFamily As String
```

Property Value

A string value.

See Also

DiagramStyle Members
DiagramStyle Class
MindFusion.Diagramming Namespace

DiagramStyle.FontSize Property

Gets or sets the font size of the item texts.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double FontSize { get; set; }
```

Visual Basic Copy Code

```
Public Property FontSize As Double
```

Property Value

A **double** value.

See Also

DiagramStyle Members
DiagramStyle Class
MindFusion.Diagramming Namespace

DiagramStyle.FontStyle Property

Gets or sets the font style of the item texts.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public FontStyle FontStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property FontStyle As FontStyle
```

Property Value

One or more of the members of the **FontStyle** enumeration.

See Also

DiagramStyle Members
DiagramStyle Class
MindFusion.Diagramming Namespace

DiagramStyle.FontUnit Property

Gets or sets the font unit of the item texts.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public GraphicsUnit FontUnit { get; set; }
```

Visual Basic Copy Code

```
Public Property FontUnit As GraphicsUnit
```

Property Value

A member of the **GraphicsUnit** enumeration.

See Also

DiagramStyle Members
DiagramStyle Class
MindFusion.Diagramming Namespace

DiagramStyle.NodeEffects Property

Gets a list with all effects applied to the nodes of this diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IList<NodeEffect> NodeEffects { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property NodeEffects As IList(Of NodeEffect)
```

Property Value

A list of NodeEffect objects.

See Also

DiagramStyle Members

MindFusion.Diagramming Namespace

DiagramStyle.ShadowBrush Property

Gets or sets the brush used to paint the shadow of the items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush ShadowBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property ShadowBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

See Also

DiagramStyle Members
DiagramStyle Class

DiagramStyle.Stroke Property

Gets or sets the brush used to paint the outline of the items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush Stroke { get; set; }
```

Visual Basic

```
Public Property Stroke As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

See Also

DiagramStyle Members

DiagramStyle.StrokeDashStyle Property

Gets or sets the pattern of dashes and gaps used to outline items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public DashStyle StrokeDashStyle { get; set; }
```

Visual Basic

```
Public Property StrokeDashStyle As DashStyle
```

Property Value

A member of the **DashStyle** enumeration.

See Also

DiagramStyle Members
DiagramStyle Class
MindFusion.Diagramming Namespace

DiagramStyle.StrokeThickness Property

Gets or sets the thickness of the items' outline, expressed in the current units of measure.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public double StrokeThickness { get; set; }
```

Visual Basic

```
Public Property StrokeThickness As Double
```

Property Value

A double value.

See Also

DiagramStyle Members

DiagramStyle.TextBrush Property

Gets or sets the brush used to paint texts inside the items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush TextBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property TextBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

DirectionConstraint Enumeration

Defines values that specify in what direction to constrain node movement.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum DirectionConstraint
```

Visual Basic Copy Code

```
Public Enum DirectionConstraint
```

Members

	Member name	Description
	None	No restrictions.
	Horizontal	Users are allowed to move the node horizontally.
	Vertical	Users are allowed to move the node vertically.

Remarks

Values from this enumeration can be assigned to the MoveDirection property of the NodeConstraints class.

DraggedItem Constructor

Initializes a new instance of the DraggedItem class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

Copy Code

```
public DraggedItem (
    DiagramItem item,
    Size size,
    string label = ""
)
```

Visual Basic Copy Code

```
Public New ( _
    item As DiagramItem, _
    size As Size, _
    Optional label As String = "" _
)
```

Parameters

item
The dragged DiagramItem.

size
The size of the item.

label
Optional.
The label to be displayed for the item.

See Also

DraggedItem Class
MindFusion.Diagramming Namespace

DraggedItem Properties

DraggedItem.Diagram Property

The Diagram this item is dropped on.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Diagram Diagram { get; set; }
```

Visual Basic Copy Code

```
Public Property Diagram As Diagram
```

Property Value

See Also

DraggedItem Members

DraggedLink Members

Class used to hold the DiagramLink instance during drag and drop. It is used for easier detection of the dragged content as DragEventArgs.Data.GetData() does not check super classes.

The following tables list the members exposed by the DraggedLink type.

Public Constructors

	Name	Description
	DraggedLink	Initializes a new instance of the DraggedLink class.

Public Properties

	Name	Description
	AutoConnectDistance	
	AutoConnectLinks	
	BaseShape	
	BaseShapeSize	
	Diagram	The Diagram this item is dropped on. (Inherited from DraggedItem.)
	HeadPen	
	HeadShape	
	HeadShapeSize	
	Item	The dragged item. (Inherited from DraggedItem.)

	Label	The text to be displayed for the item. (Inherited from DraggedItem.)
	Link	Returns the dragged DiagramLink.
	Size	The size of the item. (Inherited from DraggedItem.)

Public Methods

	Name	Description
	Connect	Overloaded.
	RestoreState	
	UpdateState

DraggedLink Class
MindFusion.Diagramming Namespace

DraggedLink Constructor

Initializes a new instance of the DraggedLink class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DraggedLink (
    DiagramLink link,
    Size size,
    string label
)
```

Visual Basic Copy Code

```
Public New ( _
    link As DiagramLink, _
    size As Size, _
    label As String _
)
```

Parameters

link
The dragged DiagramLink.

size
The size of the link.

label
The text to be displayed for the link.

MindFusion.Diagramming Namespace

DraggedNode Constructor (DiagramNode, Size, String)

Initializes a new instance of the DraggedNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public DraggedNode (
    DiagramNode node,
    Size size,
    string label
)
```

Visual Basic

```
Public New ( _
    node As DiagramNode, _
    size As Size, _
    label As String _
)
```

Parameters

node
The dragged DiagramNode.

size
The size of the node.

label
The text to be displayed for the node.

DraggedShape Class
MindFusion.Diagramming Namespace

DraggedShape Constructor

Initializes a new instance of the DraggedShape class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DraggedShape (
    string id,
    Size size
)
```

Visual Basic Copy Code

```
Public New ( _
    id As String, _
    size As Size _
)
```

Parameters

id
The Id of the dragged shape.

size
The recommended size of the dragged shape.

See Also

DraggedShape Class

DraggedShape Properties

DraggedShape.Id Property

Gets the Id of the dragged shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Id { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Id As String
```

Property Value

A string specifying the identifier of the dragged shape.

See Also

DraggedShape Members
DraggedShape Class
MindFusion.Diagramming Namespace

DraggedShape.Size Property

Gets the recommended size of the dragged shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Size Size { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Size As Size
```

Property Value

A **Microsoft.Maui.Graphics.Size** specifying the recommended size for the shape.

See Also

DraggedShape Members
DraggedShape Class

DrawAnchorPointEventArgs Members

Contains the arguments passed to the DrawAnchorPoint event handlers.

The following tables list the members exposed by the DrawAnchorPointEventArgs type.

Public Constructors

	Name	Description
	DrawAnchorPointEventArgs	Initializes a new instance of the **DrawAnchorPointEventArgs** class.

Public Properties

	Name	Description
	AnchorIndex	Gets the index of the anchor point within its containing pattern.
	AnchorPattern	Gets the anchor pattern containing the anchor point being drawn.
	Graphics	Gets an object implementing the IGraphics interface whose methods should be used to draw the anchor point mark.
	Location	Gets the location of the anchor point being drawn.
	Node	Gets the node whose anchor point is being drawn.

See Also

DrawAnchorPointEventArgs Class
MindFusion.Diagramming Namespace

DrawAnchorPointEventArgs Constructor

Initializes a new instance of the DrawAnchorPointEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DrawAnchorPointEventArgs (
    IGraphics graphics,
    Point location,
```

```
    DiagramNode node,
    AnchorPattern anchorPattern,
    int anchorIndex
)
```

Visual Basic Copy Code

```
Public New ( _
    graphics As IGraphics, _
    location As Point, _
    node As DiagramNode, _
    anchorPattern As AnchorPattern, _
    anchorIndex As Integer _
)
```

Parameters

graphics
The IGraphics object that represents the target of the drawing operation.

location
The position of the anchor point, expressed in document coordinates.

node
The DiagramNode related to the event.

anchorPattern
The AnchorPattern object whose point is being drawn.

anchorIndex
The zero-based index of the anchor point being drawn within its anchor pattern.

See Also

DrawAnchorPointEventArgs Class
MindFusion.Diagramming Namespace

DrawAnchorPointEventArgs Properties

DrawAnchorPointEventArgs.AnchorIndex Property

Gets the index of the anchor point within its containing pattern.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int AnchorIndex { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property AnchorIndex As Integer
```

Property Value

An integer value specifying the zero-based index of the anchor point within its AnchorPattern.

See Also

DrawAnchorPointEventArgs Members
DrawAnchorPointEventArgs Class

DrawAnchorPointEventArgs.Graphics Property

Gets an object implementing the IGraphics interface whose methods should be used to draw the anchor point mark.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IGraphics Graphics { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Graphics As IGraphics
```

Property Value

An instance of a class implementing the IGraphics interface.

See Also

DrawAnchorPointEventArgs Members
DrawAnchorPointEventArgs Class
MindFusion.Diagramming Namespace

DrawAnchorPointEventArgs.Location Property

Gets the location of the anchor point being drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point Location { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Location As Point
```

Property Value

A **Microsoft.Maui.Graphics.Point** specifying the location of the anchor point.

See Also

DrawAnchorPointEventArgs Members
DrawAnchorPointEventArgs Class
MindFusion.Diagramming Namespace

DrawAnchorPointEventArgs.Node Property

Gets the node whose anchor point is being drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNode Node { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Node As DiagramNode
```

Property Value

An instance of the DiagramNode class.

DrawAnchorPointEventArgs Members
DrawAnchorPointEventArgs Class
MindFusion.Diagramming Namespace

DrawBranchIndicatorEventArgs Class

Contains the arguments passed to the DrawBranchIndicator event handlers.

Syntax

C# Copy Code

```
public class DrawBranchIndicatorEventArgs : EventArgs
```

Visual Basic Copy Code

```
Public Class DrawBranchIndicatorEventArgs
    Inherits EventArgs
```

Inheritance Hierarchy

System.Object
  System.EventArgs
    MindFusion.Diagramming.DrawBranchIndicatorEventArgs

See Also

DrawBranchIndicatorEventArgs Members
MindFusion.Diagramming Namespace

DrawBranchIndicatorEventArgs Members

Contains the arguments passed to the DrawBranchIndicator event handlers.

The following tables list the members exposed by the DrawBranchIndicatorEventArgs type.

Public Properties

	Name	Description
	From	A Vector specifying the direction of the incoming link segment.
	Graphics	Gets an IGraphics object whose methods should be used to draw the branch indicator.
	Merge	A value indicating whether the indicator designates merge or branch point.
	Position	A **Point** specifying the position of the branch indicator.
	To	A **Vector** specifying the direction of the outgoing link segment.

See Also

DrawBranchIndicatorEventArgs Class
MindFusion.Diagramming Namespace

DrawBranchIndicatorEventArgs Properties

DrawBranchIndicatorEventArgs.From Property

A Vector specifying the direction of the incoming link segment.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Vector From { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property From As Vector
```

Property Value

A Vector instance specifying the link direction before the branch point's bend.

See Also

DrawBranchIndicatorEventArgs Members
DrawBranchIndicatorEventArgs Class
MindFusion.Diagramming Namespace

DrawBranchIndicatorEventArgs.Graphics Property

Gets an IGraphics object whose methods should be used to draw the branch indicator.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IGraphics Graphics { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Graphics As IGraphics
```

Property Value

An object implementing the IGraphics interface.

See Also

DrawBranchIndicatorEventArgs Members
DrawBranchIndicatorEventArgs Class
MindFusion.Diagramming Namespace

DrawBranchIndicatorEventArgs.Merge Property

A value indicating whether the indicator designates merge or branch point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Merge { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Merge As Boolean
```

Property Value

true to draw a merge indicator, or **false** to draw a branch indicator.

See Also

DrawBranchIndicatorEventArgs Members
DrawBranchIndicatorEventArgs Class
MindFusion.Diagramming Namespace

DrawBranchIndicatorEventArgs.Position Property

A **Point** specifying the position of the branch indicator.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point Position { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Position As Point
```

Property Value

A **Microsoft.Maui.Graphics.Point** containing coordinates of the indicator.

See Also

DrawBranchIndicatorEventArgs Members
DrawBranchIndicatorEventArgs Class
MindFusion.Diagramming Namespace

DrawBranchIndicatorEventArgs.To Property

A Vector specifying the direction of the outgoing link segment.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Vector To { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property To As Vector
```

Property Value

A Vector instance specifying the link direction after the branch point's bend.

DrawCellEventArgs Class

Contains the arguments passed to the DrawCell event handlers.

Syntax

C# Copy Code

```
public class DrawCellEventArgs : EventArgs
```

Visual Basic Copy Code

```
Public Class DrawCellEventArgs
    Inherits EventArgs
```

Inheritance Hierarchy

System.Object
  System.EventArgs
    MindFusion.Diagramming.DrawCellEventArgs

DrawCellEventArgs Members

Contains the arguments passed to the DrawCell event handlers.

The following tables list the members exposed by the DrawCellEventArgs type.

Public Constructors

	Name	Description
	DrawCellEventArgs	Initializes a new instance of the **DrawCellEventArgs** class.

Public Properties

	Name	Description
	Bounds	Gets the bounding rectangle of the cell being drawn.
	Cell	Gets the cell that should be custom drawn.
	Column	Gets the index of the table's column that contains **Cell**.
	Graphics	An object implementing the IGraphics interface whose methods should be used to draw the cell.
	Row	Gets the index of the table's row that contains **Cell**.
	Table	Get the table that contains **Cell**.

See Also

DrawCellEventArgs Class
MindFusion.Diagramming Namespace

DrawCellEventArgs Constructor

Initializes a new instance of the DrawCellEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DrawCellEventArgs (
    IGraphics graphics,
    TableNode table,
    int column,
    int row,
    Rect bounds
)
```

Visual Basic Copy Code

```
Public New ( _
    graphics As IGraphics, _
    table As TableNode, _
    column As Integer, _
    row As Integer, _
    bounds As Rect _
)
```

Parameters

graphics
The IGraphics object that represents the target of the drawing operation.

table
The TableNode related to the event.

column
The zero-based index of the table column related to the event.

row
The zero-based index of the table row related to the event.

bounds
The bounding rectangle of the cell being drawn.

See Also

DrawCellEventArgs Class
MindFusion.Diagramming Namespace

DrawCellEventArgs Properties

DrawCellEventArgs.Bounds Property

Gets the bounding rectangle of the cell being drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect Bounds { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Bounds As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** specifying the bounding rectangle of the cell.

See Also

DrawCellEventArgs Members
DrawCellEventArgs Class
MindFusion.Diagramming Namespace

DrawCellEventArgs.Cell Property

Gets the cell that should be custom drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.Cell Cell { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Cell As TableNode.Cell
```

Property Value

An instance of the TableNode.Cell class.

See Also

DrawCellEventArgs Members
DrawCellEventArgs Class
MindFusion.Diagramming Namespace

DrawCellEventArgs.Column Property

Gets the index of the table's column that contains Cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Column { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Column As Integer
```

Property Value

An integer value specifying the zero-based index of the column.

See Also

DrawCellEventArgs Members
DrawCellEventArgs Class
MindFusion.Diagramming Namespace

DrawCellEventArgs.Graphics Property

An object implementing the IGraphics interface whose methods should be used to draw the cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IGraphics Graphics { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Graphics As IGraphics
```

Property Value

An instance of a class implementing the IGraphics interface.

See Also

DrawCellEventArgs Members
DrawCellEventArgs Class
MindFusion.Diagramming Namespace

DrawCellEventArgs.Row Property

Gets the index of the table's row that contains Cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Row { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Row As Integer
```

Property Value

An integer value specifying the zero-based index of the row.

DrawCellEventArgs Members
DrawCellEventArgs Class
MindFusion.Diagramming Namespace

DrawCellEventArgs.Table Property

Get the table that contains Cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode Table { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Table As TableNode
```

Property Value

An instance of the TableNode class.

DrawItemEventArgs Members

Contains the arguments passed to the DrawAdjustmentHandles event handlers.

The following tables list the members exposed by the DrawItemEventArgs type.

Public Constructors

	Name	Description
	DrawItemEventArgs	Initializes a new instance of the **DrawItemEventArgs** class.

Public Properties

	Name	Description
	Graphics	Gets an object implementing the IGraphics interface whose methods should be used to draw the adjustment handles.
	Item	Gets the item whose selection handles are being drawn.

See Also

DrawItemEventArgs Class
MindFusion.Diagramming Namespace

DrawItemEventArgs Constructor

Initializes a new instance of the DrawItemEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DrawItemEventArgs (
    IGraphics graphics,
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public New ( _
    graphics As IGraphics, _
    item As DiagramItem _
)
```

Parameters

graphics
The IGraphics object that represents the target of the drawing operation.

item
The DiagramItem related to the event.

DrawItemEventArgs Class
MindFusion.Diagramming Namespace

DrawItemEventArgs Properties

DrawItemEventArgs.Graphics Property

Gets an object implementing the IGraphics interface whose methods should be used to draw the adjustment handles.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IGraphics Graphics { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Graphics As IGraphics
```

Property Value

An instance of a class implementing the IGraphics interface.

See Also

DrawItemEventArgs Members
DrawItemEventArgs Class
MindFusion.Diagramming Namespace

DrawItemEventArgs.Item Property

Gets the item whose selection handles are being drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem Item { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Item As DiagramItem
```

Property Value

An instance of the DiagramItem class.

DrawLinkEventArgs Members

Contains the arguments passed to the DrawLink event handlers.

The following tables list the members exposed by the DrawLinkEventArgs type.

Public Constructors

	Name	Description
	DrawLinkEventArgs	Initializes a new instance of the **DrawLinkEventArgs** class.

Public Properties

	Name	Description
	Graphics	Gets an object implementing the IGraphics interface whose methods should be used to draw the link.
	Link	Gets the DiagramLink object that should be custom drawn.
	Points	Gets a collection of the link's control points.
	Shadow	Gets a value indicating whether the event is raised to draw the link's shadow.

See Also

DrawLinkEventArgs Class
MindFusion.Diagramming Namespace

DrawLinkEventArgs Constructor

Initializes a new instance of the DrawLinkEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DrawLinkEventArgs (
    IGraphics graphics,
    DiagramLink link,
    bool shadow,
    PointCollection points
)
```

Visual Basic Copy Code

```
Public New ( _
    graphics As IGraphics, _
    link As DiagramLink, _
    shadow As Boolean, _
    points As PointCollection _
)
```

Parameters

graphics
The IGraphics object that represents the target of the drawing operation.

link
The DiagramLink related to the event.

shadow
Specifies whether to draw the link's shadow or the link itself.

points
The collection containing the coordinates of the link control points, pretranslated depending on whether drawing the shadow or not.

MindFusion.Diagramming Namespace

DrawLinkEventArgs Properties

DrawLinkEventArgs.Graphics Property

Gets an object implementing the IGraphics interface whose methods should be used to draw the link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IGraphics Graphics { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Graphics As IGraphics
```

Property Value

An instance of a class implementing the IGraphics interface.

See Also

DrawLinkEventArgs Members
DrawLinkEventArgs Class
MindFusion.Diagramming Namespace

DrawLinkEventArgs.Link Property

Gets the DiagramLink object that should be custom drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink Link { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Link As DiagramLink
```

Property Value

An instance of the DiagramLink class.

See Also

DrawLinkEventArgs Members
DrawLinkEventArgs Class
MindFusion.Diagramming Namespace

DrawLinkEventArgs.Points Property

Gets a collection of the link's control points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PointCollection Points { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Points As PointCollection
```

Property Value

An instance of the PointCollection class.

Remarks

When drawing shadows, the points are offset as necessary.

MindFusion.Diagramming Namespace

DrawLinkEventArgs.Shadow Property

Gets a value indicating whether the event is raised to draw the link's shadow.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Shadow { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Shadow As Boolean
```

Property Value

true if now drawing the link's shadow; otherwise, **false**.

MindFusion.Diagramming Namespace

DrawNodeEventArgs Constructor

Initializes a new instance of the DrawNodeEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DrawNodeEventArgs (
    IGraphics graphics,
    DiagramNode node,
    bool shadow,
    Rect bounds
)
```

Visual Basic Copy Code

```
Public New ( _
    graphics As IGraphics, _
    node As DiagramNode, _
    shadow As Boolean, _
    bounds As Rect _
)
```

Parameters

graphics
The IGraphics object that represents the target of the drawing operation.

node
The DiagramNode related to the event.

shadow
Specifies whether to draw the node's shadow or the node itself.

bounds
The bounding rectangle of the node being drawn.

DrawNodeEventArgs Properties

DrawNodeEventArgs.Bounds Property

Gets the bounding rectangle of the node being drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect Bounds { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Bounds As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** specifying the bounding rectangle of the node being drawn.

Remarks

When drawing shadows, the rectangle is offset as necessary.

DummyNode Class

Represents virtual nodes used for disconnected links.

Syntax

C# Copy Code

```
public class DummyNode : DiagramNode
```

Visual Basic Copy Code

```
Public Class DummyNode
    Inherits DiagramNode
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.DiagramItem
    MindFusion.Diagramming.DiagramNode
      MindFusion.Diagramming.DummyNode

See Also

DummyNode Members
MindFusion.Diagramming Namespace

DummyNode Members

Represents virtual nodes used for disconnected links.

The following tables list the members exposed by the DummyNode type.

Public Constructors

	Name	Description
	DummyNode	Initializes a new instance of the **DummyNode** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)

	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)

	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	DiagramItem.ContainsPoint override.
	CreateConnectionPoint	DiagramNode.CreateConnectionPoint override.
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override.
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override.
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	DiagramItem.DrawShadow override.

	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	DiagramNode.GetIntersection override.
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the smallest distance from the specified point.
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override.
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)

	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)

DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
LoadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
LoadFromXml	DiagramItem.LoadFromXml override. (Inherited from DiagramNode.)
LoadObsolete	For internal use. (Inherited from DiagramItem.)
OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
Repaint	Overloaded. (Inherited from DiagramItem.)
RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)
RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)

	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramNode.)
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

DummyNode Class
MindFusion.Diagramming Namespace

DummyNode Constructor

Initializes a new instance of the DummyNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DummyNode (
    Diagram parent
)
```

Visual Basic Copy Code

```
Public New ( _
    parent As Diagram _
)
```

Parameters

parent
The Diagram this node will be associated with.

DummyNode Methods

DummyNode.ContainsPoint Method

DiagramItem.ContainsPoint override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool ContainsPoint (
    Point point
)
```

Visual Basic Copy Code

```
Public Overrides Function ContainsPoint( _
    point As Point _
) As Boolean
```

Parameters

point
The point to check.

Return Value

DummyNode.CreateConnectionPoint Method

DiagramNode.CreateConnectionPoint override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override ConnectionPoint CreateConnectionPoint (
    DiagramLink link,
    Point point,
    bool incoming
)
```

Visual Basic Copy Code

```
Public Overrides Function CreateConnectionPoint( _
    link As DiagramLink, _
    point As Point, _
    incoming As Boolean _
) As ConnectionPoint
```

Parameters

link

point

incoming

Return Value

DummyNode.Draw Method

DiagramItem.Draw override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void Draw (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub Draw( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
The IGraphics surface to draw the item on.

options
A RenderOptions object specifying options for the drawing operation.

DummyNode.DrawHandles Method

DiagramItem.DrawHandles override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawHandles (
    IGraphics graphics,
    HandlesVisualStyle style,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawHandles( _
    graphics As IGraphics, _
    style As HandlesVisualStyle, _
    options As RenderOptions _
)
```

Parameters

graphics

style

options

DummyNode.DrawShadow Method

DiagramItem.DrawShadow override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawShadow (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawShadow( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
The IGraphics surface to draw the shadow on.

options
A RenderOptions object specifying options for the drawing operation.

EditCellTextEventArgs Members

Contains the arguments passed to the CellTextEdited event handlers.

The following tables list the members exposed by the EditCellTextEventArgs type.

Public Constructors

	Name	Description
	EditCellTextEventArgs	Initializes a new instance of the **EditCellTextEventArgs** class.

Public Properties

	Name	Description
	Cell	Get the cell whose text has been edited.
	Column	Gets the index of the table's column that contains **Cell**.
	NewText	Gets the text that has just been entered by the user.
	OldText	Gets the text that had been displayed in the cell before the user edited it.
	Row	Gets the index of the table's row that contains **Cell**.
	Table	Get the table that contains **Cell**.

EditCellTextEventArgs Class
MindFusion.Diagramming Namespace

EditCellTextEventArgs Constructor

Initializes a new instance of the EditCellTextEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public EditCellTextEventArgs (
    TableNode.Cell cell,
    string oldText,
    string newText,
    int column,
    int row
)
```

Visual Basic Copy Code

```
Public New ( _
    cell As TableNode.Cell, _
    oldText As String, _
    newText As String, _
    column As Integer, _
    row As Integer _
)
```

Parameters

cell
The TableNode.Cell related to the event.

oldText
The old text of the cell.

newText
The new text of the cell.

column
The zero-based index of the table column related to the event.

row
The zero-based index of the table row related to the event.

EditCellTextEventArgs Properties

EditCellTextEventArgs.Cell Property

Get the cell whose text has been edited.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.Cell Cell { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Cell As TableNode.Cell
```

Property Value

An instance of the TableNode.Cell class.

See Also

EditCellTextEventArgs Members

EditCellTextEventArgs.Column Property

Gets the index of the table's column that contains Cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Column { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Column As Integer
```

Property Value

An integer value specifying the zero-based index of the column.

MindFusion.Diagramming Namespace

EditLinkTextEventArgs Constructor

Initializes a new instance of the EditLinkTextEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public EditLinkTextEventArgs (
    DiagramLink link,
    string oldText,
```

```
    string newText
)
```

Visual Basic Copy Code

```
Public New ( _
    link As DiagramLink, _
    oldText As String, _
    newText As String _
)
```

Parameters

link
The link whose text is edited.

oldText
The old value of the link's Text.

newText
The new value of the link's Text.

EditNodeTextEventArgs Class
MindFusion.Diagramming Namespace

EditNodeTextEventArgs Constructor

Initializes a new instance of the EditNodeTextEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public EditNodeTextEventArgs (
    DiagramNode node,
    string oldText,
    string newText
)
```

Visual Basic Copy Code

```
Public New ( _
    node As DiagramNode, _
    oldText As String, _
    newText As String _
)
```

Parameters

node
The DiagramNode related to the event.

oldText
The old text of the node.

newText
The new text of the node.

See Also

EditNodeTextEventArgs Class

EditNodeTextEventArgs Properties

EditNodeTextEventArgs.Label Property

Gets or sets a NodeLabel related to this event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeLabel Label { get; set; }
```

Visual Basic Copy Code

```
Public Property Label As NodeLabel
```

Property Value

A NodeLabel instance.

Remarks

This property is set to **null** when the user edits node's main Text. It has a value only if user edits a supplementary node label.

ElementTemplate Members

Represents an element of a shape definition. This is the parent class of specific element types, such as ArcTemplate, LineTemplate and BezierTemplate.

The following tables list the members exposed by the ElementTemplate type.

Protected Constructors

	Name	Description
	ElementTemplate	Initializes a new instance of the **ElementTemplate** class.

Public Properties

	Name	Description
	Color	Gets or sets the outline color of this element.
	DashStyle	Gets or sets the dash style of the outline of this element.
	Width	Gets or sets the outline width of this element.

Public Methods

	Name	Description
	Clone	Creates an exact copy of this element.
	SameAs	Checks whether the current element and the specified element resemble each other closely enough to be considered identical.

Protected Methods

	Name	Description
	GetElementPen	Gets a pen used to render the element. If no pen properties are explicitly specified for this element, returns the pen passed as an argument.

ElementTemplate Members
ElementTemplate Class
MindFusion.Diagramming Namespace

ElementTemplate.GetElementPen Method

Gets a pen used to render the element. If no pen properties are explicitly specified for this element, returns the pen passed as an argument.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected Pen GetElementPen (
    Pen pen
)
```

Visual Basic Copy Code

```
Protected Function GetElementPen( _
    pen As Pen _
) As Pen
```

Parameters

pen
The Pen object specifying the base pen.

Return Value

See Also

ElementTemplate Members
ElementTemplate Class
MindFusion.Diagramming Namespace

ElementTemplate.SameAs Method

Checks whether the current element and the specified element resemble each other closely enough to be considered identical.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public abstract bool SameAs (
    ElementTemplate obj
)
```

Visual Basic — Copy Code

```
Public MustOverride Function SameAs( _
    obj As ElementTemplate _
) As Boolean
```

Parameters

obj
The ElementTemplate to compare to this element.

Return Value

true if the specified object closely approximates this element; otherwise, **false**.

See Also

ElementTemplate Members
ElementTemplate Class
MindFusion.Diagramming Namespace

ElementTemplate Properties

ElementTemplate.Color Property

Gets or sets the outline color of this element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# — Copy Code

```
public Color Color { get; set; }
```

Visual Basic — Copy Code

```
Public Property Color As Color
```

Property Value

A **Microsoft.Maui.Graphics.Color** specifying the color of the outline.

See Also

ElementTemplate Members
ElementTemplate Class
MindFusion.Diagramming Namespace

ElementTemplate.DashStyle Property

Gets or sets the dash style of the outline of this element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# — Copy Code

```
public DashStyle DashStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property DashStyle As DashStyle
```

Property Value

A member of the **DashStyle** enumeration specifying the style of the outline.

See Also

ElementTemplate Members
ElementTemplate Class
MindFusion.Diagramming Namespace

ElementTemplate.Width Property

Gets or sets the outline width of this element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Width { get; set; }
```

Visual Basic Copy Code

```
Public Property Width As Double
```

Property Value

A **double** value specifying the width of the outline.

See Also

MindFusion.Diagramming Namespace

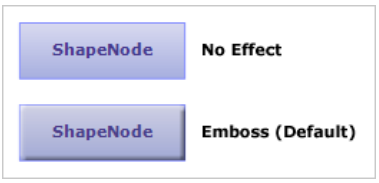
EmbossEffect Class

Represents an emboss effect.

Syntax

C# Copy Code

```
public sealed class EmbossEffect : NodeEffect
```



Visual Basic Copy Code

```
Public NotInheritable Class EmbossEffect
    Inherits NodeEffect
```

Remarks

This effect can be applied to the nodes in a Diagram by adding an instance of this class to the NodeEffects collection. In addition, this effect will be active only when the Diagram.EffectsProvider property is set to an object implementing the GenerateEmboss method of the IEffectsProvider interface.

The following image illustrates the Emboss effect applied to a rectangular node:

Example

The following example demonstrates how to apply emboss effect to the nodes of an existing diagram.

C# Copy Code

```
diagram.NodeEffects.Add(new EmbossEffect());
```

Visual Basic Copy Code

```
diagram.NodeEffects.Add(New EmbossEffect())
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.NodeEffect
    MindFusion.Diagramming.EmbossEffect

See Also

EmbossEffect Members
MindFusion.Diagramming Namespace

EmbossEffect Members

Represents an emboss effect.

The following tables list the members exposed by the EmbossEffect type.

Public Constructors

	Name	Description
	EmbossEffect	Initializes a new instance of the **EmbossEffect** class.

Public Methods

	Name	Description
	Clone	NodeEffect.Clone override.

Public Events

	Name	Description
	PropertyChanged	INotifyPropertyChanged.PropertyChanged implementation. (Inherited from NodeEffect.)

See Also

EmbossEffect Class
MindFusion.Diagramming Namespace

EmbossEffect Constructor

Initializes a new instance of the EmbossEffect class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public EmbossEffect ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

EmbossEffect Class
MindFusion.Diagramming Namespace

EmbossEffect Methods

EmbossEffect.Clone Method

NodeEffect.Clone override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Object Clone ()
```

Visual Basic Copy Code

```
Public Overrides Function Clone () As Object
```

Return Value

The copy of this effect.

EmbossEffect Events

ExpandButtonAction Enumeration

Specifies what action is triggered by the [±] buttons that are displayed near expandable nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum ExpandButtonAction
```

Visual Basic Copy Code

```
Public Enum ExpandButtonAction
```

Members

	Member name	Description
	ExpandTreeBranch	Expands or collapses the children of a node in a tree-like diagram and raises the TreeExpanded or TreeCollapsed event.
	RaiseEvents	Raises the ExpandButtonClicked event.

Remarks

The members of this enumeration can be assigned to the ExpandButtonAction property of the Diagram class.

See Also

MindFusion.Diagramming Namespace

ExpandButtonPosition Enumeration

Defines values that specify possible locations for expand/collapse buttons.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum ExpandButtonPosition
```

Visual Basic Copy Code

```
Public Enum ExpandButtonPosition
```

Members

	Member name	Description
	OuterRight	Place expand/collapse buttons at the right-hand side of their nodes.
	OuterLowerRight	Place expand/collapse buttons at the lower-right corner of their nodes.
	OuterUpperRight	Place expand/collapse buttons at the upper-right corner of their nodes.
	OuterBottom	Place expand/collapse buttons at the bottom side of their nodes.
	OuterLeft	Place expand/collapse buttons at the left-hand side of their nodes.
	OuterLowerLeft	Place expand/collapse buttons at the lower-left corner of their nodes.
	OuterUpperLeft	Place expand/collapse buttons at the upper-left corner of their nodes.
	OuterTop	Place expand/collapse buttons at the top side of their nodes.

Remarks

Assign values from this enumeration to the ExpandButtonPosition property of the Diagram class.

MindFusion.Diagramming Namespace

Factory Members

Provides shortcut methods for creating and adding instances of the standard MvcDiagram item types. Call the class methods through the Factory property of the Diagram class.

The following tables list the members exposed by the Factory type.

Public Constructors

	Name	Description
	Factory	Initializes a new instance of the **Factory** class over the specified **Diagram**.

Public Methods

	Name	Description
	CreateContainerNode	Overloaded. Creates a new ContainerNode instance and adds it to the Nodes collection of the underlying diagram.
	CreateDiagramLink	Overloaded. Creates a new DiagramLink instance and adds it to the Links collection of the underlying diagram.
	CreateGroup	Creates a new hierarchical Group with the specified main item.
	CreatePagedContainerNode	Overloaded.
	CreateShapeNode	Overloaded. Creates a new ShapeNode instance and adds it to the **Nodes** collection of the underlying diagram.
	CreateSvgNode	Overloaded. Creates a new SvgNode instance.
	CreateTableNode	Overloaded. Creates a new TableNode instance and adds it to the **Nodes** collection of the underlying diagram.
	CreateTreeViewNode	Overloaded. Creates a new TreeViewNode instance.

Factory Class
MindFusion.Diagramming Namespace

Factory Constructor

Initializes a new instance of the Factory class over the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Factory (
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram _
)
```

Parameters

diagram
The Diagram object for which to create the new factory.

See Also

Factory Class
MindFusion.Diagramming Namespace

Factory Methods

Factory.CreateContainerNode Method

Creates a new ContainerNode instance and adds it to the Nodes collection of the underlying diagram.

Overload List

Name	Description
Factory.CreateContainerNode (Double, Double, Double, Double)	Creates a new **ContainerNode** instance at the specified location with the specified size and adds it to the **Nodes** collection of the underlying diagram.
Factory.CreateContainerNode (Double, Double, Double, Double, Boolean)	Creates a new **ContainerNode** instance at the specified location with the specified size, optionally foldable, and adds it to the **Nodes** collection of the underlying diagram.
Factory.CreateContainerNode (Point, Size)	Creates a new **ContainerNode** instance at the specified location with the specified size and adds it to the **Nodes** collection of the underlying diagram.
Factory.CreateContainerNode (Point, Size, Boolean)	Creates a new **ContainerNode** instance at the specified location with the specified size, optionally foldable, and adds it to the **Nodes** collection of the underlying diagram.
Factory.CreateContainerNode (Rect)	Creates a new **ContainerNode** instance with the specified dimensions and adds it to the **Nodes** collection of the underlying diagram.
Factory.CreateContainerNode (Rect, Boolean)	Creates a new **ContainerNode** instance with the specified dimensions, optionally foldable, and adds it to the **Nodes** collection of the underlying diagram.

See Also

Factory.CreateContainerNode Method (Double, Double, Double, Double)

Creates a new ContainerNode instance at the specified location with the specified size and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerNode CreateContainerNode (
    double x,
    double y,
    double width,
    double height
)
```

Visual Basic Copy Code

```
Public Function CreateContainerNode( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double _
) As ContainerNode
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

Return Value

The newly created ContainerNode instance.

Remarks

The method creates a container node at the position specified by x and y. The size of the container is set by *width* and *height*. For further customization of the node, use the properties and methods of the ContainerNode class.

Factory.CreateContainerNode Method (Double, Double, Double, Double, Boolean)

Creates a new ContainerNode instance at the specified location with the specified size, optionally foldable, and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerNode CreateContainerNode (
    double x,
    double y,
    double width,
    double height,
    bool foldable
)
```

Visual Basic Copy Code

```
Public Function CreateContainerNode( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double, _
    foldable As Boolean _
) As ContainerNode
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

foldable
true if the container can be folded; otherwise, **false**.

Return Value

The newly created ContainerNode instance.

Remarks

The method creates a container node at the position specified by *x* and *y*. The size of the container is set by *width* and *height*. The parameter *foldable* specifies whether the container node is initially foldable. For further customization of the node, use the properties and methods of the ContainerNode class.

Factory.CreateContainerNode Method (Point, Size)

Creates a new ContainerNode instance at the specified location with the specified size and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerNode CreateContainerNode (
    Point location,
    Size size
)
```

Visual Basic Copy Code

```
Public Function CreateContainerNode( _
    location As Point, _
    size As Size _
) As ContainerNode
```

Parameters

location

The location of the ContainerNode object.

size

The size of the **ContainerNode** object.

Return Value

The newly created **ContainerNode** instance.

Remarks

The method creates a container node at the position specified by *location*. The size of the container is set by *size*. For further customization of the node, use the properties and methods of the ContainerNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerNode CreateContainerNode (
    Point location,
    Size size,
    bool foldable
)
```

Visual Basic Copy Code

```
Public Function CreateContainerNode( _
    location As Point, _
    size As Size, _
    foldable As Boolean _
) As ContainerNode
```

Parameters

location
The location of the ContainerNode object.

size
The newly created **ContainerNode** instance.

foldable
true if the container can be folded; otherwise, **false**.

Return Value

The newly created **ContainerNode** instance.

Remarks

The method creates a container node at the position specified by *location*. The size of the container is set by *size*. The parameter *foldable* specifies whether the container node is initially foldable. For further customization of the node, use the properties and methods of the ContainerNode class.

Factory.CreateContainerNode Method (Rect)

Creates a new ContainerNode instance with the specified dimensions and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerNode CreateContainerNode (
    Rect bounds
)
```

Visual Basic Copy Code

```
Public Function CreateContainerNode( _
    bounds As Rect _
) As ContainerNode
```

Parameters

bounds
The initial bounding rectangle of the new node.

Return Value

The newly created ContainerNode instance.

Remarks

The method creates a container node with the position and size specified by *bounds*. For further customization of the node, use the properties and methods of the ContainerNode class.

Factory.CreateDiagramLink Method

Creates a new DiagramLink instance and adds it to the Links collection of the underlying diagram.

Overload List

Name	Description
Factory.CreateDiagramLink (DiagramNode, DiagramNode)	Creates a new **DiagramLink** instance between the specified nodes and adds it to the **Links** collection of the underlying diagram.
Factory.CreateDiagramLink (DiagramNode, Point)	Creates a new **DiagramLink** instance between the specified node and the specified point, and adds it to the **Links** collection of the underlying diagram.
Factory.CreateDiagramLink (DiagramNode, TableNode, Int32)	Creates a new **DiagramLink** instance between the specified nodes and the specified table, and adds it to the **Links** collection of the underlying diagram.
Factory.CreateDiagramLink (Point, DiagramNode)	Creates a new **DiagramLink** instance between the specified point and the specified node, and adds it to the **Links** collection of the underlying diagram.

Factory.CreateDiagramLink (Point, Point)	Creates a new **DiagramLink** instance between the specified points and adds it to the **Links** collection of the underlying diagram.
Factory.CreateDiagramLink (ShapeNode, Int32, ShapeNode, Int32)	Creates a new **DiagramLink** instance between the specified nodes and adds it to the **Links** collection of the underlying diagram.
Factory.CreateDiagramLink (TableNode, Int32, DiagramNode)	Creates a new **DiagramLink** instance between the specified table and the specified node, and adds it to the **Links** collection of the underlying diagram.
Factory.CreateDiagramLink (TableNode, Int32, TableNode, Int32)	Creates a new **DiagramLink** instance between the specified tables and adds it to the **Links** collection of the underlying diagram.
Factory.CreateDiagramLink (TableNode, TableNode)	Creates a new **DiagramLink** instance between the specified tables and adds it to the **Links** collection of the underlying diagram.
Factory.CreateDiagramLink (TreeViewNode, TreeViewItem, TreeViewNode, TreeViewItem)	Creates a new **DiagramLink** instance between the specified tree items and adds it to the **Links** collection of the underlying diagram.

Factory.CreateDiagramLink Method (DiagramNode, DiagramNode)

Creates a new DiagramLink instance between the specified nodes and adds it to the Links collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink CreateDiagramLink (
    DiagramNode origin,
    DiagramNode destination
)
```

Visual Basic Copy Code

```
Public Function CreateDiagramLink( _
    origin As DiagramNode, _
    destination As DiagramNode _
) As DiagramLink
```

Parameters

origin
The origin node.

destination
The destination node.

Return Value

The newly created DiagramLink instance.

Remarks

The method creates a link connecting the nodes specified by *origin* and *destination*. For further customization of the link, use the properties and methods of the DiagramLink class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink CreateDiagramLink (
    DiagramNode origin,
    Point destination
)
```

Visual Basic Copy Code

```
Public Function CreateDiagramLink( _
    origin As DiagramNode, _
    destination As Point _
) As DiagramLink
```

Parameters

origin
The origin node.

destination
The destination point.

Return Value

The newly created DiagramLink instance.

Remarks

The method creates a link connecting the node specified by *origin* and the point specified by *destination*. For further customization of the link, use the properties and methods of the DiagramLink class.

    DiagramNode origin,
```

```
    TableNode destination,
    int destRow
)
```

Visual Basic Copy Code

```
Public Function CreateDiagramLink( _
    origin As DiagramNode, _
    destination As TableNode, _
    destRow As Integer _
) As DiagramLink
```

Parameters

origin
The origin node.

destination
The destination node.

destRow
The zero-based index of the destination table row of the new link.

Return Value

The newly created DiagramLink instance.

Remarks

The method creates a link connecting the node specified by *origin* and the table specified by *destination*. For further customization of the link, use the properties and methods of the DiagramLink class.

    origin As ShapeNode, _
    originAnchor As Integer, _
    destination As ShapeNode, _
    destAnchor As Integer _
) As DiagramLink
```

Parameters

origin
The origin node.

originAnchor
The index of an anchor point within the origin node's AnchorPattern.

destination
The destination node.

destAnchor
The index of an anchor point within the destination node's **AnchorPattern**.

Return Value

The newly created DiagramLink instance.

Remarks

The method creates a link connecting the shape nodes specified by *origin* and *destination*. For further customization of the link, use the properties and methods of the DiagramLink class.

    destinationItem As TreeViewItem _
) As DiagramLink
```

Parameters

origin
The origin node.

originItem
The origin item.

destination
The destination node.

destinationItem
The destination item.

Return Value

The newly created DiagramLink instance.

See Also

CreateDiagramLink Method Overload List
Factory Members
Factory Class
MindFusion.Diagramming Namespace

Factory.CreateGroup Method

Creates a new hierarchical Group with the specified main item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Group CreateGroup (
    DiagramItem mainItem
)
```

Visual Basic Copy Code

```
Public Function CreateGroup( _
    mainItem As DiagramItem _
) As Group
```

Parameters

mainItem
The DiagramItem around which the group would be built.

Return Value

The newly created Group instance if successfully created; otherwise **null** (**Nothing** in Visual Basic).

Remarks

Use this method to create an hierarchical group of items. Attach subordinated items by using the various Group members.

Factory.CreatePagedContainerNode Method

Overload List

Name	Description
Factory.CreatePagedContainerNode (Double, Double, Double, Double)	Creates a new PagedContainerNode instance at the specified location with the specified size and adds it to the Nodes collection of the underlying diagram.
Factory.CreatePagedContainerNode (Double, Double, Double, Double, IEnumerable(String))	Creates a new PagedContainerNode instance at the specified location with the specified size and page titles, and adds it to the Nodes collection of the underlying diagram.
Factory.CreatePagedContainerNode (Point, Size)	Creates a new PagedContainerNode instance at the specified location with the specified size and adds it to the Nodes collection of the underlying diagram.
Factory.CreatePagedContainerNode (Point, Size, IEnumerable(String))	Creates a new PagedContainerNode instance at the specified location with the specified size and page titles, and adds it to the Nodes collection of the underlying diagram.
Factory.CreatePagedContainerNode (Rect)	Creates a new PagedContainerNode instance with the specified dimensions and adds it to the Nodes collection of the underlying diagram.
Factory.CreatePagedContainerNode (Rect, IEnumerable(String))	Creates a new PagedContainerNode instance with the specified dimensions and page titles, and adds it to the Nodes collection of the underlying diagram.

Factory.CreatePagedContainerNode Method (Double, Double, Double, Double)

Creates a new PagedContainerNode instance at the specified location with the specified size and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PagedContainerNode CreatePagedContainerNode (
    double x,
    double y,
    double width,
    double height
)
```

Visual Basic Copy Code

```
Public Function CreatePagedContainerNode( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double _
) As PagedContainerNode
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

Return Value

The newly created PagedContainerNode instance.

Remarks

The method creates a paged container node at the position specified by x and y. The size of the container is set by width and height.

Factory.CreatePagedContainerNode Method (Double, Double, Double, Double, IEnumerable(String))

Creates a new PagedContainerNode instance at the specified location with the specified size and page titles, and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PagedContainerNode CreatePagedContainerNode (
    double x,
    double y,
    double width,
    double height,
    IEnumerable<string> pageTitles
)
```

Visual Basic Copy Code

```
Public Function CreatePagedContainerNode( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double, _
    pageTitles As IEnumerable(Of String) _
) As PagedContainerNode
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

pageTitles
A list of strings specifying the titles of the initial pages.

Return Value

The newly created PagedContainerNode instance.

Remarks

The method creates a paged container node at the position specified by x and y. The size of the container is set by width and height. The parameter pageTitles specifies the titles of the initial pages of the container.

Factory.CreatePagedContainerNode Method (Point, Size)

Creates a new PagedContainerNode instance at the specified location with the specified size and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PagedContainerNode CreatePagedContainerNode (
    Point location,
    Size size
)
```

Visual Basic Copy Code

```
Public Function CreatePagedContainerNode( _
    location As Point, _
    size As Size _
) As PagedContainerNode
```

Parameters

location
The location of the PagedContainerNode object.

size
The size of the PagedContainerNode object.

Return Value

The newly created PagedContainerNode instance.

Remarks

The method creates a paged container node at the position specified by location. The size of the container is set by size.

Creates a new PagedContainerNode instance at the specified location with the specified size and page titles, and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PagedContainerNode CreatePagedContainerNode (
    Point location,
    Size size,
    IEnumerable<string> pageTitles
)
```

Visual Basic Copy Code

```
Public Function CreatePagedContainerNode( _
    location As Point, _
    size As Size, _
    pageTitles As IEnumerable(Of String) _
) As PagedContainerNode
```

Parameters

location
The location of the PagedContainerNode object.

size
The size of the PagedContainerNode object.

pageTitles
A list of strings specifying the titles of the initial pages.

Return Value

The newly created PagedContainerNode instance.

Remarks

The method creates a paged container node at the position specified by location. The size of the container is set by size. The parameter pageTitles specifies the titles of the initial pages of the container.

Syntax

C# Copy Code

```
public PagedContainerNode CreatePagedContainerNode (
    Rect bounds
)
```

Visual Basic Copy Code

```
Public Function CreatePagedContainerNode( _
    bounds As Rect _
) As PagedContainerNode
```

Parameters

bounds
The initial bounding rectangle of the new node.

Return Value

The newly created PagedContainerNode instance.

Remarks

The method creates a paged container node with the position and size specified by bounds.

Creates a new PagedContainerNode instance with the specified dimensions and page titles, and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PagedContainerNode CreatePagedContainerNode (
    Rect bounds,
    IEnumerable<string> pageTitles
)
```

Visual Basic Copy Code

```
Public Function CreatePagedContainerNode( _
    bounds As Rect, _
    pageTitles As IEnumerable(Of String) _
) As PagedContainerNode
```

Parameters

bounds
The initial bounding rectangle of the new node.

pageTitles
A list of strings specifying the titles of the initial pages.

Return Value

The newly created PagedContainerNode instance.

Remarks

The method creates a paged container node with the position and size specified by bounds. The parameter pageTitles specifies the titles of the initial pages of the container.

Factory.CreateShapeNode Method

Creates a new ShapeNode instance and adds it to the Nodes collection of the underlying diagram.

Overload List

Name	Description
Factory.CreateShapeNode (Double, Double, Double, Double)	Creates a new **ShapeNode** instance at the specified position with the specified size and adds it to the **Nodes** collection of the underlying diagram.
Factory.CreateShapeNode (Double, Double, Double, Double, Shape)	Creates a new **ShapeNode** instance at the specified position with the specified size and shape, and adds it to the **Nodes** collection of the underlying diagram.
Factory.CreateShapeNode (Point, Size)	Creates a new **ShapeNode** instance at the specified position with the specified size and adds it to the **Nodes** collection of the underlying diagram.
Factory.CreateShapeNode (Point, Size, Shape)	Creates a new **ShapeNode** instance at the specified position with the specified size and shape, and adds it to the **Nodes** collection of the underlying diagram.
Factory.CreateShapeNode (Rect)	Creates a new **ShapeNode** instance with the specified dimensions and adds it to the **Nodes** collection of the underlying diagram.
Factory.CreateShapeNode (Rect, Shape)	Creates a new **ShapeNode** instance with the specified dimensions and shape, and adds it to the **Nodes** collection of the underlying diagram.

See Also

Factory.CreateShapeNode Method (Double, Double, Double, Double)

Creates a new ShapeNode instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShapeNode CreateShapeNode (
    double x,
    double y,
    double width,
    double height
)
```

Visual Basic Copy Code

```
Public Function CreateShapeNode( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double _
) As ShapeNode
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

Return Value

The newly created ShapeNode instance.

Remarks

The method creates a shape node at the position specified by *x* and *y*. The size of the node is set by *width* and *height*. For further customization of the node, use the properties and methods of the ShapeNode class.

Factory.CreateShapeNode Method (Double, Double, Double, Double, Shape)

Creates a new ShapeNode instance at the specified position with the specified size and shape, and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShapeNode CreateShapeNode (
    double x,
    double y,
    double width,
    double height,
    Shape shape
)
```

Visual Basic Copy Code

```
Public Function CreateShapeNode( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double, _
    shape As Shape _
) As ShapeNode
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

shape
The shape of the new node.

Return Value

The newly created ShapeNode instance.

Remarks

The method creates a shape node at the position specified by *x* and *y*. The size of the node is set by *width* and *height*. The shape of the new node is specified by *shape*. For further customization of the node, use the properties and methods of the ShapeNode class.

C# Copy Code

```
public ShapeNode CreateShapeNode (
    Point location,
    Size size
)
```

Visual Basic Copy Code

```
Public Function CreateShapeNode( _
    location As Point, _
    size As Size _
) As ShapeNode
```

Parameters

location

The position of the new node.

size

The size of the new node.

Return Value

The newly created ShapeNode instance.

Remarks

The method creates a shape node at the position specified by *location*. The size of the node is set by *size*. For further customization of the node, use the properties and methods of the ShapeNode class.

    Shape shape
)
```

Visual Basic Copy Code

```
Public Function CreateShapeNode( _
    location As Point, _
    size As Size, _
```

```
    shape As Shape _
) As ShapeNode
```

Parameters

location
The position of the new node.

size
The size of the new node.

shape
The shape of the new node.

Return Value

The newly created ShapeNode instance.

Remarks

The method creates a shape node at the position specified by *location*. The size of the node is set by *size*. The shape of the new node is specified by *shape*. For further customization of the node, use the properties and methods of the ShapeNode class.

Creates a new SvgNode instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SvgNode CreateSvgNode (
    double x,
    double y,
    double width,
    double height
)
```

Visual Basic Copy Code

```
Public Function CreateSvgNode( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double _
) As SvgNode
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

Return Value

The newly created SvgNode instance.

Remarks

The method creates an SVG node at the position specified by *x* and *y*. The size of the node is set by *width* and *height*.

Creates a new SvgNode instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SvgNode CreateSvgNode (
    double x,
    double y,
    double width,
    double height,
    SvgContent content
)
```

Visual Basic Copy Code

```
Public Function CreateSvgNode( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double, _
    content As SvgContent _
) As SvgNode
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

content
The content of the new node.

Return Value

The newly created SvgNode instance.

Remarks

The method creates an SVG node at the position specified by *x* and *y*. The size of the node is set by *width* and *height*.

Factory Members
Factory Class
MindFusion.Diagramming Namespace

Factory.CreateSvgNode Method (Point, Size, SvgContent)

Creates a new SvgNode instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SvgNode CreateSvgNode (
    Point location,
    Size size,
    SvgContent content
)
```

Visual Basic Copy Code

```
Public Function CreateSvgNode( _
    location As Point, _
    size As Size, _
```

```
    content As SvgContent _
) As SvgNode
```

Parameters

location
The position of the new node.

size
The size of the new node.

content
The content of the new node.

Return Value

The newly created SvgNode instance.

Remarks

The method creates an SVG node at the position specified by *location*. The size of the node is set by *size*.

Example

The following example illustrates how to create new **SvgContent** from an SVG file and how to create an SvgNode based on this content. The variable *diagram* references an existing Diagram object and *fileName* contains the name of the SVG file to load.

C# Copy Code

```
SvgNode node = diagram.Factory.CreateSvgNode(0, 0, 20, 20);

SvgContent content = new SvgContent();
content.Parse(fileName);

node.Content = content;
```

Visual Basic Copy Code

```
Dim node As SvgNode = diagram.Factory.CreateSvgNode(0, 0, 20, 20)

Dim content As New SvgContent()
content.Parse(fileName)

node.Content = content
```

Factory.CreateTableNode Method (Double, Double, Double, Double)

Creates a new TableNode instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode CreateTableNode (
    double x,
    double y,
    double width,
    double height
)
```

Visual Basic Copy Code

```
Public Function CreateTableNode( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double _
) As TableNode
```

Parameters

x
The x-coordinate of the upper-left corner of the new table.

y
The y-coordinate of the upper-left corner of the new table.

width
The width of the new table.

height
The height of the new table.

Return Value

The newly created TableNode instance.

Remarks

The method creates a table node at the position specified by *x* and *y*. The size of the node is set by *width* and *height*. For further customization of the node, use the properties and methods of the TableNode class.

Factory.CreateTableNode Method (Double, Double, Double, Double, Int32, Int32)

Creates a new TableNode instance at the specified position with the specified size and the specified number of columns and rows, and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode CreateTableNode (
    double x,
    double y,
    double width,
    double height,
    int columns,
    int rows
)
```

Visual Basic Copy Code

```
Public Function CreateTableNode( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double, _
    columns As Integer, _
    rows As Integer _
) As TableNode
```

Parameters

x
The x-coordinate of the upper-left corner of the new table.

y
The y-coordinate of the upper-left corner of the new table.

width

The width if the new table.

height
The height of the new table.

columns
The initial number of columns in the table.

rows
The initial number of rows in the table.

Return Value

The newly created TableNode instance.

Remarks

The method creates a table node at the position specified by *x* and *y*. The size of the node is set by *width* and *height*. The initial number of columns and rows in the table is specified by *columns* and *rows* respectively. For further customization of the node, use the properties and methods of the TableNode class.

Diagram.AlignPointToGrid Method

Factory.CreateTableNode Method (Point, Size)

Creates a new TableNode instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode CreateTableNode (
    Point location,
    Size size
)
```

Visual Basic Copy Code

```
Public Function CreateTableNode( _
    location As Point, _
    size As Size _
) As TableNode
```

Parameters

location
The position of the new table.

size
The size of the new table.

Return Value

The newly created TableNode instance.

Remarks

The method creates a table node at the position specified by *location*. The size of the node is set by *size*. For further customization of the node, use the properties and methods of the TableNode class.

Factory.CreateTableNode Method (Point, Size, Int32, Int32)

Creates a new TableNode instance at the specified position with the specified size and with the specified number of columns and rows, and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode CreateTableNode (
    Point location,
    Size size,
    int columns,
    int rows
)
```

Visual Basic Copy Code

```
Public Function CreateTableNode( _
    location As Point, _
    size As Size, _
    columns As Integer, _
    rows As Integer _
) As TableNode
```

Parameters

location
The position of the new table.

size
The size of the new table.

columns
The initial number of columns in the table.

rows
The initial number of rows in the table.

Return Value

The newly created TableNode instance.

Remarks

The method creates a table node at the position specified by *location*. The size of the node is set by *size*. The initial number of columns and rows in the table is specified by *columns* and *rows* respectively. For further customization of the node, use the properties and methods of the TableNode class.

Factory.CreateTableNode Method (Rect)

Creates a new TableNode instance with the specified dimensions and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode CreateTableNode (
    Rect bounds
)
```

Visual Basic Copy Code

```
Public Function CreateTableNode( _
    bounds As Rect _
) As TableNode
```

Parameters

bounds
The bounding rectangle of the new table.

Return Value

The newly created TableNode instance.

Remarks

The method creates a table node with dimensions specified by *bounds*. For further customization of the node, use the properties and methods of the TableNode class.

Creates a new TableNode instance with the specified dimensions and with the specified number of columns and rows, and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode CreateTableNode (
    Rect bounds,
    int columns,
    int rows
)
```

Visual Basic Copy Code

```
Public Function CreateTableNode( _
    bounds As Rect, _
    columns As Integer, _
    rows As Integer _
) As TableNode
```

Parameters

bounds
The bounding rectangle of the new table.

columns
The initial number of columns in the table.

rows
The initial number of rows in the table.

Return Value

The newly created TableNode instance.

Remarks

The method creates a table node with dimensions specified by *bounds*. The initial number of columns and rows in the table is specified by *columns* and *rows* respectively. For further customization of the node, use the properties and methods of the TableNode class.

Factory.CreateTreeViewNode Method (Double, Double, Double, Double)

Creates a new TreeViewNode instance at the specified position with the specified size and adds it to the Nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TreeViewNode CreateTreeViewNode (
    double x,
    double y,
    double width,
    double height
)
```

Visual Basic Copy Code

```
Public Function CreateTreeViewNode( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double _
) As TreeViewNode
```

Parameters

x
The x-coordinate of the upper-left corner of the new node.

y
The y-coordinate of the upper-left corner of the new node.

width
The width of the new node.

height
The height of the new node.

Return Value

The newly created TreeViewNode instance.

Remarks

The method creates a treeview node at the position specified by *x* and *y*. The size of the node is set by *width* and *height*.

FitSize Enumeration

Specifies how the ResizeToFitText method should resize a node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

Copy Code

```
public enum FitSize
```

Visual Basic Copy Code

```
Public Enum FitSize
```

Members

	Member name	Description
	KeepWidth	Specifies that the original node width should remain intact.
	KeepHeight	Specifies that the original node height should remain intact.
	KeepRatio	Allows changing both the width and height of a node, but keep the original width/height ratio if possible.

MindFusion.Diagramming Namespace

FreeFormHandle Members

Represents an adjustment handle used to modify the outline of a FreeFormNode.

The following tables list the members exposed by the FreeFormHandle type.

Public Constructors

	Name	Description
	FreeFormHandle	Initializes a new instance of the **FreeFormHandle** class.

Public Properties

	Name	Description
	PointIndex	Gets or sets the index of a point from FreeFormNode.Points collection that is being modified through this handle.

Public Methods

	Name	Description
	IsMoveHandle	Returns a value indicating whether this handle is used to move items. (Inherited from AdjustmentHandle.)
	IsResizeHandle	Gets whether this adjustment handle resizes the item. (Inherited from AdjustmentHandle.)
	IsRotationHandle	Gets whether this adjustment handle changes item's rotation angle. (Inherited from AdjustmentHandle.)

FreeFormHandle Properties

FreeFormHandle.PointIndex Property

Gets or sets the index of a point from FreeFormNode.Points collection that is being modified through this handle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int PointIndex { get; set; }
```

Visual Basic Copy Code

```
Public Property PointIndex As Integer
```

Property Value

An integer value.

FreeFormHandle Members
FreeFormHandle Class
MindFusion.Diagramming Namespace

FreeFormNode Class

A **FreeFormNode** collects all points from users' mouse or touch input and displays them as node's outline.

Syntax

C# Copy Code

```
public class FreeFormNode : DiagramNode
```

Visual Basic Copy Code

```
Public Class FreeFormNode
    Inherits DiagramNode
```

Remarks

To let users draw free-form nodes interactively, set **Behavior** to DrawFreeForms or **LinkFreeForms**. Use the Points property of **FreeFormNode** to get or set outline points programmatically. If the Closed property is set, the node is drawn as a closed shape and its interior filled, or otherwise the node is drawn as a polyline. If the distance between first and last points drawn by user is shorter than AutoCloseDistance, the node's **Closed** property is automatically set to **true**. **AutoCloseDistance** default value is **float.MaxValue**, so free-form nodes are always closed.

Inheritance Hierarchy

FreeFormNode Members

A FreeFormNode collects all points from users' mouse or touch input and displays them as node's outline.

The following tables list the members exposed by the **FreeFormNode** type.

Public Constructors

	Name	Description
	FreeFormNode	Overloaded.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Closed	Gets or sets if the node's shape is closed.
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	ConvertToShape	Gets or sets whether the **FreeFormNode** currently being drawn should be replaced by a matching ShapeNode.
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)

	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Points	Gets or sets the node's outline points.
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed inside this node.
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)

	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded.
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	Draws the node using the specified IGraphics surface.
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramNode.DrawHandles override.
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	Draws the shadow of this node on the specified **IGraphics** surface.

	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline.
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	DiagramNode.GetOutlinePoly override.
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramNode.HitTestHandle override.
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)

	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	StandardShapeReplacement	Returns a replacement **ShapeNode** that most closely matches this node's position and outline shape.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	UpdateFromPoints	Updates the node's internal state after its points have changed.
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramNode.AllowCreate override.
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramNode.CancelModify override.
	CompleteCreate	DiagramNode.CompleteCreate override.
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override.

	CreateState	DiagramNode.CreateState override.
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object.
	LoadFromXml	Loads the item content from an XML element.
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	DiagramNode.OnUpdateBounds override.
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramNode.RestoreProperties override.
	RestoreState	DiagramNode.RestoreState override.

	SaveProperties	DiagramNode.SaveProperties override.
	SaveState	DiagramNode.SaveState override.
	SaveToJson	Saves the node as a JSON object.
	SaveToXml	Saves the item content into an XML element.
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramNode.StartCreate override.
	StartModify	DiagramNode.StartModify override.
	UpdateCreate	DiagramNode.UpdateCreate override.
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override.

MindFusion.Diagramming Namespace

FreeFormNode Constructor (FreeFormNode)

Initializes a new instance of the FreeFormNode class using the specified node as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public FreeFormNode (
    FreeFormNode prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As FreeFormNode _
)
```

Parameters

prototype
The node to use as a prototype. The properties of the new node are initialized from the property values of this node.

FreeFormNode Methods

FreeFormNode.AllowCreate Method

DiagramNode.AllowCreate override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override bool AllowCreate (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Function AllowCreate( _
    current As Point, _
    ist As InteractionState _
) As Boolean
```

Parameters

current
The current mouse pointer position.

ist
An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the creation of this node; otherwise, **false**.

FreeFormNode.CancelModify Method

DiagramNode.CancelModify override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void CancelModify (
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub CancelModify( _
    ist As InteractionState _
)
```

Parameters

ist
An InteractionState object containing more information about the current state of the operation.

FreeFormNode.CompleteCreate Method

DiagramNode.CompleteCreate override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void CompleteCreate (
    Point end
)
```

Visual Basic Copy Code

```
Protected Overrides Sub CompleteCreate( _
    end As Point _
)
```

Parameters

end
The mouse pointer position.

FreeFormNode.ContainsPoint Method (Point, Double)

DiagramItem.ContainsPoint override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool ContainsPoint (
    Point point,
    double threshold
)
```

Visual Basic Copy Code

```
Public Overrides Function ContainsPoint( _
    point As Point, _
    threshold As Double _
) As Boolean
```

Parameters

point

threshold

Return Value

FreeFormNode.CreateProperties Method

DiagramItem.CreateProperties override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override DiagramItemProperties CreateProperties ()
```

Visual Basic Copy Code

```
Protected Overrides Function CreateProperties () As DiagramItemProperties
```

Return Value

A DiagramItemProperties-derived object containing a snapshot of the item's properties.

FreeFormNode.CreateState Method

DiagramNode.CreateState override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override DiagramItemState CreateState ()
```

Visual Basic

```
Protected Overrides Function CreateState () As DiagramItemState
```

Return Value

An instance of the DiagramItemState class.

FreeFormNode.Draw Method

Draws the node using the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override void Draw (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic

```
Public Overrides Sub Draw( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics

An IGraphics object where the node should be rendered.

options

Provides options for the drawing operation.

See Also

FreeFormNode Members
FreeFormNode Class
MindFusion.Diagramming Namespace

FreeFormNode.DrawHandles Method

DiagramNode.DrawHandles override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override void DrawHandles (
    IGraphics graphics,
    HandlesVisualStyle hstyle,
    RenderOptions options
)
```

Visual Basic

```
Public Overrides Sub DrawHandles( _
    graphics As IGraphics, _
    hstyle As HandlesVisualStyle, _
    options As RenderOptions _
)
```

Parameters

graphics
The IGraphics surface to draw the handles on.

hstyle
The style that should be used to render the handles.

options
Provides options for the drawing operation.

MindFusion.Diagramming Namespace

FreeFormNode.DrawShadow Method

Draws the shadow of this node on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override void DrawShadow (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic

```
Public Overrides Sub DrawShadow( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
An IGraphics object where the shadow should be rendered.

options
Provides options for the drawing operation.

FreeFormNode.GetIntersection Method

Calculates the intersection point between the segment defined by the specified point pair and the node's outline.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Point GetIntersection (
    Point segmentStart,
    Point segmentEnd
)
```

Visual Basic Copy Code

```
Public Overrides Function GetIntersection( _
    segmentStart As Point, _
    segmentEnd As Point _
) As Point
```

Parameters

segmentStart
The first point of the segment.

segmentEnd
The second point of the segment.

Return Value

A **Microsoft.Maui.Graphics.Point** representing the intersection point.

FreeFormNode.GetOutlinePoly Method

DiagramNode.GetOutlinePoly override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override PointCollection GetOutlinePoly (
    bool rendering
)
```

Visual Basic Copy Code

```
Public Overrides Function GetOutlinePoly( _
    rendering As Boolean _
) As PointCollection
```

Parameters

rendering

Return Value

A PointCollection containing the node's outline points.

FreeFormNode.HitTestHandle Method

DiagramNode.HitTestHandle override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override AdjustmentHandle HitTestHandle (
    Point point,
    double distance
)
```

Visual Basic Copy Code

```
Public Overrides Function HitTestHandle( _
    point As Point, _
    distance As Double _
) As AdjustmentHandle
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** specifying where to look for a selection handle.

distance
Maximum distance from a handle at which it is still considered as hit.

Return Value

Returns an AdjustmentHandle instance representing the adjustment handle found at the specified location, or **null** if there is none.

Remarks

FreeFormNode can return either a FreeFormHandle to modify the node's outline, or a NodeAdjustmentHandle to move or resize the node.

FreeFormNode.LoadFromJson Method

Loads the node from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

FreeFormNode.LoadFromXml Method

Loads the item content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** containing the item's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void RestoreProperties (
    DiagramItemProperties props
)
```

Visual Basic Copy Code

```
Protected Overrides Sub RestoreProperties( _
    props As DiagramItemProperties _
)
```

Parameters

props
A DiagramItemProperties-derived object containing a snapshot of the item's properties.

FreeFormNode.SaveToJson Method

Saves the node as a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

FreeFormNode Members

FreeFormNode.SaveToXml Method

Saves the item content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An XmlElement the item's data should be stored into.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

FreeFormNode.StandardShapeReplacement Method

Returns a replacement ShapeNode that most closely matches this node's position and outline shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShapeNode StandardShapeReplacement (
    Shape[] shapes,
    Shape defaultShape
)
```

Visual Basic Copy Code

```
Public Function StandardShapeReplacement( _
    shapes() As Shape, _
    defaultShape As Shape _
) As ShapeNode
```

Parameters

shapes

An array of Shapes against which the free-form outline is matched.

defaultShape

The default shape to assign to the node if there is no match.

Return Value

A ShapeNode instance.

FreeFormNode.StartCreate Method

DiagramNode.StartCreate override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void StartCreate (
    Point org
)
```

Visual Basic

```
Protected Overrides Sub StartCreate( _
    org As Point _
)
```

Parameters

org
Position of the mouse pointer.

See Also

FreeFormNode.StartModify Method

DiagramNode.StartModify override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected override void StartModify (
    Point org,
    AdjustmentHandle handle,
    InteractionState ist
)
```

Visual Basic

```
Protected Overrides Sub StartModify( _
    org As Point, _
    handle As AdjustmentHandle, _
    ist As InteractionState _
)
```

Parameters

org
Position of the mouse pointer.

handle
The adjustment handle used to modify this node.

ist
An InteractionState object containing more information about the current state of the operation.

```
protected override void UpdateModify (
    Point current,
    InteractionState ist
)
```

Visual Basic

```
Protected Overrides Sub UpdateModify( _
    current As Point, _
```

```
    ist As InteractionState _
)
```

Parameters

current
Position of the mouse pointer.

ist
An InteractionState object containing more information about the current state of the operation.

FreeFormNode Properties

FreeFormNode.Closed Property

Gets or sets if the node's shape is closed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Closed { get; set; }
```

Visual Basic Copy Code

```
Public Property Closed As Boolean
```

Property Value

A boolean value.

See Also

FreeFormNode Members
FreeFormNode Class

FreeFormNode.ConvertToShape Property

Gets or sets whether the FreeFormNode currently being drawn should be replaced by a matching ShapeNode.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ConvertToShape { get; set; }
```

Visual Basic Copy Code

```
Public Property ConvertToShape As Boolean
```

Property Value

A boolean value.

MindFusion.Diagramming Namespace

FreeFormNodeStyle Members

Represents a reusable set of properties that define the appearance of free-form nodes.

The following tables list the members exposed by the FreeFormNodeStyle type.

Public Constructors

	Name	Description
	FreeFormNodeStyle	Initializes a new instance of the **FreeFormNodeStyle** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	Effects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	FontFamily	Gets or sets the font family of the item text. (Inherited from DiagramItemStyle.)
	FontSize	Gets or sets the font size of the item text. (Inherited from DiagramItemStyle.)
	FontStyle	Gets or sets the font style of the item text. (Inherited from DiagramItemStyle.)
	FontUnit	Gets or sets the font unit of the item text. (Inherited from DiagramItemStyle.)
	ShadowBrush	Gets or sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	Stroke	Gets or sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	StrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline items. (Inherited from DiagramItemStyle.)

	StrokeThickness	Gets or sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)

Public Methods

	Name	Description
	GetProperties	Gets all properties in the style. (Inherited from Style.)
	GetProperty	Returns the property with the specified name, if any. (Inherited from Style.)
S	RegisterType	Associates a type with an alias. (Inherited from Style.)

Protected Methods

	Name	Description
	GetValue	Gets the value of the specified property. (Inherited from Style.)
	IsPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	LoadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	LoadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from Style.)
	RegisterProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	SaveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	SaveToXml	Saves the style content into an XML element. (Inherited from Style.)
	SetValue	Sets the value of the specified property. (Inherited from Style.)
	UnsetValue	Clears the value of the specified property. (Inherited from Style.)

Public Events

	Name	Description
	PropertyChanged	Raised when any of the registered style properties has changed. (Inherited from Style.)

FreeFormNodeStyle Class
MindFusion.Diagramming Namespace

FreeFormNodeStyle Events

GlassEffect Class

Represents a glass-like visual effect.

Syntax

C# — Copy Code

```
public sealed class GlassEffect : NodeEffect
```

Visual Basic — Copy Code

```
Public NotInheritable Class GlassEffect
    Inherits NodeEffect
```

Remarks

This effect can be applied to the nodes in a Diagram by adding an instance of this class to the NodeEffects collection.

The following image illustrates the Glass effect applied to an item as well as how the different properties affect the output:

Example

The following example demonstrates how to apply glass effect to the nodes of an existing diagram.

C# — Copy Code

```
diagram.NodeEffects.Add(new GlassEffect());
```

Visual Basic — Copy Code

```
diagram.NodeEffects.Add(New GlassEffect())
```

Inheritance Hierarchy

System.Object
MindFusion.Diagramming.NodeEffect
MindFusion.Diagramming.GlassEffect

MindFusion.Diagramming Namespace

GlassEffect Members

Represents a glass-like visual effect.

The following tables list the members exposed by the GlassEffect type.

Public Constructors

	Name	Description
	GlassEffect	Initializes a new instance of the **GlassEffect** class.

Public Properties

	Name	Description
	GlowColor	Gets or sets the color of the glow portion of the effect.
	ReflectionColor	Gets or sets the color of the reflection portion of the effect.
	Type	Gets or sets the type of the glass effect.
	UsePenAsGlow	Gets or sets a value indicating whether the glow portion of the effect should be painted with the Pen color of the respective node.

Public Methods

	Name	Description
	Clone	NodeEffect.Clone override.

Public Events

	Name	Description
	PropertyChanged	INotifyPropertyChanged.PropertyChanged implementation. (Inherited from NodeEffect.)

GlassEffect Members
GlassEffect Class
MindFusion.Diagramming Namespace

GlassEffect Properties

GlassEffect.GlowColor Property

Gets or sets the color of the glow portion of the effect.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public Color GlowColor { get; set; }
```

Visual Basic

```
Public Property GlowColor As Color
```

Property Value

A **Microsoft.Maui.Graphics.Color** instance. The default is **White**.

Remarks

The recommended value for this property is **Black** (or other dark color) for Type4 glass effects.

See Also

GlassEffect Members

MindFusion.Diagramming Namespace

GlassEffect.UsePenAsGlow Property

Gets or sets a value indicating whether the glow portion of the effect should be painted with the Pen color of the respective node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool UsePenAsGlow { get; set; }
```

Visual Basic Copy Code

```
Public Property UsePenAsGlow As Boolean
```

Property Value

true to ignore GlowColor and use the color of the pen for the effect glow; otherwise, **false**.

GlassEffectType Enumeration

Specifies the type of a GlassEffect node effect.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum GlassEffectType
```

Visual Basic Copy Code

```
Public Enum GlassEffectType
```

Members

	Member name	Description
	Type1	Indicates a glass effect with soft radial glow at the bottom and a sharp reflection at the top.
	Type2	Indicates a glass effect with linear glow at the bottom and sharp reflection at the top.
	Type3	Indicates a glass effect with radial glow at the bottom and smooth reflection and emphasized outline at the top.
	Type4	Indicates a glass effect with sharp reflection at the top and soft glow at the left and right sides.

```

Visual Basic Copy Code

```
Public Enum Granularity
```

Members

	Member name	Description
	CoarseGrained	Merge map tiles if possible to create a coarse-grained map. The fewer tiles in the map lead to faster path-finding.
	Normal	Use the map tiles found by the initial division algorithm.
	FineGrained	Reserved for future use.

Remarks

Members of this enumeration can be assigned to the Granularity property of QuickRouter.

MindFusion.Diagramming Namespace

GridRouter Class

Implements a link routing algorithm that uses a grid to represent the free and occupied regions in the diagram.

Syntax

C# Copy Code

```
public class GridRouter : ILinkRouter
```

Visual Basic Copy Code

```
Public Class GridRouter
    Implements ILinkRouter
```

Remarks

To use this class for link routing simply assign its instance to the LinkRouter property of the Diagram class.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.GridRouter

GridRouter Methods

GridRouter.RouteLink Method

Implements ILinkRouter.RouteLink.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RouteLink (
    DiagramLink link,
    ConnectionPoint originConnection,
    ConnectionPoint destinationConnection,
    bool nowCreating
)
```

Visual Basic Copy Code

```
Public Function RouteLink( _
    link As DiagramLink, _
    originConnection As ConnectionPoint, _
    destinationConnection As ConnectionPoint, _
    nowCreating As Boolean _
) As Boolean
```

Parameters

link
The DiagramLink to route.

originConnection
Represents connection to Origin node, potentially different from link's stored connection when modifying first control point.

destinationConnection
Represents connection to Destination node, potentially different from link's stored connection when modifying last control point.

nowCreating
Indicates whether link is currently being created.

Return Value

true if a path has been found successfully, otherwise false.

GridRouter.RouteLinks Method

Implements ILinkRouter.RouteLinks.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLinkCollection RouteLinks (
    DiagramLinkCollection links
)
```

Visual Basic Copy Code

```
Public Function RouteLinks( _
    links As DiagramLinkCollection _
) As DiagramLinkCollection
```

Parameters

links
A list of DiagramLink objects that should be routed.

Return Value

A list of links that were not routed successfully.

GridStyle Enumeration

Defines values that specify the visual style of the alignment grid.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum GridStyle
```

Visual Basic Copy Code

```
Public Enum GridStyle
```

Members

	Member name	Description
	Points	The grid is painted as a matrix of points.
	Lines	The grid is represented as a series of crossing horizontal and vertical lines.

See Also

Group Class

Represents a group of items in the diagram document.

Syntax

C# Copy Code

```
public class Group
```

Visual Basic Copy Code

```
Public Class Group
```

Remarks

An hierarchy of items can be built, so that moving an item that is higher in the hierarchy moves all subordinated items too. The immediate subordinates of an item are represented by a **Group** instance. Every group should have a single master item, to which all group members are attached. The master item can be accessed from the MainItem property. The group of items attached to an item is accessed through the SubordinateGroup property of the latter. MasterGroup gets the group in which an item is subordinate.

To create a group, instantiate a **Group** object and add it to the diagram's Groups collection, or call the CreateGroup method passing the master item as argument. A group is automatically destroyed when its master item is deleted.

To destroy a group programmatically, call the Remove method of the **Groups** collection. If AutoDeleteItems is enabled, subordinated items in the group are deleted too. If **AutoDeleteItems** is disabled, subordinated items are just detached from their master and remain intact.

Nodes can be attached to a group in several ways, depending on the type of the master item. If the master is a node, other nodes can be attached by calling the AttachProportional or AttachToCorner methods. If the master is a link, nodes can be attached to it using the AttachToLinkSegment or AttachToLinkPoint methods. The DiagramNode class provides a shortcut AttachTo method, which creates a group if necessary and calls the group's appropriate **AttachTo*** method. Items can be detached from a group by calling the Detach method.

The Expandable property specifies whether expanding or collapsing a tree should propagate from the master node through the subordinated nodes. FollowMasterRotation can be used when the master node is a shape node. If it is enabled, the positions of the subordinated nodes are updated to reflect the RotationAngle of the shape node while it is rotated.

The Tag property allows attaching custom data to any group. The FindGroup methods looks for a groups having a specific tag.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.Group

Group Members
MindFusion.Diagramming Namespace

Group Members

Represents a group of items in the diagram document.

The following tables list the members exposed by the Group type.

Public Constructors

	Name	Description
	Group	Overloaded. Initializes a new instance of the **Group** class.

Public Properties

	Name	Description
	AttachedNodes	Gets a collection of the nodes attached to this group.
	AutoDeleteItems	Gets or sets a value indicating whether the subordinated items in a group are automatically deleted if the group is destroyed.
	Expandable	Gets or sets a value indicating whether expanding/collapsing a tree branch propagates through this group.
	FollowMasterContainment	Gets or sets a value indicating whether the subordinated items should be considered by a ContainerNode when the master item is added to the container.
	FollowMasterRotation	Gets or sets a value indicating whether attached nodes position should follow the RotationAngle of a master node.
	MainItem	Gets or sets the main item of this group.
	Tag	Gets or sets a custom data associated with the group.
	Visible	Gets or sets a value indicating whether the group is visible.

Public Methods

	Name	Description
	AttachAlongLinkLength	Attaches a node to a link and keeps the initial distance between the node and the link origin when the latter is modified. The distance is measured along the link length, regardless of the number and shape of its segments.
	AttachCustom	Attaches a new node to the group.
	AttachProportional	Attaches a new node to the group, in such a way that its area is always occupying certain percentage of the main item's area.
	AttachToCorner	Attaches a node to the specified corner of the main node.
	AttachToEdges	Anchors a node to the specified edges of the master node.
	AttachToFractionalPosition	Attaches specified node to this group, keeping original size intact and maintaining original distance to point specified as fraction of main node's size.
	AttachToLinkPoint	Attaches a node to the specified control point of the link that is **MainItem**.
	AttachToLinkSegment	Attaches a node to the specified segment of the link that is **MainItem**.
	AttachToLongestHSegment	Adds an item to the group, maintaining its relative position to the longest horizontal segment of the master link.
	AttachToSideMiddle	Adds an item to the group, attaching it to the middle point of a side of the master node.
	Detach	Detaches the specified item from this group.
	GetRepaintRect	Gets a rectangle containing the repaint rectangle of the group's master and all attached objects.

Group Constructor

Initializes a new instance of the Group class.

Overload List

Name	Description
Group (Diagram)	Initializes a new instance of the **Group** class with the specified Diagram as parent.
Group (Group)	Initializes a new instance of the **Group** class using the specified group as a prototype.

See Also

Group Class
MindFusion.Diagramming Namespace

Group Constructor (Diagram)

Initializes a new instance of the Group class with the specified Diagram as parent.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Group (
    Diagram parent
)
```

Visual Basic Copy Code

```
Public New ( _
    parent As Diagram _
)
```

Parameters

parent
The Diagram the new group will belong to.

See Also

Group Constructor Overload List
Group Class
MindFusion.Diagramming Namespace

Group Constructor (Group)

Initializes a new instance of the Group class using the specified group as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Group (
    Group prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As Group _
)
```

Parameters

prototype
The group to use as a prototype.

Remarks

This constructor supports the MvcDiagram infrastructure and is not intended to be used directly from your code. Instead use the other constructor or the CreateGroup method of the Factory class.

See Also

Group Constructor Overload List
Group Class
MindFusion.Diagramming Namespace

Group Methods

Group.AttachAlongLinkLength Method

Attaches a node to a link and keeps the initial distance between the node and the link origin when the latter is modified. The distance is measured along the link length, regardless of the number and shape of its segments.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AttachAlongLinkLength (
    DiagramNode node,
    bool relativeDistance
)
```

Visual Basic Copy Code

```
Public Function AttachAlongLinkLength( _
    node As DiagramNode, _
    relativeDistance As Boolean _
) As Boolean
```

Parameters

node
The DiagramNode to be attached.

relativeDistance
true to preserve the absolute distance, false to preserve relative distance.

Return Value

false if the node could not be attached; otherwise, true.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace

Group.AttachCustom Method

Attaches a new node to the group.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AttachCustom (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public Function AttachCustom( _
    node As DiagramNode _
) As Boolean
```

Parameters

node
A subordinate node whose position depends on the position of the group master item.

Return Value

true if the node has been attached to this group successfully.

Remarks

This method is used in conjunction with an UpdateGroup override defined in derived item types. The **UpdateGroup** override must set the position of attached nodes by calling their SetBounds method.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace

Group.AttachProportional Method

Attaches a new node to the group, in such a way that its area is always occupying certain percentage of the main item's area.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AttachProportional (
    DiagramNode node,
    double left,
    double top,
    double right,
    double bottom
)
```

Visual Basic Copy Code

```
Public Function AttachProportional( _
    node As DiagramNode, _
    left As Double, _
    top As Double, _
    right As Double, _
    bottom As Double _
) As Boolean
```

Parameters

node
The DiagramNode to be attached.

left
The left side of the node's bounding rectangle, expressed as percentage of the main node width.

top

The top side of the node's bounding rectangle, expressed as percentage of the main node height.

right
The right side of the node's bounding rectangle, expressed as percentage of the main node width.

bottom
The bottom side of the node's bounding rectangle, expressed as percentage of the main node height.

Return Value

false if the node could not be attached; otherwise, **true**.

Remarks

You can use this method when the main item of the group is a node. Use the left, top, right and bottom arguments to specify the position and size of the attached node relative to that of the main item. When moving or resizing the main node, the specified ratio between it and the attached node is preserved.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace
AttachToCorner Method

Group.AttachToCorner Method

Attaches a node to the specified corner of the main node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AttachToCorner (
    DiagramNode node,
    int corner
)
```

Visual Basic Copy Code

```
Public Function AttachToCorner( _
    node As DiagramNode, _
    corner As Integer _
) As Boolean
```

Parameters

node
The DiagramNode to be attached.

corner
The zero-based index of the main node's corner.

Return Value

false if the node could not be attached; otherwise, **true**.

Remarks

You can use this method if the main item of the group is a node. When the specified corner position of the main node's bounding rectangle is changed, the position of the attached node is also changed and the distance between them is preserved.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace
AttachProportional Method

Group.AttachToEdges Method

Anchors a node to the specified edges of the master node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AttachToEdges (
    DiagramNode node,
    GroupAnchorStyles anchorStyles
)
```

Visual Basic Copy Code

```
Public Function AttachToEdges( _
    node As DiagramNode, _
    anchorStyles As GroupAnchorStyles _
) As Boolean
```

Parameters

node
The DiagramNode to be attached.

anchorStyles
A member of the GroupAnchorStyles enumeration.

Return Value

false if the node could not be attached; otherwise, **true**.

Remarks

This method can be used only if the master item in the group is a node. Anchoring works in a manner similar to how child controls in a form can be anchored to the form edges. When the master node position changes, the position of the attached node is also changed so that the initial distance between the specified edges is preserved.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace
AttachProportional Method

Group.AttachToFractionalPosition Method

Attaches specified node to this group, keeping original size intact and maintaining original distance to point specified as fraction of main node's size.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AttachToFractionalPosition (
    DiagramNode node,
    double xPercent,
    double yPercent
)
```

Visual Basic Copy Code

```
Public Function AttachToFractionalPosition( _
    node As DiagramNode, _
    xPercent As Double, _
```

```
    yPercent As Double _
) As Boolean
```

Parameters

node
The DiagramNode to be attached.

xPercent
Percentage of main node's width.

yPercent
Percentage of main node's height.

Return Value

true if specified node was attached to the group, or **false** otherwise.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace

Group.AttachToLinkPoint Method

Attaches a node to the specified control point of the link that is MainItem.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AttachToLinkPoint (
    DiagramNode node,
    int point
)
```

Visual Basic Copy Code

```
Public Function AttachToLinkPoint( _
    node As DiagramNode, _
    point As Integer _
) As Boolean
```

Parameters

node
The DiagramNode to be attached.

point
The link point to which the node should be attached.

Return Value

false if the node could not be attached; otherwise, **true**.

Remarks

You can use this method when the main item of the group is a link. When the user moves the link control point whose index is passed as argument, the attached node is also moved with the same translation vector as that of the control point.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace
AttachToLinkSegment Method

Group.AttachToLinkSegment Method

Attaches a node to the specified segment of the link that is MainItem.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AttachToLinkSegment (
    DiagramNode node,
    int segment
)
```

Visual Basic Copy Code

```
Public Function AttachToLinkSegment( _
    node As DiagramNode, _
    segment As Integer _
) As Boolean
```

Parameters

node
The DiagramNode to be attached.

segment
The link segment to which the node will be attached.

Return Value

false if the node could not be attached; otherwise, **true**.

Remarks

Call this method when the main item of the group is a link. When the specified link segment changes its position, the position of the attached node is also changed, so their mutual distance and orientation are preserved.

AttachToLinkPoint Method

Group.AttachToLongestHSegment Method

Adds an item to the group, maintaining its relative position to the longest horizontal segment of the master link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AttachToLongestHSegment (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public Function AttachToLongestHSegment( _
    node As DiagramNode _
) As Boolean
```

Parameters

node

The object to attach to the current group.

Return Value

false if the node could not be attached; otherwise, **true**.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace

Group.AttachToSideMiddle Method

Adds an item to the group, attaching it to the middle point of a side of the master node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AttachToSideMiddle (
    DiagramNode node,
    int side
)
```

Visual Basic Copy Code

```
Public Function AttachToSideMiddle( _
    node As DiagramNode, _
    side As Integer _
) As Boolean
```

Parameters

node
The object to attach to the current group.

side
The corner to attach to.

Return Value

false if the node could not be attached; otherwise, **true**.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace

Group.Detach Method

Detaches the specified item from this group.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Detach (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Function Detach( _
    item As DiagramItem _
) As Boolean
```

Parameters

item
The DiagramItem to be detached.

Return Value

false if the item could not be detached; otherwise, **true**.

Remarks

Call this method to remove a item from this group. Note that this method does not delete the item, but just detaches it.

MindFusion.Diagramming Namespace
AttachToLinkSegment Method
AttachToLinkPoint Method
AttachProportional Method
AttachToCorner Method

Group.GetRepaintRect Method

Gets a rectangle containing the repaint rectangle of the group's master and all attached objects.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect GetRepaintRect ()
```

Visual Basic Copy Code

```
Public Function GetRepaintRect () As Rect
```

Return Value

A **Microsoft.Maui.Graphics.Rect** that represents the smallest rectangle containing all diagram items related directly or indirectly to this group.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace

Group Properties

Group.AttachedNodes Property

Gets a collection of the nodes attached to this group.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ReadOnlyDiagramNodeCollection AttachedNodes { get; }
```

Visual Basic — Copy Code

```
Public ReadOnly Property AttachedNodes As ReadOnlyDiagramNodeCollection
```

Property Value

A collection that references all nodes attached to the group.

Remarks

The MainItem is not included in this collection.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace
MainItem Property

Group.AutoDeleteItems Property

Gets or sets a value indicating whether the subordinated items in a group are automatically deleted if the group is destroyed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# — Copy Code

```
public bool AutoDeleteItems { get; set; }
```

Visual Basic — Copy Code

```
Public Property AutoDeleteItems As Boolean
```

Property Value

true to delete subordinated items automatically; otherwise, **false**. The default is **false**.

Remarks

A group is destroyed explicitly by calling the Remove method of the Groups collection. A group is destroyed implicitly when its MainItem is deleted.

If a group is destroyed and this property is disabled, all subordinated items remain intact in the diagram, however they are no longer grouped. If a group is destroyed and this property is enabled, all subordinated items are deleted.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace

Group.Expandable Property

Gets or sets a value indicating whether expanding/collapsing a tree branch propagates through this group.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# — Copy Code

```
public bool Expandable { get; set; }
```

Visual Basic

```
Public Property Expandable As Boolean
```

Property Value

true if expanding or collapsing of a tree branch should propagate through the group members; otherwise, **false**. The default is **false**.

Remarks

By default expanding or collapsing tree branches is done by following the links between the branch nodes. If there are not links going out from a node, the expanding or collapsing stops there. However, if a node has a group of subordinated nodes, it could be desirable to continue expanding through them. To enable that, set the group's **Expandable** property to **true**.

Group Members
Group Class
MindFusion.Diagramming Namespace
Diagram.RecursiveExpand Property
Diagram.NodesExpandable Property

Group.FollowMasterContainment Property

Gets or sets a value indicating whether the subordinated items should be considered by a ContainerNode when the master item is added to the container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public bool FollowMasterContainment { get; set; }
```

Visual Basic

```
Public Property FollowMasterContainment As Boolean
```

Property Value

true if the whole group is contained in the ContainerNode; otherwise, **false**. The default is **false**.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace

Group.FollowMasterRotation Property

Gets or sets a value indicating whether attached nodes position should follow the RotationAngle of a master node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public GroupRotation FollowMasterRotation { get; set; }
```

Visual Basic

```
Public Property FollowMasterRotation As GroupRotation
```

Property Value

A member of the GroupRotation enumeration. The default is **IgnoreRotation**.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace

Group.MainItem Property

Gets or sets the main item of this group.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem MainItem { get; set; }
```

Visual Basic Copy Code

```
Public Property MainItem As DiagramItem
```

Property Value

An instance of the DiagramItem class that represents the main item.

Remarks

Each group has an item which the subordinated items follow when it is moved. This main item can be a node or a link. The main item is passed as argument to the CreateGroup method.

See Also

Group Members
Group Class
MindFusion.Diagramming Namespace
AttachedNodes Property

Group.Tag Property

Gets or sets a custom data associated with the group.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Tag { get; set; }
```

Visual Basic Copy Code

```
Public Property Tag As Object
```

Property Value

An instance of a **System.Object**-derived class that represents the tag.

Remarks

This property holds data that you define. MvcDiagram does not use it in any way. Possible usage might be to store an integer identifier or a reference to a larger structure.

Group.Visible Property

Gets or sets a value indicating whether the group is visible.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Visible { get; set; }
```

Visual Basic Copy Code

```
Public Property Visible As Boolean
```

Property Value

true if the group is visible; otherwise, **false**.

Remarks

Assigning a value to this property sets the Visible property of all items in the group.

Group.Attachment.Type Property

Gets or sets the attachment type.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AttachTo Type { get; set; }
```

Visual Basic Copy Code

```
Public Property Type As AttachTo
```

Property Value

See Also

Group.Attachment Members
Group.Attachment Class
MindFusion.Diagramming Namespace

GroupAnchorStyles Enumeration

Specifies the master node edges to which a subordinate node can be anchored.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum GroupAnchorStyles
```

Visual Basic Copy Code

```
Public Enum GroupAnchorStyles
```

Members

	Member name	Description
	Left	Specifies the left edge.
	Top	Specifies the top edge.
	Right	Specifies the right edge.
	Bottom	Specifies the bottom edge.

GroupCollection Members

Represents a strongly typed collection of Group objects.

The following tables list the members exposed by the GroupCollection type.

Public Constructors

	Name	Description
	GroupCollection	Initializes a new instance of the **GroupCollection** class.

Protected Fields

	Name	Description
	groupEventArgs	A ItemEventArgs instance used for passing arguments to the event handlers for the events of this collection. Used to avoid creating many small objects that would burden the garbage collector.
	InnerList	Gets a **List<T>** containing the list of elements in the collection instance. (Inherited from CollectionBase.)
	notifyParent	If enabled, the collection raises events to let their containing objects handle the addition or removal of items.

Public Properties

	Name	Description
	Count	Gets the number of elements actually contained in the collection. (Inherited from CollectionBase.)
	IsReadOnly	Gets a value indicating whether the collection is read-only. (Inherited from CollectionBase.)
	Item	Gets or sets the element at the specified index. (Inherited from CollectionBase.)

Public Methods

	Name	Description
	Add	Adds an object to the end of the collection. (Inherited from CollectionBase.)
	Add	Adds the specified group to the collection.
	Clear	Removes all groups from the collection.
	Clone	Creates a shallow copy of this collection.
	Contains	Determines whether an element is in the collection. (Inherited from CollectionBase.)
	CopyTo	Copies the entire collection to a compatible one-dimensional array, starting at the specified index of the target array. (Inherited from CollectionBase.)
	GetAt	The zero-based index of the group to retrieve.
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from CollectionBase.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire collection. (Inherited from CollectionBase.)
	Insert	Inserts an element into the collection at the specified index. (Inherited from CollectionBase.)
	Insert	Inserts the specified group in the collection at the specified position.
	Remove	Removes the first occurrence of a specific object from the collection. (Inherited from CollectionBase.)
	Remove	Removes the specified group from the collection.
	RemoveAt	Removes the diagram item from the collection.
	Sort	Overloaded. (Inherited from CollectionBase.)

Protected Methods

	Name	Description
	RaiseAdding	Raises the Adding event.
	RaiseInserting	Raises the Inserting event.
	RaiseRemoving	Raises the Removing event.

GroupCollection Fields

GroupCollection.groupEventArgs Field

A ItemEventArgs instance used for passing arguments to the event handlers for the events of this collection. Used to avoid creating many small objects that would burden the garbage collector.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected GroupEventArgs groupEventArgs
```

Visual Basic

```
Protected groupEventArgs As GroupEventArgs
```

See Also

GroupCollection Members
GroupCollection Class
MindFusion.Diagramming Namespace

GroupCollection.notifyParent Field

If enabled, the collection raises events to let their containing objects handle the addition or removal of items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected bool notifyParent
```

Visual Basic

```
Protected notifyParent As Boolean
```

See Also

GroupCollection Members
GroupCollection Class
MindFusion.Diagramming Namespace

GroupCollection Constructor

Initializes a new instance of the GroupCollection class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public GroupCollection ()
```

Visual Basic

```
Public Sub New ()
```

See Also

GroupCollection Class

GroupCollection Methods

GroupCollection.Add Method

Adds the specified group to the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void Add (
    Group group
)
```

Visual Basic Copy Code

```
Public Overrides Sub Add( _
    group As Group _
)
```

Parameters

group
The Group object to add to the collection.

See Also

GroupCollection Members
GroupCollection Class
MindFusion.Diagramming Namespace

GroupCollection.Clear Method

Removes all groups from the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void Clear ()
```

Visual Basic Copy Code

```
Public Overrides Sub Clear ()
```

See Also

GroupCollection Members
GroupCollection Class
MindFusion.Diagramming Namespace

GroupCollection.Clone Method

Creates a shallow copy of this collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public GroupCollection Clone ()
```

Visual Basic — Copy Code

```
Public Function Clone () As GroupCollection
```

Return Value

An instance of the GroupCollection class.

See Also

GroupCollection Members
GroupCollection Class
MindFusion.Diagramming Namespace

GroupCollection.GetAt Method

The zero-based index of the group to retrieve.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# — Copy Code

```
public Group GetAt (
    int index
)
```

Visual Basic — Copy Code

```
Public Function GetAt( _
    index As Integer _
) As Group
```

Parameters

index
The zero-based index of the group to retrieve.

Return Value

An instance of the Group class that represents the node at the specified position.

See Also

GroupCollection Members
GroupCollection Class
MindFusion.Diagramming Namespace

GroupCollection.Insert Method

Inserts the specified group in the collection at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# — Copy Code

```
public override void Insert (
    int index,
    Group group
)
```

Visual Basic

```
Public Overrides Sub Insert( _
    index As Integer, _
    group As Group _
)
```

Parameters

index
The zero-based index at which to insert the group.

group
The Group object to add to the collection.

See Also

GroupCollection Members
GroupCollection Class
MindFusion.Diagramming Namespace

GroupCollection.RaiseAdding Method

Raises the Adding event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected void RaiseAdding (
    Group group
)
```

Visual Basic

```
Protected Sub RaiseAdding( _
    group As Group _
)
```

Parameters

group
The group that is being added.

See Also

GroupCollection Members
GroupCollection Class
MindFusion.Diagramming Namespace

GroupCollection.RaiseInserting Method

Raises the Inserting event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected void RaiseInserting (
    Group group,
    int index
)
```

Visual Basic

```
Protected Sub RaiseInserting( _
    group As Group, _
    index As Integer _
)
```

Parameters

group
The group that is being added.

index
Index of the new group.

See Also

GroupCollection Members
GroupCollection Class
MindFusion.Diagramming Namespace

GroupCollection.RaiseRemoving Method

Raises the Removing event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected void RaiseRemoving (
    Group group
)
```

Visual Basic

```
Protected Sub RaiseRemoving( _
    group As Group _
)
```

Parameters

group
The group that is being removed.

See Also

GroupCollection Members
GroupCollection Class
MindFusion.Diagramming Namespace

GroupCollection.Remove Method

Removes the specified group from the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override bool Remove (
    Group group
)
```

Visual Basic

```
Public Overrides Function Remove( _
    group As Group _
) As Boolean
```

Parameters

group
The Group object to remove from the collection.

Return Value

See Also

GroupCollection Members
GroupCollection Class
MindFusion.Diagramming Namespace

GroupCollection.RemoveAt Method

Removes the diagram item from the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override void RemoveAt (
    int index
)
```

Visual Basic

```
Public Overrides Sub RemoveAt( _
    index As Integer _
)
```

Parameters

index
Index of the object that should be removed from this collection.

MindFusion.Diagramming Namespace

GroupEventArgs Members

Contains the arguments passed to handlers of group-related events, such as GroupDestroyed.

The following tables list the members exposed by the GroupEventArgs type.

Public Constructors

	Name	Description
	GroupEventArgs	Initializes a new instance of the **GroupEventArgs** class.

Public Properties

	Name	Description
	Group	Gets the group for which the event was raised.
	Index	Gets an integer index related to the event.

See Also

GroupEventArgs Class
MindFusion.Diagramming Namespace

GroupEventArgs Constructor

Initializes a new instance of the GroupEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public GroupEventArgs (
    Group group
)
```

Visual Basic Copy Code

```
Public New ( _
    group As Group _
)
```

Parameters

group
The Group related to the event.

See Also

GroupEventArgs Properties

GroupEventArgs.Group Property

Gets the group for which the event was raised.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Group Group { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Group As Group
```

Property Value

An instance of the Group class.

See Also

GroupEventArgs Members
GroupEventArgs Class
MindFusion.Diagramming Namespace

GroupEventArgs.Index Property

Gets an integer index related to the event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Index { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Index As Integer
```

Property Value

An integer value.

See Also

GroupEventArgs Members
GroupEventArgs Class
MindFusion.Diagramming Namespace

GroupRotation Enumeration

Defines values that indicate how rotation of a group's master node affects the nodes attached to that group.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum GroupRotation
```

Visual Basic Copy Code

```
Public Enum GroupRotation
```

Members

	Member name	Description
	IgnoreRotation	Attached nodes ignore the rotation angle applied to the master node.
	FerrisWheel	Attached nodes are moved to a position corresponding to the master node's rotation angle, but they are not rotated.
	RotateChildren	Attached nodes are rotated by the RotationAngle of the group's master node and around its center.

See Also

MindFusion.Diagramming Namespace

HandlesStyle Enumeration

Enumerates possible visual styles for frames that are drawn around selected nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum HandlesStyle
```

Visual Basic Copy Code

```
Public Enum HandlesStyle
```

Members

	Member name	Description
	Invisible	There is no visible difference between selected and unselected node.
	SquareHandles	If selected, the node is drawn with square modification handles.
	DashFrame	If selected, a node is drawn with a dashed frame. The frame enables resizing the node. The center of the node allows moving it and the edge area enables creating links.
	HatchFrame	If selected, the item is drawn with hatched frame. Modifications can be done as with **DashFrame**.
	HatchHandles	If selected, a node is drawn with both hatched frame and modification handles. The frame enable moving the node, and the handles enable resizing. Links are created from any point of the interior.
	HatchHandles2	Looks like **HatchHandles**, but allows moving the node from the interior area. Links are created from the points near the edge.

	HatchHandles3	Behaves like **HatchHandles2**, but paints the selection frame using a denser brush pattern.
	MoveOnly	If a node is selected, it can be only moved. Best used with **ModificationStart** set to AutoHandles.
	EasyMove	Any point of the interior of a node enables moving the node, except a small area in the center that allows creating links. Best used with **ModificationStart** set to **AutoHandles**.
	SquareHandles2	Square resize handles are drawn around a selected node. There isn't a move handle in the center as with the **SquareHandles** style, but nodes can be moved by dragging their interior or caption areas. Links can be created by drawing from near the edges of a node.
	Custom	MvcDiagram raises the DrawAdjustmentHandles and HitTestAdjustmentHandles events to let your application perform custom drawing and hit testing of selection handles.
	InvisibleMove	There aren't any selection handles displayed. The selected node can be only moved, but not resized.
	RoundAndSquare	Corner resize handles are round, remaining handles are square.
	RoundAndSquare2	Corner resize handles are round, remaining handles are square. In addition, there is a dashed frame drawn around selected nodes.

Remarks

The selection style can be set independently for individual nodes and links through their **DiagramNode.HandlesStyle** and DiagramLink.HandlesStyle properties. For most of these styles, it is recommended to set **ModificationStart** to **AutoHandles**.

MindFusion.Diagramming Namespace

HandlesVisualStyle Class

Defines the Pen and Brush objects used to draw items' adjustment handles.

Syntax

C# Copy Code

```
public class HandlesVisualStyle
```

Visual Basic Copy Code

```
Public Class HandlesVisualStyle
```

Remarks

The component uses several different **HandlesVisualStyle** objects depending on the context. They can be accessed through the ActiveItemHandlesStyle, SelectedItemHandlesStyle and DisabledHandlesStyle properties of Diagram.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.HandlesVisualStyle

MindFusion.Diagramming Namespace

HandlesVisualStyle Members

Defines the Pen and Brush objects used to draw items' adjustment handles.

The following tables list the members exposed by the HandlesVisualStyle type.

Public Constructors

	Name	Description
	HandlesVisualStyle	Initializes a new instance of the HandlesVisualStyle class.

Public Properties

	Name	Description
	ControlPointBrush	Gets or sets a **Brush** used to fill the interior of shape control points.
	DashPen	Gets or sets a **Pen** used to draw dashed selection frames.
	HandleBrush	Gets or sets a **Brush** used to fill the interior of selection handles.
	HandlePen	Gets or sets a **Pen** used to draw the border of selection handles.
	HatchBrush	Gets or sets a **Brush** used to draw hatch frames.
	PatternBrush	Gets or sets a **Brush** used to draw selection frames for the MoveOnly style.
	RotationHandleBrush	Gets or sets a **Brush** used to fill the interior of the rotation handle.

Public Methods

	Name	Description
	LoadFromXml	Loads the style from XML.
	SaveToXml	Saves the style to XML.

Protected Methods

	Name	Description
	LoadFromJson	Loads the style content from a JSON object.
	SaveToJson	Saves the style content into a JsonObject.

HandlesVisualStyle Methods

HandlesVisualStyle.LoadFromJson Method

Loads the style content from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the style's data.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

HandlesVisualStyle Members
HandlesVisualStyle Class
MindFusion.Diagramming Namespace

HandlesVisualStyle.LoadFromXml Method

Loads the style from XML.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    string elementName,
    string colorElementName,
    XmlElement parentElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Public Sub LoadFromXml( _
    elementName As String, _
    colorElementName As String, _
    parentElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

elementName

The name of the element that describes the style.

colorElementName

The name of an element that contains a fallback color.

parentElement

The parent XML element.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

HandlesVisualStyle Members
HandlesVisualStyle Class
MindFusion.Diagramming Namespace

HandlesVisualStyle.SaveToJson Method

Saves the style content into a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject the style's data should be stored into.

context

A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

MindFusion.Diagramming Namespace

HandlesVisualStyle.SaveToXml Method

Saves the style to XML.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SaveToXml (
    string elementName,
    XmlElement parentElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Public Sub SaveToXml( _
    elementName As String, _
    parentElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

elementName
The name of the element that describes the style.

parentElement
The parent XML element.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

HandlesVisualStyle Properties

HandlesVisualStyle.ControlPointBrush Property

Gets or sets a Brush used to fill the interior of shape control points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush ControlPointBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property ControlPointBrush As Brush
```

Property Value

An instance of a Brush -derived class. The default is solid-color yellow brush.

See Also

HandlesVisualStyle Members
HandlesVisualStyle Class
MindFusion.Diagramming Namespace

HandlesVisualStyle.DashPen Property

Gets or sets a Pen used to draw dashed selection frames.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen DashPen { get; set; }
```

Visual Basic Copy Code

```
Public Property DashPen As Pen
```

Property Value

An instance of the Pen class.

Remarks

This pen is used to draw selection frame around items whose **HandlesStyle** property is set to DashFrame.

See Also

HandlesVisualStyle Members
HandlesVisualStyle Class
MindFusion.Diagramming Namespace

HandlesVisualStyle.HandleBrush Property

Gets or sets a Brush used to fill the interior of selection handles.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush HandleBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property HandleBrush As Brush
```

Property Value

An instance of a Brush -derived class.

Remarks

This brush is used to fill the interior of adjustment handles rendered for most of the HandlesStyle types.

See Also

HandlesVisualStyle Members
HandlesVisualStyle Class
MindFusion.Diagramming Namespace

HandlesVisualStyle.HandlePen Property

Gets or sets a Pen used to draw the border of selection handles.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen HandlePen { get; set; }
```

Visual Basic Copy Code

```
Public Property HandlePen As Pen
```

Property Value

An instance of the Pen class.

Remarks

This pen is used to draw the borders of adjustment handles rendered for most of the HandlesStyle types.

See Also

HandlesVisualStyle Members
HandlesVisualStyle Class
MindFusion.Diagramming Namespace

HandlesVisualStyle.HatchBrush Property

Gets or sets a Brush used to draw hatch frames.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush HatchBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property HatchBrush As Brush
```

Property Value

An instance of a Brush -derived class.

Remarks

This brush is used to draw the hatch pattern for HandlesStyle types that display hatch frames.

See Also

HandlesVisualStyle Members
HandlesVisualStyle Class
MindFusion.Diagramming Namespace

HandlesVisualStyle.PatternBrush Property

Gets or sets a Brush used to draw selection frames for the MoveOnly style.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush PatternBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property PatternBrush As Brush
```

Property Value

An instance of a Brush -derived class.

Remarks

This brush is used to render the dot pattern for the HatchHandles3 and **MoveOnly HandlesStyle** types.

See Also

HandlesVisualStyle Members
HandlesVisualStyle Class
MindFusion.Diagramming Namespace

HandlesVisualStyle.RotationHandleBrush Property

Gets or sets a Brush used to fill the interior of the rotation handle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush RotationHandleBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property RotationHandleBrush As Brush
```

Property Value

A Brush instance. The default value is **null**.

Remarks

If this property is set to **null**, the rotation brush is painted using HandleBrush.

HitTestEventArgs Members

Contains the arguments passed to the HitTestAdjustmentHandles event handlers.

The following tables list the members exposed by the HitTestEventArgs type.

Public Constructors

	Name	Description
	HitTestEventArgs	Initializes a new instance of the **HitTestEventArgs** class.

Public Properties

	Name	Description
	HitResult	Gets or sets the adjustment handle that has been hit.
	Item	Gets the item whose adjustment handles are being hit-tested.
	MousePosition	Gets the current cursor position, expressed in document coordinates.

See Also

HitTestEventArgs Class
MindFusion.Diagramming Namespace

HitTestEventArgs Constructor

Initializes a new instance of the HitTestEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HitTestEventArgs (
    DiagramItem item,
    Point mousePosition
)
```

Visual Basic Copy Code

```
Public New ( _
    item As DiagramItem, _
    mousePosition As Point _
)
```

Parameters

item

The DiagramItem related to the event.

mousePosition

The cursor location at the time the event is raised, expressed in document coordinates.

See Also

HitTestEventArgs Class
MindFusion.Diagramming Namespace

HitTestEventArgs Properties

HitTestEventArgs.HitResult Property

Gets or sets the adjustment handle that has been hit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AdjustmentHandle HitResult { get; set; }
```

Visual Basic Copy Code

```
Public Property HitResult As AdjustmentHandle
```

Property Value

An instance of AdjustmentHandle -derived class, or **null** if there is no handle located at the specified position.

See Also

HitTestEventArgs Members
HitTestEventArgs Class
MindFusion.Diagramming Namespace

HitTestEventArgs.Item Property

Gets the item whose adjustment handles are being hit-tested.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem Item { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Item As DiagramItem
```

Property Value

An instance of the DiagramItem class.

See Also

HitTestEventArgs Members

HitTestPriority Property

HitTestResult Enumeration

Represents the return value from a hit test.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum HitTestResult
```

Visual Basic Copy Code

```
Public Enum HitTestResult
```

Members

	Member name	Description
	Nothing	No recognizable element of the item has been hit.
	ScrollBar	A scrollbar has been hit.
	CollapseButton	A collapse/expand button has been hit.

See Also

MindFusion.Diagramming Namespace

HtmlBuilder Class

Provides methods to create and use HTML client side image maps.

Syntax

C# Copy Code

```
public class HtmlBuilder
```

Visual Basic Copy Code

```
Public Class HtmlBuilder
```

Remarks

If an exported diagram image is displayed in an HTML page, it is helpful to create an image map whose areas correspond to the items visible in the image. The CreateImageMap method generates a full <MAP> tag, including its <AREA> elements. CreateUseMapAttr method creates the code to reference a map from within an <IMG> tag, and also adds a WIDTH and HEIGHT attributes that define to the width and height of the exported image, measured in pixels.

Each <AREA> tag in the image map has its attributes set as follows:

- HREF is set to the HyperLink value of the diagram item or table's cell corresponding to the area;
- ALT is set to the ToolTip value of the node or table's cell corresponding to the area;
- TARGET is set to the value of HtmlBuilder's LinkTarget property.

Image map areas can be also generated for the [±] buttons displayed beside **Expandable** nodes. To enable that, assign an URL to the ExpandBtnHyperLink property. That URL can contain some format specifiers which are automatically replaced with the values of nodes' Tag or ZIndex properties. That lets you identify on the server side the node whose [±] button is clicked.

HtmlBuilder is most useful when it is used in conjunction with the WebChart library to create diagram images on the server, though it is available in the Windows Forms MvcDiagram control too.

HtmlBuilder Members

Provides methods to create and use HTML client side image maps.

The following tables list the members exposed by the HtmlBuilder type.

Public Constructors

	Name	Description
	HtmlBuilder	Initializes a new instance of the **HtmlBuilder** class.

Public Properties

	Name	Description
	AreasForTableCells	Gets or sets a value indicating whether AREA tags are generated for table cells.
	AreasForTreeViewItems	Gets or sets a value indicating whether AREA tags are generated for TreeViewNode items.
	ExpandBtnHyperLink	Gets or sets the hyperlink assigned to AREA tags generated for the [±] buttons of **Expandable** nodes.
	LinkTarget	Gets or sets the value of the TARGET attribute of AREA tags.
	Scale	Gets or sets the scale factor for the generated image.
	ScrollDownHyperLink	Gets or sets the hyperlink assigned to AREA tags generated for the lower scroll arrow of tables.
	ScrollUpHyperLink	Gets or sets the hyperlink assigned to AREA tags generated for the upper scroll arrow of tables.

Public Methods

	Name	Description
	CreateImageHtml	Generates an image map HTML code.
	CreateImageMap	Overloaded.
	CreateUseMapAttr	Generates a USEMAP attribute to be used within an <IMG> tag.

Public Events

	Name	Description
	CreatingArea	Raised just before a new AREA tag is added to the image map.

MindFusion.Diagramming Namespace

HtmlBuilder Constructor

Initializes a new instance of the HtmlBuilder class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HtmlBuilder (
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram _
)
```

Parameters

diagram
The Diagram object whose contents will generate the image map.

See Also

HtmlBuilder Class
MindFusion.Diagramming Namespace

HtmlBuilder Methods

HtmlBuilder.CreateImageHtml Method

Generates an image map HTML code.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string CreateImageHtml (
    string htmlFileName,
    string htmlTitle,
    string imgLocalPath,
    string imgURL
)
```

Visual Basic Copy Code

```
Public Function CreateImageHtml( _
    htmlFileName As String, _
    htmlTitle As String, _
    imgLocalPath As String, _
    imgURL As String _
) As String
```

Parameters

htmlFileName
A string that represents the full name of the HTML file that is created.

htmlTitle
A string that represents the <TITLE> of the HTML file created.

imgLocalPath
A string that specifies the location of the image.

imgURL
A string that specifies the URL of the image at the server.

Return Value

A string with the HTML code of the created HTML file.

Remarks

The method also creates an HTML file with attributes specified as parameters.

HtmlBuilder.CreateImageMap Method

Overload List

Name	Description
HtmlBuilder.CreateImageMap (String)	Creates an HTML code for a MAP tag.
HtmlBuilder.CreateImageMap (String, Rect)	Creates an HTML code for a MAP tag.

See Also

HtmlBuilder Members
HtmlBuilder Class
MindFusion.Diagramming Namespace

HtmlBuilder.CreateImageMap Method (String)

Creates an HTML code for a MAP tag.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string CreateImageMap (
    string mapName
)
```

Visual Basic Copy Code

```
Public Function CreateImageMap( _
    mapName As String _
) As String
```

Parameters

mapName
A string that represents the NAME attribute in the <MAP> tag.

Return Value

A string value containing the generated HTML code.

Remarks

There are <AREA> tags generated for each node or link whose HyperLink is not an empty string. Outlines of items that cannot be represented exactly with standard <AREA> shapes are approximated to polygons. The HREF attribute of the area is set to the value of item's **HyperLink** property. The ALT attribute is set to the value of item's ToolTip property.

Example

The following HTML code:

HTML

```
<MAP NAME="diagram1">
    <AREA SHAPE ="RECT" COORDS="15,3,650,774" HREF="https://mindfusion.dev" ALT="">
```

```
    <AREA SHAPE ="POLY"
COORDS="198,43,195,48,185,52,170,55,151,57,130,58,109,57,90,55,75,52,65,48,62,43,65,38,75,34,90,31,10
HREF="" ALT="">
    <AREA SHAPE ="POLY" COORDS="96,85,164,85,198,96,198,119,164,130,96,130,62,119,62,96" HREF="https:
    <AREA SHAPE ="RECT" COORDS="60,151,196,196" HREF="" ALT="">
    <AREA SHAPE ="RECT" COORDS="60,230,196,287" HREF="" ALT="">
</MAP>
```

is generated from the following code:

C# Copy Code

```
HtmlBuilder hb = new HtmlBuilder(diagram);
string htmlCode = hb.CreateImageMap("diagram1");
```

Visual Basic Copy Code

```
Dim hb As HtmlBuilder = New HtmlBuilder(Diagram)
Dim htmlCode As String = hb.CreateImageMap("diagram1")
```

HtmlBuilder.CreateImageMap Method (String, Rect)

Creates an HTML code for a MAP tag.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string CreateImageMap (
    string mapName,
    Rect viewport
)
```

Visual Basic Copy Code

```
Public Function CreateImageMap( _
    mapName As String, _
    viewport As Rect _
) As String
```

Parameters

mapName

A string that represents the NAME attribute in the <MAP> tag.

viewport

Specifies the diagram region for which to generate an image map.

Return Value

A string value containing the generated HTML code.

See Also

CreateImageMap Method Overload List
HtmlBuilder Members
HtmlBuilder Class
MindFusion.Diagramming Namespace

HtmlBuilder.CreateUseMapAttr Method

Generates a USEMAP attribute to be used within an <IMG> tag.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string CreateUseMapAttr (
    string mapID
)
```

Visual Basic Copy Code

```
Public Function CreateUseMapAttr( _
    mapID As String _
) As String
```

Parameters

mapID
A string that represents the ID in the USEMAP attribute of the <IMG> HTML tag.

Return Value

A string that contains the generated HTML code for the USEMAP attribute.

Remarks

Use the same *mapID* as the one you have passed to CreateImageMap. The method generates also WIDTH and HEIGHT attributes, converting the diagram's MeasureUnit values to pixel values.

Example

The result of this method looks like:

HTML Copy Code

```
USEMAP="#diagram1" WIDTH="672" HEIGHT="808"
```

and is ready to be inserted in your <IMG> tag.

HtmlBuilder Properties

HtmlBuilder.AreasForTableCells Property

Gets or sets a value indicating whether AREA tags are generated for table cells.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AreasForTableCells { get; set; }
```

Visual Basic Copy Code

```
Public Property AreasForTableCells As Boolean
```

Property Value

true to create AREA tags for table cells; otherwise, **false**. The default is **false**.

Remarks

If disabled, there is a single <AREA> created for each table, corresponding to the table's bounding rectangle. If enabled, each cell of a table has a corresponding <AREA> tag created and one <AREA> is created for the table's caption bar rectangle.

See Also

HtmlBuilder Members
HtmlBuilder Class
MindFusion.Diagramming Namespace
Table.Cell.HyperLink Property

HtmlBuilder.AreasForTreeViewItems Property

Gets or sets a value indicating whether AREA tags are generated for TreeViewNode items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AreasForTreeViewItems { get; set; }
```

Visual Basic Copy Code

```
Public Property AreasForTreeViewItems As Boolean
```

Property Value

true to create AREA tags for TreeViewNode items; otherwise, **false**. The default is **false**.

See Also

HtmlBuilder Members
HtmlBuilder Class
MindFusion.Diagramming Namespace

HtmlBuilder.ExpandBtnHyperLink Property

Gets or sets the hyperlink assigned to AREA tags generated for the [±] buttons of **Expandable** nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ExpandBtnHyperLink { get; set; }
```

Visual Basic Copy Code

```
Public Property ExpandBtnHyperLink As String
```

Property Value

A string value containing an URL. The default is an empty string.

Remarks

If the value of this property is not an empty string, the HtmlBuilder creates <AREA> tags for the expand/collapse buttons displayed besides nodes. That lets you process requests to expand or collapse a tree branch on the server, or just use the [±] button as additional hot spots in the image map. The hyperlink string can contain any of the following format specifiers:

Specifier	Description
{0}	Replaced with the ZIndex of the node associated with the [±] button.
{1}	Replaced with the Tag of the node associated with the [±] button.

The **ZIndex** of a node can be used to directly access the node within the Items collection, it has the same value as the index of an item within that collection. The **Tag** can be used to find a node by calling the FindNode method.

Example

To have a JavaScript method called with node's Tag passed as parameter when a [±] button area is clicked, setup an **HtmlBuilder** instance as shown below:

C# Copy Code

```
HtmlBuilder hb = new HtmlBuilder(diagram);
hb.ExpandBtnHyperLink = "javascript: void processExpand({1})";
...
```

Visual Basic Copy Code

```
Dim hb As New HtmlBuilder(diagram)
hb.ExpandBtnHyperLink = "javascript: void processExpand({1})"
...
```

HtmlBuilder Members
HtmlBuilder Class
MindFusion.Diagramming Namespace

HtmlBuilder.LinkTarget Property

Gets or sets the value of the TARGET attribute of AREA tags.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string LinkTarget { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkTarget As String
```

Property Value

A string containing the target frame name. The default is "_self".

Remarks

This property provides a value for the TARGET attribute of each <AREA> tag included in the image map. TARGET indicates the target window or frame where image area hyperlinks are opened. The target could be either a named frame or one of the following special values:

Value	Description
_blank	Loads the linked document into a new blank window.
_parent	Loads the linked document into current document's parent.

_self	Loads the linked document into the same window.
_top	Loads the linked document into the topmost browser window.

HtmlBuilder Members
HtmlBuilder Class
MindFusion.Diagramming Namespace

HtmlBuilder.Scale Property

Gets or sets the scale factor for the generated image.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Scale { get; set; }
```

Visual Basic Copy Code

```
Public Property Scale As Double
```

Property Value

A **double** value that specifies the scale factor for the generated diagram image. The default is 100 (indicating no scale transformation).

See Also

HtmlBuilder Members
HtmlBuilder Class
MindFusion.Diagramming Namespace

HtmlBuilder.ScrollDownHyperLink Property

Gets or sets the hyperlink assigned to AREA tags generated for the lower scroll arrow of tables.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ScrollDownHyperLink { get; set; }
```

Visual Basic Copy Code

```
Public Property ScrollDownHyperLink As String
```

Property Value

A string value containing an URL. The default is an empty string.

Remarks

If the value of this property is not an empty string, the HtmlBuilder creates <AREA> tags for the scroll-down button displayed for Scrollable tables. That lets you process requests to scroll the table rows on the server, or just use the scroll buttons as additional hot spots in the image map. If the URL contains the {0} format specifier, it is replaced with the ZIndex of the clicked table.

See Also

HtmlBuilder Members
HtmlBuilder Class
MindFusion.Diagramming Namespace

HtmlBuilder.ScrollUpHyperLink Property

Gets or sets the hyperlink assigned to AREA tags generated for the upper scroll arrow of tables.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ScrollUpHyperLink { get; set; }
```

Visual Basic Copy Code

```
Public Property ScrollUpHyperLink As String
```

Property Value

A string value containing an URL. The default is an empty string.

Remarks

If the value of this property is not an empty string, the HtmlBuilder creates <AREA> tags for the scroll-down button displayed for Scrollable tables. That lets you process requests to scroll the table rows on the server, or just use the scroll buttons as additional hot spots in the image map. If the URL contains the {0} format specifier, it is replaced with the ZIndex of the clicked table.

HtmlBuilder Events

HtmlBuilder.CreatingArea Event

Raised just before a new AREA tag is added to the image map.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<AreaEventArgs> CreatingArea
```

Visual Basic Copy Code

```
Public Event CreatingArea As EventHandler(Of AreaEventArgs)
```

Event Data

CreatingArea event handlers receive an argument of type AreaEventArgs. The following **AreaEventArgs** members provide information relevant to the event:

Member name	Description

AreaTag	The HTML AREA tag created by HtmlBuilder.
Item	The diagram element represented by AreaTag in the image map.
Column	Contains the index of a column if the event is raised for a table cell.
Row	Contains the index of a row if the event is raised for a table cell.

Remarks

You could handle this event in order to insert additional attributes or **JavaScript** event handlers into the AREA tag. The tag string already ends with a closing ">" when the event is raised, so you must insert any additional attributes one character before the end of the tag string.

Example

The following code adds a JavaScript onClick event handler to the area tag:

C# Copy Code

```
private void htb_CreatingArea(object sender, AreaEventArgs e)
{
    string script = " onClick=\"alert('click click')\"";
    e.AreaTag = e.AreaTag.Insert(e.AreaTag.Length - 1, script);
}
```

Visual Basic Copy Code

```
Private Sub htb_CreatingArea(ByVal sender As Object, ByVal e As AreaEventArgs)

    Dim script As String = " onClick=" + Chr(34) + "alert('click click')" + Chr(34)
    e.AreaTag = e.AreaTag.Insert(e.AreaTag.Length - 1, script)

End Sub
```

MindFusion.Diagramming Namespace

HyperLinkStyle Enumeration

Specifies how various export components should treat the HyperLink property of items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum HyperLinkStyle
```

Visual Basic Copy Code

```
Public Enum HyperLinkStyle
```

Members

	Member name	Description
	None	Do not generate hyperlinks.

	Text	Generate hyperlinks for the text bounding rectangle.
	Shape	Generate hyperlinks that correspond to the item's shape.
	ShapeAndText	Generate hyperlinks for the item's shape and text bounding rectangle.

Remarks

At this time, members of this enumeration can be assigned to the HyperLinkStyle property of SvgExporter and PdfExporter.

IDiagramView Members

Controls that display Diagram objects must implement this interface to provide screen resolution information to drawing methods.

The following tables list the members exposed by the IDiagramView type.

Public Properties

	Name	Description
	Diagram	Gets the **Diagram** instance displayed by this control.

Public Methods

	Name	Description
	ZoomToRect	Zooms and scrolls the view to fit the specified document rectangle in the view's client area.

See Also

IDiagramView Interface
MindFusion.Diagramming Namespace

IDiagramView Methods

IDiagramView.ZoomToRect Method

Zooms and scrolls the view to fit the specified document rectangle in the view's client area.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
void ZoomToRect (
    Rect rect,
    bool centered
)
```

Visual Basic Copy Code

```
Sub ZoomToRect( _
    rect As Rect, _
    centered As Boolean _
)
```

Parameters

rect
A **Microsoft.Maui.Graphics.Rect** specifying the desired viewport's position and size.

centered
true to center the rectangle in viewport, or **false** to align it to top-left corner.

IEffectsProvider Members

Visual effects provider.

The following tables list the members exposed by the IEffectsProvider type.

Public Methods

	Name	Description
	GenerateEmboss	Generates an emboss mask for the shape defined by the specified path.
	GenerateShadow	Generates a shadow for the shape defined by the specified path.

See Also

IEffectsProvider Interface
MindFusion.Diagramming Namespace

IEffectsProvider Methods

IEffectsProvider.GenerateEmboss Method

Generates an emboss mask for the shape defined by the specified path.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
IImage GenerateEmboss (
    Diagram diagram,
    IGraphicsPath path
)
```

Visual Basic Copy Code

```
Function GenerateEmboss( _
    diagram As Diagram, _
    path As IGraphicsPath _
) As IImage
```

Parameters

diagram

A reference to a Diagram object containing the shape whose emboss mask is being generated.

path

A GraphicsPath that represents of the shape outline.

Return Value

A **Microsoft.Maui.Graphics.IImage** instance containing the generated emboss mask.

See Also

IEffectsProvider Members

IEffectsProvider.GenerateShadow Method

Generates a shadow for the shape defined by the specified path.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
IImage GenerateShadow (
    Diagram diagram,
    IGraphicsPath path,
    int dispersion,
    Brush brush
)
```

Visual Basic Copy Code

```
Function GenerateShadow( _
    diagram As Diagram, _
    path As IGraphicsPath, _
    dispersion As Integer, _
    brush As Brush _
) As IImage
```

Parameters

diagram

path

dispersion

brush

Return Value

ILinkRouter Members

Defines methods that should be implemented by a link-router component. The control calls them when a new link path should be set in response to changes in the diagram, such as adding or modifying nodes.

The following tables list the members exposed by the ILinkRouter type.

Public Properties

	Name	Description
	Diagram	Gets or sets the diagram this router is associated with.

Public Methods

	Name	Description
	RouteLink	Called when a single link must be routed.
	RouteLinks	Called when more than one link must be routed.

See Also

ILinkRouter Interface
MindFusion.Diagramming Namespace

ILinkRouter Methods

ILinkRouter.RouteLink Method

Called when a single link must be routed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
bool RouteLink (
    DiagramLink link,
    ConnectionPoint originConnection,
    ConnectionPoint destinationConnection,
    bool nowCreating
)
```

Visual Basic Copy Code

```
Function RouteLink( _
    link As DiagramLink, _
    originConnection As ConnectionPoint, _
    destinationConnection As ConnectionPoint, _
    nowCreating As Boolean _
) As Boolean
```

Parameters

link
A DiagramLink object representing the link.

originConnection
Represents connection to Origin node, potentially different from link's stored connection when modifying first control point.

destinationConnection
Represents connection to Destination node, potentially different from link's stored connection when modifying last control point.

nowCreating
Indicates whether link is currently being created.

Return Value

true if a path has been found, otherwise false.

ILinkRouter Members
ILinkRouter Interface
MindFusion.Diagramming Namespace

ILinkRouter.RouteLinks Method

Called when more than one link must be routed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
DiagramLinkCollection RouteLinks (
    DiagramLinkCollection links
)
```

Visual Basic Copy Code

```
Function RouteLinks( _
    links As DiagramLinkCollection _
) As DiagramLinkCollection
```

Parameters

links
A DiagramLinkCollection containing the links that should be routed.

Return Value

A list of links that were not routed successfully.

IMeasureUnitConverter Methods

IMeasureUnitConverter.CanConvertFrom Method

Returns a value indicating whether this converter can convert from the specified target unit to the specified source unit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
bool CanConvertFrom (
    MeasureUnit targetUnit,
    MeasureUnit sourceUnit
)
```

Visual Basic Copy Code

```
Function CanConvertFrom( _
    targetUnit As MeasureUnit, _
    sourceUnit As MeasureUnit _
) As Boolean
```

Parameters

targetUnit
The target MeasureUnit instance.

sourceUnit
The source **MeasureUnit** instance.

Return Value

true if conversion between the specified units is supported, or **false** otherwise.

See Also

IMeasureUnitConverter Members
IMeasureUnitConverter Interface
MindFusion.Diagramming Namespace

IMeasureUnitConverter.CanConvertTo Method

Returns a value indicating whether this converter can convert from the specified source unit to the specified target unit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
bool CanConvertTo (
    MeasureUnit sourceUnit,
    MeasureUnit targetUnit
)
```

Visual Basic Copy Code

```
Function CanConvertTo( _
    sourceUnit As MeasureUnit, _
    targetUnit As MeasureUnit _
) As Boolean
```

Parameters

sourceUnit

The source MeasureUnit instance.

targetUnit

The target **MeasureUnit** instance.

Return Value

true if conversion between the specified units is supported, or **false** otherwise.

See Also

IMeasureUnitConverter Members
IMeasureUnitConverter Interface
MindFusion.Diagramming Namespace

IMeasureUnitConverter.ConvertFrom Method

Converts a value from the specified source unit to the specified target unit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
double ConvertFrom (
    MeasureUnit targetUnit,
    MeasureUnit sourceUnit,
    double value,
    Axis axis,
    Object param
)
```

Visual Basic Copy Code

```
Function ConvertFrom( _
    targetUnit As MeasureUnit, _
    sourceUnit As MeasureUnit, _
    value As Double, _
    axis As Axis, _
    param As Object _
) As Double
```

Parameters

targetUnit

The target MeasureUnit instance.

sourceUnit

The source **MeasureUnit** instance.

value
A **double** value that should be converted.

axis
A member of the Axis enumeration specifying whether the value represents a horizontal or a vertical dimension.

param
An object providing device resolution information.

Return Value

The converted value.

Remarks

param can be set to either **Graphics**, IGraphics, **DiagramView** or IResolution object.

See Also

IMeasureUnitConverter Members
IMeasureUnitConverter Interface
MindFusion.Diagramming Namespace

IMeasureUnitConverter.ConvertTo Method

Converts a value from the specified source unit to the specified target unit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
double ConvertTo (
    MeasureUnit sourceUnit,
    MeasureUnit targetUnit,
    double value,
    Axis axis,
    Object param
)
```

Visual Basic Copy Code

```
Function ConvertTo( _
    sourceUnit As MeasureUnit, _
    targetUnit As MeasureUnit, _
    value As Double, _
    axis As Axis, _
    param As Object _
) As Double
```

Parameters

sourceUnit
The source MeasureUnit instance.

targetUnit
The target **MeasureUnit** instance.

value
A **double** value that should be converted.

axis
A member of the Axis enumeration specifying whether the value represents a horizontal or a vertical dimension.

param
An object providing device resolution information.

Return Value

The converted value.

Remarks

param can be set to either **Graphics**, IGraphics, **DiagramView** or IResolution object.

InplaceEditable Members
MindFusion.Diagramming Namespace

InplaceEditable Members

Represents an in-place editable object.

The following tables list the members exposed by the InplaceEditable type.

Public Methods

	Name	Description
	GetEditRect	Returns the rectangle where the in-place editing control appears (in document coordinates).
	GetTextToEdit	Returns the text of the object which should be displayed initially when the object is in-place edited.
	SetEditedText	Sets the edited text to the object after the in-place editing operation has been completed successfully.

MindFusion.Diagramming Namespace

InplaceEditable Methods

InplaceEditable.GetEditRect Method

Returns the rectangle where the in-place editing control appears (in document coordinates).

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
Rect GetEditRect (
    DiagramItem item,
    Point mousePosition
)
```

Visual Basic Copy Code

```
Function GetEditRect( _
    item As DiagramItem, _
    mousePosition As Point _
) As Rect
```

Parameters

item
The item being edited.

mousePosition
A **Microsoft.Maui.Graphics.Point** instance specifying the mouse position.

Return Value

A **Microsoft.Maui.Graphics.Rect** that represents the destination rectangle of the in-place editing control.

See Also

InplaceEditable Members
InplaceEditable Interface
MindFusion.Diagramming Namespace

InplaceEditable.GetTextToEdit Method

Returns the text of the object which should be displayed initially when the object is in-place edited.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
string GetTextToEdit ()
```

Visual Basic Copy Code

```
Function GetTextToEdit () As String
```

Return Value

A string value that represents the initial contents of the in-place editing box.

See Also

InplaceEditable Members
InplaceEditable Interface
MindFusion.Diagramming Namespace

InplaceEditable.SetEditedText Method

Sets the edited text to the object after the in-place editing operation has been completed successfully.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
void SetEditedText (
    string newText
)
```

Visual Basic Copy Code

```
Sub SetEditedText( _
    newText As String _
)
```

Parameters

newText
The new text of the in-place edited object.

InplaceEditable Members
InplaceEditable Interface
MindFusion.Diagramming Namespace

InplaceEditableList Interface

Represents an object that can be edited via an inplace list control.

Syntax

C# Copy Code

```
public interface InplaceEditableList
```

Visual Basic Copy Code

```
Public Interface InplaceEditableList
```

Inheritors

MindFusion.Diagramming.PagedContainerNode

See Also

InplaceEditableList Members
MindFusion.Diagramming Namespace

InplaceEditableList Members

Represents an object that can be edited via an inplace list control.

The following tables list the members exposed by the InplaceEditableList type.

Public Methods

	Name	Description

	GetCurrentItem	Gets the index of the currently selected item.
	GetListItems	Gets the list of items to be displayed in the editor.
	SetCurrentItem	Sets the currently selected item by its index.

See Also

InplaceEditableList Interface
MindFusion.Diagramming Namespace

InplaceEditableList Methods

InplaceEditableList.GetCurrentItem Method

Gets the index of the currently selected item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
int GetCurrentItem ()
```

Visual Basic Copy Code

```
Function GetCurrentItem () As Integer
```

Return Value

See Also

InplaceEditableList Members
InplaceEditableList Interface
MindFusion.Diagramming Namespace

InplaceEditableList.GetListItems Method

Gets the list of items to be displayed in the editor.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
IList<string> GetListItems ()
```

Visual Basic Copy Code

```
Function GetListItems () As IList(Of String)
```

Return Value

A list of strings representing the items.

See Also

InplaceEditableList Members
InplaceEditableList Interface
MindFusion.Diagramming Namespace

InplaceEditableList.SetCurrentItem Method

Sets the currently selected item by its index.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
void SetCurrentItem (
    int index
)
```

Visual Basic Copy Code

```
Sub SetCurrentItem( _
    index As Integer _
)
```

Parameters

index
The index of the item to select.

MindFusion.Diagramming Namespace

InstantiateItemEventArgs Members

Contains the arguments passed to the InstantiateItem event handlers.

The following tables list the members exposed by the InstantiateItemEventArgs type.

Public Constructors

	Name	Description
	InstantiateItemEventArgs	Initializes a new instance of the **InstantiateItemEventArgs** class.

Public Properties

	Name	Description
	Item	Gets or sets a reference to the created diagram item.
	ItemClass	Gets the item class identifier.

See Also

InstantiateItemEventArgs Class
MindFusion.Diagramming Namespace

InstantiateItemEventArgs Constructor

Initializes a new instance of the InstantiateItemEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public InstantiateItemEventArgs (
    string itemClass
)
```

Visual Basic Copy Code

```
Public New ( _
    itemClass As String _
)
```

Parameters

itemClass
The class string identifier specifying the type of the new item.

See Also

InstantiateItemEventArgs Class
MindFusion.Diagramming Namespace

InstantiateItemEventArgs Properties

InstantiateItemEventArgs.Item Property

Gets or sets a reference to the created diagram item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem Item { get; set; }
```

Visual Basic Copy Code

```
Public Property Item As DiagramItem
```

Property Value

An instance of the DiagramItem class.

See Also

InstantiateItemEventArgs Members
InstantiateItemEventArgs Class
MindFusion.Diagramming Namespace

InstantiateItemEventArgs.ItemClass Property

Gets the item class identifier.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ItemClass { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ItemClass As String
```

Property Value

A string value specifying the item class identifier.

See Also

InstantiateItemEventArgs Members
InstantiateItemEventArgs Class
MindFusion.Diagramming Namespace

InteractionState Class

Encapsulates the current state of user interaction with the control.

Syntax

C# Copy Code

```
public class InteractionState
```

Visual Basic Copy Code

```
Public Class InteractionState
```

Remarks

Return an instance of this class from the **StartDraw** method of a custom **Behavior** class.

Inheritance Hierarchy

System.Object
MindFusion.Diagramming.InteractionState

See Also

InteractionState Members
MindFusion.Diagramming Namespace

InteractionState Members

Encapsulates the current state of user interaction with the control.

The following tables list the members exposed by the InteractionState type.

Public Constructors

	Name	Description
	InteractionState	Initializes a new instance of the **InteractionState** class.

Public Properties

	Name	Description
	Action	Gets the type of Action currently performed by the user in the Diagram.
	AdjustmentHandle	Gets the adjustment handle being dragged by the user.
	CurrentItem	Gets a reference to the DiagramItem to be created or modified.
	CurrentPoint	Gets the current location of the mouse pointer.
	Diagram	Gets the current **Diagram** instance.
	InvalidRect	Gets or sets the area that should be repainted.
	LinkTarget	Gets or sets the current target node when a link is being modified.
	MouseMoved	Gets or sets a value indicating whether the mouse pointer has moved since the user pressed down the mouse button.
	SkipSavingState	Gets a value indicating whether diagram items should skip storing their state for subsequent cancel.
	StartPoint	Gets the mouse position where the interaction started.

Public Methods

	Name	Description
	Cancel	Cancels the user interaction.
	CancelNow	Instruct the interaction to terminate on the next pass.
	Complete	This method is invoked to complete the interaction, usually when the user releases the left mouse button.
	IsAllowed	Checks whether the current interaction can be completed at the specified point.
	IsCompleting	Returns whether the interaction has been completed successfully.
	SetHandleIndex	Sets the adjustment handle tracked by this object to the specified handle.
	SetItemDeleted	Notifies the interaction that its associated diagram item has been deleted.

	ShouldCancelDrag	Gets a value indicating whether the interaction should terminate on the next pass.
	Start	This method is invoked in the beginning of the interaction, usually when the user presses the left mouse button over a modification handle.
	Update	This method is invoked to update the interaction state, usually in response to the user moving the mouse after the modification has started.
	ValidateAndSetCursor	Sets the cursor depending on whether the interaction can be completed at the specified point or not.

See Also

InteractionState Class
MindFusion.Diagramming Namespace

InteractionState Constructor

Initializes a new instance of the InteractionState class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public InteractionState (
    DiagramItem currentItem,
    AdjustmentHandle adjustmentHandle,
    Action action
)
```

Visual Basic Copy Code

```
Public New ( _
    currentItem As DiagramItem, _
    adjustmentHandle As AdjustmentHandle, _
    action As Action _
)
```

Parameters

currentItem
The DiagramItem to be created or modified.

adjustmentHandle
The selection handle to be dragged with the mouse, defines what kind of modification to perform.

action
One of the Action enumeration values, specifying what kind of action to perform.

See Also

InteractionState Class
MindFusion.Diagramming Namespace

InteractionState Methods

InteractionState.Cancel Method

Cancels the user interaction.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Cancel (
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public Sub Cancel( _
    diagram As Diagram _
)
```

Parameters

diagram
The Diagram, at which the action is performed.

Remarks

Call this method to cancel interaction, usually in response to the user clicking the right mouse button while dragging.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace
CancelNow

InteractionState.CancelNow Method

Instruct the interaction to terminate on the next pass.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void CancelNow ()
```

Visual Basic Copy Code

```
Public Sub CancelNow ()
```

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace
Cancel

InteractionState.Complete Method

This method is invoked to complete the interaction, usually when the user releases the left mouse button.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Complete (
    Point point,
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public Sub Complete( _
    point As Point, _
    diagram As Diagram _
)
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** instance indicating the location of the cursor, in document coordinates.

diagram
The Diagram, at which the action is performed.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace
IsCompleting

InteractionState.IsAllowed Method

Checks whether the current interaction can be completed at the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool IsAllowed (
    Point point
)
```

Visual Basic Copy Code

```
Public Function IsAllowed( _
    point As Point _
) As Boolean
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** indicating the location of the cursor, in document coordinates.

Return Value

true if the action can be completed at *point*; otherwise, **false**.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.IsCompleting Method

Returns whether the interaction has been completed successfully.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool IsCompleting ()
```

Visual Basic Copy Code

```
Public Function IsCompleting () As Boolean
```

Return Value

true if the interaction has been completed successfully; otherwise, **false**.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace
Complete

InteractionState.SetHandleIndex Method

Sets the adjustment handle tracked by this object to the specified handle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetHandleIndex (
    AdjustmentHandle newHandle
)
```

Visual Basic Copy Code

```
Public Sub SetHandleIndex( _
    newHandle As AdjustmentHandle _
)
```

Parameters

newHandle

An AdjustmentHandle instance representing the modified handle.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.SetItemDeleted Method

Notifies the interaction that its associated diagram item has been deleted.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetItemDeleted ()
```

Visual Basic

```
Public Sub SetItemDeleted ()
```

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.ShouldCancelDrag Method

Gets a value indicating whether the interaction should terminate on the next pass.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public bool ShouldCancelDrag ()
```

Visual Basic

```
Public Function ShouldCancelDrag () As Boolean
```

Return Value

true if the interaction should terminate; otherwise, **false**.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.Start Method

This method is invoked in the beginning of the interaction, usually when the user presses the left mouse button over a modification handle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public void Start (
    Point point,
    Diagram diagram
)
```

Visual Basic

```
Public Sub Start( _
    point As Point, _
    diagram As Diagram _
)
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** indicating the location of the cursor, in document coordinates.

diagram
The Diagram, at which the interaction is performed.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.Update Method

This method is invoked to update the interaction state, usually in response to the user moving the mouse after the modification has started.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Update (
    Point point,
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public Function Update( _
    point As Point, _
    diagram As Diagram _
) As Boolean
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** indicating the location of the cursor, in document coordinates.

diagram
The Diagram, at which the interaction is performed.

Return Value

true if the update has been successful; otherwise, **false**.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.ValidateAndSetCursor Method

Sets the cursor depending on whether the interaction can be completed at the specified point or not.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CursorHint ValidateAndSetCursor (
    Point point,
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public Function ValidateAndSetCursor( _
    point As Point, _
```

```
    diagram As Diagram _
) As CursorHint
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** indicating the location of the cursor, in document coordinates.

diagram
The Diagram, at which the interaction is performed.

Return Value

One of the CursorHint enumeration values, which is used by **DiagramView** to set its **Cursor** property. The method might return CursorHint.DontChange and the cursor will be left as it is.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState Properties

InteractionState.Action Property

Gets the type of Action currently performed by the user in the Diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Action Action { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Action As Action
```

Property Value

A member of the Action enumeration that specifies what kind of action the user currently performs on the Diagram.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.AdjustmentHandle Property

Gets the adjustment handle being dragged by the user.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AdjustmentHandle AdjustmentHandle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property AdjustmentHandle As AdjustmentHandle
```

Property Value

An AdjustmentHandle object representing the dragged handle.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.CurrentItem Property

Gets a reference to the DiagramItem to be created or modified.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem CurrentItem { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property CurrentItem As DiagramItem
```

Property Value

An instance of the DiagramItem class.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.CurrentPoint Property

Gets the current location of the mouse pointer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point CurrentPoint { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property CurrentPoint As Point
```

Property Value

A **Microsoft.Maui.Graphics.Point** that specifies the current location of the cursor, in document coordinates.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.Diagram Property

Gets the current Diagram instance.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Diagram Diagram { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Diagram As Diagram
```

Property Value

An instance of the Diagram class.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.InvalidRect Property

Gets or sets the area that should be repainted.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect InvalidRect { get; set; }
```

Visual Basic Copy Code

```
Public Property InvalidRect As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** specifying a rectangular region of the diagram that should be repainted.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.LinkTarget Property

Gets or sets the current target node when a link is being modified.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNode LinkTarget { get; set; }
```

Visual Basic

```
Public Property LinkTarget As DiagramNode
```

Property Value

A DiagramNode that the currently modified DiagramLink should connect to if the interaction completes at the current mouse position.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.MouseMoved Property

Gets or sets a value indicating whether the mouse pointer has moved since the user pressed down the mouse button.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public bool MouseMoved { get; set; }
```

Visual Basic

```
Public Property MouseMoved As Boolean
```

Property Value

true is the mouse has moved; otherwise, **false**.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.SkipSavingState Property

Gets a value indicating whether diagram items should skip storing their state for subsequent cancel.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public bool SkipSavingState { get; }
```

Visual Basic

```
Public ReadOnly Property SkipSavingState As Boolean
```

Property Value

A boolean value.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

InteractionState.StartPoint Property

Gets the mouse position where the interaction started.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point StartPoint { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property StartPoint As Point
```

Property Value

A **Microsoft.Maui.Graphics.Point** specifying the mouse position where the user started to draw or modify an item.

See Also

InteractionState Members
InteractionState Class
MindFusion.Diagramming Namespace

IProperty Interface

Represents a property that can have an undefined value.

Syntax

C# Copy Code

```
public interface IProperty
```

Visual Basic Copy Code

```
Public Interface IProperty
```

See Also

IProperty Members
MindFusion.Diagramming Namespace

IProperty Members

Represents a property that can have an undefined value.

The following tables list the members exposed by the IProperty type.

Public Properties

	Name	Description
	HasValue	Gets a value indicating whether the property has a value.
	Name	Gets the name of the property.

Public Methods

	Name	Description

	GetValue	Gets the value of the property.
	SetValue	Sets the value of the property.
	Unset	Clears the value of the property.

See Also

IProperty Interface
MindFusion.Diagramming Namespace

IProperty Methods

IProperty.GetValue Method

Gets the value of the property.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
Object GetValue ()
```

Visual Basic Copy Code

```
Function GetValue () As Object
```

Return Value

See Also

IProperty Members
IProperty Interface
MindFusion.Diagramming Namespace

IProperty.SetValue Method

Sets the value of the property.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
void SetValue (
    Object value
)
```

Visual Basic Copy Code

```
Sub SetValue( _
    value As Object _
)
```

Parameters

value

See Also

IProperty Members
IProperty Interface
MindFusion.Diagramming Namespace

IProperty.Unset Method

Clears the value of the property.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
void Unset ()
```

Visual Basic Copy Code

```
Sub Unset ()
```

See Also

IProperty Members

IProperty Properties

IProperty.HasValue Property

Gets a value indicating whether the property has a value.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
bool HasValue { get; }
```

Visual Basic Copy Code

```
ReadOnly Property HasValue As Boolean
```

Property Value

See Also

IProperty Members
IProperty Interface
MindFusion.Diagramming Namespace

IProperty.Name Property

Gets the name of the property.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
string Name { get; }
```

Visual Basic Copy Code

```
ReadOnly Property Name As String
```

Property Value

See Also

IProperty Members

IResolution Interface

Provides information about device resolution.

Syntax

C# Copy Code

```
public interface IResolution
```

Visual Basic Copy Code

```
Public Interface IResolution
```

Inheritors

MindFusion.Diagramming.IDiagramView

See Also

IResolution Members
MindFusion.Diagramming Namespace

IResolution Members

Provides information about device resolution.

The following tables list the members exposed by the IResolution type.

Public Properties

	Name	Description
	DpiX	Gets the horizontal resolution of the device.
	DpiY	Gets the vertical resolution of the device.

See Also

IResolution Interface
MindFusion.Diagramming Namespace

IResolution Properties

IResolution.DpiX Property

Gets the horizontal resolution of the device.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
double DpiX { get; }
```

Visual Basic Copy Code

```
ReadOnly Property DpiX As Double
```

Property Value

A **double** value specifying horizontal dots-per-inch resolution.

See Also

IResolution Members
IResolution Interface
MindFusion.Diagramming Namespace

IResolution.DpiY Property

Gets the vertical resolution of the device.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
double DpiY { get; }
```

Visual Basic Copy Code

```
ReadOnly Property DpiY As Double
```

Property Value

A **double** value specifying vertical dots-per-inch resolution.

ItemCollectionBase(T) Class

A base collection class for the diagram item collections.

Syntax

C# Copy Code

```
public abstract class ItemCollectionBase<T> : CollectionBase<T> where T : DiagramItem
```

Visual Basic Copy Code

```
Public MustInherit Class ItemCollectionBase(Of T As DiagramItem)
    Inherits CollectionBase(Of T)
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.CollectionBase(T)
    MindFusion.Diagramming.ItemCollectionBase(T)
      MindFusion.Diagramming.DiagramItemCollection
      MindFusion.Diagramming.DiagramLinkCollection
      MindFusion.Diagramming.DiagramNodeCollection

See Also

ItemCollectionBase(T) Members
MindFusion.Diagramming Namespace

ItemCollectionBase(T) Members

A base collection class for the diagram item collections.

The following tables list the members exposed by the ItemCollectionBase(T) type.

Protected Fields

	Name	Description
	InnerList	Gets a **List<T>** containing the list of elements in the collection instance. (Inherited from CollectionBase.)
	itemEventArgs	A ItemEventArgs instance used for passing arguments to the event handlers for the events of this collection. Used to avoid creating many small objects that would burden the garbage collector.
	notifyParent	If enabled, the collection raises events to let their containing objects handle the addition or removal of items.

Public Properties

	Name	Description
	Count	Gets the number of elements actually contained in the collection. (Inherited from CollectionBase.)
	IsReadOnly	Gets a value indicating whether the collection is read-only. (Inherited from CollectionBase.)
	Item	Gets or sets the element at the specified index. (Inherited from CollectionBase.)

Public Methods

	Name	Description
	Add	Adds the specified diagram item to the collection.
	Clear	Removes all diagram items from the collection.
	Contains	Determines whether an element is in the collection. (Inherited from CollectionBase.)
	CopyTo	Copies the entire collection to a compatible one-dimensional array, starting at the specified index of the target array. (Inherited from CollectionBase.)

	GetAt	Gets the diagram item at the specified position.
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from CollectionBase.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire collection. (Inherited from CollectionBase.)
	Insert	Inserts the specified diagram item into the collection at the specified position.
	Remove	Removes the diagram item from the collection.
	RemoveAt	Removes the diagram item from the collection.
	Sort	Overloaded. (Inherited from CollectionBase.)

Protected Methods

	Name	Description
	RaiseAdding	Raises the **Adding** event.
	RaiseInserting	Raises the **Inserting** event.
	RaiseRemoving	Raises the **Removing** event.

ItemCollectionBase(T) Class
MindFusion.Diagramming Namespace

ItemCollectionBase(T) Fields

ItemCollectionBase(T).itemEventArgs Field

A ItemEventArgs instance used for passing arguments to the event handlers for the events of this collection. Used to avoid creating many small objects that would burden the garbage collector.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected ItemEventArgs itemEventArgs
```

Visual Basic Copy Code

```
Protected itemEventArgs As ItemEventArgs
```

See Also

ItemCollectionBase(T) Members
ItemCollectionBase(T) Class
MindFusion.Diagramming Namespace

ItemCollectionBase(T).notifyParent Field

If enabled, the collection raises events to let their containing objects handle the addition or removal of items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected bool notifyParent
```

Visual Basic Copy Code

```
Protected notifyParent As Boolean
```

See Also

ItemCollectionBase(T) Members
ItemCollectionBase(T) Class
MindFusion.Diagramming Namespace

ItemCollectionBase(T) Methods

ItemCollectionBase(T).Add Method

Adds the specified diagram item to the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void Add (
    T item
)
```

Visual Basic Copy Code

```
Public Overrides Sub Add( _
    item As T _
)
```

Parameters

item
The DiagramItem object to add to the collection.

See Also

ItemCollectionBase(T) Members
ItemCollectionBase(T) Class
MindFusion.Diagramming Namespace

ItemCollectionBase(T).Clear Method

Removes all diagram items from the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void Clear ()
```

Visual Basic Copy Code

```
Public Overrides Sub Clear ()
```

See Also

ItemCollectionBase(T) Members
ItemCollectionBase(T) Class
MindFusion.Diagramming Namespace

ItemCollectionBase(T).GetAt Method

Gets the diagram item at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem GetAt (
    int index
)
```

Visual Basic Copy Code

```
Public Function GetAt( _
    index As Integer _
) As DiagramItem
```

Parameters

index
The zero-based index of the item to retrieve.

Return Value

An instance of the DiagramItem class that represents the item at the specified position.

See Also

ItemCollectionBase(T) Members
ItemCollectionBase(T) Class
MindFusion.Diagramming Namespace

ItemCollectionBase(T).Insert Method

Inserts the specified diagram item into the collection at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void Insert (
    int index,
    T item
)
```

Visual Basic Copy Code

```
Public Overrides Sub Insert( _
    index As Integer, _
    item As T _
)
```

Parameters

index
The zero-based index at which to insert the item.

item
The DiagramItem object to add to the collection.

See Also

ItemCollectionBase(T) Members
ItemCollectionBase(T) Class
MindFusion.Diagramming Namespace

ItemCollectionBase(T).RaiseAdding Method

Raises the **Adding** event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void RaiseAdding (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Protected Sub RaiseAdding( _
    item As DiagramItem _
)
```

Parameters

item
The diagram item that is being added.

See Also

ItemCollectionBase(T) Members
ItemCollectionBase(T) Class
MindFusion.Diagramming Namespace

ItemCollectionBase(T).RaiseInserting Method

Raises the **Inserting** event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void RaiseInserting (
    DiagramItem item,
    int index
)
```

Visual Basic

```
Protected Sub RaiseInserting( _
    item As DiagramItem, _
    index As Integer _
)
```

Parameters

item

The diagram item that is being inserted.

index

Index of the new item.

See Also

ItemCollectionBase(T) Members
ItemCollectionBase(T) Class
MindFusion.Diagramming Namespace

ItemCollectionBase(T).RaiseRemoving Method

Raises the **Removing** event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected void RaiseRemoving (
    DiagramItem item
)
```

Visual Basic

```
Protected Sub RaiseRemoving( _
    item As DiagramItem _
)
```

Parameters

item

The diagram item that is being removed.

See Also

ItemCollectionBase(T) Members
ItemCollectionBase(T) Class
MindFusion.Diagramming Namespace

ItemCollectionBase(T).Remove Method

Removes the diagram item from the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override bool Remove (
    T item
)
```

Visual Basic

```
Public Overrides Function Remove( _
    item As T _
) As Boolean
```

Parameters

item
The DiagramItem object to remove from the collection.

Return Value

See Also

ItemCollectionBase(T) Members
ItemCollectionBase(T) Class
MindFusion.Diagramming Namespace

ItemCollectionBase(T).RemoveAt Method

Removes the diagram item from the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override void RemoveAt (
    int index
)
```

Visual Basic

```
Public Overrides Sub RemoveAt( _
    index As Integer _
)
```

Parameters

index
Index of the object that should be removed from this collection.

ItemEventArgs Class

Contains the arguments passed to item instantiation event handlers.

Syntax

C#

```
public class ItemEventArgs : EventArgs
```

Visual Basic

```
Public Class ItemEventArgs
    Inherits EventArgs
```

Inheritance Hierarchy

System.Object
  System.EventArgs
    MindFusion.Diagramming.ItemEventArgs
      MindFusion.Diagramming.LinkEventArgs
      MindFusion.Diagramming.NodeEventArgs

See Also

ItemEventArgs Members
MindFusion.Diagramming Namespace

ItemEventArgs Members

Contains the arguments passed to item instantiation event handlers.

The following tables list the members exposed by the ItemEventArgs type.

Public Constructors

	Name	Description
	ItemEventArgs	Initializes a new instance of the **ItemEventArgs** class.

Public Properties

	Name	Description
	Index	Gets an integer index related to the event.
	Item	Gets the item for which the event is raised.

See Also

ItemEventArgs Class
MindFusion.Diagramming Namespace

ItemEventArgs Constructor

Initializes a new instance of the ItemEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ItemEventArgs (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public New ( _
    item As DiagramItem _
)
```

Parameters

item

The DiagramItem related to the event.

See Also

ItemEventArgs Properties

ItemEventArgs.Index Property

Gets an integer index related to the event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Index { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Index As Integer
```

Property Value

An integer value specifying the item's position within its containing collection.

See Also

ItemEventArgs Members
ItemEventArgs Class
MindFusion.Diagramming Namespace

ItemEventArgs.Item Property

Gets the item for which the event is raised.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem Item { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Item As DiagramItem
```

Property Value

An instance of the DiagramItem class.

See Also

ItemEventArgs Members
ItemEventArgs Class
MindFusion.Diagramming Namespace

ItemLabel Class

The base class for node and link labels.

Syntax

C# Copy Code

```
public class ItemLabel : InplaceEditable
```

Visual Basic Copy Code

```
Public Class ItemLabel
    Implements InplaceEditable
```

Remarks

This class represents supplementary labels displayed by an item, in addition to its main Text property. Call the AddLabel method to create a label, and customize it through various members of type-specific LinkLabel and NodeLabel classes.

A label can also display an image assigned to the Image or ImageUrl property. This lets you draw multiple icons per node, or along a link's geometry.

Inheritance Hierarchy

System.Object
MindFusion.Diagramming.ItemLabel
MindFusion.Diagramming.LinkLabel
MindFusion.Diagramming.NodeLabel
MindFusion.Diagramming.LinkLabel
MindFusion.Diagramming.NodeLabel

See Also

ItemLabel Members
MindFusion.Diagramming Namespace

ItemLabel Members

The base class for node and link labels.

The following tables list the members exposed by the ItemLabel type.

Public Constructors

	Name	Description
	ItemLabel	Overloaded.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to draw the label's background.
	ContentPadding	Gets or sets the distance between image and text when both are specified.
	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled.
	EnableWrap	Gets or sets a value indicating whether the label's text can be wrapped.
	Font	Gets or sets the label's font.
	HorizontalAlign	Gets or sets the label's horizontal alignment.
	HorizontalOffset	Gets or sets the label's horizontal offset from its pin point.
	Image	Gets or sets the image displayed by this label.
	ImageAlign	Gets or sets the alignment of label's image relative to text.
	ImageSize	Gets or sets a size that overrides the native image size.

	ImageUrl	Gets or sets URL of the image to display inside this label.
	Index	Gets or sets the index of an edge or point this label is relative to.
	Item	Gets or sets the DiagramItem that displays this label.
	Locked	Gets or sets a value indicating whether users are allowed to edit this label.
	Margin	Gets or sets the label's margin.
	MaxWidth	Gets or sets the maximum width of the label.
	Text	Gets or sets the label's text.
	TextBrush	Gets or sets the brush used to draw the label's text.
	VerticalAlign	Gets or sets the label's vertical alignment.
	VerticalOffset	Gets or sets the label's vertical offset from its pin point.

Public Methods

	Name	Description
	Cancel	Called when drag operation is canceled.
	Draw	Draws the label on the specified IGraphics surface.
	GetEditRect	InplaceEditable.GetEditRect implementation.
	GetTextToEdit	InplaceEditable.GetTextToEdit implementation.
	LoadFromXml	Loads the label from the specified XML element.
	OnMouseDown	Called when the left mouse button is pressed while the pointer is over this label.
	OnMouseMove	Called when the mouse is moved while this label tracks the mouse events.
	OnMouseUp	Called when the left mouse button is released while this label tracks the mouse events.
	SaveToXml	Saves the label into the specified XML element.
	SetEditedText	InplaceEditable.SetEditedText implementation.
	SetMouseCursor	Indicates what cursor to display for interactive labels.
	UpdateValue	Called while drag operation is in progress.

Protected Methods

	Name	Description
	LoadFromJson	Loads the label from a JsonObject.
	SaveToJson	Saves the label into a **JsonObject**.

ItemLabel Constructor

Overload List

Name	Description
ItemLabel ()	Initializes a new instance of the ItemLabel class.
ItemLabel (DiagramItem)	Initializes a new instance of the **ItemLabel** class.

See Also

ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel Constructor ()

Initializes a new instance of the ItemLabel class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ItemLabel ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

ItemLabel Constructor Overload List
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel Constructor (DiagramItem)

Initializes a new instance of the ItemLabel class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ItemLabel (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public New ( _
    item As DiagramItem _
)
```

Parameters

item
The DiagramItem that displays the label.

See Also

ItemLabel Constructor Overload List
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel Methods

ItemLabel.Cancel Method

Called when drag operation is canceled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void Cancel ()
```

Visual Basic Copy Code

```
Public Overridable Sub Cancel ()
```

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.Draw Method

Draws the label on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void Draw (
    IGraphics graphics
)
```

Visual Basic Copy Code

```
Public Overridable Sub Draw( _
    graphics As IGraphics _
)
```

Parameters

graphics
An IGraphics object where the label should be rendered.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.GetEditRect Method

InplaceEditable.GetEditRect implementation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect GetEditRect (
    DiagramItem item,
    Point mousePosition
)
```

Visual Basic Copy Code

```
Public Function GetEditRect( _
    item As DiagramItem, _
    mousePosition As Point _
) As Rect
```

Parameters

item

The item being edited.

mousePosition

A **Microsoft.Maui.Graphics.Point** instance specifying the mouse position.

Return Value

A **Microsoft.Maui.Graphics.Rect** specifying position of in-place edit control.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.GetTextToEdit Method

InplaceEditable.GetTextToEdit implementation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string GetTextToEdit ()
```

Visual Basic Copy Code

```
Public Function GetTextToEdit () As String
```

Return Value

A string value containing label's text.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.LoadFromJson Method

Loads the label from a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject containing the label's data.

context

A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.LoadFromXml Method

Loads the label from the specified XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Public Overridable Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** instance.

context

An XmlPersistContext instance.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.OnMouseDown Method

Called when the left mouse button is pressed while the pointer is over this label.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void OnMouseDown (
    Point mousePosition
)
```

Visual Basic Copy Code

```
Public Overridable Sub OnMouseDown( _
    mousePosition As Point _
)
```

Parameters

mousePosition
A **Microsoft.Maui.Graphics.Point** that specifies the current mouse position.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.OnMouseMove Method

Called when the mouse is moved while this label tracks the mouse events.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void OnMouseMove (
    Point mousePosition
)
```

Visual Basic Copy Code

```
Public Overridable Sub OnMouseMove( _
    mousePosition As Point _
)
```

Parameters

mousePosition
A **Microsoft.Maui.Graphics.Point** that specifies the current mouse position.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.OnMouseUp Method

Called when the left mouse button is released while this label tracks the mouse events.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void OnMouseUp (
    Point mousePosition
)
```

Visual Basic Copy Code

```
Public Overridable Sub OnMouseUp( _
    mousePosition As Point _
)
```

Parameters

mousePosition
A **Microsoft.Maui.Graphics.Point** that specifies the current mouse position.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.SaveToJson Method

Saves the label into a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject the label's data should be stored into.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.SaveToXml Method

Saves the label into the specified XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Public Overridable Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
A **XmlElement** instance.

context
A XmlPersistContext instance.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.SetEditedText Method

InplaceEditable.SetEditedText implementation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetEditedText (
    string newText
)
```

Visual Basic Copy Code

```
Public Sub SetEditedText( _
    newText As String _
)
```

Parameters

newText
The new text of the in-place edited object.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.SetMouseCursor Method

Indicates what cursor to display for interactive labels.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CursorHint SetMouseCursor (
    Point point
)
```

Visual Basic Copy Code

```
Public Function SetMouseCursor( _
    point As Point _
) As CursorHint
```

Parameters

point
Specifies mouse pointer position

Return Value

A member of the CursorHint enumeration.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.UpdateValue Method

Called while drag operation is in progress.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public virtual void UpdateValue (
    Point current
)
```

Visual Basic Copy Code

```
Public Overridable Sub UpdateValue( _
    current As Point _
)
```

Parameters

current
A **Microsoft.Maui.Graphics.Point** specifying current position of mouse pointer.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel Properties

ItemLabel.Brush Property

Gets or sets the brush used to draw the label's background.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush Brush { get; set; }
```

Visual Basic Copy Code

```
Public Property Brush As Brush
```

Property Value

A Brush used to paint the label's background. The default value is **null**.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.ContentPadding Property

Gets or sets the distance between image and text when both are specified.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Nullable<Double> ContentPadding { get; set; }
```

Visual Basic Copy Code

```
Public Property ContentPadding As Nullable(Of Double)
```

Property Value

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.EnableStyledText Property

Gets or sets a value indicating whether styled text rendering is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableStyledText { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableStyledText As Boolean
```

Property Value

true to parse the label's text in order to find formatting tags, or **false** otherwise.

Remarks

Styled text allows applying various attributes to the characters it contains. Attributes are specified using HTML-like formatting tags embedded in the raw text. Formatting tags are listed and described in the **Text Attributes and Formatting** section of this help file.

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace
Text Property

ItemLabel.EnableWrap Property

Gets or sets a value indicating whether the label's text can be wrapped.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableWrap { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableWrap As Boolean
```

Property Value

true to enable text wrapping, or **false** otherwise.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.Font Property

Gets or sets the label's font.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Font Font { get; set; }
```

Visual Basic Copy Code

```
Public Property Font As Font
```

Property Value

A Font instance.

Remarks

This property can be **null** (**Nothing** in Visual Basic) in which case the label will use the Font of its parent item.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace
Text Property
TextBrush Property

ItemLabel.HorizontalAlign Property

Gets or sets the label's horizontal alignment.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public StringAlignment HorizontalAlign { get; set; }
```

Visual Basic Copy Code

```
Public Property HorizontalAlign As StringAlignment
```

Property Value

A member of the StringAlignment enumeration. The default is **Center**.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.HorizontalOffset Property

Gets or sets the label's horizontal offset from its pin point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double HorizontalOffset { get; set; }
```

Visual Basic Copy Code

```
Public Property HorizontalOffset As Double
```

Property Value

A **double** value specifying distance.

See Also

ItemLabel.Image Property

Gets or sets the image displayed by this label.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage Image { get; set; }
```

Visual Basic Copy Code

```
Public Property Image As IImage
```

Property Value

A **Microsoft.Maui.Graphics.IImage** instance. The default value is **null**.

Remarks

If a label displays both **Image** and Text, the image position relative to text depends on the ImageAlign property.

If the label is only intended to display an icon image and no text, you could also set its Locked property to prevent users from entering text.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace
ImageSize Property
ImageUrl Property

ItemLabel.ImageAlign Property

Gets or sets the alignment of label's image relative to text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ImageAlign ImageAlign { get; set; }
```

Visual Basic Copy Code

```
Public Property ImageAlign As ImageAlign
```

Property Value

A member of the ImageAlign enumeration. The default value is **MiddleLeft**.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace
Image Property
ImageUrl Property

ItemLabel.ImageSize Property

Gets or sets a size that overrides the native image size.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Size ImageSize { get; set; }
```

Visual Basic Copy Code

```
Public Property ImageSize As Size
```

Property Value

A **Microsoft.Maui.Graphics.Size** instance. The default value is **Empty**.

Remarks

By default, Image is rendered using bitmap's intrinsic size. Set this value to increase or reduce the size of the rendered image.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace
Image Property
ImageUrl Property

ItemLabel.ImageUrl Property

Gets or sets URL of the image to display inside this label.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ImageUrl { get; set; }
```

Visual Basic Copy Code

```
Public Property ImageUrl As String
```

Property Value

A URL string that identifies the image file location.

Remarks

If a label displays both image and Text, the image position relative to text depends on the ImageAlign property.

If the label is only intended to display an icon image and no text, you could also set its Locked property to prevent users from entering text.

ItemLabel.Index Property

Gets or sets the index of an edge or point this label is relative to.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Index { get; set; }
```

Visual Basic Copy Code

```
Public Property Index As Integer
```

Property Value

An integer index.

ItemLabel.Item Property

Gets or sets the DiagramItem that displays this label.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem Item { get; set; }
```

Visual Basic Copy Code

```
Public Property Item As DiagramItem
```

Property Value

A DiagramItem reference.

See Also

ItemLabel Members
ItemLabel Class

ItemLabel.Locked Property

Gets or sets a value indicating whether users are allowed to edit this label.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Locked { get; set; }
```

Visual Basic

```
Public Property Locked As Boolean
```

Property Value

true to prevent users from editing this label, or **false** otherwise.

See Also

ItemLabel.Margin Property

Gets or sets the label's margin.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public Thickness Margin { get; set; }
```

Visual Basic

```
Public Property Margin As Thickness
```

Property Value

A Thickness instance specifying the size of text margins.

Gets or sets the maximum width of the label.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public double MaxWidth { get; set; }
```

Visual Basic

```
Public Property MaxWidth As Double
```

Property Value

A **double** value.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.Text Property

Gets or sets the label's text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Text { get; set; }
```

Visual Basic Copy Code

```
Public Property Text As String
```

Property Value

A string containing label's text.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace
Font Property
EnableStyledText Property

ItemLabel.TextBrush Property

Gets or sets the brush used to draw the label's text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush TextBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property TextBrush As Brush
```

Property Value

An instance of a Brush -derived class.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.VerticalAlign Property

Gets or sets the label's vertical alignment.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public StringAlignment VerticalAlign { get; set; }
```

Visual Basic Copy Code

```
Public Property VerticalAlign As StringAlignment
```

Property Value

A member of the StringAlignment enumeration. The default is **Center**.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.VerticalOffset Property

Gets or sets the label's vertical offset from its pin point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double VerticalOffset { get; set; }
```

Visual Basic Copy Code

```
Public Property VerticalOffset As Double
```

Property Value

A **double** value specifying distance.

ItemLabel Class
MindFusion.Diagramming Namespace

JsonPersistContext Class

Contains methods that can help you serialize and deserialize MindFusion.Diagramming items to and from JSON.

Syntax

C# Copy Code

```
public class JsonPersistContext : JsonContext
```

Visual Basic Copy Code

```
Public Class JsonPersistContext
    Inherits JsonContext
```

Inheritance Hierarchy

System.Object
  MindFusion.Json.JsonContext
    MindFusion.Diagramming.JsonPersistContext

See Also

JsonPersistContext Members

Contains methods that can help you serialize and deserialize MindFusion.Diagramming items to and from JSON.

The following tables list the members exposed by the JsonPersistContext type.

Public Constructors

	Name	Description
	JsonPersistContext	Overloaded.

Public Fields

	Name	Description
	LatestFormat	Specifies the latest file format revision number.

Protected Fields

	Name	Description
	brushes	A list of all brushes. (Inherited from JsonContext.)
	inplaceImages	Specifies whether images are encoded in place. (Inherited from JsonContext.)
	inplaceResources	Specifies whether resource accumulation is disabled. (Inherited from JsonContext.)

Public Properties

	Name	Description
	Diagram	Gets the underlying diagram object.
	FileVersion	Gets the format revision number for the file being currently serialized.

Public Methods

	Name	Description
	InitItem	
	LoadItem	Reads a diagram item from the specified JsonObject.
	Parse	Deserializes the specified JSON formatted string to a JsonObject. (Inherited from JsonContext.)
	ReadAnchorPattern	Reads an AnchorPattern object.
	ReadBrush	Overloaded. (Inherited from JsonContext.)
	ReadBrushColor	Reads a Brush object with the specified color. (Inherited from JsonContext.)
	ReadBrushes	Reads all brushes. (Inherited from JsonContext.)
	ReadColor	Overloaded. (Inherited from JsonContext.)
	ReadColorBlend	Overloaded. (Inherited from JsonContext.)
	ReadComposite	Reads the properties of a CompositeNode, which are marked with the AutoJson attribute.

	ReadEffect	Reads a NodeEffect object.
	ReadEnum	Reads an enum value. (Inherited from JsonContext.)
	ReadFloatArray	Reads a float array. (Inherited from JsonContext.)
	ReadFont	Reads a Font object.
	ReadImage	Reads an Image object. (Inherited from JsonContext.)
	ReadImages	Reads all images. (Inherited from JsonContext.)
	ReadItemId	Reads an item reference.
	ReadMap	Reads a MapContent object.
	ReadObject	Reads an object. (Inherited from JsonContext.)
	ReadPen	Overloaded. (Inherited from JsonContext.)
	ReadPointF	Reads a **Point** object. (Inherited from JsonContext.)
	ReadPointString	Reads a Point string. (Inherited from JsonContext.)
	ReadRectangleF	Reads a Rect object. (Inherited from JsonContext.)
	ReadShape	Reads a Shape object.
	ReadSizeF	Reads a SizeF object. (Inherited from JsonContext.)
	ReadStringFormat	Reads a StringFormat object. (Inherited from JsonContext.)
	ReadStyle	Reads a Style object.
	ReadSvg	Reads a SVG objec.
	ReadTag	Reads the specified tag for the specified object.
	ReadTheme	Reads a Theme object.
	ReadThickness	Reads a Thickness object.
	SaveItem	Saves the specified diagram item to a JsonObject.
	Serialize	Serializes the specified JsonObject to a JSON formatted string. (Inherited from JsonContext.)
	WriteAnchorPattern	Writes an AnchorPattern object.
	WriteBrush	Writes a MindFusion.Drawing.Brush object. (Inherited from JsonContext.)
	WriteBrushColor	Writes the color of the specified brush. (Inherited from JsonContext.)
	WriteBrushes	Writes all currently accumulated brushes. (Inherited from JsonContext.)
	WriteColor	Writes a Color object. (Inherited from JsonContext.)
	WriteColorBlend	Overloaded. (Inherited from JsonContext.)
	WriteComposite	Writes the properties of a CompositeNode, which are marked with the AutoJson attribute.
	WriteEffect	Writes a NodeEffect object.
	WriteEnum	Writes an enum value. (Inherited from JsonContext.)
	WriteFont	Writes a Font object.
	WriteHandlesStyle	Writes a HandlesVisualStyle object.
	WriteImage	Writes an Image object. (Inherited from JsonContext.)
	WriteImageAsync	Writes an Image object. (Inherited from JsonContext.)

	WriteImages	Writes all currently accumulated images. (Inherited from JsonContext.)
	WriteImagesAsync	Writes all currently accumulated images asynchronously. (Inherited from JsonContext.)
	WriteItemId	Writes a reference to the specified item.
	WriteItemType	Writes an item type.
	WriteMap	Writes a MapContent object.
	WriteObject	Writes an object. (Inherited from JsonContext.)
	WritePen	Writes a MindFusion.Drawing.Pen object. (Inherited from JsonContext.)
	WritePointF	Writes a **Point** object. (Inherited from JsonContext.)
	WritePointString	Writes a Point string. (Inherited from JsonContext.)
	WriteRectangleF	Writes a Rect object. (Inherited from JsonContext.)
	WriteShape	Writes a Shape object.
	WriteSizeF	Writes a SizeF object. (Inherited from JsonContext.)
	WriteStringFormat	Writes a StringFormat object. (Inherited from JsonContext.)
	WriteStyle	Writes a Style object.
	WriteSvg	Writes an SvgContent object.
	WriteTag	Writes the specified tag of the specified object.
	WriteTheme	Writes a Theme object.
	WriteThickness	Writes a Thickness object.

Protected Methods

	Name	Description
	Base64Decode	Decodes a string from Base64 representation. (Inherited from JsonContext.)
	Base64Encode	Encodes a string to Base64 representation. (Inherited from JsonContext.)
	ToCamelCase	Converts a string to Pascal case. (Inherited from JsonContext.)
	ToPascalCase	Converts a string to Camel case. (Inherited from JsonContext.)

JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext Fields

JsonPersistContext.LatestFormat Field

Specifies the latest file format revision number.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static int LatestFormat
```

Visual Basic Copy Code

```
Public Shared LatestFormat As Integer
```

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext Constructor

Overload List

Name	Description
JsonPersistContext (Diagram, Int32)	Initializes a new instance of the JsonPersistContext class.
JsonPersistContext (Diagram, Int32, Boolean)	Initializes a new instance of the JsonPersistContext class.

See Also

JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext Constructor (Diagram, Int32)

Initializes a new instance of the JsonPersistContext class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonPersistContext (
    Diagram diagram,
    int fileVersion
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram, _
    fileVersion As Integer _
)
```

Parameters

diagram
The Diagram that will be serialized or deserialized.

fileVersion
Specifies the current file format number.

See Also

JsonPersistContext Constructor Overload List
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext Constructor (Diagram, Int32, Boolean)

Initializes a new instance of the JsonPersistContext class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonPersistContext (
    Diagram diagram,
    int fileVersion,
    bool trackItems
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram, _
    fileVersion As Integer, _
    trackItems As Boolean _
)
```

Parameters

diagram
The Diagram that will be serialized or deserialized.

fileVersion
Specifies the current file format number.

trackItems
true to track shared item instances by their identifier, or false otherwise.

See Also

JsonPersistContext Constructor Overload List
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext Methods

JsonPersistContext.InitItem Method

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem InitItem (
    JsonObject obj
)
```

Visual Basic Copy Code

```
Public Function InitItem( _
    obj As JsonObject _
) As DiagramItem
```

Parameters

obj

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.LoadItem Method

Reads a diagram item from the specified JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem LoadItem (
    JsonObject obj
)
```

Visual Basic Copy Code

```
Public Function LoadItem( _
    obj As JsonObject _
) As DiagramItem
```

Parameters

obj

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.ReadAnchorPattern Method

Reads an AnchorPattern object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPattern ReadAnchorPattern (
    JsonValue value
)
```

Visual Basic Copy Code

```
Public Function ReadAnchorPattern( _
    value As JsonValue _
) As AnchorPattern
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.ReadComposite Method

Reads the properties of a CompositeNode, which are marked with the AutoJson attribute.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ReadComposite (
    JsonObject obj,
    CompositeNode node
)
```

Visual Basic Copy Code

```
Public Sub ReadComposite( _
    obj As JsonObject, _
    node As CompositeNode _
)
```

Parameters

obj

node

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.ReadEffect Method

Reads a NodeEffect object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeEffect ReadEffect (
    JsonValue value
)
```

Visual Basic Copy Code

```
Public Function ReadEffect( _
    value As JsonValue _
) As NodeEffect
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.ReadFont Method

Reads a Font object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Font ReadFont (
    JsonObject obj,
    Font defaultFont
)
```

Visual Basic Copy Code

```
Public Overrides Function ReadFont( _
    obj As JsonObject, _
    defaultFont As Font _
) As Font
```

Parameters

obj

defaultFont

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.ReadItemId Method

Reads an item reference.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem ReadItemId (
    JsonValue value
)
```

Visual Basic Copy Code

```
Public Function ReadItemId( _
    value As JsonValue _
) As DiagramItem
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.ReadMap Method

Reads a MapContent object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public MapContent ReadMap (
    JsonValue value
)
```

Visual Basic Copy Code

```
Public Function ReadMap( _
    value As JsonValue _
) As MapContent
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.ReadShape Method

Reads a Shape object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape ReadShape (
    JsonValue value
)
```

Visual Basic Copy Code

```
Public Function ReadShape( _
    value As JsonValue _
) As Shape
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.ReadStyle Method

Reads a Style object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ReadStyle (
    JsonValue value,
    Style style
)
```

Visual Basic Copy Code

```
Public Sub ReadStyle( _
    value As JsonValue, _
    style As Style _
)
```

Parameters

value

style

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.ReadSvg Method

Reads a SVG objec.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SvgContent ReadSvg (
    JsonValue value
)
```

Visual Basic Copy Code

```
Public Function ReadSvg( _
    value As JsonValue _
) As SvgContent
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.ReadTag Method

Reads the specified tag for the specified object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object ReadTag (
    Object item,
    JsonValue tagValue,
    string propertyName
)
```

Visual Basic Copy Code

```
Public Function ReadTag( _
    item As Object, _
    tagValue As JsonValue, _
    propertyName As String _
) As Object
```

Parameters

item

tagValue

propertyName

Return Value

Remarks

Tags are read similarly to arbitrary objects except that the client of the diagram is given a chance to perform custom deserialization through event handling.

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.ReadTheme Method

Reads a Theme object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Theme ReadTheme (
    JsonValue value
)
```

Visual Basic

```
Public Function ReadTheme( _
    value As JsonValue _
) As Theme
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.ReadThickness Method

Reads a Thickness object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public Thickness ReadThickness (
    JsonValue value
)
```

Visual Basic

```
Public Function ReadThickness( _
    value As JsonValue _
) As Thickness
```

Parameters

value

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.SaveItem Method

Saves the specified diagram item to a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public JsonObject SaveItem (
    DiagramItem item
)
```

Visual Basic

```
Public Function SaveItem( _
    item As DiagramItem _
) As JsonObject
```

Parameters

item

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteAnchorPattern Method

Writes an AnchorPattern object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public JsonValue WriteAnchorPattern (
    AnchorPattern anchorPattern
)
```

Visual Basic

```
Public Function WriteAnchorPattern( _
    anchorPattern As AnchorPattern _
) As JsonValue
```

Parameters

anchorPattern

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteComposite Method

Writes the properties of a CompositeNode, which are marked with the AutoJson attribute.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public void WriteComposite (
    JsonObject obj,
    CompositeNode node
)
```

Visual Basic

```
Public Sub WriteComposite( _
    obj As JsonObject, _
    node As CompositeNode _
)
```

Parameters

obj

node

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteEffect Method

Writes a NodeEffect object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public JsonValue WriteEffect (
    NodeEffect effect
)
```

Visual Basic

```
Public Function WriteEffect( _
    effect As NodeEffect _
) As JsonValue
```

Parameters

effect

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteFont Method

Writes a Font object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override JsonObject WriteFont (
    Font font
)
```

Visual Basic

```
Public Overrides Function WriteFont( _
    font As Font _
) As JsonObject
```

Parameters

font

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteHandlesStyle Method

Writes a HandlesVisualStyle object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonValue WriteHandlesStyle (
    HandlesVisualStyle style
)
```

Visual Basic Copy Code

```
Public Function WriteHandlesStyle( _
    style As HandlesVisualStyle _
) As JsonValue
```

Parameters

style

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteItemId Method

Writes a reference to the specified item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonValue WriteItemId (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Function WriteItemId( _
    item As DiagramItem _
) As JsonValue
```

Parameters

item

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteItemType Method

Writes an item type.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonValue WriteItemType (
    Type itemType
)
```

Visual Basic Copy Code

```
Public Function WriteItemType( _
    itemType As Type _
) As JsonValue
```

Parameters

itemType

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteMap Method

Writes a MapContent object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonValue WriteMap (
    MapContent map
)
```

Visual Basic Copy Code

```
Public Function WriteMap( _
    map As MapContent _
) As JsonValue
```

Parameters

map

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteShape Method

Writes a Shape object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonValue WriteShape (
    Shape shape
)
```

Visual Basic Copy Code

```
Public Function WriteShape( _
    shape As Shape _
) As JsonValue
```

Parameters

shape

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteStyle Method

Writes a Style object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonValue WriteStyle (
    Style style
)
```

Visual Basic Copy Code

```
Public Function WriteStyle( _
    style As Style _
) As JsonValue
```

Parameters

style

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteSvg Method

Writes an SvgContent object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonValue WriteSvg (
    SvgContent svg
)
```

Visual Basic Copy Code

```
Public Function WriteSvg( _
    svg As SvgContent _
) As JsonValue
```

Parameters

svg

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteTag Method

Writes the specified tag of the specified object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonValue WriteTag (
    Object item,
    Object tagValue,
    string propertyName
)
```

Visual Basic

```
Public Function WriteTag( _
    item As Object, _
    tagValue As Object, _
    propertyName As String _
) As JsonValue
```

Parameters

item

tagValue

propertyName

Return Value

Remarks

Tags are written similarly to arbitrary objects except that the client of the diagram is given a chance to perform custom serialization through event handling.

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteTheme Method

Writes a Theme object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public JsonObject WriteTheme (
    Theme theme
)
```

Visual Basic

```
Public Function WriteTheme( _
    theme As Theme _
) As JsonObject
```

Parameters

theme

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.WriteThickness Method

Writes a Thickness object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonObject WriteThickness (
    Thickness thickness
)
```

Visual Basic Copy Code

```
Public Function WriteThickness( _
    thickness As Thickness _
) As JsonObject
```

Parameters

thickness

Return Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext Properties

JsonPersistContext.Diagram Property

Gets the underlying diagram object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Diagram Diagram { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Diagram As Diagram
```

Property Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonPersistContext.FileVersion Property

Gets the format revision number for the file being currently serialized.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int FileVersion { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property FileVersion As Integer
```

Property Value

See Also

JsonPersistContext Members
JsonPersistContext Class
MindFusion.Diagramming Namespace

JsonSerializeTagEventArgs Class

Contains the arguments passed to the JsonSerializeTag and JsonDeserializeTag event handlers.

Syntax

C# Copy Code

```
public class JsonSerializeTagEventArgs : EventArgs
```

Visual Basic Copy Code

```
Public Class JsonSerializeTagEventArgs
    Inherits EventArgs
```

Inheritance Hierarchy

System.Object
  System.EventArgs
    MindFusion.Diagramming.JsonSerializeTagEventArgs

See Also

JsonSerializeTagEventArgs Members
MindFusion.Diagramming Namespace

JsonSerializeTagEventArgs Members

Contains the arguments passed to the JsonSerializeTag and JsonDeserializeTag event handlers.

The following tables list the members exposed by the JsonSerializeTagEventArgs type.

Public Properties

	Name	Description
	Context	Gets a context object that can help you write and read various values.
	Handled	Gets or sets a value indicating whether the event is handled.
	Object	Gets the object being serialized/deserialized.
	PropertyName	Gets the name of the property being serialized.
	Representation	Gets or sets the JsonObject, representing the tag object being serialized / deserialized.
	Tag	Gets or sets the tag object being serialized/deserialized.

See Also

JsonSerializeTagEventArgs Properties

JsonSerializeTagEventArgs.Context Property

Gets a context object that can help you write and read various values.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonPersistContext Context { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Context As JsonPersistContext
```

Property Value

See Also

JsonSerializeTagEventArgs Members
JsonSerializeTagEventArgs Class
MindFusion.Diagramming Namespace

JsonSerializeTagEventArgs.Handled Property

Gets or sets a value indicating whether the event is handled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Handled { get; set; }
```

Visual Basic Copy Code

```
Public Property Handled As Boolean
```

Property Value

Remarks

Always set this flag to true if you perform custom tag serialization.

See Also

JsonSerializeTagEventArgs Members
JsonSerializeTagEventArgs Class
MindFusion.Diagramming Namespace

JsonSerializeTagEventArgs.Object Property

Gets the object being serialized/deserialized.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Object { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Object As Object
```

Property Value

See Also

JsonSerializeTagEventArgs Members
JsonSerializeTagEventArgs Class
MindFusion.Diagramming Namespace

JsonSerializeTagEventArgs.PropertyName Property

Gets the name of the property being serialized.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string PropertyName { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property PropertyName As String
```

Property Value

See Also

JsonSerializeTagEventArgs Members
JsonSerializeTagEventArgs Class
MindFusion.Diagramming Namespace

JsonSerializeTagEventArgs.Representation Property

Gets or sets the JsonObject, representing the tag object being serialized / deserialized.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public JsonObject Representation { get; set; }
```

Visual Basic Copy Code

```

Key Enumeration

A copy of the **System.Windows.Forms.Key** enumeration used to propagate input information to manipulators and components.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum Key
```

Visual Basic Copy Code

```
Public Enum Key
```

Members

	Member name	Description
	Modifiers	The bitmask to extract modifiers from a key value.
	None	No key pressed.
	LButton	The left mouse button.
	RButton	The right mouse button.

	Cancel	The CANCEL key.
	MButton	The middle mouse button (three-button mouse).
	XButton1	The first x mouse button (five-button mouse).
	XButton2	The second x mouse button (five-button mouse).
	Back	The BACKSPACE key.
	Tab	The TAB key.
	LineFeed	The LINEFEED key.
	Clear	The CLEAR key.
	Enter	The ENTER key.
	Return	The RETURN key.
	ShiftKey	The SHIFT key.
	ControlKey	The CTRL key.
	Menu	The ALT key.
	Pause	The PAUSE key.
	Capital	The CAPS LOCK key.
	CapsLock	The CAPS LOCK key.
	KanaMode	The IME Kana mode key.
	HangulMode	The IME Hangul mode key.
	HanguelMode	The IME Hanguel mode key. (maintained for compatibility; use HangulMode)
	JunjaMode	The IME Junja mode key.
	FinalMode	The IME final mode key.
	KanjiMode	The IME Kanji mode key.
	HanjaMode	The IME Hanja mode key.
	Escape	The ESC key.
	IMEConvert	The IME convert key.
	IMENonconvert	The IME nonconvert key.
	IMEAceept	The IME accept key. Obsolete, use System.Windows.Forms.Keys.IMEAccept instead.
	IMEAccept	The IME accept key, replaces System.Windows.Forms.Keys.IMEAceept.
	IMEModeChange	The IME mode change key.
	Space	The SPACEBAR key.
	PageUp	The PAGE UP key.
	Prior	The PAGE UP key.
	PageDown	The PAGE DOWN key.
	Next	The PAGE DOWN key.
	End	The END key.
	Home	The HOME key.

	Left	The LEFT ARROW key.
	Up	The UP ARROW key.
	Right	The RIGHT ARROW key.
	Down	The DOWN ARROW key.
	Select	The SELECT key.
	Print	The PRINT key.
	Execute	The EXECUTE key.
	Snapshot	The PRINT SCREEN key.
	PrintScreen	The PRINT SCREEN key.
	Insert	The INS key.
	Delete	The DEL key.
	Help	The HELP key.
	D0	The 0 key.
	D1	The 1 key.
	D2	The 2 key.
	D3	The 3 key.
	D4	The 4 key.
	D5	The 5 key.
	D6	The 6 key.
	D7	The 7 key.
	D8	The 8 key.
	D9	The 9 key.
	A	The A key.
	B	The B key.
	C	The C key.
	D	The D key.
	E	The E key.
	F	The F key.
	G	The G key.
	H	The H key.
	I	The I key.
	J	The J key.
	K	The K key.
	L	The L key.
	M	The M key.
	N	The N key.
	O	The O key.

	P	The P key.
	Q	The Q key.
	R	The R key.
	S	The S key.
	T	The T key.
	U	The U key.
	V	The V key.
	W	The W key.
	X	The X key.
	Y	The Y key.
	Z	The Z key.
	LWin	The left Windows logo key (Microsoft Natural Keyboard).
	RWin	The right Windows logo key (Microsoft Natural Keyboard).
	Apps	The application key (Microsoft Natural Keyboard).
	Sleep	The computer sleep key.
	NumPad0	The 0 key on the numeric keypad.
	NumPad1	The 1 key on the numeric keypad.
	NumPad2	The 2 key on the numeric keypad.
	NumPad3	The 3 key on the numeric keypad.
	NumPad4	The 4 key on the numeric keypad.
	NumPad5	The 5 key on the numeric keypad.
	NumPad6	The 6 key on the numeric keypad.
	NumPad7	The 7 key on the numeric keypad.
	NumPad8	The 8 key on the numeric keypad.
	NumPad9	The 9 key on the numeric keypad.
	Multiply	The multiply key.
	Add	The add key.
	Separator	The separator key.
	Subtract	The subtract key.
	Decimal	The decimal key.
	Divide	The divide key.
	F1	The F1 key.
	F2	The F2 key.
	F3	The F3 key.
	F4	The F4 key.
	F5	The F5 key.
	F6	The F6 key.

	F7	The F7 key.
	F8	The F8 key.
	F9	The F9 key.
	F10	The F10 key.
	F11	The F11 key.
	F12	The F12 key.
	F13	The F13 key.
	F14	The F14 key.
	F15	The F15 key.
	F16	The F16 key.
	F17	The F17 key.
	F18	The F18 key.
	F19	The F19 key.
	F20	The F20 key.
	F21	The F21 key.
	F22	The F22 key.
	F23	The F23 key.
	F24	The F24 key.
	NumLock	The NUM LOCK key.
	Scroll	The SCROLL LOCK key.
	LShiftKey	The left SHIFT key.
	RShiftKey	The right SHIFT key.
	LControlKey	The left CTRL key.
	RControlKey	The right CTRL key.
	LMenu	The left ALT key.
	RMenu	The right ALT key.
	BrowserBack	The browser back key (Windows 2000 or later).
	BrowserForward	The browser forward key (Windows 2000 or later).
	BrowserRefresh	The browser refresh key (Windows 2000 or later).
	BrowserStop	The browser stop key (Windows 2000 or later).
	BrowserSearch	The browser search key (Windows 2000 or later).
	BrowserFavorites	The browser favorites key (Windows 2000 or later).
	BrowserHome	The browser home key (Windows 2000 or later).
	VolumeMute	The volume mute key (Windows 2000 or later).
	VolumeDown	The volume down key (Windows 2000 or later).
	VolumeUp	The volume up key (Windows 2000 or later).
	MediaNextTrack	The media next track key (Windows 2000 or later).

	MediaPreviousTrack	The media previous track key (Windows 2000 or later).
	MediaStop	The media Stop key (Windows 2000 or later).
	MediaPlayPause	The media play pause key (Windows 2000 or later).
	LaunchMail	The launch mail key (Windows 2000 or later).
	SelectMedia	The select media key (Windows 2000 or later).
	LaunchApplication1	The start application one key (Windows 2000 or later).
	LaunchApplication2	The start application two key (Windows 2000 or later).
	Oem1	The OEM 1 key.
	OemSemicolon	The OEM Semicolon key on a US standard keyboard (Windows 2000 or later).
	Oemplus	The OEM plus key on any country/region keyboard (Windows 2000 or later).
	Oemcomma	The OEM comma key on any country/region keyboard (Windows 2000 or later).
	OemMinus	The OEM minus key on any country/region keyboard (Windows 2000 or later).
	OemPeriod	The OEM period key on any country/region keyboard (Windows 2000 or later).
	Oem2	The OEM 2 key.
	OemQuestion	The OEM question mark key on a US standard keyboard (Windows 2000 or later).
	Oem3	The OEM 3 key.
	Oemtilde	The OEM tilde key on a US standard keyboard (Windows 2000 or later).
	Oem4	The OEM 4 key.
	OemOpenBrackets	The OEM open bracket key on a US standard keyboard (Windows 2000 or later).
	OemPipe	The OEM pipe key on a US standard keyboard (Windows 2000 or later).
	Oem5	The OEM 5 key.
	OemCloseBrackets	The OEM close bracket key on a US standard keyboard (Windows 2000 or later).
	Oem6	The OEM 6 key.
	OemQuotes	The OEM singled/double quote key on a US standard keyboard (Windows 2000 or later).
	Oem7	The OEM 7 key.
	Oem8	The OEM 8 key.
	Oem102	The OEM 102 key.
	OemBackslash	The OEM angle bracket or backslash key on the RT 102 key keyboard (Windows 2000 or later).
	ProcessKey	The PROCESS KEY key.
	Packet	Used to pass Unicode characters as if they were keystrokes. The Packet key value is the low word of a 32-bit virtual-key value used for non-keyboard input methods.
	Attn	The ATTN key.

	Crsel	The CRSEL key.
	Exsel	The EXSEL key.
	EraseEof	The ERASE EOF key.
	Play	The PLAY key.
	Zoom	The ZOOM key.
	NoName	A constant reserved for future use.
	Pa1	The PA1 key.
	OemClear	The CLEAR key.
	KeyCode	The bitmask to extract a key code from a key value.
	Shift	The SHIFT modifier key.
	Control	The CTRL modifier key.
	Alt	The ALT modifier key.

MindFusion.Diagramming Namespace

LabelPosition Enumeration

Specifies the position of labels in a **ListView** control.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum LabelPosition
```

Visual Basic Copy Code

```
Public Enum LabelPosition
```

Members

	Member name	Description
	Auto	Labels are positioned depending on the column count.
	Right	Labels are on the right side of the icon.
	Left	Labels are on the left side of the icon.
	Bottom	Labels are positioned below the icon.

MindFusion.Diagramming Namespace

Layer Class

Represents a layer in a Diagram object.

Syntax

C# Copy Code

```
public class Layer : INotifyPropertyChanged
```

Visual Basic Copy Code

```
Public Class Layer
    Implements INotifyPropertyChanged
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.Layer

See Also

Layer Members
MindFusion.Diagramming Namespace

Layer Members

Represents a layer in a Diagram object.

The following tables list the members exposed by the Layer type.

Public Constructors

	Name	Description
	Layer	Initializes a new instance of the **Layer** class.

Public Properties

	Name	Description
	Locked	Gets or sets a value indicating whether the layer is locked.
	Title	Gets or sets a title associated with the layer.
	Visible	Gets or sets a value indicating whether the layer is visible.
	ZIndex	Gets or sets the z-index of the layer.

Protected Methods

	Name	Description
	OnPropertyChanged	Raises the PropertyChanged event.

Public Events

	Name	Description
	PropertyChanged	**INotifyPropertyChanged.PropertyChanged** implementation.

See Also

Layer Class
MindFusion.Diagramming Namespace

Layer Constructor

Initializes a new instance of the Layer class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Layer ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

Layer Class
MindFusion.Diagramming Namespace

Layer Methods

Layer.OnPropertyChanged Method

Raises the PropertyChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnPropertyChanged (
    PropertyChangedEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnPropertyChanged( _
    e As PropertyChangedEventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

Layer Members
Layer Class
MindFusion.Diagramming Namespace

Layer Properties

Layer.Locked Property

Gets or sets a value indicating whether the layer is locked.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Locked { get; set; }
```

Visual Basic Copy Code

```
Public Property Locked As Boolean
```

Property Value

true if the layer is locked; otherwise, **false**.

Remarks

Items associated with locked layers cannot be modified interactively, regardless of their own Locked property.

See Also

Layer Members
Layer Class
MindFusion.Diagramming Namespace

Layer.Title Property

Gets or sets a title associated with the layer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Title { get; set; }
```

Visual Basic Copy Code

```
Public Property Title As String
```

Property Value

A string value.

See Also

Layer Members
Layer Class
MindFusion.Diagramming Namespace

Layer.Visible Property

Gets or sets a value indicating whether the layer is visible.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Visible { get; set; }
```

Visual Basic

```
Public Property Visible As Boolean
```

Property Value

true if the layer is visible; otherwise, **false**.

Remarks

Items associated with hidden layers are not displayed, regardless of their own Visible property.

Layer.ZIndex Property

Gets or sets the z-index of the layer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public int ZIndex { get; set; }
```

Visual Basic

```
Public Property ZIndex As Integer
```

Property Value

An integer value.

Layer Events

Layer.PropertyChanged Event

INotifyPropertyChanged.PropertyChanged implementation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public event PropertyChangedEventHandler PropertyChanged
```

Visual Basic

```
Public Event PropertyChanged As PropertyChangedEventHandler
```

Event Data

PropertyChanged event handlers receive an argument of type **PropertyChangedEventArgs**.

LineTemplate Members

Represents a line segment in a shape definition.

The following tables list the members exposed by the LineTemplate type.

Public Constructors

	Name	Description
	LineTemplate	Overloaded. Initializes a new instance of the **LineTemplate** class.

Public Properties

	Name	Description
	Color	Gets or sets the outline color of this element. (Inherited from ElementTemplate.)

	Coordinates	Gets a double array containing the coordinates of the end points of this line segment.
	DashStyle	Gets or sets the dash style of the outline of this element. (Inherited from ElementTemplate.)
	Width	Gets or sets the outline width of this element. (Inherited from ElementTemplate.)

Public Methods

	Name	Description
	Clone	Create an exact copy of this **LineTemplate** element.
	SameAs	ElementTemplate.SameAs override.

Protected Methods

	Name	Description
	GetElementPen	Gets a pen used to render the element. If no pen properties are explicitly specified for this element, returns the pen passed as an argument. (Inherited from ElementTemplate.)

LineTemplate Class
MindFusion.Diagramming Namespace

LineTemplate Constructor

Initializes a new instance of the LineTemplate class.

Overload List

Name	Description
LineTemplate (Double, Double, Double, Double)	Initializes a new instance of the **LineTemplate** class with the specified start and end point.
LineTemplate (Double, Double, Double, Double, Color, DashStyle, Double)	Initializes a new instance of the **LineTemplate** class with the specified start and end points, and the specified color and style.

See Also

LineTemplate Class
MindFusion.Diagramming Namespace

LineTemplate Constructor (Double, Double, Double, Double)

Initializes a new instance of the LineTemplate class with the specified start and end point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LineTemplate (
    double x1,
    double y1,
    double x2,
```

```
    double y2
)
```

Visual Basic Copy Code

```
Public New ( _
    x1 As Double, _
    y1 As Double, _
    x2 As Double, _
    y2 As Double _
)
```

Parameters

x1
The x-coordinate of the first point, expressed as percentage of a shape node's bounding rectangle.

y1
The y-coordinate of the first point, expressed as percentage of a shape node's bounding rectangle.

x2
The x-coordinate of the second point, expressed as percentage of a shape node's bounding rectangle.

y2
The y-coordinate of the second point, expressed as percentage of a shape node's bounding rectangle.

Remarks

A line template is defined by two points whose coordinates are passed as arguments.

LineTemplate Constructor Overload List
LineTemplate Class
MindFusion.Diagramming Namespace

LineTemplate Constructor (Double, Double, Double, Double, Color, DashStyle, Double)

Initializes a new instance of the LineTemplate class with the specified start and end points, and the specified color and style.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LineTemplate (
    double x1,
    double y1,
    double x2,
    double y2,
    Color color,
    DashStyle dashStyle,
    double width
)
```

Visual Basic Copy Code

```
Public New ( _
    x1 As Double, _
    y1 As Double, _
    x2 As Double, _
    y2 As Double, _
    color As Color, _
    dashStyle As DashStyle, _
    width As Double _
)
```

Parameters

x1
The x-coordinate of the first point, expressed as percentage of a shape node's bounding rectangle.

y1
The y-coordinate of the first point, expressed as percentage of a shape node's bounding rectangle.

x2
The x-coordinate of the second point, expressed as percentage of a shape node's bounding rectangle.

y2
The y-coordinate of the second point, expressed as percentage of a shape node's bounding rectangle.

color
The color of this segment.

dashStyle
The dash style of this segment.

width
The width of this segment.

Remarks

A line template is defined by two points whose coordinates are passed as arguments.

MindFusion.Diagramming Namespace

LineTemplate Methods

LineTemplate.Clone Method

Create an exact copy of this LineTemplate element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Object Clone ()
```

Visual Basic Copy Code

```
Public Overrides Function Clone () As Object
```

Return Value

An instance of the LineTemplate class.

Remarks

An instance of the LineTemplate class.

See Also

LineTemplate Members

LineTemplate.SameAs Method

ElementTemplate.SameAs override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool SameAs (
    ElementTemplate obj
)
```

Visual Basic Copy Code

```
Public Overrides Function SameAs( _
    obj As ElementTemplate _
) As Boolean
```

Parameters

obj
The ElementTemplate to compare to this template.

Return Value

true if the specified object is a LineTemplate closely approximating this template; otherwise, **false**.

LineTemplate Members
LineTemplate Class
MindFusion.Diagramming Namespace

LineTemplate Properties

LineTemplate.Coordinates Property

Gets a double array containing the coordinates of the end points of this line segment.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double[] Coordinates { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Coordinates As Double()
```

Property Value

An array of **double** values containing the coordinates of the points composing this element.

MindFusion.Diagramming Namespace

LinkAdjustmentHandle Members

Represents an adjustment handle used to modify the position of a link's control point.

The following tables list the members exposed by the LinkAdjustmentHandle type.

Public Constructors

	Name	Description
	LinkAdjustmentHandle	Initializes a new instance of the **LinkAdjustmentHandle** class.

Public Properties

	Name	Description
	PointIndex	Gets or sets the index of a link's control point that will be adjusted by this handle.

Public Methods

	Name	Description
	IsMoveHandle	Returns a value indicating whether this handle is used to move items. (Inherited from AdjustmentHandle.)
	IsResizeHandle	Gets whether this adjustment handle resizes the item. (Inherited from AdjustmentHandle.)
	IsRotationHandle	Gets whether this adjustment handle changes item's rotation angle. (Inherited from AdjustmentHandle.)

See Also

LinkAdjustmentHandle Class
MindFusion.Diagramming Namespace

LinkAdjustmentHandle Constructor

Initializes a new instance of the LinkAdjustmentHandle class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkAdjustmentHandle (
    int pointIndex
)
```

Visual Basic Copy Code

```
Public New ( _
    pointIndex As Integer _
)
```

Parameters

pointIndex
An integer value specifying the index of a link's control point that will be adjusted by this handle.

Remarks

When the user moves this handle, the respective element in link's ControlPoints collection is set to the handle's position.

See Also

LinkAdjustmentHandle Class
MindFusion.Diagramming Namespace

LinkAdjustmentHandle Properties

LinkAdjustmentHandle.PointIndex Property

Gets or sets the index of a link's control point that will be adjusted by this handle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int PointIndex { get; set; }
```

Visual Basic Copy Code

```
Public Property PointIndex As Integer
```

Property Value

An integer index specifying which element of link's ControlPoints collection is updated by this handle.

LinkCrossingEventArgs Members

Contains the arguments passed to the ValidateLinkCrossing event handler.

The following tables list the members exposed by the LinkCrossingEventArgs type.

Public Constructors

	Name	Description
	LinkCrossingEventArgs	

Public Properties

	Name	Description
	BottomLink	The link at lower Z position.
	BottomSegmentIndex	Index of bottom link's segment that contains the intersection point.
	Cancel	Specifies whether crossing decoration should be displayed.
	IntersectionPoint	Intersection point that will show crossing decoration if the event is validated.
	TopLink	The link at higher Z position.
	TopSegmentIndex	Index of top link's segment that contains the intersection point.

LinkCrossingEventArgs.BottomSegmentIndex Property

Index of bottom link's segment that contains the intersection point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int BottomSegmentIndex { get; set; }
```

Visual Basic Copy Code

```
Public Property BottomSegmentIndex As Integer
```

Property Value

An integer index of link's segment containing IntersectionPoint.

LinkCrossingEventArgs Members
LinkCrossingEventArgs Class
MindFusion.Diagramming Namespace

LinkCrossingEventArgs.Cancel Property

Specifies whether crossing decoration should be displayed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Cancel { get; set; }
```

Visual Basic Copy Code

```
Public Property Cancel As Boolean
```

Property Value

true to hide the crossing decoration, or **false** to display it.

See Also

LinkCrossingEventArgs Members
LinkCrossingEventArgs Class
MindFusion.Diagramming Namespace

LinkCrossingEventArgs.IntersectionPoint Property

Intersection point that will show crossing decoration if the event is validated.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point IntersectionPoint { get; set; }
```

Visual Basic Copy Code

```
Public Property IntersectionPoint As Point
```

Property Value

A **Microsoft.Maui.Graphics.Point** containing intersection coordinates.

See Also

LinkCrossingEventArgs Members
LinkCrossingEventArgs Class
MindFusion.Diagramming Namespace

LinkCrossingEventArgs.TopLink Property

The link at higher Z position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink TopLink { get; set; }
```

Visual Basic

```
Public Property TopLink As DiagramLink
```

Property Value

A DiagramLink reference.

See Also

LinkCrossingEventArgs Members
LinkCrossingEventArgs Class
MindFusion.Diagramming Namespace

LinkCrossingEventArgs.TopSegmentIndex Property

Index of top link's segment that contains the intersection point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public int TopSegmentIndex { get; set; }
```

Visual Basic

```
Public Property TopSegmentIndex As Integer
```

Property Value

An integer index of link's segment containing IntersectionPoint.

See Also

LinkCrossingEventArgs Members
LinkCrossingEventArgs Class
MindFusion.Diagramming Namespace

LinkCrossings Enumeration

Defines values that indicate how to render link intersection points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public enum LinkCrossings
```

Visual Basic

```
Public Enum LinkCrossings
```

Members

	Member name	Description
	Straight	No special indication for link intersection points.
	Arcs	An arc is drawn at the intersection point of two links. It connects the segments of the link at higher Z position and goes over the link at lower Z.

	Cut	The intersection segments of links at lower Z position are cut by links at higher Z position.

Remarks

Values from this enumeration can be assigned to LinkCrossings.

LinkEventArgs Class

Contains the arguments passed to handlers of link related events, such as LinkCreated and LinkDeleted.

Syntax

C# Copy Code

```
public class LinkEventArgs : EventArgs
```

Visual Basic Copy Code

```
Public Class LinkEventArgs
    Inherits EventArgs
```

Inheritance Hierarchy

System.Object
  System.EventArgs
    MindFusion.Diagramming.LinkEventArgs
      MindFusion.Diagramming.LinkShapeEventArgs

LinkEventArgs Members

Contains the arguments passed to handlers of link related events, such as LinkCreated and LinkDeleted.

The following tables list the members exposed by the LinkEventArgs type.

Public Constructors

	Name	Description
	LinkEventArgs	Overloaded. Initializes a new instance of the **LinkEventArgs** class.

Public Properties

	Name	Description
	AdjustmentHandle	Gets or sets the adjustment handle being moved by the user.
	Label	Gets or sets a LinkLabel related to this event.
	Link	Gets the link for which the event raised.
	MouseButton	Gets which mouse button has been pressed.
	MousePosition	Gets or sets the current mouse pointer position.

LinkEventArgs Constructor (DiagramLink)

Initializes a new instance of the LinkEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkEventArgs (
    DiagramLink link
)
```

Visual Basic Copy Code

```
Public New ( _
    link As DiagramLink _
)
```

Parameters

link
The DiagramLink related to the event.

See Also

LinkEventArgs Constructor Overload List
LinkEventArgs Class
MindFusion.Diagramming Namespace

LinkEventArgs Constructor (DiagramLink, MouseButton, Point)

Initializes a new instance of the LinkEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkEventArgs (
    DiagramLink link,
    MouseButton mouseButton,
    Point mousePosition
)
```

Visual Basic Copy Code

```
Public New ( _
    link As DiagramLink, _
    mouseButton As MouseButton, _
    mousePosition As Point _
)
```

Parameters

link
The DiagramLink related to the event.

mouseButton
The mouse button related to the event.

mousePosition
The position of the mouse cursor, in document coordinates.

See Also

LinkEventArgs Constructor Overload List

LinkEventArgs Constructor (DiagramLink, Point, Int32)

Initializes a new instance of the LinkEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkEventArgs (
    DiagramLink link,
    Point mousePosition,
    int adjustmentHandle
)
```

Visual Basic Copy Code

```
Public New ( _
    link As DiagramLink, _
    mousePosition As Point, _
    adjustmentHandle As Integer _
)
```

Parameters

link
The DiagramLink related to the event.

mousePosition
The position of the mouse cursor, in document coordinates.

adjustmentHandle
The zero-based index of the control point related to the event.

LinkEventArgs Properties

LinkEventArgs.AdjustmentHandle Property

Gets or sets the adjustment handle being moved by the user.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int AdjustmentHandle { get; set; }
```

Visual Basic Copy Code

```
Public Property AdjustmentHandle As Integer
```

Property Value

An integer that represents the index of the link's control point being moved.

LinkEventArgs.Link Property

Gets the link for which the event raised.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink Link { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Link As DiagramLink
```

Property Value

A DiagramLink instance.

LinkEventArgs.MouseButton Property

Gets which mouse button has been pressed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public MouseButton MouseButton { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property MouseButton As MouseButton
```

Property Value

A member of the MouseButton enumeration specifying the currently pressed mouse button.

See Also

LinkEventArgs.MousePosition Property

Gets or sets the current mouse pointer position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point MousePosition { get; set; }
```

Visual Basic

```
Public Property MousePosition As Point
```

Property Value

A **Microsoft.Maui.Graphics.Point** specifying the current mouse position.

See Also

LinkEventArgs Members
LinkEventArgs Class
MindFusion.Diagramming Namespace

LinkLabel Class

Represents a supplementary label displayed by a DiagramLink. New labels can be added to a link by calling the AddLabel method.

Syntax

C#

```
public class LinkLabel : ItemLabel
```

Visual Basic

```
Public Class LinkLabel
    Inherits ItemLabel
```

Remarks

The text displayed by a **LinkLabel** is set via the Text property, and its attributes are specified via Font. The label's foreground and background can be set via TextBrush and Brush properties.

The position of a label is determined by where it is pinned along the link's geometry, as set using RelativeTo and Index properties, and offset from the pin point specified by HorizontalOffset and VerticalOffset properties. The SetControlPointPosition, SetSegmentPosition and SetLinkLengthPosition methods let you specify the values as arguments. Instead of using fixed offsets, enable the AutoArrange property to let links automatically choose positions of their labels that won't intersect nodes or other labels.

You can let users arrange labels manually by setting the **Behavior** property of **DiagramView** to MoveLabels.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.ItemLabel
    MindFusion.Diagramming.LinkLabel

LinkLabel Members

Represents a supplementary label displayed by a DiagramLink. New labels can be added to a link by calling the AddLabel method.

The following tables list the members exposed by the LinkLabel type.

Public Constructors

	Name	Description
	LinkLabel	Overloaded. Initializes a new instance of the **LinkLabel** class.

Public Properties

	Name	Description
	AutoArrange	Gets or sets a value indicating whether the label can be auto arranged.
	Brush	Gets or sets the brush used to draw the label's background.
	ContentPadding	Gets or sets the distance between image and text when both are specified. (Inherited from ItemLabel.)
	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled. (Inherited from ItemLabel.)
	EnableWrap	Gets or sets a value indicating whether the label's text can be wrapped.
	Font	Gets or sets the label's font.
	HorizontalAlign	Gets or sets the label's horizontal alignment.
	HorizontalOffset	Gets or sets the label's horizontal offset.
	Image	Gets or sets the image displayed by this label. (Inherited from ItemLabel.)
	ImageAlign	Gets or sets the alignment of label's image relative to text. (Inherited from ItemLabel.)
	ImageSize	Gets or sets a size that overrides the native image size. (Inherited from ItemLabel.)
	ImageUrl	Gets or sets URL of the image to display inside this label. (Inherited from ItemLabel.)
	Index	Gets or sets the index of the segment or control point this label is relative to.
	Item	Gets or sets the DiagramItem that displays this label. (Inherited from ItemLabel.)
	LengthFactor	Gets or sets label's position along link's length when the RelativeTo property is set to LinkLength.
	Link	Gets or sets the **DiagramLink** that displays this label.
	Locked	Gets or sets a value indicating whether users are allowed to edit this label. (Inherited from ItemLabel.)
	Margin	Gets or sets the label's margin size.
	MaxWidth	Gets or sets the maximum width of the label.
	RelativeTo	Gets or sets the label's relative positioning.
	Text	Gets or sets the label's text.
	TextBrush	Gets or sets the brush used to draw the label's text.
	VerticalAlign	Gets or sets the label's vertical alignment.
	VerticalOffset	Gets or sets the label's vertical offset.

Public Methods

	Name	Description
	Cancel	Called when drag operation is canceled. (Inherited from ItemLabel.)
	Clone	Creates a clone of this label.
	Draw	Draws the link label on the specified IGraphics surface.
	GetEditRect	InplaceEditable.GetEditRect implementation.
	GetTextToEdit	InplaceEditable.GetTextToEdit implementation.

	LoadFromXml	Loads the label from the specified XML element.
	OnMouseDown	Called when the left mouse button is pressed while the pointer is over this label. (Inherited from ItemLabel.)
	OnMouseMove	Called when the mouse is moved while this label tracks the mouse events. (Inherited from ItemLabel.)
	OnMouseUp	Called when the left mouse button is released while this label tracks the mouse events. (Inherited from ItemLabel.)
	SaveToXml	Saves the label into the specified XML element.
	SetControlPointPosition	Positions this label relatively to the specified control point.
	SetEditedText	InplaceEditable.SetEditedText implementation.
	SetLinkLengthPosition	Positions this label relatively to the link length.
	SetMouseCursor	Indicates what cursor to display for interactive labels. (Inherited from ItemLabel.)
	SetSegmentPosition	Positions this label relatively to the specified link segment.
	UpdateValue	Called while drag operation is in progress. (Inherited from ItemLabel.)

Protected Methods

	Name	Description
	LoadFromJson	Loads the label from a JSON object.
	PointAlongLength	Returns a point lying on a polyline that is positioned at a relative position along the polyline's length.
	SaveToJson	Saves the label as a JSON object.

MindFusion.Diagramming Namespace

LinkLabel Constructor (DiagramLink)

Initializes a new instance of the LinkLabel class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkLabel (
    DiagramLink link
)
```

Visual Basic Copy Code

```
Public New ( _
    link As DiagramLink _
)
```

Parameters

link
The DiagramLink that displays the label.

See Also

LinkLabel Constructor Overload List
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel Constructor (DiagramLink, String)

Initializes a new instance of the LinkLabel class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkLabel (
    DiagramLink link,
    string text
)
```

Visual Basic

```
Public New ( _
    link As DiagramLink, _
    text As String _
)
```

Parameters

link

The DiagramLink that displays the label.

text

The label's text.

See Also

LinkLabel Constructor Overload List
LinkLabel Class

LinkLabel Methods

LinkLabel.Clone Method

Creates a clone of this label.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public LinkLabel Clone ()
```

Visual Basic

```
Public Function Clone () As LinkLabel
```

Return Value

A new LinkLabel instance that is an exact copy of this label.

See Also

LinkLabel Members

LinkLabel.Draw Method

Draws the link label on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public virtual void Draw (
    IGraphics graphics
)
```

Visual Basic

```
Public Overridable Sub Draw( _
    graphics As IGraphics _
)
```

Parameters

graphics
An IGraphics object where the link label should be rendered.

See Also

LinkLabel Members

MindFusion.Diagramming Namespace

LinkLabel.GetEditRect Method

InplaceEditable.GetEditRect implementation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public Rect GetEditRect (
    DiagramItem item,
    Point mousePosition
)
```

Visual Basic

```
Public Function GetEditRect( _
    item As DiagramItem, _
    mousePosition As Point _
) As Rect
```

Parameters

item
The item being edited.

mousePosition
A **Microsoft.Maui.Graphics.Point** specifying the mouse position.

Return Value

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.GetTextToEdit Method

InplaceEditable.GetTextToEdit implementation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public string GetTextToEdit ()
```

Visual Basic

```
Public Function GetTextToEdit () As String
```

Return Value

A string value.

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.LoadFromJson Method

Loads the label from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject containing the label's data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.LoadFromXml Method

Loads the label from the specified XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic

```
Public Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

A **XmlElement** instance.

context

A XmlPersistContext instance.

See Also

LinkLabel Members

MindFusion.Diagramming Namespace

LinkLabel.PointAlongLength Method

Returns a point lying on a polyline that is positioned at a relative position along the polyline's length.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected Point PointAlongLength (
    double lengthFactor,
    IList<Point> segments
)
```

Visual Basic Copy Code

```
Protected Function PointAlongLength( _
    lengthFactor As Double, _
    segments As IList(Of Point) _
) As Point
```

Parameters

lengthFactor

A value from 0 to 1 specifying a portion of link's length.

segments

A list of points specifying the polyline segments.

Return Value

A **Microsoft.Maui.Graphics.Point** instance.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.SaveToJson Method

Saves the label as a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected override void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.SaveToXml Method

Saves the label into the specified XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic

```
Public Overrides Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
A **XmlElement** instance.

context
A XmlPersistContext instance.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.SetControlPointPosition Method

Positions this label relatively to the specified control point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetControlPointPosition (
    int controlPoint,
    double dx,
    double dy
)
```

Visual Basic Copy Code

```
Public Sub SetControlPointPosition( _
    controlPoint As Integer, _
    dx As Double, _
    dy As Double _
)
```

Parameters

controlPoint
The control point index.

dx
Horizontal offset from the point.

dy
Vertical offset from the point.

Remarks

This method sets the specified control point as label's pin point and assigns specified offsets to HorizontalOffset and VerticalOffset properties.

See Also

LinkLabel.SetEditedText Method

InplaceEditable.SetEditedText implementation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetEditedText (
    string newText
)
```

Visual Basic Copy Code

```
Public Sub SetEditedText( _
    newText As String _
)
```

Parameters

newText
The new text of the in-place edited object.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.SetLinkLengthPosition Method

Positions this label relatively to the link length.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetLinkLengthPosition (
    double lengthFactor
)
```

Visual Basic Copy Code

```
Public Sub SetLinkLengthPosition( _
    lengthFactor As Double _
)
```

Parameters

lengthFactor
A value between 0 and 1 specifying the position of the label relatively to the link's length.

Remarks

This method sets the point at specified distance along link's geometry as pin point and assigns specified offsets to HorizontalOffset and VerticalOffset properties.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.SetSegmentPosition Method

Positions this label relatively to the specified link segment.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetSegmentPosition (
    int segment,
    double dx,
    double dy
)
```

Visual Basic Copy Code

```
Public Sub SetSegmentPosition( _
    segment As Integer, _
    dx As Double, _
    dy As Double _
)
```

Parameters

segment
The segment index.

dx
Horizontal offset from the segment center.

dy
Vertical offset from the segment center.

Remarks

This method sets the middle of specified segment as label's pin point and assigns specified offsets to HorizontalOffset and VerticalOffset properties.

LinkLabel Properties

LinkLabel.AutoArrange Property

Gets or sets a value indicating whether the label can be auto arranged.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AutoArrange { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoArrange As Boolean
```

Property Value

true to automatically place the label; otherwise, **false**.

See Also

LinkLabel Members

LinkLabel.Brush Property

Gets or sets the brush used to draw the label's background.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush Brush { get; set; }
```

Visual Basic Copy Code

```
Public Property Brush As Brush
```

Property Value

A Brush used to paint the label's background. The default value is **null**.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.EnableWrap Property

Gets or sets a value indicating whether the label's text can be wrapped.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableWrap { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableWrap As Boolean
```

Property Value

true to enable text wrapping; otherwise, **false**.

LinkLabel.Font Property

Gets or sets the label's font.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Font Font { get; set; }
```

Visual Basic Copy Code

```
Public Property Font As Font
```

Property Value

A Font object.

Remarks

This property can be **null**, in which case the label will use the Font of its parent link.

LinkLabel.HorizontalAlign Property

Gets or sets the label's horizontal alignment.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public StringAlignment HorizontalAlign { get; set; }
```

Visual Basic Copy Code

```
Public Property HorizontalAlign As StringAlignment
```

Property Value

A member of the **StringAlignment** enumeration. The default is **Center**.

LinkLabel.Index Property

Gets or sets the index of the segment or control point this label is relative to.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Index { get; set; }
```

Visual Basic Copy Code

```
Public Property Index As Integer
```

Property Value

An integer value.

See Also

LinkLabel Members

LinkLabel.LengthFactor Property

Gets or sets label's position along link's length when the RelativeTo property is set to LinkLength.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double LengthFactor { get; set; }
```

Visual Basic Copy Code

```
Public Property LengthFactor As Double
```

Property Value

A **double** value in 0-1 range. The default is **0.5**.

```
public RelativeToLink RelativeTo { get; set; }
```

Visual Basic Copy Code

```
Public Property RelativeTo As RelativeToLink
```

Property Value

A member of the RelativeToLink enumeration. The default is **LinkLength**.

LinkLabel.Text Property

Gets or sets the label's text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Text { get; set; }
```

Visual Basic Copy Code

```
Public Property Text As String
```

Property Value

A string value.

LinkLabel.TextBrush Property

Gets or sets the brush used to draw the label's text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush TextBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property TextBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

LinkLabel.VerticalAlign Property

Gets or sets the label's vertical alignment.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public StringAlignment VerticalAlign { get; set; }
```

Visual Basic Copy Code

```
Public Property VerticalAlign As StringAlignment
```

Property Value

A member of the **StringAlignment** enumeration. The default is **Far**.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.VerticalOffset Property

Gets or sets the label's vertical offset.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public float VerticalOffset { get; set; }
```

Visual Basic Copy Code

```
Public Property VerticalOffset As Single
```

Property Value

A float value.

LinkShape Enumeration

Specifies available styles for the segments of links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum LinkShape
```

Visual Basic Copy Code

```
Public Enum LinkShape
```

Members

	Member name	Description
	Bezier	The segments of a link are Bézier curves.
	Polyline	The segments of the link are straight lines.
	Cascading	The segments of a link are horizontal and vertical lines, each one orthogonal to its adjacent segments.
	Spline	The segments of a link are curves forming an interpolating spline that passes through all control points.

Remarks

Values from this enumeration can be assigned to the Shape property of links or to the LinkShape property of the diagram.

LinkShapeEventArgs Members

Contains the arguments passed to the SetSelfLoopShape event handler.

The following tables list the members exposed by the LinkShapeEventArgs type.

Public Constructors

	Name	Description
	LinkShapeEventArgs	Initializes a new instance of the **LinkShapeEventArgs** class.

Public Properties

	Name	Description
	AdjustmentHandle	Gets or sets the adjustment handle being moved by the user. (Inherited from LinkEventArgs.)
	Handled	Indicates whether the event handler has set a custom loop shape.
	Label	Gets or sets a LinkLabel related to this event. (Inherited from LinkEventArgs.)
	Link	Gets the link for which the event raised. (Inherited from LinkEventArgs.)
	MouseButton	Gets which mouse button has been pressed. (Inherited from LinkEventArgs.)
	MousePosition	Gets or sets the current mouse pointer position. (Inherited from LinkEventArgs.)

LinkShapeEventArgs Class
MindFusion.Diagramming Namespace

LinkShapeEventArgs Constructor

Initializes a new instance of the LinkShapeEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkShapeEventArgs (
    DiagramLink link
)
```

Visual Basic Copy Code

```
Public New ( _
    link As DiagramLink _
)
```

Parameters

link
The DiagramLink that becomes a self-loop.

See Also

LinkShapeEventArgs Class
MindFusion.Diagramming Namespace

LinkShapeEventArgs Properties

LinkShapeEventArgs.Handled Property

Indicates whether the event handler has set a custom loop shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Handled { get; set; }
```

Visual Basic Copy Code

```
Public Property Handled As Boolean
```

Property Value

true if a custom shape is specified and the control should not set the standard loop shape; otherwise, **false**. The default value is **false**.

See Also

LinkShapeEventArgs Members
LinkShapeEventArgs Class

LinkTextStyle Enumeration

Specifies the position and alignment of links' labels.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum LinkTextStyle
```

Visual Basic Copy Code

```
Public Enum LinkTextStyle
```

Members

	Member name	Description
	Center	The text is displayed horizontally above the middle link segment or control point, depending on whether there are an odd or even number of segments.
	Rotate	The text is displayed rotated at the same angle as the segment where the text is placed. A long enough segment from the middle link segments is chosen for that purpose.
	OverLongestSegment	The text follows the longest link segment and is displayed centered at the segment's middle point.
	Follow	The label text starts from the first point of the link and follows the path defined by the link segments. This style is useful for displaying long text.
	MiddleSegment	The text is displayed horizontally above the middle link segment. If there are an even number of segments, the label is drawn over the longer from the two segments adjacent to the middle control point.
	MiddleSegmentRotated	The text is displayed rotated at the same angle as the segment where the text is placed. A long enough segment from the middle link segments is chosen for that purpose.

Remarks

Values from this enumeration can be assigned to the TextStyle property of links or the LinkTextStyle property of the diagram.

LinkValidationEventArgs Members

Contains the arguments passed to handlers of link validation events.

The following tables list the members exposed by the LinkValidationEventArgs type.

Public Constructors

	Name	Description
	LinkValidationEventArgs	Overloaded. Initializes a new instance of the **LinkValidationEventArgs** class.

Public Properties

	Name	Description
	AdjustmentHandle	Gets or sets the adjustment handle being moved by the user. (Inherited from LinkEventArgs.)
	AnchorIndex	Gets the anchor point related to a link validation event.
	Cancel	Gets or sets a value indicating whether to cancel the current operation.
	ChangingDestination	Gets a value indicating whether the user modifies the link's destination end point.
	ChangingOrigin	Gets a value indicating whether the user modifies the link's origin end point.
	Destination	Gets the node that will become the link's destination if the event is validated.
	Label	Gets or sets the LinkLabel related to this event.

	Link	Gets the link for which the event raised. (Inherited from LinkEventArgs.)
	MouseButton	Gets which mouse button has been pressed. (Inherited from LinkEventArgs.)
	MousePosition	Gets or sets the current mouse pointer position. (Inherited from LinkEventArgs.)
	Node	Gets the node to which the link will be connected.
	NodeElement	Gets the node's element to which the link will be connected.
	Origin	Gets the node that would become the link's origin if the event is validated.
	SelectionRectangle	Gets the current selection rectangle.
	TableRow	Gets the table row related to a link validation event.

Public Methods

	Name	Description
	CancelDrag	Cancels the creation or modification of the link.

LinkValidationEventArgs Constructor (DiagramLink)

Initializes a new instance of the LinkValidationEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkValidationEventArgs (
    DiagramLink link
)
```

Visual Basic Copy Code

```
Public New ( _
    link As DiagramLink _
)
```

Parameters

link
The DiagramLink related to the event.

See Also

LinkValidationEventArgs Constructor Overload List
LinkValidationEventArgs Class
MindFusion.Diagramming Namespace

LinkValidationEventArgs Constructor (DiagramLink, Point, Int32, DiagramNode, Int32, Int32)

Initializes a new instance of the LinkValidationEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkValidationEventArgs (
    DiagramLink link,
    Point mousePosition,
    int adjustmentHandle,
    DiagramNode node,
    int anchorIndex,
    int tableRow
)
```

Visual Basic Copy Code

```
Public New ( _
    link As DiagramLink, _
    mousePosition As Point, _
    adjustmentHandle As Integer, _
    node As DiagramNode, _
    anchorIndex As Integer, _
    tableRow As Integer _
)
```

Parameters

link
The DiagramLink related to the event.

mousePosition
The position of the mouse cursor, in document coordinates.

adjustmentHandle
The zero-based index of the control point related to the event.

node
The DiagramNode related to the event.

anchorIndex
The zero-based index of the anchor point related to the event.

tableRow
The zero-based index of the table row related to the event.

LinkValidationEventArgs Constructor Overload List
LinkValidationEventArgs Class
MindFusion.Diagramming Namespace

LinkValidationEventArgs Constructor (DiagramLink, Rect)

Initializes a new instance of the LinkValidationEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public LinkValidationEventArgs (
    DiagramLink link,
    Rect selectionRectangle
)
```

Visual Basic Copy Code

```
Public New ( _
    link As DiagramLink, _
    selectionRectangle As Rect _
)
```

Parameters

link
The DiagramLink related to the event.

selectionRectangle
A **Microsoft.Maui.Graphics.Rect** that represents the current selection rectangle.

See Also

LinkValidationEventArgs Constructor Overload List
LinkValidationEventArgs Class
MindFusion.Diagramming Namespace

LinkValidationEventArgs Methods

LinkValidationEventArgs.CancelDrag Method

Cancels the creation or modification of the link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void CancelDrag ()
```

Visual Basic Copy Code

```
Public Sub CancelDrag ()
```

Remarks

Calling this method immediately stops the operation. On the other hand, setting Cancel to **true** only changes the mouse cursor to a Stop icon and the operation is cancelled when the user releases the mouse button.

See Also

LinkValidationEventArgs Members
LinkValidationEventArgs Class

LinkValidationEventArgs Properties

LinkValidationEventArgs.AnchorIndex Property

Gets the anchor point related to a link validation event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int AnchorIndex { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property AnchorIndex As Integer
```

Property Value

An integer value specifying the index of an anchor point within an AnchorPattern.

See Also

LinkValidationEventArgs Members
LinkValidationEventArgs Class
MindFusion.Diagramming Namespace

LinkValidationEventArgs.Cancel Property

Gets or sets a value indicating whether to cancel the current operation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Cancel { get; set; }
```

Visual Basic Copy Code

```
Public Property Cancel As Boolean
```

Property Value

true to cancel the operation; **false** to approve it.

Remarks

Set this property to **true** to prevent the user from completing the operation.

See Also

LinkValidationEventArgs Members

LinkValidationEventArgs.ChangingDestination Property

Gets a value indicating whether the user modifies the link's destination end point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ChangingDestination { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ChangingDestination As Boolean
```

Property Value

true if the user is changing the destination point; otherwise, **false**.

See Also

LinkValidationEventArgs Members
LinkValidationEventArgs Class
MindFusion.Diagramming Namespace

LinkValidationEventArgs.ChangingOrigin Property

Gets a value indicating whether the user modifies the link's origin end point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ChangingOrigin { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ChangingOrigin As Boolean
```

Property Value

true if the user is changing the origin point; otherwise, **false**.

See Also

LinkValidationEventArgs Members
LinkValidationEventArgs Class
MindFusion.Diagramming Namespace

LinkValidationEventArgs.Destination Property

Gets the node that will become the link's destination if the event is validated.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNode Destination { get; }
```

Visual Basic

```
Public ReadOnly Property Destination As DiagramNode
```

Property Value

An instance of the DiagramNode class.

See Also

LinkValidationEventArgs Members
LinkValidationEventArgs Class
MindFusion.Diagramming Namespace

LinkValidationEventArgs.Label Property

Gets or sets the LinkLabel related to this event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public LinkLabel Label { get; set; }
```

Visual Basic

```
Public Property Label As LinkLabel
```

Property Value

A LinkLabel reference.

See Also

LinkValidationEventArgs Members
LinkValidationEventArgs Class
MindFusion.Diagramming Namespace

LinkValidationEventArgs.Node Property

Gets the node to which the link will be connected.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public DiagramNode Node { get; }
```

Visual Basic

```
Public ReadOnly Property Node As DiagramNode
```

Property Value

An instance of the DiagramNode class.

See Also

LinkValidationEventArgs Members
LinkValidationEventArgs Class
MindFusion.Diagramming Namespace
NodeElement Property

LinkValidationEventArgs.NodeElement Property

Gets the node's element to which the link will be connected.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object NodeElement { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property NodeElement As Object
```

Property Value

The element of a compound node to which the link will connect.

Remarks

This property could refer to a TreeViewItem if the link connects to a TreeViewNode, or a Row if the link connects to a TableNode.

See Also

LinkValidationEventArgs Members
LinkValidationEventArgs Class

Node Property

LinkValidationEventArgs.Origin Property

Gets the node that would become the link's origin if the event is validated.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNode Origin { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Origin As DiagramNode
```

Property Value

An instance of the DiagramNode class.

LinkValidationEventArgs.SelectionRectangle Property

Gets the current selection rectangle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect SelectionRectangle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property SelectionRectangle As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** representing the selection rectangle.

See Also

LinkValidationEventArgs Members
LinkValidationEventArgs Class
MindFusion.Diagramming Namespace

LinkValidationEventArgs.TableRow Property

Gets the table row related to a link validation event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int TableRow { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property TableRow As Integer
```

Property Value

An integer value specifying the zero-based index of a TableNode's row.

See Also

LinkValidationEventArgs Members
LinkValidationEventArgs Class

MarkStyle Enumeration

Specifies the visual style of anchor point marks.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum MarkStyle
```

Visual Basic Copy Code

```
Public Enum MarkStyle
```

Members

	Member name	Description

	None	No visual indication for the anchor point.
	Cross	Anchor point marked with a cross.
	X	Anchor point marked with an 'X'.
	Circle	Anchor point marked with a circle.
	Rectangle	Anchor point marked with a rectangle.
	Custom	A DrawAnchorPoint event is fired, allowing custom painting of anchor points.

Remarks

Members of this enumeration are used as values of the MarkStyle property of the AnchorPoint class.

MeasureUnit Class

Represents a unit of measure.

Syntax

C# Copy Code

```
public class MeasureUnit
```

Visual Basic Copy Code

```
Public Class MeasureUnit
```

Remarks

Instances of this class can be assigned to the MeasureUnit property of the Diagram class to indicate how size and length property values should be mapped to device pixels.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.MeasureUnit

MeasureUnit Members

Represents a unit of measure.

The following tables list the members exposed by the MeasureUnit type.

Public Constructors

	Name	Description
	MeasureUnit	Overloaded.

Public Fields

	Name	Description
	Centimeter	Specifies centimeters as the unit of measure.
	Document	Specifies document units (1/300 inch) as the unit of measure.
	Inch	Specifies inches as the unit of measure.
	Millimeter	Specifies millimeters as the unit of measure.
	Percent	Specifies percents as the unit of measure.
	Pixel	Specifies device pixels as the unit of measure.
	Point	Specifies printer's points (1/72 inch) as the unit of measure.
	WpfPoint	Specifies device-independent pixels (1/96 inch) as the unit of measure.

Public Properties

	Name	Description
	Amount	Gets the unit's size in inches.
	Id	Gets the unit identifier.
	Name	Gets the name of the unit.
	StandardDivisions	Gets the number of subunits that measures of this unit type are commonly divided to.

Public Methods

	Name	Description
	ApplyTo	Overloaded.
	Convert	Overloaded.
	Equals	Overloaded.
	FromGraphicsUnit	Returns the measure unit corresponding to the specified graphics unit.
	FromId	Returns a **MeasureUnit** from its integer identifier.
	GetHashCode	Object.GetHashCode override.
	ToGraphicsUnit	Returns the GraphicsUnit corresponding to this **MeasureUnit**.
	ToString	Object.ToString override.

MeasureUnit Constructor (Int32, String, MeasureUnitType, Double, Int32)

Initializes one of the built-in units of measure.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public MeasureUnit (
    int id,
    string name,
    MeasureUnitType type,
    double unitsPerInch,
    int standardDivisions
)
```

Visual Basic Copy Code

```
Public New ( _
    id As Integer, _
    name As String, _
    type As MeasureUnitType, _
    unitsPerInch As Double, _
    standardDivisions As Integer _
)
```

Parameters

id
An integer identifier used to represent this unit in saved diagram files.

name
The display name of this unit.

type
A MeasureUnitType enumeration member specifying how unit size should be calculated.

unitsPerInch
A **double** value specifying how many units of this type fit within an inch.

standardDivisions
An integer value specifying how many standard divisions should be displayed for this unit in the scales of the **Ruler** control.

MeasureUnit Class

MeasureUnit Constructor (Int32, String, MeasureUnitType, Double, Int32, IMeasureUnitConverter)

Initializes one of the built-in units of measure.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public MeasureUnit (
    int id,
    string name,
    MeasureUnitType type,
    double unitsPerInch,
    int standardDivisions,
    IMeasureUnitConverter converter
)
```

Visual Basic Copy Code

```
Public New ( _
    id As Integer, _
    name As String, _
    type As MeasureUnitType, _
    unitsPerInch As Double, _
    standardDivisions As Integer, _
    converter As IMeasureUnitConverter _
)
```

Parameters

id
An integer identifier used to represent this unit in saved diagram files.

name
The display name of this unit.

type
A MeasureUnitType enumeration member specifying how unit size should be calculated.

unitsPerInch
A **double** value specifying how many units of this type fit within an inch.

standardDivisions
An integer value specifying how many standard divisions should be displayed for this unit in the scales of the **Ruler** control.

converter
An IMeasureUnitConverter object used to convert values from this unit to device pixels or other logical units.

Initializes a new instance of the MeasureUnit class with the specified unit of measure as a base.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public MeasureUnit (
    string name,
    MeasureUnit baseUnit,
    double scale
)
```

Visual Basic Copy Code

```
Public New ( _
    name As String, _
    baseUnit As MeasureUnit, _
    scale As Double _
)
```

Parameters

name
The name of the new unit.

baseUnit
The base of the new unit.

scale
The scale of the new unit, relatively to the base.

Syntax

C# Copy Code

```
public MeasureUnit (
    string name,
    MeasureUnit baseUnit,
    double scale,
    int standardDivisions
)
```

Visual Basic Copy Code

```
Public New ( _
    name As String, _
    baseUnit As MeasureUnit, _
    scale As Double, _
    standardDivisions As Integer _
)
```

Parameters

name
The name of the new unit.

baseUnit
The base of the new unit.

scale
The scale of the new unit, relatively to the base.

standardDivisions
The number of divisions of the new unit.

MeasureUnit Methods

MeasureUnit.ApplyTo Method

Overload List

Name	Description
MeasureUnit.ApplyTo (Graphics)	Applies this unit to the specified **Graphics** drawing surface.
MeasureUnit.ApplyTo (IGraphics)	Applies this unit to the specified IGraphics drawing surface.
MeasureUnit.ApplyTo (IMatrix, IGraphics)	Applies this unit to the specified IGraphics drawing surface.

See Also

MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.ApplyTo Method (Graphics)

Applies this unit to the specified **Graphics** drawing surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ApplyTo (
    Graphics graphics
)
```

Visual Basic Copy Code

```
Public Sub ApplyTo( _
    graphics As Graphics _
)
```

Parameters

graphics
A **Graphics** instance whose **PageUnit** and **PageScale** are set to match the resolution of this unit.

See Also

ApplyTo Method Overload List
MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.ApplyTo Method (IGraphics)

Applies this unit to the specified IGraphics drawing surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ApplyTo (
    IGraphics graphics
)
```

Visual Basic Copy Code

```
Public Sub ApplyTo( _
    graphics As IGraphics _
)
```

Parameters

graphics
An IGraphics instance whose PageUnit and PageScale are set to match the resolution of this unit.

See Also

ApplyTo Method Overload List
MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.ApplyTo Method (IMatrix, IGraphics)

Applies this unit to the specified IGraphics drawing surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ApplyTo (
    IMatrix matrix,
    IGraphics graphics
)
```

Visual Basic Copy Code

```
Public Sub ApplyTo( _
    matrix As IMatrix, _
    graphics As IGraphics _
)
```

Parameters

matrix
An IMatrix instance that should be set to match the resolution of this unit.

graphics
An IGraphics that should supply the DPI.

MeasureUnit.Convert Method

Overload List

Name	Description
MeasureUnit.Convert (Double, MeasureUnit, Object)	Converts the specified value from this unit to the specified unit.
MeasureUnit.Convert (Double, MeasureUnit, Object, Axis)	Converts the specified value from this unit to the specified unit.
MeasureUnit.Convert (Point, MeasureUnit, Object)	Converts the specified point from this unit to the specified unit.
MeasureUnit.Convert (Rect, MeasureUnit, Object)	Converts the specified rectangle from this unit to the specified unit.

See Also

MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.Convert Method (Double, MeasureUnit, Object)

Converts the specified value from this unit to the specified unit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Convert (
    double value,
    MeasureUnit targetUnit,
    Object context
)
```

Visual Basic Copy Code

```
Public Function Convert( _
    value As Double, _
    targetUnit As MeasureUnit, _
    context As Object _
) As Double
```

Parameters

value
The value to convert, expressed in the current measure unit.

targetUnit
The target measure unit.

context
A parameter that is used when converting from logical units (such as inches and millimeters) to device units (such as pixels) or special units. This can be either **Graphics**, IGraphics, or IResolution.

Return Value
The converted value.

Remarks
If the target represents logical unit (such as millimeter, inch, point) or a unit derived from a logical unit, and the current unit is not logical (for example pixel), the third parameter is required to perform the conversion.

See Also

MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.Convert Method (Double, MeasureUnit, Object, Axis)

Converts the specified value from this unit to the specified unit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Convert (
    double value,
    MeasureUnit targetUnit,
    Object context,
    Axis axis
)
```

Visual Basic Copy Code

```
Public Function Convert( _
    value As Double, _
    targetUnit As MeasureUnit, _
    context As Object, _
    axis As Axis _
) As Double
```

Parameters
value
The value to convert, expressed in the current measure unit.

targetUnit
The target measure unit.

context
A parameter that is used when converting from logical units (such as inches and millimeters) to device units (such as pixels) or special units. This can be either **Graphics**, IGraphics, or IResolution.

axis
One of the coordinate axes.

Return Value
The converted value.

Remarks
If the target represents logical unit (such as millimeter, inch, point) or a unit derived from a logical unit, and the current unit is not logical (for example pixel), the third parameter is required to perform the conversion.

Convert Method Overload List
MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.Convert Method (Point, MeasureUnit, Object)

Converts the specified point from this unit to the specified unit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point Convert (
    Point p,
    MeasureUnit targetUnit,
    Object context
)
```

Visual Basic Copy Code

```
Public Function Convert( _
    p As Point, _
    targetUnit As MeasureUnit, _
    context As Object _
) As Point
```

Parameters

p
The point to convert, expressed in the current measure unit.

targetUnit
The target measure unit.

context
A parameter that is used when converting from logical units (such as inches and millimeters) to device units (such as pixels) or special units. This can be either **Graphics**, IGraphics, or IResolution.

Return Value

The converted point.

Remarks

If the target represents logical unit (such as millimeter, inch, point) or a unit derived from a logical unit, and the current unit is not logical (for example pixel), the third parameter is required to perform the conversion. If both units are of the same generic type, graphics is ignored.

MeasureUnit.Convert Method (Rect, MeasureUnit, Object)

Converts the specified rectangle from this unit to the specified unit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect Convert (
    Rect r,
    MeasureUnit targetUnit,
    Object context
)
```

Visual Basic Copy Code

```
Public Function Convert( _
    r As Rect, _
    targetUnit As MeasureUnit, _
    context As Object _
) As Rect
```

Parameters

r
The rectangle to convert, expressed in the current measure unit.

targetUnit
The target measure unit.

context
A parameter that is used when converting from logical units (such as inches and millimeters) to device units (such as pixels) or special units. This can be either **Graphics**, IGraphics, or IResolution.

Return Value

The converted rectangle.

Remarks

If the target represents logical unit (such as mm, inch, point) or a unit derived from a logical unit, and the current unit is not logical (for example pixel), the third parameter is required to perform the conversion. If both units are of the same generic type, graphics is ignored.

MeasureUnit.Equals Method

Overload List

Name	Description
MeasureUnit.Equals (MeasureUnit)	Determines whether the specified measure unit is equal to the current measure unit.
MeasureUnit.Equals (Object)	Object.Equals override.

See Also

MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.Equals Method (MeasureUnit)

Determines whether the specified measure unit is equal to the current measure unit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public new bool Equals (
    MeasureUnit unit
)
```

Visual Basic Copy Code

```
Public Shadows Function Equals( _
    unit As MeasureUnit _
) As Boolean
```

Parameters

unit
The object to compare to this measure unit.

Return Value

true if the specified measure unit is equal to this object; otherwise, **false**.

See Also

Equals Method Overload List
MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.Equals Method (Object)

Object.Equals override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool Equals (
    Object obj
)
```

Visual Basic Copy Code

```
Public Overrides Function Equals( _
    obj As Object _
) As Boolean
```

Parameters

obj
The object to compare with the current unit.

Return Value

true if the specified object is the same as or is equal to the current unit; otherwise, **false**.

See Also

Equals Method Overload List
MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.FromGraphicsUnit Method

Returns the measure unit corresponding to the specified graphics unit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static MeasureUnit FromGraphicsUnit (
    GraphicsUnit unit
)
```

Visual Basic Copy Code

```
Public Shared Function FromGraphicsUnit( _
    unit As GraphicsUnit _
) As MeasureUnit
```

Parameters

unit
One of the **GraphicsUnit** values.

Return Value

The built-in MeasureUnit corresponding to the specified graphics unit. If *unit* is **World**, this method returns **null**. If unit is **Display**, this method returns Pixel.

See Also

MeasureUnit Members
MeasureUnit Class

MeasureUnit.FromId Method

Returns a MeasureUnit from its integer identifier.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static MeasureUnit FromId (
    int id
)
```

Visual Basic Copy Code

```
Public Shared Function FromId( _
    id As Integer _
) As MeasureUnit
```

Parameters

id
The identifier of one of the built-in measure units.

Return Value

The built-in MeasureUnit corresponding to the specified identifier.

See Also

MeasureUnit Members
MeasureUnit Class

MeasureUnit.GetHashCode Method

Object.GetHashCode override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override int GetHashCode ()
```

Visual Basic Copy Code

```
Public Overrides Function GetHashCode () As Integer
```

Return Value

A hash code for the current unit.

See Also

MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.ToGraphicsUnit Method

Returns the GraphicsUnit corresponding to this MeasureUnit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public GraphicsUnit ToGraphicsUnit ()
```

Visual Basic Copy Code

```
Public Function ToGraphicsUnit () As GraphicsUnit
```

Return Value

A member of the GraphicsUnit enumeration if there is one corresponding to this unit, or otherwise **null**.

See Also

MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.ToString Method

Object.ToString override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override string ToString ()
```

Visual Basic

```
Public Overrides Function ToString () As String
```

Return Value

The name of the unit.

See Also

MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit Properties

MeasureUnit.Amount Property

Gets the unit's size in inches.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public double Amount { get; }
```

Visual Basic

```
Public ReadOnly Property Amount As Double
```

Property Value

A **double** value specifying the size in inches of a single unit of this type.

See Also

MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.Id Property

Gets the unit identifier.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public int Id { get; }
```

Visual Basic

```
Public ReadOnly Property Id As Integer
```

Property Value

Remarks

This property returns the integer identifier passed to MeasureUnit constructors.

See Also

MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.Name Property

Gets the name of the unit.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Name { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Name As String
```

Property Value

The name passed to MeasureUnit constructors.

See Also

MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnit.StandardDivisions Property

Gets the number of subunits that measures of this unit type are commonly divided to.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int StandardDivisions { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property StandardDivisions As Integer
```

Property Value

The *standardDivisions* value passed to MeasureUnit constructors.

See Also

MeasureUnit Members
MeasureUnit Class
MindFusion.Diagramming Namespace

MeasureUnitType Enumeration

Specifies the type of a unit of measure.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum MeasureUnitType
```

Visual Basic Copy Code

```
Public Enum MeasureUnitType
```

Members

	Member name	Description
	Logical	Indicates logical unit of measure, expressed as units-per-inch.
	Device	Indicates device-dependent unit of measure, expressed in device pixels.
	Special	Indicates special unit of measure, such as percentage.

See Also

MindFusion.Diagramming Namespace

ModificationEffect Enumeration

Specifies the visual effect to apply during interactive modification of items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum ModificationEffect
```

Visual Basic Copy Code

```
Public Enum ModificationEffect
```

Members

	Member name	Description
	None	Show the actual modified item as it would look if the user completes the modification at the current mouse position.
	MoveShades	Show a semi-transparent shade of the modified item at the current mouse position.

See Also

MindFusion.Diagramming Namespace

ModificationStart Enumeration

Specifies how the user can start modifying an item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum ModificationStart
```

Visual Basic Copy Code

```
Public Enum ModificationStart
```

Members

	Member name	Description
	SelectedOnly	Only selected items can be modified.
	AutoHandles	Adjustment handles appear automatically around the item under the mouse; it can be modified without selecting it first.

Remarks

This enumeration specifies the possible values of the **ModificationStart** property.

See Also

MindFusion.Diagramming Namespace
ModificationStart Property

ModifierKeyAction Enumeration

Defines the actions that can be assigned to a modifier key such as CTRL or ALT.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum ModifierKeyAction
```

Visual Basic Copy Code

```
Public Enum ModifierKeyAction
```

Members

	Member name	Description
	None	Specifies that a modifier key does not have any specific function assigned to it.
	Pan	Pan the view if the mouse is dragged while the modifier key is pressed down.
	Select	Start drawing a selection rectangle if the mouse is dragged while a modifier key is pressed down. Toggle the selection if an item is clicked while the key is down.

	OverrideBehavior	While the modifier key is pressed down, dragging the mouse starts creating a new item or drawing a selection rectangle instead of modifying a selected item. Otherwise, dragging the mouse could start modification of the selected item.
	Magnify	Magnifies the diagram objects under the mouse while the modifier key is pressed down.
	ExtendSelection	Similar to **Select**, but does not deselect currently selected items when they are outside of a newly drawn lasso rectangle.
	Zoom	Start drawing a zoom-lasso if the mouse is dragged while respective modifier key is pressed down.

Remarks

The values from this enumeration can be assigned to the members of the diagram view's **ModifierKeyActions**.

See Also

MindFusion.Diagramming Namespace
ModifierKeyActions Class

MouseButton Enumeration

Specifies constants that define which mouse button was pressed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum MouseButton
```

Visual Basic Copy Code

```
Public Enum MouseButton
```

Members

	Member name	Description
	None	No mouse button was pressed.
	Left	The left mouse button was pressed.
	Right	The right mouse button was pressed.
	Middle	The middle mouse button was pressed.
	XButton1	The first XButton was pressed.
	XButton2	The second XButton was pressed.

See Also

MindFusion.Diagramming Namespace

MouseButtonActions Enumeration

Specifies what actions can be associated with the middle and right mouse buttons.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum MouseButtonActions
```

Visual Basic Copy Code

```
Public Enum MouseButtonActions
```

Members

	Member name	Description
	None	Do not associate any action with the button.
	Pan	Pans the view if the mouse is dragged while the button is pressed down.
	Cancel	Cancels the current drawing operation.
	Select	Starts a multiple selection operation.
	Draw	Draw new items or modify existing items.
	Magnify	Magnifies the items under the mouse while the button is pressed down.
	Zoom	Draw a zoom-lasso if the mouse is dragged with specified button pressed down.

Remarks

The **Cancel** value can be combined with **Pan** or **Select**. Thus if a user presses the mouse button while drawing an item, the operation will be cancelled; otherwise dragging with the specified button will start panning or drawing a selection rectangle.

MindFusion.Diagramming Namespace
MiddleButtonActions Property
RightButtonActions Property

MouseWheelAction Enumeration

Specifies the type of action performed when the user rotates the mouse wheel.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum MouseWheelAction
```

Visual Basic Copy Code

```
Public Enum MouseWheelAction
```

Members

	Member name	Description
	None	The DiagramView control does not handle wheel rotation internally, but raises MouseWheel event to allow custom handling.
	Scroll	Indicates that the mouse wheel should scroll the view.

	Zoom	Indicates that the mouse wheel should zoom the view.

NodeAdjustmentHandle Members

Represents an adjustment handle used to move, resize or rotate a node.

The following tables list the members exposed by the NodeAdjustmentHandle type.

Public Constructors

	Name	Description
	NodeAdjustmentHandle	Initializes a new instance of the **NodeAdjustmentHandle** class.

Public Fields

	Name	Description
	Move	A **NodeAdjustmentHandle** used to move nodes.
	ResizeBottomRight	A **NodeAdjustmentHandle** used to resize nodes from bottom-right corner.

Public Properties

	Name	Description
	HandleType	Gets or sets the type of this adjustment handle.

Public Methods

	Name	Description

	IsMoveHandle	Returns a value indicating whether this handle is used to move nodes.
	IsResizeHandle	Gets whether this adjustment handle resizes the item.
	IsRotationHandle	Gets whether this adjustment handle changes item's rotation angle.

See Also

NodeAdjustmentHandle Class

NodeAdjustmentHandle Constructor

Initializes a new instance of the NodeAdjustmentHandle class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeAdjustmentHandle (
    NodeHandleType handleType
)
```

Visual Basic Copy Code

```
Public New ( _
    handleType As NodeHandleType _
)
```

Parameters

handleType
A member of the NodeHandleType enumeration identifying the handle type.

See Also

NodeAdjustmentHandle Class
MindFusion.Diagramming Namespace

NodeAdjustmentHandle Methods

NodeAdjustmentHandle.IsMoveHandle Method

Returns a value indicating whether this handle is used to move nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool IsMoveHandle ()
```

Visual Basic Copy Code

```
Public Overrides Function IsMoveHandle () As Boolean
```

Return Value

true if this is a move handle, or **false** otherwise.

See Also

NodeAdjustmentHandle Members
NodeAdjustmentHandle Class
MindFusion.Diagramming Namespace

NodeAdjustmentHandle.IsResizeHandle Method

Gets whether this adjustment handle resizes the item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool IsResizeHandle ()
```

Visual Basic Copy Code

```
Public Overrides Function IsResizeHandle () As Boolean
```

Return Value

true if this handle resizes the item, or false otherwise.

See Also

NodeAdjustmentHandle.IsRotationHandle Method

Gets whether this adjustment handle changes item's rotation angle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool IsRotationHandle ()
```

Visual Basic Copy Code

```
Public Overrides Function IsRotationHandle () As Boolean
```

Return Value

true if this handle rotates the item, or false otherwise.

See Also

NodeAdjustmentHandle Members
NodeAdjustmentHandle Class
MindFusion.Diagramming Namespace

NodeAdjustmentHandle Properties

NodeAdjustmentHandle.HandleType Property

Gets or sets the type of this adjustment handle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeHandleType HandleType { get; set; }
```

Visual Basic Copy Code

```
Public Property HandleType As NodeHandleType
```

Property Value

A member of the NodeHandleType enumeration specifying the type of this handle.

See Also

NodeAdjustmentHandle Members
NodeAdjustmentHandle Class
MindFusion.Diagramming Namespace

NodeConstraints Class

Defines specific constraints that can be applied to the size and location of nodes.

Syntax

C# Copy Code

```
public class NodeConstraints : ICloneable
```

Visual Basic Copy Code

```
Public Class NodeConstraints
    Implements ICloneable
```

Remarks

Instances of this class can be assigned to the **Constraints** property of nodes.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.NodeConstraints

See Also

NodeConstraints Members
MindFusion.Diagramming Namespace

NodeConstraints Members

Defines specific constraints that can be applied to the size and location of nodes.

The following tables list the members exposed by the NodeConstraints type.

Public Constructors

	Name	Description
	NodeConstraints	Initializes a new instance of the **NodeConstraints** class.

Public Properties

	Name	Description
	DisableMirroring	Gets or sets a value indicating whether the user can drag a side of the node past its opposite side, so that they switch positions.
	KeepInsideDiagram	Gets or sets a value indicating whether a node should always stay inside the boundaries of the diagram that contains it.

	KeepInsideParent	Gets or sets a value indicating whether a node must always stay in the boundaries of its group master node.
	KeepRatio	Gets or sets a value indicating whether the initial width/height ratio of a node must be preserved.
	MaxHeight	Gets or sets the maximal node height allowed.
	MaxWidth	Gets or sets the maximal node width allowed.
	MinHeight	Gets or sets the minimal node height allowed.
	MinWidth	Gets or sets the minimal node width allowed.
	MoveDirection	Gets or sets constraints on movement direction.

Public Methods

	Name	Description
	Clone	Creates a copy of this object.
	LoadFromXml	Loads the label from the specified XML element.
	SaveToXml	Saves the label into the specified XML element.

NodeConstraints.LoadFromXml Method

Loads the label from the specified XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Public Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
A XmlElement instance.

context
A XmlPersistContext instance.

See Also

NodeConstraints Members
NodeConstraints Class
MindFusion.Diagramming Namespace

NodeConstraints.SaveToXml Method

Saves the label into the specified XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SaveToXml (
    XmlElement xmlElement,
```

```
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Public Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

A XmlElement instance.

context

A XmlPersistContext instance.

MindFusion.Diagramming Namespace

NodeConstraints.KeepInsideParent Property

Gets or sets a value indicating whether a node must always stay in the boundaries of its group master node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public bool KeepInsideParent { get; set; }
```

Visual Basic

```
Public Property KeepInsideParent As Boolean
```

Property Value

true if users should be prevented from moving the node out of its parent; otherwise, **false**. The default is **false**.

Remarks

This property lets you restrict nodes attached to another node by calling the AttachTo method so that users cannot move the attached nodes out of the bounds of their parent.

NodeConstraints Members
NodeConstraints Class
MindFusion.Diagramming Namespace

NodeConstraints.KeepRatio Property

Gets or sets a value indicating whether the initial width/height ratio of a node must be preserved.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public bool KeepRatio { get; set; }
```

Visual Basic

```
Public Property KeepRatio As Boolean
```

Property Value

true if the node width to height ratio should be preserved; otherwise, **false**. The default is **false**.

Remarks

If you enable this property in an initialization-event handler, the node will have an aspect ratio of 1:1. In order to let users draw perfect square or circle shapes, set **KeepRatio** to **true** in the InitializeNode handler.

NodeConstraints.MaxHeight Property

Gets or sets the maximal node height allowed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double MaxHeight { get; set; }
```

Visual Basic Copy Code

```
Public Property MaxHeight As Double
```

Property Value

0 = no height constraints; any other value specifies the maximal node height allowed.

See Also

NodeConstraints Members
NodeConstraints Class
MindFusion.Diagramming Namespace

NodeConstraints.MaxWidth Property

Gets or sets the maximal node width allowed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double MaxWidth { get; set; }
```

Visual Basic Copy Code

```
Public Property MaxWidth As Double
```

Property Value

0 = no width constraints; any other value specifies the maximal node width allowed.

NodeConstraints.MinHeight Property

Gets or sets the minimal node height allowed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double MinHeight { get; set; }
```

Visual Basic Copy Code

```
Public Property MinHeight As Double
```

Property Value

0 = no height constraints; any other value specifies the minimal node height allowed.

NodeConstraints.MoveDirection Property

Gets or sets constraints on movement direction.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DirectionConstraint MoveDirection { get; set; }
```

Visual Basic Copy Code

```
Public Property MoveDirection As DirectionConstraint
```

Property Value

One of the DirectionConstraint enumeration values; the default is **None**.

NodeEffect Class

Represents the base class of all visual effects that can be applied to the nodes in a Diagram.

Syntax

C# Copy Code

```
public abstract class NodeEffect : INotifyPropertyChanged, ICloneable
```

Visual Basic Copy Code

```
Public MustInherit Class NodeEffect
    Implements INotifyPropertyChanged, ICloneable
```

Remarks

Effects can be applied by adding instances of the concrete effect classes to the NodeEffects collection of the Diagram.

Inheritance Hierarchy

System.Object
MindFusion.Diagramming.NodeEffect
MindFusion.Diagramming.AeroEffect
MindFusion.Diagramming.EmbossEffect
MindFusion.Diagramming.GlassEffect

Initializes a new instance of the NodeEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeEventArgs (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public New ( _
    node As DiagramNode _
)
```

Parameters

node
The DiagramNode related to the event.

NodeEventArgs Constructor (DiagramNode, MouseButton, Point)

Initializes a new instance of the NodeEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeEventArgs (
    DiagramNode node,
```

```
    MouseButton mouseButton,
    Point mousePosition
)
```

Visual Basic Copy Code

```
Public New ( _
    node As DiagramNode, _
    mouseButton As MouseButton, _
    mousePosition As Point _
)
```

Parameters

node
The DiagramNode related to the event.

mouseButton
The mouse button related to the event.

mousePosition
The position of the mouse cursor, in document coordinates.

NodeEventArgs Constructor (DiagramNode, Point, AdjustmentHandles)

Initializes a new instance of the NodeEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeEventArgs (
    DiagramNode node,
    Point mousePosition,
    AdjustmentHandles adjustmentHandle
)
```

Visual Basic Copy Code

```
Public New ( _
    node As DiagramNode, _
    mousePosition As Point, _
    adjustmentHandle As AdjustmentHandles _
)
```

Parameters

node
The DiagramNode related to the event.

mousePosition
The position of the mouse cursor, in document coordinates.

adjustmentHandle
The zero-based index of the adjustment handle related to the event.

NodeEventArgs Properties

NodeEventArgs.AdjustmentHandle Property

Gets or sets the adjustment handle being moved by the user.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AdjustmentHandles AdjustmentHandle { get; set; }
```

Visual Basic Copy Code

```
Public Property AdjustmentHandle As AdjustmentHandles
```

Property Value

A member of the AdjustmentHandles enumeration specifying what handle has been used.

NodeHandleType Enumeration

Identifies the types of selection handles of a node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum NodeHandleType
```

Visual Basic Copy Code

```
Public Enum NodeHandleType
```

Members

	Member name	Description
	ResizeTopLeft	A top-left handle that can be used to resize the node.
	ResizeTopRight	A top-right handle that can be used to resize the node.
	ResizeBottomRight	A bottom-right handle that can be used to resize the node.
	ResizeBottomLeft	A bottom-left handle that can be used to resize the node.
	ResizeTopCenter	A top-center handle that can be used to resize the node vertically.
	ResizeMiddleRight	A middle-right handle that can be used to resize the node horizontally.
	ResizeBottomCenter	A bottom-center handle that can be used to resize the node vertically.
	ResizeMiddleLeft	A middle-left handle that can be used to resize the node horizontally.
	Move	A central selection handle that can be used to move the node.
	Rotate	A rotation handle that can be used to rotate the node.

MindFusion.Diagramming Namespace

NodeLabel Class

Represents a supplementary label displayed by a DiagramNode. New labels can be added to a node by calling its AddLabel method.

Syntax

C# Copy Code

```
public class NodeLabel : ItemLabel
```

Visual Basic

```
Public Class NodeLabel
    Inherits ItemLabel
```

Remarks

The position of a label is determined by where it is pinned relative to node's bounding box, and offset from the pin point, as set using SetCornerPosition, SetEdgePosition and SetCenterPosition methods. In addition, the HorizontalAlign and VerticalAlign properties specify whether the label is centered on its pin point or aligned to it.

You can let users arrange labels manually by setting the **Behavior** property of **DiagramView** to MoveLabels.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.ItemLabel
    MindFusion.Diagramming.NodeLabel

NodeLabel Members

Represents a supplementary label displayed by a DiagramNode. New labels can be added to a node by calling its AddLabel method.

The following tables list the members exposed by the NodeLabel type.

Public Constructors

	Name	Description
	NodeLabel	Overloaded.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to draw the label's background. (Inherited from ItemLabel.)
	ContentPadding	Gets or sets the distance between image and text when both are specified. (Inherited from ItemLabel.)
	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled. (Inherited from ItemLabel.)
	EnableWrap	Gets or sets a value indicating whether the label's text can be wrapped. (Inherited from ItemLabel.)
	Font	Gets or sets the label's font. (Inherited from ItemLabel.)
	HorizontalAlign	Gets or sets the label's horizontal alignment. (Inherited from ItemLabel.)
	HorizontalOffset	Gets or sets the label's horizontal offset from its pin point. (Inherited from ItemLabel.)
	Image	Gets or sets the image displayed by this label. (Inherited from ItemLabel.)
	ImageAlign	Gets or sets the alignment of label's image relative to text. (Inherited from ItemLabel.)
	ImageSize	Gets or sets a size that overrides the native image size. (Inherited from ItemLabel.)
	ImageUrl	Gets or sets URL of the image to display inside this label. (Inherited from ItemLabel.)

	Index	Gets or sets the index of an edge or point this label is relative to. (Inherited from ItemLabel.)
	Item	Gets or sets the DiagramItem that displays this label. (Inherited from ItemLabel.)
	Locked	Gets or sets a value indicating whether users are allowed to edit this label. (Inherited from ItemLabel.)
	Margin	Gets or sets the label's margin. (Inherited from ItemLabel.)
	MaxWidth	Gets or sets the maximum width of the label. (Inherited from ItemLabel.)
	Node	Gets or sets the **DiagramNode** that displays this label.
	RelativeTo	Gets or sets the label's relative positioning.
	Text	Gets or sets the label's text. (Inherited from ItemLabel.)
	TextBrush	Gets or sets the brush used to draw the label's text. (Inherited from ItemLabel.)
	VerticalAlign	Gets or sets the label's vertical alignment. (Inherited from ItemLabel.)
	VerticalOffset	Gets or sets the label's vertical offset from its pin point. (Inherited from ItemLabel.)

Public Methods

	Name	Description
	Cancel	Called when drag operation is canceled. (Inherited from ItemLabel.)
	Clone	Creates a clone of this label.
	Draw	Draws the label on the specified IGraphics surface. (Inherited from ItemLabel.)
	GetEditRect	InplaceEditable.GetEditRect implementation. (Inherited from ItemLabel.)
	GetTextToEdit	InplaceEditable.GetTextToEdit implementation. (Inherited from ItemLabel.)
	LoadFromXml	Loads the label from the specified XML element.
	OnMouseDown	Called when the left mouse button is pressed while the pointer is over this label. (Inherited from ItemLabel.)
	OnMouseMove	Called when the mouse is moved while this label tracks the mouse events. (Inherited from ItemLabel.)
	OnMouseUp	Called when the left mouse button is released while this label tracks the mouse events. (Inherited from ItemLabel.)
	SaveToXml	Saves the label into the specified XML element.
	SetCenterPosition	Positions this label relatively to the node center.
	SetCornerPosition	Positions this label relatively to the specified corner point.
	SetEdgePosition	Positions this label relatively to the specified node edge.
	SetEditedText	InplaceEditable.SetEditedText implementation. (Inherited from ItemLabel.)
	SetMouseCursor	Indicates what cursor to display for interactive labels. (Inherited from ItemLabel.)
	UpdateValue	Called while drag operation is in progress. (Inherited from ItemLabel.)

Protected Methods

	Name	Description

	LoadFromJson	Loads the label from a JsonObject.
	SaveToJson	Saves the label into a **JsonObject**.

NodeLabel Constructor (DiagramNode)

Initializes a new instance of the NodeLabel class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeLabel (
    DiagramNode node
```

```
)
```

Visual Basic Copy Code

```
Public New ( _
    node As DiagramNode _
)
```

Parameters

node
The DiagramNode that displays the label.

See Also

NodeLabel Constructor Overload List
NodeLabel Class
MindFusion.Diagramming Namespace

NodeLabel Constructor (DiagramNode, String)

Initializes a new instance of the NodeLabel class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeLabel (
    DiagramNode node,
    string text
)
```

Visual Basic Copy Code

```
Public New ( _
    node As DiagramNode, _
    text As String _
)
```

Parameters

node
The DiagramNode that displays the label.

text
The label's text.

NodeLabel Methods

NodeLabel.Clone Method

Creates a clone of this label.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeLabel Clone ()
```

Visual Basic Copy Code

```
Public Function Clone () As NodeLabel
```

Return Value

A new NodeLabel instance that is an exact copy of this label.

See Also

NodeLabel Members

MindFusion.Diagramming Namespace

NodeLabel.LoadFromJson Method

Loads the label from a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the label's data.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

NodeLabel Members
NodeLabel Class
MindFusion.Diagramming Namespace

NodeLabel.LoadFromXml Method

Loads the label from the specified XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Public Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** instance.

context
An XmlPersistContext instance.

See Also

NodeLabel Members
NodeLabel Class
MindFusion.Diagramming Namespace

NodeLabel.SaveToJson Method

Saves the label into a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject the label's data should be stored into.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

NodeLabel Members
NodeLabel Class
MindFusion.Diagramming Namespace

NodeLabel.SaveToXml Method

Saves the label into the specified XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Public Overrides Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** instance.

context
An XmlPersistContext instance.

See Also

NodeLabel Members
NodeLabel Class
MindFusion.Diagramming Namespace

NodeLabel.SetCenterPosition Method

Positions this label relatively to the node center.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetCenterPosition (
    double dx,
    double dy
)
```

Visual Basic Copy Code

```
Public Sub SetCenterPosition( _
    dx As Double, _
    dy As Double _
)
```

Parameters

dx
Horizontal offset from the center point.

dy
Vertical offset from the center point.

Remarks

This method sets the node's center as label's pin point and assigns specified offsets to HorizontalOffset and VerticalOffset properties.

See Also

NodeLabel Members
NodeLabel Class
MindFusion.Diagramming Namespace

NodeLabel.SetCornerPosition Method

Positions this label relatively to the specified corner point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetCornerPosition (
    int cornerPoint,
    double dx,
    double dy
)
```

Visual Basic Copy Code

```
Public Sub SetCornerPosition( _
    cornerPoint As Integer, _
    dx As Double, _
    dy As Double _
)
```

Parameters

cornerPoint
The corner point index.

dx
Horizontal offset from the point.

dy
Vertical offset from the point.

Remarks

This method sets node's corner as label's pin point and assigns specified offsets to HorizontalOffset and VerticalOffset properties. The *cornerPoint* index starts counting from top-left corner in clockwise direction:

- 0 desigates top-left corner;
- 1 desigates top-right corner;
- 2 desigates bottom-right corner;
- 3 desigates bottom-left corner;

See Also

NodeLabel Members
NodeLabel Class
MindFusion.Diagramming Namespace

NodeLabel.SetEdgePosition Method

Positions this label relatively to the specified node edge.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetEdgePosition (
    int edge,
    double dx,
    double dy
)
```

Visual Basic Copy Code

```
Public Sub SetEdgePosition( _
    edge As Integer, _
    dx As Double, _
    dy As Double _
)
```

Parameters

edge
The edge index.

dx
Horizontal offset from the edge center.

dy
Vertical offset from the edge center.

Remarks

This method sets the middle point of node's edge as label's pin point and assigns specified offsets to HorizontalOffset and VerticalOffset properties. The edge index starts counting from top side in clockwise direction:

- 0 desigates center of top edge;
- 1 desigates center of right edge;
- 2 desigates center of bottom edge;
- 3 desigates center of left edge;

NodeValidationEventArgs Members

Contains the arguments passed to handlers of node validation events.

The following tables list the members exposed by the NodeValidationEventArgs type.

Public Constructors

	Name	Description
	NodeValidationEventArgs	Overloaded. Initializes a new instance of the **NodeValidationEventArgs** class.

Public Properties

	Name	Description
	AdjustmentHandle	Gets or sets the adjustment handle being moved by the user. (Inherited from NodeEventArgs.)
	Cancel	Gets or sets a value indicating whether to cancel the current operation.
	Label	Gets or sets a NodeLabel related to this event.
	MouseButton	Gets which mouse button has been pressed. (Inherited from NodeEventArgs.)
	MousePosition	Gets or sets the current mouse pointer position. (Inherited from NodeEventArgs.)
	Node	Gets the node for which the event was raised. (Inherited from NodeEventArgs.)
	OverrideBounds	Gets or sets a rectangle that should be assigned to the **Bounds** property of nodes after NodeModifying event is raised.
	SelectionRectangle	Gets the current selection rectangle.

Public Methods

	Name	Description
	CancelDrag	Cancels the creation or modification of the node.
	ShouldCancelDrag	Gets whether the interaction should cancel immediately.

```
public NodeValidationEventArgs (
    DiagramNode node,
    Point mousePosition,
    AdjustmentHandles adjustmentHandle
)
```

Visual Basic Copy Code

```
Public New ( _
    node As DiagramNode, _
    mousePosition As Point, _
    adjustmentHandle As AdjustmentHandles _
)
```

Parameters

node
The DiagramNode related to the event.

mousePosition
The position of the mouse cursor, in document coordinates.

adjustmentHandle
The zero-based index of the adjustment handle related to the event.

NodeValidationEventArgs Class
MindFusion.Diagramming Namespace

NodeValidationEventArgs Constructor (DiagramNode, Rect)

Initializes a new instance of the NodeValidationEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeValidationEventArgs (
    DiagramNode node,
    Rect selectionRectangle
)
```

Visual Basic Copy Code

```
Public New ( _
    node As DiagramNode, _
    selectionRectangle As Rect _
)
```

Parameters

node
The DiagramNode related to the event.

selectionRectangle
A **Microsoft.Maui.Graphics.Rect** representing the selection rectangle.

NodeValidationEventArgs Constructor Overload List
NodeValidationEventArgs Class
MindFusion.Diagramming Namespace

NodeValidationEventArgs Methods

NodeValidationEventArgs.CancelDrag Method

Cancels the creation or modification of the node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void CancelDrag ()
```

Visual Basic Copy Code

```
Public Sub CancelDrag ()
```

Remarks

Calling this method immediately stops the operation. On the other hand, setting Cancel to **true** only changes the mouse cursor to a Stop icon and the operation is cancelled when the user releases the mouse button.

NodeValidationEventArgs Members
NodeValidationEventArgs Class
MindFusion.Diagramming Namespace

NodeValidationEventArgs.ShouldCancelDrag Method

Gets whether the interaction should cancel immediately.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ShouldCancelDrag ()
```

Visual Basic Copy Code

```
Public Function ShouldCancelDrag () As Boolean
```

Return Value

true to cancel, or false otherwise.

See Also

NodeValidationEventArgs Members
NodeValidationEventArgs Class
MindFusion.Diagramming Namespace

NodeValidationEventArgs Properties

NodeValidationEventArgs.Cancel Property

Gets or sets a value indicating whether to cancel the current operation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Cancel { get; set; }
```

Visual Basic Copy Code

```
Public Property Cancel As Boolean
```

Property Value

true to cancel the operation; **false** to approve it.

Remarks

Set this property to **true** to prevent the user from completing the operation.

See Also

NodeValidationEventArgs.Label Property

Gets or sets a NodeLabel related to this event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeLabel Label { get; set; }
```

Visual Basic Copy Code

```
Public Property Label As NodeLabel
```

Property Value

A NodeLabel instance.

Remarks

This property is set when events are raised for supplementary node labels, e.g. NodeTextEditing firing when user tries to edit a label.

MindFusion.Diagramming Namespace
DiagramNode.AddLabel Method

NodeValidationEventArgs.OverrideBounds Property

Gets or sets a rectangle that should be assigned to the **Bounds** property of nodes after NodeModifying event is raised.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect OverrideBounds { get; set; }
```

Visual Basic Copy Code

```
Public Property OverrideBounds As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** instance. The default value is **Empty**, signifying that the control should apply standard interaction logic when calculating new coordinates.

See Also

NodeValidationEventArgs.SelectionRectangle Property

Gets the current selection rectangle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect SelectionRectangle { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property SelectionRectangle As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** representing the selection rectangle.

NotifyCollectionChangedAction Enumeration

Describes the action that caused a CollectionChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum NotifyCollectionChangedAction
```

Visual Basic Copy Code

```
Public Enum NotifyCollectionChangedAction
```

Members

	Member name	Description
	Add	One or more items were added to the collection.
	Remove	One or more items were removed from the collection.
	Replace	One or more items were replaced in the collection.
	Reset	The content of the collection changed dramatically.

NotifyCollectionChangedEventArgs(T).NewItems Property

Gets the list of new items involved in the change.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public T[] NewItems { get; set; }
```

Visual Basic Copy Code

```
Public Property NewItems As T()
```

Property Value

A list with the new items added to the collection. This can be **null** (**Nothing** in Visual Basic).

NotifyCollectionChangedEventArgs(T).OldItems Property

Gets the list of items affected by a Replace, **Remove**, or **Reset** action.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public T[] OldItems { get; set; }
```

Visual Basic Copy Code

```
Public Property OldItems As T()
```

Property Value

A list with the items removed from the collection. This can be **null** (**Nothing** in Visual Basic).

ObservableCollection(T) Members

Represents a dynamic data collection that provides notifications when items get added, removed, or when the whole list is refreshed.

The following tables list the members exposed by the ObservableCollection(T) type.

Public Constructors

	Name	Description
	ObservableCollection	Overloaded. Initializes a new instance of the **ObservableCollection<T>** class.

Public Methods

	Name	Description
	AddRange	Adds the specified objects to the end of the collection.

Protected Methods

	Name	Description
	ClearItems	**Collection<T>.ClearItems** override.
	InsertItem	**Collection<T>.InsertItem** override.
	OnCollectionChanged	Raises the CollectionChanged event.
	RemoveItem	**Collection<T>.RemoveItem** override.
	SetItem	**Collection<T>.SetItem** override.

Public Events

	Name	Description
	CollectionChanged	Occurs when an item is added, removed, changed, moved, or the entire list is refreshed.

ObservableCollection(T) Constructor (ICollection(T))

Initializes a new instance of the ObservableCollection<T> class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ObservableCollection<T> (
    ICollection<T> items
)
```

Visual Basic Copy Code

```
Public New (Of T) ( _
    items As ICollection(Of T) _
)
```

Parameters

items
The initial contents of the collection.

See Also

Syntax

C#

```
protected override void InsertItem (
    int index,
    T item
)
```

Visual Basic

```
Protected Overrides Sub InsertItem( _
    index As Integer, _
    item As T _
)
```

Parameters

index
The zero-based index at which item should be inserted.

item
The object to insert. The value can be **null** (**Nothing** in Visual Basic) for reference types.

ObservableCollection(T).SetItem Method

Collection<T>.SetItem override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SetItem (
    int index,
    T item
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SetItem( _
    index As Integer, _
    item As T _
)
```

Parameters

index
The zero-based index of the element to replace.

item
The new value for the element at the specified index. The value can be **null** (**Nothing** in Visual Basic) for reference types.

ObservableCollection(T) Members
ObservableCollection(T) Class
MindFusion.Diagramming Namespace

ObservableCollection(T) Events

ObservableCollection(T).CollectionChanged Event

Occurs when an item is added, removed, changed, moved, or the entire list is refreshed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NotifyCollectionChangedEventArgs<T>> CollectionChanged
```

Visual Basic Copy Code

```
Public Event CollectionChanged As EventHandler(Of NotifyCollectionChangedEventArgs(Of T))
```

Event Data

CollectionChanged event handlers receive an argument of type NotifyCollectionChangedEventArgs<T>.

Orientation Enumeration

Defines values that specify the orientation of the first segment of cascading links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum Orientation
```

Visual Basic Copy Code

```
Public Enum Orientation
```

Members

	Member name	Description
	Auto	MvcDiagram determines automatically the initial direction of link's first segment.
	Horizontal	The first segment of the link is always horizontal.
	Vertical	The first segment of the link is always vertical.

See Also

MindFusion.Diagramming Namespace
CascadeOrientation Property

PagedContainerNode Class

A container that can arrange its children in pages.

Syntax

C# Copy Code

```
public class PagedContainerNode : ContainerNode,
     InplaceEditableList
```

Visual Basic Copy Code

```
Public Class PagedContainerNode
    Inherits ContainerNode
    Implements InplaceEditableList
```

Remarks

PagedContainerNode is a ContainerNode subclass that organizes its child nodes into a collection of pages, represented by ContainerPage objects. This allows for the creation of more orgainzed diagrams where nodes can be grouped into logical views within a single container. Only the nodes belonging to the currently active page, specified by CurrentPage property, are rendered and participate in user interactions.

Navigation between pages is handled by scroll arrows in the caption bar, allowing users to cycle through the pages sequentially. For faster access, users can also double-click the container's caption to open an in-place combo box listing available page titles,

enabling direct navigation to any page. The node's Caption automatically displays the Title of newly activated **ContainerPage**.

The appearance of pager arrows can be fully customized by implementing a PageIconRenderer and assigning it to the static PageIconRenderer property of **Renderers**, allowing for custom drawing logic, images, or SVG icons.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.DiagramItem
    MindFusion.Diagramming.DiagramNode
      MindFusion.Diagramming.ContainerNode
        MindFusion.Diagramming.PagedContainerNode

PagedContainerNode Members

A container that can arrange its children in pages.

The following tables list the members exposed by the PagedContainerNode type.

Public Constructors

	Name	Description
	PagedContainerNode	Overloaded.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowAddChildren	Gets or sets a value indicating whether child nodes can be added interactively to this container. (Inherited from ContainerNode.)
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AllowRemoveChildren	Gets or sets a value indicating whether child nodes can be removed interactively from this container. (Inherited from ContainerNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	AutoDeleteChildren	Gets or sets whether deleting this container should also remove its child items from the diagram. (Inherited from ContainerNode.)
	AutoGrow	Gets or sets a value indicating whether the container should grow in size when nodes are added to it. (Inherited from ContainerNode.)
	AutoShrink	Gets or sets a value indicating whether the container should shrink in size when nodes are removed from it. (Inherited from ContainerNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)

	Caption	Gets or sets the text displayed as caption of the table. (Inherited from ContainerNode.)
	CaptionBackBrush	Gets or sets the brush used to paint the caption bar of this container. (Inherited from ContainerNode.)
	CaptionBrush	Gets or sets the brush used to paint the container caption. (Inherited from ContainerNode.)
	CaptionFormat	Gets or sets the caption alignment and format. (Inherited from ContainerNode.)
	CaptionHeight	Gets or sets the height of the container's caption bar. (Inherited from ContainerNode.)
	Children	Gets the child nodes of this container. (Inherited from ContainerNode.)
	ClipChildren	Gets or sets a value indicating whether child items should be clipped by container boundaries. (Inherited from ContainerNode.)
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent **ContainerNode** containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	CurrentPage	Gets or sets the current page.
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveCaptionBackBrush	Gets the effective caption back brush of the container. (Inherited from ContainerNode.)
	EffectiveCaptionBrush	Gets the effective caption brush of the container. (Inherited from ContainerNode.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled. (Inherited from ContainerNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Foldable	Gets or sets a value indicating whether the user is allowed to fold this container. (Inherited from ContainerNode.)
	Folded	Gets or sets a value indicating whether this container is folded. (Inherited from ContainerNode.)
	FoldedSize	Gets or sets the size of the container when folded. (Inherited from ContainerNode.)
	FoldIconSize	Gets or sets the size of the fold/unfold icon. (Inherited from ContainerNode.)

	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HighlightPen	Gets or sets the pen used to draw the container frame lines when an item is dragged over the container. (Inherited from ContainerNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	Margin	Gets or sets how much space should be left between contained nodes and the container borders. (Inherited from ContainerNode.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	MinimumSize	Gets or sets the minimum size of the container. (Inherited from ContainerNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Pages	Gets the pages of this container.
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Scrollable	Gets or sets a value indicating whether users are allowed to scroll the contents of this container. (Inherited from ContainerNode.)

	ScrollX	Gets or sets the container's horizontal scroll position. (Inherited from ContainerNode.)
	ScrollY	Gets or sets the container's vertical scroll position. (Inherited from ContainerNode.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Shape	Gets or sets the shape of the container's outline. (Inherited from ContainerNode.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	UnfoldedSize	Returns the original size of a folded container. (Inherited from ContainerNode.)
	Visible	Gets or sets a value indicating whether the container is visible. (Inherited from ContainerNode.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description

	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	Add	Adds a node to this container. (Inherited from ContainerNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	AddPage	Adds a page to the container.
	Animate	Animates the item. (Inherited from DiagramItem.)
	Arrange	Arranges the container's children with the given layout. (Inherited from ContainerNode.)
	ArrangeAnimated	Arranges the container's children using the given layout, and animates items moving to their new positions. (Inherited from ContainerNode.)
	ArrangeAsync	Arranges the container's children with the given layout asynchronously. (Inherited from ContainerNode.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	Clone	Creates a copy of this item.
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	ContainsRecursively	Determines whether this container contains the specified node, either directly or recursively through other containers. (Inherited from ContainerNode.)
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramNode.Draw override. Draws the container on the specified IGraphics surface. (Inherited from ContainerNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	DiagramNode.DrawLocal override. Draws the container on the specified IGraphics surface. (Inherited from ContainerNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified **IGraphics** surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)

	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
S	GetContainer	Retrieves the container node (if any) the specified node belongs to. (Inherited from ContainerNode.)
	GetCurrentItem	Implements InplaceEditableList.GetCurrentItem.
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectiveCaptionBackBrush	Returns a Brush object representing the currently effective caption background of the container. (Inherited from ContainerNode.)
	GetEffectiveCaptionBrush	Returns a Brush object representing the currently effective caption brush of the container. (Inherited from ContainerNode.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetListItems	Implements InplaceEditableList.GetListItems.
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramNode.GetRepaintRect override. (Inherited from ContainerNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	DiagramItem.HitTest override. (Inherited from ContainerNode.)
	HitTestHandle	DiagramNode.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from ContainerNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	InsertPage	Inserts a page at the specified index.
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	MovePage	Moves a page to a new position in the page list.

	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from ContainerNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from ContainerNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from ContainerNode.)
	OnLoad	DiagramItem.OnLoad override. (Inherited from ContainerNode.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	Remove	Removes a node from this container. (Inherited from ContainerNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	RemovePage	Removes a page from the container.
	Resize	Resizes the node. (Inherited from DiagramNode.)
	ResizeToFitChildren	Resizes the container making it big enough to contain its child nodes. (Inherited from ContainerNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetCurrentItem	Implements InplaceEditableList.SetCurrentItem.
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	UpdateBounds	Overloaded. (Inherited from ContainerNode.)
	VisitNodes	Visits the diagram nodes in reverse Z order. (Inherited from ContainerNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from ContainerNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the item content from a JsonObject.
	LoadFromXml	Loads the item content from an XML element.
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from ContainerNode.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramNode.OnRemove override. (Inherited from ContainerNode.)

	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramNode.RestoreProperties override. (Inherited from ContainerNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramNode.SaveProperties override. (Inherited from ContainerNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the item content into a **JsonObject**.
	SaveToXml	Saves the item content into an XML element.
	ScaleElements	DiagramNode.ScaleElements override. (Inherited from ContainerNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)

	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

PagedContainerNode Constructor

Overload List

Name	Description
PagedContainerNode ()	Initializes a new instance of the PagedContainerNode class.
PagedContainerNode (Diagram)	Initializes a new instance of the **PagedContainerNode** class.
PagedContainerNode (Diagram, IEnumerable(String))	Initializes a new instance of the **PagedContainerNode** class with the specified page titles.
PagedContainerNode (PagedContainerNode)	Initializes a new instance of the **PagedContainerNode** class using the specified node as a prototype.

PagedContainerNode Constructor ()

Initializes a new instance of the PagedContainerNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PagedContainerNode ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

PagedContainerNode Constructor Overload List
PagedContainerNode Class
MindFusion.Diagramming Namespace

PagedContainerNode Constructor (Diagram)

Initializes a new instance of the PagedContainerNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PagedContainerNode (
    Diagram parent
)
```

Visual Basic Copy Code

```
Public New ( _
    parent As Diagram _
)
```

Parameters

parent
The parent Diagram instance.

See Also

PagedContainerNode Constructor Overload List
PagedContainerNode Class
MindFusion.Diagramming Namespace

PagedContainerNode Constructor (Diagram, IEnumerable(String))

Initializes a new instance of the PagedContainerNode class with the specified page titles.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PagedContainerNode (
    Diagram parent,
    IEnumerable<string> pageTitles
)
```

Visual Basic Copy Code

```
Public New ( _
    parent As Diagram, _
    pageTitles As IEnumerable(Of String) _
)
```

Parameters

parent
The parent Diagram instance.

pageTitles
A list of titles for the initial pages.

PagedContainerNode Constructor (PagedContainerNode)

Initializes a new instance of the PagedContainerNode class using the specified node as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PagedContainerNode (
    PagedContainerNode prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As PagedContainerNode _
)
```

Parameters

prototype
The prototype to copy.

PagedContainerNode Methods

PagedContainerNode.AddPage Method

Adds a page to the container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void AddPage (
    ContainerPage page
)
```

Visual Basic Copy Code

```
Public Sub AddPage( _
    page As ContainerPage _
)
```

Parameters

page
The page to add.

Remarks

Container's current pages are accessible via Pages collection.

RemovePage Method

PagedContainerNode.Clone Method

Creates a copy of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override DiagramItem Clone (
    bool clipboard
)
```

Visual Basic Copy Code

```
Public Overrides Function Clone( _
    clipboard As Boolean _
) As DiagramItem
```

Parameters

clipboard

Return Value

PagedContainerNode.InsertPage Method

Inserts a page at the specified index.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void InsertPage (
    int index,
    ContainerPage page
)
```

Visual Basic Copy Code

```
Public Sub InsertPage( _
    index As Integer, _
    page As ContainerPage _
)
```

Parameters

index
The zero-based index at which the page should be inserted.

page
The page to insert.

Remarks

Container's current pages are accessible via Pages collection.

PagedContainerNode.LoadFromJson Method

Loads the item content from a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

context

PagedContainerNode.LoadFromXml Method

Loads the item content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

context

PagedContainerNode.MovePage Method

Moves a page to a new position in the page list.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void MovePage (
    int newIndex,
    ContainerPage page
)
```

Visual Basic Copy Code

```
Public Sub MovePage( _
    newIndex As Integer, _
    page As ContainerPage _
)
```

Parameters

newIndex
The new index of the page.

page
The page to move.

PagedContainerNode.RemovePage Method

Removes a page from the container.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RemovePage (
    ContainerPage page
)
```

Visual Basic Copy Code

```
Public Sub RemovePage( _
    page As ContainerPage _
)
```

Parameters

page
The page to remove.

Remarks

Container's current pages are accessible via Pages collection.

PagedContainerNode Properties

PagedContainerNode.CurrentPage Property

Gets or sets the current page.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ContainerPage CurrentPage { get; set; }
```

Visual Basic Copy Code

```
Public Property CurrentPage As ContainerPage
```

Property Value

A ContainerPage reference.

Remarks

PagedContainerNode displays only child items associated with this page. Users can change the current page by clicking on arrow icons in the caption bar.

PageIconRenderer Class
MindFusion.Diagramming Namespace

PageIconRenderer Constructor (IImage, IImage)

Initializes a new instance of the PageIconRenderer class that renders scroll arrow icons provided as bitmaps.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PageIconRenderer (
    IImage scrollLeftIcon,
    IImage scrollRightIcon
)
```

Visual Basic Copy Code

```
Public New ( _
    scrollLeftIcon As IImage, _
    scrollRightIcon As IImage _
)
```

Parameters

scrollLeftIcon
A **Microsoft.Maui.Graphics.IImage** representing the scroll-left icon.

scrollRightIcon
A **Microsoft.Maui.Graphics.IImage** representing the scroll-right icon.

See Also

PageIconRenderer Constructor (IImage, IImage, IImage, IImage)

Initializes a new instance of the PageIconRenderer class that renders scroll arrow icons provided as bitmaps.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PageIconRenderer (
    IImage scrollLeftIcon,
    IImage scrollRightIcon,
    IImage disabledScrollLeftIcon,
    IImage disabledScrollRightIcon
)
```

Visual Basic Copy Code

```
Public New ( _
    scrollLeftIcon As IImage, _
    scrollRightIcon As IImage, _
    disabledScrollLeftIcon As IImage, _
    disabledScrollRightIcon As IImage _
)
```

Parameters

scrollLeftIcon
A **Microsoft.Maui.Graphics.IImage** representing the scroll-left icon.

scrollRightIcon
A **Microsoft.Maui.Graphics.IImage** representing the scroll-right icon.

disabledScrollLeftIcon
A **Microsoft.Maui.Graphics.IImage** representing disabled scroll-left icon.

disabledScrollRightIcon
A **Microsoft.Maui.Graphics.IImage** representing disabled scroll-right icon.

PageIconRenderer Constructor (SvgContent, SvgContent)

Initializes a new instance of the PageIconRenderer class that renders collapse / expand icons provided as SVG drawings.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PageIconRenderer (
    SvgContent scrollLeftIcon,
    SvgContent scrollRightIcon
)
```

Visual Basic Copy Code

```
Public New ( _
    scrollLeftIcon As SvgContent, _
    scrollRightIcon As SvgContent _
)
```

Parameters

scrollLeftIcon

An SvgContent representing the scroll-left icon.

scrollRightIcon

An SvgContent representing the scroll-right icon.

PageIconRenderer Constructor (SvgContent, SvgContent, SvgContent, SvgContent)

Initializes a new instance of the PageIconRenderer class that renders collapse / expand icons provided as SVG drawings.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PageIconRenderer (
    SvgContent scrollLeftIcon,
    SvgContent scrollRightIcon,
    SvgContent disabledScrollLeftIcon,
    SvgContent disabledScrollRightIcon
)
```

Visual Basic Copy Code

```
Public New ( _
    scrollLeftIcon As SvgContent, _
    scrollRightIcon As SvgContent, _
    disabledScrollLeftIcon As SvgContent, _
    disabledScrollRightIcon As SvgContent _
)
```

Parameters

scrollLeftIcon
An SvgContent representing the scroll-left icon.

scrollRightIcon
An SvgContent representing the scroll-right icon.

disabledScrollLeftIcon
An SvgContent representing disabled scroll-left icon.

disabledScrollRightIcon
An SvgContent representing disabled scroll-right icon.

Path Members

Represents a sequence of connected DiagramNode and DiagramLink elements.

The following tables list the members exposed by the Path type.

Public Properties

	Name	Description
	Items	Gets a collection of all DiagramNode and DiagramLink elements in the path.
	Length	Gets the length of the **Path** expressed as the number of Links participating in it.
	Links	Gets a collection of all DiagramLink elements participating in the path.
	Nodes	Gets a collection of all DiagramNode elements participating in the path.

Public Methods

	Name	Description
	GetWeight	Calculates the weight of this **Path** by accumulating the Weight of all participating Diagram elements.

See Also

Path Class

Path Methods

Path.GetWeight Method

Calculates the weight of this Path by accumulating the Weight of all participating Diagram elements.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public float GetWeight (
    bool incNodes,
    bool incLinks
)
```

Visual Basic Copy Code

```
Public Function GetWeight( _
    incNodes As Boolean, _
    incLinks As Boolean _
) As Single
```

Parameters

incNodes
A boolean value, which specifies whether the Weight of DiagramNode elements should be considered.

incLinks
A boolean value, which specifies whether the **Weight** of DiagramLink elements should be considered.

Return Value

A float value that represents the total weight of the elements in this Path according to the *incNodes* and *incLinks* parameters.

Syntax

C# Copy Code

```
public DiagramItemCollection Items { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Items As DiagramItemCollection
```

Property Value

An instance of the DiagramItemCollection class.

Remarks

The collection contains consecutive DiagramNode and DiagramLink objects.

See Also

Path Members
Path Class
MindFusion.Diagramming Namespace

Path.Length Property

Gets the length of the Path expressed as the number of Links participating in it.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Length { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Length As Integer
```

Property Value

An integer value that represents the number of edges (links) in the path.

See Also

Path Members
Path Class
MindFusion.Diagramming Namespace

Path.Links Property

Gets a collection of all DiagramLink elements participating in the path.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLinkCollection Links { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Links As DiagramLinkCollection
```

Property Value

An instance of the DiagramLinkCollection class.

Remarks

Use Nodes to get all DiagramNode elements in the Path.

See Also

Path Members
Path Class

Path.Nodes Property

Gets a collection of all DiagramNode elements participating in the path.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNodeCollection Nodes { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Nodes As DiagramNodeCollection
```

Property Value

An instance of the DiagramNodeCollection class.

Remarks

Use Links to get all DiagramLinks elements in the Path.

PathCollection Members

Represents a strongly typed collection of Path objects.

The following tables list the members exposed by the PathCollection type.

Public Constructors

	Name	Description
	PathCollection	Initializes a new instance of the **PathCollection** class.

Public Properties

	Name	Description
	Item	Gets or sets the Path at the specified position.

Public Methods

	Name	Description
	Add	Adds the specified Path to the collection.
	Clear	Removes all Path elements from the **PathCollection**.
	GetAt	Gets the Path at the specified position.
	Insert	Inserts the specified Path to the **PathCollection** at the specified index.
	Remove	Removes the specified Path element from the **PathCollection**.

PathCollection Class
MindFusion.Diagramming Namespace

PathCollection Constructor

Initializes a new instance of the PathCollection class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PathCollection ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

PathCollection Class
MindFusion.Diagramming Namespace

PathCollection Methods

PathCollection.Add Method

Adds the specified Path to the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

Copy Code

```
public void Add (
    Path path
)
```

Visual Basic Copy Code

```
Public Sub Add( _
    path As Path _
)
```

Parameters

path

The Path object to add.

Remarks

The Path object is added at the end of the PathCollection. Use Insert to specify the place of the new element.

See Also

PathCollection Members
PathCollection Class
MindFusion.Diagramming Namespace

PathCollection.Clear Method

Removes all Path elements from the PathCollection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public new void Clear ()
```

Visual Basic Copy Code

```
Public Shadows Sub Clear ()
```

Remarks

The method removes all Path elements in the collection. If you want to delete a specific element use Remove.

See Also

PathCollection Members
PathCollection Class
MindFusion.Diagramming Namespace

PathCollection.GetAt Method

Gets the Path at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Path GetAt (
    int index
```

```
)
```

Visual Basic Copy Code

```
Public Function GetAt( _
    index As Integer _
) As Path
```

Parameters

index

The zero-based index of the Path element to get.

Return Value

The **Path** at the specified position in the PathCollection.

See Also

PathCollection Members
PathCollection Class
MindFusion.Diagramming Namespace

PathCollection.Insert Method

Inserts the specified Path to the PathCollection at the specified index.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Insert (
    int index,
    Path path
)
```

Visual Basic Copy Code

```
Public Sub Insert( _
    index As Integer, _
    path As Path _
)
```

Parameters

index

The zero-based index at which the new Path element should be inserted.

path

The **Path** element to insert.

Remarks

The method inserts a new element at a given position in the PathCollection. Use Add to add a new element to the end of the collection.

See Also

PathCollection Members
PathCollection Class
MindFusion.Diagramming Namespace

PathCollection.Remove Method

Removes the specified Path element from the PathCollection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Remove (
    Path path
)
```

Visual Basic Copy Code

```
Public Sub Remove( _
    path As Path _
)
```

Parameters

path
The Path element to remove.

Remarks

The size of the PathCollection is corrected. Indexes of the elements after *path* are updated too.

See Also

PathCollection Members
PathCollection Class
MindFusion.Diagramming Namespace

PathCollection Properties

PathCollection.Item Property

Gets or sets the Path at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Path Item [
    int index
] { get; set; }
```

Visual Basic Copy Code

```
Public Property Item( _
    index As Integer _
) As Path
```

Parameters

index
The zero-based index of the Path element to access.

Property Value

An instance of the **Path** class that represents the path at the specified position.

See Also

PathFinder Class

Provides methods that help you find paths and cycles in a graph.

Syntax

C# Copy Code

```
public sealed class PathFinder
```

Visual Basic Copy Code

```
Public NotInheritable Class PathFinder
```

Remarks

By default the direction of links is taken into account when looking for paths or cycles. In that case the direction of a path is considered to be the direction defined by the outgoing links of nodes. Use the second constructor override to specify that link direction should be ignored when looking for paths.

A path-finder object caches graph information between method calls in order to achieve better performance when path and cycle -finding methods are called on the same diagram more than once. However if the diagram structure changes, you must create a new **PathFinder** instance in order to use the new structure of the diagram graph.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.PathFinder

PathFinder Members
MindFusion.Diagramming Namespace

PathFinder Members

Provides methods that help you find paths and cycles in a graph.

The following tables list the members exposed by the PathFinder type.

Public Constructors

	Name	Description
	PathFinder	Overloaded. Initializes a new instance of the **PathFinder** class.

Public Methods

	Name	Description
	EnumAllCycles	Enumerates all cycles in the underlying diagram.
	EnumAllPaths	Overloaded.
	FindAllCycles	Finds all cycles in the underlying diagram.
	FindAllPaths	Overloaded.
	FindCycle	Overloaded. Finds a cycle in the underlying diagram.
	FindLongestPath	Overloaded. Finds the longest path in the underlying diagram.

	FindShortestPath	Overloaded. Finds the shortest path in the underlying diagram.

PathFinder Class
MindFusion.Diagramming Namespace

PathFinder Constructor

Initializes a new instance of the PathFinder class.

Overload List

Name	Description
PathFinder (Diagram)	Initializes a new instance of the **PathFinder** class. Path-finding will depend on the direction of links.
PathFinder (Diagram, Boolean)	Initializes a new instance of the PathFinder class, optionally ignoring the link direction.

See Also

PathFinder Class
MindFusion.Diagramming Namespace

PathFinder Constructor (Diagram)

Initializes a new instance of the PathFinder class. Path-finding will depend on the direction of links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PathFinder (
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram _
)
```

Parameters

diagram
An instance of the Diagram class in which to look for paths or cycles.

Remarks

The PathFinder methods look for paths and cycles in the Diagram instance specified through the argument. The diagram is treated as a directed graph and the direction of links is considered when looking for a path, that is, a path continues from a node only through its **OutgoingLinks**.

See Also

PathFinder Constructor Overload List
PathFinder Class
MindFusion.Diagramming Namespace

PathFinder Constructor (Diagram, Boolean)

Initializes a new instance of the PathFinder class, optionally ignoring the link direction.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PathFinder (
    Diagram diagram,
    bool ignoreDirection
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram, _
    ignoreDirection As Boolean _
)
```

Parameters

diagram
A Diagram instance in which to look for paths or cycles.

ignoreDirection
Specifies whether the direction of links should be considered when looking for paths or cycles.

Remarks

The PathFinder methods look for paths and cycles in the Diagram instance specified with the first argument. By default, the diagram is treated as a directed graph and the direction of links is considered when looking for a path, that is, a path continues from a node only through its **OutgoingLinks**.

To ignore the direction of links, pass **true** as a value of the *ignoreDirection* argument; then the path-finding algorithm will look for paths both through the **OutgoingLinks** and **IncomingLinks** collections of nodes. If you do not want to ignore the direction of links you can use the alternative constructor.

See Also

PathFinder Constructor Overload List
PathFinder Class
MindFusion.Diagramming Namespace

PathFinder Methods

PathFinder.EnumAllCycles Method

Enumerates all cycles in the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IEnumerable<Path> EnumAllCycles ()
```

Visual Basic Copy Code

```
Public Function EnumAllCycles () As IEnumerable(Of Path)
```

Return Value

A collection of Path objects; if no cycles are detected, the collection is empty.

Remarks

The **Enum*** methods of PathFinder immediately yield each path once found, as opposed to **Find*** methods which collect them in a list.

MindFusion.Diagramming Namespace

PathFinder.EnumAllPaths Method (DiagramNode, DiagramNode)

Enumerates all paths that exist between two DiagramNode objects.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IEnumerable<Path> EnumAllPaths (
    DiagramNode from,
    DiagramNode to
)
```

Visual Basic Copy Code

```
Public Function EnumAllPaths( _
    from As DiagramNode, _
    to As DiagramNode _
) As IEnumerable(Of Path)
```

Parameters

from
The first DiagramNode in the path.

to
The last **DiagramNode** in the path.

Return Value

A collection of Path objects. If no paths are found, the collection is empty.

Remarks

The returned Path instances include the from and to nodes.

The **Enum*** methods of PathFinder immediately yield each path once found, as opposed to **Find*** methods which collect them in a list.

PathFinder.EnumAllPaths Method (DiagramNode, DiagramNode, Int32)

Enumerates all paths that exist between two DiagramNode objects.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IEnumerable<Path> EnumAllPaths (
    DiagramNode from,
    DiagramNode to,
    int maxPaths
)
```

Visual Basic Copy Code

```
Public Function EnumAllPaths( _
    from As DiagramNode, _
    to As DiagramNode, _
    maxPaths As Integer _
) As IEnumerable(Of Path)
```

Parameters

from
The first DiagramNode in the Path.

to
The last **DiagramNode** in the Path.

maxPaths
The maximum number of paths to find.

Return Value

A collection of Path objects; if no paths are found, the collection is empty.

Remarks

The returned Path instances include the from and to nodes.

The **Enum*** methods of PathFinder immediately yield each path once found, as opposed to **Find*** methods which collect them in a list.

PathFinder.FindAllPaths Method (DiagramNode, DiagramNode)

Finds and returns all paths that exist between two DiagramNode objects.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PathCollection FindAllPaths (
    DiagramNode from,
    DiagramNode to
)
```

Visual Basic Copy Code

```
Public Function FindAllPaths( _
    from As DiagramNode, _
    to As DiagramNode _
) As PathCollection
```

Parameters

from
The first DiagramNode in the Path.

to
The last **DiagramNode** in the **Path**.

Return Value

A collection of **Path** objects; if no paths are found, the collection is empty.

Remarks

The returned Path instances include the *from* an *to* nodes.

EnumAllPaths Method

PathFinder.FindAllPaths Method (DiagramNode, DiagramNode, Int32)

Finds and returns all paths that exist between two DiagramNode objects.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PathCollection FindAllPaths (
    DiagramNode from,
    DiagramNode to,
    int maxPaths
)
```

Visual Basic Copy Code

```
Public Function FindAllPaths( _
    from As DiagramNode, _
    to As DiagramNode, _
    maxPaths As Integer _
) As PathCollection
```

Parameters

from
The first DiagramNode in the Path.

to
The last DiagramNode in the Path.

maxPaths
The maximum number of paths to find.

Return Value

A collection of Path objects; if no paths are found, the collection is empty.

Remarks

The returned Path instances include the from and to nodes.

FindShortestPath Method

PathFinder.FindCycle Method (DiagramNode)

Detects whether the specified DiagramNode participates in a cycle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Path FindCycle (
    DiagramNode participant
)
```

Visual Basic

```
Public Function FindCycle( _
    participant As DiagramNode _
) As Path
```

Parameters

participant
A DiagramNode element which should participate in the found cycle.

Return Value

A Path instance that represents the found cycle; **null** (**Nothing** in Visual Basic) if no cycle is detected.

See Also

FindCycle Method Overload List
PathFinder Members

Finds the longest path in the graph.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public Path FindLongestPath ()
```

Visual Basic

```
Public Function FindLongestPath () As Path
```

Return Value

A Path instance that represents the longest path found; **null** (**Nothing** in Visual Basic) if there are no DiagramNode elements in the graph.

See Also

FindLongestPath Method Overload List
PathFinder Members
PathFinder Class
MindFusion.Diagramming Namespace
FindAllPaths Method

PathFinder.FindLongestPath Method (DiagramNode, DiagramNode)

Finds the longest path between the specified DiagramNode objects.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Path FindLongestPath (
    DiagramNode from,
    DiagramNode to
)
```

Visual Basic Copy Code

```
Public Function FindLongestPath( _
    from As DiagramNode, _
    to As DiagramNode _
) As Path
```

Parameters

from
The first DiagramNode element in the Path.

to
The last **DiagramNode** element in the **Path**.

Return Value

A **Path** instance that represents the longest path found; **null** (**Nothing** in Visual Basic) if there is no **Path** connecting *from* and *to*.

See Also

FindLongestPath Method Overload List

FindAllPaths Method

PathFinder.FindLongestPath Method (Int64)

Finds the longest path in the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Path FindLongestPath (
    long timeLimit
)
```

Visual Basic Copy Code

```
Public Function FindLongestPath( _
    timeLimit As Long _
```

```
) As Path
```

Parameters

timeLimit
The maximum duration of the search process, in milliseconds.

Return Value

The longest Path found; **null** (**Nothing** in Visual Basic) if no **Path** has been detected.

See Also

FindLongestPath Method Overload List
PathFinder Members

PathFinder.FindShortestPath Method (DiagramNode, DiagramNode)

Finds and returns the shortest Path between the specified DiagramNode objects.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Path FindShortestPath (
    DiagramNode from,
    DiagramNode to
)
```

Visual Basic Copy Code

```
Public Function FindShortestPath( _
    from As DiagramNode, _
    to As DiagramNode _
) As Path
```

Parameters

from
The first DiagramNode in the Path.

to

The last **DiagramNode** in the **Path**.

Return Value

A **Path** instance that represents the shortest path found; **null** (**Nothing** in Visual Basic) if there is no path connecting *from* and *to*.

FindAllPaths Method

PathFinder.FindShortestPath Method (DiagramNode, DiagramNode, Boolean, Boolean)

Finds and returns the shortest path between two DiagramNode elements, considering the Weight of the nodes, the **Weight** of the links or both.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Path FindShortestPath (
    DiagramNode from,
    DiagramNode to,
    bool useNodeWeights,
    bool useLinkWeights
)
```

Visual Basic Copy Code

```
Public Function FindShortestPath( _
    from As DiagramNode, _
    to As DiagramNode, _
    useNodeWeights As Boolean, _
    useLinkWeights As Boolean _
) As Path
```

Parameters

from

The first DiagramNode in the Path.

to

The last **DiagramNode** in the **Path**.

useNodeWeights

If **true**, the **Path** with minimal total weight is found, summing the Weight of nodes in the **Path**.

useLinkWeights

If **true**, the **Path** with minimal total weight is found, summing the **Weight** of links in the **Path**.

Return Value

A **Path** instance that represents the shortest **Path** found or **null** (**Nothing** in Visual Basic) if there is no **Path** connecting *from* and *to*.

FindAllPaths Method

PatternRouter Class

Routes links by applying patterns of segment and turn sequences and accepting them when resulting paths do not cross nodes.

Syntax

C# Copy Code

```
public class PatternRouter : ILinkRouter
```

Visual Basic Copy Code

```
Public Class PatternRouter
    Implements ILinkRouter
```

Remarks

You can add custom patterns to the Patterns list, or replace the standard patterns altogether. Patterns are defined using RoutePattern and RouteStep objects.

Example

The following code defines a Z-like link route that will be accepted if it does not cross Obstacle nodes, nor passes by them within MinimumDistance.

C# Copy Code

```
var rightZigzag = new RoutePattern();
rightZigzag.Steps.Add(
    new RouteStep(RouteStepKind.AdvanceRelative, 0.5f));
rightZigzag.Steps.Add(
    new RouteStep(RouteStepKind.TurnRight));
rightZigzag.Steps.Add(
    new RouteStep(RouteStepKind.AdvanceRelative, 1));
rightZigzag.Steps.Add(
    new RouteStep(RouteStepKind.TurnLeft));
rightZigzag.Steps.Add(
    new RouteStep(RouteStepKind.AdvanceRelative, 0.5f));
router.Patterns.Add(rightZigzag);

// this can be defined in shorter form using a pattern string
// var rightZigzag = new RoutePattern(
//     "ADR0.5 TRR ADR1 TRL ADR0.5");
```

Inheritance Hierarchy

PatternRouter Members

Routes links by applying patterns of segment and turn sequences and accepting them when resulting paths do not cross nodes.

The following tables list the members exposed by the PatternRouter type.

Public Constructors

	Name	Description
	PatternRouter	Overloaded.

Public Properties

	Name	Description
	Diagram	Gets or sets the Diagram whose links will be routed.
	MinimumDistance	Gets or sets the minimum allowed distance from obstacles for a route to be accepted.
	Obstacles	Gets or sets a list of obstacle nodes.
	Patterns	Gets or sets a list of RoutePattern objects representing the routing patterns.
	PreferredDistance	Gets or sets the preferred distance from link's bend points to the link's nodes.

Public Methods

	Name	Description
	RouteLink	Implements ILinkRouter.RouteLink.
	RouteLinks	Implements ILinkRouter.RouteLinks.

PatternRouter Constructor (Diagram)

Initializes a new instance of the PatternRouter class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PatternRouter (
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram _
)
```

Parameters

diagram
The Diagram whose links will be routed.

See Also

PatternRouter Constructor Overload List
PatternRouter Class
MindFusion.Diagramming Namespace

PatternRouter Constructor (Diagram, List(RoutePattern))

Initializes a new instance of the PatternRouter class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PatternRouter (
    Diagram diagram,
    List<RoutePattern> patterns
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram, _
    patterns As List(Of RoutePattern) _
)
```

Parameters

diagram
The Diagram whose links will be routed.

patterns
A list of RoutePattern objects.

See Also

PatternRouter Constructor Overload List

PatternRouter Methods

PatternRouter.RouteLink Method

Implements ILinkRouter.RouteLink.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RouteLink (
    DiagramLink link,
    ConnectionPoint originConnection,
    ConnectionPoint destinationConnection,
    bool nowCreating
)
```

Visual Basic Copy Code

```
Public Function RouteLink( _
    link As DiagramLink, _
    originConnection As ConnectionPoint, _
    destinationConnection As ConnectionPoint, _
    nowCreating As Boolean _
) As Boolean
```

Parameters

link
The DiagramLink to route.

originConnection
Represents connection to Origin node, potentially different from link's stored connection when modifying first control point.

destinationConnection
Represents connection to Destination node, potentially different from link's stored connection when modifying last control point.

nowCreating
Indicates whether link is currently being created.

Return Value

true if a path has been found successfully, otherwise false.

public DiagramLinkCollection RouteLinks (
    DiagramLinkCollection links
)
```

Visual Basic Copy Code

```
Public Function RouteLinks( _
    links As DiagramLinkCollection _
) As DiagramLinkCollection
```

Parameters

links

A list of DiagramLink objects that should be routed.

Return Value

A list of links that were not routed successfully.

See Also

PatternRouter Members
PatternRouter Class
MindFusion.Diagramming Namespace

PatternRouter Properties

PatternRouter.Diagram Property

Gets or sets the Diagram whose links will be routed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Diagram Diagram { get; set; }
```

Visual Basic Copy Code

```
Public Property Diagram As Diagram
```

Property Value

An instance of the Diagram class.

See Also

PatternRouter Members
PatternRouter Class
MindFusion.Diagramming Namespace

PatternRouter.MinimumDistance Property

Gets or sets the minimum allowed distance from obstacles for a route to be accepted.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double MinimumDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property MinimumDistance As Double
```

Property Value

A **double** value specifying minimum distance. The default value is 4 millimeters.

See Also

PatternRouter Members
PatternRouter Class
MindFusion.Diagramming Namespace
PreferredDistance Property

PatternRouter.Obstacles Property

Gets or sets a list of obstacle nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNodeCollection Obstacles { get; set; }
```

Visual Basic Copy Code

```
Public Property Obstacles As DiagramNodeCollection
```

Property Value

A list of obstacles.

Remarks

If this value is set, the router ignores diagram's Nodes and only considers nodes from specified list.

See Also

PatternRouter Members
PatternRouter Class
MindFusion.Diagramming Namespace

PatternRouter.Patterns Property

Gets or sets a list of RoutePattern objects representing the routing patterns.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public List<RoutePattern> Patterns { get; set; }
```

Visual Basic Copy Code

```
Public Property Patterns As List(Of RoutePattern)
```

Property Value

A list of RoutePattern objects defining link route templates.

See Also

PatternRouter Members
PatternRouter Class
MindFusion.Diagramming Namespace

PatternRouter.PreferredDistance Property

Gets or sets the preferred distance from link's bend points to the link's nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double PreferredDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property PreferredDistance As Double
```

Property Value

A **double** value specifying preferred distance.

Remarks

The value of this property can be used in route templates using an AdvancePreferred RouteStep.

MinimumDistance Property

PointCollection Class

Represents a strongly typed collection of points.

Syntax

C# Copy Code

```
public class PointCollection : List<Point>
```

Visual Basic Copy Code

```
Public Class PointCollection
    Inherits List(Of Point)
```

Inheritance Hierarchy

System.Object
  System.Collections.Generic.List(Point)
    MindFusion.Diagramming.PointCollection

See Also

PointCollection Members

Represents a strongly typed collection of points.

The following tables list the members exposed by the PointCollection type.

Public Constructors

	Name	Description
	PointCollection	Overloaded. Initializes a new instance of the **PointCollection** class.

Public Properties

	Name	Description
	Item	Gets or sets the point at the specified position.

Public Methods

	Name	Description
	Add	Adds the specified point to the collection.
	AddRange	Adds the points in the specified collection to this collection.
	Clear	Removes all points from the collection.
	Clone	Creates a shallow copy of this collection.
	GetArray	Gets a **Point** array containing the points in this collection.
	GetAt	Gets the point at the specified position.
	Insert	Inserts the specified point in the collection at the specified position.
	Remove	Removes the specified point from the collection.
	Reverse	Returns a copy of this collection with reversed order of elements.
	SetAt	Sets the specified point at the specified position within the collection.

PointCollection Class
MindFusion.Diagramming Namespace

PointCollection Constructor

Initializes a new instance of the PointCollection class.

Overload List

Name	Description
PointCollection (IList(Point))	Initializes a new instance of the PointCollection class with the specified point values.
PointCollection (Int32)	Initializes a new instance of the **PointCollection** class with the specified initial size.

PointCollection (Point[])	Initializes a new instance of the **PointCollection** class with the specified point values.

See Also

PointCollection Class
MindFusion.Diagramming Namespace

PointCollection Constructor (IList(Point))

Initializes a new instance of the PointCollection class with the specified point values.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PointCollection (
    IList<Point> points
)
```

Visual Basic Copy Code

```
Public New ( _
    points As IList(Of Point) _
)
```

Parameters

points
An array of Point values that supplies the elements initially contained in the collection.

See Also

PointCollection Constructor Overload List
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection Constructor (Int32)

Initializes a new instance of the PointCollection class with the specified initial size.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PointCollection (
    int size
)
```

Visual Basic Copy Code

```
Public New ( _
    size As Integer _
)
```

Parameters

size
The initial size of the collection.

See Also

PointCollection Constructor Overload List
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection Constructor (Point[])

Initializes a new instance of the PointCollection class with the specified point values.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PointCollection (
    Point[] points
)
```

Visual Basic Copy Code

```
Public New ( _
    points() As Point _
)
```

Parameters

points
An array of **Microsoft.Maui.Graphics.Point** values that supplies the elements initially contained in the collection.

See Also

PointCollection Constructor Overload List
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection Methods

PointCollection.Add Method

Adds the specified point to the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Add (
    Point point
)
```

Visual Basic Copy Code

```
Public Sub Add( _
    point As Point _
)
```

Parameters

point
The **Microsoft.Maui.Graphics.Point** to add to the collection.

See Also

PointCollection Members
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection.AddRange Method

Adds the points in the specified collection to this collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void AddRange (
    ICollection c
)
```

Visual Basic Copy Code

```
Public Sub AddRange( _
    c As ICollection _
)
```

Parameters

c
The .NET **ICollection** object that contains the points to add to this collection.

See Also

PointCollection Members
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection.Clear Method

Removes all points from the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public new void Clear ()
```

Visual Basic Copy Code

```
Public Shadows Sub Clear ()
```

See Also

PointCollection Members
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection.Clone Method

Creates a shallow copy of this collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PointCollection Clone ()
```

Visual Basic Copy Code

```
Public Function Clone () As PointCollection
```

Return Value

An instance of the PointCollection class.

See Also

PointCollection Members
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection.GetArray Method

Gets a **Point** array containing the points in this collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point[] GetArray ()
```

Visual Basic Copy Code

```
Public Function GetArray () As Point()
```

Return Value

An array of **Microsoft.Maui.Graphics.Point** objects containing all points in the collection.

See Also

PointCollection Members
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection.GetAt Method

Gets the point at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point GetAt (
    int index
)
```

Visual Basic Copy Code

```
Public Function GetAt( _
    index As Integer _
) As Point
```

Parameters

index
The zero-based index of the point to retrieve.

Return Value

The **Point** object at the specified index.

See Also

PointCollection Members
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection.Insert Method

Inserts the specified point in the collection at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Insert (
    int index,
    Point point
)
```

Visual Basic Copy Code

```
Public Sub Insert( _
    index As Integer, _
    point As Point _
)
```

Parameters

index
The zero-based index at which to insert the point.

point
The **Microsoft.Maui.Graphics.Point** to add to the collection.

See Also

PointCollection Members
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection.Remove Method

Removes the specified point from the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Remove (
    Point point
```

```
)
```

Visual Basic Copy Code

```
Public Sub Remove( _
    point As Point _
)
```

Parameters

point
The **Microsoft.Maui.Graphics.Point** to remove.

See Also

PointCollection Members
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection.Reverse Method

Returns a copy of this collection with reversed order of elements.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public new PointCollection Reverse ()
```

Visual Basic Copy Code

```
Public Shadows Function Reverse () As PointCollection
```

Return Value

The reverse collection.

See Also

PointCollection Members
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection.SetAt Method

Sets the specified point at the specified position within the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SetAt (
    int index,
    Point point
)
```

Visual Basic Copy Code

```
Public Sub SetAt( _
    index As Integer, _
```

```
    point As Point _
)
```

Parameters

index
The zero-based index of the point to set.

point
The **Microsoft.Maui.Graphics.Point** to set at the specified position.

See Also

PointCollection Members
PointCollection Class
MindFusion.Diagramming Namespace

PointCollection Properties

PointCollection.Item Property

Gets or sets the point at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point Item [
    int index
] { get; set; }
```

Visual Basic Copy Code

```
Public Property Item( _
    index As Integer _
) As Point
```

Parameters

index
The zero-based index of the point to set or retrieve.

Property Value

The **Microsoft.Maui.Graphics.Point** object at the specified index.

See Also

PointCollection Members
PointCollection Class
MindFusion.Diagramming Namespace

PolylineRouting Enumeration

Defines values that indicate how Polyline links should be routed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum PolylineRouting
```

Visual Basic	Copy Code
`Public Enum PolylineRouting`	

Members

	Member name	Description
	UnrestrictedInclined	Allow any segment to be inclined by non-multiple of 90 angles.
	EndSegmentsOrthogonal	Keep the end segments orthogonal to node's sides, and allow interior segments to be inclined.
	AllOrthogonal	Keep all segments orthogonal to node's sides and each other.

See Also

MindFusion.Diagramming Namespace

QuickRouter Class

Implements a very fast link routing algorithm that uses a tree to represent the free and occupied regions in the diagram.

Syntax

C#	Copy Code
`public class QuickRouter : ILinkRouter`	

Visual Basic	Copy Code
`Public Class QuickRouter` `    Implements ILinkRouter`	

Remarks

To use this class for link routing simply assign its instance to the LinkRouter property of the Diagram class.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.QuickRouter

See Also

QuickRouter Members
MindFusion.Diagramming Namespace

QuickRouter Members

Implements a very fast link routing algorithm that uses a tree to represent the free and occupied regions in the diagram.

The following tables list the members exposed by the QuickRouter type.

Public Constructors

	Name	Description
	QuickRouter	Overloaded.

Public Properties

	Name	Description

	Diagram	Gets or sets the diagram this router is associated with.
	Granularity	Gets or sets the granularity of the obstacles map generated by **QuickRouter**.
	TurnCost	Gets or sets a value added to the total cost of a route if it makes a turn.
	UBendMaxLen	Gets or sets the maximum U-bend length.

Public Methods

	Name	Description
	RouteAllLinks	Routes all links in the diagram.
	RouteLink	Implements ILinkRouter.RouteLink.
	RouteLinks	Implements ILinkRouter.RouteLinks.

QuickRouter Class
MindFusion.Diagramming Namespace

QuickRouter Constructor ()

Initializes a new instance of the QuickRouter class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public QuickRouter ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

QuickRouter Constructor Overload List
QuickRouter Class
MindFusion.Diagramming Namespace

QuickRouter Constructor (Diagram)

Initializes a new instance of the QuickRouter class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public QuickRouter (
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram _
)
```

Parameters

diagram
The Diagram this router will operate on.

See Also

QuickRouter Constructor Overload List
QuickRouter Class
MindFusion.Diagramming Namespace

QuickRouter Methods

QuickRouter.RouteAllLinks Method

Routes all links in the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RouteAllLinks ()
```

Visual Basic Copy Code

```
Public Sub RouteAllLinks ()
```

See Also

QuickRouter Members
QuickRouter Class
MindFusion.Diagramming Namespace

QuickRouter.RouteLink Method

Implements ILinkRouter.RouteLink.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RouteLink (
    DiagramLink link,
    ConnectionPoint originConnection,
    ConnectionPoint destinationConnection,
    bool nowCreating
)
```

Visual Basic Copy Code

```
Public Function RouteLink( _
    link As DiagramLink, _
    originConnection As ConnectionPoint, _
    destinationConnection As ConnectionPoint, _
    nowCreating As Boolean _
) As Boolean
```

Parameters

link
The DiagramLink to route.

originConnection
Represents connection to Origin node, potentially different from link's stored connection when modifying first control point.

destinationConnection
Represents connection to Destination node, potentially different from link's stored connection when modifying last control point.

nowCreating
Indicates whether link is currently being created.

Return Value

true if a path has been found successfully, otherwise false.

See Also

QuickRouter Members
QuickRouter Class
MindFusion.Diagramming Namespace

QuickRouter.RouteLinks Method

Implements ILinkRouter.RouteLinks.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLinkCollection RouteLinks (
    DiagramLinkCollection links
)
```

Visual Basic Copy Code

```
Public Function RouteLinks( _
    links As DiagramLinkCollection _
) As DiagramLinkCollection
```

Parameters

links
A list of DiagramLink objects that should be routed.

Return Value

A list of links that were not routed successfully.

See Also

QuickRouter Members
QuickRouter Class
MindFusion.Diagramming Namespace

QuickRouter Properties

QuickRouter.Diagram Property

Gets or sets the diagram this router is associated with.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Diagram Diagram { get; set; }
```

Visual Basic Copy Code

```
Public Property Diagram As Diagram
```

Property Value

See Also

QuickRouter Members
QuickRouter Class
MindFusion.Diagramming Namespace

QuickRouter.Granularity Property

Gets or sets the granularity of the obstacles map generated by QuickRouter.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Granularity Granularity { get; set; }
```

Visual Basic Copy Code

```
Public Property Granularity As Granularity
```

Property Value

A member of the Granularity enumeration. The default value is **CoarseGrained**.

Remarks

A CoarseGrained obstacle map leads to faster path finding, however the found paths might be longer than necessary in a small percent of the cases. The coarse-grained map also takes slightly more time to build, so you might disable it if there are aren't many links in the diagram.

See Also

QuickRouter.TurnCost Property

Gets or sets a value added to the total cost of a route if it makes a turn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double TurnCost { get; set; }
```

Visual Basic Copy Code

```
Public Property TurnCost As Double
```

Property Value

See Also

QuickRouter Members
QuickRouter Class
MindFusion.Diagramming Namespace

QuickRouter.UBendMaxLen Property

Gets or sets the maximum U-bend length.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double UBendMaxLen { get; set; }
```

Visual Basic Copy Code

```
Public Property UBendMaxLen As Double
```

Property Value

A **double** value specifying the maximum length of U-bends. The default is 30.

ReadOnlyCollection(T) Class

Represents a read-only wrapper of a collection.

Syntax

C# Copy Code

```
public class ReadOnlyCollection<T> : ICollection, IEnumerable
```

Visual Basic Copy Code

```
Public Class ReadOnlyCollection(Of T)
    Implements ICollection, IEnumerable
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.ReadOnlyCollection(T)
    MindFusion.Diagramming.ReadOnlyDiagramItemCollection
    MindFusion.Diagramming.ReadOnlyDiagramLinkCollection
    MindFusion.Diagramming.ReadOnlyDiagramNodeCollection

See Also

ReadOnlyCollection(T) Members
MindFusion.Diagramming Namespace

ReadOnlyCollection(T) Members

Represents a read-only wrapper of a collection.

The following tables list the members exposed by the ReadOnlyCollection(T) type.

Public Constructors

	Name	Description
	ReadOnlyCollection	Initializes a new instance of the **ReadonlyCollection** class.

Public Properties

	Name	Description
	Count	Gets the number of elements contained in the collection.
	IsSynchronized	Gets a value indicating whether the access to the collection is synchronized.
	SyncRoot	Gets an object that can be used to synchronize access to the collection.

Public Methods

	Name	Description
	CopyTo	Copies a range of elements from this collection to a compatible one-dimensional **System.Array**, starting at the specified index of the target array.
	GetEnumerator	Returns an enumerator that iterates through the collection.

See Also

ReadOnlyCollection(T) Class
MindFusion.Diagramming Namespace

ReadOnlyCollection(T) Constructor

Initializes a new instance of the ReadonlyCollection class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ReadOnlyCollection<T> (
    ICollection<T> innerCollection
)
```

Visual Basic Copy Code

```
Public New (Of T) ( _
    innerCollection As ICollection(Of T) _
)
```

Parameters

innerCollection
A .NET **ICollection** that represents the collection to wrap.

See Also

ReadOnlyCollection(T) Class
MindFusion.Diagramming Namespace

ReadOnlyCollection(T) Methods

ReadOnlyCollection(T).CopyTo Method

Copies a range of elements from this collection to a compatible one-dimensional **System.Array**, starting at the specified index of the target array.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void CopyTo (
    Array array,
    int index
)
```

Visual Basic Copy Code

```
Public Sub CopyTo( _
    array As Array, _
    index As Integer _
)
```

Parameters

array
The one-dimensional **Array** that is the destination of the elements copied from the current collection.

index
A 32-bit integer that represents the index in array at which copying begins.

See Also

ReadOnlyCollection(T) Members
ReadOnlyCollection(T) Class
MindFusion.Diagramming Namespace

ReadOnlyCollection(T).GetEnumerator Method

Returns an enumerator that iterates through the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IEnumerator<T> GetEnumerator ()
```

Visual Basic Copy Code

```
Public Function GetEnumerator () As IEnumerator(Of T)
```

Return Value

An .NET **IEnumerator** for the collection.

See Also

ReadOnlyCollection(T) Members
ReadOnlyCollection(T) Class

ReadOnlyCollection(T) Properties

ReadOnlyCollection(T).Count Property

Gets the number of elements contained in the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Count { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Count As Integer
```

Property Value

The number of elements actually contained in the collection.

See Also

ReadOnlyCollection(T) Members
ReadOnlyCollection(T) Class
MindFusion.Diagramming Namespace

ReadOnlyCollection(T).IsSynchronized Property

Gets a value indicating whether the access to the collection is synchronized.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public bool IsSynchronized { get; }
```

Visual Basic

```
Public ReadOnly Property IsSynchronized As Boolean
```

Property Value

true if access to the collection is synchronized (thread safe); otherwise, **false**.

See Also

ReadOnlyCollection(T) Members
ReadOnlyCollection(T) Class
MindFusion.Diagramming Namespace

ReadOnlyCollection(T).SyncRoot Property

Gets an object that can be used to synchronize access to the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public Object SyncRoot { get; }
```

Visual Basic

```
Public ReadOnly Property SyncRoot As Object
```

Property Value

An object that can be used to synchronize access to the collection.

See Also

ReadOnlyCollection(T) Members
ReadOnlyCollection(T) Class
MindFusion.Diagramming Namespace

ReadOnlyDiagramItemCollection Class

Represents a read-only collection of items.

Syntax

C#

```
public class ReadOnlyDiagramItemCollection : ReadOnlyCollection<DiagramItem>
```

Visual Basic

```
Public Class ReadOnlyDiagramItemCollection
    Inherits ReadOnlyCollection(Of DiagramItem)
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.ReadOnlyCollection(DiagramItem)
    MindFusion.Diagramming.ReadOnlyDiagramItemCollection

See Also

ReadOnlyDiagramItemCollection Members
MindFusion.Diagramming Namespace

ReadOnlyDiagramItemCollection Members

Represents a read-only collection of items.

The following tables list the members exposed by the ReadOnlyDiagramItemCollection type.

Public Constructors

	Name	Description
	ReadOnlyDiagramItemCollection	Initializes a new instance of the **ReadOnlyDiagramItemCollection** class.

Public Properties

	Name	Description
	Count	Gets the number of elements contained in the collection. (Inherited from ReadOnlyCollection.)
	IsSynchronized	Gets a value indicating whether the access to the collection is synchronized. (Inherited from ReadOnlyCollection.)
	Item	Gets the DiagramItem at the specified position.
	SyncRoot	Gets an object that can be used to synchronize access to the collection. (Inherited from ReadOnlyCollection.)

Public Methods

	Name	Description
	Contains	Checks whether the specified **DiagramItem** is contained within the collection.
	CopyTo	Copies a range of elements from this collection to a compatible one-dimensional **System.Array**, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from ReadOnlyCollection.)
	IndexOf	Searches for the specified **DiagramItem** and returns the 0-based index of the first occurrence within the entire collection.

See Also

ReadOnlyDiagramItemCollection Class
MindFusion.Diagramming Namespace

ReadOnlyDiagramItemCollection Constructor

Initializes a new instance of the ReadOnlyDiagramItemCollection class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ReadOnlyDiagramItemCollection (
    DiagramItemCollection innerCollection
)
```

Visual Basic Copy Code

```
Public New ( _
    innerCollection As DiagramItemCollection _
)
```

Parameters

innerCollection
A DiagramItemCollection object that represents the collection to wrap.

Remarks

A DiagramItemCollection object that represents the collection to wrap.

See Also

ReadOnlyDiagramItemCollection Class
MindFusion.Diagramming Namespace

ReadOnlyDiagramItemCollection Methods

ReadOnlyDiagramItemCollection.Contains Method

Checks whether the specified DiagramItem is contained within the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Contains (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Function Contains( _
    item As DiagramItem _
) As Boolean
```

Parameters

item
The DiagramItem to search for in the collection.

Return Value

true if the specified item is contained in the collection; otherwise, **false**.

See Also

ReadOnlyDiagramItemCollection Members
ReadOnlyDiagramItemCollection Class
MindFusion.Diagramming Namespace

ReadOnlyDiagramItemCollection.IndexOf Method

Searches for the specified DiagramItem and returns the 0-based index of the first occurrence within the entire collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int IndexOf (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Function IndexOf( _
    item As DiagramItem _
) As Integer
```

Parameters

item
The DiagramItem whose index to retrieve from the collection.

Return Value

The zero-based index of the specified item within the collection; or -1 if the item is not found.

See Also

ReadOnlyDiagramItemCollection Members
ReadOnlyDiagramItemCollection Class
MindFusion.Diagramming Namespace

ReadOnlyDiagramItemCollection Properties

ReadOnlyDiagramItemCollection.Item Property

Gets the DiagramItem at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem Item [
    int index
] { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Item( _
    index As Integer _
) As DiagramItem
```

Parameters

index
The zero-based index of the item to get.

Property Value

An instance of the DiagramItem class that represents the item at the specified position.

See Also

ReadOnlyDiagramItemCollection Members
ReadOnlyDiagramItemCollection Class

ReadOnlyDiagramLinkCollection Members

Represents a read-only collection of links.

The following tables list the members exposed by the ReadOnlyDiagramLinkCollection type.

Public Constructors

	Name	Description
	ReadOnlyDiagramLinkCollection	Initializes a new instance of the **ReadOnlyDiagramLinkCollection** class.

Public Properties

	Name	Description
	Count	Gets the number of elements contained in the collection. (Inherited from ReadOnlyCollection.)
	IsSynchronized	Gets a value indicating whether the access to the collection is synchronized. (Inherited from ReadOnlyCollection.)
	Item	Gets the DiagramLink at the specified position.
	SyncRoot	Gets an object that can be used to synchronize access to the collection. (Inherited from ReadOnlyCollection.)

Public Methods

	Name	Description
	Contains	Checks whether the specified **DiagramLink** is contained within the collection.
	CopyTo	Copies a range of elements from this collection to a compatible one-dimensional **System.Array**, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from ReadOnlyCollection.)

	IndexOf	Searches for the specified **DiagramLink** and returns the 0-based index of the first occurrence within the entire collection.

ReadOnlyDiagramLinkCollection Constructor

Initializes a new instance of the ReadOnlyDiagramLinkCollection class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ReadOnlyDiagramLinkCollection (
    DiagramLinkCollection innerCollection
)
```

Visual Basic Copy Code

```
Public New ( _
    innerCollection As DiagramLinkCollection _
)
```

Parameters

innerCollection
A DiagramLinkCollection object that represents the collection to wrap.

See Also

ReadOnlyDiagramLinkCollection Class
MindFusion.Diagramming Namespace

ReadOnlyDiagramLinkCollection Methods

ReadOnlyDiagramLinkCollection.Contains Method

Checks whether the specified DiagramLink is contained within the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Contains (
    DiagramLink link
)
```

Visual Basic Copy Code

```
Public Function Contains( _
    link As DiagramLink _
) As Boolean
```

Parameters

link
The DiagramLink to search for in the collection.

Return Value

true if the specified link is contained in the collection; otherwise, **false**.

See Also

ReadOnlyDiagramLinkCollection Members
ReadOnlyDiagramLinkCollection Class
MindFusion.Diagramming Namespace

ReadOnlyDiagramLinkCollection.IndexOf Method

Searches for the specified DiagramLink and returns the 0-based index of the first occurrence within the entire collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int IndexOf (
    DiagramLink link
)
```

Visual Basic Copy Code

```
Public Function IndexOf( _
    link As DiagramLink _
) As Integer
```

Parameters

link
The DiagramLink whose index to retrieve from the collection.

Return Value

The zero-based index of the specified link within the collection; or -1 if the link is not found.

ReadOnlyDiagramLinkCollection Properties

ReadOnlyDiagramLinkCollection.Item Property

Gets the DiagramLink at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink Item [
    int index
] { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Item( _
    index As Integer _
) As DiagramLink
```

Parameters

index
The zero-based index of the link to get.

Property Value

An instance of the DiagramLink class that represents the link at the specified position.

ReadOnlyDiagramNodeCollection.Contains Method

Checks whether the specified DiagramNode is contained within the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Contains (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public Function Contains( _
    node As DiagramNode _
) As Boolean
```

Parameters

node
The DiagramNode to search for in the collection.

Return Value

true if the specified node is contained in the collection; otherwise, **false**.

ReadOnlyDiagramNodeCollection Properties

ReadOnlyDiagramNodeCollection.Item Property

Gets the DiagramNode at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNode Item [
    int index
] { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Item( _
    index As Integer _
) As DiagramNode
```

Parameters

index
The zero-based index of the node to get.

Property Value

An instance of the DiagramNode class that represents the node at the specified position.

ReadOnlyDiagramNodeCollection Members
ReadOnlyDiagramNodeCollection Class
MindFusion.Diagramming Namespace

Relationship Enumeration

Specifies the type of relationship between two tables.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum Relationship
```

Visual Basic Copy Code

```
Public Enum Relationship
```

Members

	Member name	Description
	OneToMany	The relationship is of type 1:M, that is, one to many.
	ManyToOne	The relationship is of type M:1, that is, many to one.

Remarks

Use the enumeration values when drawing database diagrams. It helps you specify how database tables' fields are related.

AddRelation Method

RelativeToLink Enumeration

Specifies how the link labels are positioned.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum RelativeToLink
```

Visual Basic Copy Code

```
Public Enum RelativeToLink
```

Members

	Member name	Description
	Segment	Indicates that the link labels are positioned relative to a specified segment.
	ControlPoint	Indicates that the link labels are positioned relative to a specified control point.
	LinkLength	Indicates that the link labels are positioned relative to the link.

See Also

LinkLabel.RelativeTo Property

RelativeToNode Enumeration

Specifies how the node labels are positioned.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum RelativeToNode
```

Visual Basic Copy Code

```
Public Enum RelativeToNode
```

Members

	Member name	Description
	Edge	Indicates that the node labels are positioned relative to a specified edge.
	Corner	Indicates that the node labels are positioned relative to a specified corner point.

	Center	Indicates that the node labels are positioned relative to the node center.

RenderOptions Members

Provides properties that allow customization of various aspects of printing and print-preview.

The following tables list the members exposed by the RenderOptions type.

Public Constructors

	Name	Description
	RenderOptions	Overloaded.

Public Properties

	Name	Description
	EnableAnchors	Gets or sets a value indicating whether the printing of anchor point marks is enabled.
	EnableBackground	Gets or sets a value indicating whether the printing of the background color is enabled.
	EnableBackgroundImage	Gets or sets a value indicating whether the printing of the background image is enabled.
	EnableEffects	Enables or disables special effects, such as emboss.
	EnableGrid	Gets or sets a value indicating whether the alignment grid is rendered.
	EnableImages	Gets or sets a value indicating whether the printing of images that are displayed in nodes is enabled.
	EnableInterior	Gets or sets a value indicating whether the printing of node interiors is enabled.

	EnableShadows	Gets or sets a value indicating whether the printing of the shadows of diagram items is enabled.
	EnableText	Gets or sets a value indicating whether the printing of the text of diagram items is enabled.
	HyperLinkStyle	Specifies how various export components should treat the HyperLink property of items.
	HyperLinkTarget	Specify the value of the **target** attribute generated by various export components for the **HyperLink** property of items.
	InternalMsg	For internal use.
	MeasureUnit	Specifies the diagram's unit of measure.
	PaintControls	Gets or sets a value indicating whether to execute custom painting code for **ControlNode** items when printing.
	RenderTarget	Gets or sets the rendering target.
	Scale	Gets or sets the scale of the print output relatively to the original on-screen size of the diagram.
	ScrollX	Gets or sets the document's X scroll position.
	ScrollY	Gets or sets the document's Y scroll position.
	SmoothingMode	Gets or sets the current anti-aliasing mode.
	TargetView	Gets or sets the object that currently displays the Diagram.
	TextRenderingHint	Gets or sets the rendering mode for text displayed in this diagram.
	VisibleRect	Specifies which part of the diagram is currently visible.

RenderOptions Constructor (RenderOptions)

Initializes a new instance of the RenderOptions class using the specified instance as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public RenderOptions (
    RenderOptions prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As RenderOptions _
)
```

Parameters

prototype
The RenderOptions instance to use as a prototype.

See Also

RenderOptions Constructor Overload List

RenderOptions Properties

RenderOptions.EnableAnchors Property

Gets or sets a value indicating whether the printing of anchor point marks is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableAnchors { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableAnchors As Boolean
```

Property Value

true if anchor point marks should be printed; otherwise, **false**. The default is **false**.

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.EnableBackground Property

Gets or sets a value indicating whether the printing of the background color is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableBackground { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableBackground As Boolean
```

Property Value

true if the diagram background should be printed; otherwise, **false**. The default is **false**.

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.EnableBackgroundImage Property

Gets or sets a value indicating whether the printing of the background image is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableBackgroundImage { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableBackgroundImage As Boolean
```

Property Value

true if the background image should be printed; otherwise, **false**. The default is **false**.

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.EnableEffects Property

Enables or disables special effects, such as emboss.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableEffects { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableEffects As Boolean
```

Property Value

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.EnableGrid Property

Gets or sets a value indicating whether the alignment grid is rendered.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableGrid { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableGrid As Boolean
```

Property Value

true to render the alignment grid, if visible; otherwise, **false**.

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.EnableImages Property

Gets or sets a value indicating whether the printing of images that are displayed in nodes is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableImages { get; set; }
```

Visual Basic

```
Public Property EnableImages As Boolean
```

Property Value

true to print node images; otherwise, **false**.

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.EnableInterior Property

Gets or sets a value indicating whether the printing of node interiors is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public bool EnableInterior { get; set; }
```

Visual Basic

```
Public Property EnableInterior As Boolean
```

Property Value

true to print node interiors; otherwise, **false**.

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.EnableShadows Property

Gets or sets a value indicating whether the printing of the shadows of diagram items is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public bool EnableShadows { get; set; }
```

Visual Basic

```
Public Property EnableShadows As Boolean
```

Property Value

true to print item shadows; otherwise, **false**.

See Also

RenderOptions Members
RenderOptions Class

RenderOptions.EnableText Property

Gets or sets a value indicating whether the printing of the text of diagram items is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableText { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableText As Boolean
```

Property Value

true to print item texts; otherwise, **false**.

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.HyperLinkStyle Property

Specifies how various export components should treat the HyperLink property of items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HyperLinkStyle HyperLinkStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property HyperLinkStyle As HyperLinkStyle
```

Property Value

A member of the HyperLinkStyle enumeration.

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.HyperLinkTarget Property

Specify the value of the **target** attribute generated by various export components for the HyperLink property of items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string HyperLinkTarget { get; set; }
```

Visual Basic

```
Public Property HyperLinkTarget As String
```

Property Value

The default value is "_self".

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.InternalMsg Property

For internal use.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public static string InternalMsg { get; set; }
```

Visual Basic

```
Public Shared Property InternalMsg As String
```

Property Value

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.MeasureUnit Property

Specifies the diagram's unit of measure.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public MeasureUnit MeasureUnit { get; set; }
```

Visual Basic

```
Public Property MeasureUnit As MeasureUnit
```

Property Value

An instance of the MeasureUnit class specifying the diagram's unit of measure.

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.PaintControls Property

Gets or sets a value indicating whether to execute custom painting code for **ControlNode** items when printing.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool PaintControls { get; set; }
```

Visual Basic Copy Code

```
Public Property PaintControls As Boolean
```

Property Value

true to raise the appropriate event when printing controls; otherwise, **false**.

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.RenderTarget Property

Gets or sets the rendering target.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public RenderTarget RenderTarget { get; set; }
```

Visual Basic Copy Code

```
Public Property RenderTarget As RenderTarget
```

Property Value

A value from the RenderTarget enumeration specifying whether rendering is done on the screen or on a printer.

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.Scale Property

Gets or sets the scale of the print output relatively to the original on-screen size of the diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Scale { get; set; }
```

Visual Basic

```
Public Property Scale As Double
```

Property Value

A **double** value specifying the scale of the print output as percentage of original size.

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.ScrollX Property

Gets or sets the document's X scroll position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public double ScrollX { get; set; }
```

Visual Basic

```
Public Property ScrollX As Double
```

Property Value

A **double** value specifying the X scroll position.

See Also

RenderOptions Members
RenderOptions Class

RenderOptions.ScrollY Property

Gets or sets the document's Y scroll position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public double ScrollY { get; set; }
```

Visual Basic

```
Public Property ScrollY As Double
```

Property Value

A **double** value specifying the Y scroll position.

See Also

RenderOptions Members
RenderOptions Class

RenderOptions.TargetView Property

Gets or sets the object that currently displays the Diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object TargetView { get; set; }
```

Visual Basic Copy Code

```
Public Property TargetView As Object
```

Property Value

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.TextRenderingHint Property

Gets or sets the rendering mode for text displayed in this diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TextRenderingHint TextRenderingHint { get; set; }
```

Visual Basic Copy Code

```
Public Property TextRenderingHint As TextRenderingHint
```

Property Value

See Also

RenderOptions Members
RenderOptions Class
MindFusion.Diagramming Namespace

RenderOptions.VisibleRect Property

Specifies which part of the diagram is currently visible.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect VisibleRect { get; set; }
```

Visual Basic Copy Code

```
Public Property VisibleRect As Rect
```

Property Value

See Also

RenderOptions Members
RenderOptions Class

RenderTarget Enumeration

Specifies where the diagram is being rendered.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum RenderTarget
```

Visual Basic Copy Code

```
Public Enum RenderTarget
```

Members

	Member name	Description
	Display	The diagram is rendered on the screen.
	Printer	The diagram is rendered on a printer.
	BackBuffer	The diagram is rendered on offscreen buffer bitmap.

RepaintEventArgs Constructor

Initializes a new instance of the RepaintEventArgs class.

Overload List

Name	Description
RepaintEventArgs (Rect)	Initializes a new instance of the **RepaintEventArgs** class.
RepaintEventArgs (Rect, Boolean)	Initializes a new instance of the **RepaintEventArgs** class.
RepaintEventArgs (Rect, Object)	Initializes a new instance of the **RepaintEventArgs** class.

See Also

RepaintEventArgs Class
MindFusion.Diagramming Namespace

RepaintEventArgs Constructor (Rect)

Initializes a new instance of the RepaintEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public RepaintEventArgs (
    Rect invalidRect
)
```

Visual Basic Copy Code

```
Public New ( _
    invalidRect As Rect _
)
```

Parameters

invalidRect
A **Microsoft.Maui.Graphics.Rect** object representing the rectangle that should be repainted.

See Also

RepaintEventArgs Constructor Overload List
RepaintEventArgs Class
MindFusion.Diagramming Namespace

RepaintEventArgs Constructor (Rect, Boolean)

Initializes a new instance of the RepaintEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public RepaintEventArgs (
    Rect invalidRect,
    bool redrawCacheImage
)
```

Visual Basic Copy Code

```
Public New ( _
    invalidRect As Rect, _
    redrawCacheImage As Boolean _
)
```

Parameters

invalidRect

A **Microsoft.Maui.Graphics.Rect** object representing the rectangle that should be repainted.

redrawCacheImage

A boolean value specifying whether the diagram cache image used during modification should be re-created.

See Also

RepaintEventArgs Constructor Overload List
RepaintEventArgs Class

RepaintEventArgs Constructor (Rect, Object)

Initializes a new instance of the RepaintEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public RepaintEventArgs (
    Rect invalidRect,
    Object sourceView
)
```

Visual Basic Copy Code

```
Public New ( _
    invalidRect As Rect, _
    sourceView As Object _
)
```

Parameters

invalidRect

A **Microsoft.Maui.Graphics.Rect** object representing the rectangle that should be repainted.

sourceView

The view object that raised the event.

See Also

RepaintEventArgs Constructor Overload List

RepaintEventArgs Properties

RepaintEventArgs.InvalidRect Property

Gets the rectangular area in the diagram document that should be repainted.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect InvalidRect { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property InvalidRect As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** instance specifying the invalid rectangle. The value of **Empty** indicates that the whole view should be repainted.

See Also

RepaintEventArgs Members
RepaintEventArgs Class
MindFusion.Diagramming Namespace

RepaintEventArgs.RedrawCacheImage Property

Gets a value indicating whether the back-buffer cache image should be repainted as well.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RedrawCacheImage { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property RedrawCacheImage As Boolean
```

Property Value

true to redraw the back-buffer image; otherwise, **false**.

RerouteLinks Enumeration

Provides values indicating in what circumstances links must be rerouted automatically.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum RerouteLinks
```

Visual Basic Copy Code

```
Public Enum RerouteLinks
```

Members

	Member name	Description
	Never	Do not reroute links automatically.
	WhenModified	Reroute a link if its end points are moved around.
	WhenIntersectNode	Reroute a link if it intersects a node.
	WhileCreating	Route new links while users draw them. This flag can be combined with any of the previous two flags.
	WhileModifying	Route links while the user modifies them or drags their incident nodes.

Remarks

These values can be assigned to the TriggerRerouting property of RoutingOptions.

RestrictToBounds Enumeration

Specifies a restriction of the position of items relatively to the diagram bounds.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum RestrictToBounds
```

Visual Basic Copy Code

```
Public Enum RestrictToBounds
```

Members

	Member name	Description
	NoRestriction	No restriction on the position of items.
	Intersection	Items must be located at least partially inside the document extents.
	InsideOnly	Items must be located entirely inside the document extents.

Remarks

This enumeration specifies the possible values of the RestrictItemsToBounds property.

RoundRectangleTemplate Class

Represents an ElementTemplate that draws round rectangle. This class ensures that the round corners do not change during resizing which is visually better. The drawback is that the radius appears to be specified in DiagramView Measure units and therefore a given shape instance will look bad when the measure unit is not the one for which the shape was designed.

Syntax

C# Copy Code

```
public class RoundRectangleTemplate : ElementTemplate
```

Visual Basic Copy Code

```
Public Class RoundRectangleTemplate
    Inherits ElementTemplate
```

Remarks

This class ensures that the round corners do not change during resizing which is visually better. The drawback is that the radius appears to be specified in DiagramView Measure units and therefore a given shape instance will look bad when the measure unit is not the one for which the shape was designed.

RoundRectangleTemplate Members

Represents an ElementTemplate that draws round rectangle. This class ensures that the round corners do not change during resizing which is visually better. The drawback is that the radius appears to be specified in DiagramView Measure units and therefore a given shape instance will look bad when the measure unit is not the one for which the shape was designed.

The following tables list the members exposed by the RoundRectangleTemplate type.

Public Constructors

	Name	Description
	RoundRectangleTemplate	Overloaded. Initializes a new instance of the **RoundRectangleTemplate** class.

Public Properties

	Name	Description
	Bounds	Gets the bounding rectangle of this element.
	Color	Gets or sets the outline color of this element. (Inherited from ElementTemplate.)
	DashStyle	Gets or sets the dash style of the outline of this element. (Inherited from ElementTemplate.)
	Radius	Gets or sets the round radius of this element.
	Width	Gets or sets the outline width of this element. (Inherited from ElementTemplate.)

Public Methods

	Name	Description
	Clone	Creates an exact copy of this **RoundRectangleTemplate** element.
	SameAs	ElementTemplate.SameAs override.

Protected Methods

	Name	Description
	GetElementPen	Gets a pen used to render the element. If no pen properties are explicitly specified for this element, returns the pen passed as an argument. (Inherited from ElementTemplate.)

RoundRectangleTemplate Constructor (Double, Double, Double, Double, Double)

Initializes a new instance of the RoundRectangleTemplate class with the specified settings.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public RoundRectangleTemplate (
    double x,
    double y,
    double w,
    double h,
    double r
)
```

Visual Basic Copy Code

```
Public New ( _
    x As Double, _
    y As Double, _
    w As Double, _
    h As Double, _
    r As Double _
)
```

Parameters

x
The x-coordinate of the top-left corner of the rectangle, expressed as percentage of a shape node's bounding rectangle.

y
The y-coordinate of the top-left corner of the rectangle, expressed as percentage of a shape node's bounding rectangle.

w
The width of the rectangle, expressed as percentage of a shape node's bounding rectangle.

h
The height of the rectangle, expressed as percentage of a shape node's bounding rectangle.

r
The round radius of the rectangle.

Syntax

C# Copy Code

```
public RoundRectangleTemplate (
    double x,
    double y,
    double w,
    double h,
    double r,
    Color color,
    DashStyle dashStyle,
    double width
)
```

Visual Basic Copy Code

```
Public New ( _
    x As Double, _
    y As Double, _
    w As Double, _
    h As Double, _
    r As Double, _
    color As Color, _
    dashStyle As DashStyle, _
    width As Double _
)
```

Parameters

x
The x-coordinate of the top-left corner of the rectangle, expressed as percentage of a shape node's bounding rectangle.

y
The y-coordinate of the top-left corner of the rectangle, expressed as percentage of a shape node's bounding rectangle.

w
The width of the rectangle, expressed as percentage of a shape node's bounding rectangle.

h
The height of the rectangle, expressed as percentage of a shape node's bounding rectangle.

r
The round radius of the rectangle.

color
The color of this segment.

dashStyle
The dash style of this segment.

width
The width of this segment.

Syntax

C# Copy Code

```
public RoutePattern (
    string data
)
```

Visual Basic Copy Code

```
Public New ( _
    data As String _
)
```

Parameters

data
A string representing a sequence of RouteSteps.

Remarks

Members of the RouteStepKind enumeration are represented by three-character acronyms, with a numerical value appended to advance- steps.

Example

The following route can be represented by "ADR0.5 TRR ADR1 TRL ADR0.5" string.

C# Copy Code

```
var rightZigzag = new RoutePattern();
rightZigzag.Steps.Add(
    new RouteStep(RouteStepKind.AdvanceRelative, 0.5f));
rightZigzag.Steps.Add(
    new RouteStep(RouteStepKind.TurnRight));
rightZigzag.Steps.Add(
    new RouteStep(RouteStepKind.AdvanceRelative, 1));
rightZigzag.Steps.Add(
    new RouteStep(RouteStepKind.TurnLeft));
rightZigzag.Steps.Add(
    new RouteStep(RouteStepKind.AdvanceRelative, 0.5f));
router.Patterns.Add(rightZigzag);

// this can be defined in shorter form using a pattern string
// var rightZigzag = new RoutePattern(
//     "ADR0.5 TRR ADR1 TRL ADR0.5");
```

Public Enum RouteStepKind
```

Members

	Member name	Description
	AdvanceRelative	Advance by the specified relative distance from origin to destination node. Equivalent to "ADR" command in pattern strings.
	AdvanceAbsolute	Advance by the specified absolute distance. Corresponds to "ADA" command in pattern strings.
	AdvancePreferred	Advance by PreferredDistance.
	AdvanceDest	Advance by the specified relative remaining distance to destination node. Corresponds to "ADD" command in pattern strings.

	AdvanceRemaining	Advance by the specified relative remaining distance to link's end point. Corresponds to "ADM" command in pattern strings.
	AlignToOrigin	Advance to align with nearest side of origin node. Corresponds to "ALO" command in pattern strings.
	AlignToDestination	Advance to align with nearest side of destination node. Corresponds to "ALD" command in pattern strings.
	AlignToStart	Advance to align with link's start point. Corresponds to "ALS" command in pattern strings.
	AlignToEnd	Advance to align with link's end point. Corresponds to "ALE" command in pattern strings.
	AlignToFarBorder	Advance to align with furthest border of both nodes. Corresponds to "AFB" command in pattern strings.
	TurnLeft	Turn 90 degrees to the left. Corresponds to "TRL" command in pattern strings.
	TurnRight	Turn 90 degrees to the right. Corresponds to "TRR" command in pattern strings.

RoutingOptions Class

Allows customization of various aspects of the link routing algorithm.

Syntax

C# Copy Code

```
public class RoutingOptions : RoutingOptions
```

Visual Basic Copy Code

```
Public Class RoutingOptions
    Implements RoutingOptions
```

Remarks

Use the RoutingOptions member of the Diagram class to access the sole instance of this class.

MvcDiagram uses a cost minimization algorithm to route links between nodes. For each link, there is a routing grid built for the area that encloses the link and its origin and destination nodes. The size of the grid pieces is set via GridSize. Each piece of the grid is marked as an obstacle if it intersects an **Obstacle** node. Some cost values are assigned to the remaining pieces, depending on how distant they are from nodes and other links.

That algorithm evaluates possible paths across the routing grid aiming to find one that has a minimal cost. The values of LengthCost, TurnCost, CrossingCost and NodeVicinityCost are added to the total cost of a route and have a great influence over the shape of the chosen path.

The StartOrientation and EndOrientation properties specify the orientation of the first and last segments of routed links, and Anchoring specifies whether link ends should be aligned to the anchor points defined for nodes.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.RoutingOptions

See Also

RoutingOptions Members
MindFusion.Diagramming Namespace

RoutingOptions Members

Allows customization of various aspects of the link routing algorithm.

The following tables list the members exposed by the RoutingOptions type.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating whether to align link ends to the anchor points of nodes.
	AvoidOverlaps	Gets or sets whether link segments should be pulled apart when they overlap in initially found routes.
	CrossingCost	Gets or sets a value added to the total cost of a route which causes a link to cross another link.
S	Distance	Gets a heuristic delegate function that returns the real distance sqrt(dx^2 + dy^2) between two pieces of the routing grid.
S	DistSquare	Gets a heuristic delegate function that returns the square distance dx^2 + dy^2 as a cost evaluation of the distance between two pieces of the routing grid.
	DontOptimizeLongRoutes	Gets or sets a value indicating whether long routes don't have their number of segments minimized in order to save up processing time.
	EndOrientation	Gets or sets the desired orientation of the last segments of routed links.
	EndPointsOffset	Gets or sets the minimum number of routing grid cells the end segments of links should occupy before they are allowed to bend.
	GridSize	Gets or sets the size of the pieces of the routing grid.
	IgnoreAnchoring	For internal use.
	LengthCost	Gets or sets a value added to the total cost of a route for each piece of the routing grid occupied by the route.
S	MaxAbs	Gets a heuristic delegate function that returns max(dx, dy) as a cost evaluation of the distance between two pieces of the routing grid.
	NodeVicinityCost	Gets or sets a value added to the total cost of a route if the route passes too close to a node.
	NodeVicinitySize	Gets or sets the size of a buffer zone around a node for which routes get a penalty cost if they pass through it.
	PolylineRouting	Gets or sets a value indicating whether the segments of Polyline links should be oriented orthogonally to node's borders and each other.
	RouteHeuristics	Gets or sets a heuristic function used to evaluate the distance between two pieces of the routing grid.
	StartOrientation	Gets or sets the desired orientation of the first segments of routed links.
	TriggerRerouting	Gets or sets a value indicating under what circumstances links are rerouted automatically.
	TurnCost	Gets or sets a value added to the total cost of a route if it makes a turn.

Public Methods

	Name	Description
	SetDefaultMode	Resets all routing properties to their default values.
	SetMinSegmentsMode	Assigns to the routing properties a predefined set of values which allow finding paths that have a small number of segments.

	SetQuickMode	Assigns to the routing properties a predefined set of values which allow finding paths quickly but the found paths are of low quality.

RoutingOptions Properties

RoutingOptions.Anchoring Property

Gets or sets a value indicating whether to align link ends to the anchor points of nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Anchoring Anchoring { get; set; }
```

Visual Basic Copy Code

```
Public Property Anchoring As Anchoring
```

Property Value

A member of the Anchoring enumeration. The default is **Ignore**.

Remarks

By default, the routing algorithm ignores anchor points. To make it align link ends to the points specified in the **AnchorPattern** property of nodes, set **Anchoring** to Keep or **Reassign**. **Keep** specifies that the routing algorithm does not change the positions of link end points. **Reassign** lets the routing algorithm choose new end points for a link from the ones specified in the **AnchorPattern** of its origin and destination nodes.

See Also

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace

RoutingOptions.AvoidOverlaps Property

Gets or sets whether link segments should be pulled apart when they overlap in initially found routes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AvoidOverlaps { get; set; }
```

Visual Basic Copy Code

```
Public Property AvoidOverlaps As Boolean
```

Property Value

true to pull apart overlapping segments, or **false** otherwise. The default value is **true**.

See Also

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace

RoutingOptions.CrossingCost Property

Gets or sets a value added to the total cost of a route which causes a link to cross another link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public byte CrossingCost { get; set; }
```

Visual Basic Copy Code

```
Public Property CrossingCost As Byte
```

Property Value

A byte value specifying the crossing cost. The default is 4.

Remarks

This is a penalty value added to the total cost of an evaluated link route if it crosses another link. The routing algorithm aims to find paths that have a minimal cost, so assigning a greater value to **CrossingCost** leads to fewer link intersections. At this time **CrossingCost** processing is implemented only for links with Shape set to Cascading.

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace
LengthCost Property
NodeVicinityCost Property
TurnCost Property

RoutingOptions.Distance Property

Gets a heuristic delegate function that returns the real distance sqrt(dx^2 + dy^2) between two pieces of the routing grid.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static RouteHeuristics Distance { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Distance As RouteHeuristics
```

Property Value

A predefined RouteHeuristics delegate instance.

Remarks

While generating a path, the routing algorithm evaluates pieces of the routing grid adjacent to the current one. It takes into account the cost for passing trough a piece and adds to that cost a heuristic value calculated by a RouteHeuristics delegate. So the smaller heuristic value a piece has, the greater the chance the found route to go through that piece.

Distance is a predefined delegate that assigns to pieces a heuristic value equaling the piece distance to the target. Thus of the four pieces adjacent to the current one, the piece closest to the target has the smallest value and the route generation continues through it. **Distance** is the default value of the RouteHeuristics property.

Example

The following sample demonstrates how to use this property:

C# Copy Code

```
diagram.RoutingOptions.RouteHeuristics = RoutingOptions.Distance;
```

Visual Basic Copy Code

```
Diagram.RoutingOptions.RouteHeuristics = RoutingOptions.Distance
```

See Also

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace
DistSquare Property
MaxAbs Property

RoutingOptions.DistSquare Property

Gets a heuristic delegate function that returns the square distance dx^2 + dy^2 as a cost evaluation of the distance between two pieces of the routing grid.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static RouteHeuristics DistSquare { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property DistSquare As RouteHeuristics
```

Property Value

A predefined RouteHeuristics delegate instance.

Remarks

While generating a path, the routing algorithm evaluates pieces of the routing grid adjacent to the current one. It takes into account the cost for passing trough a piece and adds to that cost a heuristic value calculated by a RouteHeuristics delegate. So the smaller heuristic value a piece has, the greater the chance the found route to go through that piece.

DistSquare is a predefined delegate that assigns to pieces a heuristic value equaling the piece distance to the target raised to the second power. **DistSquare** can be assigned to the RouteHeuristics property. By returning larger values than the default heuristic

function Distance, it makes the prediction part of the routing algorithm have greater impact on the evaluated routes.That would lead to faster path-finding, but the real cost functions might have less impact and thus the quality of the found routes could be low.

Example

The following sample demonstrates how to use this property:

C# Copy Code

```
diagram.RoutingOptions.RouteHeuristics = RoutingOptions.DistSquare;
```

Visual Basic Copy Code

```
Diagram.RoutingOptions.RouteHeuristics = RoutingOptions.DistSquare
```

See Also

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace
MaxAbs Property

RoutingOptions.DontOptimizeLongRoutes Property

Gets or sets a value indicating whether long routes don't have their number of segments minimized in order to save up processing time.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool DontOptimizeLongRoutes { get; set; }
```

Visual Basic Copy Code

```
Public Property DontOptimizeLongRoutes As Boolean
```

Property Value

true to disable route optimization for long links; otherwise, **false**. The default is **false**.

Remarks

Segment optimization done on routed links might need much processing time. The control allows disabling that optimization for long links. That would make the found routes have a "staircase" pattern when they run diagonally.

See Also

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace

RoutingOptions.EndOrientation Property

Gets or sets the desired orientation of the last segments of routed links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Orientation EndOrientation { get; set; }
```

Visual Basic

```
Public Property EndOrientation As Orientation
```

Property Value

A member of the Orientation enumeration. The default value is **Auto**.

Remarks

For some diagrams it might be desirable that first and last segments of links always have a specific direction. For example, in database ER diagrams links usually connect to table rows on the left- or right-hand sides of tables; in that case their end segments must be horizontal. **EndOrientation** specifies what orientation of links' last segments to be applied by the routing algorithm.

See Also

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace
StartOrientation Property

RoutingOptions.EndPointsOffset Property

Gets or sets the minimum number of routing grid cells the end segments of links should occupy before they are allowed to bend.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public int EndPointsOffset { get; set; }
```

Visual Basic

```
Public Property EndPointsOffset As Integer
```

Property Value

Number of routing grid cells the end segments of links should occupy before a bend is allowed. The default value is 0.

Remarks

Set this property to a value greater than 0 to ensure the first bend the link makes is not too close to the node boundaries.

See Also

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace
GridSize Property

RoutingOptions.GridSize Property

Gets or sets the size of the pieces of the routing grid.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public double GridSize { get; set; }
```

Visual Basic

```
Public Property GridSize As Double
```

Property Value

A **double** value specifying the size of the pieces of the routing grid. The default is 4.

Remarks

A smaller size of routing grid pieces helps finding more precise paths, however since the number of pieces increases, there would be more time needed to find a path.

For internal use.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public bool IgnoreAnchoring { get; }
```

Visual Basic

```
Public ReadOnly Property IgnoreAnchoring As Boolean
```

Property Value

See Also

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace

RoutingOptions.LengthCost Property

Gets or sets a value added to the total cost of a route for each piece of the routing grid occupied by the route.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public byte LengthCost { get; set; }
```

Visual Basic

```
Public Property LengthCost As Byte
```

Property Value

A byte value specifying the length cost. The default is 2.

Remarks

This is a penalty value added to the total cost of an evaluated link route for each piece of the routing grid it occupies. The routing algorithm aims to find paths that have a minimal cost, so assigning a greater value to **LengthCost** leads to generating shorter paths.

See Also

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace
CrossingCost Property
NodeVicinityCost Property
TurnCost Property

RoutingOptions.MaxAbs Property

Gets a heuristic delegate function that returns max(dx, dy) as a cost evaluation of the distance between two pieces of the routing grid.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static RouteHeuristics MaxAbs { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property MaxAbs As RouteHeuristics
```

Property Value

A predefined RouteHeuristics delegate instance.

Remarks

While generating a path, the routing algorithm evaluates pieces of the routing grid adjacent to the current one. It takes into account the cost for passing trough a piece and adds to that cost a heuristic value calculated by a RouteHeuristics delegate function. So the smaller heuristic value a piece has, the greater the chance the found route to go through that piece.

MaxAbs is a predefined delegate that assigns to pieces the higher value from the horizontal or vertical -only distances between a piece and the target. **MaxAbs** can be assigned to the RouteHeuristics property. By returning smaller values than the default heuristic function Distance, it makes the prediction part of the routing algorithm have less impact on the evaluated routes. That might lead to slower path-finding, but the real cost functions would have greater impact and thus the quality of the found routes could be higher.

RoutingOptions.NodeVicinityCost Property

Gets or sets a value added to the total cost of a route if the route passes too close to a node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public byte NodeVicinityCost { get; set; }
```

Visual Basic Copy Code

```
Public Property NodeVicinityCost As Byte
```

Property Value

A byte value specifying the node vicinity cost. The default is 2.

Remarks

This is a penalty value added to the total cost of an evaluated link route if it passes too close to a node. The routing algorithm aims to find paths that have a minimal cost, so assigning a greater value to **NodeVicinityCost** makes links avoid passing close to nodes. The size of the buffer area around nodes in which passing links get a penalty cost is set via NodeVicinitySize.

LengthCost Property
TurnCost Property

RoutingOptions.NodeVicinitySize Property

Gets or sets the size of a buffer zone around a node for which routes get a penalty cost if they pass through it.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double NodeVicinitySize { get; set; }
```

Visual Basic Copy Code

```
Public Property NodeVicinitySize As Double
```

Property Value

A **double** value specifying the size of the buffer area in which passing routes receive a penalty cost. The default is 12.

Remarks

The pieces of the routing grid that are closest to a node have the value of NodeVicinityCost assigned as their cost. The outer pieces of the buffer zone are assigned a portion of **NodeVicinityCost** proportional to their distance to the node.

RoutingOptions.PolylineRouting Property

Gets or sets a value indicating whether the segments of Polyline links should be oriented orthogonally to node's borders and each other.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PolylineRouting PolylineRouting { get; set; }
```

Visual Basic

```
Public Property PolylineRouting As PolylineRouting
```

Property Value

A member of the PolylineRouting enumeration. The default value is **AllOrthogonal**.

Remarks

This property is valid only for links whose Shape is set to Polyline.

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace

RoutingOptions.RouteHeuristics Property

Gets or sets a heuristic function used to evaluate the distance between two pieces of the routing grid.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public RouteHeuristics RouteHeuristics { get; set; }
```

Visual Basic

```
Public Property RouteHeuristics As RouteHeuristics
```

Property Value

A RouteHeuristics delegate used to evaluate the distance from a current routing grid piece to the target one. The default is Distance.

Remarks

While generating a path, the routing algorithm evaluates pieces of the routing grid adjacent to the current one. It takes into account the cost for passing trough a piece and adds to that cost a heuristic value calculated by **RouteHeuristics**. So the smaller heuristic value a piece has, the greater the chance the found route to go through that piece.

There are three predefined heuristic functions that can be assigned to **RouteHeuristics**: Distance, DistSquare and MaxAbs. All of them assign to pieces heuristic values that are larger for larger distances to the target. Thus of the four pieces adjacent to the current one, the piece closest to the target has the smallest value and the route generation continues through it.

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace

RoutingOptions.StartOrientation Property

Gets or sets the desired orientation of the first segments of routed links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public Orientation StartOrientation { get; set; }
```

Visual Basic Copy Code

```
Public Property StartOrientation As Orientation
```

Property Value

A member of the Orientation enumeration. The default is **Auto**.

Remarks

For some diagrams it might be desirable that first and last segments of links always have a specific direction. For example, in database ER diagrams links usually connect to table rows on the left- or right-hand sides of tables; in that case their end segments must be horizontal. **StartOrientation** specifies what orientation of links' first segments to be applied by the routing algorithm.

EndOrientation Property

RoutingOptions.TriggerRerouting Property

Gets or sets a value indicating under what circumstances links are rerouted automatically.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public RerouteLinks TriggerRerouting { get; set; }
```

Visual Basic Copy Code

```
Public Property TriggerRerouting As RerouteLinks
```

Property Value

A member of the RerouteLinks enumeration. The default is **WhenModified**.

See Also

RoutingOptions Members
RoutingOptions Class
MindFusion.Diagramming Namespace

RoutingOptions.TurnCost Property

Gets or sets a value added to the total cost of a route if it makes a turn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public byte TurnCost { get; set; }
```

Visual Basic Copy Code

```
Public Property TurnCost As Byte
```

Property Value

A byte value specifying the turn cost. The default is 4.

Remarks

This is a penalty value added to the total cost of an evaluated link route for each turn it makes. The routing algorithm aims to find paths that have a minimal cost, so assigning a greater value to **TurnCost** leads paths that make less turns (hence they have less segments).

RowEventArgs Members

Contains the arguments passed to handlers of table row-related events, such as TableSectionCollapsed and TableSectionExpanded.

The following tables list the members exposed by the RowEventArgs type.

Public Constructors

	Name	Description
	RowEventArgs	Initializes a new instance of the **RowEventArgs** class.

Public Properties

	Name	Description
	RowIndex	Gets the index of the table row for which the event has been raised.
	Table	Get the table for which the event has been raised.

See Also

RowEventArgs Constructor

Initializes a new instance of the RowEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public RowEventArgs (
    TableNode table,
    int rowIndex
)
```

Visual Basic Copy Code

```
Public New ( _
    table As TableNode, _
    rowIndex As Integer _
)
```

Parameters

table
The TableNode related to the event.

rowIndex
The zero-based index of the table row related to the event.

See Also

RowEventArgs Class
MindFusion.Diagramming Namespace

RowEventArgs Properties

RowEventArgs.RowIndex Property

Gets the index of the table row for which the event has been raised.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int RowIndex { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property RowIndex As Integer
```

Property Value

An integer value specifying the row's index.

See Also

RowEventArgs Members
RowEventArgs Class

RowEventArgs.Table Property

Get the table for which the event has been raised.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode Table { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Table As TableNode
```

Property Value

An instance of the TableNode class.

SaveToStringFormat Enumeration

Specifies in what format to save the diagram when generating a string using the SaveToString method.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum SaveToStringFormat
```

Visual Basic Copy Code

```
Public Enum SaveToStringFormat
```

Members

	Member name	Description
	Xml	Indicates a non-compressed XML output.
	CompressedXml	Indicates a compressed XML output.
	Json

ScriptHelper.ApplyLayout Method

Applies the specified layout to the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ApplyLayout (
    Object layout
)
```

Visual Basic Copy Code

```
Public Sub ApplyLayout( _
    layout As Object _
)
```

Parameters

layout
An instance of one of the layout classes that represents the layout to perform on the underlying diagram.

ScriptHelper.CreateObject Method

Creates a MvcDiagram object given its class name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object CreateObject (
    string className
)
```

Visual Basic Copy Code

```
Public Function CreateObject( _
    className As String _
) As Object
```

Parameters

className
The class name of the object to create.

Return Value

A reference to the MvcDiagram object of the specified class.

ScriptHelper.CreateSolidBrush Method

Creates a solid brush with the specified color components.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush CreateSolidBrush (
    int alpha,
    int red,
    int green,
    int blue
)
```

Visual Basic Copy Code

```
Public Function CreateSolidBrush( _
    alpha As Integer, _
    red As Integer, _
    green As Integer, _
    blue As Integer _
) As Brush
```

Parameters

alpha
The alpha factor of the solid brush color.

red
The red component of the solid brush color.

green
The green component of the solid brush color.

blue
The blue component of the solid brush color.

Return Value

An instance of the MindFusion.Drawing.SolidBrush that represents the newly created brush.

ScriptHelper.NodesIntersect Method

Calculates whether the specified nodes' outlines intersect.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool NodesIntersect (
    DiagramNode n1,
    DiagramNode n2
)
```

Visual Basic Copy Code

```
Public Function NodesIntersect( _
    n1 As DiagramNode, _
    n2 As DiagramNode _
) As Boolean
```

Parameters

n1
The first DiagramNode to check.

n2
The second **DiagramNode** to check.

Return Value

true if the outlines of the specified nodes intersect; otherwise, **false**.

ScriptHelper.ShapeTemplateFromId Method

Returns the Shape having the specified identifier.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape ShapeTemplateFromId (
    string shapeId
)
```

Visual Basic Copy Code

```
Public Function ShapeTemplateFromId( _
    shapeId As String _
) As Shape
```

Parameters

shapeId
The id of the shape to create.

Return Value

An instance of the Shape class.

Scrollable Members

Interface used by scrollbars to interact with their containing nodes.

The following tables list the members exposed by the Scrollable type.

Public Methods

	Name	Description
	CreateScrollCommand	Creates a Command -derived object that can be used to undo the scroll operation.
	GetScrollbarLargeChange	Gets the amount to scroll by when the user clicks above or below the scrollbar thumb.
	GetScrollbarMaximum	Gets the maximum scroll position.
	GetShape	Returns the node's shape.
	IntegralScrollMode	Checks if the scrollbar should report only integer values as scroll positions.
	UpdateScrollPosition	Updates the node's scroll position from scrollbar's value.

Scrollable Methods

Scrollable.CreateScrollCommand Method

Creates a Command -derived object that can be used to undo the scroll operation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
Command CreateScrollCommand ()
```

Visual Basic Copy Code

```
Function CreateScrollCommand () As Command
```

Return Value

A **Command** object that can be used to undo the scroll operation. Target nodes return different commands depending on the type of their contents, e.g. ScrollContainerCmd for scrolling child nodes inside ContainerNode or ScrollTableCmd for scrolling rows of TableNode.

Scrollable.GetScrollbarLargeChange Method

Gets the amount to scroll by when the user clicks above or below the scrollbar thumb.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
double GetScrollbarLargeChange (
    bool vertical
)
```

Visual Basic Copy Code

```
Function GetScrollbarLargeChange( _
    vertical As Boolean _
) As Double
```

Parameters

vertical
true if scrolling using a vertical scrollbar, or **false** if horizontal one.

Return Value

A **double** value specifying the amount to scroll.

See Also

Scrollable.GetScrollbarMaximum Method

Gets the maximum scroll position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
double GetScrollbarMaximum (
    bool vertical
)
```

Visual Basic Copy Code

```
Function GetScrollbarMaximum( _
    vertical As Boolean _
) As Double
```

Parameters

vertical
true if scrolling using a vertical scrollbar, or **false** if horizontal one.

Return Value

The maximum scroll position for specified scroll direction.

See Also

Scrollable Interface
MindFusion.Diagramming Namespace

Scrollable.GetShape Method

Returns the node's shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
SimpleShape GetShape ()
```

Visual Basic Copy Code

```
Function GetShape () As SimpleShape
```

Return Value

A member of the SimpleShape enumeration.

Scrollable Members
Scrollable Interface
MindFusion.Diagramming Namespace

Scrollable.IntegralScrollMode Method

Checks if the scrollbar should report only integer values as scroll positions.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
bool IntegralScrollMode ()
```

Visual Basic Copy Code

```
Function IntegralScrollMode () As Boolean
```

Return Value

true if the scroll target expects integer values for scroll offset, or **false** otherwise.

See Also

Scrollable Members
Scrollable Interface
MindFusion.Diagramming Namespace

Scrollable.UpdateScrollPosition Method

Updates the node's scroll position from scrollbar's value.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
void UpdateScrollPosition (
    double newValue,
    bool vertical
)
```

Visual Basic Copy Code

```
Sub UpdateScrollPosition( _
    newValue As Double, _
    vertical As Boolean _
)
```

Parameters

newValue

A **double** value specifying scroll offset.

vertical

true if scrolling using a vertical scrollbar, or **false** if horizontal one.

See Also

Scrollable Members
Scrollable Interface

Selection Class

Represents a set of items selected in the diagram document.

Syntax

C# Copy Code

```
public class Selection : DiagramItem
```

Visual Basic Copy Code

```
Public Class Selection
    Inherits DiagramItem
```

Remarks

In a diagram document, several items can be selected simultaneously. If more than one item is selected, the compound set of selected items is handled by an instance of the **Selection** class.
