Items in the selection can be of any element type. The Items property gives a collection of all the items in the selection. You can get type-safe access to items of specific class by using the Links and Nodes collections properties.

Users can select multiple items by drawing a selection rectangle. Depending on the **DiagramView**'s **Behavior**, this is done either by simply dragging the mouse, or by holding CTRL down while dragging the mouse. Depending on the IncludeItemsIfIntersect value, items are selected if they are entirely inside the drawn selection rectangle, or if at least a part of them is inside the rectangle. It is possible to prevent users from selecting more than one items at the same time by setting AllowMultipleSelection to **false**.

Items can be always added or removed programmatically to selection by calling the AddItem and RemoveItem methods. Selection state of an item can be toggled, getting deselected from selected and vice versa, by calling the Toggle method. All items in the selection are deselected if Clear is invoked.

Use the Selected property of the DiagramItem class to determine whether a particular item is selected. The Selection's GetSize method returns how many items are selected. Bounds returns the rectangle that bounds all selected items.

The visual style of multiple selection is defined by the Style property. For example selection might be painted as a dashed rectangle or a semi-transparent filled rectangle.

Selection Members

Represents a set of items selected in the diagram document.

The following tables list the members exposed by the Selection type.

Public Constructors

	Name	Description
	Selection	Initializes a new instance of the **Selection** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowMultipleSelection	Gets or sets a value indicating whether more than one items can be selected simultaneously.

	Bounds	Gets the rectangle that bounds all selected items.
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	ExtendMode	Gets or sets whether to prevent deselecting currently selected items when they are outside of a newly drawn lasso rectangle.
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncludeItemsIfIntersect	Gets or sets a value indicating which items are selected when drawing a selection rectangle.
	Items	Gets a collection of all selected items.
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Links	Gets the collection of all links in the selection.
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	Nodes	Gets a collection of all selected nodes.
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	SetsDirtyFlag	Gets or sets a value indicating whether the diagram's Dirty flag should be set when selection changes.
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)

	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets a value indicating how to display multiple selection of items.
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	True if this is a top-level item in the diagram, or false if it is inside a container. (Inherited from DiagramItem.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AddItem	Adds a new item to the current selection.
	Animate	Animates the item. (Inherited from DiagramItem.)
	Change	Selects an item and deselects all others.
	Clear	Removes all items from the selection.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	ContainsPoint	Overloaded.
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override.
	DrawHandles	DiagramItem.DrawHandles override.
	DrawInRect	(Inherited from DiagramItem.)

	DrawShadow	DiagramItem.DrawShadow override.
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetOutlinePoly	Gets a polygon approximating the outline of this object. (Inherited from DiagramItem.)
	GetRepaintRect	DiagramItem.GetRepaintRect override.
	GetRotatedBounds	Gets the bounding rectangle of this item when it is rotated. (Inherited from DiagramItem.)
	GetSize	Gets the number of selected items.
	GetToolTip	Gets the tooltip that should be displayed for this item at the specified point. (Inherited from DiagramItem.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override.
	HitTestManipulators	Finds the **Manipulator** object located at the specified point. (Inherited from DiagramItem.)
	LabelFromPoint	Returns the ItemLabel located at specified point. (Inherited from DiagramItem.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	RemoveItem	Removes an item from the selection.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	Toggle	Toggles the selection state of an item.
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description

	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override.
	AllowModify	DiagramItem.AllowModify override.
	CancelModify	DiagramItem.CancelModify override.
	CompleteCreate	DiagramItem.CompleteCreate override.
	CompleteModify	DiagramItem.CompleteModify override.
	CreateProperties	Creates an item property set corresponding to the type of this diagram item. (Inherited from DiagramItem.)
	CreateState	Creates an item state corresponding to the type of this diagram item. (Inherited from DiagramItem.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	DiagramItem.FreeResources override.
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	LoadFromJson	Loads the item from a JSON object. (Inherited from DiagramItem.)
	LoadFromXml	Loads the item content from an XML element. (Inherited from DiagramItem.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	Called when the item is added to a Diagram, either by the user, programmatically or via undo / redo. (Inherited from DiagramItem.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	OnRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or via undo / redo. (Inherited from DiagramItem.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnZoomChanged	Called when the diagram's **ZoomFactor** changes. (Inherited from DiagramItem.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	Restores the properties of this diagram item. (Inherited from DiagramItem.)
	RestoreState	Restores the state of this diagram item. (Inherited from DiagramItem.)

	SaveProperties	Saves the properties of this diagram item. (Inherited from DiagramItem.)
	SaveState	Saves the state of this diagram item. (Inherited from DiagramItem.)
	SaveToJson	Saves the item as a JSON object. (Inherited from DiagramItem.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramItem.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpanded	Sets whether the item is in expanded or collapsed state. (Inherited from DiagramItem.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	StartCreate	DiagramItem.StartCreate override.
	StartModify	DiagramItem.StartModify override.
	UpdateCreate	Invoked during interactive creation of this item. (Inherited from DiagramItem.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateModify	DiagramItem.UpdateModify override.

Selection Class
MindFusion.Diagramming Namespace

Selection Constructor

Initializes a new instance of the Selection class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Selection (
    Diagram parent,
    bool toolMode,
    IDiagramView zoomTarget
)
```

Visual Basic Copy Code

```
Public New ( _
    parent As Diagram, _
    toolMode As Boolean, _
    zoomTarget As IDiagramView _
)
```

Parameters

parent
The Diagram instance.

toolMode
true if this object is used only to draw lasso, or **false** if used to select diagram items.

zoomTarget
The diagram view zoomed by lasso tool.

Selection Class
MindFusion.Diagramming Namespace

Selection Methods

Selection.AddItem Method

Adds a new item to the current selection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void AddItem (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Sub AddItem( _
    item As DiagramItem _
)
```

Parameters

item
The DiagramItem to be added to the selection.

Remarks

This method adds a new item to the selection. It also deactivates the ActiveItem, if any, and makes the newly added item the active one.

Clear Method

Selection.AllowCreate Method

DiagramItem.AllowCreate override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override bool AllowCreate (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Function AllowCreate( _
    current As Point, _
    ist As InteractionState _
) As Boolean
```

Parameters

current

ist

Return Value

Selection.AllowModify Method

DiagramItem.AllowModify override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override bool AllowModify (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Function AllowModify( _
    current As Point, _
    ist As InteractionState _
) As Boolean
```

Parameters

current

ist

Return Value

See Also

Selection Members
Selection Class

Selection.CancelModify Method

DiagramItem.CancelModify override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void CancelModify (
    InteractionState ist
```

```
)
```

Visual Basic Copy Code

```
Protected Overrides Sub CancelModify( _
    ist As InteractionState _
)
```

Parameters

ist

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.Change Method

Selects an item and deselects all others.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Change (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Sub Change( _
    item As DiagramItem _
)
```

Parameters

item

The DiagramItem which should be made active.

Remarks

Call this method to select an item and make it the ActiveItem. The method doesn't let you select locked items.

Clear Method

Selection.Clear Method

Removes all items from the selection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Clear ()
```

Visual Basic Copy Code

```
Public Sub Clear ()
```

Remarks

Call **Clear** to deselect all items. The items are not deleted. The method also sets the diagram's ActiveItem to **null** (**Nothing** in Visual Basic).

Selection.ContainsPoint Method (Point)

DiagramItem.ContainsPoint override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override bool ContainsPoint (
    Point point
)
```

Visual Basic

```
Public Overrides Function ContainsPoint( _
    point As Point _
) As Boolean
```

Parameters

point
The point to check.

Return Value

See Also

ContainsPoint Method Overload List
Selection Members

Selection.ContainsPoint Method (Point, Double)

DiagramItem.ContainsPoint override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool ContainsPoint (
    Point point,
    double threshold
)
```

Visual Basic Copy Code

```
Public Overrides Function ContainsPoint( _
    point As Point, _
    threshold As Double _
) As Boolean
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** specifying the logical coordinates of a diagram point.

threshold
Specifies the size of the area around the item outlines where the point is still considered inside the item.

Return Value

true it this item contains the specified point; otherwise, **false**.

Selection.DrawHandles Method

DiagramItem.DrawHandles override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawHandles (
    IGraphics graphics,
    HandlesVisualStyle style1,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawHandles( _
    graphics As IGraphics, _
    style1 As HandlesVisualStyle, _
    options As RenderOptions _
)
```

Parameters

graphics

style1

options

See Also

Selection Members
Selection Class

Selection.DrawShadow Method

DiagramItem.DrawShadow override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawShadow (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawShadow( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics

An IGraphics object where the shadow should be rendered.

options

A RenderOptions object specifying options for the drawing operation.

Selection.GetRepaintRect Method

DiagramItem.GetRepaintRect override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Rect GetRepaintRect (
    bool connected
)
```

Visual Basic Copy Code

```
Public Overrides Function GetRepaintRect( _
    connected As Boolean _
) As Rect
```

Parameters

connected

Return Value

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.GetSize Method

Gets the number of selected items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int GetSize ()
```

Visual Basic Copy Code

```
Public Function GetSize () As Integer
```

Return Value

An integer value indicating the size of the collection.

Remarks

Call this method to get the number of selected items, including both nodes and links.

Selection.RemoveItem Method

Removes an item from the selection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RemoveItem (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Function RemoveItem( _
    item As DiagramItem _
) As Boolean
```

Parameters

item

The DiagramItem to be removed from the selection.

Return Value

true if the item has been successfully removed; otherwise, **false**.

Remarks

Call this method to deselect an item. Note that the item is not deleted, but just removed from the selection.

Selection.Toggle Method

Toggles the selection state of an item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Toggle (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Sub Toggle( _
    item As DiagramItem _
)
```

Parameters

item
The DiagramItem whose selection state should be changed.

Remarks

Call this method to toggle an item's selection state. The method selects the diagram item passed as argument if previously it was deselected. If the item was selected, the method deselects it.

Selection Properties

Selection.AllowMultipleSelection Property

Gets or sets a value indicating whether more than one items can be selected simultaneously.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowMultipleSelection { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowMultipleSelection As Boolean
```

Property Value

A boolean flag indicating whether multiple items can be selected simultaneously by the user.

Remarks

The property controls whether multiple items can be selected interactively. If it is disabled, multiple items can still be selected programmatically.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.Bounds Property

Gets the rectangle that bounds all selected items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect Bounds { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Bounds As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** instance.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.ExtendMode Property

Gets or sets whether to prevent deselecting currently selected items when they are outside of a newly drawn lasso rectangle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ExtendMode { get; set; }
```

Visual Basic Copy Code

```
Public Property ExtendMode As Boolean
```

Property Value

false to deselect items located out of newly drawn lasso rectangle, or **true** to keep them selected. The default value is **false**.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.IncludeItemsIfIntersect Property

Gets or sets a value indicating which items are selected when drawing a selection rectangle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool IncludeItemsIfIntersect { get; set; }
```

Visual Basic Copy Code

```
Public Property IncludeItemsIfIntersect As Boolean
```

Property Value

true to select items that intersect the drawn selection rectangle; **false** to select items only if they are entirely inside the selection rectangle. The default is **true**.

Remarks

The value of this property is considered when users draw a selection rectangle using a pointing device. By default, all items inside the drawn rectangle and the ones that are only partially inside it are selected. Set the property to **false** to let users select items only when the items are entirely inside the selection rectangle.

Selection.Items Property

Gets a collection of all selected items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItemCollection Items { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Items As DiagramItemCollection
```

Property Value

An instance of the DiagramItemCollection class that represents the selected diagram items.

Remarks

You can select items programmatically by adding them to this collection.

See Also

Selection Members

Nodes Property
Links Property

Selection.Links Property

Gets the collection of all links in the selection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLinkCollection Links { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Links As DiagramLinkCollection
```

Property Value

An instance of the DiagramLinkCollection class that represents the selected diagram items.

Remarks

You can select links programmatically by adding them to this collection.

Nodes Property

Selection.Nodes Property

Gets a collection of all selected nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNodeCollection Nodes { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Nodes As DiagramNodeCollection
```

Property Value

An instance of the DiagramNodeCollection class that represents the nodes in the selection.

Remarks

You can select nodes programmatically by adding them to this collection.

Selection.SetsDirtyFlag Property

Gets or sets a value indicating whether the diagram's Dirty flag should be set when selection changes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool SetsDirtyFlag { get; set; }
```

Visual Basic Copy Code

```
Public Property SetsDirtyFlag As Boolean
```

Property Value

true to set the flag when selection changes, otherwise **false**. The default value is **true**.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.Style Property

Gets or sets a value indicating how to display multiple selection of items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public new SelectionStyle Style { get; set; }
```

Visual Basic Copy Code

```
Public Shadows Property Style As SelectionStyle
```

Property Value

A member of the SelectionStyle enumeration. The default is **SelectionHandles**.

Remarks

The property specifies how multiple selection is presented visually to users - with manipulation handles painted around each item or with a rectangle painted around all items.

SelectionCopy Constructor

Initializes a new instance of the SelectionCopy class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SelectionCopy (
    DiagramItemCollection items,
    DiagramItemCollection originalItems,
    GroupCollection groups
)
```

Visual Basic Copy Code

```
Public New ( _
    items As DiagramItemCollection, _
    originalItems As DiagramItemCollection, _
    groups As GroupCollection _
)
```

Parameters

items
A collection containing the item copies.

originalItems
A collection containing the original items.

groups
A collection containing the group copies.

Remarks

This constructor supports the MvcDiagram infrastructure and is not intended to be used directly from your code.

ShadowsStyle Enumeration

Enumerates possible shadows-drawing styles.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum ShadowsStyle
```

Visual Basic

```
Public Enum ShadowsStyle
```

Members

	Member name	Description
	None	No shadows are drawn.
	OneLevel	All shadows are drawn at the lowest z-level, and appear to be on one level.
	ZOrder	Every shadows is drawn just below its item, possibly covering other items.

Remarks

This enumeration provides the possible values for the ShadowsStyle property of the Diagram class.

See Also

MindFusion.Diagramming Namespace
ShadowsStyle Property

Shape Class

An instance of this class represents a shape defined through a series of arc, line and Bézier segments. The segments can be a part of the shape outline, in which case they define the part of the shape is filled, used for hit-testing and for aligning links to the node edges. Segments can also be added as decoration elements, in which case they only affect the appearance of a ShapeNode.

Syntax

C#

```
public class Shape : ICloneable
```

Visual Basic

```
Public Class Shape
    Implements ICloneable
```

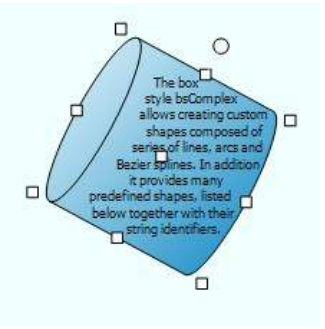
Remarks

Shape Definitions

The **Shape** class provides the means for defining complex node shapes. With its help you can design any shape composed of lines, arcs and Bézier-curves. A shape template should contain an outline to be used for hit testing, clipping and finding intersections with other items. If the outline is not defined, the rectangle specified by the **Bounds** property of nodes is used for hit-testing. Optionally, shapes can contain decoration elements and text region definitions. Decorations are visual elements that do not take part in clipping, and are used for hit-testing only if DecorationHitTesting is enabled. Text regions are the parts of shapes in which node's text is laid out and rendered.

Predefined Shapes

MvcDiagram provides a set of about 100 predefined shape templates accessible through the static Shapes collection and the FromId method of **Shape**. A shape template can be applied to a node by assigning it to the Shape property of shape nodes. The predefined shapes are also exposed as properties of the Shapes class.



Custom Shapes

There are several Shape constructor overrides you might choose from, depending on the complexity of the shapes you want to create. They take arrays of ElementTemplate objects as arguments, which define the outline, decorations and text region definitions. Templates are described with coordinates expressed as percentage of a shape node's area. It is also possible to associate an image with a shape definition by means of the Image property and to define the area in which the image is displayed by ImageRectangle.

Dynamic Shapes

Shapes defined via ElementTemplate objects are scaled proportionally to the size of nodes. If shape elements should scale non-uniformly, use the Shape(formula) constructor to define shapes through Visio-like formulas that take into consideration the current width and height of nodes. Another constructor takes a CreatePathDelegate parameter that can be used to define shapes via .NET functions.

A formula shape can be parameterized by adding ShapeControlPoint objects to the shape's ControlPoints collection. The control point positions are passed as arguments to the shape scripts, where they can be used to modify the node's appearance. For example, the following code defines a rounded rectangle shape, whose corner radius can be modified by users via the control point.

C# Copy Code

```
// a rounded rectangle shape, with an arc at each corner
string roundRect = @"
    r = Min(Width / 2, radius.X);
    MoveTo(r, 0);
    LineTo(Width - r, 0);
    ArcTo(Width, r, false, false, r, r);
    LineTo(Width, Height - r);
    ArcTo(Width - r, Height, false, false, r, r);
    LineTo(r, Height);
    ArcTo(0, Height - r, false, false, r, r);
    LineTo(0, r);
    ArcTo(r, 0, false, false, r, r);
    ";

var myRect = new Shape(roundRect, "MyRect");

// add a control point for the 'radius' parameter
myRect.ControlPoints.Add(new ShapeControlPoint(
    "radius", 5, 1, 15, UnitType.Fixed, 0, 0, 0, UnitType.Fixed));
```

Shape Libraries

The **ShapeDesigner** tool included in the MvcDiagram suite lets you draw custom shapes and store them in shape libraries. A library file can be loaded into your application using the ShapeLibrary class. The definitions loaded from a shape library are automatically added to the Shapes collection and can be accessed through the FromId method, just as the predefined shapes.

Link Arrowheads

A **Shape** instance can be assigned to the HeadShape, BaseShape or IntermediateShape properties of a DiagramLink. When used for arrowheads, position (50, 0) in the shape definition corresponds to the arrowhead's tip point. Several predefined arrowhead shapes are provided as static properties of the ArrowHeads class.

Example

Here is how the DirectAccessStorage shape is defined in the MvcDiagram source code:

C# Copy Code

```
new Shape(

    // Outlines
    new ElementTemplate[]
    {
        new LineTemplate(10, 0, 90, 0),
        new ArcTemplate(80, 0, 20, 100, -90, 180),
        new LineTemplate(90, 100, 10, 100),
        new ArcTemplate(0, 0, 20, 100, 90, 180)
    },

    // Decorations
    new ElementTemplate[]
    {
        new ArcTemplate(0, 0, 20, 100, -90, 180)
    },

    // Text area
    new ElementTemplate[]
    {
        new LineTemplate(10, 0, 90, 0),
        new ArcTemplate(80, 0, 20, 100, -90, 180),
```

```
        new LineTemplate(90, 100, 10, 100),
        new BezierTemplate(10, 100, 35, 66, 35, 33, 10, 0)
    },

    FillMode.Winding, "DirectAccessStorage");
```

Visual Basic Copy Code

```
New Shape( _
    New ElementTemplate() _
    { _
        New LineTemplate(10, 0, 90, 0), _
        New ArcTemplate(80, 0, 20, 100, -90, 180), _
        New LineTemplate(90, 100, 10, 100), _
        New ArcTemplate(0, 0, 20, 100, 90, 180) _
    }, _
    New ElementTemplate() _
    { _
        New ArcTemplate(0, 0, 20, 100, -90, 180) _
    }, _
    New ElementTemplate() _
    { _
        New LineTemplate(10, 0, 90, 0), _
        New ArcTemplate(80, 0, 20, 100, -90, 180), _
        New LineTemplate(90, 100, 10, 100), _
        New BezierTemplate(10, 100, 35, 66, 35, 33, 10, 0) _
    }, _
    FillMode.Winding, "DirectAccessStorage")
```

Shape Members

An instance of this class represents a shape defined through a series of arc, line and Bézier segments. The segments can be a part of the shape outline, in which case they define the part of the shape is filled, used for hit-testing and for aligning links to the node edges. Segments can also be added as decoration elements, in which case they only affect the appearance of a ShapeNode.

The following tables list the members exposed by the Shape type.

Public Constructors

	Name	Description
	Shape	Overloaded. Initializes a new instance of the **Shape** class.

Public Properties

	Name	Description
	AnchorPattern	Gets or sets the default anchor pattern for nodes that use this shape.
	ControlPoints	A list of ShapeControlPoint objects that let users adjust a node's shape.
	DecorationHitTesting	Gets or sets a value indicating whether decoration lines should be considered when hit-testing.
	Decorations	Gets or sets a list with all decorations of this shape.
	DecorationsFormula	Gets or sets a formula describing the shape decorations depending on the current width and height of the node.

	DisplayName	Specifies the name that should be displayed for this shape in user interface objects, for example the **ShapeListBox** or **ShapeToolBar**.
	EnableOutline	Gets or sets a value indicating whether to enable the shape's outline.
	FillMode	Gets or sets a value indicating how areas are filled if the outline path of the shape intersects itself.
	Id	Gets or sets the shape identifier.
	Image	Gets or sets the image displayed in all instances of this shape.
	ImageLocation	Gets or sets the path to the file that contains the image displayed in this shape.
	ImageRectangle	Gets or sets the position of the images displayed in instances of this shape.
	IsArrowhead	Specifies if this shape is used as arrowhead.
	LinkSegmentInset	Specifies what length of link's line segment is drawn inside the arrowhead shape, expressed as percentage of arrowhead size.
	Outline	Gets or sets the outline of this shape.
	OutlineFormula	Gets or sets a formula describing the shape outline depending on the current width and height of the node.
	ShapeDecorations	Gets or sets the ShapeDecoration objects associated with this shape.
S	Shapes	Gets a read-only collection of all named shapes.
	TextArea	Gets or sets the outline of the text area of this shape.

Public Methods

	Name	Description
	Clone	Creates an exact copy of this shape.
	Draw	Overloaded. Draws this shape on an IGraphics surface.
	Equals	Checks whether this shape template is equivalent to the specified shape.
S	FromId	Returns a reference to the shape with the specified string identifier.
S	FromSvg	Overloaded. Creates a **Shape** from the outline of an SVG drawing.
	GetHitPath	Returns a **GraphicsPath** object corresponding to the outline of the specified shape when rotated at the specified angle. That **GraphicsPath** can be used for hit-testing and intersection checks.
	GetRenderingPath	Returns a **GraphicsPath** object corresponding to the outline of the shape when rotated at the specified angle. That **GraphicsPath** can be used when drawing the shape's outline.
	LoadFromXml	Loads the shape content from an XML element.
	SaveToXml	Saves the shape content into an XML element.
	ToString	Returns the identifier of this shape template.

Shape Class
MindFusion.Diagramming Namespace

Shape Constructor

Initializes a new instance of the Shape class.

Overload List

Name	Description
Shape (Byte[])	Initializes a new instance of the **Shape** class with the specified outline.
Shape (Byte[], String)	Initializes a new instance of the **Shape** class with the specified outline and id.
Shape (CreatePathDelegate, CreatePathDelegate, String)	Initializes a new instance of the **Shape** class with the specified outline and decorations callbacks and id.
Shape (CreatePathDelegate, String)	Initializes a new instance of the **Shape** class with the specified outline delegate and id.
Shape (ElementTemplate[], ElementTemplate[], ElementTemplate[], FillMode)	Initializes a new instance of the **Shape** class with the specified outline, decorations and text area.
Shape (ElementTemplate[], ElementTemplate[], ElementTemplate[], FillMode, String)	Initializes a new instance of the **Shape** class with the specified outline, decorations, text area and id.
Shape (ElementTemplate[], ElementTemplate[], ElementTemplate[], FillMode, String, ShapeDecoration[])	Initializes a new instance of the Shape class with the specified outline, decorations, text area and id.
Shape (ElementTemplate[], FillMode)	Initializes a new instance of the **Shape** class with the specified outline.
Shape (ElementTemplate[], FillMode, String)	Initializes a new instance of the **Shape** class with the specified outline and id.
Shape (String, String)	Initializes a new instance of the **Shape** class with the specified outline formula and id.
Shape (String, String, List(ShapeControlPoint), String)	Initializes a new instance of the **Shape** class with the specified outline and decorations formulas, control points and id.
Shape (String, String, String)	Initializes a new instance of the **Shape** class with the specified outline and decorations formulas and id.

Shape Class
MindFusion.Diagramming Namespace

Shape Constructor (Byte[])

Initializes a new instance of the Shape class with the specified outline.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape (
    byte[] outline
)
```

Visual Basic Copy Code

```
Public New ( _
    outline() As Byte _
)
```

Parameters

outline
An array containing even number of coordinate values, which define the points of the shape outline.

Remarks

The specified array should contain even number of values. Each odd value represents the X-coordinate and each even value represents the Y-coordinate of the corresponding point in the shape outline. The point coordinates are expressed in numbers in the interval [0..100] indicating the position of this point relative to the node's bounding rectangle.

Exceptions

Exception Type	Condition
ArgumentException	The specified array is a **null** reference (**Nothing** in Visual Basic), does not contain even number of elements or contains less than six arguments.

Shape Constructor Overload List
Shape Class
MindFusion.Diagramming Namespace

Shape Constructor (Byte[], String)

Initializes a new instance of the Shape class with the specified outline and id.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape (
    byte[] outline,
    string id
)
```

Visual Basic Copy Code

```
Public New ( _
    outline() As Byte, _
    id As String _
)
```

Parameters

outline

An array containing even number of coordinate values, which define the points of the shape outline.

id

The string identifier of the new shape.

Remarks

The specified array should contain even number of values. Each odd value represents the X-coordinate and each even value represents the Y-coordinate of the corresponding point in the shape outline. The point coordinates are expressed in numbers in the interval [0..100] indicating the position of this point relative to the node's bounding rectangle.

Exceptions

Exception Type	Condition
ArgumentException	The specified array is a **null** reference (**Nothing** in Visual Basic), does not contain even number of elements or contains less than six arguments.

```
public Shape (
    CreatePathDelegate outlineDelegate,
    CreatePathDelegate decorationsDelegate,
    string id
)
```

Visual Basic Copy Code

```
Public New ( _
    outlineDelegate As CreatePathDelegate, _
    decorationsDelegate As CreatePathDelegate, _
    id As String _
)
```

Parameters

outlineDelegate
A delegate called to generate **GraphicsPath** objects representing the shape outline.

decorationsDelegate
A delegate called to generate **GraphicsPath** objects representing the shape decorations.

id
The string identifier of the new shape.

See Also

Shape Constructor Overload List
Shape Class
MindFusion.Diagramming Namespace
ShapeData Class

Shape Constructor (CreatePathDelegate, String)

Initializes a new instance of the Shape class with the specified outline delegate and id.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape (
    CreatePathDelegate outlineDelegate,
    string id
)
```

Visual Basic Copy Code

```
Public New ( _
    outlineDelegate As CreatePathDelegate, _
```

```
    id As String _
)
```

Parameters

outlineDelegate

A delegate called to generate **GraphicsPath** objects representing the shape outline.

id

The string identifier of the new shape.

Example

This example creates a triangular shape:

C# Copy Code

```
Shape shape = new Shape(CreatePath, "my shape");

IGraphicsPath CreatePath(Rect shapeData)
{
    var path = GraphicsFactory.CreatePath();
    path.AddLine(10, 0, shapeData.Width, 10);
    path.AddLine(shapeData.Width, 10, shapeData.Width / 2, shapeData.Height);
    path.CloseFigure();
    return path;
}
```

Shape Constructor Overload List
Shape Class
MindFusion.Diagramming Namespace
ShapeData Class

Shape Constructor (ElementTemplate[], ElementTemplate[], ElementTemplate[], FillMode)

Initializes a new instance of the Shape class with the specified outline, decorations and text area.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape (
    ElementTemplate[] elements,
    ElementTemplate[] decorations,
    ElementTemplate[] textArea,
    FillMode fillMode
)
```

Visual Basic Copy Code

```
Public New ( _
    elements() As ElementTemplate, _
    decorations() As ElementTemplate, _
    textArea() As ElementTemplate, _
    fillMode As FillMode _
)
```

Parameters

elements

An array of shape template elements that define the outline of a shape. Can contain lines, arcs and Bézier curves.

decorations

An array of shape template elements that define shape decorations. Can contain lines, arcs and Bézier curves. Decorations are visual elements that do not take part in hit testing and clipping.

textArea

An array of shape template elements that define the region of a node in which text is laid out and rendered. Can contain lines, arcs and Bézier curves. Latter two are approximated to polygons by the text-formatting algorithm.

fillMode

Specifies how areas are filled if the outline path intersects itself.

MindFusion.Diagramming Namespace

Shape Constructor (ElementTemplate[], ElementTemplate[], ElementTemplate[], FillMode, String)

Initializes a new instance of the Shape class with the specified outline, decorations, text area and id.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape (
    ElementTemplate[] elements,
    ElementTemplate[] decorations,
    ElementTemplate[] textArea,
    FillMode fillMode,
    string id
)
```

Visual Basic Copy Code

```
Public New ( _
    elements() As ElementTemplate, _
    decorations() As ElementTemplate, _
    textArea() As ElementTemplate, _
    fillMode As FillMode, _
    id As String _
)
```

Parameters

elements

An array of shape template elements that define the outline of a shape. Can contain lines, arcs and Bézier curves.

decorations

An array of shape template elements that define shape decorations. Can contain lines, arcs and Bézier curves. Decorations are visual elements that do not take part in hit testing and clipping.

textArea

An array of shape template elements that define the region of a node in which text is laid out and rendered. Can contain lines, arcs and Bézier curves. Latter two are approximated to polygons by the text-formatting algorithm.

fillMode

Specifies how areas are filled if the outline path intersects itself.

id

The string identifier of the new shape.

Shape Constructor (ElementTemplate[], ElementTemplate[], ElementTemplate[], FillMode, String, ShapeDecoration[])

Initializes a new instance of the Shape class with the specified outline, decorations, text area and id.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape (
    ElementTemplate[] elements,
    ElementTemplate[] decorations,
    ElementTemplate[] textArea,
    FillMode fillMode,
    string id,
    ShapeDecoration[] closedDecorations
)
```

Visual Basic Copy Code

```
Public New ( _
    elements() As ElementTemplate, _
    decorations() As ElementTemplate, _
    textArea() As ElementTemplate, _
    fillMode As FillMode, _
    id As String, _
    closedDecorations() As ShapeDecoration _
)
```

Parameters

elements
An array of shape template elements that define the outline of a shape. Can contain lines, arcs and Bézier curves.

decorations
An array of shape template elements that define shape decorations. Can contain lines, arcs and Bézier curves. Decorations are visual elements that do not take part in hit testing and clipping.

textArea
An array of shape template elements that define the region of a node in which text is laid out and rendered. Can contain lines, arcs and Bézier curves. Latter two are approximated to polygons by the text-formatting algorithm.

fillMode
Specifies how areas are filled if the outline path intersects itself.

id
The string identifier of the new shape.

closedDecorations
An array of ShapeDecoration objects.

Shape Constructor Overload List
Shape Class
MindFusion.Diagramming Namespace

Shape Constructor (ElementTemplate[], FillMode)

Initializes a new instance of the Shape class with the specified outline.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape (
    ElementTemplate[] elements,
    FillMode fillMode
)
```

Visual Basic Copy Code

```
Public New ( _
    elements() As ElementTemplate, _
    fillMode As FillMode _
)
```

Parameters

elements
An array of shape template elements that define the outline of a shape. Can contain lines, arcs and Bézier curves.

fillMode
Specifies how areas are filled if the outline path intersects itself.

Example

C# Copy Code

```
diagram.DefaultShape = new Shape(
    new ElementTemplate[] {
        new LineTemplate(0, 100, 35, 0),
        new LineTemplate(35, 0, 100, 0),
        new LineTemplate(100, 0, 65, 100),
        new LineTemplate(65, 100, 0, 100) },
    FillMode.Winding);
```

Visual Basic Copy Code

```
diagram.DefaultShape = new Shape( _
    new ElementTemplate() { _
        new LineTemplate(0, 100, 35, 0), _
        new LineTemplate(35, 0, 100, 0), _
        new LineTemplate(100, 0, 65, 100), _
        new LineTemplate(65, 100, 0, 100) }, _
    FillMode.Winding)
```

See Also

Shape Constructor Overload List
Shape Class
MindFusion.Diagramming Namespace

Shape Constructor (ElementTemplate[], FillMode, String)

Initializes a new instance of the Shape class with the specified outline and id.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape (
    ElementTemplate[] elements,
    FillMode fillMode,
    string id
)
```

Visual Basic Copy Code

```
Public New ( _
    elements() As ElementTemplate, _
```

```
    fillMode As FillMode, _
    id As String _
)
```

Parameters

elements
Refers to an array of shape template elements that define the outline of a shape. Can contain lines, arcs and Bézier curves.

fillMode
Specifies how areas are filled if the outline path intersects itself.

id
The string identifier of the new shape.

See Also

Shape Constructor Overload List
Shape Class
MindFusion.Diagramming Namespace

Shape Constructor (String, String)

Initializes a new instance of the Shape class with the specified outline formula and id.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape (
    string outlineFormula,
    string id
)
```

Visual Basic Copy Code

```
Public New ( _
    outlineFormula As String, _
    id As String _
)
```

Parameters

outlineFormula
A string containing the formula that defines the shape.

id
The string identifier of the new shape.

Remarks

Shape formulas are small scripts that call one of the following functions to add graphics to the shape:

Function	Description
MoveTo (x,y)	Moves the current position to the specified point without drawing.
LineTo (x,y)	Draws a line from the current position to the specified point.
BezierTo (x1,y1,x2,y2,x3,y3)	Draws a Bezier curve from the current position to (x3,y3) using (x1,y1) and (x2,y2) as control points.
ArcTo (x,y,largeArc,clockwiseArc,rx,ry)	Draws an arc from the specified point to (x,y) where rx and ry are the ellipse radiuses and the arc flags are boolean values specifying which of the four possible arcs to draw.

Each of them starts drawing from the current position and changes the current position to their point argument after drawing. In addition, the scripts can access the current size of the node through the Width and Height variables.

Example

This sample creates an arrow shape with fixed shaft width and arrowhead length, which will still shrink when the node gets small due to the Min calls.

C# Copy Code

```
string outline = @"
    my = Height / 2;
    ah = Min(10, Height / 4);
    aw = Min(20, Width / 2);
    MoveTo(0, my - ah);
    LineTo(Width - aw, my - ah);
    LineTo(Width - aw, 0);
    LineTo(Width, my);
    LineTo(Width - aw, Height);
    LineTo(Width - aw, my + ah);
    LineTo(0, my + ah);
 ";
Shape shape = new Shape(outline, "my shape");
```

See Also

Shape Constructor Overload List
Shape Class
MindFusion.Diagramming Namespace
OutlineFormula Property

Shape Constructor (String, String, List(ShapeControlPoint), String)

Initializes a new instance of the Shape class with the specified outline and decorations formulas, control points and id.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape (
    string outlineFormula,
    string decorationsFormula,
    List<ShapeControlPoint> controlPoints,
    string id
)
```

Visual Basic Copy Code

```
Public New ( _
    outlineFormula As String, _
    decorationsFormula As String, _
    controlPoints As List(Of ShapeControlPoint), _
    id As String _
)
```

Parameters

outlineFormula
A string containing the formula that defines the shape.

decorationsFormula
A string containing the formula that defines the shape.

controlPoints
A list of ShapeControlPoint objects that let users adjust the shape.

id
The string identifier of the new shape.

Remarks

Shape formulas are small scripts that call one of the following functions to add graphics to the shape:

Function	Description
MoveTo (x,y)	Moves the current position to the specified point without drawing.
LineTo (x,y)	Draws a line from the current position to the specified point.
BezierTo (x1,y1,x2,y2,x3,y3)	Draws a Bezier curve from the current position to (x3,y3) using (x1,y1) and (x2,y2) as control points.
ArcTo (x,y,largeArc,clockwiseArc,rx,ry)	Draws an arc from the specified point to (x,y) where rx and ry are the ellipse radiuses and the arc flags are boolean values specifying which of the four possible arcs to draw.

Each of them starts drawing from the current position and changes the current position to their point argument after drawing. In addition, the scripts can access the current size of the node through the Width and Height variables.

Shape Methods

Shape.Clone Method

Creates an exact copy of this shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Clone ()
```

Visual Basic Copy Code

```
Public Function Clone () As Object
```

Return Value

An instance of the Shape class representing the newly created clone.

Shape.Draw Method

Draws this shape on an IGraphics surface.

Overload List

Name	Description
Shape.Draw (IGraphics, Brush, Pen, Boolean)	Draws this shape on the specified **IGraphics** surface.
Shape.Draw (IGraphics, Brush, Pen, Boolean, Rect, Double)	Draws this shape on the specified **IGraphics** surface.

See Also

Shape.Draw Method (IGraphics, Brush, Pen, Boolean)

Draws this shape on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Draw (
    IGraphics drawingContext,
    Brush brush,
    Pen pen,
    bool shadow
)
```

Visual Basic Copy Code

```
Public Sub Draw( _
    drawingContext As IGraphics, _
    brush As Brush, _
    pen As Pen, _
    shadow As Boolean _
)
```

Parameters

drawingContext
The IGraphics to draw the shape on.

brush
A **Brush** used to fill the shape.

pen
A **Pen** used to draw the shape outline.

shadow
When *shadow* is **true** the *brush* and *pen* parameters have higher priority over shape's brush and pen.

See Also

Shape.Draw Method (IGraphics, Brush, Pen, Boolean, Rect, Double)

Draws this shape on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Draw (
    IGraphics drawingContext,
    Brush brush,
    Pen pen,
    bool shadow,
    Rect rc,
```

```
    double orientation
)
```

Visual Basic Copy Code

```
Public Sub Draw( _
    drawingContext As IGraphics, _
    brush As Brush, _
    pen As Pen, _
    shadow As Boolean, _
    rc As Rect, _
    orientation As Double _
)
```

Parameters

drawingContext
The IGraphics to draw the shape on.

brush
A **Brush** used to fill the shape.

pen
A **Pen** used to draw the shape outline.

shadow
When *shadow* is **true** the *brush* and *pen* parameters have higher priority over shape's brush and pen.

rc
The bounding rectangle.

orientation
Orientation of the shape.

Shape.Equals Method

Checks whether this shape template is equivalent to the specified shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public new bool Equals (
    Shape shape
)
```

Visual Basic Copy Code

```
Public Shadows Function Equals( _
    shape As Shape _
) As Boolean
```

Parameters

shape
The shape to check for equality with the current shape.

Return Value

true if the current shape is equivalent to the specified shape; otherwise, **false**.

Remarks

Two shapes are considered equivalent if they have the same fill type, the same number and type of segments and if the points of those segments are close enough to each other.

Shape Members
Shape Class
MindFusion.Diagramming Namespace

Shape.FromId Method

Returns a reference to the shape with the specified string identifier.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape FromId (
    string id
)
```

Visual Basic Copy Code

```
Public Shared Function FromId( _
    id As String _
) As Shape
```

Parameters

id
The identifier of the shape of interest.

Return Value

A reference to the Shape with the specified identifier or a **null** reference (**Nothing** in Visual Basic) if there is no such shape.

Remarks

The *id* argument should match an identifier passed to a constructor of the existing shape templates.

Shape.FromSvg Method

Creates a Shape from the outline of an SVG drawing.

Overload List

Name	Description
Shape.FromSvg (SvgContent)	Creates a **Shape** from the outline of an SVG drawing.
Shape.FromSvg (SvgContent, Boolean)	Creates a **Shape** from the outline of an SVG drawing.
Shape.FromSvg (SvgContent, Boolean, Boolean)	Creates a Shape from the outline of an SVG drawing.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace

Shape.FromSvg Method (SvgContent)

Creates a Shape from the outline of an SVG drawing.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape FromSvg (
    SvgContent svgContent
)
```

Visual Basic Copy Code

```
Public Shared Function FromSvg( _
    svgContent As SvgContent _
) As Shape
```

Parameters

svgContent
An SvgContent object representing the SVG drawing.

Return Value

A Shape generated from the specified SVG drawing.

Remarks

SVG drawings do not contain intrinsic semantic information about which elements of a drawing should be considered its outline. However the Shape class is primarily concerned with the outlines of nodes, for drawing, hit-testing and link alignment purposes. If you need the filled interior of nodes and the positions of links connected to them to match the SVG content, call this method to generate a shape outline from SVG, and assign the result to the nodes' Shape property. The shape outline is generated using a convex-hull algorithm.

Shape.FromSvg Method (SvgContent, Boolean)

Creates a Shape from the outline of an SVG drawing.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape FromSvg (
    SvgContent svgContent,
    bool stretch
)
```

Visual Basic Copy Code

```
Public Shared Function FromSvg( _
    svgContent As SvgContent, _
```

```
    stretch As Boolean _
) As Shape
```

Parameters

svgContent
An SvgContent object representing the SVG drawing.

stretch
Sets whether the Shape outline generated from SVG should be stretched to fill the entire shape definition range [0-100, 0-100], or should be scaled uniformly to preserve the original aspect ratio of the drawing. In effect, this specifies whether the shape will match the SVG drawing when ContentAlign is set to Stretch or **Fit**.

Return Value

A **Shape** generated from the specified SVG drawing.

Remarks

SVG drawings do not contain intrinsic semantic information about which elements of a drawing should be considered its outline. However the Shape class is primarily concerned with the outlines of nodes, for drawing, hit-testing and link alignment purposes. If you need the filled interior of nodes and the positions of links connected to them to match the SVG content, call this method to generate a shape outline from SVG, and assign the result to the nodes' Shape property. The shape outline is generated using a convex-hull algorithm.

Shape.FromSvg Method (SvgContent, Boolean, Boolean)

Creates a Shape from the outline of an SVG drawing.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape FromSvg (
    SvgContent svgContent,
    bool stretch,
    bool concave
)
```

Visual Basic Copy Code

```
Public Shared Function FromSvg( _
    svgContent As SvgContent, _
    stretch As Boolean, _
    concave As Boolean _
) As Shape
```

Parameters

svgContent
An SvgContent object representing the SVG drawing.

stretch
Specifies whether the Shape outline should match the SVG drawing when ContentAlign is set to Stretch.

concave
Specifies whether the Shape outline should be defined by a concave hull.

Return Value

A Shape generated from the specified SVG drawing.

Shape.GetHitPath Method

Returns a **GraphicsPath** object corresponding to the outline of the specified shape when rotated at the specified angle. That **GraphicsPath** can be used for hit-testing and intersection checks.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IGraphicsPath GetHitPath (
    Rect nodeBounds,
    double rotationAngle,
    double orientation,
    bool flipX,
    bool flipY,
    Dictionary<string, ShapeFormulaParam> formulaParams
)
```

Visual Basic Copy Code

```
Public Function GetHitPath( _
    nodeBounds As Rect, _
    rotationAngle As Double, _
    orientation As Double, _
    flipX As Boolean, _
    flipY As Boolean, _
    formulaParams As Dictionary(Of String, ShapeFormulaParam) _
) As IGraphicsPath
```

Parameters

nodeBounds
The bounding rectangle of the ShapeNode.

rotationAngle
The node's rotation angle.

orientation
The shape's orientation angle.

flipX
true to flip the path horizontally, or **false** otherwise.

flipY
true to flip the path vertically, or **false** otherwise.

formulaParams
A list of ShapeFormulaParam objects specifying the current positions of shape control points.

Return Value

A **GraphicsPath** representing the shape's outline.

See Also

Shape Members

Shape.GetRenderingPath Method

Returns a **GraphicsPath** object corresponding to the outline of the shape when rotated at the specified angle. That **GraphicsPath** can be used when drawing the shape's outline.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IGraphicsPath GetRenderingPath (
    Rect nodeBounds,
    double rotationAngle,
    double orientation,
    bool flipX,
    bool flipY,
    Dictionary<string, ShapeFormulaParam> formulaParams
)
```

Visual Basic Copy Code

```
Public Function GetRenderingPath( _
    nodeBounds As Rect, _
    rotationAngle As Double, _
    orientation As Double, _
    flipX As Boolean, _
    flipY As Boolean, _
    formulaParams As Dictionary(Of String, ShapeFormulaParam) _
) As IGraphicsPath
```

Parameters

nodeBounds
The bounding rectangle of the ShapeNode.

rotationAngle
The node's rotation angle.

orientation
The shape's orientation angle.

flipX
true to flip the path horizontally, or **false** otherwise.

flipY
true to flip the path vertically, or **false** otherwise.

formulaParams
A list of ShapeFormulaParam objects specifying the current positions of shape control points.

Return Value

A **GraphicsPath** representing the shape's outline.

Shape.LoadFromXml Method

Loads the shape content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic

```
Public Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

The **XmlElement** containing the shape's data.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

MindFusion.Diagramming Namespace

Shape.SaveToXml Method

Saves the shape content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic

```
Public Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

The **XmlElement** the shape's data should be stored into.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace
LoadFromXml Method

Shape.ToString Method

Returns the identifier of this shape template.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override string ToString ()
```

Visual Basic Copy Code

```
Public Overrides Function ToString () As String
```

Return Value

A string value representing the shape identifier.

Shape Properties

Shape.AnchorPattern Property

Gets or sets the default anchor pattern for nodes that use this shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPattern AnchorPattern { get; set; }
```

Visual Basic Copy Code

```
Public Property AnchorPattern As AnchorPattern
```

Property Value

An AnchorPattern instance. The default value is **null** (**Nothing** in Visual Basic).

Remarks

If the **AnchorPattern** of a ShapeNode is set, it overrides the one associated with the Shape definition.

See Also

Shape.ControlPoints Property

A list of ShapeControlPoint objects that let users adjust a node's shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public List<ShapeControlPoint> ControlPoints { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ControlPoints As List(Of ShapeControlPoint)
```

Property Value

A List<ShapeControlPoint> instance.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace

Shape.DecorationHitTesting Property

Gets or sets a value indicating whether decoration lines should be considered when hit-testing.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool DecorationHitTesting { get; set; }
```

Visual Basic Copy Code

```
Public Property DecorationHitTesting As Boolean
```

Property Value

true if decoration lines should be considered for hit-testing; otherwise, **false**. The default is **false**.

Remarks

If this property is enabled, users are able to select shape nodes of such shape by clicking near a decoration line or curve, even if it lies outside the shape outlines.

Shape.Decorations Property

Gets or sets a list with all decorations of this shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ElementTemplate[] Decorations { get; set; }
```

Visual Basic Copy Code

```
Public Property Decorations As ElementTemplate()
```

Property Value

An array of ElementTemplate objects specifying the decorations of this shape.

See Also

Shape Class
MindFusion.Diagramming Namespace
Outline Property
DecorationsFormula Property

Shape.DecorationsFormula Property

Gets or sets a formula describing the shape decorations depending on the current width and height of the node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string DecorationsFormula { get; set; }
```

Visual Basic Copy Code

```
Public Property DecorationsFormula As String
```

Property Value

A string containing the script that defines the shape decorations.

Remarks

Shape formulas are small scripts that call one of the following functions to add graphics to the shape:

Function	Description
MoveTo (x,y)	Moves the current position to the specified point without drawing.
LineTo (x,y)	Draws a line from the current position to the specified point.
BezierTo (x1,y1,x2,y2,x3,y3)	Draws a Bezier curve from the current position to (x3,y3) using (x1,y1) and (x2,y2) as control points.
ArcTo (x,y,largeArc,clockwiseArc,rx,ry)	Draws an arc from the specified point to (x,y) where rx and ry are the ellipse radiuses and the arc flags are boolean values specifying which of the four possible arcs to draw.

Each of them starts drawing from the current position and changes the current position to their point argument after drawing. In addition, the scripts can access the current size of the node through the Width and Height variables.

Shape.DisplayName Property

Specifies the name that should be displayed for this shape in user interface objects, for example the **ShapeListBox** or **ShapeToolBar**.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string DisplayName { get; set; }
```

Visual Basic Copy Code

```
Public Property DisplayName As String
```

Property Value

The **DisplayName** of all predefined shapes is set to the value of their Id property.

Shape.FillMode Property

Gets or sets a value indicating how areas are filled if the outline path of the shape intersects itself.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public FillMode FillMode { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property FillMode As FillMode
```

Property Value

A member of the FillMode enumeration specifying the fill type of the shape.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace

Shape.Id Property

Gets or sets the shape identifier.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Id { get; set; }
```

Visual Basic Copy Code

```
Public Property Id As String
```

Property Value

A string id that has been passed as an argument of the Shape constructor.

Remarks

Once assigned through the constructor, the shape identifier should not be changed, that is, do not use the *set* accessor of this property. To get the shape with a specified id, call the static FromId method.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace

Shape.Image Property

Gets or sets the image displayed in all instances of this shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage Image { get; set; }
```

Visual Basic Copy Code

```
Public Property Image As IImage
```

Property Value

A **Microsoft.Maui.Graphics.IImage** instance. The default is **null** (**Nothing** in Visual Basic).

Remarks

Assigning an image object to this property sets the ImageLocation to **null** (**Nothing** in Visual Basic). The image is displayed in the rectangle specified in ImageRectangle. If the Image property of a shape node is set, it overrides the image specified in the shape definition.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace

Shape.ImageLocation Property

Gets or sets the path to the file that contains the image displayed in this shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ImageLocation { get; set; }
```

Visual Basic Copy Code

```
Public Property ImageLocation As String
```

Property Value

A string containing the file path. The default is **null** (**Nothing** in Visual Basic).

Remarks

Assigning a valid file path to this property will automatically load the image. When adding a shape to a ShapeLibrary, if the Image property is set and the image location is not specified, the image bitmap contents is stored in the library file. If the image location is specified, only the path to the image file is saved in the shape library.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace

Shape.ImageRectangle Property

Gets or sets the position of the images displayed in instances of this shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect ImageRectangle { get; set; }
```

Visual Basic Copy Code

```
Public Property ImageRectangle As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** specifying the location of an image relatively to the shape node that displays the image.

Remarks

The coordinates of the image location are specified as percentage of the rectangular bounds of shape nodes. The default value (0, 0, 100, 100) makes the image displayed in the whole area of that node.

Example

The following code defines a shape, which displays an image in the lower-right quarter of shape nodes and lays out text in the other three quarters.

C# Copy Code

```
Shape myShape = new Shape(

    // Outlines: reuse the rectangle definition
    Shape.FromId("Rectangle").Outline,

    // Decorations: draw frame lines around the image
    new ElementTemplate[] {
        new LineTemplate(100, 50, 50, 50),
        new LineTemplate(50, 50, 50, 100),
    },

    // Text area: the area not covered by the image rectangle
    new ElementTemplate[] {
        new LineTemplate(0, 0, 100, 0),
        new LineTemplate(100, 0, 100, 50),
        new LineTemplate(100, 50, 50, 50),
        new LineTemplate(50, 50, 50, 100),
        new LineTemplate(50, 100, 0, 100),
        new LineTemplate(0, 100, 0, 0)
    },

    // The fill type
    FillMode.Winding,

    // The id
    "MyShape");

// Image area: the lower right corner of boxes
myShape.ImageRectangle = new Rect(50, 50, 50, 50);

// Use the shape defined above
diagram.DefaultShape = myShape;

// Use polygonal text layout
diagram.EnableStyledText = true;
diagram.PolygonalTextLayout = true;
```

Image Property

Shape.IsArrowhead Property

Specifies if this shape is used as arrowhead.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool IsArrowhead { get; set; }
```

Visual Basic Copy Code

```
Public Property IsArrowhead As Boolean
```

Property Value

true if this shape is designated as arrowhead; otherwise **false**.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace

Shape.LinkSegmentInset Property

Specifies what length of link's line segment is drawn inside the arrowhead shape, expressed as percentage of arrowhead size.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double LinkSegmentInset { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkSegmentInset As Double
```

Property Value

A **double** value specifying percents of arrowhead size. The default value is 100.

Remarks

The inset value matters when using transparent or semi-transparent arrowhead brush, or when the link's Pen is thicker than one pixel and its cap might extend beyond the arrowhead outline. **LinkSegmentInset** is set to appropriate values for all shapes from the ArrowHeads class. You might want to set it when using custom arrowhead shapes for which the link's end segment should not reach all the way to the arrowhead tip.

Shape.Outline Property

Gets or sets the outline of this shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ElementTemplate[] Outline { get; set; }
```

Visual Basic Copy Code

```
Public Property Outline As ElementTemplate()
```

Property Value

An array of ElementTemplate objects specifying the outline of the shape.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace
Decorations Property
OutlineFormula Property

Shape.OutlineFormula Property

Gets or sets a formula describing the shape outline depending on the current width and height of the node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string OutlineFormula { get; set; }
```

Visual Basic Copy Code

```
Public Property OutlineFormula As String
```

Property Value

A string containing the script that defines the shape outline.

Remarks

Shape formulas are small scripts that call one of the following functions to add graphics to the shape:

Function	Description
MoveTo (x,y)	Moves the current position to the specified point without drawing.
LineTo (x,y)	Draws a line from the current position to the specified point.
BezierTo (x1,y1,x2,y2,x3,y3)	Draws a Bezier curve from the current position to (x3,y3) using (x1,y1) and (x2,y2) as control points.
ArcTo (x,y,largeArc,clockwiseArc,rx,ry)	Draws an arc from the specified point to (x,y) where rx and ry are the ellipse radiuses and the arc flags are boolean values specifying which of the four possible arcs to draw.

Each of them starts drawing from the current position and changes the current position to their point argument after drawing. In addition, the scripts can access the current size of the node through the Width and Height variables.

Shape.Shapes Property

Gets a read-only collection of all named shapes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static ShapeCollection Shapes { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Shapes As ShapeCollection
```

Property Value

An instance of the ShapeCollection class.

Remarks

Initially the collection contains only the predefined shapes. Any new shape you create is added automatically to **Shapes** if an identifier has been specified via the Shape constructor.

ShapeAdjustmentHandle Members

Represents an adjustment handle used to modify the Shape of a ShapeNode.

The following tables list the members exposed by the ShapeAdjustmentHandle type.

Public Constructors

	Name	Description
	ShapeAdjustmentHandle	Initializes a new instance of the **ShapeAdjustmentHandle** class.

Public Properties

	Name	Description

	ControlPoint	Gets or sets the ShapeControlPoint that will be modified by this adjustment handle.
	FormulaParam	Gets or sets the ShapeFormulaParam whose values will be updated by this handle.

Public Methods

	Name	Description
	IsMoveHandle	Returns a value indicating whether this handle is used to move items. (Inherited from AdjustmentHandle.)
	IsResizeHandle	Gets whether this adjustment handle resizes the item. (Inherited from AdjustmentHandle.)
	IsRotationHandle	Gets whether this adjustment handle changes item's rotation angle. (Inherited from AdjustmentHandle.)

ShapeAdjustmentHandle Constructor

Initializes a new instance of the ShapeAdjustmentHandle class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShapeAdjustmentHandle (
    ShapeControlPoint controlPoint,
    ShapeFormulaParam formulaParam
)
```

Visual Basic Copy Code

```
Public New ( _
    controlPoint As ShapeControlPoint, _
    formulaParam As ShapeFormulaParam _
)
```

Parameters

controlPoint
A ShapeControlPoint representing the shape's control point that will be modified by this adjustment handle.

formulaParam
A ShapeFormulaParam whose values will be updated by this handle.

See Also

ShapeAdjustmentHandle Class
MindFusion.Diagramming Namespace

ShapeAdjustmentHandle Properties

ShapeAdjustmentHandle.ControlPoint Property

Gets or sets the ShapeControlPoint that will be modified by this adjustment handle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShapeControlPoint ControlPoint { get; set; }
```

Visual Basic Copy Code

```
Public Property ControlPoint As ShapeControlPoint
```

Property Value

A ShapeControlPoint instance.

See Also

ShapeAdjustmentHandle Members
ShapeAdjustmentHandle Class
MindFusion.Diagramming Namespace

ShapeAdjustmentHandle.FormulaParam Property

Gets or sets the ShapeFormulaParam whose values will be updated by this handle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShapeFormulaParam FormulaParam { get; set; }
```

Visual Basic Copy Code

```
Public Property FormulaParam As ShapeFormulaParam
```

Property Value

A ShapeFormulaParam instance.

ShapeCollection Members

Represents a read-only collection of shapes.

The following tables list the members exposed by the ShapeCollection type.

Public Properties

	Name	Description
	Count	Gets the number of elements contained in the collection.
	IsSynchronized	Gets a value indicating whether the access to this collection is synchronized.
	Item	Gets or sets the diagram item at the specified position.
	SyncRoot	Gets an object that can be used to synchronize access to this collection.

Public Methods

	Name	Description
	Contains	Checks whether the specified shape is contained in the collection.
	CopyTo	Copies a range of shapes from this collection to the specified one-dimensional array starting at the specified index of the target array.
	GetAt	Gets the shape at the specified position.
	GetEnumerator	Returns an enumerator for this collection.

See Also

ShapeCollection Class
MindFusion.Diagramming Namespace

ShapeCollection Methods

ShapeCollection.Contains Method

Checks whether the specified shape is contained in the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Contains (
    Shape shape
)
```

Visual Basic Copy Code

```
Public Function Contains( _
    shape As Shape _
) As Boolean
```

Parameters

shape

The Shape object to search for in the collection.

Return Value

true if the specified item was found in the collection; otherwise, **false**.

See Also

ShapeCollection Members
ShapeCollection Class
MindFusion.Diagramming Namespace

ShapeCollection.CopyTo Method

Copies a range of shapes from this collection to the specified one-dimensional array starting at the specified index of the target array.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void CopyTo (
    Array array,
    int index
)
```

Visual Basic Copy Code

```
Public Sub CopyTo( _
    array As Array, _
    index As Integer _
)
```

Parameters

array

The one-dimensional **Array** that is the destination of the elements copied from the current collection.

index

A 32-bit integer that represents the index in array at which copying begins.

See Also

ShapeCollection Members
ShapeCollection Class
MindFusion.Diagramming Namespace

ShapeCollection.GetAt Method

Gets the shape at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape GetAt (
    int index
)
```

Visual Basic Copy Code

```
Public Function GetAt( _
    index As Integer _
) As Shape
```

Parameters

index
The zero-based index of the shape to retrieve.

Return Value

An instance of the Shape class that represents the shape at the specified position.

See Also

ShapeCollection Members
ShapeCollection Class
MindFusion.Diagramming Namespace

ShapeCollection.GetEnumerator Method

Returns an enumerator for this collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IEnumerator GetEnumerator ()
```

Visual Basic Copy Code

```
Public Function GetEnumerator () As IEnumerator
```

Return Value

An .NET **IEnumerator** for the collection.

See Also

ShapeCollection Members
ShapeCollection Class
MindFusion.Diagramming Namespace

ShapeCollection Properties

ShapeCollection.Count Property

Gets the number of elements contained in the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Count { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Count As Integer
```

Property Value

An integer value specifying the size of the collection.

See Also

ShapeCollection Members
ShapeCollection Class
MindFusion.Diagramming Namespace

ShapeCollection.IsSynchronized Property

Gets a value indicating whether the access to this collection is synchronized.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool IsSynchronized { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property IsSynchronized As Boolean
```

Property Value

true if access to the collection is synchronized (thread safe); otherwise, **false**. The default is **false**.

See Also

ShapeCollection Members

MindFusion.Diagramming Namespace

ShapeCollection.Item Property

Gets or sets the diagram item at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape Item [
    int index
] { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Item( _
    index As Integer _
) As Shape
```

Parameters

index
The zero-based index of the shape to retrieve.

Property Value

An instance of the Shape class that represents the shape at the specified position.

See Also

ShapeCollection Members
ShapeCollection Class
MindFusion.Diagramming Namespace

ShapeCollection.SyncRoot Property

Gets an object that can be used to synchronize access to this collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object SyncRoot { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property SyncRoot As Object
```

Property Value

An object that can be used to synchronize access to the collection.

See Also

ShapeCollection Members
ShapeCollection Class
MindFusion.Diagramming Namespace

ShapeControlPoint Class

Represents a control point that can be used to adjust the shape of a ShapeNode. Control point positions are passed as parameters to shape formulas, whose code can alter the coordinates of the shape's graphic primitives based on the parameter values.

Syntax

C# Copy Code

```
public class ShapeControlPoint
```

Visual Basic Copy Code

```
Public Class ShapeControlPoint
```

Remarks

The component raises the ShapeModified event when users drag a shape control point.

Inheritance Hierarchy

System.Object
MindFusion.Diagramming.ShapeControlPoint

ShapeControlPoint Members
MindFusion.Diagramming Namespace

ShapeControlPoint Members

Represents a control point that can be used to adjust the shape of a ShapeNode. Control point positions are passed as parameters to shape formulas, whose code can alter the coordinates of the shape's graphic primitives based on the parameter values.

The following tables list the members exposed by the ShapeControlPoint type.

Public Constructors

	Name	Description
	ShapeControlPoint	Initializes a new instance of the **ShapeControlPoint** class.

Public Properties

	Name	Description
	MaxXRelativeToWidth	Gets or sets a value indicating whether the maximum horizontal position is specified relatively to the node's right side.
	MaxYRelativeToHeight	Gets or sets a value indicating whether the maximum vertical position is specified relatively to the node's bottom side.
	ParamName	Gets or sets the name of the formula parameter corresponding to this control point.

Public Methods

	Name	Description
	Clone	Creates a copy of this control point.

MindFusion.Diagramming Namespace

ShapeControlPoint Constructor

Initializes a new instance of the ShapeControlPoint class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShapeControlPoint (
    string paramName,
    double defaultX,
    double minX,
    double maxX,
    UnitType xUnit,
    double defaultY,
    double minY,
    double maxY,
```

```
    UnitType yUnit
)
```

Visual Basic Copy Code

```
Public New ( _
    paramName As String, _
    defaultX As Double, _
    minX As Double, _
    maxX As Double, _
    xUnit As UnitType, _
    defaultY As Double, _
    minY As Double, _
    maxY As Double, _
    yUnit As UnitType _
)
```

Parameters

paramName
Specifies the name of the shape formula parameter corresponding to this control point.

defaultX
The initial horizontal position of this control point.

minX
The minimum horizontal position that is allowed for this control point.

maxX
The maximum horizontal position that is allowed for this control point.

xUnit
The unit used to specify the horizontal position of this control point.

defaultY
The initial vertical position of this control point.

minY
The minimum vertical position that is allowed for this control point.

maxY
The maximum vertical position that is allowed for this control point.

yUnit
The unit used to specify the vertical position of this control point.

ShapeControlPoint Properties

ShapeControlPoint.MaxXRelativeToWidth Property

Gets or sets a value indicating whether the maximum horizontal position is specified relatively to the node's right side.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool MaxXRelativeToWidth { get; set; }
```

Visual Basic Copy Code

```
Public Property MaxXRelativeToWidth As Boolean
```

Property Value

true if the *maxX* value is relative to the node's right side, **false** if it's relative to the left side.

See Also

ShapeControlPoint Members
ShapeControlPoint Class
MindFusion.Diagramming Namespace

ShapeControlPoint.MaxYRelativeToHeight Property

Gets or sets a value indicating whether the maximum vertical position is specified relatively to the node's bottom side.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool MaxYRelativeToHeight { get; set; }
```

Visual Basic Copy Code

```
Public Property MaxYRelativeToHeight As Boolean
```

Property Value

true if the *maxY* value is relative to the node's bottom side, **false** if it's relative to the top side.

See Also

ShapeConverter Methods

ShapeConverter.CanConvertFrom Method

TypeConverter.CanConvertFrom override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool CanConvertFrom (
    ITypeDescriptorContext context,
    Type sourceType
)
```

Visual Basic

```
Public Overrides Function CanConvertFrom( _
    context As ITypeDescriptorContext, _
    sourceType As Type _
) As Boolean
```

Parameters

context

An **ITypeDescriptorContext** that provides a format context.

sourceType

A **Type** that represents the type you want to convert from.

Return Value

true if this converter can perform the conversion; otherwise, **false**.

TypeConverter.CanConvertTo override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override bool CanConvertTo (
    ITypeDescriptorContext context,
    Type destinationType
)
```

Visual Basic

```
Public Overrides Function CanConvertTo( _
    context As ITypeDescriptorContext, _
    destinationType As Type _
) As Boolean
```

Parameters

context

An **ITypeDescriptorContext** that provides a format context.

destinationType

A **Type** that represents the type you want to convert to.

Return Value

true if this converter can perform the conversion; otherwise, **false**.

ShapeConverter.ConvertFrom Method

TypeConverter.ConvertFrom override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Object ConvertFrom (
    ITypeDescriptorContext context,
    CultureInfo culture,
    Object value
)
```

Visual Basic Copy Code

```
Public Overrides Function ConvertFrom( _
    context As ITypeDescriptorContext, _
    culture As CultureInfo, _
    value As Object _
) As Object
```

Parameters

context
An **ITypeDescriptorContext** that provides a format context.

culture
The **CultureInfo** to use as the current culture.

value
The **Object** to convert.

Return Value

An **Object** that represents the converted value.

ShapeConverter.ConvertTo Method

TypeConverter.ConvertTo override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Object ConvertTo (
    ITypeDescriptorContext context,
    CultureInfo culture,
    Object value,
    Type destinationType
)
```

Visual Basic Copy Code

```
Public Overrides Function ConvertTo( _
    context As ITypeDescriptorContext, _
    culture As CultureInfo, _
    value As Object, _
    destinationType As Type _
) As Object
```

Parameters

context
An **ITypeDescriptorContext** that provides a format context.

culture

A **CultureInfo**. If **null** is passed, the current culture is assumed.

value
The **Object** to convert.

destinationType
An **Object** that represents the converted value.

Return Value

An **Object** that represents the converted value.

ShapeConverter.GetStandardValues Method

TypeConverter.GetStandardValues override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override TypeConverter.StandardValuesCollection GetStandardValues (
    ITypeDescriptorContext context
)
```

Visual Basic Copy Code

```
Public Overrides Function GetStandardValues( _
    context As ITypeDescriptorContext _
) As TypeConverter.StandardValuesCollection
```

Parameters

context
An **System.ComponentModel.ITypeDescriptorContext** that provides a format context that can be used to extract additional information about the environment from which this converter is invoked. This parameter or properties of this parameter can be **null**.

Return Value

A **System.ComponentModel.TypeConverter.StandardValuesCollection** that holds a standard set of valid values.

TypeConverter.GetStandardValuesExclusive override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool GetStandardValuesExclusive (
    ITypeDescriptorContext context
)
```

Visual Basic

```
Public Overrides Function GetStandardValuesExclusive( _
    context As ITypeDescriptorContext _
) As Boolean
```

Parameters

context
An **System.ComponentModel.ITypeDescriptorContext** that provides a format context.

Return Value

Always returns **true**.

```
public override bool GetStandardValuesSupported (
    ITypeDescriptorContext context
)
```

Visual Basic

```
Public Overrides Function GetStandardValuesSupported( _
    context As ITypeDescriptorContext _
) As Boolean
```

Parameters

context
An **System.ComponentModel.ITypeDescriptorContext** that provides a format context.

Return Value

Always returns **true**.

ShapeDecoration Members

Defines decoration elements that are displayed as filled shapes.

The following tables list the members exposed by the ShapeDecoration type.

Public Constructors

	Name	Description
	ShapeDecoration	Initializes a new instance of the ShapeDecoration class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the decoration shape interior.
	Elements	Gets the elements that define the decoration's shape.
	FillMode	Gets or sets how areas are filled if the outline path intersects itself.
	Pen	Gets or sets the brush used to draw the decoration shape outline.

Public Methods

	Name	Description
	Clone	Clones this ShapeDecoration object.
	LoadFromXml	Loads the ShapeDecoration definition from an XML document.
	SaveToXml	Saves the ShapeDecoration definition in an XML document.

ShapeDecoration Class
MindFusion.Diagramming Namespace

ShapeDecoration Constructor

Initializes a new instance of the ShapeDecoration class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShapeDecoration (
    ElementTemplate[] elements,
    Brush brush,
    FillMode fillMode,
    Pen pen
)
```

Visual Basic Copy Code

```
Public New ( _
    elements() As ElementTemplate, _
    brush As Brush, _
    fillMode As FillMode, _
    pen As Pen _
)
```

Parameters

elements
An array of ElementTemplate objects that define the decoration shape outline.

brush
A Brush object used to fill the decoration shape interior.

fillMode
Specifies how areas are filled if the outline path intersects itself.

pen
A Pen object used to draw the decoration shape outline.

ShapeDecoration.LoadFromXml Method

Loads the ShapeDecoration definition from an XML document.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Public Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

The parent XmlElement object.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

ShapeDecoration Members
ShapeDecoration Class

Syntax

C# Copy Code

```
public ShapeEventArgs (
    Shape shapeTemplate,
    int index
)
```

Visual Basic Copy Code

```
Public New ( _
    shapeTemplate As Shape, _
    index As Integer _
)
```

Parameters

shapeTemplate
The Shape related to the event.

index
The zero-based index of the shape within its containing collection.

See Also

ShapeEventArgs Constructor Overload List
ShapeEventArgs Class
MindFusion.Diagramming Namespace

ShapeEventArgs Constructor (Shape, Int32, String)

Initializes a new instance of the ShapeEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShapeEventArgs (
    Shape shapeTemplate,
    int index,
    string oldName
)
```

Visual Basic Copy Code

```
Public New ( _
    shapeTemplate As Shape, _
    index As Integer, _
```

```
    oldName As String _
)
```

Parameters

shapeTemplate
The Shape related to the event.

index
The zero-based index of the shape within its containing collection.

oldName
The old DisplayName of the shape.

ShapeFormulaParam.Y Property

Gets or sets the vertical position of the control point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Y { get; set; }
```

Visual Basic Copy Code

```
Public Property Y As Double
```

Property Value

A **double** value specifying the vertical position of the shape control point.

See Also

ShapeLibrary Class

The **ShapeLibrary** class represents a collection of shape definitions stored together.

Syntax

C# Copy Code

```
public class ShapeLibrary
```

Visual Basic Copy Code

```
Public Class ShapeLibrary
```

Remarks

Shape libraries can be created using the **ShapeDesigner** tool that comes with MvcDiagram. Use the LoadFrom method to load a shape library from a file. The loaded shapes can be accessed through the Shapes property. They will be automatically added to the shared list of shapes kept in the Shape class, which lets you access them through the FromId method. A shape library can be saved into a file in XML based format using the SaveToXml method.

ShapeLibrary Methods

ShapeLibrary.LoadFrom Method

Loads a shape library from the specified file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static ShapeLibrary LoadFrom (
    string fileName
)
```

Visual Basic Copy Code

```
Public Shared Function LoadFrom( _
    fileName As String _
) As ShapeLibrary
```

Parameters

fileName
The name of the file that contains the shape library.

Return Value

An instance of the ShapeLibrary class whose Shapes array contains the loaded shape definitions.

ShapeLibrary.LoadFromXml Method (XmlDocument)

Loads the shape library from the specified XML document.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    XmlDocument document
)
```

Visual Basic Copy Code

```
Public Sub LoadFromXml( _
    document As XmlDocument _
)
```

Parameters

document
The document to load the library from.

See Also

LoadFromXml Method Overload List
ShapeLibrary Members

ShapeLibrary.LoadFromXml Method (XmlDocument, String)

Loads the library from the specified XML document. All locations of images associated with shapes in the library are loaded relative to the specified library path.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void LoadFromXml (
    XmlDocument document,
    string libraryPath
)
```

Visual Basic Copy Code

```
Public Sub LoadFromXml( _
    document As XmlDocument, _
    libraryPath As String _
)
```

Parameters

document

libraryPath

Remarks

If the path is an empty string or null, image locations are loaded relative to the BaseURI of the specified document.

ShapeLibrary.SaveToXml Method (String)

Saves this library to the specified file.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SaveToXml (
    string fileName
)
```

Visual Basic Copy Code

```
Public Sub SaveToXml( _
    fileName As String _
)
```

Parameters

fileName
The name of the file where to save the shape library.

ShapeLibrary.SaveToXml Method (XmlDocument)

Saves the shape library into the specified XML document.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SaveToXml (
    XmlDocument document
)
```

Visual Basic Copy Code

```
Public Sub SaveToXml( _
    document As XmlDocument _
)
```

Parameters

document

MindFusion.Diagramming Namespace

ShapeLibrary.SaveToXml Method (XmlDocument, String)

Saves the shape library into the specified XML document. All locations of images associated with shapes in the library are saved relative to the specified destination path.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void SaveToXml (
    XmlDocument document,
    string libraryFileName
)
```

Visual Basic Copy Code

```
Public Sub SaveToXml( _
    document As XmlDocument, _
    libraryFileName As String _
)
```

Parameters

document

libraryFileName

Remarks

If the path is an empty string or null, image locations are written as absolute.

ShapeLibrary Properties

ShapeLibrary.Shapes Property

Gets or sets the array of all shapes in the library.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape[] Shapes { get; set; }
```

Visual Basic Copy Code

```
Public Property Shapes As Shape()
```

Property Value

An array of Shape objects containing the shape definitions.

ShapeNode Class

ShapeNode instances are diagram nodes that represent geometric shapes.

Syntax

C# Copy Code

```
public class ShapeNode : DiagramNode
```

Visual Basic Copy Code

```
Public Class ShapeNode
    Inherits DiagramNode
```

Remarks

A **ShapeNode** instance represents nodes in graphs, tree, process diagrams, and so on.

The shape of a node is specified through the Shape property. Shapes can be rotated, either interactively using the rotation handle above the node, or programmatically using the RotationAngle property.

Shape nodes can display images and text. Set an image to be painted inside a node by assigning it to the Image property. The position of the image within the node and its alignment are set by the ImageAlign property. To make a node as big as its image, call ResizeToFitImage.

Text inside a shape node is represented by the Text property. Its attributes can be changed by the TextBrush and TextFormat properties. To get even richer text formatting, set EnableStyledText to **true** and embed HTML-like formatting tags in the raw text. Text can be laid out inside arbitrary polygonal shapes by enabling PolygonalTextLayout. To make a node big enough to display its text without clipping, call ResizeToFitText.

To let users edit a node's text inline, call the **BeginEdit** method of **DiagramView**. Call **EndEdit** to exit in-place editing mode.

Fill and border colors can be specified by setting the Pen and Brush properties. Shape nodes can be transparent as set through the Transparent property.

Shape nodes can have incoming and outgoing DiagramLink objects accessible through the **IncomingLinks** and **OutgoingLinks** properties defined in the DiagramNode class.

ShapeNode Members

ShapeNode instances are diagram nodes that represent geometric shapes.

The following tables list the members exposed by the **ShapeNode** type.

Public Constructors

	Name	Description
	ShapeNode	Overloaded. Initializes a new instance of the **ShapeNode** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowFlip	Gets or sets a value indicating whether the node's shape flips when an edge is dragged over its opposite edge.
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	CustomDraw	Gets or sets the type of custom drawing performed on this shape node.
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled.
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	FlipX	Gets or sets a value indicating whether the node's shape is flipped horizontally.
	FlipY	Gets or sets a value indicating whether the node's shape is flipped vertically.
	Font	Gets or sets the font used to render the node's text.
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)

	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	Image	Gets or sets the image that is displayed in this shape node.
	ImageAlign	Gets or sets the alignment of the image displayed in this shape node.
	ImagePadding	Gets or sets the padding distance between node's borders and **Image**.
	ImageUrl	Gets or sets a URL used to load an image into this node.
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	PlainText	Gets the plain text of this shape node.
	PolygonalTextLayout	Gets or sets a value indicating whether the node's Text is formatted inside non-rectangular outline.
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotateImage	Gets or sets a value indicating whether the **Image** should be rotated when the shape node is rotated.
	RotateText	Gets or sets a value indicating whether the **Text** should be rotated when the shape node is rotated.
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)

	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Shape	Gets or sets a reference to the node's geometric shape definition.
	ShapeOrientation	Gets or sets the angle specifying the orientation with which a shape template is applied to the node bounds.
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed inside the shape node.
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of the text that is displayed inside shape nodes.
	TextPadding	Gets or sets the spacing between the item boundaries and its text.
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Transparent	Gets or sets a value indicating whether this shape node is transparent.
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)

AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
Clone	Creates a copy of this item. (Inherited from DiagramItem.)
Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
ContainsPoint	Overloaded.
CreateConnectionPoint	DiagramNode.CreateConnectionPoint override.
Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
DoModify	For internal use. (Inherited from DiagramItem.)
Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
DrawHandles	DiagramNode.DrawHandles override. Renders the adjustment handles of this item.
DrawInRect	(Inherited from DiagramNode.)
DrawLocal	Draws the node on the specified IGraphics surface.
DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified **IGraphics** surface. (Inherited from DiagramNode.)
DrawShadowLocal	Draws the shadow of this node on the specified **IGraphics** surface.
Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline.
GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
GetOutlinePoly	Node.GetOutlinePoly override.
GetRepaintRect	DiagramNode.GetRepaintRect override.

	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramNode.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point.
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	DiagramItem.OnLoad override.
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	ResizeToFitImage	Makes the shape node as big as the image it displays.
	ResizeToFitText	Makes the shape node big enough to display its text without clipping.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)

	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramNode.AllowModify override. Invoked during interactive modification of items to test whether the operation can be completed in the current context.
	CancelModify	DiagramNode.CancelModify override. Invoked when the interactive modification of this object has been canceled.
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramNode.CompleteModify override. Invoked when the item modification has been completed.
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override.
	CreateState	DiagramNode.CreateState override; creates a ShapeNodeState instance.
	Dispose	Disposes any disposable resources managed by this shape.
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetImageRect	Overloaded. Gets the destination rectangle of the node's image.
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a GraphicsPath object for this node as though it is contained in the specified rectangle.
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object.
	LoadFromXml	Loads the item content from an XML element.
	LoadObsolete	For internal use. (Inherited from DiagramItem.)

	OnAdd	Called when the item is added to a **Diagram**, either by users, programmatically or via undo / redo.
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	Called when the Diagram's MeasureUnit changes.
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	DiagramNode.OnRotationAngleChanged override.
	OnStyleChanged	DiagramItem.OnStyleChanged override.
	OnTextChanged	DiagramItem.OnTextChanged override.
	OnTextFormatChanged	DiagramItem.OnTextFormatChanged override.
	OnUpdateBounds	DiagramNode.OnUpdateBounds override.
	OnZoomChanged	Called when the Diagram's **ZoomFactor** changes.
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramNode.RestoreProperties override.
	RestoreState	DiagramNode.RestoreState override. Restores the state of this diagram item.
	SaveProperties	DiagramNode.SaveProperties override.
	SaveState	DiagramNode.SaveState override. Saves the state of this diagram item.
	SaveToJson	Saves the node as a JSON object.
	SaveToXml	Saves the item content into an XML element.
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)

	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramNode.StartModify override. Invoked when the user starts modifying this item interactively.
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	**DiagramNode.UpdateModify** override. Invoked during interactive modification of this item.

ShapeNode Constructor

Initializes a new instance of the ShapeNode class.

Overload List

Name	Description
ShapeNode ()	Initializes a new instance of the **ShapeNode** class.
ShapeNode (Diagram)	Initializes a new instance of the **ShapeNode** class with default values supplied form the specified Diagram.
ShapeNode (ShapeNode)	Initializes a new instance of the **ShapeNode** class using the specified node as a prototype.

See Also

ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode Constructor ()

Initializes a new instance of the ShapeNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShapeNode ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

ShapeNode Constructor Overload List
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode Constructor (Diagram)

Initializes a new instance of the ShapeNode class with default values supplied form the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShapeNode (
    Diagram parent
)
```

Visual Basic Copy Code

```
Public New ( _
    parent As Diagram _
)
```

Parameters

parent
The Diagram from which to obtain default values for the node properties.

Remarks

This constructor initializes the ShapeNode properties with the values specified in the respective default-value properties of the Diagram object. For more information see **Initial Values of Item Properties**.

See Also

ShapeNode Constructor Overload List
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode Constructor (ShapeNode)

Initializes a new instance of the ShapeNode class using the specified node as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ShapeNode (
    ShapeNode prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As ShapeNode _
)
```

Parameters

prototype

The node to use as a prototype. The properties of the new node are initialized from the property values of this node.

Remarks

This constructor copies the ShapeNode property values from the specified prototype node.

ShapeNode Methods

ShapeNode.AllowModify Method

DiagramNode.AllowModify override. Invoked during interactive modification of items to test whether the operation can be completed in the current context.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override bool AllowModify (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Function AllowModify( _
    current As Point, _
    ist As InteractionState _
) As Boolean
```

Parameters

current

The current mouse pointer position.

ist

An InteractionState object containing more information about the current state of the operation.

Return Value

true to allow the modification of this node; otherwise, **false**.

Remarks

This method is invoked after each mouse movement in order to update the mouse pointer icon, so do not perform any time-consuming operations in its implementation.

ShapeNode.CancelModify Method

DiagramNode.CancelModify override. Invoked when the interactive modification of this object has been canceled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void CancelModify (
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub CancelModify( _
    ist As InteractionState _
)
```

Parameters

ist

An InteractionState object containing more information about the current state of the operation.

ShapeNode.CompleteModify Method

DiagramNode.CompleteModify override. Invoked when the item modification has been completed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void CompleteModify (
    Point end,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub CompleteModify( _
    end As Point, _
    ist As InteractionState _
)
```

Parameters

end

The mouse pointer position.

ist

An InteractionState object containing more information about the current state of the operation.

ShapeNode.ContainsPoint Method (Point, Double)

Tests whether the specified point is contained within the outline of this node, relaxed with the specified threshold.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool ContainsPoint (
    Point point,
    double threshold
)
```

Visual Basic Copy Code

```
Public Overrides Function ContainsPoint( _
    point As Point, _
```

```
    threshold As Double _
) As Boolean
```

Parameters

point

threshold

Return Value

ShapeNode.CreateConnectionPoint Method

DiagramNode.CreateConnectionPoint override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override ConnectionPoint CreateConnectionPoint (
    DiagramLink link,
    Point point,
    bool incoming
)
```

Visual Basic Copy Code

```
Public Overrides Function CreateConnectionPoint( _
    link As DiagramLink, _
    point As Point, _
    incoming As Boolean _
) As ConnectionPoint
```

Parameters

link
A DiagramLink that should be connected to this node.

point
The point at which the link should be connected.

incoming
true if link is an incoming link; otherwise, **false**.

Return Value

A ConnectionPoint instance representing the connection.

ShapeNode.CreateProperties Method

DiagramItem.CreateProperties override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override DiagramItemProperties CreateProperties ()
```

Visual Basic Copy Code

```
Protected Overrides Function CreateProperties () As DiagramItemProperties
```

Return Value

A DiagramItemProperties -derived object containing a snapshot of the item's properties.

ShapeNode.CreateState Method

DiagramNode.CreateState override; creates a ShapeNodeState instance.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override DiagramItemState CreateState ()
```

Visual Basic Copy Code

```
Protected Overrides Function CreateState () As DiagramItemState
```

Return Value

A ShapeNodeState instance.

ShapeNode.Dispose Method

Disposes any disposable resources managed by this shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void Dispose (
    bool disposing
)
```

Visual Basic Copy Code

```
Protected Overrides Sub Dispose( _
    disposing As Boolean _
)
```

Parameters

disposing
Specifies whether the method is called explicitly or from the garbage collector.

ShapeNode.DrawHandles Method

DiagramNode.DrawHandles override. Renders the adjustment handles of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawHandles (
    IGraphics graphics,
    HandlesVisualStyle style,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawHandles( _
    graphics As IGraphics, _
    style As HandlesVisualStyle, _
    options As RenderOptions _
)
```

Parameters

graphics
The IGraphics surface on which the handles should be drawn.

style
A HandlesVisualStyle instance containing brush and pen objects that should be used when drawing handles.

options
Provides options for the drawing operation.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.DrawLocal Method

Draws the node on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawLocal (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawLocal( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
An IGraphics object where the node should be rendered.

options
Provides options for the drawing operation.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.DrawShadowLocal Method

Draws the shadow of this node on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawShadowLocal (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawShadowLocal( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
An IGraphics object where the shadow should be rendered.

options
Provides options for the drawing operation.

ShapeNode.GetImageRect Method

Gets the destination rectangle of the node's image.

Overload List

Name	Description
ShapeNode.GetImageRect ()	Gets the image rectangle from the associated Shape template, or the node's bounding rectangle if there is no associated shape template.
ShapeNode.GetImageRect (Boolean)	Gets the image rectangle from the associated shape template or the node's bounding rectangle if there is no associated shape template.

ShapeNode.GetImageRect Method ()

Gets the image rectangle from the associated Shape template, or the node's bounding rectangle if there is no associated shape template.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected Rect GetImageRect ()
```

Visual Basic Copy Code

```
Protected Function GetImageRect () As Rect
```

Return Value

A **Microsoft.Maui.Graphics.Rect** specifying the region inside this node where its associated Image will be rendered.

See Also

GetImageRect Method Overload List

ShapeNode.GetImageRect Method (Boolean)

Gets the image rectangle from the associated shape template or the node's bounding rectangle if there is no associated shape template.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected Rect GetImageRect (
    bool inLocal
)
```

Visual Basic Copy Code

```
Protected Function GetImageRect( _
    inLocal As Boolean _
) As Rect
```

Parameters

inLocal

Return Value

A **Microsoft.Maui.Graphics.Rect** specifying the region inside this node where its associated Image will be rendered.

See Also

GetImageRect Method Overload List
ShapeNode Members
ShapeNode Class

ShapeNode.GetIntersection Method

Calculates the intersection point between the segment defined by the specified point pair and the node's outline.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Point GetIntersection (
    Point segmentStart,
    Point segmentEnd
)
```

Visual Basic Copy Code

```
Public Overrides Function GetIntersection( _
    segmentStart As Point, _
    segmentEnd As Point _
) As Point
```

Parameters

segmentStart

The first point of the segment.

segmentEnd

The second point of the segment.

Return Value

A **Microsoft.Maui.Graphics.Point** object representing the intersection point.

ShapeNode.GetOutlinePoly Method

Node.GetOutlinePoly override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override PointCollection GetOutlinePoly (
    bool rendering
)
```

Visual Basic

```
Public Overrides Function GetOutlinePoly( _
    rendering As Boolean _
) As PointCollection
```

Parameters

rendering

Return Value

See Also

ShapeNode.GetRepaintRect Method

DiagramNode.GetRepaintRect override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override Rect GetRepaintRect (
    bool includeConnected
)
```

Visual Basic

```
Public Overrides Function GetRepaintRect( _
    includeConnected As Boolean _
) As Rect
```

Parameters

includeConnected
true if related items should be considered too; otherwise, **false**.

Return Value

A rectangular region that should be repainted when this node is modified.

ShapeNode.GetRgnInRect Method

Creates and returns a GraphicsPath object for this node as though it is contained in the specified rectangle.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected override IGraphicsPath GetRgnInRect (
    Rect rc,
    bool inLocal
)
```

Visual Basic Copy Code

```
Protected Overrides Function GetRgnInRect( _
    rc As Rect, _
    inLocal As Boolean _
) As IGraphicsPath
```

Parameters

rc

inLocal

Return Value

ShapeNode.HitTestHandle Method

DiagramNode.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override AdjustmentHandle HitTestHandle (
    Point point,
    double distance
)
```

Visual Basic Copy Code

```
Public Overrides Function HitTestHandle( _
    point As Point, _
    distance As Double _
) As AdjustmentHandle
```

Parameters

point
A **Microsoft.Maui.Graphics.Point** specifying where to look for a selection handle.

distance
Maximum distance from a handle at which it is still considered as hit.

Return Value

Returns an AdjustmentHandle instance representing the adjustment handle found at the specified location, or **null** if there is none.

ShapeNode.LoadFromJson Method

Loads the node from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

ShapeNode.LoadFromXml Method

Loads the item content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** containing the item's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

ShapeNode.ResizeToFitImage Method

Makes the shape node as big as the image it displays.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ResizeToFitImage ()
```

Visual Basic Copy Code

```
Public Sub ResizeToFitImage ()
```

Remarks

Call this method to make a shape node exactly the same size as the image it contains. The dots-per-inch resolution of the image is considered too when calculating the new node size. Use the Image property to assign an image to a node and ImageAlign to specify position of the image within the node.

ResizeToFitText Method

ShapeNode.ResizeToFitText Method

Makes the shape node big enough to display its text without clipping.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ResizeToFitText (
    FitSize fit
)
```

Visual Basic Copy Code

```
Public Function ResizeToFitText( _
    fit As FitSize _
) As Boolean
```

Parameters

fit
A member of the FitSize enumeration specifying whether the width or height of the node should remain unchanged.

Return Value

true if the node is resized successfully, or **false** otherwise.

Example

The following sample resizes a node to fit its text, using 1:1 width to height ratio.

C# Copy Code

```
var r = new Rect(shapeNode.Bounds.Left, shapeNode.Bounds.Top, 10, 10);

shapeNode.PolygonalTextLayout = true;
shapeNode.Bounds = r;
shapeNode.Text = "the method changes both the box' width" +
    "and height, maintaining their original ratio.";
shapeNode.ResizeToFitText(FitSize.KeepRatio);
```

ShapeNode.RestoreProperties Method

DiagramNode.RestoreProperties override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void RestoreProperties (
    DiagramItemProperties props
)
```

Visual Basic Copy Code

```
Protected Overrides Sub RestoreProperties( _
    props As DiagramItemProperties _
)
```

Parameters

props
A DiagramItemProperties -derived object containing a snapshot of the item's properties.

ShapeNode.RestoreState Method

DiagramNode.RestoreState override. Restores the state of this diagram item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void RestoreState (
    DiagramItemState state
)
```

Visual Basic Copy Code

```
Protected Overrides Sub RestoreState( _
    state As DiagramItemState _
)
```

Parameters

state
A ShapeNodeState instance, previously created by CreateState.

ShapeNode.SaveToJson Method

Saves the node as a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

ShapeNode Members

MindFusion.Diagramming Namespace

ShapeNode.SaveToXml Method

Saves the item content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** the item's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

ShapeNode.StartModify Method

DiagramNode.StartModify override. Invoked when the user starts modifying this item interactively.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void StartModify (
    Point org,
    AdjustmentHandle handle,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub StartModify( _
    org As Point, _
    handle As AdjustmentHandle, _
    ist As InteractionState _
)
```

Parameters

org
Position of the mouse pointer.

handle
The adjustment handle used to modify this node.

ist
An InteractionState object containing more information about the current state of the operation.

MindFusion.Diagramming Namespace

ShapeNode.UpdateModify Method

DiagramNode.UpdateModify override. Invoked during interactive modification of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void UpdateModify (
    Point current,
    InteractionState ist
)
```

Visual Basic Copy Code

```
Protected Overrides Sub UpdateModify( _
    current As Point, _
    ist As InteractionState _
)
```

Parameters

current
Position of the mouse pointer.

ist
An InteractionState object containing more information about the current state of the operation.

ShapeNode Properties

ShapeNode.AllowFlip Property

Gets or sets a value indicating whether the node's shape flips when an edge is dragged over its opposite edge.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowFlip { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowFlip As Boolean
```

Property Value

true to let users flip the shape, or **false** otherwise. The default value is **false**.

ShapeNode.CustomDraw Property

Gets or sets the type of custom drawing performed on this shape node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CustomDraw CustomDraw { get; set; }
```

Visual Basic Copy Code

```
Public Property CustomDraw As CustomDraw
```

Property Value

A member of the CustomDraw enumeration. Initialized with the value of ShapeCustomDraw.

Remarks

This property allows invoking custom painting code for a shape node. That code must execute in response to the DrawNode event. There are several modes of custom painting, allowing the custom code to paint the shape node entirely, or do that in addition to what MvcDiagram paints by default. The following CustomDraw members can be assigned to this property to specify the custom painting mode:

Member Name	Description
None	Do not perform custom drawing, let all painting be done by MvcDiagram.
Additional	The custom painting code executes after the node interior and frame are painted by MvcDiagram, but before text is rendered. In this mode, the **Graphics** instance passed to the custom drawing event handler has a clipping region applied to it.
Full	The component does not do any standard drawing, the entire painting of the node is done by the application.
ShadowOnly	Only the shadow of the node is painted by custom code, the node itself is drawn by the component.

Additional2	The custom painting code executes after all parts of the node are painted by MvcDiagram. In this mode, the **Graphics** instance passed to the custom drawing event handler doesn't have a clipping region applied to it.

ShapeNode.EnableStyledText Property

Gets or sets a value indicating whether styled text rendering is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableStyledText { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableStyledText As Boolean
```

Property Value

true to parse the node's text in order to find formatting tags; otherwise, **false**. Initialized with the value of EnableStyledText.

Remarks

Styled text allows applying various attributes to the characters it contains. Attributes are specified using HTML-like formatting tags embedded in the raw text. Formatting tags are listed and described in the **Text Attributes and Formatting** section of this help file.

Styled text can be enabled only if PolygonalTextLayout is set to **true**. If enabled, Text is parsed and analyzed each time it is changed. Parsing determines what formatting tags are used and adds the corresponding attribute records to MvcDiagram's internal representation of styled text. If the property value is **false**, the text is not processed in any way and is displayed without formatting.

Example

The following sample code demonstrates how to use styled text:

C# Copy Code

```
shapeNode.PolygonalTextLayout = true;
shapeNode.EnableStyledText = true;
shapeNode.Text = "CH<sub>2</sub>CL<sub>2</sub> " + "\n" +
    "<b><color=#0088FF>methylene-chloride</b>";
```

Visual Basic Copy Code

```
shapeNode.PolygonalTextLayout = True
shapeNode.EnableStyledText = True
shapeNode.Text = "CH<sub>2</sub>CL<sub>2</sub> " + vbNewLine + _
    "<b><color=#0088FF>methylene-chloride</b>"
```

ShapeNode.FlipX Property

Gets or sets a value indicating whether the node's shape is flipped horizontally.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool FlipX { get; set; }
```

Visual Basic Copy Code

```
Public Property FlipX As Boolean
```

Property Value

true if the shape is flipped horizontally, or **false** otherwise.

MindFusion.Diagramming Namespace
FlipY Property
AllowFlip Property

ShapeNode.FlipY Property

Gets or sets a value indicating whether the node's shape is flipped vertically.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool FlipY { get; set; }
```

Visual Basic Copy Code

```
Public Property FlipY As Boolean
```

Property Value

true if the shape is flipped vertically, or **false** otherwise.

AllowFlip Property

ShapeNode.Font Property

Gets or sets the font used to render the node's text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Font Font { get; set; }
```

Visual Basic Copy Code

```
Public Overrides Property Font As Font
```

Property Value

A Font instance specifying the font attributes.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.Image Property

Gets or sets the image that is displayed in this shape node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage Image { get; set; }
```

Visual Basic Copy Code

```
Public Property Image As IImage
```

Property Value

A **Microsoft.Maui.Graphics.IImage** instance. The default value is **null** (**Nothing** in Visual Basic).

Remarks

This property lets you display an image inside the node. The ImageRectangle attribute of the shape definition specifies a rectangular area inside the node in which the image is displayed. Use the ImageAlign property to specify how the image is aligned to that area. By default, the image is displayed in the center of the bounding rectangle of the node.

If there isn't any image assigned to this property, the shape node displays the Image specified in its Shape template.

If a node should display multiple images, you could add and arrange them using NodeLabel objects.

See Also

ShapeNode Members

MindFusion.Diagramming Namespace
RotateImage Property
ResizeToFitImage Method
ImagePadding Property

ShapeNode.ImageAlign Property

Gets or sets the alignment of the image displayed in this shape node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ImageAlign ImageAlign { get; set; }
```

Visual Basic Copy Code

```
Public Property ImageAlign As ImageAlign
```

Property Value

A member of the ImageAlign enumeration. The default is **Center**.

Remarks

This property specifies how the Image is aligned to the bounding rectangle of this node. The image is aligned relatively to the rectangle specified in the ImageRectangle attribute of the Shape definition.

ImagePadding Property

ShapeNode.ImagePadding Property

Gets or sets the padding distance between node's borders and Image.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Nullable<Thickness> ImagePadding { get; set; }
```

Visual Basic Copy Code

```
Public Property ImagePadding As Nullable(Of Thickness)
```

Property Value

An optional Thickness value specifying padding distance; the default value is **null**.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace
ImageAlign Property

ShapeNode.ImageUrl Property

Gets or sets a URL used to load an image into this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ImageUrl { get; set; }
```

Visual Basic Copy Code

```
Public Property ImageUrl As String
```

Property Value

A string specifying the image location.

Remarks

This property is used in MindFusion Web components. If it is set, the image data is not transferred to the client-side together with the diagram but only the URL string. Such images are downloaded asynchronously after all other diagram elements load on the client.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace
Image Property

ShapeNode.PlainText Property

Gets the plain text of this shape node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string PlainText { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property PlainText As String
```

Property Value

A string containing the plain text of the shape node.

Remarks

This property removes any formatting tags from the node's Text and returns the plain human-readable text. That is useful when styled text formatting is enabled and you need to display the node's text outside of MvcDiagram, for example in a message box or a dialog box.

ShapeNode.PolygonalTextLayout Property

Gets or sets a value indicating whether the node's Text is formatted inside non-rectangular outline.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool PolygonalTextLayout { get; set; }
```

Visual Basic Copy Code

```
Public Property PolygonalTextLayout As Boolean
```

Property Value

true to enable polygonal formatting; **false** to disable it.

Remarks

The node's area in which text is rendered can be explicitly defined for each Shape definition, and if it is not specified, the shape outline is used implicitly. The formatting algorithm is designed to layout text inside polygonal outlines. A polygonal approximation is created for outlines that have curved segments, so text can be laid out in shapes that consist of Bézier curves too.

Shape Property

ShapeNode.RotateImage Property

Gets or sets a value indicating whether the Image should be rotated when the shape node is rotated.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RotateImage { get; set; }
```

Visual Basic Copy Code

```
Public Property RotateImage As Boolean
```

Property Value

true to rotate the node's image; otherwise, **false**. The default is **true**.

Remarks

The image is clipped by the rotated shape outline, even if this property is set to **false**.

MindFusion.Diagramming Namespace
RotationAngle Property
RotateText Property

ShapeNode.RotateText Property

Gets or sets a value indicating whether the Text should be rotated when the shape node is rotated.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool RotateText { get; set; }
```

Visual Basic Copy Code

```
Public Property RotateText As Boolean
```

Property Value

true to rotate the node's text; otherwise, **false**. The default is **false**.

Remarks

If the property is set to **false** and PolygonalTextLayout is enabled, the text stays horizontal but it adapts to the rotated outline of the shape node.

ShapeNode.Shape Property

Gets or sets a reference to the node's geometric shape definition.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape Shape { get; set; }
```

Visual Basic Copy Code

```
Public Property Shape As Shape
```

Property Value

An instance of the Shape class.

Remarks

Use this property to assign a complex shape to a node. Complex shapes consist of outlines, decorations and text-region definitions that can be defined as series of lines, arcs and curves. To define a custom shape, create an instance of the Shape class. That class also provides 87 predefined shapes exposed by the Shapes collection.

Example

The following sample code illustrates how to use the predefined shapes and how to create your own custom shapes.

C# Copy Code

```
private void example_Click(object sender, System.EventArgs e)
{
    ShapeNode shapeNode0 = diagram.Nodes[0] as ShapeNode;
    ShapeNode shapeNode1 = diagram.Nodes[1] as ShapeNode;

    // Use one of the predefined shapes
    shapeNode0.Shape = Shape.FromId("MultiDocument");

    // Create a custom shape
    shapeNode1.Shape = new Shape(
        new ElementTemplate[] {
            new LineTemplate(0, 100, 60, 100),
            new BezierTemplate(60, 100, 80, 100, 100, 75, 100, 50),
            new BezierTemplate(100, 50, 100, 25, 80, 0,  60, 0),
            new LineTemplate(60, 0, 0, 0),
            new LineTemplate(0, 0, 0, 100) },
        FillMode.Winding);
}
```

Visual Basic Copy Code

```
Private Sub example_Click(ByVal sender As Object, ByVal e As System.EventArgs) Handles
example.Click

    Dim shapeNode0 As ShapeNode = CType(diagram.Nodes(0), ShapeNode)
    Dim shapeNode1 As ShapeNode = CType(diagram.Nodes(1), ShapeNode)

    ' Use one of the predefined shapes
    shapeNode0.Shape = Shape.FromId("MultiDocument")

    ' Create a custom shape
    shapeNode1.Shape = New Shape( _
        New ElementTemplate() { _
            New LineTemplate(0, 100, 60, 100), _
            New BezierTemplate(60, 100, 80, 100, 100, 75, 100, 50), _
            New BezierTemplate(100, 50, 100, 25, 80, 0, 60, 0), _
            New LineTemplate(60, 0, 0, 0), _
            New LineTemplate(0, 0, 0, 100)}, _
        FillMode.Winding)

End Sub
```

Shape.Shapes Property
PolygonalTextLayout Property
ShapeOrientation Property
AllowFlip Property

ShapeNode.ShapeOrientation Property

Gets or sets the angle specifying the orientation with which a shape template is applied to the node bounds.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ShapeOrientation { get; set; }
```

Visual Basic Copy Code

```
Public Property ShapeOrientation As Double
```

Property Value

A **double** value specifying the orientation angle in degrees. Initialized with the value of ShapeOrientation.

Remarks

That property does not rotate the node, that is, does not rotate the bounding rectangle of the node around its center. It specifies a rotation transformation to be performed on the definition of the Shape when it is applied to a node; the node's bounding rectangle (location, width and height) remain intact. In the current MvcDiagram version, only 0, 90, 180 or 270 can be set as value of **ShapeOrientation**.

Shape Property
RotationAngle Property

ShapeNode.Text Property

Gets or sets the text displayed inside the shape node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Text { get; set; }
```

Visual Basic Copy Code

```
Public Property Text As String
```

Property Value

A string containing the node's text. Initialized with the value of ShapeText.

Remarks

This property specifies the text that should be drawn inside the shape. The text appearance can be customized through the TextBrush and TextFormat properties.

Styled text allows applying various attributes to the text characters. Attributes are specified by embedding HTML-like formatting tags within the raw text. Styled text is enabled by setting EnableStyledText to **true**.

You can add more text labels by calling the AddLabel method, and customize their position and appearance via the various members of returned NodeLabel object.

ShapeNode.TextFormat Property

Gets or sets the alignment of the text that is displayed inside shape nodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public StringFormat TextFormat { get; set; }
```

Visual Basic Copy Code

```
Public Property TextFormat As StringFormat
```

Property Value

An instance of the StringFormat class. Initialized with the value of TextFormat.

Remarks

Use this property to specify the wrapping mode and alignment of the text that is contained in nodes.

If there isn't enough space available to fit a whole line of text, MvcDiagram wraps the text to a new line when it reaches the edge of the node. You can specify that the text should be wrapped only at word boundaries by setting the **Trimming** member of **TextFormat** to **StringTrimming.Word**. The default is to split words into multiple parts if there is not enough space to fit a whole word.

If you prefer to use your own line-breaks, you can disable the automatic text wrapping by enabling the **NoWrap** flag in the **FormatFlags** member of **TextFormat**. If automatic wrapping is disabled and there isn't enough space to fit the whole line, the text is clipped at the node boundaries.

TextColor Property
Diagram.TextFormat Property

ShapeNode.TextPadding Property

Gets or sets the spacing between the item boundaries and its text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Thickness TextPadding { get; set; }
```

Visual Basic Copy Code

```
Public Overrides Property TextPadding As Thickness
```

Property Value

A Thickness instance specifying the size of the padding space left around the text.

ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.Transparent Property

Gets or sets a value indicating whether this shape node is transparent.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Transparent { get; set; }
```

Visual Basic Copy Code

```
Public Property Transparent As Boolean
```

Property Value

true if the shape node is transparent; otherwise, **false**. The default is **false**.

Remarks

If a node is transparent, only its image and text are drawn. Shape, filling and frames are not painted.

ShapeNodeStyle Members

Represents a reusable set of properties that define the appearance of shape nodes.

The following tables list the members exposed by the ShapeNodeStyle type.

Public Constructors

	Name	Description
	ShapeNodeStyle	Initializes a new instance of the **ShapeNodeStyle** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	Effects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	FontFamily	Gets or sets the font family of the item text. (Inherited from DiagramItemStyle.)
	FontSize	Gets or sets the font size of the item text. (Inherited from DiagramItemStyle.)
	FontStyle	Gets or sets the font style of the item text. (Inherited from DiagramItemStyle.)
	FontUnit	Gets or sets the font unit of the item text. (Inherited from DiagramItemStyle.)
	ShadowBrush	Gets or sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	Stroke	Gets or sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	StrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline items. (Inherited from DiagramItemStyle.)
	StrokeThickness	Gets or sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)

Public Methods

	Name	Description
	GetProperties	Gets all properties in the style. (Inherited from Style.)
	GetProperty	Returns the property with the specified name, if any. (Inherited from Style.)
	RegisterType	Associates a type with an alias. (Inherited from Style.)

Protected Methods

	Name	Description

	GetValue	Gets the value of the specified property. (Inherited from Style.)
	IsPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	LoadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	LoadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from Style.)
	RegisterProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	SaveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	SaveToXml	Saves the style content into an XML element. (Inherited from Style.)
	SetValue	Sets the value of the specified property. (Inherited from Style.)
	UnsetValue	Clears the value of the specified property. (Inherited from Style.)

Public Events

	Name	Description
	PropertyChanged	Raised when any of the registered style properties has changed. (Inherited from Style.)

Shapes Members

Provides alternative method of access to the MvcDiagram **predefined shapes**, that allows code completion and IntelliSense support, which is not available when using Shape.FromId.

The following tables list the members exposed by the Shapes type.

Public Properties

	Name	Description
	Actor	Gets the Actor predefined shape.
	Alternative	Gets the Alternative predefined shape.
	Arrow1	Gets the Arrow1 predefined shape.
	Arrow2	Gets the Arrow2 predefined shape.
	Arrow3	Gets the Arrow3 predefined shape.
	Arrow4	Gets the Arrow4 predefined shape.
	Arrow5	Gets the Arrow5 predefined shape.
	Arrow6	Gets the Arrow6 predefined shape.
	Arrow7	Gets the Arrow7 predefined shape.
	Arrow8	Gets the Arrow8 predefined shape.

	Arrow9	Gets the Arrow9 predefined shape.
	BeginLoop	Gets the BeginLoop predefined shape.
	BpmnComplex	Gets the BpmnComplex predefined shape.
	BpmnDataBasedXor	Gets the BpmnDataBasedXor predefined shape.
	BpmnEndCancel	Gets the BpmnEndCancel predefined shape.
	BpmnEndCompensation	Gets the BpmnEndCompensation predefined shape.
	BpmnEndError	Gets the BpmnEndError predefined shape.
	BpmnEndLink	Gets the BpmnEndLink predefined shape.
	BpmnEndMessage	Gets the BpmnEndMessage predefined shape.
	BpmnEndMultiple	Gets the BpmnEndMultiple predefined shape.
	BpmnEndTerminate	Gets the BpmnEndTerminate predefined shape.
	BpmnEventBasedXor	Gets the BpmnEventBasedXor predefined shape.
	BpmnInclusive	Gets the BpmnInclusive predefined shape.
	BpmnIntermediateCancel	Gets the BpmnIntermediateCancel predefined shape.
	BpmnIntermediateCompensation	Gets the BpmnIntermediateCompensation predefined shape.
	BpmnIntermediateError	Gets the BpmnIntermediateError predefined shape.
	BpmnIntermediateLink	Gets the BpmnIntermediateLink predefined shape.
	BpmnIntermediateMessage	Gets the BpmnIntermediateMessage predefined shape.
	BpmnIntermediateMultiple	Gets the BpmnIntermediateMultiple predefined shape.
	BpmnIntermediateRule	Gets the BpmnIntermediateRule predefined shape.
	BpmnIntermediateTimer	Gets the BpmnIntermediateTimer predefined shape.

	BpmnStartMessage	Gets the BpmnStartMessage predefined shape.
	BpmnStartMultiple	Gets the BpmnStartMultiple predefined shape.
	BpmnStartRule	Gets the BpmnStartRule predefined shape.
	BpmnStartTimer	Gets the BpmnStartTimer predefined shape.
	Cloud	Gets the Cloud predefined shape.
	Collate	Gets the Collate predefined shape.
	ConeDown	Gets the ConeDown predefined shape.
	ConeUp	Gets the ConeUp predefined shape.
	ConnectedIssues	Gets the ConnectedIssues predefined shape.
	CreateRequest	Gets the CreateRequest predefined shape.
	Cross	Gets the Cross predefined shape.
	Cube	Gets the Cube predefined shape.
	Cylinder	Gets the Cylinder predefined shape.
	Database	Gets the Database predefined shape.

	DataTransmition	Gets the DataTransmition predefined shape.
	DDelay	Gets the DDelay predefined shape.
	Decagon	Gets the Decagon predefined shape.
	Decision	Gets the Decision predefined shape.
	Decision2	Gets the Decision2 predefined shape.
	Delay	Gets the Delay predefined shape.
	DInDelay	Gets the DInDelay predefined shape.
	DirectAccessStorage	Gets the DirectAccessStorage predefined shape.
	DiskStorage	Gets the DiskStorage predefined shape.
	Display	Gets the Display predefined shape.
	DividedEvent	Gets the DividedEvent predefined shape.
	DividedProcess	Gets the DividedProcess predefined shape.
	Document	Gets the Document predefined shape.
	Donut	Gets the Donut predefined shape.
	DOutDelay	Gets the DOutDelay predefined shape.
	Ellipse	Gets the Ellipse predefined shape.
	EndLoop	Gets the EndLoop predefined shape.
	ExternalOrganization	Gets the ExternalOrganization predefined shape.
	ExternalProcess	Gets the ExternalProcess predefined shape.
	File	Gets the File predefined shape.
	FramedRectangle	Gets the FramedRectangle predefined shape.
	Gate	Gets the Gate predefined shape.
	Heart	Gets the Heart predefined shape.
	Heptagon	Gets the Heptagon predefined shape.
	Hourglass	Gets the Hourglass predefined shape.
	Input	Gets the Input predefined shape.
	InternalStorage	Gets the InternalStorage predefined shape.
	Interrupt	Gets the Interrupt predefined shape.
	Interrupt2	Gets the Interrupt2 predefined shape.
	IsoProcess	Gets the IsoProcess predefined shape.
	Junction	Gets the Junction predefined shape.
	Lightning	Gets the Lightning predefined shape.
	LinedDocument	Gets the LinedDocument predefined shape.
	ManualOperation	Gets the ManualOperation predefined shape.
	Merge	Gets the Merge predefined shape.
	MessageFromUser	Gets the MessageFromUser predefined shape.
	MessageToUser	Gets the MessageToUser predefined shape.

	Microform	Gets the Microform predefined shape.
	MicroformProcessing	Gets the MicroformProcessing predefined shape.
	MicroformRecording	Gets the MicroformRecording predefined shape.
	MultiDocument	Gets the MultiDocument predefined shape.
	MultiProc	Gets the MultiProc predefined shape.
	Octagon	Gets the Octagon predefined shape.
	OfflineStorage	Gets the OfflineStorage predefined shape.
	OffpageConnection	Gets the OffpageConnection predefined shape.
	OffpageReference	Gets the OffpageReference predefined shape.
	Or	Gets the Or predefined shape.
	Pentagon	Gets the Pentagon predefined shape.
	Plaque	Gets the Plaque predefined shape.
	PrimitiveFromCall	Gets the PrimitiveFromCall predefined shape.
	PrimitiveToCall	Gets the PrimitiveToCall predefined shape.
	Procedure	Gets the Procedure predefined shape.
	Process	Gets the Process predefined shape.
	Prysm	Gets the Prysm predefined shape.
	PunchedCard	Gets the PunchedCard predefined shape.
	PyramidDown	Gets the PyramidDown predefined shape.
	PyramidUp	Gets the PyramidUp predefined shape.
	Rectangle	Gets the Rectangle predefined shape.
	RightTriangle	Gets the RightTriangle predefined shape.
	RoundRect	Gets the RoundRect predefined shape.
	RSave	Gets the RSave predefined shape.
	Save	Gets the Save predefined shape.
	Sort	Gets the Sort predefined shape.
	Sphere	Gets the Sphere predefined shape.
	Star	Gets the Star predefined shape.
	Star16Pointed	Gets the Star16Pointed predefined shape.
	Star24Pointed	Gets the Star24Pointed predefined shape.
	Star32Pointed	Gets the Star32Pointed predefined shape.
	Star4Pointed	Gets the Star4Pointed predefined shape.
	Star5Pointed	Gets the Star5Pointed predefined shape.
	Star6Pointed	Gets the Star6Pointed predefined shape.
	Star7Pointed	Gets the Star7Pointed predefined shape.
	Start	Gets the Start predefined shape.
	Tape	Gets the Tape predefined shape.

	Terminator	Gets the Terminator predefined shape.
	TransmittalTape	Gets the TransmittalTape predefined shape.
	Trapezoid	Gets the Trapezoid predefined shape.

Public Shared ReadOnly Property Actor As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Alternative Property

Gets the Alternative predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Alternative { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Alternative As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class

Shapes.Arrow1 Property

Gets the Arrow1 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Arrow1 { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Arrow1 As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace
Table of Predefined Shapes

Shapes.Arrow2 Property

Gets the Arrow2 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Arrow2 { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Arrow2 As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Arrow3 Property

Gets the Arrow3 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Arrow3 { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Arrow3 As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Arrow4 Property

Gets the Arrow4 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Arrow4 { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Arrow4 As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Arrow5 Property

Gets the Arrow5 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Arrow5 { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Arrow5 As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Arrow6 Property

Gets the Arrow6 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Arrow6 { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Arrow6 As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Arrow7 Property

Gets the Arrow7 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Arrow7 { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Arrow7 As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Arrow8 Property

Gets the Arrow8 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Arrow8 { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Arrow8 As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Arrow9 Property

Gets the Arrow9 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Arrow9 { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Arrow9 As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BeginLoop Property

Gets the BeginLoop predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BeginLoop { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BeginLoop As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnComplex Property

Gets the BpmnComplex predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnComplex { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnComplex As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnDataBasedXor Property

Gets the BpmnDataBasedXor predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnDataBasedXor { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnDataBasedXor As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndCancel Property

Gets the BpmnEndCancel predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnEndCancel { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnEndCancel As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndCompensation Property

Gets the BpmnEndCompensation predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnEndCompensation { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnEndCompensation As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndError Property

Gets the BpmnEndError predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnEndError { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnEndError As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndLink Property

Gets the BpmnEndLink predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnEndLink { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnEndLink As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndMessage Property

Gets the BpmnEndMessage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnEndMessage { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnEndMessage As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndMultiple Property

Gets the BpmnEndMultiple predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnEndMultiple { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnEndMultiple As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndTerminate Property

Gets the BpmnEndTerminate predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnEndTerminate { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnEndTerminate As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEventBasedXor Property

Gets the BpmnEventBasedXor predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnEventBasedXor { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnEventBasedXor As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnInclusive Property

Gets the BpmnInclusive predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnInclusive { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnInclusive As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateCancel Property

Gets the BpmnIntermediateCancel predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnIntermediateCancel { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnIntermediateCancel As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateCompensation Property

Gets the BpmnIntermediateCompensation predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public static Shape BpmnIntermediateCompensation { get; }
```

Visual Basic

```
Public Shared ReadOnly Property BpmnIntermediateCompensation As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateError Property

Gets the BpmnIntermediateError predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public static Shape BpmnIntermediateError { get; }
```

Visual Basic

```
Public Shared ReadOnly Property BpmnIntermediateError As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateLink Property

Gets the BpmnIntermediateLink predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public static Shape BpmnIntermediateLink { get; }
```

Visual Basic

```
Public Shared ReadOnly Property BpmnIntermediateLink As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateMessage Property

Gets the BpmnIntermediateMessage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnIntermediateMessage { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnIntermediateMessage As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateMultiple Property

Gets the BpmnIntermediateMultiple predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnIntermediateMultiple { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnIntermediateMultiple As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateRule Property

Gets the BpmnIntermediateRule predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnIntermediateRule { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnIntermediateRule As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateTimer Property

Gets the BpmnIntermediateTimer predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnIntermediateTimer { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnIntermediateTimer As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnParallelFork Property

Gets the BpmnParallelFork predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnParallelFork { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnParallelFork As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnStartLink Property

Gets the BpmnStartLink predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnStartLink { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnStartLink As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnStartMessage Property

Gets the BpmnStartMessage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnStartMessage { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnStartMessage As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnStartMultiple Property

Gets the BpmnStartMultiple predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnStartMultiple { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnStartMultiple As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnStartRule Property

Gets the BpmnStartRule predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnStartRule { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnStartRule As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnStartTimer Property

Gets the BpmnStartTimer predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape BpmnStartTimer { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property BpmnStartTimer As Shape
```

Property Value

See Also

Shapes.Cloud Property

Gets the Cloud predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Cloud { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Cloud As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace
Table of Predefined Shapes

Shapes.Collate Property

Gets the Collate predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Collate { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Collate As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.ConeDown Property

Gets the ConeDown predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape ConeDown { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property ConeDown As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.ConeUp Property

Gets the ConeUp predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape ConeUp { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property ConeUp As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.ConnectedIssues Property

Gets the ConnectedIssues predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape ConnectedIssues { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property ConnectedIssues As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.CreateRequest Property

Gets the CreateRequest predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape CreateRequest { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property CreateRequest As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Cross Property

Gets the Cross predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Cross { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Cross As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Cube Property

Gets the Cube predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Cube { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Cube As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Cylinder Property

Gets the Cylinder predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Cylinder { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Cylinder As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Database Property

Gets the Database predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Database { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Database As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DataTransmition Property

Gets the DataTransmition predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape DataTransmition { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property DataTransmition As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DDelay Property

Gets the DDelay predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape DDelay { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property DDelay As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Decagon Property

Gets the Decagon predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Decagon { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Decagon As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Decision Property

Gets the Decision predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Decision { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Decision As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Decision2 Property

Gets the Decision2 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Decision2 { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Decision2 As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Delay Property

Gets the Delay predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Delay { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Delay As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DInDelay Property

Gets the DInDelay predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape DInDelay { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property DInDelay As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DirectAccessStorage Property

Gets the DirectAccessStorage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape DirectAccessStorage { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property DirectAccessStorage As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DiskStorage Property

Gets the DiskStorage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape DiskStorage { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property DiskStorage As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Display Property

Gets the Display predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Display { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Display As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DividedEvent Property

Gets the DividedEvent predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape DividedEvent { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property DividedEvent As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DividedProcess Property

Gets the DividedProcess predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape DividedProcess { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property DividedProcess As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Document Property

Gets the Document predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Document { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Document As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Donut Property

Gets the Donut predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Donut { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Donut As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DOutDelay Property

Gets the DOutDelay predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape DOutDelay { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property DOutDelay As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Ellipse Property

Gets the Ellipse predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Ellipse { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Ellipse As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.EndLoop Property

Gets the EndLoop predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape EndLoop { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property EndLoop As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.ExternalOrganization Property

Gets the ExternalOrganization predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape ExternalOrganization { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property ExternalOrganization As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.ExternalProcess Property

Gets the ExternalProcess predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape ExternalProcess { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property ExternalProcess As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.File Property

Gets the File predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape File { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property File As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.FramedRectangle Property

Gets the FramedRectangle predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape FramedRectangle { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property FramedRectangle As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

MindFusion.Diagramming Namespace

Shapes.Gate Property

Gets the Gate predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Gate { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Gate As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Heart Property

Gets the Heart predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Heart { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Heart As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Heptagon Property

Gets the Heptagon predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Heptagon { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Heptagon As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Hourglass Property

Gets the Hourglass predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Hourglass { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Hourglass As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Input Property

Gets the Input predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Input { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Input As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.InternalStorage Property

Gets the InternalStorage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape InternalStorage { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property InternalStorage As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Interrupt Property

Gets the Interrupt predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Interrupt { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Interrupt As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Interrupt2 Property

Gets the Interrupt2 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Interrupt2 { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Interrupt2 As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.IsoProcess Property

Gets the IsoProcess predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape IsoProcess { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property IsoProcess As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Junction Property

Gets the Junction predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Junction { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Junction As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Lightning Property

Gets the Lightning predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Lightning { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Lightning As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.LinedDocument Property

Gets the LinedDocument predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape LinedDocument { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property LinedDocument As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.ManualOperation Property

Gets the ManualOperation predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape ManualOperation { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property ManualOperation As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Merge Property

Gets the Merge predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Merge { get; }
```

Visual Basic

```
Public Shared ReadOnly Property Merge As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.MessageFromUser Property

Gets the MessageFromUser predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public static Shape MessageFromUser { get; }
```

Visual Basic

```
Public Shared ReadOnly Property MessageFromUser As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.MessageToUser Property

Gets the MessageToUser predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public static Shape MessageToUser { get; }
```

Visual Basic

```
Public Shared ReadOnly Property MessageToUser As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Microform Property

Gets the Microform predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Microform { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Microform As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.MicroformProcessing Property

Gets the MicroformProcessing predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape MicroformProcessing { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property MicroformProcessing As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.MicroformRecording Property

Gets the MicroformRecording predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape MicroformRecording { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property MicroformRecording As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.MultiDocument Property

Gets the MultiDocument predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape MultiDocument { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property MultiDocument As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.MultiProc Property

Gets the MultiProc predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape MultiProc { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property MultiProc As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Octagon Property

Gets the Octagon predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Octagon { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Octagon As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.OfflineStorage Property

Gets the OfflineStorage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape OfflineStorage { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property OfflineStorage As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.OffpageConnection Property

Gets the OffpageConnection predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape OffpageConnection { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property OffpageConnection As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.OffpageReference Property

Gets the OffpageReference predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape OffpageReference { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property OffpageReference As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Or Property

Gets the Or predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Or { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Or As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Pentagon Property

Gets the Pentagon predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Pentagon { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Pentagon As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Plaque Property

Gets the Plaque predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Plaque { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Plaque As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.PrimitiveFromCall Property

Gets the PrimitiveFromCall predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape PrimitiveFromCall { get; }
```

Visual Basic

```
Public Shared ReadOnly Property PrimitiveFromCall As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.PrimitiveToCall Property

Gets the PrimitiveToCall predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public static Shape PrimitiveToCall { get; }
```

Visual Basic

```
Public Shared ReadOnly Property PrimitiveToCall As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Procedure Property

Gets the Procedure predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public static Shape Procedure { get; }
```

Visual Basic

```
Public Shared ReadOnly Property Procedure As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Process Property

Gets the Process predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Process { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Process As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Prysm Property

Gets the Prysm predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Prysm { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Prysm As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.PunchedCard Property

Gets the PunchedCard predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape PunchedCard { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property PunchedCard As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.PyramidDown Property

Gets the PyramidDown predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape PyramidDown { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property PyramidDown As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.PyramidUp Property

Gets the PyramidUp predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape PyramidUp { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property PyramidUp As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class

Shapes.Star Property

Gets the Star predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Star { get; }
```

Visual Basic

```
Public Shared ReadOnly Property Star As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Star16Pointed Property

Gets the Star16Pointed predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public static Shape Star16Pointed { get; }
```

Visual Basic

```
Public Shared ReadOnly Property Star16Pointed As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Star24Pointed Property

Gets the Star24Pointed predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

Shapes.Tape Property

Gets the Tape predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Tape { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Tape As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Terminator Property

Gets the Terminator predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Terminator { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Terminator As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.TransmittalTape Property

Gets the TransmittalTape predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape TransmittalTape { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property TransmittalTape As Shape
```

Property Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Trapezoid Property

Gets the Trapezoid predefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static Shape Trapezoid { get; }
```

Visual Basic Copy Code

```
Public Shared ReadOnly Property Trapezoid As Shape
```

Property Value

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

ShowAnchors Enumeration

Specifies when anchors points should be displayed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum ShowAnchors
```

Visual Basic Copy Code

```
Public Enum ShowAnchors
```

Members

	Member name	Description
	Always	Anchor point marks are always painted.
	Never	Anchor point marks are never painted.
	Auto	Anchor point marks are shown for the node under the mouse cursor.
	Selected	Anchor point marks are painted for the selected node.

Remarks

Members of this enumeration are used as values of the ShowAnchors property of the Diagram class. **Auto** and **Selected** can be combined using the bitwise or operator.

See Also

MindFusion.Diagramming Namespace
ShowAnchors Property
MarkStyle Enumeration

SimpleShape Enumeration

Defines the possible values for Shape property of tables.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum SimpleShape
```

Visual Basic Copy Code

```
Public Enum SimpleShape
```

Members

	Member name	Description
	Rectangle	Sets table's shape to rectangle.
	RoundedRectangle	Sets table's shape to rounded rectangle.

MindFusion.Diagramming Namespace

SmoothShadowEffect Class

Represents an effect that smooths the shadow of nodes. This effect does nothing if shadows are not visible.

Syntax

C# Copy Code

```
public sealed class SmoothShadowEffect : NodeEffect
```

Visual Basic Copy Code

```
Public NotInheritable Class SmoothShadowEffect
    Inherits NodeEffect
```

Remarks

This effect can be applied to the nodes in a Diagram by adding an instance of this class to the NodeEffects collection. In addition, this effect will be active only when the Diagram.EffectsProvider property is set to an object implementing the GenerateShadow method of the IEffectsProvider interface.

The following image illustrates the Shadow effect applied to a rectangular node:

Example

The following example demonstrates how to apply smooth shadow effect to the nodes of an existing diagram.

C# Copy Code

```
diagram.NodeEffects.Add(new SmoothShadowEffect());
```

Visual Basic Copy Code

```
diagram.NodeEffects.Add(New SmoothShadowEffect())
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.NodeEffect
    MindFusion.Diagramming.SmoothShadowEffect

See Also

SmoothShadowEffect Members
MindFusion.Diagramming Namespace

SmoothShadowEffect Members

Represents an effect that smooths the shadow of nodes. This effect does nothing if shadows are not visible.

The following tables list the members exposed by the SmoothShadowEffect type.

Public Constructors

	Name	Description
	SmoothShadowEffect	Initializes a new instance of the **SmoothShadowEffect** class.

Public Properties

	Name	Description
	Dispersion	Gets or sets the shadow dispersion.

Public Methods

	Name	Description
	Clone	NodeEffect.Clone override.

Public Events

	Name	Description
	PropertyChanged	INotifyPropertyChanged.PropertyChanged implementation. (Inherited from NodeEffect.)

SmoothShadowEffect Class
MindFusion.Diagramming Namespace

SmoothShadowEffect Constructor

Initializes a new instance of the SmoothShadowEffect class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SmoothShadowEffect ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

SmoothShadowEffect Class
MindFusion.Diagramming Namespace

SmoothShadowEffect Methods

SmoothShadowEffect.Clone Method

NodeEffect.Clone override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Object Clone ()
```

Visual Basic Copy Code

```
Public Overrides Function Clone () As Object
```

Return Value

SmoothShadowEffect Properties

SmoothShadowEffect.Dispersion Property

Gets or sets the shadow dispersion.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int Dispersion { get; set; }
```

Visual Basic Copy Code

```
Public Property Dispersion As Integer
```

Property Value

Remarks

This property is hidden because it slows down performance with bigger values.

SmoothShadowEffect Events

SnapToAnchor Enumeration

Specifies when link ends are snapped to nearest anchor points.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum SnapToAnchor
```

Visual Basic	Copy Code
`Public Enum SnapToAnchor`	

Members

	Member name	Description
	OnCreate	Snap to anchor point when creating a new link.
	OnCreateOrModify	Snap to anchor point when creating or modifying a link.

Remarks

Members of this enumeration are used as values of the SnapToAnchor property of the Diagram class.

See Also

MindFusion.Diagramming Namespace

Style Members

Represents an unordered dynamic collection of properties that can be identified by name.

The following tables list the members exposed by the Style type.

Public Constructors

	Name	Description
	Style	Initializes a new instance of the **Style** class.

Public Methods

	Name	Description

	GetProperties	Gets all properties in the style.
	GetProperty	Returns the property with the specified name, if any.
S	RegisterType	Associates a type with an alias.

Protected Methods

	Name	Description
	GetValue	Gets the value of the specified property.
	IsPropertySet	Checks whether the specified property has a value.
	LoadFromXml	Loads the style content from an XML element.
	OnPropertyChanged	Raises the PropertyChanged event.
	RegisterProperty	Registers a new property with the specified name and type.
	SaveToXml	Saves the style content into an XML element.
	SetValue	Sets the value of the specified property.
	UnsetValue	Clears the value of the specified property.

Public Events

	Name	Description
	PropertyChanged	Raised when any of the registered style properties has changed.

Style Class
MindFusion.Diagramming Namespace

Style Constructor

Initializes a new instance of the Style class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Style ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

Style Class
MindFusion.Diagramming Namespace

Style Methods

Style.GetProperties Method

Gets all properties in the style.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IEnumerable<IProperty> GetProperties ()
```

Visual Basic Copy Code

```
Public Function GetProperties () As IEnumerable(Of IProperty)
```

Return Value

See Also

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.GetProperty Method

Returns the property with the specified name, if any.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IProperty GetProperty (
    string name
)
```

Visual Basic Copy Code

```
Public Function GetProperty( _
    name As String _
) As IProperty
```

Parameters

name

Return Value

See Also

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.GetValue Method

Gets the value of the specified property.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected Object GetValue (
    Object property
)
```

Visual Basic Copy Code

```
Protected Function GetValue( _
    property As Object _
) As Object
```

Parameters

property
The property to get.

Return Value

The value of the property or **null** (**Nothing** in Visual Basic) if the property is not defined.

See Also

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.IsPropertySet Method

Checks whether the specified property has a value.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected bool IsPropertySet (
    Object property
)
```

Visual Basic Copy Code

```
Protected Function IsPropertySet( _
    property As Object _
) As Boolean
```

Parameters

property
The property to check.

Return Value

true if the property has a local value; otherwise, **false**.

MindFusion.Diagramming Namespace

Style.LoadFromXml Method

Loads the style content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** containing the style's data.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.OnPropertyChanged Method

Raises the PropertyChanged event.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void OnPropertyChanged (
    StylePropertyChangedEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnPropertyChanged( _
    e As StylePropertyChangedEventArgs _
)
```

Parameters

e

An object providing the event data.

See Also

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.RegisterProperty Method

Registers a new property with the specified name and type.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected Object RegisterProperty (
    string name
)
```

Visual Basic Copy Code

```
Protected Function RegisterProperty( _
    name As String _
) As Object
```

Parameters

name
The name of the property.

Return Value

An object that can be used to identify the property in subsequent calls to methods like SetValue and GetValue.

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.RegisterType Method

Associates a type with an alias.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static void RegisterType (
    Type type,
    string alias
)
```

Visual Basic Copy Code

```
Public Shared Sub RegisterType( _
    type As Type, _
    alias As String _
)
```

Parameters

type
The type to associate.

alias
The unique alias for the type.

Remarks

The alias is used when saving and loading objects of the specified type during style serialization and deserialization.

MindFusion.Diagramming Namespace

Style.SaveToXml Method

Saves the style content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected virtual void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overridable Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** the style's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

Style Class
MindFusion.Diagramming Namespace

Style.SetValue Method

Sets the value of the specified property.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void SetValue (
    Object property,
    Object value
)
```

Visual Basic Copy Code

```
Protected Sub SetValue( _
    property As Object, _
    value As Object _
)
```

Parameters

property
The property to set.

value
The new property value.

Style Class
MindFusion.Diagramming Namespace

Style.UnsetValue Method

Clears the value of the specified property.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void UnsetValue (
    Object property
)
```

Visual Basic Copy Code

```
Protected Sub UnsetValue( _
    property As Object _
)
```

Parameters

property
The property to clear.

StylePropertyChangedEventArgs Members

Contains the arguments passed to handlers of the PropertyChanged event.

The following tables list the members exposed by the StylePropertyChangedEventArgs type.

Public Properties

	Name	Description
	NewValue	Gets the new (current) value of the changed property.
	OldValue	Gets the previous value of the changed property.
	Property	Gets the property that has changed.

StylePropertyChangedEventArgs Class
MindFusion.Diagramming Namespace

StylePropertyChangedEventArgs Properties

StylePropertyChangedEventArgs.NewValue Property

Gets the new (current) value of the changed property.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object NewValue { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property NewValue As Object
```

Property Value

An object representing the new property value.

See Also

StylePropertyChangedEventArgs Members
StylePropertyChangedEventArgs Class
MindFusion.Diagramming Namespace

StylePropertyChangedEventArgs.OldValue Property

Gets the previous value of the changed property.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object OldValue { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property OldValue As Object
```

Property Value

An object representing the old property value.

StylePropertyChangedEventArgs.Property Property

Gets the property that has changed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Property { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Property As Object
```

Property Value

An object identifying the changed property.

SvgNode Class

Represents nodes that can render SVG drawings.

Syntax

C# Copy Code

```
public class SvgNode : ShapeNode
```

Visual Basic Copy Code

```
Public Class SvgNode
    Inherits ShapeNode
```

Remarks

An **SvgNode** instance represents nodes that can display SVG drawings in addition to the rendering provided by the base ShapeNode class. The SVG drawing is rendered after the associated Image and just before the DrawNode event is raised with CustomDraw.Additional.

The SVG drawing of the node is specified through its Content property. The SVG graphics is loaded and associated with the node through an **SvgContent** object, which should be initialized and then assigned to this property.

The following code illustrates how to load an SVG graphics from a local file and associate it with an existing **SvgNode** (referenced by the *svgNode* variable):

C# Copy Code

```
SvgContent content = new SvgContent();
content.Parse(@"c:\image.svg");
svgNode.Content = content;
```

VB.NET Copy Code

```
Dim content As New SvgContent()
content.Parse("c:\image.svg")
svgNode.Content = content
```

Note

The **SvgContent** class is defined in the *MindFusion.Svg.dll* assembly. You need to add a reference to this assembly in the target project and import the necessary namespaces.

SvgNode Members

Represents nodes that can render SVG drawings.

The following tables list the members exposed by the SvgNode type.

Public Constructors

	Name	Description
	SvgNode	Overloaded. Initializes a new instance of the **SvgNode** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowFlip	Gets or sets a value indicating whether the node's shape flips when an edge is dragged over its opposite edge. (Inherited from ShapeNode.)

	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	Content	Gets or set an **SvgContent** instance representing the SVG drawing rendered in this node.
	ContentAlign	Gets or sets the alignment of the SvgContent displayed in this node.
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	CustomDraw	Gets or sets the type of custom drawing performed on this shape node. (Inherited from ShapeNode.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled. (Inherited from ShapeNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	FlipX	Gets or sets a value indicating whether the node's shape is flipped horizontally. (Inherited from ShapeNode.)
	FlipY	Gets or sets a value indicating whether the node's shape is flipped vertically. (Inherited from ShapeNode.)
	Font	Gets or sets the font used to render the node's text. (Inherited from ShapeNode.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)

	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	Image	Gets or sets the image that is displayed in this shape node. (Inherited from ShapeNode.)
	ImageAlign	Gets or sets the alignment of the image displayed in this shape node. (Inherited from ShapeNode.)
	ImagePadding	Gets or sets the padding distance between node's borders and **Image**. (Inherited from ShapeNode.)
	ImageUrl	Gets or sets a URL used to load an image into this node. (Inherited from ShapeNode.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	PlainText	Gets the plain text of this shape node. (Inherited from ShapeNode.)
	PolygonalTextLayout	Gets or sets a value indicating whether the node's Text is formatted inside non-rectangular outline. (Inherited from ShapeNode.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotateImage	Gets or sets a value indicating whether the **Image** should be rotated when the shape node is rotated. (Inherited from ShapeNode.)
	RotateText	Gets or sets a value indicating whether the **Text** should be rotated when the shape node is rotated. (Inherited from ShapeNode.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)

	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Shape	Gets or sets a reference to the node's geometric shape definition. (Inherited from ShapeNode.)
	ShapeOrientation	Gets or sets the angle specifying the orientation with which a shape template is applied to the node bounds. (Inherited from ShapeNode.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	SvgUrl	Gets or sets a URL used to load an SVG file into this node.
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed inside the shape node. (Inherited from ShapeNode.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of the text that is displayed inside shape nodes. (Inherited from ShapeNode.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from ShapeNode.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Transparent	Gets or sets a value indicating whether this shape node is transparent. (Inherited from ShapeNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description

	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from ShapeNode.)
	CreateConnectionPoint	DiagramNode.CreateConnectionPoint override. (Inherited from ShapeNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramNode.DrawHandles override. Renders the adjustment handles of this item. (Inherited from ShapeNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Draws the node on the specified IGraphics surface. (Inherited from ShapeNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified **IGraphics** surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Draws the shadow of this node on the specified **IGraphics** surface. (Inherited from ShapeNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)

	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from ShapeNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	Node.GetOutlinePoly override. (Inherited from ShapeNode.)
	GetRepaintRect	DiagramNode.GetRepaintRect override. (Inherited from ShapeNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramNode.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from ShapeNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	DiagramItem.OnLoad override. (Inherited from ShapeNode.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	ResizeToFitImage	Makes the shape node as big as the image it displays. (Inherited from ShapeNode.)
	ResizeToFitText	Makes the shape node big enough to display its text without clipping. (Inherited from ShapeNode.)

	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramNode.AllowModify override. Invoked during interactive modification of items to test whether the operation can be completed in the current context. (Inherited from ShapeNode.)
	CancelModify	DiagramNode.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from ShapeNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramNode.CompleteModify override. Invoked when the item modification has been completed. (Inherited from ShapeNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override.
	CreateState	DiagramNode.CreateState override; creates a ShapeNodeState instance. (Inherited from ShapeNode.)
	Dispose	Disposes any disposable resources managed by this shape. (Inherited from ShapeNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)

	GetImageRect	Overloaded. Gets the destination rectangle of the node's image. (Inherited from ShapeNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a GraphicsPath object for this node as though it is contained in the specified rectangle. (Inherited from ShapeNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object.
	LoadFromXml	Loads the item content from an XML element.
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	Called when the item is added to a **Diagram**, either by users, programmatically or via undo / redo. (Inherited from ShapeNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	Called when the Diagram's MeasureUnit changes. (Inherited from ShapeNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	DiagramNode.OnRotationAngleChanged override. (Inherited from ShapeNode.)
	OnStyleChanged	DiagramItem.OnStyleChanged override. (Inherited from ShapeNode.)
	OnTextChanged	DiagramItem.OnTextChanged override. (Inherited from ShapeNode.)
	OnTextFormatChanged	DiagramItem.OnTextFormatChanged override. (Inherited from ShapeNode.)
	OnUpdateBounds	DiagramNode.OnUpdateBounds override. (Inherited from ShapeNode.)
	OnZoomChanged	Called when the Diagram's **ZoomFactor** changes. (Inherited from ShapeNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramNode.RestoreProperties override.
	RestoreState	DiagramNode.RestoreState override. Restores the state of this diagram item. (Inherited from ShapeNode.)
	SaveProperties	DiagramNode.SaveProperties override.
	SaveState	DiagramNode.SaveState override. Saves the state of this diagram item. (Inherited from ShapeNode.)
	SaveToJson	Saves the node as a JSON object.
	SaveToXml	Saves the item content into an XML element.

	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramNode.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from ShapeNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	**DiagramNode.UpdateModify** override. Invoked during interactive modification of this item. (Inherited from ShapeNode.)

SvgNode Constructor

Initializes a new instance of the SvgNode class.

Overload List

Name	Description
SvgNode ()	Initializes a new instance of the **SvgNode** class.
SvgNode (Diagram)	Initializes a new instance of the **SvgNode** class with default values supplied form the specified Diagram.
SvgNode (SvgNode)	Initializes a new instance of the **SvgNode** class using the specified node as a prototype.

SvgNode Constructor (Diagram)

Initializes a new instance of the SvgNode class with default values supplied form the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SvgNode (
    Diagram parent
)
```

Visual Basic Copy Code

```
Public New ( _
    parent As Diagram _
)
```

Parameters

parent
The Diagram from which to obtain default values for the node properties.

SvgNode Constructor (SvgNode)

Initializes a new instance of the SvgNode class using the specified node as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SvgNode (
    SvgNode prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As SvgNode _
)
```

Parameters

prototype
The node to use as a prototype. The properties of the new node are initialized from the property values of this node.

SvgNode Methods

SvgNode.CreateProperties Method

DiagramItem.CreateProperties override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override DiagramItemProperties CreateProperties ()
```

Visual Basic Copy Code

```
Protected Overrides Function CreateProperties () As DiagramItemProperties
```

Return Value

A DiagramItemProperties-derived object containing a snapshot of the item's properties.

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

```
protected override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** containing the item's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

SvgNode Properties

SvgNode.Content Property

Gets or set an **SvgContent** instance representing the SVG drawing rendered in this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SvgContent Content { get; set; }
```

Visual Basic Copy Code

```
Public Property Content As SvgContent
```

Property Value

An instance of the **MindFusion.Svg.SvgContent** class representing the SVG drawing.

Remarks

The **SvgContent** class is defined in the *MindFusion.Svg.dll* file. You must add a reference to this assembly to the target project.

Example

The following example illustrates how to create an **SvgContent** object from a local SVG file and associate it with an existing SvgNode object. The **SvgNode** object is referenced by the *node* variable.

C# Copy Code

```
SvgContent content = new SvgContent();
content.Parse(@"c:\image.svg");
node.Content = content;
```

Visual Basic Copy Code

```
Dim content As New SvgContent()
content.Parse("c:\image.svg")
node.Content = content
```

SvgNode.ContentAlign Property

Gets or sets the alignment of the SvgContent displayed in this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ImageAlign ContentAlign { get; set; }
```

Visual Basic Copy Code

```
Public Property ContentAlign As ImageAlign
```

Property Value

A member of the ImageAlign enumeration. The default is **Fit**.

SvgNode.SvgUrl Property

Gets or sets a URL used to load an SVG file into this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string SvgUrl { get; set; }
```

Visual Basic Copy Code

```
Public Property SvgUrl As String
```

Property Value

A string specifying the SVG file location.

Remarks

At this time this property is used only in web versions of the component (ASP.NET and ASP.NET MVC). Note that the MIME type of .svg files on server should be set to image/svg+xml.

The following tables list the members exposed by the SvgNodeStyle type.

Public Constructors

	Name	Description
	SvgNodeStyle	Initializes a new instance of the **SvgNodeStyle** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)

	Effects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	FontFamily	Gets or sets the font family of the item text. (Inherited from DiagramItemStyle.)
	FontSize	Gets or sets the font size of the item text. (Inherited from DiagramItemStyle.)
	FontStyle	Gets or sets the font style of the item text. (Inherited from DiagramItemStyle.)
	FontUnit	Gets or sets the font unit of the item text. (Inherited from DiagramItemStyle.)
	ShadowBrush	Gets or sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	Stroke	Gets or sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	StrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline items. (Inherited from DiagramItemStyle.)
	StrokeThickness	Gets or sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)

Public Methods

	Name	Description
	GetProperties	Gets all properties in the style. (Inherited from Style.)
	GetProperty	Returns the property with the specified name, if any. (Inherited from Style.)
S	RegisterType	Associates a type with an alias. (Inherited from Style.)

Protected Methods

	Name	Description
	GetValue	Gets the value of the specified property. (Inherited from Style.)
	IsPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	LoadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	LoadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from Style.)
	RegisterProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	SaveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	SaveToXml	Saves the style content into an XML element. (Inherited from Style.)
	SetValue	Sets the value of the specified property. (Inherited from Style.)
	UnsetValue	Clears the value of the specified property. (Inherited from Style.)

Public Events

	Name	Description

	PropertyChanged	Raised when any of the registered style properties has changed. (Inherited from Style.)

TableConnectionStyle Enumeration

Specifies the possible values for the ConnectionStyle property of tables.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum TableConnectionStyle
```

Visual Basic Copy Code

```
Public Enum TableConnectionStyle
```

Members

	Member name	Description
	Table	Users are allowed to create relations to a table as whole entity.
	Rows	Users are allowed to create relations to the rows of a table.
	Both	Users are allowed to create relations both to the rows of a table or the the table as a whole.

Remarks

The enumeration provides possible values for the ConnectionStyle property, which specifies whether relation ends are the rows of a table or the table as a whole entity.

See Also

MindFusion.Diagramming Namespace

TableNode Class

Tables are diagram nodes that can contain multiple cells and can be related to other nodes through their rows.

Syntax

C# Copy Code

```
public class TableNode : DiagramNode, Scrollable
```

Visual Basic Copy Code

```
Public Class TableNode
    Inherits DiagramNode
    Implements Scrollable
```

Remarks

Tables in flow diagrams are represented by instances of the **TableNode** class. Probably the most important property of tables is ConnectionStyle, which specifies whether users are allowed to draw links to the rows of a table, to the table as an integral entity, or both.

Tables consist of Cell instances distributed across rows and columns. Number of rows and columns can be set with the RowCount and ColumnCount properties. The width of the columns is set with ColumnWidth property and the height of the rows with the RowHeight property. Cells can be made to span several rows and columns by setting their RowSpan and ColumnSpan properties to values larger than one.

Rows can be assigned to distinct sections of the table. Each section can be collapsed or expanded, hiding or showing all rows in the section except the header one. To define a section, set a Header row. A section consists of all rows after a header row and spans to the next header. Each header row displays a [±] button that allows expanding or collapsing the section interactively. The button appears either on the left of the first cell of a header row or in a separate column, as set in OffsetHeaderRows. Clicking that button raises the TableSectionCollapsed and TableSectionExpanded events. Sections can be collapsed or expanded programmatically using the Expanded property of their header rows.

The structure of a table can be dynamically changed by adding and deleting rows and columns. This can be done with the AddColumn and AddRow methods as well as with the InsertColumn, InsertRow and RedimTable methods. DeleteRow and DeleteColumn methods delete existing rows and columns.

Table cells contain Text, displayed as specified through TextBrush and TextFormat. A table can also have a caption, whose text is set by the Caption property. The height of the caption and the alignment of the text are specified by CaptionHeight and CaptionFormat properties. To get even richer text formatting, set EnableStyledText to **true** and embed HTML-like formatting tags in the caption and cell texts. The ResizeToFitText method resizes all columns and rows so that each table cell fits its text on a single line without clipping it.

To display a text box that lets users edit the table caption or the text of a cell, call the **BeginEdit** method of **DiagramView**. Call **EndEdit** to exit the in-place editing mode. If the view's **AllowInplaceEdit** property is enabled, users can double-click the table caption bar or a cell in order to edit their text.

The interior of tables is filled using their Brush property. The color of the table and cell borders can be set by using the Pen property. The caption bar is painted using the CaptionBackBrush brush.

In order to set an image as table's background use the Image property. The alignment of the image in relation to the table's rectangle is set through the ImageAlign property. The table can be resized to fit the size of its image by calling the ResizeToFitImage method.

The rectangle, which a table occupies, is accessible with the Bounds property. Rows and columns that build the table are stored and accessed by means of the Rows and Columns collections.

TableNode Members

Tables are diagram nodes that can contain multiple cells and can be related to other nodes through their rows.

The following tables list the members exposed by the TableNode type.

Public Constructors

	Name	Description
	TableNode	Overloaded. Initializes a new instance of the **TableNode** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AllowResizeColumns	Gets or sets a value indicating whether users are allowed to resize table columns.
	AllowResizeRows	Gets or sets a value indicating whether users are allowed to resize table rows.
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Caption	Gets or sets the text displayed as caption of the table.
	CaptionBackBrush	Gets or sets the brush used to paint the caption bar of this table.
	CaptionBrush	Gets or sets the brush used to paint the table caption.
	CaptionFormat	Gets or sets the alignment and line position of the text used as table caption.
	CaptionHeight	Gets or sets the height of the table's caption bar.
	CaptionPlainText	Gets the plain text of the table's caption.
	CellCustomDraw	Gets or sets the type of custom drawing performed on the table cells.
	CellFrameStyle	Gets or sets the style of the table cells.
	CellTextBrush	Gets or sets the brush used to paint texts inside table cells.
	ColumnCount	Gets or sets the number of columns in the table.
	Columns	Gets a list of all columns in the table.

	ColumnWidth	Gets or sets the default width of the table columns.
	ConnectionStyle	Gets or sets a value indicating whether drawing a link from/to this table, should connect a row of the table, or the whole table as single entity.
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	CurrentScrollRow	Gets or sets the index of the first visible row in the table.
	CustomDraw	Gets or sets the type of custom drawing performed on this table.
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveCaptionBackBrush	Gets the effective caption back brush of the table.
	EffectiveCaptionBrush	Gets the effective caption brush of the table.
	EffectiveCellTextBrush	Gets the effective text brush of the table cells.
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled.
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used when rendering the table's texts.
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HighlightedRow	Gets or sets the highlighted row.
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	Image	Gets or sets the image that is displayed in this table.
	ImageAlign	Gets or sets the alignment of the image displayed in this table.
	ImagePadding	Gets or sets the padding distance between node's borders and **Image**.

	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Item	Gets the Cell instance at the specified position.
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	OffsetHeaderRows	Gets or sets a value indicating whether the table cells are offset to the right to accommodate for the expand buttons of Header rows.
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RowAnchorPattern	Gets or sets a default anchor pattern for the rows of this table.
	RowCount	Gets or sets the number of rows in the table.
	RowHeight	Gets or sets the default height of table rows.
	Rows	Gets a list of all rows in the table.
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Scrollable	Gets or sets a value indicating whether users are allowed to scroll table rows.
	ScrollUI	Gets or sets what type of scroll UI to show in **TableNode**s.
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Shape	Gets or sets the shape of the table's outline.

	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text.
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	DiagramNode.HasItems override.
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	DiagramNode.AcceptLinks override.
	AddColumn	Adds new empty column at the right end of the table.
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	AddRelation	Creates a relation with the specified table.
	AddRow	Adds new empty row at the bottom of the table.
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	BreakRelation	Breaks the relation with the specified table.
	CellFromPoint	Returns the row and column indices of the cell located at the specified point, taking into consideration the cells span.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)

	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	CreateConnectionPoint	DiagramNode.CreateConnectionPoint override.
	DeleteColumn	Deletes the column with the specified index within the table.
	DeleteRow	Deletes the row at the specified position within the table.
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	DiagramNode.DrawAnchors override.
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Draws the node on the specified IGraphics surface.
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified **IGraphics** surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Draws the shadow of this node on the specified **IGraphics** surface.
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectiveCaptionBackBrush	Returns a Brush representing the currently effective caption back brush of the table.
	GetEffectiveCaptionBrush	Returns a Brush representing the currently effective caption brush of the table.
	GetEffectiveCellTextBrush	Returns a Brush representing the currently effective text brush of the table cells.
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	DiagramNode.GetIntersection override.
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)

	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetSpannedCellRect	Overloaded. Calculates the bounding rectangle of the specified cell, taking in consideration the cell's row and column spans.
	GetToolTip	DiagramNode.GetToolTip override.
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override.
	InsertColumn	Inserts new empty column at the specified position within the table.
	InsertRow	Inserts new empty row at the specified position within the table.
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	DiagramItem.OnLoad override.
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RedimTable	Sets new number of rows and columns for this table.
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	ResizeToFitImage	Makes a table as big as the image it displays.
	ResizeToFitText	Overloaded.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)

	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	ScrollDown	Scrolls the table rows downwards.
	ScrollUp	Scrolls the table rows upwards.
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override.
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	Dispose	Disposes any disposable resources managed by this table.
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllIncomingLinks	Node.GetAllIncomingLinks override.
	GetAllOutgoingLinks	Node.GetAllOutgoingLinks override.
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)

	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object.
	LoadFromXml	Loads the item content from an XML element.
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	Called when the Diagram's MeasureUnit changes.
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	DiagramItem.OnStyleChanged override.
	OnTextChanged	DiagramItem.OnTextChanged override.
	OnTextFormatChanged	DiagramItem.OnTextFormatChanged override.
	OnUpdateBounds	DiagramNode.OnUpdateBounds override.
	OnZoomChanged	Called when the **DiagramView.ZoomFactor** changes.
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramNode.RestoreProperties override.
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramNode.SaveProperties override.
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object.
	SaveToXml	Saves the item content into an XML element.
	ScaleElements	DiagramNode.ScaleElements override.
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)

	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it.
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

TableNode Constructor

Initializes a new instance of the TableNode class.

Overload List

Name	Description
TableNode ()	Initializes a new instance of the **TableNode** class.
TableNode (Diagram)	Initializes a new instance of the **TableNode** class.
TableNode (TableNode)	Initializes a new instance of the **TableNode** class using the specified node as a prototype.

See Also

TableNode Class
MindFusion.Diagramming Namespace

TableNode Constructor ()

Initializes a new instance of the TableNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public TableNode ()
```

Visual Basic

```
Public Sub New ()
```

See Also

TableNode Constructor Overload List
TableNode Class
MindFusion.Diagramming Namespace

TableNode Constructor (Diagram)

Initializes a new instance of the TableNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public TableNode (
    Diagram parent
)
```

Visual Basic

```
Public New ( _
    parent As Diagram _
)
```

Parameters

parent
The Diagram from which to obtain default values for the node properties.

Remarks

This constructor initializes the TableNode properties with the values specified in the respective default-value properties of the Diagram object. For more information see **Initial Values of Item Properties**.

TableNode Constructor Overload List
TableNode Class
MindFusion.Diagramming Namespace

TableNode Constructor (TableNode)

Initializes a new instance of the TableNode class using the specified node as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public TableNode (
    TableNode prototype
)
```

Visual Basic

```
Public New ( _
    prototype As TableNode _
)
```

Parameters

prototype
The table node to use as a prototype. The properties of the new table are initialized from the property values of *prototype*.

Remarks

This constructor copies the TableNode property values from the specified prototype node.

TableNode Methods

TableNode.AcceptLinks Method

DiagramNode.AcceptLinks override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public override bool AcceptLinks (
    bool outgoing
)
```

Visual Basic

```
Public Overrides Function AcceptLinks( _
    outgoing As Boolean _
) As Boolean
```

Parameters

outgoing
true to check for outgoing links; otherwise, **false**.

Return Value

true if the node accepts connections of the specified type; otherwise, **false**.

TableNode.AddColumn Method

Adds new empty column at the right end of the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int AddColumn ()
```

Visual Basic Copy Code

```
Public Function AddColumn () As Integer
```

Return Value

Returns the index of the newly added column within the Columns collection.

Remarks

Call the method to add new columns at the end of the table. The size of the table is automatically updated and the columns are added to the column collection.

TableNode.AddRelation Method

Creates a relation with the specified table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLink AddRelation (
    int row,
    Relationship rel,
    TableNode tableNode,
    int relRow
)
```

Visual Basic Copy Code

```
Public Function AddRelation( _
    row As Integer, _
    rel As Relationship, _
    tableNode As TableNode, _
    relRow As Integer _
) As DiagramLink
```

Parameters

row
Zero-based index of a row in this table to be related.

rel
The type of the relation (and the direction of the link).

tableNode
The other table in the relation.

relRow
Zero-based index of the row in the other table.

Return Value

A DiagramLink object representing the relation.

Remarks

Call this method to link rows of two tables.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
BreakRelation Method

TableNode.AddRow Method

Adds new empty row at the bottom of the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int AddRow ()
```

Visual Basic Copy Code

```
Public Function AddRow () As Integer
```

Return Value

Returns the index of the newly added row within the Rows collection.

Remarks

Call the method to add new rows at the end of the table. The size of the table is automatically updated and the rows are added to the row collection.

Rows Property

TableNode.BreakRelation Method

Breaks the relation with the specified table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void BreakRelation (
    int row,
    Relationship rel,
    TableNode tableNode
)
```

Visual Basic Copy Code

```
Public Sub BreakRelation( _
    row As Integer, _
```

```
    rel As Relationship, _
    tableNode As TableNode _
)
```

Parameters

row
Zero-based index of a row in this table that is related to a row in another.

rel
The type of the relation (and the direction of the link).

tableNode
The other table in the relation.

Remarks

Call this method to break the link between two tables.

AddRelation Method

TableNode.CellFromPoint Method

Returns the row and column indices of the cell located at the specified point, taking into consideration the cells span.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool CellFromPoint (
    Point point,
    ref int row,
    ref int col
)
```

Visual Basic Copy Code

```
Public Function CellFromPoint( _
    point As Point, _
    ByRef row As Integer, _
    ByRef col As Integer _
) As Boolean
```

Parameters

point
The point to check.

row
Receives the row index if a cell is found at the specified position.

col
Receives the column index if a cell is found at the specified position.

Return Value

true if a cell of this table contains the specified point; otherwise, false.

TableNode.CreateConnectionPoint Method

DiagramNode.CreateConnectionPoint override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override ConnectionPoint CreateConnectionPoint (
    DiagramLink link,
    Point point,
    bool incoming
)
```

Visual Basic Copy Code

```
Public Overrides Function CreateConnectionPoint( _
    link As DiagramLink, _
    point As Point, _
    incoming As Boolean _
) As ConnectionPoint
```

Parameters

link
A DiagramLink that should be connected to this node.

point
The point at which the link should be connected.

incoming
true if *link* is an incoming link; otherwise, **false**.

Return Value

A ConnectionPoint instance representing the connection.

TableNode.CreateProperties Method

DiagramItem.CreateProperties override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override DiagramItemProperties CreateProperties ()
```

Visual Basic Copy Code

```
Protected Overrides Function CreateProperties () As DiagramItemProperties
```

Return Value

A DiagramItemProperties -derived object containing a snapshot of the item's properties.

TableNode.DeleteColumn Method

Deletes the column with the specified index within the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void DeleteColumn (
    int col
)
```

Visual Basic Copy Code

```
Public Sub DeleteColumn( _
    col As Integer _
)
```

Parameters

col
The zero-based index of the column to be deleted.

Remarks

Call the method to delete a column from the table. The size of the table is automatically updated and the columns are removed from the column collection.

InsertColumn Method
RedimTable Method

TableNode.DeleteRow Method

Deletes the row at the specified position within the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void DeleteRow (
    int row
)
```

Visual Basic Copy Code

```
Public Sub DeleteRow( _
    row As Integer _
)
```

Parameters

row
The zero-based index of the row to be deleted.

Remarks

Call the method to delete a row from the table. The size of the table is automatically updated and the rows are removed from the row collection.

TableNode.Dispose Method

Disposes any disposable resources managed by this table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void Dispose (
    bool disposing
)
```

Visual Basic Copy Code

```
Protected Overrides Sub Dispose( _
    disposing As Boolean _
)
```

Parameters

disposing
Specifies whether the method is called explicitly or from the garbage collector.

TableNode.DrawAnchors Method

DiagramNode.DrawAnchors override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawAnchors (
    IGraphics graphics
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawAnchors( _
    graphics As IGraphics _
)
```

Parameters

graphics
The IGraphics surface to draw the anchor points on.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.DrawLocal Method

Draws the node on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawLocal (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawLocal( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
An IGraphics object where the node should be rendered.

options
Provides options for the drawing operation.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.DrawShadowLocal Method

Draws the shadow of this node on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawShadowLocal (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic

```
Public Overrides Sub DrawShadowLocal( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
An IGraphics object where the shadow should be rendered.

options
Provides options for the drawing operation.

TableNode.GetEffectiveCaptionBackBrush Method

Returns a Brush representing the currently effective caption back brush of the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush GetEffectiveCaptionBackBrush (
    Rect bounds,
    double dx,
    double dy
)
```

Visual Basic Copy Code

```
Public Function GetEffectiveCaptionBackBrush( _
    bounds As Rect, _
    dx As Double, _
    dy As Double _
) As Brush
```

Parameters

bounds
The bounds of the new brush.

dx
The horizontal translation of the new brush.

dy
The vertical translation of the new brush.

Return Value

A Brush instance.

Remarks

This method returns either the table's CaptionBackBrush if not **null**, or the CaptionBackBrush property of the table's style.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.GetEffectiveCaptionBrush Method

Returns a Brush representing the currently effective caption brush of the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush GetEffectiveCaptionBrush ()
```

Visual Basic Copy Code

```
Public Function GetEffectiveCaptionBrush () As Brush
```

Return Value

A Brush instance.

Remarks

This method returns either the table's CaptionBrush if not **null**, or the TextBrush property of the table's style.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.GetEffectiveCellTextBrush Method

Returns a Brush representing the currently effective text brush of the table cells.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush GetEffectiveCellTextBrush ()
```

Visual Basic Copy Code

```
Public Function GetEffectiveCellTextBrush () As Brush
```

Return Value

A Brush instance.

Remarks

This method returns either the table's CellTextBrush if not **null**, or the CellTextBrush property of the table's style.

TableNode.GetIntersection Method

DiagramNode.GetIntersection override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```

```

```
public override Point GetIntersection (
    Point segmentStart,
    Point segmentEnd
)
```

Visual Basic Copy Code

```
Public Overrides Function GetIntersection( _
    segmentStart As Point, _
    segmentEnd As Point _
) As Point
```

Parameters

segmentStart
The first point of the segment.

segmentEnd
The second point of the segment.

Return Value

A **Microsoft.Maui.Graphics.Point** representing the intersection point.

TableNode.GetSpannedCellRect Method (Int32, Int32)

Calculates the bounding rectangle of the cell in the specified row and column also taking in consideration the cell row and column spanning.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect GetSpannedCellRect (
    int row,
    int col
)
```

Visual Basic

```
Public Function GetSpannedCellRect( _
    row As Integer, _
    col As Integer _
) As Rect
```

Parameters

row

An integer value specifying the cell's row.

col

An integer value specifying the cell's column.

Return Value

A **Microsoft.Maui.Graphics.Rect** representing the cell's bounding rectangle.

See Also

TableNode.GetSpannedCellRect Method (TableNode.Cell)

Calculates the bounding rectangle of the specified cell also taking in consideration the cell row and column spanning.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public Rect GetSpannedCellRect (
    TableNode.Cell cell
)
```

Visual Basic

```
Public Function GetSpannedCellRect( _
    cell As TableNode.Cell _
) As Rect
```

Parameters

cell

A Cell instance.

Return Value

A **Microsoft.Maui.Graphics.Rect** representing the cell's bounding rectangle.

```
public override Manipulator HitTestManipulators (
    Point point
)
```

Visual Basic Copy Code

```
Public Overrides Function HitTestManipulators( _
    point As Point _
) As Manipulator
```

Parameters

point

Return Value

An instance of **Manipulator** -derived class, or **null** if there isn't one found at specified location.

TableNode.InsertColumn Method

Inserts new empty column at the specified position within the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void InsertColumn (
    int col
)
```

Visual Basic Copy Code

```
Public Sub InsertColumn( _
    col As Integer _
)
```

Parameters

col
The zero-based index of the column to be inserted.

Remarks

Call the method to add new column at a particular position in the table. The size of the table is automatically updated and the columns are added to the column collection.

TableNode.InsertRow Method

Inserts new empty row at the specified position within the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void InsertRow (
    int row
)
```

Visual Basic Copy Code

```
Public Sub InsertRow( _
    row As Integer _
)
```

Parameters

row
The zero-based index of the row to be inserted.

Remarks

Call the method to add new row at a particular position in the table. The size of the table is automatically updated and the rows are added to the row collection.

TableNode.LoadFromJson Method

Loads the node from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the node's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

TableNode.LoadFromXml Method

Loads the item content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** containing the item's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

TableNode.RedimTable Method

Sets new number of rows and columns for this table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RedimTable (
    int cols,
    int rows
)
```

Visual Basic Copy Code

```
Public Sub RedimTable( _
    cols As Integer, _
    rows As Integer _
)
```

Parameters

cols
The new number of columns.

rows
The new number of rows.

Remarks

This method does not preserve the old contents of table cells. After its invocation all cells are empty and columns and rows are with default sizes.

TableNode.ResizeToFitImage Method

Makes a table as big as the image it displays.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ResizeToFitImage ()
```

Visual Basic Copy Code

```
Public Sub ResizeToFitImage ()
```

Remarks

Call this method to make a table exactly the same size as the image it contains. The dots-per-inch resolution of the image is considered too when calculating the new table size. You can use ImageAlign to specify position of the picture and Image to set the picture itself.

TableNode.ResizeToFitText Method

Overload List

Name	Description
TableNode.ResizeToFitText (Boolean)	Resizes the columns and rows so that the cells are large enough to fit their text.
TableNode.ResizeToFitText (Boolean, Boolean)	Resizes the columns and rows so that the cells are large enough to fit their text.

See Also

TableNode Members

TableNode.ResizeToFitText Method (Boolean)

Resizes the columns and rows so that the cells are large enough to fit their text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ResizeToFitText (
    bool ignoreCaption
)
```

Visual Basic Copy Code

```
Public Sub ResizeToFitText( _
    ignoreCaption As Boolean _
)
```

Parameters

ignoreCaption
false if the caption bar too should be resized to fit the caption text; otherwise, **true**.

Remarks

This method resizes the cells so they fit their Text on a single line, as long as the text does not contain new-line characters. The Width of each column is set to the width of its widest cell, and the Height of each row is set to the height of its highest cell. In the end, the table size is set to the sum of the extents of all rows and columns.

If *ignoreCaption* is **false**, the caption bar too will be resized, by setting CaptionHeight and the table width, so that it fits the Caption text.

ResizeToFitImage Method

TableNode.ResizeToFitText Method (Boolean, Boolean)

Resizes the columns and rows so that the cells are large enough to fit their text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ResizeToFitText (
    bool ignoreCaption,
    bool keepCellWidth
)
```

Visual Basic Copy Code

```
Public Sub ResizeToFitText( _
    ignoreCaption As Boolean, _
    keepCellWidth As Boolean _
)
```

Parameters

ignoreCaption
false if the caption bar too should be resized to fit the caption text; otherwise, **true**.

keepCellWidth
true if column widths should stay unchanged; otherwise, **false**.

Remarks

This method resizes the cells so they fit their Text on a single line, as long as the text does not contain new-line characters. The Width of each column is set to the width of its widest cell, and the Height of each row is set to the height of its highest cell. In the end, the table size is set to the sum of the extents of all rows and columns.

If *ignoreCaption* is **false**, the caption bar too will be resized, by setting CaptionHeight and the table width, so that it fits the Caption text.

If *keepCellWidth* is **true**, the cell width is preserved unchanged.

TableNode Properties

TableNode.AllowResizeColumns Property

Gets or sets a value indicating whether users are allowed to resize table columns.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool AllowResizeColumns { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowResizeColumns As Boolean
```

Property Value

true to let users resize columns, or **false** otherwise. The default value is **false**.

Remarks

A column can be resized by dragging its right border. If the ColumnStyle property of a column is set to AutoWidth, it is automatically reset to **FixedWidth** when the column is resized. Rightmost columns always fill all remaining space in their tables and cannot be resized.

See Also

TableNode Members
TableNode Class

TableNode.Caption Property

Gets or sets the text displayed as caption of the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Caption { get; set; }
```

Visual Basic Copy Code

```
Public Property Caption As String
```

Property Value

A string containing the text of the caption. Initialized with the value of TableCaption.

Remarks

Text color and alignment can be customized by using the CaptionBrush and CaptionFormat properties.

Styled text allows applying various attributes to the text characters. Attributes are specified by embedding HTML-like formatting tags within the raw text. Styled text is enabled by setting EnableStyledText to **true**.

CaptionBackBrush Property
Diagram.TableCaption Property

TableNode.CaptionBackBrush Property

Gets or sets the brush used to paint the caption bar of this table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush CaptionBackBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property CaptionBackBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class. The default is **null** (**Nothing** in Visual Basic).

Remarks

This property refers to a brush object used to paint the caption bar. An instance of one of the following classes can be assigned to it: HatchBrush, LinearGradientBrush, PathGradientBrush, SolidBrush or TextureBrush, all located in the MindFusion.Drawing namespace. If there is no brush assigned to this property, the caption bar is painted using the Brush property of the TableNode class.

TableNode.CaptionBrush Property

Gets or sets the brush used to paint the table caption.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush CaptionBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property CaptionBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
CaptionHeight Property
CaptionFormat Property
Caption Property

TableNode.CaptionFormat Property

Gets or sets the alignment and line position of the text used as table caption.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public StringFormat CaptionFormat { get; set; }
```

Visual Basic Copy Code

```
Public Property CaptionFormat As StringFormat
```

Property Value

An instance of the StringFormat class.

Remarks

Use this property to change the alignment of text or its position inside the caption bar.

If there isn't enough space available to fit a whole line of text, MvcDiagram wraps the text to a new line when it reaches the edge of the table. You can specify that the text should be wrapped only at word boundaries by setting the **Trimming** member of **CaptionFormat** to **StringTrimming.Word**. The default is to split words into multiple parts if there is not enough space to fit a whole word.

If you prefer to use your own line-breaks, you can disable the automatic text wrapping by enabling the **NoWrap** flag in the **FormatFlags** member of **CaptionFormat**. If automatic wrapping is disabled and there isn't enough space to fit the whole line, the text is clipped at the table boundaries.

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
CaptionHeight Property
CaptionBrush Property
Caption Property

TableNode.CaptionHeight Property

Gets or sets the height of the table's caption bar.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double CaptionHeight { get; set; }
```

Visual Basic Copy Code

```
Public Property CaptionHeight As Double
```

Property Value

A **double** value specifying the height of the table caption. Initialized with the value of TableCaptionHeight.

Remarks

Keep in mind that a table is moved by dragging its caption bar (per default HandlesStyle). Making the caption bar too narrow would make it harder for users to move.

TableNode.CaptionPlainText Property

Gets the plain text of the table's caption.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string CaptionPlainText { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property CaptionPlainText As String
```

Property Value

A string containing the plain text of the caption.

Remarks

This property removes any formatting tags from Caption and returns the plain human-readable text. That is useful when styled text is enabled and you need to display caption's content outside of MvcDiagram, that is, in a message box or a dialog box.

Example

The following sample code demonstrates how **CaptionPlainText** can be used.

C# Copy Code

```
t.EnableStyledText = true;
t.Caption = "<b>interface</b> <i><u>IMouseListener</u></i>";
MessageBox.Show(t.CaptionPlainText);
```

Visual Basic Copy Code

```
t.EnableStyledText = True
t.Caption = "<b>interface</b> <i><u>IMouseListener</u></i>"
MessageBox.Show(t.CaptionPlainText)
```

TableNode.CellCustomDraw Property

Gets or sets the type of custom drawing performed on the table cells.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CustomDraw CellCustomDraw { get; set; }
```

Visual Basic Copy Code

```
Public Property CellCustomDraw As CustomDraw
```

Property Value

A member of the CustomDraw enumeration. Initialized with the value of CellCustomDraw.

Remarks

This property allows invoking custom painting code for the cells of a table. That code must execute in response to the DrawCell event. There are several modes of custom painting, allowing the custom code to paint the cell entirely, or do that in addition to what MvcDiagram paints by default. The following CustomDraw members can be assigned to this property to specify the custom painting mode:

Member Name	Description
None	Do not perform custom drawing, let all painting be done by MvcDiagram.
Additional	The custom painting code executes after the cell interior is painted by MvcDiagram, but before the cell's text is rendered.
Full	The component does not do any standard drawing of the cell, the entire painting is left for the application.
Additional2	The custom painting code executes after all parts of the cell, including its text, are painted by MvcDiagram.

TableNode.CellFrameStyle Property

Gets or sets the style of the table cells.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CellFrameStyle CellFrameStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property CellFrameStyle As CellFrameStyle
```

Property Value

A member of the CellFrameStyle enumeration. Initialized with the value of CellFrameStyle.

Remarks

This property specifies whether there are borders drawn around table cells, and if yes, their appearance.

TableNode.ColumnCount Property

Gets or sets the number of columns in the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int ColumnCount { get; set; }
```

Visual Basic Copy Code

```
Public Property ColumnCount As Integer
```

Property Value

An integer value indicating the number of columns in the table.

Remarks

If you increase the number of columns the contents of the old columns will remain intact. If you decrease the number, the last columns are removed and the other remain unchanged.

Gets or sets the default width of the table columns.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ColumnWidth { get; set; }
```

Visual Basic Copy Code

```
Public Property ColumnWidth As Double
```

Property Value

A **double** value specifying the width of the table columns. Initialized with the value of TableColumnWidth.

Remarks

The value of this property is used to initialize the width of new columns when they are created.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
RowHeight Property

TableNode.ConnectionStyle Property

Gets or sets a value indicating whether drawing a link from/to this table, should connect a row of the table, or the whole table as single entity.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableConnectionStyle ConnectionStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property ConnectionStyle As TableConnectionStyle
```

Property Value

A member of the TableConnectionStyle enumeration. Initialized with the value of TableConnectionStyle.

Remarks

There are three possible ways to relate tables to other nodes. This property specifies how users are allowed to create such relations:

- Rows - relation ends are the rows of a table. A link connected to the table is connected to a particular row. This mode is convenient for database diagrams.

- **Table** - relations target the table as a whole entity, and not any particular row. This mode is convenient for class diagrams.
- **Both** - a mixed mode where links can target either a row of the table or the table itself.

Programmatically, links can be connected to a table in any way, regardless of the **ConnectionStyle**. **ConnectionStyle** value is considered only when end-users draw links to or from a table. To link to a table as an entity and not to a specific row, pass -1 as row argument of the CreateDiagramLink method.

TableNode.CurrentScrollRow Property

Gets or sets the index of the first visible row in the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int CurrentScrollRow { get; set; }
```

Visual Basic Copy Code

```
Public Property CurrentScrollRow As Integer
```

Property Value

An integer value indicating the index of the first visible row.

Remarks

To allow users to scroll the table interactively, enable the Scrollable property.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
Rows Property

TableNode.CustomDraw Property

Gets or sets the type of custom drawing performed on this table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CustomDraw CustomDraw { get; set; }
```

Visual Basic Copy Code

```
Public Property CustomDraw As CustomDraw
```

Property Value

A member of the CustomDraw enumeration. Initialized with the value of TableCustomDraw.

Remarks

This property allows invoking custom painting code for a table. That code must execute in response to the DrawNode event. There are several modes of custom painting, allowing the custom code to paint the table entirely, or do that in addition to what

MvcDiagram paints by default. The following CustomDraw members can be assigned to this property to specify the custom painting mode:

Member Name	Description
None	Do not perform custom drawing, let all painting be done by MvcDiagram.
Additional	The custom painting code executes after the table interior and frame are painted by MvcDiagram, but before cells are rendered.
Full	The component does not do any standard drawing of the table frame, whose painting is left for the application. Cells are painted independently, as set in CellCustomDraw.
ShadowOnly	Only the shadow of the table is painted by custom code, the table itself is drawn by the component.
Additional2	The custom painting code executes after all parts of the table, including its cells, are painted by MvcDiagram.

This property doesn't affect the painting of table cells. Table cells can be custom painted in the DrawCell event as set in **CellCustomDraw**.

Gets the effective text brush of the table cells.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush EffectiveCellTextBrush { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property EffectiveCellTextBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.EnableStyledText Property

Gets or sets a value indicating whether styled text rendering is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableStyledText { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableStyledText As Boolean
```

Property Value

true to parse the text of table's caption and cells in order to find formatting tags; otherwise **false**. Initialized with the value of EnableStyledText.

Remarks

Styled text allows applying various attributes to the characters it contains. Attributes are specified using HTML-like formatting tags embedded in the raw text. Formatting tags are listed and described in the **Text Attributes and Formatting** section of this help file.

If **EnableStyledText** is set to **true**, table's Caption and cells' Text are parsed and analyzed each time they change. Parsing determines what formatting tags are used and adds the corresponding attribute records to MvcDiagram's internal representation of styled text. If the property value is **false**, the text is not processed in any way and is displayed without formatting.

TableNode.Font Property

Gets or sets the font used when rendering the table's texts.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Font Font { get; set; }
```

Visual Basic Copy Code

```
Public Overrides Property Font As Font
```

Property Value

A Font instance specifying the font attributes.

TableNode.HighlightedRow Property

Gets or sets the highlighted row.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int HighlightedRow { get; set; }
```

Visual Basic Copy Code

```
Public Property HighlightedRow As Integer
```

Property Value

See Also

TableNode Members

TableNode.Image Property

Gets or sets the image that is displayed in this table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage Image { get; set; }
```

Visual Basic Copy Code

```
Public Property Image As IImage
```

Property Value

A **Microsoft.Maui.Graphics.IImage** instance.

Remarks

Use the property to customize your table's background. Further customization can be done with the ImageAlign property.

TableNode.ImageAlign Property

Gets or sets the alignment of the image displayed in this table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ImageAlign ImageAlign { get; set; }
```

Visual Basic Copy Code

```
Public Property ImageAlign As ImageAlign
```

Property Value

A member of the ImageAlign enumeration. The default value is **Fit**.

Remarks

This property specifies how images are positioned inside tables.

TableNode.ImagePadding Property

Gets or sets the padding distance between node's borders and Image.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Nullable<Thickness> ImagePadding { get; set; }
```

Visual Basic Copy Code

```
Public Property ImagePadding As Nullable(Of Thickness)
```

Property Value

An optional Thickness value specifying padding distance; the default value is **null**.

TableNode.Item Property

Gets the Cell instance at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.Cell Item [
    int col,
```

```
    int row
] { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Item( _
    col As Integer, _
    row As Integer _
) As TableNode.Cell
```

Parameters

col

The zero-based index of the cell's column.

row

The zero-based index of the cell's row.

Property Value

An instance of the Cell class that represents the cell of the table at the specified position.

See Also

TableNode.OffsetHeaderRows Property

Gets or sets a value indicating whether the table cells are offset to the right to accommodate for the expand buttons of Header rows.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool OffsetHeaderRows { get; set; }
```

Visual Basic Copy Code

```
Public Property OffsetHeaderRows As Boolean
```

Property Value

true to offset table cells when there are header rows defined; otherwise, **false**. The default is **false**.

Remarks

If this property is set to **false**, the [±] buttons used to expand or collapse table sections are drawn inside the first cell of each header row. Otherwise, the buttons are drawn in their own column in front of the table's first column of cells.

TableNode.RowAnchorPattern Property

Gets or sets a default anchor pattern for the rows of this table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPattern RowAnchorPattern { get; set; }
```

Visual Basic Copy Code

```
Public Property RowAnchorPattern As AnchorPattern
```

Property Value

An instance of the AnchorPattern class. The default is **null** (**Nothing** in Visual Basic).

Remarks

Defines a default value for the AnchorPattern property of the rows of a table.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
AnchorPoint.Column Property
Row.AnchorPattern Property

TableNode.RowCount Property

Gets or sets the number of rows in the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int RowCount { get; set; }
```

Visual Basic Copy Code

```
Public Property RowCount As Integer
```

Property Value

An integer value specifying the number of rows in the table.

Remarks

If you increase the number of rows the content of the initial rows will remain intact. If you decrease the number, the last rows are removed and the other remain unchanged.

TableNode.RowHeight Property

Gets or sets the default height of table rows.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double RowHeight { get; set; }
```

Visual Basic Copy Code

```
Public Property RowHeight As Double
```

Property Value

A **double** value specifying the height of the table rows. Initialized with the value of TableRowHeight.

Remarks

The value of this property is used to initialize the height of new rows when they are created.

TableNode.Rows Property

Gets a list of all rows in the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.RowCollection Rows { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Rows As TableNode.RowCollection
```

Property Value

An instance of the RowCollection class.

Remarks

The property refers to the collection of all rows that compose the table. Do not add or remove rows through this collection, but use the table's AddRow, InsertRow or DeleteRow methods.

See Also

TableNode.Scrollable Property

Gets or sets a value indicating whether users are allowed to scroll table rows.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Scrollable { get; set; }
```

Visual Basic Copy Code

```
Public Property Scrollable As Boolean
```

Property Value

true to allow scrolling the table up or down, or **false** otherwise. Initialized with the value of TablesScrollable.

Remarks

A button containing up and down arrows appears in the caption bar of a table for which scrolling is enabled. If a user clicks these arrows, table rows scroll up or down. The table can always be scrolled programmatically using the CurrentScrollRow property.

The appearance of the scroll icons can be customized by setting **Renderers.ScrollIconRenderer**.

TableNode.ScrollUI Property

Gets or sets what type of scroll UI to show in TableNodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static TableScrollUI ScrollUI { get; set; }
```

Visual Basic Copy Code

```
Public Shared Property ScrollUI As TableScrollUI
```

Property Value

A member of the TableScrollUI enumeration. The default value is **ScrollButtons**.

TableNode.Shape Property

Gets or sets the shape of the table's outline.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SimpleShape Shape { get; set; }
```

Visual Basic Copy Code

```
Public Property Shape As SimpleShape
```

Property Value

A member of the SimpleShape enumeration. Initialized with the value of TableShape.

TableNode.TextPadding Property

Gets or sets the spacing between the item boundaries and its text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Thickness TextPadding { get; set; }
```

Visual Basic Copy Code

```
Public Overrides Property TextPadding As Thickness
```

Property Value

A Thickness instance specifying the size of the padding space left around the text.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.Cell Class

Represents a cell in a TableNode instance.

Syntax

C# Copy Code

```
public class TableNode.Cell : InplaceEditable
```

Visual Basic Copy Code

```
Public Class TableNode.Cell
    Implements InplaceEditable
```

Remarks

Cells are the building blocks of tables. They get their height and width indirectly, from the width of table columns and the height of table rows as set by the ColumnWidth and RowHeight properties. Cells can be made to span several rows and columns by setting their RowSpan and ColumnSpan properties to values larger than 1.

Cells can hold text, which is set by their Text property. The text can be aligned and this is set by the TextFormat property. Color of the text in the cells is set with the TextBrush property.

Appearance of a cell can be customized further by the Brush and Image properties.

MindFusion.Diagramming Namespace

TableNode.Cell Members

Represents a cell in a TableNode instance.

The following tables list the members exposed by the TableNode.Cell type.

Public Constructors

	Name	Description
	TableNode.Cell	Initializes a new instance of the **TableNode.Cell** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill this cell.
	ColumnSpan	Gets or sets how many columns the cell should span.
	Font	Gets or sets the font used to draw text inside this cell.
	HyperLink	Gets or sets the hyperlink associated with the cell.
	Image	Gets or sets the image that is displayed in this cell.
	ImageAlign	Gets or sets the alignment of the image displayed in this cell.
	ImagePadding	Gets or sets the padding distance between cell's borders and **Image**.
	ImageUrl	Gets or sets a URL used to load an image into this cell.
	PlainText	Gets the plain text of the cell.
	RowSpan	Gets or sets how many rows the cell should span.
	Table	Gets a reference to the **TableNode** containing this cell.
	Tag	Gets or sets custom data associated with this cell.
	Text	Gets or sets text displayed inside the cell.
	TextBrush	Gets or sets the brush used to paint the text of the cell.
	TextFormat	Gets or sets the alignment of the text that is displayed inside the cell.
	ToolTip	Gets or sets the tooltip text associated with the cell.

Public Methods

	Name	Description
	Clone	Creates a copy of this cell.

Protected Methods

	Name	Description
	LoadFromJson	Loads the cell from a JSON object.

	LoadFromXml	Loads the cell content from an XML element.
	SaveToJson	Saves the cell as a JSON object.
	SaveToXml	Saves the cell content into an XML element.

MindFusion.Diagramming Namespace

TableNode.Cell Constructor

Initializes a new instance of the TableNode.Cell class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.Cell (
    TableNode table
)
```

Visual Basic Copy Code

```
Public New ( _
    table As TableNode _
)
```

Parameters

table
The TableNode this cell belongs to.

See Also

TableNode.Cell Class
MindFusion.Diagramming Namespace

TableNode.Cell Methods

TableNode.Cell.Clone Method

Creates a copy of this cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.Cell Clone ()
```

Visual Basic Copy Code

```
Public Function Clone () As TableNode.Cell
```

Return Value

An instance of the TableNode.Cell class.

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace

TableNode.Cell.LoadFromJson Method

Loads the cell from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the cell's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace

TableNode.Cell.LoadFromXml Method

Loads the cell content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** containing the cell's data.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace

TableNode.Cell.SaveToJson Method

Saves the cell as a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject instance to contain the serialized data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace

TableNode.Cell.SaveToXml Method

Saves the cell content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** the cell's data should be stored into.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

TableNode.Cell Class
MindFusion.Diagramming Namespace

TableNode.Cell Properties

TableNode.Cell.Brush Property

Gets or sets the brush used to fill this cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush Brush { get; set; }
```

Visual Basic Copy Code

```
Public Property Brush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class. The default is **null** (**Nothing** in Visual Basic).

Remarks

This property refers to a brush used to paint the cell's interior. You can assign to it an instance of one of the following classes: HatchBrush, LinearGradientBrush, PathGradientBrush, SolidBrush or TextureBrush, located in the MindFusion.Drawing namespace. If the default **null** value is used, the cell's interior is painted with the table's Brush instead of cell's one.

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace
Image Property

TableNode.Cell.ColumnSpan Property

Gets or sets how many columns the cell should span.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int ColumnSpan { get; set; }
```

Visual Basic Copy Code

```
Public Property ColumnSpan As Integer
```

Property Value

A positive integer value specifying how many columns the cell spans to the right. The default is 1.

Remarks

Use this property and RowSpan to define a cell that overlaps several columns and rows of the table's grid. The spanning cell covers any non-spanning cells to the right or below it, as far as the spanned columns and rows go. The Image and Text of spanning cells are aligned and laid out inside the enlarged bounding rectangles of the cells. That allows composing nodes with a very elaborate structure using spanning cells, as alternative to attaching ShapeNode objects to a container/master node.

TableNode.Cell Class
MindFusion.Diagramming Namespace

TableNode.Cell.Font Property

Gets or sets the font used to draw text inside this cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Font Font { get; set; }
```

Visual Basic Copy Code

```
Public Property Font As Font
```

Property Value

A Font used to render the cell's Text, or **null** (**Nothing** in Visual Basic) if the text should be rendered using the table's Font.

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace

TableNode.Cell.HyperLink Property

Gets or sets the hyperlink associated with the cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string HyperLink { get; set; }
```

Visual Basic Copy Code

```
Public Property HyperLink As String
```

Property Value

A string value containing the hyperlink URL.

Remarks

This property is used by the CreateImageMap method of the HtmlBuilder class. Its value is assigned to the HREF attribute of the <AREA> tag that corresponds to the cell. Map areas are defined for table cells only if the AreasForTableCells property is enabled.

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace

TableNode.Cell.Image Property

Gets or sets the image that is displayed in this cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage Image { get; set; }
```

Visual Basic Copy Code

```
Public Property Image As IImage
```

Property Value

A **Microsoft.Maui.Graphics.IImage** instance. The default is **null** (**Nothing** in Visual Basic).

Remarks

Use this property to set an image to be displayed in the cell. Use the ImageAlign property to specify how the image is placed.

See Also

TableNode.Cell Members

ImagePadding Property

TableNode.Cell.ImageAlign Property

Gets or sets the alignment of the image displayed in this cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ImageAlign ImageAlign { get; set; }
```

Visual Basic Copy Code

```
Public Property ImageAlign As ImageAlign
```

Property Value

A member of the ImageAlign enumeration.

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace
Image Property
ImagePadding Property

TableNode.Cell.ImagePadding Property

Gets or sets the padding distance between cell's borders and Image.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Nullable<Thickness> ImagePadding { get; set; }
```

Visual Basic Copy Code

```
Public Property ImagePadding As Nullable(Of Thickness)
```

Property Value

An optional Thickness value specifying padding distance; the default value is **null**.

See Also

TableNode.Cell Members

TableNode.Cell.ImageUrl Property

Gets or sets a URL used to load an image into this cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ImageUrl { get; set; }
```

Visual Basic Copy Code

```
Public Property ImageUrl As String
```

Property Value

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace

TableNode.Cell.PlainText Property

Gets the plain text of the cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string PlainText { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property PlainText As String
```

Property Value

A string containing the plain text of the cell.

Remarks

This property removes any formatting tags from cell's Text and returns the plain human-readable text. That is useful when styled text is enabled and you need to display cell's content outside of MvcDiagram, that is, in a message or a dialog box.

See Also

TableNode.EnableStyledText Property

TableNode.Cell.RowSpan Property

Gets or sets how many rows the cell should span.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int RowSpan { get; set; }
```

Visual Basic Copy Code

```
Public Property RowSpan As Integer
```

Property Value

A positive integer value specifying how many rows the cell spans downwards. The default is 1.

Remarks

Use this property and ColumnSpan to define a cell that overlaps several columns and rows of the table's grid. The spanning cell covers any non-spanning cells to the right or below it, as far as the spanned columns and rows go. The Image and Text displayed in spanning cells are aligned and laid out inside the enlarged bounding rectangles of the cells. That allows composing nodes with a very elaborate structure using spanning cells, as an alternative to attaching ShapeNode objects to a container/master node.

TableNode.Cell.Table Property

Gets a reference to the TableNode containing this cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode Table { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Table As TableNode
```

Property Value

An instance of the TableNode class representing the table containing this cell.

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace

TableNode.Cell.Tag Property

Gets or sets custom data associated with this cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Tag { get; set; }
```

Visual Basic Copy Code

```
Public Property Tag As Object
```

Property Value

An instance of any class derived from **System.Object**. The default value is **null** (**Nothing** in Visual Basic).

Remarks

This property holds data that you define and is not used by MvcDiagram in any way. The tag could be any value of a primitive data type or a complex object from the .NET class library or a class defined by you. If the tag is an instance of a value type, it will be serialized together with the cell containing it when saving/loading the diagram. Reference types are serialized if marked with the **[Serializable]** attribute or if they implement the **ISerializable** interface.

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace
Diagram.SerializeTag Event

TableNode.Cell.Text Property

Gets or sets text displayed inside the cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Text { get; set; }
```

Visual Basic Copy Code

```
Public Property Text As String
```

Property Value

A string value containing the text. The default is an empty string.

Remarks

The property specifies text that appears inside a cell. Text can be customized via the TextBrush and TextFormat properties.

Styled text allows applying various attributes to the text characters. Attributes are specified by embedding HTML-like formatting tags within the raw text. Styled text is enabled by setting EnableStyledText to **true**.

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace
Image Property
TableNode.ResizeToFitText Method

TableNode.Cell.TextBrush Property

Gets or sets the brush used to paint the text of the cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush TextBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property TextBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class. The default is **null** (**Nothing** in Visual Basic).

Remarks

The Text of the cell is painted with this brush. However, if the property is set to the default **null** value, the table's CellTextBrush property is used instead of the cell's one.

See Also

TableNode.Cell Members
TableNode.Cell Class
MindFusion.Diagramming Namespace
Font Property
TextFormat Property

TableNode.Cell.TextFormat Property

Gets or sets the alignment of the text that is displayed inside the cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public StringFormat TextFormat { get; set; }
```

Visual Basic Copy Code

```
Public Property TextFormat As StringFormat
```

Property Value

An instance of the StringFormat class. The default alignment is **StringAlignment.Center** for lines and **StringAlignment.Near** for the written text.

Remarks

Use this property to specify the alignment of the text that is contained in cells.

If there isn't enough space available to fit a whole line of text, MvcDiagram wraps the text to a new line when it reaches the edge of the cell. You can specify that the text should be wrapped only at word boundaries by setting the **Trimming** member of **TextFormat** to **StringTrimming.Word**. The default is to split words into multiple parts if there is not enough space to fit a whole word.

If you prefer to use your own line-breaks, disable the automatic text wrapping by enabling the **NoWrap** flag in the **FormatFlags** member of **TextFormat**. If automatic wrapping is disabled and there isn't enough space to fit the whole line, the text is clipped at the cell boundaries.

TableNode.CellCollection Class

Represents a strongly-typed collection of TableNode.Cell objects.

Syntax

C# Copy Code

```
public class TableNode.CellCollection : CollectionBase
```

Visual Basic Copy Code

```
Public Class TableNode.CellCollection
    Inherits CollectionBase
```

Remarks

Do not use the methods and properties of this class to modify the contents of this collection directly. If you want to add or remove cells from a table, use the AddRow, AddColumn, InsertRow, InsertColumn, DeleteRow, DeleteColumn and RedimTable methods of the TableNode class instead.

Inheritance Hierarchy

TableNode.CellCollection Members

Represents a strongly-typed collection of TableNode.Cell objects.

The following tables list the members exposed by the TableNode.CellCollection type.

Public Constructors

	Name	Description
	TableNode.CellCollection	Initializes a new instance of the **TableNode.CellCollection** class.

Public Properties

	Name	Description
	Item	Gets or sets the cell at the specified position within the collection.

Public Methods

	Name	Description
	Add	Adds the specified cell to the collection.
	Clone	Creates a deep copy of this collection.
	GetAt	Returns the cell at the specified position.
	Insert	Inserts the specified cell at the specified index within the collection.
	Remove	Removes the specified cell from the collection.

See Also

TableNode.CellCollection Constructor

Initializes a new instance of the TableNode.CellCollection class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.CellCollection ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

Remarks

This constructor supports the MvcDiagram infrastructure and is not intended to be used directly from your code.

TableNode.CellCollection Methods

TableNode.CellCollection.Add Method

Adds the specified cell to the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Add (
    TableNode.Cell cell
)
```

Visual Basic Copy Code

```
Public Sub Add( _
    cell As TableNode.Cell _
)
```

Parameters

cell
The TableNode.Cell object to add to the collection.

Remarks

Do not use this method directly. Use the methods of the TableNode class instead.

See Also

TableNode.CellCollection Members
TableNode.CellCollection Class

TableNode.CellCollection.Clone Method

Creates a deep copy of this collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.CellCollection Clone ()
```

Visual Basic Copy Code

```
Public Function Clone () As TableNode.CellCollection
```

Return Value

An instance of the TableNode.CellCollection class.

Remarks

This method supports the MvcDiagram infrastructure and is not intended to be used directly from your code.

MindFusion.Diagramming Namespace

TableNode.CellCollection.GetAt Method

Returns the cell at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.Cell GetAt (
    int index
)
```

Visual Basic Copy Code

```
Public Function GetAt( _
    index As Integer _
) As TableNode.Cell
```

Parameters

index
The zero-based index of the cell to retrieve.

Return Value

A reference to the TableNode.Cell object at the specified position.

See Also

TableNode.CellCollection Members
TableNode.CellCollection Class

TableNode.CellCollection.Insert Method

Inserts the specified cell at the specified index within the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Insert (
    int index,
    TableNode.Cell cell
)
```

Visual Basic Copy Code

```
Public Sub Insert( _
    index As Integer, _
    cell As TableNode.Cell _
)
```

Parameters

index
The zero-based index at which to insert the cell.

cell
The TableNode.Cell object to add to the collection.

Remarks

Do not use this method directly. Use the methods of the TableNode class instead.

See Also

TableNode.CellCollection Members
TableNode.CellCollection Class
MindFusion.Diagramming Namespace

TableNode.CellCollection.Remove Method

Removes the specified cell from the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Remove (
    TableNode.Cell cell
)
```

Visual Basic Copy Code

```
Public Sub Remove( _
    cell As TableNode.Cell _
)
```

Parameters

cell
The TableNode.Cell object to add to the collection.

Remarks

Do not use this method directly. Use the methods of the TableNode class instead.

See Also

TableNode.CellCollection Properties

TableNode.CellCollection.Item Property

Gets or sets the cell at the specified position within the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.Cell Item [
    int index
] { get; set; }
```

Visual Basic Copy Code

```
Public Property Item( _
    index As Integer _
) As TableNode.Cell
```

Parameters

index
The zero-based index of the item which should be get or set.

Property Value

A reference to the TableNode.Cell object at the specified index.

Remarks

Do not use the *set* accessor of this property. It supports the MvcDiagram infrastructure and is not intended to be used directly from your code.

See Also

TableNode.CellCollection Members
TableNode.CellCollection Class

TableNode.Column Class

Represents a column of a TableNode.

Syntax

C# Copy Code

```
public class TableNode.Column
```

Visual Basic Copy Code

```
Public Class TableNode.Column
```

Remarks

The width of a column can be set via its Width property. The width of a column determines the width of all cells contained within the column.

When resizing a table, its columns can be resized too. That depends on the value of ColumnStyle, which specifies whether columns are with fixed width or they resize to keep column-to-table width ratio.

Inheritance Hierarchy

System.Object
MindFusion.Diagramming.TableNode.Column

See Also

TableNode.Column Members
MindFusion.Diagramming Namespace

TableNode.Column Members

Represents a column of a TableNode.

The following tables list the members exposed by the TableNode.Column type.

Public Constructors

	Name	Description
	TableNode.Column	Initializes a new instance of the **TableNode.Column** class.

Public Properties

	Name	Description
	ColumnStyle	Gets or sets the manner in which column's width is set.
	Width	Gets or sets the width of the table column.

Public Methods

	Name	Description
	Clone	Creates a copy of this column.

Protected Methods

	Name	Description
	LoadFromJson	Loads the column from a JSON object.
	LoadFromXml	Loads the column properties from an XML element.
	SaveToJson	Saves the column as a JSON object.
	SaveToXml	Saves the column properties into an XML element.

TableNode.Column.LoadFromJson Method

Loads the column from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the column's data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

TableNode.Column Members
TableNode.Column Class
MindFusion.Diagramming Namespace

TableNode.Column.LoadFromXml Method

Loads the column properties from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** containing the column's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

TableNode.Column Members
TableNode.Column Class
MindFusion.Diagramming Namespace

TableNode.Column.SaveToJson Method

Saves the column as a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

TableNode.Column Members
TableNode.Column Class
MindFusion.Diagramming Namespace

TableNode.Column.SaveToXml Method

Saves the column properties into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** the column's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

MindFusion.Diagramming Namespace

TableNode.Column Properties

TableNode.Column.ColumnStyle Property

Gets or sets the manner in which column's width is set.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ColumnStyle ColumnStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property ColumnStyle As ColumnStyle
```

Property Value

A member of the ColumnStyle enumeration. The default is **ColumnStyle.FixedWidth**.

Remarks

This property is used for calculating the width of a table column. The column can have either a fixed width set through the Width property, or can be resized proportionally to the table width.

TableNode.Column.Width Property

Gets or sets the width of the table column.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Width { get; set; }
```

Visual Basic Copy Code

```
Public Property Width As Double
```

Property Value

A **double** value indicating the width of the column. The default is 50.

TableNode.ColumnCollection.GetAt Method

Returns the column at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.Column GetAt (
    int index
)
```

Visual Basic Copy Code

```
Public Function GetAt( _
    index As Integer _
) As TableNode.Column
```

Parameters

index

The zero-based index of the column to retrieve.

Return Value

A reference to the TableNode.Column object at the specified position.

See Also

TableNode.ColumnCollection Members
TableNode.ColumnCollection Class
MindFusion.Diagramming Namespace

TableNode.ColumnCollection.Insert Method

Inserts the specified column at the specified index within the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Insert (
    int index,
    TableNode.Column column
)
```

Visual Basic Copy Code

```
Public Sub Insert( _
    index As Integer, _
    column As TableNode.Column _
)
```

Parameters

index
The zero-based index at which to insert the column.

column
The TableNode.Column object to add to the collection.

Remarks

Do not use this method directly. Use the InsertColumn method of the TableNode class instead.

See Also

TableNode.ColumnCollection Members

TableNode.ColumnCollection Properties

TableNode.ColumnCollection.Item Property

Gets or sets the column at the specified position within the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.Column Item [
    int index
] { get; set; }
```

Visual Basic Copy Code

```
Public Property Item( _
    index As Integer _
) As TableNode.Column
```

Parameters

index
The zero-based index of the item which should be get or set.

Property Value

A reference to the TableNode.Column object at the specified index.

Remarks

Do not use the *set* accessor of this property. It supports the MvcDiagram infrastructure and is not intended to be used directly from your code.

See Also

TableNode.ColumnCollection Members
TableNode.ColumnCollection Class
MindFusion.Diagramming Namespace

TableNode.Row Class

Represents a row in TableNode node.

Syntax

C# Copy Code

```
public class TableNode.Row
```

Visual Basic Copy Code

```
Public Class TableNode.Row
```

Remarks

Table rows can be assigned to distinct sections of a table. For example, sections could contain rows representing different types of class members in class diagrams, there could be one section displaying the methods, another one for the events and one more for the properties of a class. Each section can be collapsed or expanded, hiding or showing all rows in the section except the header one. To define a section, set a Header row. A section consists of all rows after a header row and spans to the next header. Each header row displays a [±] button that allows expanding or collapsing the section interactively. Sections can be collapsed and expanded programmatically using the Expanded property of the header row.

The height of a row is set via the Height property. That determines the height of all non-spanning cells contained within the row. Cells can be made to span several rows by setting their RowSpan property.

Rows can be bound together to represent relationship between database tables. The relationship can be one to many and many to one. The tables that stay on the left side of M:1 relationships are stored in the RelatedManyToOne collection; the tables in 1:M relationship with the row are stored in the RelatedOneToMany collection.

The relationship between tables is shown with links. You can access the DiagramLink elements that go out of a table row via the OutgoingLinks property. Links that come into a given row can be accessed with the IncomingLinks property.

Inheritance Hierarchy

System.Object
MindFusion.Diagramming.TableNode.Row

See Also

TableNode.Row Members
MindFusion.Diagramming Namespace

TableNode.Row Members

Represents a row in TableNode node.

The following tables list the members exposed by the TableNode.Row type.

Public Constructors

	Name	Description
	TableNode.Row	Initializes a new instance of the **TableNode.Row** class.

Public Properties

	Name	Description
	AnchorPattern	Gets or sets a set of anchor points to which links can dock when connected to this row.
	Expanded	Gets or sets a value indicating whether the table section starting from this Header row is collapsed or expanded.
	Header	Gets or sets a value indicating whether this row is a section header.
	Height	Gets or sets the height of the table row.
	IncomingLinks	Gets a collection of all links that point to this table row.
	OutgoingLinks	Gets a collection of all links that go out of this table row.
	RelatedManyToOne	Gets a collection of all tables that are in many-to-one relation with this table row.
	RelatedOneToMany	Gets a collection of all tables that are in one-to-many relation with this table row.
	Table	Gets the **TableNode** that contains this row.

Public Methods

	Name	Description
	Clone	Creates a copy of this row.

Protected Methods

	Name	Description
	LoadFromJson	Loads the row from a JSON object.
	LoadFromXml	Loads the row properties from an XML element.
	SaveToJson	Saves the row as a JSON object.
	SaveToXml	Saves the row properties into an XML element.

TableNode.Row.LoadFromJson Method

Loads the row from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic

```
Protected Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject containing the row's data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

TableNode.Row.LoadFromXml Method

Loads the row properties from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
protected void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic

```
Protected Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** containing the row's data.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

Syntax

C# Copy Code

```
protected void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject instance to contain the serialized data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

TableNode.Row Members
TableNode.Row Class
MindFusion.Diagramming Namespace

TableNode.Row.SaveToXml Method

Saves the row properties into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** the row's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

TableNode.Row Members
TableNode.Row Class
MindFusion.Diagramming Namespace

TableNode.Row Properties

TableNode.Row.AnchorPattern Property

Gets or sets a set of anchor points to which links can dock when connected to this row.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPattern AnchorPattern { get; set; }
```

Visual Basic Copy Code

```
Public Property AnchorPattern As AnchorPattern
```

Property Value

An instance of the AnchorPattern class.

Remarks

AnchorPattern defines a set of locations where links connected to a row are allowed to connect. When a link is connected to a row, the respective end of the link is aligned to the nearest AnchorPoint assigned to that row. If a row does not have associated anchor points of the appropriate type (incoming/outgoing), the link will be connected to the nearest row that has such anchors defined. If none of the rows of a table has an associated anchor pattern, links are connected to the middle of the left or right side of the pointed row.

See Also

TableNode.Row Members
TableNode.Row Class
MindFusion.Diagramming Namespace
TableNode.RowAnchorPattern Property
AnchorPoint.Column Property

TableNode.Row.Expanded Property

Gets or sets a value indicating whether the table section starting from this Header row is collapsed or expanded.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Expanded { get; set; }
```

Visual Basic Copy Code

```
Public Property Expanded As Boolean
```

Property Value

true if the table section that starts from this row is expanded; otherwise, **false**. The default is **true**.

Remarks

This property can be set only if the row is a Header. Links connected to the rows of a collapsed table section appear to be connected to the section header row.

See Also

TableNode.Row Members
TableNode.Row Class
MindFusion.Diagramming Namespace

TableNode.Row.Header Property

Gets or sets a value indicating whether this row is a section header.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Header { get; set; }
```

Visual Basic Copy Code

```
Public Property Header As Boolean
```

Property Value

true if this is the header row of a table section, otherwise **false**. The default is **false**.

Remarks

Each header row defines a section of the table that includes all non-header rows after the header. Such sections can be expanded or collapsed, that is, the rows included in them can be shown or hidden. This can be done interactively by pressing the [±] button displayed in header rows, or programmatically by setting the Expanded property. The TableSectionCollapsed and TableSectionExpanded events are raised when a user clicks the [±] button.

TableNode.Row.Height Property

Gets or sets the height of the table row.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Height { get; set; }
```

Visual Basic Copy Code

```
Public Property Height As Double
```

Property Value

A **double** value indicating the height of the row. The default is 22.

See Also

MindFusion.Diagramming Namespace
TableNode.RowHeight Property

TableNode.Row.IncomingLinks Property

Gets a collection of all links that point to this table row.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLinkCollection IncomingLinks { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property IncomingLinks As DiagramLinkCollection
```

Property Value

A DiagramLinkCollection containing references to the incoming links.

Remarks

The property returns a collection of all links that point to this table row. Use it to access the links or get their number.

See Also

TableNode.Row Members

OutgoingLinks Property

TableNode.Row.OutgoingLinks Property

Gets a collection of all links that go out of this table row.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLinkCollection OutgoingLinks { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property OutgoingLinks As DiagramLinkCollection
```

Property Value

A DiagramLinkCollection containing references to the outgoing links.

Remarks

The property returns a collection of all links that start from this table row. Use it to access the links or get their number.

See Also

TableNode.Row Members
TableNode.Row Class

IncomingLinks Property

TableNode.Row.RelatedManyToOne Property

Gets a collection of all tables that are in many-to-one relation with this table row.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNodeCollection RelatedManyToOne { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property RelatedManyToOne As DiagramNodeCollection
```

Property Value

A DiagramNodeCollection containing references to the TableNode objects, which are in relation M:1 with this row.

Remarks

When working with database diagrams, use this property to find all tables which are in M:1 relation with this row.

See Also

TableNode.Row Members
TableNode.Row Class

RelatedOneToMany Property

TableNode.Row.RelatedOneToMany Property

Gets a collection of all tables that are in one-to-many relation with this table row.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramNodeCollection RelatedOneToMany { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property RelatedOneToMany As DiagramNodeCollection
```

Property Value

A DiagramNodeCollection containing references to the TableNode objects, which are in relation 1:M with this row.

Remarks

When working with database diagrams, use this property to find all tables which are in 1:M relation with this row.

TableNode.Row Members
TableNode.Row Class
MindFusion.Diagramming Namespace

TableNode.Row.Table Property

Gets the TableNode that contains this row.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode Table { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Table As TableNode
```

Property Value

A TableNode instance.

See Also

TableNode.Row Members
TableNode.Row Class
MindFusion.Diagramming Namespace

TableNode.RowCollection Class

Represents a strongly-typed collection of TableNode.Row objects.

Syntax

C# Copy Code

```
public class TableNode.RowCollection : CollectionBase
```

Visual Basic Copy Code

```
Public Class TableNode.RowCollection
    Inherits CollectionBase
```

Remarks

Do not use the methods and properties of this class to modify the contents of this collection directly. If you want to add or remove rows from a table, use the AddRow, InsertRow, DeleteRow and RedimTable methods of the TableNode class instead.

TableNode.RowCollection Members

Represents a strongly-typed collection of TableNode.Row objects.

The following tables list the members exposed by the TableNode.RowCollection type.

Public Constructors

	Name	Description
	TableNode.RowCollection	Initializes a new instance of the **TableNode.RowCollection** class.

Public Properties

	Name	Description
	Item	Gets or sets the row at the specified position within the collection.

Public Methods

	Name	Description
	Add	Adds the specified row to the collection.
	Clone	Creates a deep copy of this collection.
	GetAt	Returns the row at the specified position.
	IndexOf	Returns the index of the specified row within the collection.
	Insert	Inserts the specified row at the specified index within the collection.
	Remove	Removes the specified row from the collection.

TableNode.RowCollection Constructor

Initializes a new instance of the TableNode.RowCollection class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.RowCollection ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

Remarks

This constructor supports the MvcDiagram infrastructure and is not intended to be used directly from your code.

TableNode.RowCollection Methods

TableNode.RowCollection.Add Method

Adds the specified row to the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Add (
    TableNode.Row r
)
```

Visual Basic Copy Code

```
Public Sub Add( _
    r As TableNode.Row _
)
```

Parameters

r
The TableNode.Row object to add to the collection.

Remarks

Do not use this method directly. Use the AddRow method of the TableNode class instead.

See Also

TableNode.RowCollection Members
TableNode.RowCollection Class
MindFusion.Diagramming Namespace

TableNode.RowCollection.Clone Method

Creates a deep copy of this collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.RowCollection Clone ()
```

Visual Basic Copy Code

```
Public Function Clone () As TableNode.RowCollection
```

Return Value

An instance of the TableNode.RowCollection class.

Remarks

This method supports the MvcDiagram infrastructure and is not intended to be used directly from your code.

TableNode.RowCollection.GetAt Method

Returns the row at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.Row GetAt (
    int index
)
```

Visual Basic Copy Code

```
Public Function GetAt( _
    index As Integer _
) As TableNode.Row
```

Parameters

index
The zero-based index of the row to retrieve.

Return Value

A reference to the TableNode.Row object at the specified position.

Remarks

A reference to the TableNode.Row object at the specified position.

See Also

TableNode.RowCollection Members
TableNode.RowCollection Class

TableNode.RowCollection.IndexOf Method

Returns the index of the specified row within the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int IndexOf (
    TableNode.Row row
```

```
)
```

Visual Basic Copy Code

```
Public Function IndexOf( _
    row As TableNode.Row _
) As Integer
```

Parameters

row
The TableNode.Row object whose index to search for in the collection.

Return Value

An integer value specifying the index of the row within the collection or -1, if the row was not found.

See Also

TableNode.RowCollection Members
TableNode.RowCollection Class
MindFusion.Diagramming Namespace

TableNode.RowCollection.Insert Method

Inserts the specified row at the specified index within the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Insert (
    int index,
    TableNode.Row row
)
```

Visual Basic Copy Code

```
Public Sub Insert( _
    index As Integer, _
    row As TableNode.Row _
)
```

Parameters

index
The zero-based index at which to insert the row.

row
The TableNode.Row object to add to the collection.

Remarks

Do not use this method directly. Use the InsertRow method of the TableNode class instead.

See Also

TableNode.RowCollection Members
TableNode.RowCollection Class
MindFusion.Diagramming Namespace

TableNode.RowCollection.Remove Method

Removes the specified row from the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Remove (
    TableNode.Row row
)
```

Visual Basic Copy Code

```
Public Sub Remove( _
    row As TableNode.Row _
)
```

Parameters

row
The TableNode.Row object to add to the collection.

Remarks

Do not use this method directly. Use the DeleteRow method of the TableNode class instead.

See Also

TableNode.RowCollection Members
TableNode.RowCollection Class
MindFusion.Diagramming Namespace

TableNode.RowCollection Properties

TableNode.RowCollection.Item Property

Gets or sets the row at the specified position within the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TableNode.Row Item [
    int index
] { get; set; }
```

Visual Basic Copy Code

```
Public Property Item( _
    index As Integer _
) As TableNode.Row
```

Parameters

index

Property Value

A reference to the TableNode.Row object at the specified index.

Remarks

Do not use the *set* accessor of this property. It supports the MvcDiagram infrastructure and is not intended to be used directly from your code.

See Also

TableNodeProperties Class

Stores the values of TableNode properties during undo / redo operations.

Syntax

C# Copy Code

```
public class TableNodeProperties : DiagramNodeProperties
```

Visual Basic Copy Code

```
Public Class TableNodeProperties
    Inherits DiagramNodeProperties
```

Remarks

If you need to implement undo support for the additional properties defined by a class derived from TableNode, do so by deriving from **TableNodeProperties** and overriding the SaveProperties, RestoreProperties, and CreateProperties methods of **TableNode**.

TableNodeStyle Members

Represents a reusable set of properties that define the appearance of table nodes.

The following tables list the members exposed by the TableNodeStyle type.

Public Constructors

	Name	Description
	TableNodeStyle	Initializes a new instance of the **TableNodeStyle** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	CaptionBackBrush	Gets or sets the brush used to paint the caption bar of a table.
	CellTextBrush	Gets or sets the brush used to paint texts inside table cells.
	Effects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	FontFamily	Gets or sets the font family of the item text. (Inherited from DiagramItemStyle.)
	FontSize	Gets or sets the font size of the item text. (Inherited from DiagramItemStyle.)
	FontStyle	Gets or sets the font style of the item text. (Inherited from DiagramItemStyle.)
	FontUnit	Gets or sets the font unit of the item text. (Inherited from DiagramItemStyle.)
	ShadowBrush	Gets or sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	Stroke	Gets or sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	StrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline items. (Inherited from DiagramItemStyle.)
	StrokeThickness	Gets or sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)

Public Methods

	Name	Description

	GetProperties	Gets all properties in the style. (Inherited from Style.)
	GetProperty	Returns the property with the specified name, if any. (Inherited from Style.)
S	RegisterType	Associates a type with an alias. (Inherited from Style.)

Protected Methods

	Name	Description
	GetValue	Gets the value of the specified property. (Inherited from Style.)
	IsPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	LoadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	LoadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from Style.)
	RegisterProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	SaveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	SaveToXml	Saves the style content into an XML element. (Inherited from Style.)
	SetValue	Sets the value of the specified property. (Inherited from Style.)
	UnsetValue	Clears the value of the specified property. (Inherited from Style.)

Public Events

	Name	Description
	PropertyChanged	Raised when any of the registered style properties has changed. (Inherited from Style.)

Theme.GetStyle Method

Gets the Style object, if any, associated with the specified type.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Style GetStyle (
    Type type
)
```

Visual Basic

```
Public Function GetStyle( _
    type As Type _
) As Style
```

Parameters

type
The runtime type whose style to retrieve.

Return Value

The Style associated with the type, or null.

ThicknessConverter Methods

ThicknessConverter.CanConvertFrom Method

TypeConverter.CanConvertFrom override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool CanConvertFrom (
    ITypeDescriptorContext context,
    Type sourceType
)
```

Visual Basic Copy Code

```
Public Overrides Function CanConvertFrom( _
    context As ITypeDescriptorContext, _
    sourceType As Type _
) As Boolean
```

Parameters

context
An **ITypeDescriptorContext** that provides a format context.

sourceType
A **Type** that represents the type you want to convert from.

Return Value

ThicknessConverter.ConvertFrom Method

TypeConverter.ConvertFrom override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Object ConvertFrom (
    ITypeDescriptorContext context,
    CultureInfo culture,
    Object value
)
```

Visual Basic Copy Code

```
Public Overrides Function ConvertFrom( _
    context As ITypeDescriptorContext, _
    culture As CultureInfo, _
    value As Object _
) As Object
```

Parameters

context
An **ITypeDescriptorContext** that provides a format context.

culture
The **CultureInfo** to use as the current culture.

value
The **Object** to convert.

Return Value

ThicknessConverter.ConvertTo Method

TypeConverter.ConvertTo override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Object ConvertTo (
    ITypeDescriptorContext context,
    CultureInfo culture,
```

```
    Object value,
    Type destinationType
)
```

Visual Basic Copy Code

```
Public Overrides Function ConvertTo( _
    context As ITypeDescriptorContext, _
    culture As CultureInfo, _
    value As Object, _
    destinationType As Type _
) As Object
```

Parameters

context

An **ITypeDescriptorContext** that provides a format context.

culture

A **CultureInfo**. If **null** is passed, the current culture is assumed.

value

The **Object** to convert.

destinationType

An **Object** that represents the converted value.

Return Value

TreeEnumerator Class

Enables an easy standard method to iterate over the elements of a tree-like structure of objects.

Syntax

C# Copy Code

```
public class TreeEnumerator : IEnumerator
```

Visual Basic Copy Code

```
Public Class TreeEnumerator
    Implements IEnumerator
```

Remarks

The **TreeEnumerator** class implements the standard .NET **IEnumerator** interface. It provides an easy method to iterate over the elements of a tree-like structure of diagram items.

Example

The following example demonstrates how to use the **TreeEnumerator**:

C# Copy Code

```
TreeEnumerator te = new TreeEnumerator(
    rootObj, false, false);

while (te.MoveNext())
{
    ShapeNode node = (ShapeNode)te.Current;
    node.Brush = new SolidBrush(Color.Blue);
}
```

Visual Basic Copy Code

```
Dim te As MindFusion.Diagramming.TreeEnumerator = New MindFusion.Diagramming.TreeEnumerator( _
    rootObj, False, False)

While te.MoveNext()
    Dim node As ShapeNode = CType(te.Current, ShapeNode)
    Node.Brush = New SolidBrush(Color.Blue)
End While
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.TreeEnumerator

TreeEnumerator Members
MindFusion.Diagramming Namespace

TreeEnumerator Members

Enables an easy standard method to iterate over the elements of a tree-like structure of objects.

The following tables list the members exposed by the TreeEnumerator type.

Public Constructors

	Name	Description
	TreeEnumerator	Initializes a new instance of the **TreeEnumerator** class.

Public Properties

	Name	Description
	Current	Gets the current element of the iteration.

Public Methods

	Name	Description
	MoveNext	Advances the enumerator to the next element of the tree.
	Reset	Sets the enumerator to its initial position, which is before the first element in the collection.

See Also

TreeEnumerator Class
MindFusion.Diagramming Namespace

TreeEnumerator Constructor

Initializes a new instance of the TreeEnumerator class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TreeEnumerator (
    DiagramNode root,
    bool enumLinks,
    bool strict
)
```

Visual Basic Copy Code

```
Public New ( _
    root As DiagramNode, _
    enumLinks As Boolean, _
    strict As Boolean _
)
```

Parameters

root
The root of the tree or subtree to be enumerated.

enumLinks
Specifies whether to enumerate links.

strict
Specifies whether to check strictly if the passed structure is a tree. If this option is enabled, NotATreeException will be thrown if a cycle or multiple links to a node are encountered. If the option is disabled, the enumerator will ignore any cycles or multiple links found and continue the iteration.

See Also

TreeEnumerator Class
MindFusion.Diagramming Namespace

TreeEnumerator Methods

TreeEnumerator.MoveNext Method

Advances the enumerator to the next element of the tree.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool MoveNext ()
```

Visual Basic Copy Code

```
Public Function MoveNext () As Boolean
```

Return Value

true if the enumerator has successfully passed to the next DiagramItem in the collection; **false** if there are no more elements available to enumerate.

Remarks

Initially an enumerator is positioned before the first element of the tree (the root), and the first call to **MoveNext** moves the enumerator over that first element.

See Also

TreeEnumerator Members
TreeEnumerator Class
MindFusion.Diagramming Namespace

TreeEnumerator.Reset Method

Sets the enumerator to its initial position, which is before the first element in the collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Reset ()
```

Visual Basic Copy Code

```
Public Sub Reset ()
```

See Also

TreeEnumerator Members
TreeEnumerator Class
MindFusion.Diagramming Namespace

TreeEnumerator Properties

TreeEnumerator.Current Property

Gets the current element of the iteration.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Current { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Current As Object
```

Property Value

The DiagramItem that is current in the enumeration.

Remarks

If the *enumLinks* constructor argument is set to **false**, only nodes are enumerated. After an enumerator is created or after a Reset, MoveNext must be called to advance the enumerator to the first element before reading the value of **Current**; otherwise, **Current** is undefined.

```
public TreeItemEventArgs (
    TreeViewItem item,
    MouseButton mouseButton,
    Point mousePosition
)
```

Visual Basic Copy Code

```
Public New ( _
    item As TreeViewItem, _
    mouseButton As MouseButton, _
    mousePosition As Point _
)
```

Parameters

item
The TreeViewItem related to the event.

mouseButton
The mouse button related to the event.

mousePosition
The position of the mouse at the time the event was raised.

TreeViewConnectionPoint Members

Represents a connection between a link and a TreeViewNode.

The following tables list the members exposed by the TreeViewConnectionPoint type.

Public Constructors

	Name	Description
	TreeViewConnectionPoint	Overloaded.

Public Properties

	Name	Description
	Item	Gets the item to which the link connects.
	RelativePosition	Gets or sets the position of this connection point, relative to the associated node's bounding rectangle, expressed as percentage. (Inherited from ConnectionPoint.)
	Row	ConnectionPoint.Row override.

Protected Properties

	Name	Description
	Incoming	Gets a flag indicating whether this connection point is at the origin or the destination of the associated link. (Inherited from ConnectionPoint.)
	Link	Gets the link associated with this connection point. (Inherited from ConnectionPoint.)
	Node	Gets the node associated with this connection point. (Inherited from ConnectionPoint.)

Public Methods

	Name	Description
	AddLinkToNode	ConnectionPoint.AddLinkToNode override.
	CalculateIntersections	Determines whether the end of a link should be aligned to the point where the node contour is intersected by the line connecting the centers of the connected nodes. (Inherited from ConnectionPoint.)
	CanMoveLink	Checks whether the specified point, expressed in document coordinates, is a valid location for this connection point. (Inherited from ConnectionPoint.)
	GetAnchorPos	Overloaded. (Inherited from ConnectionPoint.)
	GetEndPoint	ConnectionPoint.GetEndPoint override.
	GetInitialPoint	ConnectionPoint.GetInitialPoint override.

	GetIntersection	ConnectionPoint.GetIntersection override.
	GetNodeRect	Returns the bounding rectangle of the node associated with this connection point. (Inherited from ConnectionPoint.)
	LinkChanges	ConnectionPoint.LinkChanges override.
	NearestAnchorPoint	Returns the anchor point closest to the specified point from the node's associated anchor pattern. (Inherited from ConnectionPoint.)
	NodesIntersect	Checks whether the node associated with the current connection point and the node associated with the specified connection point intersect. (Inherited from ConnectionPoint.)
	RemoveLinkFromNode	ConnectionPoint.RemoveLinkFromNode override.
	SameNode	Checks whether the current connection point and the specified connection point are associated with the same node. (Inherited from ConnectionPoint.)
	SaveEndRelative	ConnectionPoint.SaveEndRelative override.

Protected Methods

	Name	Description
	GetNearestBorderPoint	ConnectionPoint.GetNearestBorderPoint override.
	UpdateFromPoint	Updates the connection stated according to the specified point, without changing the related node.

TreeViewConnectionPoint Constructor (TreeViewNode, DiagramLink, Boolean, TreeViewItem)

Initializes a new instance of the TreeViewConnectionPoint class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public TreeViewConnectionPoint (
    TreeViewNode node,
    DiagramLink link,
    bool incoming,
    TreeViewItem item
)
```

Visual Basic

```
Public New ( _
    node As TreeViewNode, _
    link As DiagramLink, _
    incoming As Boolean, _
    item As TreeViewItem _
)
```

Parameters

node
A TreeViewNode instance.

link
A DiagramLink instance.

incoming
Specifies which end of the link is represented by this TreeViewConnectionPoint.

item
The TreeViewItem to which the link connects.

MindFusion.Diagramming Namespace

TreeViewItem Class

Represents a constituent item of the hierarchy displayed inside a TreeViewNode.

Syntax

C#	Copy Code
`public class TreeViewItem : INotifyPropertyChanged, InplaceEditable`	

Visual Basic	Copy Code
`Public Class TreeViewItem` `    Implements INotifyPropertyChanged, InplaceEditable`	

Remarks

The items of a TreeViewNode can be traversed recursively starting from the node's RootItems. Given an item, you can find its parent and child items by means of the Parent and Children properties.

If the ConnectionStyle of a node is set to Items, links connect to specific items of the node. Such links can be accessed by means of the IncomingLinks and OutgoingLinks collections.

TreeViewItem Members

Represents a constituent item of the hierarchy displayed inside a TreeViewNode.

The following tables list the members exposed by the TreeViewItem type.

Public Constructors

	Name	Description
	TreeViewItem	Overloaded. Initializes a new instance of the **TreeViewItem** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to paint item's background.
	Children	Gets a list of this item's children in the hierarchy.
	Expanded	Gets or sets whether this item is expanded to show its children.
	Height	Gets or sets the height of this item.
	Image	Gets or sets the image that is displayed in this treeview item.
	ImageUrl	Gets or sets a URL used to load an image into this item.
	IncomingLinks	Gets a collection of all links that point to this item.
	Label	Gets or sets the label of this item.
	LabelBrush	Gets or sets the brush used to draw the label of this item.
	LabelFont	Gets or sets the label font of this item.
	OutgoingLinks	Gets a collection of all links that go out of this item.
	Parent	Gets the parent item of this item.
	Tag	Gets or sets custom data associated with this item.

Public Events

	Name	Description
	PropertyChanged	Implements INotifyPropertyChanged.PropertyChanged.

TreeViewItem Constructor

Initializes a new instance of the TreeViewItem class.

Overload List

Name	Description
TreeViewItem ()	Initializes a new instance of the **TreeViewItem** class.
TreeViewItem (String)	Initializes a new instance of the **TreeViewItem** class.
TreeViewItem (TreeViewItem)	Initializes a new instance of the **TreeViewItem** class using the specified item as a prototype.

TreeViewItem Constructor ()

Initializes a new instance of the TreeViewItem class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TreeViewItem ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

TreeViewItem Constructor Overload List
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem Constructor (String)

Initializes a new instance of the TreeViewItem class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TreeViewItem (
    string label
)
```

Visual Basic Copy Code

```
Public New ( _
    label As String _
)
```

Parameters

label
The text initially displayed by the item.

See Also

MindFusion.Diagramming Namespace

TreeViewItem Constructor (TreeViewItem)

Initializes a new instance of the TreeViewItem class using the specified item as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TreeViewItem (
    TreeViewItem prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As TreeViewItem _
)
```

Parameters

prototype
The treeview item to use as a prototype. The properties of the new treeview are initialized from the property values of prototype.

Remarks

This constructor copies the TreeViewItem property values from the specified prototype item.

TreeViewItem Properties

TreeViewItem.Brush Property

Gets or sets the brush used to paint item's background.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush Brush { get; set; }
```

Visual Basic Copy Code

```
Public Property Brush As Brush
```

Property Value

An instance of Brush -derived class. The default value is **null**.

Remarks

If this property is not set, item's background is painted using the parent node's Brush.

TreeViewItem.Children Property

Gets a list of this item's children in the hierarchy.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IList<TreeViewItem> Children { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Children As IList(Of TreeViewItem)
```

Property Value

A list of child TreeViewItem objects.

See Also

TreeViewItem Members

Parent Property

TreeViewItem.Expanded Property

Gets or sets whether this item is expanded to show its children.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool Expanded { get; set; }
```

Visual Basic Copy Code

```
Public Property Expanded As Boolean
```

Property Value

true to show the children of this item, otherwise **false**; the default value is **true**.

TreeViewItem.Height Property

Gets or sets the height of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double Height { get; set; }
```

Visual Basic Copy Code

```
Public Property Height As Double
```

Property Value

A **double** value specifying the item's height. The default value is 5.

TreeViewItem.Image Property

Gets or sets the image that is displayed in this treeview item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage Image { get; set; }
```

Visual Basic Copy Code

```
Public Property Image As IImage
```

Property Value

A **Microsoft.Maui.Graphics.IImage** instance.

TreeViewItem.ImageUrl Property

Gets or sets a URL used to load an image into this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ImageUrl { get; set; }
```

Visual Basic Copy Code

```
Public Property ImageUrl As String
```

Property Value

TreeViewItem.IncomingLinks Property

Gets a collection of all links that point to this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLinkCollection IncomingLinks { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property IncomingLinks As DiagramLinkCollection
```

Property Value

An instance of the DiagramLinkCollection class.

Remarks

The property returns a collection of all links that point to this item. Use it to access the links or get their number.

TreeViewItem.Label Property

Gets or sets the label of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Label { get; set; }
```

Visual Basic Copy Code

```
Public Property Label As String
```

Property Value

A string specifying the item's label.

LabelFont Property
TreeViewNode.ResizeToFitText Method

TreeViewItem.LabelBrush Property

Gets or sets the brush used to draw the label of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush LabelBrush { get; set; }
```

Visual Basic Copy Code

```
Public Property LabelBrush As Brush
```

Property Value

An instance of a MindFusion.Drawing.Brush-derived class. The default value is **null** (**Nothing** in Visual Basic).

Remarks

It this property is set to **null**, the label is rendered using the TextBrush value of the parent node.

Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Font LabelFont { get; set; }
```

Visual Basic Copy Code

```
Public Property LabelFont As Font
```

Property Value

An instance of the Font class. The default value is **null**.

Remarks

It this property is set to **null**, the label is rendered using the Font of the parent node.

TreeViewItem.OutgoingLinks Property

Gets a collection of all links that go out of this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramLinkCollection OutgoingLinks { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property OutgoingLinks As DiagramLinkCollection
```

Property Value

An instance of the DiagramLinkCollection class.

Remarks

The property returns a collection of all links that start from this item. Use it to access the links or get their number.

TreeViewItem.Tag Property

Gets or sets custom data associated with this item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object Tag { get; set; }
```

Visual Basic Copy Code

```
Public Property Tag As Object
```

Property Value

An instance of any class derived from **System.Object**. The default value is **null** (**Nothing** in Visual Basic).

TreeViewItem Events

TreeViewItem.PropertyChanged Event

Implements INotifyPropertyChanged.PropertyChanged.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event PropertyChangedEventHandler PropertyChanged
```

Visual Basic Copy Code

```
Public Event PropertyChanged As PropertyChangedEventHandler
```

See Also

TreeViewItem Members
TreeViewItem Class

TreeViewNode Class

Represents nodes that can draw hierarchical data.

Syntax

C# Copy Code

```
public class TreeViewNode : DiagramNode, Scrollable
```

Visual Basic Copy Code

```
Public Class TreeViewNode
    Inherits DiagramNode
    Implements Scrollable
```

Remarks

The root items displayed in the node can be accessed through the RootItems property. New items can be added to and removed from the returned collection. The root items can have child items on their own and so on. For more information, refer to the TreeViewItem class.

The text and image displayed in the node caption can be customized through the Caption and CaptionImage properties respectively. The scroll position can be manipulated through ScrollPosition.

TreeViewNode Members

Represents nodes that can draw hierarchical data.

The following tables list the members exposed by the TreeViewNode type.

Public Constructors

	Name	Description
	TreeViewNode	Overloaded. Initializes a new instance of the **TreeViewNode** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Caption	Gets or sets the text displayed as caption of the table.
	CaptionHeight	Gets or sets the height of the node's caption bar.
	CaptionImage	Gets or sets the image that is displayed in the caption.
	ConnectionStyle	Gets or sets a value indicating whether drawing a link from/to this node should connect an item or the whole node as an integral entity.
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)

	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled.
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the node's caption.
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RootItems	Gets a list of the root TreeViewItem objects displayed in this node.
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	ScrollPosition	Gets or sets the current scroll position.
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)

	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Shape	Gets or sets the shape of the table's outline.
	ShowLines	Gets or sets whether to display lines connecting child items to parent items.
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of texts displayed inside this shape node.
	TextPadding	Gets or sets the spacing between the item boundaries and its text.
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	DiagramNode.HasItems override.
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	DiagramNode.AcceptLinks override.
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)

	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	CreateConnectionPoint	DiagramNode.CreateConnectionPoint override.
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Draws the node on the specified IGraphics surface.
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified **IGraphics** surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetFlatItemList	Gets a list with all items of this node.
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetItemRect	Gets the location and size of the specified TreeViewItem.
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)

	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTest	Returns the type of graphics element at the specified coordinates.
	HitTestExpander	Gets whether there is a collapse/expand button located at the specified position.
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	ItemFromPoint	Returns the item at the specified location.
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	DiagramItem.OnLoad override.
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveItem	Removes the specified item from the node.
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	ResizeToFitText	Resizes the tree view so that it is large enough to fit the text of its items.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)

	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override.
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllIncomingLinks	DiagramNode.GetAllIncomingLinks override.
	GetAllOutgoingLinks	DiagramNode.GetAllOutgoingLinks override.
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object.
	LoadFromXml	Loads the item content from an XML element.

	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	DiagramNode.OnClick override.
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	Called when the Diagram's MeasureUnit changes.
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	DiagramItem.OnStyleChanged override.
	OnTextChanged	DiagramItem.OnTextChanged override.
	OnTextFormatChanged	DiagramItem.OnTextFormatChanged override.
	OnUpdateBounds	DiagramNode.OnUpdateBounds override.
	OnZoomChanged	Called when the Diagram's **ZoomFactor** changes.
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramNode.RestoreProperties override.
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramNode.SaveProperties override.
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object.
	SaveToXml	Saves the item content into an XML element.
	ScaleElements	DiagramNode.ScaleElements override.
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it.
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)

	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

TreeViewNode Constructor

Initializes a new instance of the TreeViewNode class.

Overload List

Name	Description
TreeViewNode ()	Initializes a new instance of the **TreeViewNode** class.
TreeViewNode (Diagram)	Initializes a new instance of the **TreeViewNode** class.
TreeViewNode (TreeViewNode)	Initializes a new instance of the **TreeViewNode** class using the specified node as a prototype.

See Also

TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode Constructor ()

Initializes a new instance of the TreeViewNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TreeViewNode ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

TreeViewNode Constructor Overload List
TreeViewNode Class

TreeViewNode Constructor (Diagram)

Initializes a new instance of the TreeViewNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TreeViewNode (
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram _
)
```

Parameters

diagram
The Diagram from which to obtain default values for the node properties.

Remarks

This constructor initializes the TreeViewNode properties with the values specified in the respective default-value properties of the Diagram object.

See Also

TreeViewNode Constructor Overload List
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode Constructor (TreeViewNode)

Initializes a new instance of the TreeViewNode class using the specified node as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TreeViewNode (
    TreeViewNode prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As TreeViewNode _
)
```

Parameters

prototype
The treeview node to use as a prototype. The properties of the new treeview are initialized from the property values of prototype.

Remarks

This constructor copies the TreeViewNode property values from the specified prototype node.

TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode Methods

TreeViewNode.AcceptLinks Method

DiagramNode.AcceptLinks override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override bool AcceptLinks (
    bool outgoing
)
```

Visual Basic Copy Code

```
Public Overrides Function AcceptLinks( _
    outgoing As Boolean _
) As Boolean
```

Parameters

outgoing
true to check for outgoing links; otherwise, **false**.

Return Value

true if the node accepts connections of the specified type; otherwise, **false**.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.CreateConnectionPoint Method

DiagramNode.CreateConnectionPoint override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override ConnectionPoint CreateConnectionPoint (
    DiagramLink link,
    Point point,
    bool incoming
)
```

Visual Basic Copy Code

```
Public Overrides Function CreateConnectionPoint( _
    link As DiagramLink, _
```

```
    point As Point, _
    incoming As Boolean _
) As ConnectionPoint
```

Parameters

link
A DiagramLink that should be connected to this node.

point
The point at which the link should be connected.

incoming
true if link is an incoming link; otherwise, **false**.

Return Value

A ConnectionPoint instance representing the connection.

TreeViewNode.CreateProperties Method

DiagramItem.CreateProperties override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override DiagramItemProperties CreateProperties ()
```

Visual Basic Copy Code

```
Protected Overrides Function CreateProperties () As DiagramItemProperties
```

Return Value

A DiagramItemProperties-derived object containing a snapshot of the item's properties.

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.DrawLocal Method

Draws the node on the specified IGraphics surface.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void DrawLocal (
    IGraphics graphics,
    RenderOptions options
)
```

Visual Basic Copy Code

```
Public Overrides Sub DrawLocal( _
    graphics As IGraphics, _
    options As RenderOptions _
)
```

Parameters

graphics
An IGraphics object where the node should be rendered.

options
Provides options for the drawing operation.

TreeViewNode.GetAllIncomingLinks Method

DiagramNode.GetAllIncomingLinks override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void GetAllIncomingLinks (
    DiagramLinkCollection links
)
```

Visual Basic Copy Code

```
Protected Overrides Sub GetAllIncomingLinks( _
    links As DiagramLinkCollection _
)
```

Parameters

links
A DiagramLinkCollection the links should be added to.

See Also

TreeViewNode Members
TreeViewNode Class

TreeViewNode.GetAllOutgoingLinks Method

DiagramNode.GetAllOutgoingLinks override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void GetAllOutgoingLinks (
    DiagramLinkCollection links
)
```

Visual Basic Copy Code

```
Protected Overrides Sub GetAllOutgoingLinks( _
    links As DiagramLinkCollection _
)
```

Parameters

links
A DiagramLinkCollection the links should be added to.

TreeViewNode.GetFlatItemList Method

Gets a list with all items of this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public List<TreeViewItem> GetFlatItemList ()
```

Visual Basic Copy Code

```
Public Function GetFlatItemList () As List(Of TreeViewItem)
```

Return Value

A list of TreeViewItem objects.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.GetItemRect Method

Gets the location and size of the specified TreeViewItem.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect GetItemRect (
    TreeViewItem treeItem
)
```

Visual Basic Copy Code

```
Public Function GetItemRect( _
    treeItem As TreeViewItem _
) As Rect
```

Parameters

treeItem
A TreeViewItem instance.

Return Value

A **Microsoft.Maui.Graphics.Rect** specifying the item's position and size.

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.HitTest Method

Returns the type of graphics element at the specified coordinates.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public HitTestResult HitTest (
    Point point
)
```

Visual Basic Copy Code

```
Public Function HitTest( _
    point As Point _
) As HitTestResult
```

Parameters

point
A point in the diagram.

Return Value

A member of the HitTestResult enumeration.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.HitTestExpander Method

Gets whether there is a collapse/expand button located at the specified position.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool HitTestExpander (
    Point point
)
```

Visual Basic Copy Code

```
Public Function HitTestExpander( _
    point As Point _
) As Boolean
```

Parameters

point
The point to check.

Return Value

true if there is +/- icon at the specified position, otherwise **false**.

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.ItemFromPoint Method

Returns the item at the specified location.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TreeViewItem ItemFromPoint (
    Point point
)
```

Visual Basic Copy Code

```
Public Function ItemFromPoint( _
    point As Point _
) As TreeViewItem
```

Parameters

point
The point to check.

Return Value

The TreeViewItem instance that contains the specified point.

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.LoadFromJson Method

Loads the node from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
```

```
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject containing the node's data.

context

A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.LoadFromXml Method

Loads the item content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An **XmlElement** containing the item's data.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

TreeViewNode.OnClick Method

DiagramNode.OnClick override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void OnClick (
    MouseButton mouseButton,
    Point mousePosition
)
```

Visual Basic Copy Code

```
Protected Overrides Sub OnClick( _
    mouseButton As MouseButton, _
    mousePosition As Point _
)
```

Parameters

mouseButton

mousePosition

TreeViewNode.OnLoad Method

DiagramItem.OnLoad override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override void OnLoad ()
```

Visual Basic Copy Code

```
Public Overrides Sub OnLoad ()
```

TreeViewNode.OnMeasureUnitChanged Method

Called when the Diagram's MeasureUnit changes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void OnMeasureUnitChanged ()
```

Visual Basic Copy Code

```
Protected Overrides Sub OnMeasureUnitChanged ()
```

TreeViewNode.OnUpdateBounds Method

DiagramNode.OnUpdateBounds override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void OnUpdateBounds (
    bool sizeChanged
)
```

Visual Basic Copy Code

```
Protected Overrides Sub OnUpdateBounds( _
    sizeChanged As Boolean _
)
```

Parameters

sizeChanged
true if the size has changed; **false** if only the position has changed.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.OnZoomChanged Method

Called when the Diagram's **ZoomFactor** changes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void OnZoomChanged ()
```

Visual Basic Copy Code

```
Protected Overrides Sub OnZoomChanged ()
```

TreeViewNode.RemoveItem Method

Removes the specified item from the node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void RemoveItem (
    TreeViewItem item
)
```

Visual Basic Copy Code

```
Public Sub RemoveItem( _
    item As TreeViewItem _
)
```

Parameters

item
The TreeViewItem to remove.

Remarks

The method removes the specified item and all its direct or indirect children, as well as the links connecting to them.

TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.ResizeToFitText Method

Resizes the tree view so that it is large enough to fit the text of its items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void ResizeToFitText ()
```

Visual Basic Copy Code

```
Public Sub ResizeToFitText ()
```

Remarks

This method also resizes the node vertically so that its height fits all items.

TreeViewItem.Label Property

TreeViewNode.RestoreProperties Method

DiagramNode.RestoreProperties override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void RestoreProperties (
    DiagramItemProperties props
)
```

Visual Basic Copy Code

```
Protected Overrides Sub RestoreProperties( _
    props As DiagramItemProperties _
)
```

Parameters

props
A DiagramItemProperties-derived object containing a snapshot of the item's properties.

See Also

TreeViewNode Members

TreeViewNode.SaveProperties Method

DiagramNode.SaveProperties override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveProperties (
    DiagramItemProperties props
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveProperties( _
    props As DiagramItemProperties _
)
```

Parameters

props
A DiagramItemProperties-derived object where the item's properties should be saved.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.SaveToJson Method

Saves the node as a JSON object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject instance to contain the serialized data.

context
A JsonPersistContext object providing contextual information about the serialization process and helper serialization methods.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.SaveToXml Method

Saves the item content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An **XmlElement** the item's data should be stored into.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

TreeViewNode.ScaleElements Method

DiagramNode.ScaleElements override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void ScaleElements (
    double scale
)
```

Visual Basic Copy Code

```
Protected Overrides Sub ScaleElements( _
    scale As Double _
)
```

Parameters

scale
The value by which to multiply node elements' sizes.

TreeViewNode.SetReflexive Method

Invoked to let a node set the shape of a reflexive link connected to it.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SetReflexive (
    DiagramLink link
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SetReflexive( _
    link As DiagramLink _
)
```

Parameters

link
Reference to the link.

TreeViewNode Properties

TreeViewNode.Caption Property

Gets or sets the text displayed as caption of the table.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string Caption { get; set; }
```

Visual Basic Copy Code

```
Public Property Caption As String
```

Property Value

A string specifying the caption text.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.CaptionHeight Property

Gets or sets the height of the node's caption bar.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double CaptionHeight { get; set; }
```

Visual Basic Copy Code

```
Public Property CaptionHeight As Double
```

Property Value

A **double** value specifying the caption bar height. The default value is 8.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.CaptionImage Property

Gets or sets the image that is displayed in the caption.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage CaptionImage { get; set; }
```

Visual Basic Copy Code

```
Public Property CaptionImage As IImage
```

Property Value

A **Microsoft.Maui.Graphics.IImage** instance.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.ConnectionStyle Property

Gets or sets a value indicating whether drawing a link from/to this node should connect an item or the whole node as an integral entity.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public TreeViewConnectionStyle ConnectionStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property ConnectionStyle As TreeViewConnectionStyle
```

Property Value

A member of the TreeViewConnectionStyle enumeration. The default value is **Items**.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.EnableStyledText Property

Gets or sets a value indicating whether styled text rendering is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool EnableStyledText { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableStyledText As Boolean
```

Property Value

true to parse the text of the node's caption and items in order to find formatting tags; otherwise **false**. Initialized with the value of EnableStyledText.

Remarks

Styled text allows applying various attributes to the characters it contains. Attributes are specified using HTML-like formatting tags embedded in the raw text. Formatting tags are listed and described in the **Text Attributes and Formatting** section of this help file.

If **EnableStyledText** is set to **true**, the node's Caption and the items' Label are parsed and analyzed each time they change. Parsing determines what formatting tags are used and adds the corresponding attribute records to MvcDiagram internal representation of styled text. If the property value is **false**, the text is not processed in any way and is displayed without formatting.

TreeViewNode.Font Property

Gets or sets the font used to render the node's caption.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Font Font { get; set; }
```

Visual Basic Copy Code

```
Public Overrides Property Font As Font
```

Property Value

A Font instance specifying the font attributes.

TreeViewNode.HasItems Property

DiagramNode.HasItems override.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override bool HasItems { get; }
```

Visual Basic Copy Code

```
Protected Overrides ReadOnly Property HasItems As Boolean
```

Property Value

See Also

TreeViewNode Members
TreeViewNode Class

TreeViewNode.RootItems Property

Gets a list of the root TreeViewItem objects displayed in this node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IList<TreeViewItem> RootItems { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property RootItems As IList(Of TreeViewItem)
```

Property Value

See Also

TreeViewNode Members

TreeViewNode.Shape Property

Gets or sets the shape of the table's outline.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SimpleShape Shape { get; set; }
```

Visual Basic Copy Code

```
Public Property Shape As SimpleShape
```

Property Value

A member of the SimpleShape enumeration. The default is **Rectangle**.

TreeViewNode.ShowLines Property

Gets or sets whether to display lines connecting child items to parent items.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ShowLines { get; set; }
```

Visual Basic Copy Code

```
Public Property ShowLines As Boolean
```

Property Value

true to draw connecting lines, or **false** otherwise. The default value is **true**.

TreeViewNode.TextFormat Property

Gets or sets the alignment of texts displayed inside this shape node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public StringFormat TextFormat { get; set; }
```

Visual Basic Copy Code

```
Public Property TextFormat As StringFormat
```

Property Value

An instance of the StringFormat class.

Remarks

Use this property to specify the wrapping mode and alignment of the caption text.

TreeViewNode.TextPadding Property

Gets or sets the spacing between the item boundaries and its text.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public override Thickness TextPadding { get; set; }
```

Visual Basic Copy Code

```
Public Overrides Property TextPadding As Thickness
```

Property Value

A Thickness instance specifying the size of the padding space left around the text.

TreeViewNodeStyle Members

Represents a reusable set of properties that define the appearance of tree view nodes.

The following tables list the members exposed by the TreeViewNodeStyle type.

Public Constructors

	Name	Description
	TreeViewNodeStyle	Initializes a new instance of the **TreeViewNodeStyle** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	Effects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	FontFamily	Gets or sets the font family of the item text. (Inherited from DiagramItemStyle.)
	FontSize	Gets or sets the font size of the item text. (Inherited from DiagramItemStyle.)
	FontStyle	Gets or sets the font style of the item text. (Inherited from DiagramItemStyle.)
	FontUnit	Gets or sets the font unit of the item text. (Inherited from DiagramItemStyle.)
	ShadowBrush	Gets or sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	Stroke	Gets or sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	StrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline items. (Inherited from DiagramItemStyle.)
	StrokeThickness	Gets or sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)

Public Methods

	Name	Description
	GetProperties	Gets all properties in the style. (Inherited from Style.)
	GetProperty	Returns the property with the specified name, if any. (Inherited from Style.)
S	RegisterType	Associates a type with an alias. (Inherited from Style.)

Protected Methods

	Name	Description
	GetValue	Gets the value of the specified property. (Inherited from Style.)
	IsPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	LoadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	LoadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from Style.)

	RegisterProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	SaveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	SaveToXml	Saves the style content into an XML element. (Inherited from Style.)
	SetValue	Sets the value of the specified property. (Inherited from Style.)
	UnsetValue	Clears the value of the specified property. (Inherited from Style.)

Public Events

	Name	Description
	PropertyChanged	Raised when any of the registered style properties has changed. (Inherited from Style.)

UndoEventArgs Members

Contains the arguments passed to the ActionRecorded, ActionUndone and ActionRedone event handlers.

The following tables list the members exposed by the UndoEventArgs type.

Public Constructors

	Name	Description
	UndoEventArgs	Initializes a new instance of the **UndoEventArgs** class.

Public Properties

	Name	Description
	Command	Gets a reference to the Command instance related to the event being handled.

See Also

UndoEventArgs Class
MindFusion.Diagramming Namespace

UndoEventArgs Constructor

Initializes a new instance of the UndoEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public UndoEventArgs (
    Command command
)
```

Visual Basic Copy Code

```
Public New ( _
    command As Command _
)
```

Parameters

command
The Command related to the event.

See Also

UndoEventArgs Properties

UndoEventArgs.Command Property

Gets a reference to the **Command** instance related to the event being handled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Command Command { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Command As Command
```

Property Value

An instance of the **Command** class.

See Also

UndoEventArgs Members
UndoEventArgs Class
MindFusion.Diagramming Namespace

UndoManager Class

Implements undo/redo functionality in MvcDiagram.

Syntax

C# Copy Code

```
public class UndoManager
```

Visual Basic Copy Code

```
Public Class UndoManager
```

Remarks

The only instance of **UndoManager** can be accessed through the UndoManager property of Diagram.

Use the UndoEnabled property to enable or disable saving action records for later undo. You might need to disable undo before performing actions that must not be undoable by end-users, such as creating special start/end nodes.

MvcDiagram does not provide shortcuts to undo or redo an action. An application must provide the user interface means for undo/redo and call the Undo or Redo methods when necessary. Undoing or redoing an action updates the current record pointer of the undo-history queue. To get access to that queue, use the History property.

Sometimes several actions must be represented as a single atomic operation. That can be achieved by using composites, represented by the CompositeCmd class. However actions records that are implicitly created by MvcDiagram as a response to users actions or method calls cannot be added directly to a composite. Instead you must use the StartComposite method to create an 'active' composite, to which implicitly created records are added automatically.

UndoManager Members

Implements undo/redo functionality in MvcDiagram.

The following tables list the members exposed by the UndoManager type.

Public Properties

	Name	Description
	History	Gets a reference to the undo manager's CommandHistory instance.
	UndoEnabled	Gets or sets a value indicating whether saving action records for later undo is enabled.

Public Methods

	Name	Description
	Redo	Executes again an action saved in the command history.
	StartComposite	Overloaded. Creates an 'active' composite record to store records of actions that are implicitly created by MvcDiagram.
	Undo	Undoes an action saved in the command history.

UndoManager Methods

UndoManager.Redo Method

Executes again an action saved in the command history.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Redo ()
```

Visual Basic Copy Code

```
Public Sub Redo ()
```

Remarks

Executes again a command from the command history. The action that would be redone by calling this method is pointed by NextRedo property of the CommandHistory class.

UndoManager Class

UndoManager.StartComposite Method

Creates an 'active' composite record to store records of actions that are implicitly created by MvcDiagram.

Overload List

Name	Description
UndoManager.StartComposite (String)	Creates an 'active' composite record with the specified title.
UndoManager.StartComposite (String, Boolean)	Creates an 'active' composite record with the specified settings.

See Also

UndoManager Members
UndoManager Class
MindFusion.Diagramming Namespace

UndoManager.StartComposite Method (String)

Creates an 'active' composite record with the specified title.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CompositeCmd StartComposite (
    string title
)
```

Visual Basic Copy Code

```
Public Function StartComposite( _
    title As String _
) As CompositeCmd
```

Parameters

title
A string to be associated with the composite record. It can be used later to give more information to users what exactly will be undone or redone. Use the Title property of the command class to get the title of an action record.

Return Value

An instance of the CompositeCmd class which represents the active composite record. Call its Execute method when done with recording actions in the composite.

Remarks

Sometimes several actions must be represented as a single atomic operation. That can be achieved by using composites, represented by the CompositeCmd class. However actions records that are implicitly created by MvcDiagram as a response to users actions or method calls cannot be added directly to a composite. The **StartComposite** method creates an 'active' composite, to which implicitly created records are added automatically. Call the composite's Execute method to stop adding action records to it and save it in the command history. Calling Undo or Redo for the composite record, undoes or redoes all actions contained within it.

See Also

StartComposite Method Overload List
UndoManager Members

UndoManager.StartComposite Method (String, Boolean)

Creates an 'active' composite record with the specified settings.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CompositeCmd StartComposite (
    string title,
    bool saveZOrder
)
```

Visual Basic Copy Code

```
Public Function StartComposite( _
    title As String, _
    saveZOrder As Boolean _
) As CompositeCmd
```

Parameters

title
A string to be associated with the composite record. It can be used later to give more information to users what exactly will be undone or redone. Use the Title property of the command class to get the title of an action record.

saveZOrder
Set this parameter to **true** to save the whole z-order array before executing the composite command, and to restore it back when the command is undone. Use that when there will be create or delete commands added to the composite one, because they do not guarantee restoring the items in the same z-order when the commands are undone or redone.

Return Value

An instance of the CompositeCmd class which represents the active composite record. Call its Execute method when done with recording actions in the composite.

Remarks

Sometimes several actions must be represented as a single atomic operation. That can be achieved by using composites, represented by the CompositeCmd class. However actions records that are implicitly created by MvcDiagram as a response to users actions or method calls cannot be added directly to a composite. The **StartComposite** method creates an 'active' composite, to which implicitly created records are added automatically. Call the composite's Execute method to stop adding action records to it and save it in the command history. Calling Undo or Redo for the composite record, undoes or redoes all actions contained within it.

Example

The following example illustrates how to create composite commands:

C# Copy Code

```
// Implicitly created undo records will be saved here
CompositeCmd composite = diagram.UndoManager.StartComposite("Create group");

// Call methods that create undo records
ShapeNode node1 = diagram.Factory.CreateShapeNode(0, 0, 30, 30);
ShapeNode node2 = diagram.Factory.CreateShapeNode(0, 0, 15, 15);
Group g = diagram.Factory.CreateGroup(node1);
g.AttachToCorner(node2, 0);

// This goes to the active composite too
ChangeItemCmd change = new ChangeItemCmd(node2, "");
node2.Locked = true;
change.Execute();

// Save the active composite in history
composite.Execute();
```

Visual Basic Copy Code

```
' Implicitly created undo records will be saved here
Dim composite As CompositeCmd = diagram.UndoManager.StartComposite("Create group")

' Call methods that create undo records
Dim node1 As ShapeNode = diagram.Factory.CreateShapeNode(0, 0, 30, 30)
Dim node2 As ShapeNode = diagram.Factory.CreateShapeNode(0, 0, 15, 15)
Dim g As Group = diagram.Factory.CreateGroup(node1)
g.AttachToCorner(node2, 0)

' This goes to the active composite too
Dim change As ChangeItemCmd = New ChangeItemCmd(node2, "")
node2.Locked = True
change.Execute()

' Save the active composite in history
composite.Execute()
```

StartComposite Method Overload List
UndoManager Members
UndoManager Class
MindFusion.Diagramming Namespace

UndoManager.Undo Method

Undoes an action saved in the command history.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public void Undo ()
```

Visual Basic Copy Code

```
Public Sub Undo ()
```

Remarks

Undoes a command from the command history. The action that would be undone by calling this method is pointed by NextUndo property of the CommandHistory class.

See Also

UndoManager Members
UndoManager Class

UndoManager Properties

UndoManager.History Property

Gets a reference to the undo manager's CommandHistory instance.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public CommandHistory History { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property History As CommandHistory
```

Property Value

An instance of the CommandHistory class.

Remarks

History represents the undo manager's queue of action records. This queue provides access to the NextUndo and NextRedo records. You could set the queue's Capacity, specifying how many records can be added to the queue before the oldest ones start to drop off its end.

See Also

UndoManager Members
UndoManager Class
MindFusion.Diagramming Namespace
Command class

UndoManager.UndoEnabled Property

Gets or sets a value indicating whether saving action records for later undo is enabled.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool UndoEnabled { get; set; }
```

Visual Basic Copy Code

```
Public Property UndoEnabled As Boolean
```

Property Value

true to save actions for later undo; otherwise **false**. The default is **false**.

Remarks

You might need to disable undo:

- before executing actions you don't want end-users to undo, for example creating special start/end nodes.
- before creating programmatically a lot of new diagram items - say hundreds or thousands. MvcDiagram creates an undo record for each item creation; if the Capacity of the command history is smaller than the number of items created, most of

the records will drop from the history queue while adding new ones. That would waste processing power and memory for creating undo records that won't be used.

VideoNode Members

Represents nodes that render video stream assigned to the VideoLocation property.

The following tables list the members exposed by the VideoNode type.

Public Constructors

	Name	Description
	VideoNode	Overloaded.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)

	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)

	VideoLocation	Gets or sets the URL of the video stream displayed in this VideoNode.
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramNode.)

	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)

	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)

	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFrom	Deserializes the object from the specified reader.
	LoadFromJson	Loads the item content from a JsonObject.
	LoadFromXml	Loads the item content from an XML element.
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)

	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveTo	Serializes the object to the specified writer.
	SaveToJson	Saves the item content into a JsonObject.
	SaveToXml	Saves the item content into an XML element.
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

VideoNode Constructor

Overload List

Name	Description
VideoNode ()	Initializes a new instance of the VideoNode class.
VideoNode (Diagram)	Initializes a new instance of the VideoNode class with default values supplied form the specified Diagram.
VideoNode (VideoNode)	Initializes a new instance of the VideoNode class using the specified node as a prototype.

See Also

VideoNode Class
MindFusion.Diagramming Namespace

VideoNode Constructor ()

Initializes a new instance of the VideoNode class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public VideoNode ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

VideoNode Constructor Overload List
VideoNode Class
MindFusion.Diagramming Namespace

VideoNode Constructor (Diagram)

Initializes a new instance of the VideoNode class with default values supplied form the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public VideoNode (
    Diagram parent
)
```

Visual Basic Copy Code

```
Public New ( _
    parent As Diagram _
)
```

Parameters

parent
The Diagram from which to obtain default values for the node properties.

See Also

VideoNode Constructor Overload List
VideoNode Class
MindFusion.Diagramming Namespace

VideoNode Constructor (VideoNode)

Initializes a new instance of the VideoNode class using the specified node as a prototype.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public VideoNode (
    VideoNode prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As VideoNode _
)
```

Parameters

prototype
The node to use as a prototype. The properties of the new node are initialized from the property values of this node.

See Also

VideoNode Constructor Overload List
VideoNode Class
MindFusion.Diagramming Namespace

VideoNode Methods

VideoNode.LoadFrom Method

Deserializes the object from the specified reader.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFrom (
    BinaryReader reader,
    PersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFrom( _
    reader As BinaryReader, _
    context As PersistContext _
)
```

Parameters

reader
A BinaryReader object from which to read the item's data.

context
A PersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

VideoNode Members
VideoNode Class
MindFusion.Diagramming Namespace

VideoNode.LoadFromJson Method

Loads the item content from a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the item's data.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

VideoNode Members
VideoNode Class
MindFusion.Diagramming Namespace

VideoNode.LoadFromXml Method

Loads the item content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
```

```
    context As XmlPersistContext _
)
```

Parameters

xmlElement
An XmlElement containing the item's data.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

VideoNode Members
VideoNode Class
MindFusion.Diagramming Namespace

VideoNode.SaveTo Method

Serializes the object to the specified writer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveTo (
    BinaryWriter writer,
    PersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveTo( _
    writer As BinaryWriter, _
    context As PersistContext _
)
```

Parameters

writer
A BinaryWriter object the item's data should be written to.

context
A PersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

VideoNode Members
VideoNode Class
MindFusion.Diagramming Namespace

VideoNode.SaveToJson Method

Saves the item content into a JsonObject.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToJson (
    JsonObject obj,
```

```
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj

A JsonObject the item's data should be stored into.

context

A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

VideoNode Members
VideoNode Class

VideoNode.SaveToXml Method

Saves the item content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
protected override void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

An XmlElement the item's data should be stored into.

context

An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

VideoNode Properties

VideoNode.VideoLocation Property

Gets or sets the URL of the video stream displayed in this VideoNode.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string VideoLocation { get; set; }
```

Visual Basic Copy Code

```
Public Property VideoLocation As String
```

Property Value

View3D Enumeration

Defines keys used to associate 3D position data with a node through the LayoutTraits property.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public enum View3D
```

Visual Basic Copy Code

```
Public Enum View3D
```

Members

	Member name	Description
	Position	Specifies the position of a node in 3D coordinate space. The value associated with this key should be a Point3D object.

VisitNode Delegate

Defines the prototype for methods called by VisitNodes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public delegate bool VisitNode (
    DiagramNode node,
    DiagramItem relatedItem
)
```

Visual Basic Copy Code

```
Public Delegate Function VisitNode( _
    node As DiagramNode, _
    relatedItem As DiagramItem _
) As Boolean
```

Parameters

node

relatedItem

Return Value

XmlPersistContext Members

Contains methods that can help you serialize and deserialize MvcDiagram items to end from XML documents.

The following tables list the members exposed by the XmlPersistContext type.

Public Constructors

	Name	Description
	XmlPersistContext	Initializes a new instance of the **XmlPersistContext** class.

Public Fields

	Name	Description
	LatestFormat	Specifies the latest file format revision number.

Public Properties

	Name	Description
	BaseURI	Gets or sets the base URI of the XML document being loaded or saved. When not specified, the BaseURI of the underlying XmlDocument is used.
	ClassVersion	Gets the class version of the currently deserialized item.
	Diagram	Gets the underlying diagram object.
	FileVersion	Gets the format revision number for the file being currently serialized.
	IncludeUnalteredProperties	Gets or sets a value specifies whether properties that have their default value should be serialized to XML.
	XmlDocument	Gets the underlying XML document.
	XmlOptions	An XmlOptions object providing properties for customizing the XML serialization process.

Public Methods

	Name	Description
	AddChildElement	Overloaded.

	FromRelativePath	Converts the specified path from relative to the BaseURI to an absolute path.
	ReadAnchorPattern	Reads an AnchorPattern with the specified name.
	ReadBool	Overloaded.
	ReadBrush	Overloaded.
	ReadByte	Reads a byte value with the specified name.
	ReadChar	Reads a char value with the specified name.
	ReadColor	Overloaded.
	ReadColorArray	Reads a color array with the specified name.
	ReadDecimal	Reads a decimal value with the specified name.
	ReadDouble	Reads a double value with the specified name.
	ReadEffect	Overloaded. Reads a NodeEffect object.
	ReadEnum	Overloaded.
	ReadFloat	Overloaded.
	ReadFloatArray	Reads a float array with the specified name.
	ReadFont	Overloaded.
	ReadGroup	Reads a group object with the specified name.
	ReadHashtable	Reads a hash or traits table object with the specified name.
	ReadImage	Reads an Image object with the specified name.
	ReadInt	Overloaded.
	ReadItemReference	Overloaded.
	ReadLong	Reads a long value with the specified name.
	ReadMap	Reads a **MapContent** object with the specified name.
	ReadNodeConstraints	Reads a NodeConstraints object with the specified name.
	ReadObject	Reads an object with the specified name.
	ReadPen	Overloaded. Reads a MindFusion.Drawing.Pen object with the specified name.
	ReadPointCollection	Reads a PointCollection object with the specified name.
	ReadPointCoordinates	Reads a List<Point> object with the specified name.
	ReadPointF	Overloaded.
	ReadRectangleF	Reads a Rect object with the specified name.
	ReadSByte	Reads a 8-bit signed integer value with the specified name.
	ReadShape	Reads a Shape object with the specified name.
	ReadShort	Overloaded.
	ReadSizeF	Reads a Size object with the specified name.
	ReadStream	Reads a stream with the specified name.
	ReadStreamOrXml	Reads a stream or xml.
	ReadString	Overloaded.

	ReadStringFormat	Overloaded.
	ReadStyle	Reads a Style object with the specified name.
	ReadSvg	Reads a SVG object with the specified name.
	ReadTag	Reads the specified tag for the specified object.
	ReadTheme	Reads a Theme object with the specified name.
	ReadThickness	Reads a Thickness object with the specified name.
	ReadUInt	Reads an unsigned integer value with the specified name.
	ReadULong	Reads an unsigned long value with the specified name.
	ReadUShort	Reads an unsigned short value with the specified name.
	ReadVisioContent	Reads a Visio content with the specified name.
	ReadXmlObject	Reads an object using XmlSerializer.
	SelectNode	Returns the child node with the specified name.
	SelectNodes	Returns the child nodes with the specified name.
	ToRelativePath	Converts the specified absolute path to a path relative to the BaseURI.
	WriteAnchorPattern	Writes the specified anchor pattern.
	WriteBool	Writes a boolean value with the specified name.
	WriteBrush	Writes a reference to the specified brush. The brush is registered within the internal hashtable for subsequent serialization.
	WriteByte	Write a byte value with the specified name.
	WriteChar	Write a char value with the specified name.
	WriteColor	Writes the specified color.
	WriteColorArray	Writes the specified array.
	WriteDecimal	Write a decimal value with the specified name.
	WriteDouble	Writes a double value with the specified name.
	WriteEffect	Writes a reference to the specified effect. The effect is registered within the internal hashtable for subsequent serialization.
	WriteEnum	Writes the specified enum value.
	WriteFloat	Writes a float value with the specified name.
	WriteFloatArray	Writes the specified array.
	WriteFont	Writes the specified font.
	WriteGroup	Writes the specified group object.
	WriteHashtable	Writes the specified hashtable.
	WriteImage	Writes a reference to the specified image. The image is registered within the internal hashtable for subsequent serialization.
	WriteInt	Writes an integer value with the specified name.
	WriteItemReference	Writes a reference to the specified item with the specified name.
	WriteLong	Writes a long value with the specified name.
	WriteMap	Writes a reference to the specified **MapContent**. The map is registered within the internal hashtable for subsequent serialization.

	WriteObject	Writes the specified object under the specified name.
	WritePen	Writes the specified pen.
	WritePointCollection	Writes the specified point collection.
	WritePointCoordinates	Writes the specified List<Point>.
	WritePointF	Overloaded.
	WriteRectangleF	Writes a Rect with the specified name.
	WriteSByte	Write a 8-bit signed integer value with the specified name.
	WriteShape	Writes the specified shape with the specified name.
	WriteShort	Writes a short value with the specified name.
	WriteSizeF	Writes a Size with the specified name.
	WriteStream	Writes the specified stream.
	WriteString	Writes a string value with the specified name.
	WriteStringFormat	Writes the specified StringFormat object.
	WriteStyle	Writes a reference to the specified style. The style is registered within the internal hashtable for subsequent serialization.
	WriteSvg	Writes a reference to the specified SVG. The SVG is registered within the internal hashtable for subsequent serialization.
	WriteTag	Writes the specified tag of the specified object.
	WriteTheme	Writes the specified **Theme** object.
	WriteThickness	Writes a Thickness with the specified name.
	WriteTraits	Writes the specified traits hashtable.
	WriteUInt	Writes an unsigned integer value with the specified name.
	WriteULong	Writes an unsigned long value with the specified name.
	WriteUShort	Writes an unsigned short value with the specified name.
	WriteVisioContent	Writes a reference to the specified Visio content. The content is registered within the internal hashtable for subsequent serialization.
	WriteXmlObject

XmlPersistContext Fields

XmlPersistContext.LatestFormat Field

Specifies the latest file format revision number.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public static int LatestFormat
```

Visual Basic Copy Code

```
Public Shared LatestFormat As Integer
```

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext Constructor

Initializes a new instance of the XmlPersistContext class.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlPersistContext (
    Diagram diagram,
    XmlDocument document,
    int fileVersion
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram, _
    document As XmlDocument, _
    fileVersion As Integer _
)
```

Parameters

diagram
The Diagram that will be serialized or deserialized.

document
An **XmlDocument** instance representing the XML file.

fileVersion
Specifies the current file format number.

XmlPersistContext Methods

XmlPersistContext.AddChildElement Method

Overload List

Name	Description
XmlPersistContext.AddChildElement (String, XmlElement)	Adds a new child node with the specified name to the specified parent node.

XmlPersistContext.AddChildElement (String, XmlElement, String)	Adds a new child node with the specified name and value to the specified parent node.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.AddChildElement Method (String, XmlElement)

Adds a new child node with the specified name to the specified parent node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement AddChildElement (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function AddChildElement( _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

elementName

parentElement

Return Value

See Also

AddChildElement Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.AddChildElement Method (String, XmlElement, String)

Adds a new child node with the specified name and value to the specified parent node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement AddChildElement (
    string elementName,
    XmlElement parentElement,
    string innerText
)
```

Visual Basic Copy Code

```
Public Function AddChildElement( _
    elementName As String, _
    parentElement As XmlElement, _
    innerText As String _
) As XmlElement
```

Parameters

elementName

parentElement

innerText

Return Value

See Also

AddChildElement Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.FromRelativePath Method

Converts the specified path from relative to the BaseURI to an absolute path.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string FromRelativePath (
    string path
)
```

Visual Basic Copy Code

```
Public Function FromRelativePath( _
    path As String _
) As String
```

Parameters

path

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadAnchorPattern Method

Reads an AnchorPattern with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public AnchorPattern ReadAnchorPattern (
    string elementName,
```

```
    XmlElement parentElement,
    bool standalone
)
```

Visual Basic Copy Code

```
Public Function ReadAnchorPattern( _
    elementName As String, _
    parentElement As XmlElement, _
    standalone As Boolean _
) As AnchorPattern
```

Parameters

elementName

parentElement

standalone

Return Value

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadBool Method

Overload List

Name	Description
XmlPersistContext.ReadBool (String, XmlElement)	Reads a boolean value with the specified name.
XmlPersistContext.ReadBool (String, XmlElement, Boolean)	Reads a boolean value with the specified name.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadBool Method (String, XmlElement)

Reads a boolean value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ReadBool (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadBool( _
    elementName As String, _
```

```
    parentElement As XmlElement _
) As Boolean
```

Parameters

elementName

parentElement

Return Value

See Also

ReadBool Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadBool Method (String, XmlElement, Boolean)

Reads a boolean value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool ReadBool (
    string elementName,
    XmlElement parentElement,
    bool defaultValue
)
```

Visual Basic Copy Code

```
Public Function ReadBool( _
    elementName As String, _
    parentElement As XmlElement, _
    defaultValue As Boolean _
) As Boolean
```

Parameters

elementName

parentElement

defaultValue

Return Value

MindFusion.Diagramming Namespace

XmlPersistContext.ReadBrush Method

Overload List

Name	Description
XmlPersistContext.ReadBrush (String, XmlElement)	Reads a MindFusion.Drawing.Brush object with the specified name.

XmlPersistContext.ReadBrush (String, XmlElement, Brush)	Reads a MindFusion.Drawing.Brush object with the specified name.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadBrush Method (String, XmlElement)

Reads a MindFusion.Drawing.Brush object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush ReadBrush (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadBrush( _
    elementName As String, _
    parentElement As XmlElement _
) As Brush
```

Parameters

elementName

parentElement

Return Value

See Also

ReadBrush Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadBrush Method (String, XmlElement, Brush)

Reads a MindFusion.Drawing.Brush object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Brush ReadBrush (
    string elementName,
    XmlElement parentElement,
    Brush defaultValue
)
```

Visual Basic Copy Code

```
Public Function ReadBrush( _
    elementName As String, _
    parentElement As XmlElement, _
    defaultValue As Brush _
) As Brush
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

ReadBrush Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadByte Method

Reads a byte value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public byte ReadByte (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadByte( _
    elementName As String, _
    parentElement As XmlElement _
) As Byte
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadChar Method

Reads a char value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public char ReadChar (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic

```
Public Function ReadChar( _
    elementName As String, _
    parentElement As XmlElement _
) As Char
```

Parameters

elementName

parentElement

Return Value

XmlPersistContext.ReadColor Method

Overload List

Name	Description
XmlPersistContext.ReadColor (String, XmlElement)	Reads a color with the specified name.
XmlPersistContext.ReadColor (String, XmlElement, Color)	Reads a color with the specified name.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadColor Method (String, XmlElement)

Reads a color with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public Color ReadColor (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic

```
Public Function ReadColor( _
    elementName As String, _
```

```
    parentElement As XmlElement _
) As Color
```

Parameters

elementName

parentElement

Return Value

See Also

ReadColor Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadColor Method (String, XmlElement, Color)

Reads a color with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Color ReadColor (
    string elementName,
    XmlElement parentElement,
    Color defaultValue
)
```

Visual Basic Copy Code

```
Public Function ReadColor( _
    elementName As String, _
    parentElement As XmlElement, _
    defaultValue As Color _
) As Color
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

ReadColor Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadColorArray Method

Reads a color array with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

Copy Code

```
public Color[] ReadColorArray (
    string elementName,
    string subElementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadColorArray( _
    elementName As String, _
    subElementName As String, _
    parentElement As XmlElement _
) As Color()
```

Parameters

elementName

subElementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadDecimal Method

Reads a decimal value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public decimal ReadDecimal (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadDecimal( _
    elementName As String, _
    parentElement As XmlElement _
) As Decimal
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadDouble Method

Reads a double value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ReadDouble (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadDouble( _
    elementName As String, _
    parentElement As XmlElement _
) As Double
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadEffect Method

Reads a NodeEffect object.

Overload List

Name	Description
XmlPersistContext.ReadEffect (String, XmlElement)	Reads a **NodeEffect** object with the specified name.
XmlPersistContext.ReadEffect (XmlElement)	Reads a **NodeEffect** object from the specified element.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadEffect Method (String, XmlElement)

Reads a NodeEffect object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeEffect ReadEffect (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadEffect( _
    elementName As String, _
    parentElement As XmlElement _
) As NodeEffect
```

Parameters

elementName

parentElement

Return Value

See Also

ReadEffect Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadEffect Method (XmlElement)

Reads a NodeEffect object from the specified element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeEffect ReadEffect (
    XmlElement element
)
```

Visual Basic Copy Code

```
Public Function ReadEffect( _
    element As XmlElement _
) As NodeEffect
```

Parameters

element

Return Value

See Also

ReadEffect Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadEnum Method

Overload List

Name	Description
XmlPersistContext.ReadEnum (String, XmlElement)	Reads an enum value with the specified name.
XmlPersistContext.ReadEnum (String, XmlElement, Object)	Reads an enum value with the specified name.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadEnum Method (String, XmlElement)

Reads an enum value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object ReadEnum (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadEnum( _
    elementName As String, _
    parentElement As XmlElement _
) As Object
```

Parameters

elementName

parentElement

Return Value

See Also

ReadEnum Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadEnum Method (String, XmlElement, Object)

Reads an enum value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object ReadEnum (
    string elementName,
    XmlElement parentElement,
    Object defaultValue
)
```

Visual Basic Copy Code

```
Public Function ReadEnum( _
    elementName As String, _
    parentElement As XmlElement, _
    defaultValue As Object _
) As Object
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

ReadEnum Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadFloat Method

Overload List

Name	Description
XmlPersistContext.ReadFloat (String, XmlElement)	Reads a float value with the specified name.
XmlPersistContext.ReadFloat (String, XmlElement, Double)	Reads a float value with the specified name.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadFloat Method (String, XmlElement)

Reads a float value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double ReadFloat (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic

```
Public Function ReadFloat( _
    elementName As String, _
    parentElement As XmlElement _
) As Double
```

Parameters

elementName

parentElement

Return Value

XmlPersistContext.ReadFloat Method (String, XmlElement, Double)

Reads a float value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public double ReadFloat (
    string elementName,
    XmlElement parentElement,
    double defaultValue
)
```

Visual Basic

```
Public Function ReadFloat( _
    elementName As String, _
    parentElement As XmlElement, _
    defaultValue As Double _
) As Double
```

Parameters

elementName

parentElement

defaultValue

Return Value

MindFusion.Diagramming Namespace

XmlPersistContext.ReadFloatArray Method

Reads a float array with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public double[] ReadFloatArray (
    string elementName,
    string subElementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadFloatArray( _
    elementName As String, _
    subElementName As String, _
    parentElement As XmlElement _
) As Double()
```

Parameters

elementName

subElementName

parentElement

Return Value

XmlPersistContext.ReadHashtable Method

Reads a hash or traits table object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Hashtable ReadHashtable (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadHashtable( _
    elementName As String, _
    parentElement As XmlElement _
) As Hashtable
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext.ReadImage Method

Reads an Image object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public IImage ReadImage (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadImage( _
    elementName As String, _
    parentElement As XmlElement _
) As IImage
```

Parameters

elementName

parentElement

Return Value

XmlPersistContext.ReadItemReference Method (String, XmlElement)

Reads a reference to the item with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem ReadItemReference (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadItemReference( _
    elementName As String, _
    parentElement As XmlElement _
) As DiagramItem
```

Parameters

elementName

parentElement

Return Value

See Also

ReadItemReference Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadItemReference Method (XmlElement)

Reads an item reference from the specified element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public DiagramItem ReadItemReference (
    XmlElement itemElement
)
```

Visual Basic Copy Code

```
Public Function ReadItemReference( _
    itemElement As XmlElement _
) As DiagramItem
```

Parameters

itemElement

Return Value

XmlPersistContext.ReadLong Method

Reads a long value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public long ReadLong (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadLong( _
    elementName As String, _
    parentElement As XmlElement _
) As Long
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadMap Method

Reads a **MapContent** object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public MapContent ReadMap (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadMap( _
    elementName As String, _
    parentElement As XmlElement _
) As MapContent
```

Parameters

elementName
A string specifying the XML element name.

parentElement
An **XmlElement** instance specifying the parent element.

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadNodeConstraints Method

Reads a NodeConstraints object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public NodeConstraints ReadNodeConstraints (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadNodeConstraints( _
    elementName As String, _
    parentElement As XmlElement _
) As NodeConstraints
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadObject Method

Reads an object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object ReadObject (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadObject( _
    elementName As String, _
    parentElement As XmlElement _
) As Object
```

Parameters

elementName

parentElement

Return Value

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadPen Method

Reads a MindFusion.Drawing.Pen object with the specified name.

Overload List

Name	Description
XmlPersistContext.ReadPen (String, XmlElement)	Reads a **MindFusion.Drawing.Pen** object with the specified name.
XmlPersistContext.ReadPen (String, XmlElement, Pen)	Reads a **MindFusion.Drawing.Pen** object with the specified name.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadPen Method (String, XmlElement)

Reads a MindFusion.Drawing.Pen object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen ReadPen (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadPen( _
    elementName As String, _
    parentElement As XmlElement _
) As Pen
```

Parameters

elementName

parentElement

Return Value

See Also

ReadPen Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadPen Method (String, XmlElement, Pen)

Reads a MindFusion.Drawing.Pen object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Pen ReadPen (
    string elementName,
    XmlElement parentElement,
    Pen defaultPen
)
```

Visual Basic Copy Code

```
Public Function ReadPen( _
    elementName As String, _
    parentElement As XmlElement, _
    defaultPen As Pen _
) As Pen
```

Parameters

elementName

parentElement

defaultPen

Return Value

See Also

ReadPen Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadPointCollection Method

Reads a PointCollection object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public PointCollection ReadPointCollection (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadPointCollection( _
    elementName As String, _
    parentElement As XmlElement _
) As PointCollection
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadPointCoordinates Method

Reads a List<Point> object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public List<Point> ReadPointCoordinates (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadPointCoordinates( _
    elementName As String, _
```

```
    parentElement As XmlElement _
) As List(Of Point)
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadPointF Method

Overload List

Name	Description
XmlPersistContext.ReadPointF (String, XmlElement)	Reads a Point object with the specified name.
XmlPersistContext.ReadPointF (XmlElement)	Reads a Point object from the specified element.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadPointF Method (String, XmlElement)

Reads a Point object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point ReadPointF (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadPointF( _
    elementName As String, _
    parentElement As XmlElement _
) As Point
```

Parameters

elementName

parentElement

Return Value

See Also

ReadPointF Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadPointF Method (XmlElement)

Reads a Point object from the specified element.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Point ReadPointF (
    XmlElement element
)
```

Visual Basic Copy Code

```
Public Function ReadPointF( _
    element As XmlElement _
) As Point
```

Parameters

element

Return Value

See Also

ReadPointF Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadRectangleF Method

Reads a Rect object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Rect ReadRectangleF (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadRectangleF( _
    elementName As String, _
    parentElement As XmlElement _
) As Rect
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadSByte Method

Reads a 8-bit signed integer value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public sbyte ReadSByte (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadSByte( _
    elementName As String, _
    parentElement As XmlElement _
) As SByte
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadShape Method

Reads a Shape object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Shape ReadShape (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadShape( _
    elementName As String, _
    parentElement As XmlElement _
) As Shape
```

Parameters

elementName

parentElement

Return Value

See Also

MindFusion.Diagramming Namespace

XmlPersistContext.ReadShort Method

Overload List

Name	Description
XmlPersistContext.ReadShort (String, XmlElement)	Reads a short value with the specified name.
XmlPersistContext.ReadShort (String, XmlElement, Int16)	Reads a short value with the specified name.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadShort Method (String, XmlElement)

Reads a short value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public short ReadShort (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadShort( _
    elementName As String, _
    parentElement As XmlElement _
) As Short
```

Parameters

elementName

parentElement

Return Value

See Also

ReadShort Method Overload List
XmlPersistContext Members

XmlPersistContext.ReadShort Method (String, XmlElement, Int16)

Reads a short value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public short ReadShort (
    string elementName,
    XmlElement parentElement,
    short defaultValue
)
```

Visual Basic Copy Code

```
Public Function ReadShort( _
    elementName As String, _
    parentElement As XmlElement, _
    defaultValue As Short _
) As Short
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

ReadShort Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadSizeF Method

Reads a Size object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Size ReadSizeF (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadSizeF( _
    elementName As String, _
    parentElement As XmlElement _
) As Size
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadStream Method

Reads a stream with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Stream ReadStream (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadStream( _
    elementName As String, _
    parentElement As XmlElement _
) As Stream
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadStreamOrXml Method

Reads a stream or xml.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object ReadStreamOrXml (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadStreamOrXml( _
    elementName As String, _
    parentElement As XmlElement _
) As Object
```

Parameters

elementName

parentElement

Return Value

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadString Method

Overload List

Name	Description
XmlPersistContext.ReadString (String, XmlElement)	Reads a string value with the specified name.
XmlPersistContext.ReadString (String, XmlElement, String)	Reads a string value with the specified name.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadString Method (String, XmlElement)

Reads a string value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ReadString (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadString( _
    elementName As String, _
    parentElement As XmlElement _
) As String
```

Parameters

elementName

parentElement

Return Value

See Also

ReadString Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadString Method (String, XmlElement, String)

Reads a string value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ReadString (
    string elementName,
    XmlElement parentElement,
    string defaultValue
)
```

Visual Basic Copy Code

```
Public Function ReadString( _
    elementName As String, _
    parentElement As XmlElement, _
    defaultValue As String _
) As String
```

Parameters

elementName

parentElement

defaultValue

Return Value

See Also

ReadString Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadStringFormat Method

Overload List

Name	Description
XmlPersistContext.ReadStringFormat (String, XmlElement)	Reads a StringFormat object with the specified name.
XmlPersistContext.ReadStringFormat (String, XmlElement, StringFormat)	Reads a StringFormat object with the specified name.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadStringFormat Method (String, XmlElement)

Reads a StringFormat object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public StringFormat ReadStringFormat (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadStringFormat( _
    elementName As String, _
    parentElement As XmlElement _
) As StringFormat
```

Parameters

elementName

parentElement

Return Value

See Also

ReadStringFormat Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadStringFormat Method (String, XmlElement, StringFormat)

Reads a StringFormat object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public StringFormat ReadStringFormat (
    string elementName,
    XmlElement parentElement,
    StringFormat defultFormat
)
```

Visual Basic Copy Code

```
Public Function ReadStringFormat( _
    elementName As String, _
    parentElement As XmlElement, _
    defultFormat As StringFormat _
) As StringFormat
```

Parameters

elementName

parentElement

defultFormat

Return Value

See Also

ReadStringFormat Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadStyle Method

Reads a Style object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Style ReadStyle (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadStyle( _
    elementName As String, _
    parentElement As XmlElement _
) As Style
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadSvg Method

Reads a SVG object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public SvgContent ReadSvg (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadSvg( _
    elementName As String, _
```

```
    parentElement As XmlElement _
) As SvgContent
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadTag Method

Reads the specified tag for the specified object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object ReadTag (
    Object item,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadTag( _
    item As Object, _
    elementName As String, _
    parentElement As XmlElement _
) As Object
```

Parameters

item

elementName

parentElement

Return Value

Remarks

Tags are read similarly to arbitrary objects except that the client of the diagram is given a chance to perform custom deserialization through event handling.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadTheme Method

Reads a Theme object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Theme ReadTheme (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadTheme( _
    elementName As String, _
    parentElement As XmlElement _
) As Theme
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadThickness Method

Reads a Thickness object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Thickness ReadThickness (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadThickness( _
    elementName As String, _
    parentElement As XmlElement _
) As Thickness
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadUInt Method

Reads an unsigned integer value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public uint ReadUInt (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadUInt( _
    elementName As String, _
    parentElement As XmlElement _
) As UInteger
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadULong Method

Reads an unsigned long value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ulong ReadULong (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadULong( _
    elementName As String, _
    parentElement As XmlElement _
) As ULong
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext.ReadUShort Method

Reads an unsigned short value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public ushort ReadUShort (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadUShort( _
    elementName As String, _
    parentElement As XmlElement _
) As UShort
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadVisioContent Method

Reads a Visio content with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public VisioContent ReadVisioContent (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadVisioContent( _
    elementName As String, _
    parentElement As XmlElement _
) As VisioContent
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ReadXmlObject Method

Reads an object using XmlSerializer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Object ReadXmlObject (
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function ReadXmlObject( _
    elementName As String, _
    parentElement As XmlElement _
) As Object
```

Parameters

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.SelectNode Method

Returns the child node with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement SelectNode (
    XmlElement parentElement,
    string name
)
```

Visual Basic Copy Code

```
Public Function SelectNode( _
    parentElement As XmlElement, _
    name As String _
) As XmlElement
```

Parameters

parentElement
The parent XML element.

name
A string specifying the name of the child node.

Return Value

An XmlElement corresponding to the child node.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.SelectNodes Method

Returns the child nodes with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlNodeList SelectNodes (
    XmlElement parentElement,
    string name
)
```

Visual Basic Copy Code

```
Public Function SelectNodes( _
    parentElement As XmlElement, _
    name As String _
) As XmlNodeList
```

Parameters

parentElement
The parent XML element.

name
A string specifying the name of the child nodes.

Return Value

An XmlNodeList containing the found child nodes.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ToRelativePath Method

Converts the specified absolute path to a path relative to the BaseURI.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string ToRelativePath (
    string path
)
```

Visual Basic Copy Code

```
Public Function ToRelativePath( _
    path As String _
) As String
```

Parameters

path

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteAnchorPattern Method

Writes the specified anchor pattern.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteAnchorPattern (
    AnchorPattern anchorPattern,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteAnchorPattern( _
    anchorPattern As AnchorPattern, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

anchorPattern

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteBool Method

Writes a boolean value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteBool (
    bool boolValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteBool( _
    boolValue As Boolean, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

boolValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteBrush Method

Writes a reference to the specified brush. The brush is registered within the internal hashtable for subsequent serialization.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteBrush (
    Brush brush,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteBrush( _
    brush As Brush, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

brush

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteByte Method

Write a byte value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteByte (
    byte byteValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteByte( _
    byteValue As Byte, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

byteValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteChar Method

Write a char value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteChar (
    char charValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteChar( _
    charValue As Char, _
```

```
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

charValue

elementName

parentElement

Return Value

An instance of the .NET **XmlElement** class representing the newly created XML element.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteColor Method

Writes the specified color.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteColor (
    Color color,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteColor( _
    color As Color, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

color

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteColorArray Method

Writes the specified array.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteColorArray (
    Color[] array,
    string elementName,
    string subElementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteColorArray( _
    array() As Color, _
    elementName As String, _
    subElementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

array

elementName

subElementName

parentElement

Return Value

See Also

MindFusion.Diagramming Namespace

XmlPersistContext.WriteDecimal Method

Write a decimal value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteDecimal (
    decimal decimalValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteDecimal( _
    decimalValue As Decimal, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

decimalValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteDouble Method

Writes a double value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteDouble (
    double doubleValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteDouble( _
    doubleValue As Double, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

doubleValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteEffect Method

Writes a reference to the specified effect. The effect is registered within the internal hashtable for subsequent serialization.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteEffect (
    NodeEffect effect,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteEffect( _
    effect As NodeEffect, _
```

```
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

effect

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteEnum Method

Writes the specified enum value.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteEnum (
    Object enumValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteEnum( _
    enumValue As Object, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

enumValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteFloat Method

Writes a float value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public XmlElement WriteFloat (
    double floatValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic

```
Public Function WriteFloat( _
    floatValue As Double, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

floatValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteFloatArray Method

Writes the specified array.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public XmlElement WriteFloatArray (
    double[] array,
    string elementName,
    string subElementName,
    XmlElement parentElement
)
```

Visual Basic

```
Public Function WriteFloatArray( _
    array() As Double, _
    elementName As String, _
    subElementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

array

elementName

subElementName

parentElement

Return Value

See Also

XmlPersistContext.WriteFont Method

Writes the specified font.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteFont (
    Font font,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteFont( _
    font As Font, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

font

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteGroup Method

Writes the specified group object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteGroup (
    Group group,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteGroup( _
    group As Group, _
    elementName As String, _
```

```
    parentElement As XmlElement _
) As XmlElement
```

Parameters

group

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteHashtable Method

Writes the specified hashtable.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteHashtable (
    Hashtable hashtable,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteHashtable( _
    hashtable As Hashtable, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

hashtable

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteImage Method

Writes a reference to the specified image. The image is registered within the internal hashtable for subsequent serialization.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteImage (
    IImage image,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteImage( _
    image As IImage, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

image

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteInt Method

Writes an integer value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteInt (
    int intValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteInt( _
    intValue As Integer, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

intValue

elementName

parentElement

Return Value

See Also

XmlPersistContext.WriteItemReference Method

Writes a reference to the specified item with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteItemReference (
    DiagramItem item,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteItemReference( _
    item As DiagramItem, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

item

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteLong Method

Writes a long value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteLong (
    long longValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteLong( _
    longValue As Long, _
    elementName As String, _
```

```
    parentElement As XmlElement _
) As XmlElement
```

Parameters

longValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteMap Method

Writes a reference to the specified **MapContent**. The map is registered within the internal hashtable for subsequent serialization.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteMap (
    MapContent map,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteMap( _
    map As MapContent, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

map
The **MapContent** object to be serialized.

elementName
A string specifying the XML element name.

parentElement
An **XmlElement** instance specifying the parent element.

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteObject Method

Writes the specified object under the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteObject (
    Object objectValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteObject( _
    objectValue As Object, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

objectValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WritePen Method

Writes the specified pen.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WritePen (
    Pen pen,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WritePen( _
    pen As Pen, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

pen

elementName

parentElement

Return Value

See Also

XmlPersistContext.WritePointCollection Method

Writes the specified point collection.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WritePointCollection (
    PointCollection points,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WritePointCollection( _
    points As PointCollection, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

points

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WritePointCoordinates Method

Writes the specified List<Point>.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WritePointCoordinates (
    List<Point> points,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WritePointCoordinates( _
    points As List(Of Point), _
    elementName As String, _
```

```
    parentElement As XmlElement _
) As XmlElement
```

Parameters

points

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WritePointF Method

Overload List

Name	Description
XmlPersistContext.WritePointF (Double, Double, String, XmlElement)	Writes the specified Point under the specified name. The x and y components of the point are written as attributes.
XmlPersistContext.WritePointF (Point, String, XmlElement)	Writes a Point with the specified name.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WritePointF Method (Double, Double, String, XmlElement)

Writes the specified Point under the specified name. The x and y components of the point are written as attributes.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WritePointF (
    double x,
    double y,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WritePointF( _
    x As Double, _
    y As Double, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

x

y

elementName

parentElement

Return Value

See Also

WritePointF Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WritePointF Method (Point, String, XmlElement)

Writes a Point with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WritePointF (
    Point point,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WritePointF( _
    point As Point, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

point

elementName

parentElement

Return Value

See Also

WritePointF Method Overload List
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteRectangleF Method

Writes a Rect with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public XmlElement WriteRectangleF (
    Rect rectangle,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic

```
Public Function WriteRectangleF( _
    rectangle As Rect, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

rectangle

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteSByte Method

Write a 8-bit signed integer value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public XmlElement WriteSByte (
    sbyte byteValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic

```
Public Function WriteSByte( _
    byteValue As SByte, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

byteValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteShape Method

Writes the specified shape with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteShape (
    Shape shape,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteShape( _
    shape As Shape, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

shape

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteShort Method

Writes a short value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteShort (
    short shortValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteShort( _
    shortValue As Short, _
    elementName As String, _
```

```
    parentElement As XmlElement _
) As XmlElement
```

Parameters

shortValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteSizeF Method

Writes a Size with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteSizeF (
    Size size,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteSizeF( _
    size As Size, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

size

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteStream Method

Writes the specified stream.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteStream (
    Stream stream,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteStream( _
    stream As Stream, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

stream

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteString Method

Writes a string value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteString (
    string stringValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteString( _
    stringValue As String, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

stringValue

elementName

parentElement

Return Value

See Also

XmlPersistContext.WriteStringFormat Method

Writes the specified StringFormat object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteStringFormat (
    StringFormat stringFormat,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteStringFormat( _
    stringFormat As StringFormat, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

stringFormat

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteStyle Method

Writes a reference to the specified style. The style is registered within the internal hashtable for subsequent serialization.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteStyle (
    Style style,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteStyle( _
    style As Style, _
    elementName As String, _
```

```
    parentElement As XmlElement _
) As XmlElement
```

Parameters

style

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteSvg Method

Writes a reference to the specified SVG. The SVG is registered within the internal hashtable for subsequent serialization.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteSvg (
    SvgContent svg,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteSvg( _
    svg As SvgContent, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

svg

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteTag Method

Writes the specified tag of the specified object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteTag (
    Object item,
    Object tagValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteTag( _
    item As Object, _
    tagValue As Object, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

item

tagValue

elementName

parentElement

Return Value

Remarks

Tags are written similarly to arbitrary objects except that the client of the diagram is given a chance to perform custom serialization through event handling.

XmlPersistContext.WriteTheme Method

Writes the specified Theme object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteTheme (
    Theme theme,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteTheme( _
    theme As Theme, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

theme

elementName

parentElement

Return Value

XmlPersistContext.WriteThickness Method

Writes a Thickness with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteThickness (
    Thickness thickness,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteThickness( _
    thickness As Thickness, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

thickness

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteTraits Method

Writes the specified traits hashtable.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteTraits (
    Hashtable traits,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic

```
Public Function WriteTraits( _
    traits As Hashtable, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

traits

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.WriteUInt Method

Writes an unsigned integer value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C#

```
public XmlElement WriteUInt (
    uint uintValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic

```
Public Function WriteUInt( _
    uintValue As UInteger, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

uintValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members

MindFusion.Diagramming Namespace

XmlPersistContext.WriteULong Method

Writes an unsigned long value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteULong (
    ulong ulongValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteULong( _
    ulongValue As ULong, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

ulongValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members
XmlPersistContext Class

XmlPersistContext.WriteUShort Method

Writes an unsigned short value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteUShort (
    ushort ushortValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteUShort( _
    ushortValue As UShort, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

ushortValue

elementName

parentElement

Return Value

See Also

XmlPersistContext Members

MindFusion.Diagramming Namespace

XmlPersistContext.WriteVisioContent Method

Writes a reference to the specified Visio content. The content is registered within the internal hashtable for subsequent serialization.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteVisioContent (
    VisioContent content,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteVisioContent( _
    content As VisioContent, _
    elementName As String, _
    parentElement As XmlElement _
) As XmlElement
```

Parameters

content

elementName

parentElement

Return Value

XmlPersistContext.WriteXmlObject Method

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlElement WriteXmlObject (
    Object objectValue,
    string elementName,
    XmlElement parentElement
)
```

Visual Basic Copy Code

```
Public Function WriteXmlObject( _
    objectValue As Object, _
    elementName As String, _
```

```
    parentElement As XmlElement _
) As XmlElement
```

Parameters

objectValue

elementName

parentElement

Return Value

XmlPersistContext Properties

XmlPersistContext.BaseURI Property

Gets or sets the base URI of the XML document being loaded or saved. When not specified, the BaseURI of the underlying XmlDocument is used.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public string BaseURI { get; set; }
```

Visual Basic Copy Code

```
Public Property BaseURI As String
```

Property Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.ClassVersion Property

Gets the class version of the currently deserialized item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int ClassVersion { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ClassVersion As Integer
```

Property Value

An integer value specifying the class version.

Remarks

This property is only useful when deserializing items.

XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.Diagram Property

Gets the underlying diagram object.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public Diagram Diagram { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Diagram As Diagram
```

Property Value

An instance of the Diagram class.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.FileVersion Property

Gets the format revision number for the file being currently serialized.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public int FileVersion { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property FileVersion As Integer
```

Property Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.IncludeUnalteredProperties Property

Gets or sets a value specifies whether properties that have their default value should be serialized to XML.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public bool IncludeUnalteredProperties { get; set; }
```

Visual Basic Copy Code

```
Public Property IncludeUnalteredProperties As Boolean
```

Property Value

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.XmlDocument Property

Gets the underlying XML document.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlDocument XmlDocument { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property XmlDocument As XmlDocument
```

Property Value

An instance of the .NET **XmlDocument** class.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.XmlOptions Property

An XmlOptions object providing properties for customizing the XML serialization process.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public XmlOptions XmlOptions { get; set; }
```

Visual Basic

```
Public Property XmlOptions As XmlOptions
```

Property Value

See Also

XmlPersistContext Members
XmlPersistContext Class

MindFusion.Diagramming.Export Namespace

AutoScale Enumeration

Specifies the auto-scale mode when exporting to a PDF document.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C#

```
public enum AutoScale
```

Visual Basic

```
Public Enum AutoScale
```

Members

	Member name	Description
	None	No automatic scaling.
	FitToPage	Scales the chart (aspect ratio is preserved) to fit the page bounds if the document is too large.
	FitToPageNoUpScale	Scales down the chart (aspect ratio is preserved) to fit the page bounds if the document is too large. Otherwise chart's size is left untouched.
	FitToWidth	Scales down the chart (aspect ratio is preserved) to make sure that the width of the chart is less than the width of the PDF page.

MindFusion.Diagramming.Export Namespace

DxfExporter Class

Exports diagrams to AutoDesk Drawing Exchange Format (DXF) files.

Syntax

C#

```
public class DxfExporter
```

Visual Basic

```
Public Class DxfExporter
```

Remarks

In order to use this component, add a reference to the *MindFusion.Diagramming.Export.Dxf.dll* to your project.

AutoCAD DXF (Drawing Exchange Format) is a file format developed by Autodesk to enable interoperability between AutoCAD and other programs. Now virtually every CAD application and most graphics programs can import DXF files.

To create a DXF file from a MvcDiagram diagram, create a **DxfExporter** instance and call its Export method, specifying a Diagram object and a file path as arguments.

Raster images can be used in DXF by referencing external image files. To avoid creating extraneous files, **DxfExporter** does not export images by default. To export the images displayed in diagram elements, enable the ExportImages property.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.Export.DxfExporter

See Also

DxfExporter Members
MindFusion.Diagramming.Export Namespace

DxfExporter Members

Exports diagrams to AutoDesk Drawing Exchange Format (DXF) files.

The following tables list the members exposed by the DxfExporter type.

Public Constructors

	Name	Description
	DxfExporter	Initializes a new instance of the **DxfExporter** class.

Public Properties

	Name	Description
	ExportImages	Gets or sets a value indicating whether the images that are displayed inside diagram nodes should be exported.
	ExportTextAsMultiline	Gets or sets a value indicating whether item labels should be exported to DXF MTEXT entities.

Public Methods

	Name	Description
	Export	Creates a DXF file representing the specified MvcDiagram diagram.

DxfExporter Class
MindFusion.Diagramming.Export Namespace

DxfExporter Constructor

Initializes a new instance of the DxfExporter class.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Dxf

Syntax

C# Copy Code

```
public DxfExporter ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

DxfExporter Class
MindFusion.Diagramming.Export Namespace

DxfExporter Methods

DxfExporter.Export Method

Creates a DXF file representing the specified MvcDiagram diagram.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Dxf

Syntax

C# Copy Code

```
public void Export (
    Diagram diagram,
    string filePath
)
```

Visual Basic Copy Code

```
Public Sub Export ( _
    diagram As Diagram, _
    filePath As String _
)
```

Parameters

diagram
A reference to the diagram to be exported.

filePath
The full path to the .dxf file.

Remarks

Each MvcDiagram node or link is exported as a group of graphic primitives, such as lines and arcs, defined as DXF entities. DxfExporter uses the entities defined in version 14 of the DXF format.

See Also

DxfExporter Members
DxfExporter Class
MindFusion.Diagramming.Export Namespace

DxfExporter Properties

DxfExporter.ExportImages Property

Gets or sets a value indicating whether the images that are displayed inside diagram nodes should be exported.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Dxf

Syntax

C# Copy Code

```
public bool ExportImages { get; set; }
```

Visual Basic Copy Code

```
Public Property ExportImages As Boolean
```

Property Value

true to export images; otherwise, **false**. The default is **false**.

Remarks

If this property is enabled, images displayed in MvcDiagram nodes are saved into external files and references to these files are placed inside the generated DXF code. The image files have the same base name as the specified DXF name, followed by an underscore symbol and a sequential number.

DxfExporter Members
DxfExporter Class
MindFusion.Diagramming.Export Namespace

DxfExporter.ExportTextAsMultiline Property

Gets or sets a value indicating whether item labels should be exported to DXF MTEXT entities.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Dxf

Syntax

C# Copy Code

```
public bool ExportTextAsMultiline { get; set; }
```

Visual Basic Copy Code

```
Public Property ExportTextAsMultiline As Boolean
```

Property Value

true to create multiple-line text entities, otherwise, **false**. The default is **true**.

Remarks

Some applications do not support the multiple-line text DXF entity - MTEXT. If you notice that the application you target does not display the labels of diagram items, set this property to **false**.

DxfExporter Members
DxfExporter Class
MindFusion.Diagramming.Export Namespace

ExcelExporter Class

Exports MindFusion.Diagramming diagrams to Excel Open XML Format (XLSX) files.

Syntax

C# Copy Code

```
public class ExcelExporter
```

Visual Basic Copy Code

```
Public Class ExcelExporter
```

Remarks

Diagrams are exported as Excel AutoShapes drawings. The Export overload that takes a DiagramDocument parameter creates a sheet for each DiagramPage in the document.

ExcelExporter.Export Method

Overload List

Name	Description
ExcelExporter.Export (Diagram, Stream)	Creates an XLSX file representing the specified diagram.
ExcelExporter.Export (Diagram, String)	Creates an XLSX file representing the specified diagram.
ExcelExporter.Export (DiagramDocument, Stream)	Creates an XLSX file representing the specified DiagramDocument.
ExcelExporter.Export (DiagramDocument, String)	Creates an XLSX file representing the specified **DiagramDocument**.

See Also

ExcelExporter Members
ExcelExporter Class
MindFusion.Diagramming.Export Namespace

ExcelExporter.Export Method (Diagram, Stream)

Creates an XLSX file representing the specified diagram.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Excel

Syntax

C# Copy Code

```
public void Export (
    Diagram diagram,
    Stream stream
)
```

Visual Basic Copy Code

```
Public Sub Export( _
    diagram As Diagram, _
    stream As Stream _
)
```

Parameters

diagram
A reference to the Diagram that will be exported.

stream
Output **System.IO.Stream** to which to write the Excel data.

See Also

Export Method Overload List

ExcelExporter.Export Method (Diagram, String)

Creates an XLSX file representing the specified diagram.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Excel

Syntax

C# Copy Code

```
public void Export (
    Diagram diagram,
    string filePath
)
```

Visual Basic Copy Code

```
Public Sub Export( _
    diagram As Diagram, _
    filePath As String _
)
```

Parameters

diagram
A reference to the Diagram that will be exported.

filePath
The full path to the XLSX file.

ExcelExporter.Export Method (DiagramDocument, Stream)

Creates an XLSX file representing the specified DiagramDocument.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Excel

Syntax

C# Copy Code

```
public void Export (
    DiagramDocument document,
    Stream stream
)
```

Visual Basic Copy Code

```
Public Sub Export( _
    document As DiagramDocument, _
    stream As Stream _
)
```

Parameters

document
A reference to the DiagramDocument that will be exported.

stream
Output **System.IO.Stream** to which to write the Excel data.

See Also

Export Method Overload List
ExcelExporter Members
ExcelExporter Class

ExportLanes Enumeration

Defines values that indicate how the LaneGrid should be exported to Visio.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Visio

Syntax

C# Copy Code

```
public enum ExportLanes
```

Visual Basic Copy Code

```
Public Enum ExportLanes
```

Members

	Member name	Description

	None	Do not export the swimlane grid.
	Horizontal	Export the grid as horizontal functional band shapes.
	Vertical	Export the grid as vertical functional band shapes.

MindFusion.Diagramming.Export Namespace

PdfExporter Class

Exports diagrams to Adobe Portable Document Format (PDF) files.

Syntax

C# Copy Code

```
public class PdfExporter
```

Visual Basic Copy Code

```
Public Class PdfExporter
```

Remarks

In order to use this component, add references to the *MindFusion.Diagramming.Export.Pdf.dll* and *MindFusion.Pdf.dll* assemblies to your project.

The Adobe Portable Document Format (PDF) is the most popular open format for representing textual and graphic information in resolution independent manner. In addition, PDF is a multiplatform format, viewable and printable on all popular operating systems. These features, along with its ability to describe complex documents that use a variety of graphics, images and fonts, make PDF a good choice when it comes to distributing your flowcharts and diagrams to others.

The **PdfExporter** class lets you create PDF files that represent MvcDiagram diagrams. In order to do that, create a **PdfExporter** instance and call its Export method. If you need to set the page size and orientation, use the PageSize, and PageOrientation properties. Margins specifies the page margins for all pages in the document. The AutoScale property lets you scale the diagram so it fits in one or more PDF pages.

Pages can display optional headers and footers. Set the HeaderFormat and HeaderFont properties to customize headers, and the FooterFormat and FooterFont properties to customize footers.

PdfExporter Members

Exports diagrams to Adobe Portable Document Format (PDF) files.

The following tables list the members exposed by the PdfExporter type.

Public Constructors

	Name	Description
	PdfExporter	Initializes a new instance of the **PdfExporter** class.

Public Properties

	Name	Description
	AutoDetectEncoding	Specifies whether character encoding should be detected automatically.
	AutoScale	Gets or sets a value indicating whether the diagram should be scaled to fit one or more pages of the PDF document.
	DefaultEncoding	Specifies what encoding to use if the encoding for a string cannot be recognized automatically.
	DisableTextClipping	A work-around for Adobe Reader V9 issue when printing to Postscript printers.
	EnableBackground	Specifies whether to fill the background with color.
	EnableGrid	Gets or sets a value indicating whether the alignment grid is rendered.
	FontCachePath	Specifies the path to a file that contains font metrics records.
	FooterFont	Gets or sets the font used to draw page footers.
	FooterFormat	Gets or sets a string specifying the content of page footers.
	HeaderFont	Gets or sets the font used to draw page headers.
	HeaderFormat	Gets or sets a string specifying the content of page headers.
	HyperLinkStyle	Specifies what kind of hyperlinks should be generated for the HyperLink property of items.
	InvisibleItems	Gets or sets a value indicating whether invisible items should be exported.
	JpegImageEncoding	Specifies whether images embedded in PDF should be encoded in Jpeg format.
	JpegImageQuality	Specifies the image quality of Jpeg images.
	Margins	Gets or sets the margins for the PDF pages.
	PageOrientation	Gets or sets the orientation of the PDF pages.
	PageSize	Gets or sets the size of the PDF pages.
	RenderOptions	Gets a RenderOptions instance that provides various settings for configuring the appearance of exported diagrams.
	Scale	Gets or sets the scale of the PDF output relatively to the original on-screen size of the diagram.
	SuppressUnmanagedCode	Suppress usage of unmanaged code.

Public Methods

	Name	Description
	Export	Overloaded.

PdfExporter.Export Method

Overload List

Name	Description
PdfExporter.Export (Diagram, Stream)	Creates a PDF file representing the specified MindFusion.Diagramming diagram.
PdfExporter.Export (Diagram, String)	Creates a PDF file representing the specified MvcDiagram diagram.
PdfExporter.Export (DiagramDocument, Stream)	Creates a PDF file representing the specified DiagramDocument.
PdfExporter.Export (DiagramDocument, String)	Creates a PDF file representing the specified DiagramDocument.

See Also

PdfExporter Members
PdfExporter Class
MindFusion.Diagramming.Export Namespace

PdfExporter.Export Method (Diagram, Stream)

Creates a PDF file representing the specified MindFusion.Diagramming diagram.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C# Copy Code

```
public void Export (
    Diagram diagram,
    Stream stream
)
```

Visual Basic Copy Code

```
Public Sub Export( _
    diagram As Diagram, _
    stream As Stream _
)
```

Parameters

diagram
A reference to the diagram that will be exported.

stream
Output **System.IO.Stream** to which to write the PDF data.

See Also

Export Method Overload List
PdfExporter Members
PdfExporter Class
MindFusion.Diagramming.Export Namespace

PdfExporter.Export Method (Diagram, String)

Creates a PDF file representing the specified MvcDiagram diagram.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C# Copy Code

```
public void Export (
    Diagram diagram,
    string filePath
)
```

Visual Basic Copy Code

```
Public Sub Export( _
    diagram As Diagram, _
    filePath As String _
)
```

Parameters

diagram
A reference to the diagram that will be exported.

filePath
The full path to the PDF file.

Remarks

By default, PdfExporter preserves the original scale of the diagram. If Bounds can not fit in a single page of size PageSize, the exported diagram is divided into multiple pages. The AutoScale property allows scaling the diagram so that it exactly fits in one or more pages.

PdfExporter Class
MindFusion.Diagramming.Export Namespace

PdfExporter.Export Method (DiagramDocument, Stream)

Creates a PDF file representing the specified DiagramDocument.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C# Copy Code

```
public void Export (
    DiagramDocument diagramDoc,
    Stream stream
)
```

Visual Basic Copy Code

```
Public Sub Export( _
    diagramDoc As DiagramDocument, _
    stream As Stream _
)
```

Parameters

diagramDoc
A reference to the DiagramDocument that will be exported.

stream
Output **System.IO.Stream** to which to write the PDF data.

Remarks

If PageSize is set to **DiagramSize**, the number of pages in the output PDF is equal to DiagramDocument.Pages.Count and each PDF page is as large as the respective DiagramPage.Bounds. Otherwise, all diagram pages are paginated using the specified PDF page size (A4 etc).

PdfExporter.Export Method (DiagramDocument, String)

Creates a PDF file representing the specified DiagramDocument.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C# Copy Code

```
public void Export (
    DiagramDocument diagramDoc,
    string filePath
)
```

Visual Basic Copy Code

```
Public Sub Export( _
    diagramDoc As DiagramDocument, _
    filePath As String _
)
```

Parameters

diagramDoc
A reference to the DiagramDocument that will be exported.

filePath
The full path to the PDF file.

Remarks

If PageSize is set to DiagramSize, the number of pages in the output PDF is equal to DiagramDocument.Pages.Count and each PDF page is as large as the respective DiagramPage.Bounds. Otherwise, all diagram pages are paginated using the specified PDF page size (A4 etc).

PdfExporter Properties

PdfExporter.AutoDetectEncoding Property

Specifies whether character encoding should be detected automatically.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C# Copy Code

```
public bool AutoDetectEncoding { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoDetectEncoding As Boolean
```

Property Value

true to detect character encoding automatically, otherwise **false**. The default value is **true**.

Remarks

If this property is disabled, the PDF encoding is always set to the DefaultEncoding value.

See Also

PdfExporter Members
PdfExporter Class

PdfExporter.AutoScale Property

Gets or sets a value indicating whether the diagram should be scaled to fit one or more pages of the PDF document.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C# Copy Code

```
public AutoScale AutoScale { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoScale As AutoScale
```

Property Value

A member of the AutoScale enumeration. The default is **None**.

Remarks

By default, the original scale of the diagram is preserved and the diagram is divided into multiple pages if needed. This property lets you scale the diagram so that it exactly fits in one or more pages.

PdfExporter.Margins Property

Gets or sets the margins for the PDF pages.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C#

```
public Thickness Margins { get; set; }
```

Visual Basic

```
Public Property Margins As Thickness
```

Property Value

A Thickness instance that represents the margins in hundredths of an inch. The default is half-inch margins on all sides.

Example

The following C# code creates a PDF file with one-inch page margins:

C#

```
var pdfExporter = new PdfExporter();
pdfExporter.Margins = new Thickness(100, 100, 100, 100);
pdfExporter.Export(diagram, stream);
```

MindFusion.Diagramming.Export Namespace
PageSize Property

PdfExporter.PageOrientation Property

Gets or sets the orientation of the PDF pages.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C# Copy Code

```
public PageOrientation PageOrientation { get; set; }
```

Visual Basic Copy Code

```
Public Property PageOrientation As PageOrientation
```

Property Value

A member of the **PageOrientation** enumeration. The default is **Portrait**. The members of the **PageOrientation** enumeration are: **Landscape**, **Portrait** or **Auto**.

Remarks

If the **Auto** value is set, PdfExporter will choose the appropriate orientation according to the proportion of width to height of the diagram.

PageSize Property

PdfExporter.PageSize Property

Gets or sets the size of the PDF pages.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C# Copy Code

```
public PageSize PageSize { get; set; }
```

Visual Basic Copy Code

```
Public Property PageSize As PageSize
```

Property Value

A member of the **PageSize** enumeration. The default is **A4**.

Remarks

The diagram is divided into multiple pages of the specified size, as long as AutoScale is not set to FitToPage.

Margins Property

PdfExporter.RenderOptions Property

Gets a RenderOptions instance that provides various settings for configuring the appearance of exported diagrams.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C# Copy Code

```
public RenderOptions RenderOptions { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property RenderOptions As RenderOptions
```

Property Value

A RenderOptions reference.

PdfExporter.Scale Property

Gets or sets the scale of the PDF output relatively to the original on-screen size of the diagram.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C# Copy Code

```
public float Scale { get; set; }
```

Visual Basic Copy Code

```
Public Property Scale As Single
```

Property Value

A float value specifying the scale as percentage of the original size. The default is 100.

Remarks

This value is used only if AutoScale is disabled.

MindFusion.Diagramming.Export Namespace

PdfExporter.SuppressUnmanagedCode Property

Suppress usage of unmanaged code.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Pdf

Syntax

C# Copy Code

```
public bool SuppressUnmanagedCode { get; set; }
```

Visual Basic Copy Code

```
Public Property SuppressUnmanagedCode As Boolean
```

Property Value

true to prevent the component from using unmanaged code; **false** to allow it. The default value is **false**.

Remarks

Unmanaged code is not allowed to run when the ASP.NET security level is set to Medium Trust. However PdfExporter relies on native Win32 calls to get some precise font metrics which are otherwise inaccessible through the .NET base class library. To work around this, the component now comes with a "pdflib-fontrecords.xml" file that contains cached information about fonts. The FontCachePath property must point to the location of this file when **SuppressUnmanagedCode** is enabled.

Unmanaged code is also used to detect character encoding automatically. When it is suppressed, PDF encoding is always set to the value of DefaultEncoding.

SvgExporter Class

Creates SVG (Scalable Vector Graphics) drawings from the content of Diagram objects.

Syntax

C# Copy Code

```
public class SvgExporter
```

Visual Basic Copy Code

```
Public Class SvgExporter
```

Remarks

In order to use this component, add references to the *MindFusion.Diagramming.Export.Svg.dll* and *MindFusion.Svg.dll* assemblies to your project.

Scalable Vector Graphics is an XML-based graphics language that describes images with vector shapes, text, and embedded raster graphics. SVG drawings can be displayed in web pages, or edited / imported by vector graphics editing applications.

In order to create an SVG file from a MvcDiagram diagram, create an **SvgExporter** instance and call its Export method, passing a Diagram object as parameter.

Inheritance Hierarchy

System.Object
MindFusion.Diagramming.Export.SvgExporter

See Also

SvgExporter Members

Creates SVG (Scalable Vector Graphics) drawings from the content of Diagram objects.

The following tables list the members exposed by the SvgExporter type.

Public Constructors

	Name	Description
	SvgExporter	Initializes a new instance of the **SvgExporter** class.

Public Properties

	Name	Description
	ExternalImages	Specifies whether images displayed by diagram items should be exported to external files.
	GZipCompression	Specifies whether to create GZip compressed SVG.
	HyperLinkStyle	Specifies what kind of hyperlinks should be generated for the HyperLink property of items.
	HyperLinkTarget	Specify the value of the **target** attribute generated for the HyperLink property of items.
	RenderOptions	Gets a RenderOptions instance that provides various settings for configuring the appearance of exported diagrams.

Public Methods

	Name	Description
	Export	Overloaded.

SvgExporter.Export Method (Diagram, Stream)

Saves SVG markup representing the specified diagram to a stream.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Svg

Syntax

C# Copy Code

```
public void Export (
    Diagram diagram,
    Stream stream
)
```

Visual Basic Copy Code

```
Public Sub Export( _
    diagram As Diagram, _
    stream As Stream _
)
```

Parameters

diagram
A reference to the diagram to be exported.

stream
Output **System.IO.Stream** to which to write the SVG data.

Visio2013Exporter Class

Exports the contents of Diagram or DiagramDocument objects to Visio 2013 XML drawing files (*.vsdx).

Syntax

C# Copy Code

```
public class Visio2013Exporter
```

Visual Basic Copy Code

```
Public Class Visio2013Exporter
```

Remarks

Add a reference to the *MindFusion.Diagramming.Export.Visio.dll* to your project in order to use this component.

The component allows exporting Visio 2003 XML Drawing files from MindFusion.Diagramming. ShapeNode objects are mapped to their closest Visio counterparts and DiagramLink instances are exported as Visio connectors of a similar style. In addition, most of the attributes of diagram items such as text, text formatting, fill and line colors and styles are preserved.

To function properly, the exporter object requires the *Visio2013.vxt* file to be present in the application's directory, or its location specified in TemplatePath. This file contains an XML template data used by the component to generate Visio documents.

Visio2013Exporter.Export Method (Diagram, String)

Creates a Visio .vsdx file representing the specified Diagram.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Visio

Syntax

C# Copy Code

```
public void Export (
    Diagram diagram,
    string filePath
)
```

Visual Basic Copy Code

```
Public Sub Export( _
    diagram As Diagram, _
    filePath As String _
)
```

Parameters

diagram
A Diagram instance.

filePath
The full path to the exported Visio .vsdx file.

Remarks

The exported document contains a single page, as big as the scrollable diagram area set in Bounds.

To run properly, this method requires the *Visio2013.vxt* file to be present in the application's directory, or its full path to be assigned to TemplatePath. That file contains an XML template data used by the component to construct Visio documents.

VisioExporter.Export Method (Diagram, String)

Creates a Visio XML Drawing file representing the specified MvcDiagram diagram.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Visio

Syntax

C# Copy Code

```
public void Export (
    Diagram diagram,
    string vdxPathName
)
```

Visual Basic Copy Code

```
Public Sub Export( _
    diagram As Diagram, _
    vdxPathName As String _
)
```

Parameters

diagram

A reference to the diagram to be exported.

vdxPathName

The full path to the exported Visio .vdx file.

Remarks

The exported document contains a single page, as big as the MvcDiagram scrollable diagram area. The Visio page dimension and items size measure unit is set to the diagram's MeasureUnit.

To run properly, this method requires the *VisioExport.vxt* file to be present in the application's directory. That file contains an XML template data used by the component to construct Visio documents.

VisioExporter Properties

VisioExporter.CreateVisioGroups Property

Gets or sets a value indicating whether Visio groups are created from the MvcDiagram groups.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Visio

Syntax

C# Copy Code

```
public bool CreateVisioGroups { get; set; }
```

Visual Basic Copy Code

```
Public Property CreateVisioGroups As Boolean
```

Property Value

true to create Visio groups when possible; otherwise, **false**. The default is **false**.

Remarks

It is not always possible to create a Visio group corresponding to a MvcDiagram one. If the structure of your diagram seems incorrect when imported in Visio, disable this property.

VisioExporter.DynamicsOff Property

Gets or sets whether Visio connector rerouting should be disabled.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Visio

Syntax

C# Copy Code

```
public bool DynamicsOff { get; set; }
```

Visual Basic Copy Code

```
Public Property DynamicsOff As Boolean
```

Property Value

See Also

VisioExporter Members
VisioExporter Class
MindFusion.Diagramming.Export Namespace

VisioExporter.ExportImagesAsGroups Property

Specifies whether a shape node that contains an image should be exported as a Visio group of a shape, picture and text objects.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Visio

Syntax

C# Copy Code

```
public bool ExportImagesAsGroups { get; set; }
```

Visual Basic Copy Code

```
Public Property ExportImagesAsGroups As Boolean
```

Property Value

true to export nodes with images as groups; otherwise, **false**. The default is **true**.

Remarks

Visio shapes cannot contain images inside them, and by default a MvcDiagram shape node that contains an image s exported as a Visio Picture object. Unfortunately, that leads to losing the node shape and the image alignment. Setting this property to **true** lets you export a shape node with an image as a group of several Visio objects that will preserve the appearance of the original MvcDiagram node as closely as possible.

VisioExporter Members
VisioExporter Class
MindFusion.Diagramming.Export Namespace

VisioExporter.ExportLanes Property

Gets or sets a value specifying whether the LaneGrid should be exported to Visio.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Visio

Syntax

C# Copy Code

```
public ExportLanes ExportLanes { get; set; }
```

Visual Basic Copy Code

```
Public Property ExportLanes As ExportLanes
```

Property Value

A member of the ExportLanes enumeration. The default value is **None**.

Remarks

If export of swimlanes is enabled, they are exported as Visio *Functional Band* shapes.

See Also

VisioExporter Members
VisioExporter Class
MindFusion.Diagramming.Export Namespace

VisioExporter.ExportTablesAsGroups Property

Gets or sets a value indicating whether MvcDiagram TableNode objects should be exported as groups of Visio rectangular shapes.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Visio

Syntax

C# Copy Code

```
public bool ExportTablesAsGroups { get; set; }
```

Visual Basic Copy Code

```
Public Property ExportTablesAsGroups As Boolean
```

Property Value

true to export tables as groups; otherwise, **false**. The default is **false**.

Remarks

Visio table entities cannot display cells in multiple columns. If your MvcDiagram diagrams contains tables having more than two columns, consider enabling this property. Then the VisioExporter would create a rectangular shape for each cell, and group the cells of each table into a Visio compound shape corresponding to the table.

See Also

VisioExporter Members

MindFusion.Diagramming.Export Namespace
ExportImagesAsGroups Property

VisioExporter.LaneGridTitle Property

Gets or sets the title of the functional band container created when exporting the diagram's swimlane grid.

Namespace: MindFusion.Diagramming.Export
Assembly: MindFusion.Diagramming.Export.Visio

Syntax

C# Copy Code

```
public string LaneGridTitle { get; set; }
```

Visual Basic Copy Code

```
Public Property LaneGridTitle As String
```

Property Value

A string specifying the title of the Functional Band container shape. The default value is empty string.

Remarks

When ExportLanes is enabled, VisioExporter create a *Functional Band* shape for each swimlane and a container shape for the whole grid. This property specifies the container's title.

Syntax

C# Copy Code

```
public string TemplatePath { get; set; }
```

Visual Basic Copy Code

```
Public Property TemplatePath As String
```

Property Value

A string specifying the location of the template file. The default is an empty string.

Remarks

If you do not specify the path to the template file, VisioExporter looks for the file in the same folder where the *MindFusion.Diagramming.Export.Visio.dll* assembly is, in the folder of the application executable file, and in the current folder. However that might not work under restricted security permissions, for example when running in a browser or in an IIS process.

ConnectorImportedEventArgs Properties

ConnectorImportedEventArgs.ConnectorXml Property

Gets the XML DOM element corresponding to the Visio document's XML code that describes the imported connector.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public XmlNode ConnectorXml { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ConnectorXml As XmlNode
```

Property Value

An **XmlNode** object corresponding to the section of the VDX document which describes the imported connector.

See Also

DrawImporter Class

DrawImporter lets you import an OpenOffice Draw document into a Diagram or DiagramDocument object.

Syntax

C# Copy Code

```
public class DrawImporter
```

Visual Basic Copy Code

```
Public Class DrawImporter
```

Remarks

The **DrawImporter** class can import .odg files, created by the OpenOffice Draw vector graphics editor. In order to use it, you must add a reference to the *MindFusion.Diagramming.Import.Draw.dll* assembly.

Various overloads of the Import method can be used to import the OpenOffice drawing into a DiagramDocument whose pages correspond to the Draw pages, or into a single Diagram whose content is merged from all imported pages. When merging multiple pages, their positions in the diagram depend on the PagesPerRow value.

DrawImporter supports shapes from the *General* and *Flowchart* shape palettes in Draw. For each node shape from the .odg file, the importer creates a ShapeNode object whose Shape, Text, Brush and Pen properties are set to values corresponding to the imported OpenOffice shape. For each connector shape, the importer creates a DiagramLink object whose Origin and Destination are set to the corresponding imported nodes, and whose ControlPoints reflect the geometry of the connector.

DrawImporter.Import Method (String)

Imports the specified OpenOffice Draw document into a new DiagramDocument, where each Draw page is imported into a separate DiagramPage of the **DiagramDocument**.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Draw

Syntax

C# Copy Code

```
public DiagramDocument Import (
    string filePath
)
```

Visual Basic Copy Code

```
Public Function Import( _
    filePath As String _
) As DiagramDocument
```

Parameters

filePath

A string specifying the path to the .odg file.

Return Value

A DiagramDocument containing the imported OpenOffice drawing.

See Also

Import Method Overload List
DrawImporter Members
DrawImporter Class
MindFusion.Diagramming.Import Namespace

DrawImporter.Import Method (String, Diagram)

Imports the specified OpenOffice Draw document into the specified Diagram.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Draw

Syntax

C# Copy Code

```
public void Import (
    string filePath,
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public Sub Import( _
    filePath As String, _
    diagram As Diagram _
)
```

Parameters

filePath

A string specifying the path to the .odg file.

diagram

A Diagram into which to import the OpenOffice drawing.

Remarks

Objects from each subsequent Draw page are imported in the same Diagram, at an offset depending on the page size and the value of the PagesPerRow property.

See Also

Import Method Overload List
DrawImporter Members

DrawImporter.Import Method (String, DiagramDocument)

Imports the specified OpenOffice Draw document into an existing DiagramDocument, where each Draw page is imported into a separate DiagramPage of the **DiagramDocument**.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Draw

Syntax

C# Copy Code

```
public void Import (
    string filePath,
    DiagramDocument document
)
```

Visual Basic Copy Code

```
Public Sub Import( _
    filePath As String, _
    document As DiagramDocument _
)
```

Parameters

filePath

A string specifying the path to the .odg file.

document

A DiagramDocument into which to import the OpenOffice drawing.

DrawImporter Properties

DrawImporter.PagesPerRow Property

Gets or sets how many Draw pages to import on a row before offsetting the import location vertically.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Draw

Syntax

C# Copy Code

```
public int PagesPerRow { get; set; }
```

Visual Basic Copy Code

```
Public Property PagesPerRow As Integer
```

Property Value

An integer value specifying how many pages to fit horizontally. The default value is 1.

Remarks

This property is considered by the Import overload that imports all pages into a single diagram.

ImportItemEventArgs.MasterXml Property

Gets the XML DOM element corresponding to the Visio document's XML code that describes the shape master.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public XmlNode MasterXml { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property MasterXml As XmlNode
```

Property Value

A **System.Xml.XmlNode** instance.

See Also

ImportItemEventArgs Members
ImportItemEventArgs Class
MindFusion.Diagramming.Import Namespace

ImportItemEventArgs.NamespaceManager Property

Gets an **XmlNamespaceManager** instance with preloaded Visio namespaces that can be used when querying the XML elements provided by this ImportItemEventArgs instance.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public XmlNamespaceManager NamespaceManager { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property NamespaceManager As XmlNamespaceManager
```

Property Value

A **System.Xml.XmlNamespaceManager** instance.

See Also

ShapeImportedEventArgs Members

Contains the arguments passed to handlers of the ShapeImported event.

The following tables list the members exposed by the ShapeImportedEventArgs type.

Public Properties

	Name	Description
	Shape	Gets a reference to the imported diagram shape.
	ShapeName	Gets the Visio name of the node shape.
	ShapeXml	Gets the XML DOM element corresponding to the Visio document's XML code that describes the imported shape.

See Also

ShapeImportedEventArgs Properties

ShapeImportedEventArgs.Shape Property

Gets a reference to the imported diagram shape.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public ShapeNode Shape { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Shape As ShapeNode
```

Property Value

An instance of the ShapeNode class.

See Also

ShapeImportedEventArgs Members
ShapeImportedEventArgs Class
MindFusion.Diagramming.Import Namespace

ShapeImportedEventArgs.ShapeName Property

Gets the Visio name of the node shape.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public string ShapeName { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ShapeName As String
```

Property Value

A string specifying the Visio name of the shape.

See Also

ShapeImportedEventArgs Members
ShapeImportedEventArgs Class
MindFusion.Diagramming.Import Namespace

ShapeImportedEventArgs.ShapeXml Property

Gets the XML DOM element corresponding to the Visio document's XML code that describes the imported shape.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public XmlNode ShapeXml { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ShapeXml As XmlNode
```

Property Value

An **XmlNode** object corresponding to the section of the VDX document which describes the imported shape.

Example

The following sample shows how to read a custom property value defined in Visio by handling the ShapeImported event.

C# Copy Code

```
private void ShapeImported(object sender, ShapeImportedEventArgs e)
{
    XmlNode vdxCode = e.ShapeXml;
    try
    {
        XmlNamespaceManager ns = new XmlNamespaceManager(e.ShapeXml.OwnerDocument.NameTable);
        ns.AddNamespace("vdx", "http://schemas.microsoft.com/visio/2003/core");

        XmlNode myPropVal =
vdxCode.SelectSingleNode("vdx:Prop[vdx:Label='MyProperty']/vdx:Value", ns);
        if (myPropVal != null)
            e.Shape.Tag = myPropVal.InnerText;
    }
    catch (Exception ex)
    {
        MessageBox.Show(ex.Message);
    }
}
```

SvgImporter Class

SvgImporter lets you import the contents of an SVG file into a Diagram object.

Syntax

C# Copy Code

```
public class SvgImporter
```

Visual Basic Copy Code

```
Public Class SvgImporter
```

Remarks

Add a reference to the *MindFusion.Diagramming.Import.Svg.dll* to your project in order to use this component.

The component allows importing Scalable Vector Graphics files (*.svg) into MindFusion.Diagramming. Each top-level SVG group element is imported as a separate SvgNode, whose Content is set to the group's child elements. If the SVG file was exported from

Visio or OpenOffice Draw, **SvgImporter** will create DiagramLink objects for groups it recognizes as connectors in order to recreate the original diagram model, though in this case it will not preserve fully the original appearance of connectors in SVG.

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.Import.SvgImporter

Visio2013Importer Class

Imports Visio 2013 XML Drawing files (*.vsdx) into Diagram or DiagramDocument objects.

Syntax

C# Copy Code

```
public class Visio2013Importer
```

Visual Basic Copy Code

```
Public Class Visio2013Importer
```

Remarks

The **Visio2013Importer** class can import .vsdx files, created by version 2013 of Microsoft Visio. In order to use it, you must add a reference to the *MindFusion.Diagramming.Import.Visio.dll* assembly.

Various overloads of the Import method can be used to import the Visio drawing into a DiagramDocument whose pages correspond to the Visio pages, or into a single Diagram whose content is merged from all imported pages. When merging multiple pages, their positions in the diagram depend on the PagesPerRow value.

Visio2013Importer supports Visio's basic flowchart and data flow stencils. For each node shape from the .vsdx file, the importer creates a ShapeNode object whose Shape, Text, Brush and Pen properties are set to values corresponding to the imported Visio shape. For each connector shape, the importer creates a DiagramLink object whose Origin and Destination are set to the corresponding imported nodes, and whose ControlPoints reflect the geometry of the connector.

VisioImporter Class

Imports Visio 2003 XML Drawing files (*.vdx) into MvcDiagram.

Syntax

C# Copy Code

```
public class VisioImporter
```

Visual Basic Copy Code

```
Public Class VisioImporter
```

Remarks

Add a reference to the *MindFusion.Diagramming.Import.Visio.dll* to your project in order to use this component.

The component allows importing Visio 2003 XML Drawing files (*.vdx) into MvcDiagram. The standard Visio flowchart shapes, as well as most of the UML and Database entity shapes are imported to their closest representation in MvcDiagram. The Visio connectors are imported as MvcDiagram DiagramLink objects, preserving the relationship between the connected nodes. In addition, most of the attributes of Visio objects such as text, text formatting, fill and line colors and styles are preserved. The component raises an event for each imported node to let you set the node shape if it is not recognized by MvcDiagram or if you need to set a different shape.

To determine how many pages contains the Visio document and import only a single page, call the GetPageCount and ImportPage methods. All pages of a Visio diagram can be imported at once by calling the ImportAllPages method, which lays out the pages as set in PagesPerRow. More properties and events provided by the class are listed below.

Public Constructors

	Name	Description
	VisioImporter	Initializes a new instance of the **VisioImporter** class.

Public Properties

	Name	Description
	ApplyVisioUnit	Gets or sets a value indicating whether the diagram's MeasureUnit should be set to the one read from the imported Visio file.

	ImportEntitiesAsTables	Gets or sets a value indicating whether Visio UML and DB entities are imported as MvcDiagram tables.
	PagesPerRow	Gets or sets how many Visio pages to import on a row before offsetting the import location vertically.
	SuppressUnmanagedCode	Suppress usage of unmanaged code.

Public Methods

	Name	Description
	GetPageCount	Determines how many pages are there in a Visio diagram.
	Import	Imports all pages from the specified Visio document into a single DiagramDocument object.
	ImportAllPages	Imports all pages from the specified Visio document.
	ImportPage	Imports a single page from the specified Visio document.

Protected Methods

	Name	Description
	OnConnectorImported	Raises the ConnectorImported event.
	OnGroupImported	Raises the GroupImported event.
	OnShapeImported	Raises the ShapeImported event.

Public Events

	Name	Description
	ConnectorImported	Raised when a Visio connector is imported as a MvcDiagram link.
	GroupImported	Raised when a Visio group is imported as a MvcDiagram group.
	ShapeImported	Raised when a Visio shape is imported into MvcDiagram as a ShapeNode.

VisioImporter Class
MindFusion.Diagramming.Import Namespace

VisioImporter Constructor

Initializes a new instance of the VisioImporter class.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public VisioImporter ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

VisioImporter Methods

VisioImporter.GetPageCount Method

Determines how many pages are there in a Visio diagram.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public long GetPageCount (
    string vdxPathName
)
```

Visual Basic Copy Code

```
Public Function GetPageCount( _
    vdxPathName As String _
) As Long
```

Parameters

vdxPathName
A full path to the Visio VDX file.

Return Value

An integer value specifying the number of pages in the Visio diagram.

Remarks

Use this method to determine the valid range of pages for ImportPage.

See Also

VisioImporter Members
VisioImporter Class
MindFusion.Diagramming.Import Namespace

VisioImporter.Import Method

Imports all pages from the specified Visio document into a single DiagramDocument object.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public DiagramDocument Import (
    string vdxPathName
)
```

Visual Basic Copy Code

```
Public Function Import( _
    vdxPathName As String _
) As DiagramDocument
```

Parameters

vdxPathName
A full path to the Visio VDX file.

Return Value

The newly crated DiagramDocument object.

See Also

VisioImporter Members
VisioImporter Class
MindFusion.Diagramming.Import Namespace

VisioImporter.ImportAllPages Method

Imports all pages from the specified Visio document.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public void ImportAllPages (
    string vdxPathName,
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public Sub ImportAllPages ( _
    vdxPathName As String, _
    diagram As Diagram _
)
```

Parameters

vdxPathName
A full path to the Visio VDX file.

diagram
Reference to the diagram where the Visio drawing is imported.

Remarks

The pages are imported starting from the top-left point of the MvcDiagram diagram area. The current import location is moved one page-width to the right with each new page imported, until PagesPerRow pages are imported on the same y-coordinate. When that happens, the current location moves to the left-most x-coordinate and one page-height down. If there are more pages to import, the process continues as above.

VisioImporter Class
MindFusion.Diagramming.Import Namespace

VisioImporter.ImportPage Method

Imports a single page from the specified Visio document.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public void ImportPage (
    string vdxPathName,
    Diagram diagram,
    int PageIndex
)
```

Visual Basic Copy Code

```
Public Sub ImportPage ( _
    vdxPathName As String, _
    diagram As Diagram, _
    PageIndex As Integer _
)
```

Parameters

vdxPathName
A full path to the Visio VDX file.

diagram
Reference to the Diagram document into which the Visio data is imported.

pageIndex
Specifies which page of the Visio document to import.

Remarks

The page index is zero based. Use GetPageCount to determine how many pages are there in the Visio diagram.

VisioImporter.OnConnectorImported Method

Raises the ConnectorImported event.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
protected virtual void OnConnectorImported (
    ConnectorImportedEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnConnectorImported ( _
    e As ConnectorImportedEventArgs _
)
```

Parameters

e
An ConnectorImportedEventArgs that contains the event data.

VisioImporter.OnGroupImported Method

Raises the GroupImported event.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
protected virtual void OnGroupImported (
    GroupImportedEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnGroupImported ( _
    e As GroupImportedEventArgs _
)
```

Parameters

e
An GroupImportedEventArgs that contains the event data.

See Also

VisioImporter Members
VisioImporter Class
MindFusion.Diagramming.Import Namespace

VisioImporter.OnShapeImported Method

Raises the ShapeImported event.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
protected virtual void OnShapeImported (
    ShapeImportedEventArgs e
)
```

Visual Basic Copy Code

```
Protected Overridable Sub OnShapeImported ( _
    e As ShapeImportedEventArgs _
)
```

Parameters

e
An ShapeImportedEventArgs that contains the event data.

VisioImporter Properties

VisioImporter.ApplyVisioUnit Property

Gets or sets a value indicating whether the diagram's MeasureUnit should be set to the one read from the imported Visio file.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public bool ApplyVisioUnit { get; set; }
```

Visual Basic Copy Code

```
Public Property ApplyVisioUnit As Boolean
```

Property Value

See Also

VisioImporter Members
VisioImporter Class
MindFusion.Diagramming.Import Namespace

VisioImporter.ImportEntitiesAsTables Property

Gets or sets a value indicating whether Visio UML and DB entities are imported as MvcDiagram tables.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public bool ImportEntitiesAsTables { get; set; }
```

Visual Basic Copy Code

```
Public Property ImportEntitiesAsTables As Boolean
```

Property Value

true to import Visio entity nodes as tables; otherwise, **false**. The default is **false**.

Remarks

If this property is disabled, Visio entity objects are imported as MvcDiagram groups of rectangular nodes; if it is enabled, entities are imported as tables.

See Also

VisioImporter Members
VisioImporter Class
MindFusion.Diagramming.Import Namespace

VisioImporter.PagesPerRow Property

Gets or sets how many Visio pages to import on a row before offsetting the import location vertically.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public long PagesPerRow { get; set; }
```

Visual Basic Copy Code

```
Public Property PagesPerRow As Long
```

Property Value

An integer value specifying how many pages to import in a row. The default is 1.

Remarks

MvcDiagram does not support stacked pages as Visio does, so the ImportAllPages method imports all pages from a Visio document in a grid that prevents items from one page to overlap with items from another page. This property specifies the width of the page grid.

VisioImporter Members
VisioImporter Class
MindFusion.Diagramming.Import Namespace

VisioImporter.SuppressUnmanagedCode Property

Suppress usage of unmanaged code.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public bool SuppressUnmanagedCode { get; set; }
```

Visual Basic Copy Code

```
Public Property SuppressUnmanagedCode As Boolean
```

Property Value

See Also

VisioImporter Members
VisioImporter Class
MindFusion.Diagramming.Import Namespace

VisioImporter Events

VisioImporter.ConnectorImported Event

Raised when a Visio connector is imported as a MvcDiagram link.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C# Copy Code

```
public event EventHandler<ConnectorImportedEventArgs> ConnectorImported
```

Visual Basic	Copy Code
`Public Event ConnectorImported As EventHandler(Of ConnectorImportedEventArgs)`	

Event Data

ConnectorImported event handlers receive an argument of type ConnectorImportedEventArgs. The following **ConnectorImportedEventArgs** members provide information relevant to the event:

Member Name	Description
Link	Refers to the imported DiagramLink instance.
ShapeName	The name of the Visio connector shape.

See Also

VisioImporter Members
VisioImporter Class
MindFusion.Diagramming.Import Namespace

VisioImporter.GroupImported Event

Raised when a Visio group is imported as a MvcDiagram group.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C#	Copy Code
`public event EventHandler<GroupImportedEventArgs> GroupImported`	

Visual Basic	Copy Code
`Public Event GroupImported As EventHandler(Of GroupImportedEventArgs)`	

Event Data

GroupImported event handlers receive an argument of type GroupImportedEventArgs. The following **GroupImportedEventArgs** members provide information relevant to the event:

Member name	Description
Group	Refers to the imported Group instance.

See Also

VisioImporter Members
VisioImporter Class
MindFusion.Diagramming.Import Namespace

VisioImporter.ShapeImported Event

Raised when a Visio shape is imported into MvcDiagram as a ShapeNode.

Namespace: MindFusion.Diagramming.Import
Assembly: MindFusion.Diagramming.Import.Visio

Syntax

C#	Copy Code
`public event EventHandler<ShapeImportedEventArgs> ShapeImported`	

Visual Basic Copy Code

```
Public Event ShapeImported As EventHandler(Of ShapeImportedEventArgs)
```

Event Data

ShapeImported event handlers receive an argument of type ShapeImportedEventArgs. The following **ShapeImportedEventArgs** members provide information relevant to the event:

Member name	Description
Shape	Refers to the imported ShapeNode instance.
ShapeName	The name of the Visio node shape.

Remarks

The basic **Visio** flowchart shapes are mapped to the MvcDiagram predefined shape templates. If the importer does not recognize a specific Visio shape, the node created for it is set to a simple rectangle. You can handle this event in order to set the shape of a node whose Visio counterpart is not recognized, or whose default value set by the importer is not appropriate for your application.

MindFusion.Diagramming.Layout Namespace

AnnealLayout Class

Implements a simulated annealing graph layout algorithm.

Syntax

C# Copy Code

```
public class AnnealLayout : Layout
```

Visual Basic Copy Code

```
Public Class AnnealLayout
    Inherits Layout
```

Remarks

Simulated Annealing is a general-purpose optimization method used to solve large-scale combinatorial problems by simulating the process of heating and cooling of metal to achieve freedom from defects. Finding a nice arrangement of a graph is a combinatorial problem that can be reduced to assigning costs to graph configurations and finding the minimum cost configuration. In that case, a cost is assigned to a graph configuration by evaluating different aesthetic criteria such as distance between nodes, length of links and the number of link crossings.

The **AnnealLayout** class implements a Simulated Annealing graph layout algorithm that can be used to arrange MvcDiagram diagrams. To arrange a diagram, create an **AnnealLayout** instance, set its properties and call the Arrange method.

The algorithm starts the simulation with the temperature set in InitialTemperature, and runs several cooling Stages. At each stage the algorithm evaluates several graph configurations for each node, as set in IterationsPerStage. At the end of each stage, the algorithm selects the configuration that has a minimum cost and decreases the temperature by multiplying it by TemperatureScale. The relative weight of an aesthetic criterion relative to the other criteria is set by the DistributionFactor, LinkLengthFactor, BoundaryFactor and CrossingLinksCost properties.

Anchoring specifies whether the layout algorithm must attach links to the anchor points of graphs nodes. The layout algorithm produces best results if it can place link ends at arbitrary positions over the nodes outlines, that is, when using the Ignore value. If your application logic requires links to be always attached to anchor points, use the other two values. In such cases **Reassign** would yield better results.

AnnealLayout Members

Implements a simulated annealing graph layout algorithm.

The following tables list the members exposed by the AnnealLayout type.

Public Constructors

	Name	Description
	AnnealLayout	Initializes a new instance of the **AnnealLayout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	ApproximateLinkLength	Gets or sets a value indicating whether the layout should approximate the length of graph links by calculating the distance between the centers of their incident nodes.
	BoundaryFactor	Gets or sets a value indicating the importance of the distance between nodes and the layout area boundaries, relative to the other criteria considered by the algorithm.
	CrossingLinksCost	Gets or sets a value indicating the importance of the low number of link crossings, relative to the other criteria considered by the algorithm.
	DistributionFactor	Gets or sets a value indicating the importance of the node distribution, relative to the other criteria considered by the algorithm.
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GatherStatistics	
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	InitialTemperature	Gets or sets the initial temperature of the simulated annealing process.
	IterationsPerStage	Gets or sets how many node shift iterations to perform at each stage of the algorithm.
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayoutArea	Gets or sets the size of the layout area.
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)

	LinkLengthFactor	Gets or sets a value indicating the importance of the short length of links, relative to the other criteria considered by the algorithm.
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	NodeLinkCrossingCost	Gets or sets a value indicating the importance of low number of overlaps between links and nodes relative to the other criteria considered by the algorithm.
	NodeLinkDistFactor	Gets or sets a value indicating the importance of the distance between nodes and links, relative to the other criteria considered by the algorithm.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	Randomize	Gets or sets a value indicating whether the nodes should be placed at random positions when the layout routine starts.
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	Root	Gets or sets a node indicating which subgraph of the diagram should be laid out.
	SplitGraph	Gets or sets a value indicating whether unconnected subgraphs should be laid out independently from each other.
	Stages	Gets or sets how many cool-down stages the algorithm should simulate.
	Statistics	
	TemperatureScale	Gets or sets how much the simulated temperature is decreased at each stage of the algorithm.
	WidthHeightRatio	Gets or sets what width/height ratio the layout area should have.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)
	BeginArrange	Initializes the layout object for a step-by-step execution.
	EndArrange	Completes the step-by-step execution started with a call to **BeginArrange**.

	Iterate	Runs one or more layout iterations.

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

MindFusion.Diagramming.Layout Namespace

AnnealLayout Constructor

Initializes a new instance of the AnnealLayout class.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public AnnealLayout ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

AnnealLayout Class
MindFusion.Diagramming.Layout Namespace

AnnealLayout Methods

AnnealLayout.BeginArrange Method

Initializes the layout object for a step-by-step execution.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool BeginArrange (
    Diagram diagram,
    DiagramItemCollection items
)
```

Visual Basic Copy Code

```
Public Function BeginArrange( _
    diagram As Diagram, _
    items As DiagramItemCollection _
) As Boolean
```

Parameters

diagram

The Diagram that will be arranged.

items

A collection of nodes and links from *diagram* that define the subgraph to arrange.

Return Value

true if the layout object has been initialized successfully; otherwise, **false**.

Remarks

You can use this method together with Iterate and EndArrange to display an animation of the layout process. To run all iterations of the process at once and display just the end result, call Arrange.

See Also

AnnealLayout Members
AnnealLayout Class
MindFusion.Diagramming.Layout Namespace

AnnealLayout.EndArrange Method

Completes the step-by-step execution started with a call to BeginArrange.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public void EndArrange ()
```

Visual Basic Copy Code

```
Public Sub EndArrange ()
```

See Also

AnnealLayout Members
AnnealLayout Class
MindFusion.Diagramming.Layout Namespace

AnnealLayout.Iterate Method

Runs one or more layout iterations.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public void Iterate (
    int iterationFrom,
    int iterationTo
)
```

Visual Basic Copy Code

```
Public Sub Iterate( _
    iterationFrom As Integer, _
    iterationTo As Integer _
)
```

Parameters

iterationFrom

Specifies from which iteration to start.

iterationTo

Specifies at which iteration to stop.

Remarks

Use this method to create an animation of the layout process, for example, by calling it from a timer. Call BeginArrange to prepare the layout object for use of **Iterate**, and call EndArrange when done. Each call to **Iterate** should start from the iteration next to the one where the previous call has stopped.

AnnealLayout Properties

AnnealLayout.ApproximateLinkLength Property

Gets or sets a value indicating whether the layout should approximate the length of graph links by calculating the distance between the centers of their incident nodes.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool ApproximateLinkLength { get; set; }
```

Visual Basic Copy Code

```
Public Property ApproximateLinkLength As Boolean
```

Property Value

See Also

AnnealLayout Members
AnnealLayout Class
MindFusion.Diagramming.Layout Namespace

AnnealLayout.BoundaryFactor Property

Gets or sets a value indicating the importance of the distance between nodes and the layout area boundaries, relative to the other criteria considered by the algorithm.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double BoundaryFactor { get; set; }
```

Visual Basic Copy Code

```
Public Property BoundaryFactor As Double
```

Property Value

A double multiplier applied to the node-to-boundary distance cost when evaluating the total cost of a graph configuration. The default is 3000.

Remarks

Assigning a larger value to this property will make the algorithm choose graph configurations in which nodes are placed farther from the layout area bounds, that is, nodes will tend to gather in the center of the layout area.

LinkLengthFactor Property
DistributionFactor Property

AnnealLayout.CrossingLinksCost Property

Gets or sets a value indicating the importance of the low number of link crossings, relative to the other criteria considered by the algorithm.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double CrossingLinksCost { get; set; }
```

Visual Basic Copy Code

```
Public Property CrossingLinksCost As Double
```

Property Value

A double value added to the total cost of a graph configuration for each pair of crossing links. The default is 120000.

Remarks

Assigning a larger value to this property will make the algorithm choose graph configurations with fewer link crossings.

See Also

AnnealLayout Members

MindFusion.Diagramming.Layout Namespace
LinkLengthFactor Property

AnnealLayout.DefaultMarginValue Property

Gets the default value of the Margins property.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
protected override Size DefaultMarginValue { get; }
```

Visual Basic Copy Code

```
Protected Overrides ReadOnly Property DefaultMarginValue As Size
```

Property Value

Returns new Size(5, 5).

See Also

AnnealLayout Members
AnnealLayout Class
MindFusion.Diagramming.Layout Namespace

AnnealLayout.DistributionFactor Property

Gets or sets a value indicating the importance of the node distribution, relative to the other criteria considered by the algorithm.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double DistributionFactor { get; set; }
```

Visual Basic Copy Code

```
Public Property DistributionFactor As Double
```

Property Value

A double multiplier applied to the node distribution cost when evaluating the total cost of a graph configuration. The default is 40000.

Remarks

Assigning a larger value to this property will make the algorithm choose graph configurations in which the nodes are placed farther one from another.

AnnealLayout Class
MindFusion.Diagramming.Layout Namespace
LinkLengthFactor Property
BoundaryFactor Property

AnnealLayout.GatherStatistics Property

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool GatherStatistics { get; set; }
```

Visual Basic Copy Code

```
Public Property GatherStatistics As Boolean
```

Property Value

See Also

AnnealLayout Members
AnnealLayout Class
MindFusion.Diagramming.Layout Namespace

AnnealLayout.InitialTemperature Property

Gets or sets the initial temperature of the simulated annealing process.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double InitialTemperature { get; set; }
```

Visual Basic Copy Code

```
Public Property InitialTemperature As Double
```

Property Value

A double value specifying the initial temperature of the simulation. The default is 40.

Remarks

A low initial temperature prevents nodes from moving far from their initial position. If you need the final arrangement to have resemblance to the initial formation of the graph elements, set a lower initial temperature and disable Randomize.

See Also

AnnealLayout Members
AnnealLayout Class
MindFusion.Diagramming.Layout Namespace
TemperatureScale Property

AnnealLayout.IterationsPerStage Property

Gets or sets how many node shift iterations to perform at each stage of the algorithm.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public int IterationsPerStage { get; set; }
```

Visual Basic Copy Code

```
Public Property IterationsPerStage As Integer
```

Property Value

An integer value specifying the number of node shift iterations. The default is 50.

Remarks

IterationsPerStage specifies how many node configurations to evaluate at each stage of the temperature cool-down simulation. More iterations will yield better layouts but require more time to complete.

See Also

AnnealLayout Members
AnnealLayout Class
MindFusion.Diagramming.Layout Namespace
Progress Property
Stages Property

AnnealLayout.LayoutArea Property

Gets or sets the size of the layout area.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Rect LayoutArea { get; set; }
```

Visual Basic Copy Code

```
Public Property LayoutArea As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** representing the boundaries of the layout area. The default is **Empty**.

Remarks

If the layout area is not explicitly set, the algorithm will choose one suitable for the graph size. In that case the WidthHeightRatio property specifies how much larger the layout area width should be than its height.

AnnealLayout.LinkLengthFactor Property

Gets or sets a value indicating the importance of the short length of links, relative to the other criteria considered by the algorithm.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double LinkLengthFactor { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkLengthFactor As Double
```

Property Value

A double multiplier applied to the link length cost when evaluating the total cost of a graph configuration. The default is 0.25.

Remarks

Assigning a larger value to this property will make the algorithm choose graph configurations in which links are shorter.

See Also

AnnealLayout.Name Property

Gets a user-friendly name of the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public override string Name { get; }
```

Visual Basic Copy Code

```
Public Overrides ReadOnly Property Name As String
```

Property Value

Returns "Anneal layout".

MindFusion.Diagramming.Layout Namespace

AnnealLayout.Root Property

Gets or sets a node indicating which subgraph of the diagram should be laid out.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public DiagramNode Root { get; set; }
```

Visual Basic Copy Code

```
Public Property Root As DiagramNode
```

Property Value

A DiagramNode whose containing graph should be arranged. The default is **null** (**Nothing** in Visual Basic).

Remarks

If a root nodes is specified and SplitGraph is enabled, only the graph that contains the root node is laid out by Arrange.

AnnealLayout Members
AnnealLayout Class
MindFusion.Diagramming.Layout Namespace

AnnealLayout.SplitGraph Property

Gets or sets a value indicating whether unconnected subgraphs should be laid out independently from each other.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool SplitGraph { get; set; }
```

Visual Basic Copy Code

```
Public Property SplitGraph As Boolean
```

Property Value

true if unconnected graphs in the diagram should be laid out independently; otherwise, **false**. The default is **false**.

Remarks

If this property is set to true, each independent graph in the diagram is laid out in its own layout area. Otherwise all subgraphs are arranged in the same layout area. If a Root node is specified and **SplitGraph** is **true**, only the graph that contains the root node will be arranged.

AnnealLayout Class
MindFusion.Diagramming.Layout Namespace

AnnealLayout.Stages Property

Gets or sets how many cool-down stages the algorithm should simulate.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public int Stages { get; set; }
```

Visual Basic Copy Code

```
Public Property Stages As Integer
```

Property Value

An integer value specifying the number of temperature decreases the simulation should run. The default is 15.

Remarks

At each stage the algorithm evaluates different graph arrangements produced by modifying the best configuration from the previous stage. The modifications are done by shifting nodes by a distance that depends on the current temperature. The TemperatureScale property specifies how much the temperature decreases at each stage. IterationsPerStage specifies how many configurations are evaluated at each stage.

AnnealLayout.Statistics Property

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public AnnealLayoutStatistics Statistics { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Statistics As AnnealLayoutStatistics
```

Property Value

See Also

AnnealLayout Members
AnnealLayout Class
MindFusion.Diagramming.Layout Namespace

AnnealLayout.TemperatureScale Property

Gets or sets how much the simulated temperature is decreased at each stage of the algorithm.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double TemperatureScale { get; set; }
```

Visual Basic Copy Code

```
Public Property TemperatureScale As Double
```

Property Value

A double multiplier applied to the simulated temperature at each stage of the algorithm. The default is 0.75.

Remarks

This value should be in the interval (0,1). The algorithm produces better results when running for many Stages with a gradual temperature decrease, that is, a **TemperatureScale** closer to 1.

See Also

AnnealLayout.WidthHeightRatio Property

Gets or sets what width/height ratio the layout area should have.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double WidthHeightRatio { get; set; }
```

Visual Basic Copy Code

```
Public Property WidthHeightRatio As Double
```

Property Value

A **double** value specifying the layout area width to height ratio. The default is 1.

Remarks

If the LayoutArea is not explicitly set, the algorithm will choose one suitable for the graph size. In that case the **WidthHeightRatio** property specifies how much larger the layout area width should be than its height.

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

CascadeLayout Class

Performs cascading layout on simple, connected graphs.

Syntax

C# Copy Code

```
public class CascadeLayout : Layout
```

Visual Basic Copy Code

```
Public Class CascadeLayout
    Inherits Layout
```

Remarks

CascadeLayout places nodes on a virtual grid and arranges links orthogonally, such that if the source graph is planar all links are guaranteed to have no more than two bends and will not intersect. By default the layout method arranges nodes in rows and link segments in columns; this can be changed by setting the Orientation property.

CascadeLayout Members

Performs cascading layout on simple, connected graphs.

The following tables list the members exposed by the CascadeLayout type.

Public Constructors

	Name	Description
	CascadeLayout	Initializes a new instance of the **CascadeLayout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)

	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	Orientation	Gets or sets the orientation of the arranged graph.
	Padding	Gets or sets the spacing between nodes in adjacent layers.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

CircularLayout Members

Implements a circular graph layout algorithm. Nodes are distributed evenly on the circumference of a circle at positions that result in as few link crossing as possible.

The following tables list the members exposed by the CircularLayout type.

Public Constructors

	Name	Description
	CircularLayout	Initializes a new instance of the **CircularLayout** class with the default settings.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	AutoRadiusFactor	Gets or sets a multiplier for the automatically calculated radius when Radius is set to 0.
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)

	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	Radius	Gets or sets the radius of the layout circle.
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	SiftingRounds	Gets or sets the number of sifts to perform during the layout.
	SplitGraph	Gets or sets a value indicating whether to split the graph to its interconnected subgraphs and arrange the subgraphs independently or arrange the graph as a whole.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

CircularLayout.Name Property

Gets a user-friendly name of the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public override string Name { get; }
```

Visual Basic Copy Code

```
Public Overrides ReadOnly Property Name As String
```

Property Value

Returns "Circular layout".

See Also

CircularLayout Members
CircularLayout Class
MindFusion.Diagramming.Layout Namespace

CircularLayout.Radius Property

Gets or sets the radius of the layout circle.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double Radius { get; set; }
```

Visual Basic Copy Code

```
Public Property Radius As Double
```

Property Value

A **double** value specifying the radius. The default value is 60.

Remarks

If this property is set to 0, the layout will try to find an appropriate radius depending on the number and size of the participating nodes.

See Also

CircularLayout Members
CircularLayout Class
MindFusion.Diagramming.Layout Namespace

CircularLayout.SiftingRounds Property

Gets or sets the number of sifts to perform during the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public int SiftingRounds { get; set; }
```

Visual Basic Copy Code

```
Public Property SiftingRounds As Integer
```

Property Value

An integer value specifying the number of sifting rounds. The default value is 1.

Remarks

After calculating the initial placement of nodes using a fast but inaccurate layout function, the algorithm can run a few sifting rounds to reduce the link crossings, as set in this property.

CircularLayout.SplitGraph Property

Gets or sets a value indicating whether to split the graph to its interconnected subgraphs and arrange the subgraphs independently or arrange the graph as a whole.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool SplitGraph { get; set; }
```

Visual Basic Copy Code

```
Public Property SplitGraph As Boolean
```

Property Value

true if unconnected graphs in the diagram should be laid out independently; otherwise, **false**. The default is **true**.

CircularLayout Members
CircularLayout Class
MindFusion.Diagramming.Layout Namespace

CircularLayout Events

CompositeLayout Class

Implements a multi-level graph layout algorithm.

Syntax

C# Copy Code

```
public class CompositeLayout : Layout
```

Visual Basic Copy Code

```
Public Class CompositeLayout
    Inherits Layout
```

Remarks

CompositeLayout partitions the diagram into several subgraphs and applies the algorithm specified via the SubgraphLayout property on each part. If the part is a tree, it is arranged using the algorithm specified via the SubtreeLayout property, which is set to a radial TreeLayout instance by default. Finally the algorithm specified via MasterLayout is applied on the graph that represents the overall partition. By running the polynomial-complexity layout algorithms on small subgraphs, **CompositeLayout** is able to process a large graph much faster than if a layout algorithm is applied on the whole graph.

CompositeLayout can run on custom partitions specified as lists of nodes, or automatically partition the diagram via two automatic methods based on graph connectivity and graph path lengths. Set the PartitionMethod and CustomPartition properties to specify how the diagram should be partitioned.

Inheritance Hierarchy

System.Object
  System.MarshalByRefObject
    System.ComponentModel.Component
      MindFusion.Diagramming.Layout.Layout
        MindFusion.Diagramming.Layout.CompositeLayout

See Also

CompositeLayout Members
MindFusion.Diagramming.Layout Namespace

CompositeLayout Members

Implements a multi-level graph layout algorithm.

The following tables list the members exposed by the CompositeLayout type.

Public Constructors

	Name	Description
	CompositeLayout	Initializes a new instance of the **CompositeLayout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	BendLinks	Gets or sets a value indicating whether the links in the trees from the additional partitioning pass will bend to avoid crossing leaves in the same tree.

	CustomLayout	Gets or sets a custom layout method that should be invoked to arrange subgraphs.
	CustomPartition	Gets or sets the custom partition to use when PartitionMethod is set to Custom.
	DesiredSubgraphSize	Gets or sets the preferred number of nodes in the subgraphs allocated by the layout algorithm.
	EmphasizeTrees	Gets or sets a value indicating whether a cut-vertex between tree and non-tree subgraphs should be considered part of the tree.
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	KeepVirtualItems	Gets or sets a value indicating whether to keep the intermediate virtual nodes and links.
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MasterLayout	Gets or sets a layout that should be applied globally to the diagram.
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	PartitionMethod	Gets or sets the partitioning method used to decompose the diagram into subgraphs.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	RotateSubgraphs	Gets or sets a value indicating whether subgraphs are rotated to minimize intersections with cross-partition links.
	SubgraphLayout	Gets or sets a layout that should be applied to general subgraphs.
	SubtreeLayout	Gets or sets a layout that should be applied to subgraphs representing trees.
	Tolerance	A multiplier applied to DesiredSubgraphSize to define the allowed subgraph size range.
	UseAdditionalPartitioning	Gets or sets a value indicating whether to use an additional partitioning pass on the result of the initial partitioning. This additional partitioning is simplified - it only looks for trees with depth 2.

Protected Properties

	Name	Description

	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

CompositeLayout.CustomLayout Property

Gets or sets a custom layout method that should be invoked to arrange subgraphs.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public LayoutSubgraph CustomLayout { get; set; }
```

Visual Basic Copy Code

```
Public Property CustomLayout As LayoutSubgraph
```

Property Value

A LayoutSubgraph delegate object.

See Also

CompositeLayout Members
CompositeLayout Class
MindFusion.Diagramming.Layout Namespace

CompositeLayout.CustomPartition Property

Gets or sets the custom partition to use when PartitionMethod is set to Custom.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public List<DiagramNodeCollection> CustomPartition { get; set; }
```

Visual Basic Copy Code

```
Public Property CustomPartition As List(Of DiagramNodeCollection)
```

Property Value

A list of DiagramNodeCollection objects that partitions the diagram into subgraphs.

Remarks

This value is used if PartitionMethod is set to Custom.

See Also

CompositeLayout Members
CompositeLayout Class
MindFusion.Diagramming.Layout Namespace

CompositeLayout.DefaultMarginValue Property

Gets the default value of the Margins property.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
protected override Size DefaultMarginValue { get; }
```

Visual Basic Copy Code

```
Protected Overrides ReadOnly Property DefaultMarginValue As Size
```

Property Value

Returns new Size(5, 5).

See Also

CompositeLayout Members
CompositeLayout Class
MindFusion.Diagramming.Layout Namespace

CompositeLayout.DesiredSubgraphSize Property

Gets or sets the preferred number of nodes in the subgraphs allocated by the layout algorithm.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public int DesiredSubgraphSize { get; set; }
```

Visual Basic Copy Code

```
Public Property DesiredSubgraphSize As Integer
```

Property Value

An integer value specifying the desired number of nodes in each subgraph.

Remarks

This property is considered by the automatic partitioning algorithm when generating subgraphs. Usually the subgraphs won't contain exactly as many nodes, but are within the Tolerance range around the property value.

See Also

CompositeLayout.EmphasizeTrees Property

Gets or sets a value indicating whether a cut-vertex between tree and non-tree subgraphs should be considered part of the tree.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool EmphasizeTrees { get; set; }
```

Visual Basic Copy Code

```
Public Property EmphasizeTrees As Boolean
```

Property Value

true to add cut-vertices to trees, otherwise **false**. The default value is **true**.

See Also

CompositeLayout Members
CompositeLayout Class
MindFusion.Diagramming.Layout Namespace
SubtreeLayout Property

CompositeLayout.KeepVirtualItems Property

Gets or sets a value indicating whether to keep the intermediate virtual nodes and links.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool KeepVirtualItems { get; set; }
```

Visual Basic Copy Code

```
Public Property KeepVirtualItems As Boolean
```

Property Value

See Also

CompositeLayout Members
CompositeLayout Class
MindFusion.Diagramming.Layout Namespace

CompositeLayout.MasterLayout Property

Gets or sets a layout that should be applied globally to the diagram.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Layout MasterLayout { get; set; }
```

Visual Basic Copy Code

```
Public Property MasterLayout As Layout
```

Property Value

An instance of Layout-derived class. The default is AnnealLayout.

Remarks

Each subset in the layout partition is considered a node in a graph representing the diagram. **MasterLayout** is used to arrange that graph, while SubgraphLayout and SubtreeLayout are applied on the partition subsets. Since in the general case subsets will occupy areas of varying size, **MasterLayout** should be set to an instance of a layout class that can handle nodes of non-uniform dimensions.

CompositeLayout Members
CompositeLayout Class
MindFusion.Diagramming.Layout Namespace

CompositeLayout.RotateSubgraphs Property

Gets or sets a value indicating whether subgraphs are rotated to minimize intersections with cross-partition links.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
public bool RotateSubgraphs { get; set; }
```

Visual Basic

```
Public Property RotateSubgraphs As Boolean
```

Property Value

true to rotate subgraphs, otherwise **false**. The default value is **false**.

See Also

CompositeLayout Members
CompositeLayout Class
MindFusion.Diagramming.Layout Namespace

CompositeLayout.SubgraphLayout Property

Gets or sets a layout that should be applied to general subgraphs.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
public Layout SubgraphLayout { get; set; }
```

Visual Basic

```
Public Property SubgraphLayout As Layout
```

Property Value

An instance of Layout-derived class. The default is CircularLayout.

Remarks

If the subgraph is a tree, CompositeLayout uses SubtreeLayout to arrange it.

See Also

CompositeLayout Members
CompositeLayout Class
MindFusion.Diagramming.Layout Namespace

CompositeLayout.SubtreeLayout Property

Gets or sets a layout that should be applied to subgraphs representing trees.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Layout SubtreeLayout { get; set; }
```

Visual Basic Copy Code

```
Public Property SubtreeLayout As Layout
```

Property Value

An instance of Layout-derived class. The default is radial TreeLayout.

Remarks

The trees isolated by the automatic partitioning methods are undirected, hence when using a custom tree layout you should use settings that ignore the direction of links. Alternatively, use custom partitioning to ensure subgraphs are directed trees, i.e. the links in paths from the root to each node follow the same direction.

MasterLayout Property
SubgraphLayout Property
PartitionMethod Property

CompositeLayout.Tolerance Property

A multiplier applied to DesiredSubgraphSize to define the allowed subgraph size range.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double Tolerance { get; set; }
```

Visual Basic Copy Code

```
Public Property Tolerance As Double
```

Property Value

A **double** value specifying the tolerance range. The default is 0.2.

CompositeLayout Class
MindFusion.Diagramming.Layout Namespace

CompositeLayout.UseAdditionalPartitioning Property

Gets or sets a value indicating whether to use an additional partitioning pass on the result of the initial partitioning. This additional partitioning is simplified - it only looks for trees with depth 2.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool UseAdditionalPartitioning { get; set; }
```

Visual Basic Copy Code

```
Public Property UseAdditionalPartitioning As Boolean
```

Property Value

true to use second partitioning pass; otherwise, **false**. The default is **false**.

CompositeLayout Events

DecisionLayout Class

Implements a flowchart layout algorithm.

Syntax

C# Copy Code

```
public class DecisionLayout : Layout
```

Visual Basic Copy Code

```
Public Class DecisionLayout
    Inherits Layout
```

Remarks

This algorithm arranges simple flowcharts consisting of decision boxes with up to three outgoing links per node and activity boxes with a single outgoing link per node. The nodes are arranged in columns and rows, whose distance depends on the HorizontalPadding and VerticalPadding property values. When links share the same row or column, they are placed at a distance specified via LinkPadding.

The layout arranges nodes recursively starting from StartNode. If **StartNode** is not specified, the algorithm selects the root of the deepest branch of the graph's spanning tree as start node.

The overall orientation of the layout can be set via the Orientation property. There is no distinction made between yes/no links, and the node sides by which links are aligned depend only on the order of links in **OutgoingLinks** collection. If you have a preferred position for links depending on their yes/no type, make sure the **OutgoingLinks** collections of nodes are sorted by links' logical values.

DecisionLayout Members

Implements a flowchart layout algorithm.

The following tables list the members exposed by the DecisionLayout type.

Public Constructors

	Name	Description
	DecisionLayout	Initializes a new instance of the **DecisionLayout** class with the default settings.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	HorizontalPadding	Gets or sets the horizontal distance between adjacent nodes.
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	LinkPadding	Gets or sets the distance between parallel links.
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	Orientation	Gets or sets the orientation of the arranged diagram.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	StartNode	Gets or sets the initial (top-left) node in the arranged diagram.
	VerticalPadding	Gets or sets the vertical distance between adjacent nodes.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

DecisionLayout.HorizontalPadding Property

Gets or sets the horizontal distance between adjacent nodes.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double HorizontalPadding { get; set; }
```

Visual Basic Copy Code

```
Public Property HorizontalPadding As Double
```

Property Value

A **double** value specifying the distance between adjacent nodes in same row. The default value is 15.

DecisionLayout.Orientation Property

Gets or sets the orientation of the arranged diagram.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
public Orientation Orientation { get; set; }
```

Visual Basic

```
Public Property Orientation As Orientation
```

Property Value

A member of the Orientation enumeration specifying the overall layout orientation. The default value is **Vertical**.

DecisionLayout.StartNode Property

Gets or sets the initial (top-left) node in the arranged diagram.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public DiagramNode StartNode { get; set; }
```

Visual Basic Copy Code

```
Public Property StartNode As DiagramNode
```

Property Value

A DiagramNode instance specifying the start node.

Remarks

If this property is **null**, the layout will pick-up a start node automatically.

FlowchartLayout Class

FlowchartLayout can be used to arrange flowcharts representing program source code.

Syntax

C# Copy Code

```
public class FlowchartLayout : Layout
```

Visual Basic Copy Code

```
Public Class FlowchartLayout
    Inherits Layout
```

Remarks

The algorithm recognizes program code -like patterns in the graph, such as loops, sequences and if/switch branchings, and arranges them recursively. **FlowchartLayout** could be used to arrange other types of graphs as well, though with some restrictions. For example it treats all back links as loops in the code, and expects that they are nested - loop links starting closer to the stop node should end closer to the start node. Another similar restriction is that there shouldn't be any cross-links that connect different branches of a decision sub-graph.

FlowchartLayout Members

FlowchartLayout can be used to arrange flowcharts representing program source code.

The following tables list the members exposed by the FlowchartLayout type.

Public Constructors

	Name	Description
	FlowchartLayout	Initializes a new instance of the **FlowchartLayout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	BranchPadding	Gets or sets how much space to leave between adjacent decision branches in the flowchart.
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	IgnoreRepeatingLinks	Gets or sets a value indicating whether to ignore repeating links.
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	LinkPadding	Gets or sets how much space to leave between adjacent back links designating nested loops.
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	NodeDistance	Gets or sets the distance between consecutive nodes in the flowchart.
	Orientation	Gets or sets the overall orientation of the arranged diagram.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	SplitGraph	Gets or sets a value indicating whether unconnected subgraphs should be laid out independently from each other.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

FlowchartLayout Members
FlowchartLayout Class
MindFusion.Diagramming.Layout Namespace

FlowchartLayout.IgnoreRepeatingLinks Property

Gets or sets a value indicating whether to ignore repeating links.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool IgnoreRepeatingLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property IgnoreRepeatingLinks As Boolean
```

Property Value

true to ignore repeating links, otherwise **false**. The default value is **false**.

Remarks

If there are many links connecting the same pair of nodes in the same direction, the analysis of the inherent flowchart structure might fail. In such cases, set this property to **true**.

FlowchartLayout Members
FlowchartLayout Class
MindFusion.Diagramming.Layout Namespace

FlowchartLayout.SplitGraph Property

Gets or sets a value indicating whether unconnected subgraphs should be laid out independently from each other.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool SplitGraph { get; set; }
```

Visual Basic Copy Code

```
Public Property SplitGraph As Boolean
```

Property Value

true to arrange each subgraph on its own, otherwise **false**. The default value is **true**.

Remarks

If this property is set to **true**, each independent graph in the diagram is laid out in its own layout area. Otherwise all subgraphs are arranged in the same layout area.

FlowchartLayout Events

FractalLayout Class

A tree layout algorithm that places child nodes symmetrically around their parent node.

Syntax

C# Copy Code

```
public class FractalLayout : Layout
```

Visual Basic Copy Code

```
Public Class FractalLayout
    Inherits Layout
```

Remarks

Nodes at the lowest level are arranged directly in a circle around their parent. At the upper level, the already arranged nodes form branches that are arranged in a circle around the new parent node. The algorithm is recursively repeated till the highest level is reached. If nodes in the tree have uniform number of children, the end result has fractal-like appearance (subsets of the graph look like scaled-down copies of the whole graph).

You can choose which node should be displayed at the center of the topmost circle by setting the Root property. If it is not specified, the algorithm automatically selects a root that leads to more balanced distribution of nodes.

Inheritance Hierarchy

FractalLayout Members

A tree layout algorithm that places child nodes symmetrically around their parent node.

The following tables list the members exposed by the FractalLayout type.

Public Constructors

	Name	Description
	FractalLayout	Initializes a new instance of the **FractalLayout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	Root	Gets or sets the tree root.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

GridLayout Class

Implements a grid graph layout algorithm.

Syntax

C# Copy Code

```
public class GridLayout : Layout
```

Visual Basic Copy Code

```
Public Class GridLayout
    Inherits Layout
```

Remarks

GridLayout arranges diagram nodes in a grid, keeping connected nodes close together. The algorithm strives to achieve a small number of link crossings. It is based on an iterative process whose initial steps shuffle the grid nodes randomly. That can lead to very different results each time the algorithm is run.

To apply the layout to a diagram, create a **GridLayout** instance, set its members and invoke the Arrange method. Arrange lays out all subgraphs in a diagram, unless the Root property is set.

The distance between points in the layout grid can be changed through GridSize. Nodes to be placed at the upper-left and lower-right corners of the grid can be assigned to StartNode and EndNode.

Anchoring specifies whether the layout algorithm must attach links to the anchor points of graphs nodes. The grid layout algorithm produces best results if it can place link ends at arbitrary positions over nodes' outlines, that is, when using the Ignore value. If your application logic requires links to be always attached to anchor points, use the other two values. In such cases **Reassign** would yield better results.

The following tables list the members exposed by the GridLayout type.

Public Constructors

	Name	Description
	GridLayout	Initializes a new instance of the **GridLayout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)

	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	EndNode	Gets or sets the node that is placed at the lower right corner of the grid.
	GridSize	Gets or sets the desired distance between adjacent grid points.
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	Iterations	Gets or sets for how many iterations to run the grid layout algorithm.
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RandomSeed	Gets or sets the randomization seed to use for generating random node positions.
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	Root	Gets or sets a node indicating which subgraph of the diagram should be laid out.
	SplitGraph	Gets or sets a value indicating whether to split the graph to its interconnected subgraphs and arrange the subgraphs independently or arrange the graph as a whole.
	StartNode	Gets or sets the node that is placed at the upper left corner of the grid.
	TimeLimit	Gets or sets a time-out value for the path-finding part of the grid layout algorithm.
	UseLongestPath	Gets or sets a value indicating whether the algorithm should arrange nodes around the longest path in the graph.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

C#

```
public DiagramNode EndNode { get; set; }
```

Visual Basic

```
Public Property EndNode As DiagramNode
```

Property Value

An instance of the DiagramNode class. Default value is **null** (**Nothing** in Visual Basic).

Remarks

If you assign a node to that property, then StartNode cannot be **null** and must be set too. GridLayout usually produces better layouts if both **StartNode** and **EndNode** are **null** references; in such a case the algorithm automatically selects suitable nodes.

GridLayout Members
GridLayout Class
MindFusion.Diagramming.Layout Namespace

GridLayout.GridSize Property

Gets or sets the desired distance between adjacent grid points.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
public double GridSize { get; set; }
```

Visual Basic

```
Public Property GridSize As Double
```

Property Value

A **double** number specifying the grid size. The default is 25.

Remarks

When placing a node at a grid position, the node center point is aligned to the grid point at that position.

See Also

GridLayout Members
GridLayout Class
MindFusion.Diagramming.Layout Namespace

GridLayout.Iterations Property

Gets or sets for how many iterations to run the grid layout algorithm.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public int Iterations { get; set; }
```

Visual Basic Copy Code

```
Public Property Iterations As Integer
```

Property Value

An integer number specifying the number of iterations. The default is 3000.

Remarks

More iterations would yield better layouts but require more time to complete.

MindFusion.Diagramming.Layout Namespace
Progress Property

GridLayout.Name Property

Gets a user-friendly name of the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public override string Name { get; }
```

Visual Basic Copy Code

```
Public Overrides ReadOnly Property Name As String
```

Property Value

Returns "Grid layout".

See Also

GridLayout Members
GridLayout Class
MindFusion.Diagramming.Layout Namespace

GridLayout.RandomSeed Property

Gets or sets the randomization seed to use for generating random node positions.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public int RandomSeed { get; set; }
```

Visual Basic Copy Code

```
Public Property RandomSeed As Integer
```

Property Value

See Also

GridLayout Members
GridLayout Class
MindFusion.Diagramming.Layout Namespace

GridLayout.Root Property

Gets or sets a node indicating which subgraph of the diagram should be laid out.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public DiagramNode Root { get; set; }
```

Visual Basic Copy Code

```
Public Property Root As DiagramNode
```

Property Value

An instance of the DiagramNode class. The default is a **null** reference (**Nothing** in Visual Basic).

Remarks

All links and nodes that can be reached from the root by following recursively its links form a graph. If the root is specified, only the graph which it defines is laid out by Arrange.

See Also

GridLayout Members
GridLayout Class
MindFusion.Diagramming.Layout Namespace

GridLayout.SplitGraph Property

Gets or sets a value indicating whether to split the graph to its interconnected subgraphs and arrange the subgraphs independently or arrange the graph as a whole.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool SplitGraph { get; set; }
```

Visual Basic Copy Code

```
Public Property SplitGraph As Boolean
```

Property Value

true to split the graph; otherwise, **false**.

See Also

GridLayout Members
GridLayout Class
MindFusion.Diagramming.Layout Namespace

GridLayout.StartNode Property

Gets or sets the node that is placed at the upper left corner of the grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public DiagramNode StartNode { get; set; }
```

Visual Basic Copy Code

```
Public Property StartNode As DiagramNode
```

Property Value

An instance of the DiagramNode class. The default is **null** (**Nothing** in Visual Basic).

Remarks

If you assign a node to that property, then EndNode cannot be **null** and must be set too. GridLayout usually produces better layouts if both **StartNode** and **EndNode** are **null** references; in such a case the algorithm automatically selects suitable nodes.

GridLayout Members
GridLayout Class
MindFusion.Diagramming.Layout Namespace

GridLayout.TimeLimit Property

Gets or sets a time-out value for the path-finding part of the grid layout algorithm.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public long TimeLimit { get; set; }
```

Visual Basic Copy Code

```
Public Property TimeLimit As Long
```

Property Value

An integer value specifying time-out in milliseconds. The default is 10000 (10 seconds).

Remarks

The grid layout algorithm arranges graph nodes and links along the longest path in the graph. Large graphs with many links could contain hundreds of thousands of possible paths, so finding the longest one would be very time-consuming. When the time-out set with this property occurs, the path-finding routine stops and the layout algorithm uses the longest path known at that moment. Usually, for graphs containing several hundreds of nodes, 1-2 seconds are enough to find a path long enough to produce a nice layout.

See Also

GridLayout Members
GridLayout Class
MindFusion.Diagramming.Layout Namespace

GridLayout.UseLongestPath Property

Gets or sets a value indicating whether the algorithm should arrange nodes around the longest path in the graph.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool UseLongestPath { get; set; }
```

Visual Basic Copy Code

```
Public Property UseLongestPath As Boolean
```

Property Value

true to look for the longest path in the graph and arrange nodes around it; otherwise, **false**.

Remarks

Initially, the algorithm places nodes and links from the longest path in the graph at the grid diagonal, and arranges the rest of the nodes around the diagonal. Large graphs with many links could contain hundreds of thousands of possible paths, so finding the longest one would be very time-consuming. Disabling this property will let you skip the path-finding part of the algorithm, which will make it work much faster.

GridLayout Events

HierarchicalLayout Class

Performs hierarchical layout on simple, connected, level-planar graphs.

Syntax

C# Copy Code

```
public class HierarchicalLayout : Layout
```

Visual Basic Copy Code

```
Public Class HierarchicalLayout
    Inherits Layout
```

Remarks

HierarchicalLayout places nodes on user-defined levels, such that if the source graph is level-planar, all links are guaranteed to have a single segment and will not intersect. A graph is considered level-planar if it is possible to draw it without link intersections when its nodes are positioned on predefined levels. The layout method requires that for each node LayoutTraits contains a HierarchicalLayoutTraits.Level entry specifying the level, and no two connected nodes must be on the same level.

HierarchicalLayout Members

Performs hierarchical layout on simple, connected, level-planar graphs.

The following tables list the members exposed by the HierarchicalLayout type.

Public Constructors

	Name	Description
	HierarchicalLayout	Initializes a new instance of the **HierarchicalLayout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	LevelDistance	Gets or sets the distance between adjacent levels in the hierarchical layout.
	LinkBendFactor	Gets or sets the bending factor of links.
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)

	Name	Gets a user-friendly name of the layout.
	Orientation	Gets or sets the orientation of the arranged graph.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

See Also

HierarchicalLayout Class
MindFusion.Diagramming.Layout Namespace

HierarchicalLayout Constructor

Initializes a new instance of the HierarchicalLayout class.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public HierarchicalLayout ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

HierarchicalLayout Class
MindFusion.Diagramming.Layout Namespace

HierarchicalLayout Properties

HierarchicalLayout.DefaultMarginValue Property

Gets the default value of the Margins property.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
protected override Size DefaultMarginValue { get; }
```

Visual Basic Copy Code

```
Protected Overrides ReadOnly Property DefaultMarginValue As Size
```

Property Value

Returns new Size(5, 5).

See Also

HierarchicalLayout Members
HierarchicalLayout Class
MindFusion.Diagramming.Layout Namespace

HierarchicalLayout.LevelDistance Property

Gets or sets the distance between adjacent levels in the hierarchical layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double LevelDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property LevelDistance As Double
```

Property Value

The default value is 40.

See Also

HierarchicalLayout Members
HierarchicalLayout Class
MindFusion.Diagramming.Layout Namespace

HierarchicalLayout.LinkBendFactor Property

Gets or sets the bending factor of links.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double LinkBendFactor { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkBendFactor As Double
```

Property Value

The default value is 1.

Remarks

A value of 1 indicates that the links should not bend. A value less than 1 indicates that the links should bend towards the geometric center of the graph. A value greater than 1 indicates that the links should bend outwards.

HierarchicalLayout.Orientation Property

Gets or sets the orientation of the arranged graph.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Orientation Orientation { get; set; }
```

Visual Basic Copy Code

```
Public Property Orientation As Orientation
```

Property Value

A member of the Orientation enumeration. The default value is **Vertical**.

ILayout.Arrange Method (Diagram)

Applies the layout to the specified Diagram instance.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
bool Arrange (
    Diagram diagram
)
```

Visual Basic Copy Code

```
Function Arrange( _
    diagram As Diagram _
) As Boolean
```

Parameters

diagram
The Diagram that will be arranged.

Return Value

Returns whether the arrangement was successful.

ISwimlaneGrid Members

Represents an object which can be used by a SwimlaneLayout to adjust the corresponding swimlane grid.

The following tables list the members exposed by the ISwimlaneGrid type.

Public Methods

	Name	Description
	GetColumnCount	Gets the number of columns in the grid.

	GetColumnWidth	Gets the the width of the specified column in the swimlane grid.
	GetRowCount	Gets the number of rows in the swimlane grid.
	GetRowHeight	Gets the the height of the specified row in the swimlane grid.
	SetColumnCount	Sets the number of columns in the swimlane grid.
	SetColumnWidth	Sets the the width of the specified column in the swimlane grid.
	SetLeftMargin	Sets the left margin of the swimlane grid.
	SetRowCount	Sets the number of rows in the swimlane grid.
	SetRowHeight	Sets the the height of the specified row in the swimlane grid.
	SetTopMargin	Sets the top margin of the swimlane grid.

ISwimlaneGrid Methods

ISwimlaneGrid.GetColumnCount Method

Gets the number of columns in the grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
int GetColumnCount ()
```

Visual Basic Copy Code

```
Function GetColumnCount () As Integer
```

Return Value

The number of columns in the grid.

See Also

ISwimlaneGrid Members

ISwimlaneGrid.GetColumnWidth Method

Gets the the width of the specified column in the swimlane grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
double GetColumnWidth (
    int index
```

```
)
```

Visual Basic Copy Code

```
Function GetColumnWidth( _
    index As Integer _
) As Double
```

Parameters

index

The zero-based index of the column.

Return Value

The width of the column.

See Also

ISwimlaneGrid Members
ISwimlaneGrid Interface
MindFusion.Diagramming.Layout Namespace

ISwimlaneGrid.GetRowCount Method

Gets the number of rows in the swimlane grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
int GetRowCount ()
```

Visual Basic Copy Code

```
Function GetRowCount () As Integer
```

Return Value

The number of rows in the grid.

ISwimlaneGrid.GetRowHeight Method

Gets the the height of the specified row in the swimlane grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
double GetRowHeight (
    int index
)
```

Visual Basic Copy Code

```
Function GetRowHeight( _
    index As Integer _
) As Double
```

Parameters

index
The zero-based index of the row.

Return Value

The height of the row.

See Also

ISwimlaneGrid Members

ISwimlaneGrid.SetColumnCount Method

Sets the number of columns in the swimlane grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
void SetColumnCount (
    int value
)
```

Visual Basic Copy Code

```
Sub SetColumnCount( _
    value As Integer _
)
```

Parameters

value
A non-negative integer value specifying the number of columns.

See Also

ISwimlaneGrid Members
ISwimlaneGrid Interface

ISwimlaneGrid.SetColumnWidth Method

Sets the the width of the specified column in the swimlane grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
void SetColumnWidth (
    int index,
    double value
)
```

Visual Basic

```
Sub SetColumnWidth( _
    index As Integer, _
    value As Double _
)
```

Parameters

index

The zero-based index of the column.

value

The new width of the column.

ISwimlaneGrid.SetLeftMargin Method

Sets the left margin of the swimlane grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
void SetLeftMargin (
    double value
)
```

Visual Basic

```
Sub SetLeftMargin( _
    value As Double _
)
```

Parameters

value

The distance between the left side of the grid and the diagram bounds.

See Also

ISwimlaneGrid Members
ISwimlaneGrid Interface

ISwimlaneGrid.SetRowCount Method

Sets the number of rows in the swimlane grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
void SetRowCount (
    int value
)
```

Visual Basic Copy Code

```
Sub SetRowCount( _
    value As Integer _
)
```

Parameters

value
A non-negative integer value specifying the number of rows.

ISwimlaneGrid.SetRowHeight Method

Sets the the height of the specified row in the swimlane grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
void SetRowHeight (
    int index,
    double value
)
```

Visual Basic Copy Code

```
Sub SetRowHeight( _
    index As Integer, _
    value As Double _
)
```

Parameters

index
The zero-based index of the row.

value
The new height of the row.

ISwimlaneGrid.SetTopMargin Method

Sets the top margin of the swimlane grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
void SetTopMargin (
    double value
)
```

Visual Basic Copy Code

```
Sub SetTopMargin( _
    value As Double _
)
```

Parameters

value
The distance between the top side of the grid and the diagram bounds.

LaneGrid Members

Represents an ISwimlaneGrid which operates on a MindFusion.Diagramming.Lanes.Grid object.

The following tables list the members exposed by the LaneGrid type.

Public Constructors

	Name	Description
	LaneGrid	Initializes a new instance of the **LaneGrid** class.

Public Methods

	Name	Description
	GetColumnCount	ISwimlaneGrid.GetColumnCount implementation.

	GetColumnWidth	ISwimlaneGrid.GetColumnCount implementation.
	GetRowCount	ISwimlaneGrid.GetRowCount implementation.
	GetRowHeight	ISwimlaneGrid.GetRowHeight implementation.
	SetColumnCount	ISwimlaneGrid.SetColumnCount implementation.
	SetColumnWidth	ISwimlaneGrid.SetColumnCount implementation.
	SetLeftMargin	ISwimlaneGrid.SetLeftMargin implementation.
	SetRowCount	ISwimlaneGrid.SetRowCount implementation.
	SetRowHeight	ISwimlaneGrid.SetRowHeight implementation.
	SetTopMargin	ISwimlaneGrid.SetTopMargin implementation.

LaneType Enumeration

Specifies where **FlowLayout** gets the swimlane dimensions from.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum LaneType
```

Visual Basic Copy Code

```
Public Enum LaneType
```

Members

	Member name	Description
	LaneGrid	**FlowLayout** gets the swimlane dimensions from Diagram.LaneGrid.
	LaneNodes	**FlowLayout** interprets locked background nodes as swimlanes.
	Custom	**FlowLayout** should get the swimlane dimensions from the array of rectangles passed as an argument to Arrange.

MindFusion.Diagramming.Layout Namespace

LayeredLayout Class

Implements a layered graph layout algorithm.

Syntax

C# Copy Code

```
public class LayeredLayout : Layout
```

Visual Basic Copy Code

```
Public Class LayeredLayout
    Inherits Layout
```

Remarks

This algorithm assigns diagram nodes to distinct horizontal or vertical layers. While arranging the layers, the layout routine seeks to meet the following criteria:

- connected nodes must be placed close together;
- links must flow in one direction if possible;
- links must cross as few layers as possible;
- links must not cross other links;

To apply this layout to a diagram, create a **LayeredLayout** instance, set its members and invoke the Arrange method. Arrange lays out all subgraphs in a diagram, unless the Root property is set.

The final appearance of arranged graphs depends mostly on the Orientation and Direction properties which define the overall orientation of the layout. The LayerDistance and NodeDistance properties specify how much space to leave between adjacent layers and adjacent nodes in a layer.

The performance of **LayeredLayout** is dependent on the number of links in the diagram. At its first stage, the algorithm looks for the longest sequence of links in the graph and builds the node layers along it. That stage can be the most time consuming if there are a lot of links in a graph, so there is the TimeLimit property provided to control how much time the layout routine is allowed to spend on path-finding. Next, if there are layers much longer than the other ones and SplitLayers is enabled, nodes from these layers are moved to new ones so the graph width is uniformly distributed.

The layout routine continues by shuffling nodes and link points across their layers, so the criteria mentioned above are approximated. Finally, link ends are aligned to anchor points if Anchoring is enabled and the distance between outermost links is decreased as set in LinksCompactFactor.

The layered graph layout algorithm produces best results if it can place link ends at arbitrary positions over nodes' outlines, that is, when using the Ignore value. If your application logic requires links to be always attached to anchor points, use the other two values. In such cases **Reassign** would yield better results.

LayeredLayout Members

Implements a layered graph layout algorithm.

The following tables list the members exposed by the LayeredLayout type.

Public Constructors

	Name	Description
	LayeredLayout	Overloaded. Initializes a new instance of the **LayeredLayout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	Direction	Gets or sets the direction of the arranged diagram.
	EnableCustomLayers	Gets or sets a value indicating whether to indicating whether the layered layout will honor the LayeredLayoutTraits.Layer flags.
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	EndNode	Gets or sets the node that should be placed in the last layer of the arranged graph.
	EnforceLinkFlow	Gets or sets a value indicating whether to attempt to force all links to point to the same direction. If the graph being arranged contains cycles, some of the links will still point backwards.
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	IgnoreNodeSize	Gets or sets a value indicating whether the distance between adjacent nodes in the final layout should be independent of the nodes' size.
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	KeepLinkShapes	Gets or sets whether to preserve initial Shape value of links when LinkType is set to Cascading.
	KeepRootPosition	Gets or sets a value indicating whether to preserve the position of the root node.
	LayerDistance	Gets or sets the desired distance between layer axis lines.
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	LinkPadding	Gets or sets the distance between parallel cascading links.
	LinksCompactFactor	Gets or sets a value indicating how much to compact the outermost links.
	LinkType	Gets or sets the appearance of the links in the final layout.
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	NodeDistance	Gets or sets the desired distance between adjacent nodes in a layer.
	Orientation	Gets or sets the overall orientation of the arranged diagram.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)

	Root	Gets or sets a node indicating which subgraph of the diagram must be laid out.
	SplitLayers	Gets or sets a value indicating whether to split layers that are much wider than the other layers.
	StableSort	Gets or sets a value indicating whether to apply stable sorting during the layout algorithm.
	StartNode	Gets or sets the node that should be placed in the first layer of the arranged graph.
	Statistics	Gets layout-specific information about the nodes and links participating in the layout.
	StraightenLongLinks	Gets or sets whether the layout algorithm should strive to straighten links that cross more than one layer of the graph.
	SwapPairsIterations	Gets or sets how many times to perform pair-swapping iterations on each layer.
	TimeLimit	Gets or sets a time-out value for the path-finding part of the layered layout algorithm.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

LayeredLayout Constructor ()

Initializes a new instance of the LayeredLayout class with the default settings.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public LayeredLayout ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

LayeredLayout Constructor Overload List
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout Constructor (Orientation, Double, Double, Size)

Initializes a new instance of the LayeredLayout class with the specified settings.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public LayeredLayout (
    Orientation orientation,
    double layerDistance,
    double nodeDistance,
    Size margins
)
```

Visual Basic Copy Code

```
Public New ( _
    orientation As Orientation, _
    layerDistance As Double, _
    nodeDistance As Double, _
    margins As Size _
)
```

Parameters

orientation
The orientation of the layout.

layerDistance
The distance between adjacent layers.

nodeDistance
The distance between adjacent nodes within the same layer.

margins
The margin between the produced graph and the left side of the diagram bounding rectangle.

See Also

LayeredLayout Constructor Overload List

LayeredLayout Properties

LayeredLayout.DefaultMarginValue Property

Gets the default value of the Margins property.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
protected override Size DefaultMarginValue { get; }
```

Visual Basic Copy Code

```
Protected Overrides ReadOnly Property DefaultMarginValue As Size
```

Property Value

Returns new Size(5, 5).

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.Direction Property

Gets or sets the direction of the arranged diagram.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Direction Direction { get; set; }
```

Visual Basic Copy Code

```
Public Property Direction As Direction
```

Property Value

A member of the Direction enumeration. The default is **Straight**.

Remarks

If Orientation is set to Horizontal, Direction.Straight stands for "left to right" and **Direction.Reversed** for "right to left". If **Orientation** is set to **Vertical**, **Direction.Straight** stands for "top to bottom" and **Direction.Reversed** for "bottom to top".

LayeredLayout.EnableCustomLayers Property

Gets or sets a value indicating whether to indicating whether the layered layout will honor the LayeredLayoutTraits.Layer flags.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool EnableCustomLayers { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableCustomLayers As Boolean
```

Property Value

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.EndNode Property

Gets or sets the node that should be placed in the last layer of the arranged graph.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public DiagramNode EndNode { get; set; }
```

Visual Basic Copy Code

```
Public Property EndNode As DiagramNode
```

Property Value

A DiagramNode object representing the end node.

Remarks

This value is honored only if StartNode is specified too.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.EnforceLinkFlow Property

Gets or sets a value indicating whether to attempt to force all links to point to the same direction. If the graph being arranged contains cycles, some of the links will still point backwards.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool EnforceLinkFlow { get; set; }
```

Visual Basic Copy Code

```
Public Property EnforceLinkFlow As Boolean
```

Property Value

Remarks

EnableCustomLayers and SplitLayers are ignored if this property is set to **true**.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace
StraightenLongLinks Property
OneWayLayout Class

LayeredLayout.IgnoreNodeSize Property

Gets or sets a value indicating whether the distance between adjacent nodes in the final layout should be independent of the nodes' size.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool IgnoreNodeSize { get; set; }
```

Visual Basic Copy Code

```
Public Property IgnoreNodeSize As Boolean
```

Property Value

true to ignore the node size; otherwise, **false**. The default is **true**.

Remarks

At this time, considering the size of nodes deteriorates the performance of the algorithm, so that's disabled by default.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.KeepLinkShapes Property

Gets or sets whether to preserve initial Shape value of links when LinkType is set to Cascading.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool KeepLinkShapes { get; set; }
```

Visual Basic Copy Code

```
Public Property KeepLinkShapes As Boolean
```

Property Value

true to preserve link Shape values, or **false** otherwise.

Remarks

If this property is enabled, the orthogonal path applied by Cascading LinkType is approximated using respective link shape.

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.KeepRootPosition Property

Gets or sets a value indicating whether to preserve the position of the root node.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool KeepRootPosition { get; set; }
```

Visual Basic Copy Code

```
Public Property KeepRootPosition As Boolean
```

Property Value

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.LayerDistance Property

Gets or sets the desired distance between layer axis lines.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double LayerDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property LayerDistance As Double
```

Property Value

A **double** value specifying the distance between layers. The default is 25.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.LinkPadding Property

Gets or sets the distance between parallel cascading links.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double LinkPadding { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkPadding As Double
```

Property Value

A **double** value specifying the padding space between cascading links. The default value is 0.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.LinksCompactFactor Property

Gets or sets a value indicating how much to compact the outermost links.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double LinksCompactFactor { get; set; }
```

Visual Basic Copy Code

```
Public Property LinksCompactFactor As Double
```

Property Value

A **double** number in the interval [0, 1]. The default is 1.

Remarks

Links and nodes on the same graph layer are distributed uniformly as specified via the NodeDistance value. However, if there are more than 2-3 outermost links on a layer, they usually take up too much space without improving the visual quality of the diagram layout. This property allows compacting such links to save space. The factor specifies roughly a fraction of **NodeDistance** to leave between outer links.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.LinkType Property

Gets or sets the appearance of the links in the final layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public LayeredLayoutLinkType LinkType { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkType As LayeredLayoutLinkType
```

Property Value

A member of the LayeredLayoutLinkType enumeration. The default is **Straight**.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace
StraightenLongLinks Property

LayeredLayout.Name Property

Gets a user-friendly name of the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public override string Name { get; }
```

Visual Basic Copy Code

```
Public Overrides ReadOnly Property Name As String
```

Property Value

Returns "Layered layout".

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.NodeDistance Property

Gets or sets the desired distance between adjacent nodes in a layer.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double NodeDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property NodeDistance As Double
```

Property Value

A **double** value specifying the distance between adjacent nodes. The default is 20.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.Orientation Property

Gets or sets the overall orientation of the arranged diagram.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Orientation Orientation { get; set; }
```

Visual Basic Copy Code

```
Public Property Orientation As Orientation
```

Property Value

A member of the Orientation enumeration. The default is **Vertical**.

Remarks

Specify Orientation.Vertical to have links flow in vertical direction and **Orientation.Horizontal** to have links flow in horizontal direction. The orientation of the resulting layers is opposite to that of the links. Thus, if the link tends to go in a vertical direction, the nodes are distributed in horizontal layers.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace
Direction Property

LayeredLayout.Root Property

Gets or sets a node indicating which subgraph of the diagram must be laid out.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public DiagramNode Root { get; set; }
```

Visual Basic Copy Code

```
Public Property Root As DiagramNode
```

Property Value

An instance of the DiagramNode class. The default is a **null** reference (**Nothing** in Visual Basic).

Remarks

All links and nodes that can be reached from the root by following recursively its links form a graph. If the root is specified, only the graph containing it is laid out by Arrange.

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.SplitLayers Property

Gets or sets a value indicating whether to split layers that are much wider than the other layers.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool SplitLayers { get; set; }
```

Visual Basic Copy Code

```
Public Property SplitLayers As Boolean
```

Property Value

true to split wide layers; otherwise, **false**. The default is **false**.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.StableSort Property

Gets or sets a value indicating whether to apply stable sorting during the layout algorithm.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool StableSort { get; set; }
```

Visual Basic Copy Code

```
Public Property StableSort As Boolean
```

Property Value

true to apply stable sorting algorithm, otherwise **false**. The default value is **false**.

Remarks

By default .NET sorts arrays using unstable sort, where if two elements have equal values, their order might not be the same between different runs of the sort method. This could lead to LayeredLayout not preserving the order of some nodes in a layer between different runs if there are more than one candidates for the same position. If you need the same order to be reproduced consistently, set **StableSort** to **true**.

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.StartNode Property

Gets or sets the node that should be placed in the first layer of the arranged graph.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public DiagramNode StartNode { get; set; }
```

Visual Basic Copy Code

```
Public Property StartNode As DiagramNode
```

Property Value

A DiagramNode object representing the start node.

Remarks

If there is no start node specified, the algorithm automatically selects one based on other LayeredLayout properties, such as EnforceLinkFlow.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace
EndNode Property

LayeredLayout.Statistics Property

Gets layout-specific information about the nodes and links participating in the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public LayeredLayoutStatistics Statistics { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Statistics As LayeredLayoutStatistics
```

Property Value

An instance of the LayeredLayoutStatistics class containing detailed information about the performed layout, such as the layers individual nodes were assigned to.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace

LayeredLayout.StraightenLongLinks Property

Gets or sets whether the layout algorithm should strive to straighten links that cross more than one layer of the graph.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool StraightenLongLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property StraightenLongLinks As Boolean
```

Property Value

true to straighten long links; otherwise **false**. The default value is **false**.

Remarks

If this property is enabled, links that cross multiple layers have at most two bends. Because of the additional horizontal alignment constraints, the arranged graph usually occupies a larger area than when not using **StraightenLongLinks**.

See Also

LayeredLayout Members
LayeredLayout Class
MindFusion.Diagramming.Layout Namespace
LinkType Property
EnforceLinkFlow Property

LayeredLayout.SwapPairsIterations Property

Gets or sets how many times to perform pair-swapping iterations on each layer.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public int SwapPairsIterations { get; set; }
```

Visual Basic Copy Code

```
Public Property SwapPairsIterations As Integer
```

Property Value

An integer value specifying how many pair-swapping iterations to perform. The default is 5.

Remarks

The algorithm swaps node pairs on each layer aiming to decrease the number of crossing links. Setting a higher value to this property helps to decrease the number of crossings.

LayeredLayout.TimeLimit Property

Gets or sets a time-out value for the path-finding part of the layered layout algorithm.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public long TimeLimit { get; set; }
```

Visual Basic Copy Code

```
Public Property TimeLimit As Long
```

Property Value

An integer value specifying time-out in milliseconds. The default is 10000 (10 seconds).

Remarks

The layered layout algorithm arranges graph nodes and links along the longest path in the graph. Large graphs with many links could contain hundreds of thousands of possible paths, so finding the longest one would be very time-consuming. When the time-out set with this property occurs, the path-finding routine stops and the layout algorithm uses the longest path known at that moment. Usually, for graphs containing several hundreds of nodes, 1-2 seconds are enough to find a long-enough path to produce nice layered layout.

MindFusion.Diagramming.Layout Namespace

LayeredLayout Events

LayeredLayoutLinkType Enumeration

Specifies the style of the links after they are laid out.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum LayeredLayoutLinkType
```

Visual Basic Copy Code

```
Public Enum LayeredLayoutLinkType
```

Members

	Member name	Description
	Straight	Indicates straight links.
	Cascading	Indicates cascading links.

LayeredLayoutStatistics Members

Encapsulates information about a layered layout which has already complete.

The following tables list the members exposed by the LayeredLayoutStatistics type.

Public Properties

	Name	Description
	LayerCount	Gets the total number of layers in the layout. If more than one subgraph is laid out, this property returns the number of layers in the last subgraph.
	LinkLayerCount	Gets a mapping between links and the number of layers they run through.
	NodeGridPositions	Gets a mapping between nodes and their assigned grid positions.
	NodeLayerIndices	Gets a mapping between nodes and their assigned layers.

Layout Members

The base class for all layout classes.

The following tables list the members exposed by the Layout type.

Protected Constructors

	Name	Description
	Layout	Initializes a new instance of the **Layout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes.
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads.
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content.
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph.
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout.
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout.
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds.
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism.
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.
	Name	Gets a user-friendly name of the layout.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress.

	RepeatingLinksPadding	Specifies the padding distance between repeating links.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value for the Margins property, which may vary across different layouts.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance.

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance.
	ArrangeAnimated	Overloaded.
	ArrangeAsync	Overloaded.

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event.

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph.

Layout.Arrange Method (Diagram)

Applies the layout to the specified Diagram instance.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public virtual bool Arrange (
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public Overridable Function Arrange( _
    diagram As Diagram _
) As Boolean
```

Parameters

diagram
The Diagram that must be arranged.

Return Value

true if the diagram has been arranged successfully; otherwise, **false**.

See Also

Arrange Method Overload List
Layout Members
Layout Class

Layout.Arrange Method (Diagram, DiagramItemCollection)

Applies the layout on the specified subset of objects from the specified Diagram instance.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public virtual bool Arrange (
    Diagram diagram,
    DiagramItemCollection items
)
```

Visual Basic Copy Code

```
Public Overridable Function Arrange( _
    diagram As Diagram, _
    items As DiagramItemCollection _
) As Boolean
```

Parameters

diagram

The Diagram that must be arranged.

items

A collection of nodes and links from diagram that define the subgraph to arrange.

Return Value

true if the diagram has been arranged successfully; otherwise, **false**.

Layout.Arrange Method (Diagram, DiagramItemCollection, Double, Double)

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public virtual bool Arrange (
    Diagram diagram,
    DiagramItemCollection items,
    double dx,
    double dy
)
```

Visual Basic Copy Code

```
Public Overridable Function Arrange( _
    diagram As Diagram, _
    items As DiagramItemCollection, _
    dx As Double, _
    dy As Double _
) As Boolean
```

Parameters

diagram

items

dx

dy

Return Value

Layout.ArrangeAnimated Method (Diagram, DiagramItemCollection, Int32, AnimationType, EasingType, Double, Double)

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public virtual bool ArrangeAnimated (
    Diagram diagram,
    DiagramItemCollection items,
    int duration,
    AnimationType animationType,
    EasingType easingType,
    double dx,
    double dy
)
```

Visual Basic Copy Code

```
Public Overridable Function ArrangeAnimated( _
    diagram As Diagram, _
    items As DiagramItemCollection, _
    duration As Integer, _
    animationType As AnimationType, _
    easingType As EasingType, _
    dx As Double, _
    dy As Double _
) As Boolean
```

Parameters

diagram

items

duration

animationType

easingType

dx

dy

Return Value

ArrangeAnimated Method Overload List
Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.ArrangeAnimated Method (Diagram, Int32, AnimationType, EasingType)

Applies the layout to the specified subset of items from the specified Diagram instance and animates items moving to their new positions.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public virtual bool ArrangeAnimated (
    Diagram diagram,
    int duration,
    AnimationType animationType,
    EasingType easingType
)
```

Visual Basic Copy Code

```
Public Overridable Function ArrangeAnimated( _
    diagram As Diagram, _
    duration As Integer, _
    animationType As AnimationType, _
    easingType As EasingType _
) As Boolean
```

Parameters

diagram
The Diagram that should be arranged.

duration
An integer, specifying the duration of the animation in milliseconds.

animationType
A member of the AnimationType enumeration, specifying the animation type to use.

easingType
A member of the EasingType enumeration, specifying the type of easing function to apply to the animation.

Return Value

true if the diagram has been arranged successfully; otherwise, false.

See Also

Layout.ArrangeAsync Method

Overload List

Name	Description
Layout.ArrangeAsync (Diagram)	Applies the layout asynchronously to the specified Diagram instance.
Layout.ArrangeAsync (Diagram, DiagramItemCollection)	Applies the layout asynchronously to the specified subset of items from the specified **Diagram** instance.
Layout.ArrangeAsync (Diagram, DiagramItemCollection, Double, Double)	

See Also

Layout Members

Layout.ArrangeAsync Method (Diagram)

Applies the layout asynchronously to the specified Diagram instance.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public async Task<Boolean> ArrangeAsync (
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public Async Function ArrangeAsync( _
    diagram As Diagram _
) As Task(Of Boolean)
```

Parameters

diagram
The Diagram that should be arranged.

Return Value

true if the diagram has been arranged successfully, or **false** otherwise.

Remarks

This method is available only in the .NET 4.5 build of the *MindFusion.Diagramming.dll* assembly.

See Also

ArrangeAsync Method Overload List
Layout Members
Layout Class

Layout.ArrangeAsync Method (Diagram, DiagramItemCollection)

Applies the layout asynchronously to the specified subset of items from the specified Diagram instance.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public async Task<Boolean> ArrangeAsync (
    Diagram diagram,
    DiagramItemCollection items
)
```

Visual Basic Copy Code

```
Public Async Function ArrangeAsync( _
    diagram As Diagram, _
    items As DiagramItemCollection _
) As Task(Of Boolean)
```

Parameters

diagram
The Diagram that should be arranged.

items
A collection of nodes and links from diagram that define the subgraph to arrange.

Return Value

true if the diagram has been arranged successfully, or **false** otherwise.

Remarks

This method is available only in the .NET 4.5 build of the *MindFusion.Diagramming.dll* assembly.

Syntax

C# Copy Code

```
public virtual Task<Boolean> ArrangeAsync (
    Diagram diagram,
    DiagramItemCollection items,
    double dx = 0,
    double dy = 0
)
```

Visual Basic Copy Code

```
Public Overridable Function ArrangeAsync( _
    diagram As Diagram, _
    items As DiagramItemCollection, _
    Optional dx As Double = 0, _
```

```
    Optional dy As Double = 0 _
) As Task(Of Boolean)
```

Parameters

diagram

items

dx
Optional.

dy
Optional.

Return Value

ArrangeAsync Method Overload List
Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.OnLayoutComplete Method

Raises the LayoutComplete event.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
protected void OnLayoutComplete (
    EventArgs e
)
```

Visual Basic Copy Code

```
Protected Sub OnLayoutComplete( _
    e As EventArgs _
)
```

Parameters

e
An object providing the event data.

See Also

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout Properties

Layout.Anchoring Property

Gets or sets a value indicating how to align links to the anchor points of graph nodes.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Anchoring Anchoring { get; set; }
```

Visual Basic Copy Code

```
Public Property Anchoring As Anchoring
```

Property Value

A member of the Anchoring enumeration. The default is **Ignore**.

See Also

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.DefaultMarginValue Property

Gets the default value for the Margins property, which may vary across different layouts.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
protected abstract Size DefaultMarginValue { get; }
```

Visual Basic Copy Code

```
Protected MustOverride ReadOnly Property DefaultMarginValue As Size
```

Property Value

See Also

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.EnableParallelism Property

Gets or sets a value indicating whether to arrange subgraphs on separate threads.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public virtual bool EnableParallelism { get; set; }
```

Visual Basic Copy Code

```
Public Overridable Property EnableParallelism As Boolean
```

Property Value

true to enable parallelism; otherwise, **false**.

Remarks

Available only in .NET 4.0 versions and later.

See Also

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.GrowToFit Property

Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool GrowToFit { get; set; }
```

Visual Basic Copy Code

```
Public Property GrowToFit As Boolean
```

Property Value

true to grow diagram's Bounds if the arranged items would not fit, or **false** otherwise. The default value is **true**.

See Also

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.KeepGroupLayout Property

Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool KeepGroupLayout { get; set; }
```

Visual Basic Copy Code

```
Public Property KeepGroupLayout As Boolean
```

Property Value

true if each Group should be processed as an integral graph node; otherwise, **false**. The default is **false**.

Remarks

Enabling this property has an effect similar to setting the IgnoreLayout property of group's subordinated nodes to **true**. The two methods differ in how the size of the graph node corresponding to a group is calculated. If **KeepGroupLayout** is enabled, the union of all bounding rectangles of grouped items is used to determine the size of the graph node. When the **IgnoreLayout** property of subordinated items is enabled, the bounding rectangle of the main node defines the size of the graph node corresponding to the group.

See Also

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.LayoutLink Property

Gets or sets a delegate, which is invoked when the position of a link is changed by the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public virtual LayoutLink LayoutLink { get; set; }
```

Visual Basic Copy Code

```
Public Overridable Property LayoutLink As LayoutLink
```

Property Value

An instance of the LayoutLink delegate.

See Also

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.LayoutNode Property

Gets or sets a delegate, which is invoked when the position of a node is changed by the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public virtual LayoutNode LayoutNode { get; set; }
```

Visual Basic Copy Code

```
Public Overridable Property LayoutNode As LayoutNode
```

Property Value

An instance of the **LayoutNode** delegate.

See Also

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.Margins Property

Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Size Margins { get; set; }
```

Visual Basic

```
Public Property Margins As Size
```

Property Value

Remarks

This value is also set as the distance between unconnected sub-graphs when they are placed as specified via MultipleGraphsPlacement.

See Also

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.MaxDegreeOfParallelism Property

Gets or sets the maximum degree of parallelism.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
public virtual int MaxDegreeOfParallelism { get; set; }
```

Visual Basic

```
Public Overridable Property MaxDegreeOfParallelism As Integer
```

Property Value

An integer value specifying the degree.

Remarks

Applicable only if EnableParallelization is set to true. Available only in .NET 4.0 versions and later.

See Also

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.MultipleGraphsPlacement Property

Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
public MultipleGraphsPlacement MultipleGraphsPlacement { get; set; }
```

Visual Basic

```
Public Property MultipleGraphsPlacement As MultipleGraphsPlacement
```

Property Value

A member of the MultipleGraphsPlacement enumeration. The default value is **Horizontal**.

Remarks

If the diagram contains several unconnected subgraphs, each of them is processed by the algorithm independently from the others. This property specifies how such subgraphs should be placed one relatively to another. The possible options are to arrange them in a row, in a column, or in such a way that the diagram covers a minimal area.

See Also

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.Name Property

Gets a user-friendly name of the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public abstract string Name { get; }
```

Visual Basic Copy Code

```
Public MustOverride ReadOnly Property Name As String
```

Property Value

See Also

Layout Members
Layout Class
MindFusion.Diagramming.Layout Namespace

Layout.Progress Property

Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public virtual LayoutProgress Progress { get; set; }
```

Visual Basic Copy Code

```
Public Overridable Property Progress As LayoutProgress
```

Property Value

A LayoutProgress delegate method to call while the algorithm proceeds.

Remarks

It might take a lot of time to arrange large diagrams or run more iterations of the algorithm to get better results. In such situations an application can be notified about the progress of the layout routine by assigning a delegate method to this property. On its turn the application could update the UI to indicate the current progress to the users.

Example

The following example updates a label text to indicate the progress of a layout algorithm. The *CreateLayout* method instantiates a layout object from a concrete class.

C# Copy Code

```
Layout layout = CreateLayout();
layout.Progress = new LayoutProgress(onProgress);
layout.Arrange(diagram);

// ...

void onProgress(int c, int n)
{
    label1.Text = (100*c/n).ToString() + "% complete";
    label1.Refresh();
}
```

Visual Basic Copy Code

```
Dim layout As Layout = CreateLayout()
layout.Progress = New LayoutProgress(AddressOf onProgress)
layout.Arrange(diagram)

' ...

Sub onProgress(ByVal c As Integer, ByVal n As Integer)

    label1.Text = (100 * c / n).ToString() + "% complete"
    label1.Refresh()

End Sub
```

Layout Events

LayoutLink Delegate

Represents methods that are called by the layout algorithms when the position of a link changes.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public delegate void LayoutLink (
    DiagramLink link
)
```

Visual Basic Copy Code

```
Public Delegate Sub LayoutLink( _
    link As DiagramLink _
)
```

Parameters

link
A reference to the link being laid out.

See Also

MindFusion.Diagramming.Layout Namespace

LayoutNode Delegate

Represents methods that are called by the layout algorithms when the position of a node changes.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public delegate void LayoutNode (
    DiagramNode node,
    Rect oldBounds
)
```

Visual Basic Copy Code

```
Public Delegate Sub LayoutNode( _
    node As DiagramNode, _
    oldBounds As Rect _
)
```

Parameters

node
A reference to the node being laid out.

oldBounds
The bounding rectangle of the node before it was repositioned by the layouting algorithm.

See Also

MindFusion.Diagramming.Layout Namespace

LayoutProgress Delegate

Represents methods that are called to report on progress of layout algorithms.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public delegate void LayoutProgress (
    int current,
    int total
)
```

Visual Basic Copy Code

```
Public Delegate Sub LayoutProgress( _
    current As Integer, _
    total As Integer _
)
```

Parameters

current
An integer value specifying the current relative progress of the layout algorithm.

total
An integer value specifying the total number of steps required by the layouting algorithm in order to finish.

See Also

MindFusion.Diagramming.Layout Namespace

LayoutSubgraph Delegate

Represents methods that are called by the layout algorithms in order to perform custom arrangement of a subgraph.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public delegate bool LayoutSubgraph (
    Diagram diagram,
    DiagramItemCollection items
)
```

Visual Basic Copy Code

```
Public Delegate Function LayoutSubgraph( _
    diagram As Diagram, _
    items As DiagramItemCollection _
) As Boolean
```

Parameters

diagram
The diagram being arranged.

items
The subset of items to arrange.

Return Value

true if the items were arranged; otherwise, **false**.

MindFusion.Diagramming.Layout Namespace

MultipleGraphsPlacement Enumeration

Specifies graph orientation.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum MultipleGraphsPlacement
```

Visual Basic Copy Code

```
Public Enum MultipleGraphsPlacement
```

Members

	Member name	Description
	Vertical	Indicates that graphs should be placed in a column.
	Horizontal	Indicates that graphs should be placed in a row.
	MinimalArea	Indicates that graphs should be placed so that they cover minimal area.
	VerticalSortDescending	Indicates that graphs should be placed in a column and sorted by the number of vertices they contain in a descending order.
	VerticalSortAscending	Indicates that graphs should be placed in a column and sorted by the number of vertices they contain in an ascending order.
	HorizontalSortDescending	Indicates that graphs should be placed in a row and sorted by the number of vertices they contain in a descending order.

	HorizontalSortAscending	Indicates that graphs should be placed in a row and sorted by the number of vertices they contain in an ascending order.

MindFusion.Diagramming.Layout Namespace

OneWayLayout Class

Implements a one-way graph layout algorithm.

Syntax

C# Copy Code

```
public class OneWayLayout : Layout
```

Visual Basic Copy Code

```
Public Class OneWayLayout
    Inherits Layout
```

Remarks

The one-way layout ensures that links enter into nodes from the same general direction and exit them from the opposite side. If the graph contains cycles, some links bend around the nodes to keep the enter/exit direction consistent. The algorithm aims to minimize the number of such links.

OneWayLayout Members

Implements a one-way graph layout algorithm.

The following tables list the members exposed by the OneWayLayout type.

Public Constructors

	Name	Description
	OneWayLayout	Initializes a new instance of the **OneWayLayout** class with the default settings.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)

	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	NodeDistance	Gets or sets the minimum spacing between adjacent nodes in the final layout.
	Orientation	Gets or sets the orientation of the arranged graph.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	RoundedLinks	Gets or sets a value indicating whether the layout should smooth link bends.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description

	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

MindFusion.Diagramming.Layout Namespace

OrthogonalLayout Class

Implements an orthogonal graph layout algorithm. Each link is drawn as a chain of alternating horizontal and vertical segments. Nodes are placed in a way that facilitates few links bends and crossings.

Syntax

C# Copy Code

```
public class OrthogonalLayout : Layout
```

Visual Basic Copy Code

```
Public Class OrthogonalLayout
    Inherits Layout
```

Remarks

This algorithm was designed for planar graphs where the nodes have at most four incident links, and produces best results with such graphs as input. It can arrange any arbitrary graph as well, by adding some dummy nodes and links to planarize the graph and reduce its vertex degree, and removing them after the layout. However this might lead to using larger area than necessary, due to the space occupied by dummy elements.

	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MinimizeLinkBends	Gets or sets a value indicating whether the layout should minimize link bends.
	MinLaneSize	Gets or sets a value indicating the minimum size of a lane.
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	Padding	Gets or sets a value indicating how much space to leave between nodes in adjacent lanes.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	Refine	Gets or sets a value indicating whether to refine the layout.
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

OrthogonalLayout.Directed Property

Gets or sets a value indicating whether the graph being laid out is directed.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool Directed { get; set; }
```

Visual Basic Copy Code

```
Public Property Directed As Boolean
```

Property Value

true to consider the direction of graph edges, **false** to ignore it; the default value is **false**.

See Also

OrthogonalLayout Members
OrthogonalLayout Class
MindFusion.Diagramming.Layout Namespace

OrthogonalLayout.MinimizeLinkBends Property

Gets or sets a value indicating whether the layout should minimize link bends.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool MinimizeLinkBends { get; set; }
```

Visual Basic Copy Code

```
Public Property MinimizeLinkBends As Boolean
```

Property Value

true to minimize link bends, otherwise **false**. The default value is **true**.

Remarks

If this option is disabled, the layout class applies a fast linear time algorithm, however the layouts produced usually contain more bending links and occupy more space. If enabled, the layout class applies an algorithm of polynomial complexity and runs much slower.

OrthogonalLayout.MinLaneSize Property

Gets or sets a value indicating the minimum size of a lane.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double MinLaneSize { get; set; }
```

Visual Basic Copy Code

```
Public Property MinLaneSize As Double
```

Property Value

A **double** value specifying the minimum lane size. The default value is 10.

Remarks

The result of the layout's Arrange is a grid that contains the diagram's nodes and links. This property specifies the size of lanes which does not contain nodes, but only links.

OrthogonalLayout Events

OrthogonalRouter Class

Implements an orthogonal link routing algorithm.

Syntax

C# Copy Code

```
public class OrthogonalRouter : Layout
```

Visual Basic Copy Code

```
Public Class OrthogonalRouter
    Inherits Layout
```

Remarks

OrthogonalRouter is a secondary layout algorithm that can be used to arrange links after an initial node arrangement has already been applied. The orthogonal layout is useful when there are much more links than nodes in a graph. The algorithm strives to achieve the following criteria, while preserving as much of the initial node configuration as possible.

- links must not overlap;
- only vertical and horizontal routing lines are used;
- graph routing is performed with respect to the specified main layout direction;

- links crossings are minimized;
- bends are minimized;

To arrange a diagram, create an **OrthogonalRouter** instance, set its properties and call the Arrange method.

OrthogonalRouter Members

Implements an orthogonal link routing algorithm.

The following tables list the members exposed by the OrthogonalRouter type.

Public Constructors

	Name	Description
	OrthogonalRouter	Initializes a new instance of the **OrthogonalRouter** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	BendDistance	Gets or sets how far from its adjacent node a link should bend.
	Direction	Gets or sets the direction of the arranged diagram when BaseLayout is set to Layered.
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	EndOrientation	Gets or sets the desired orientation of the last segments of routed links.
	GridSize	Gets or sets the distance between adjacent grid points when BaseLayout is set to Grid.
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayerDistance	Gets or sets the desired distance between layer axis lines.
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from

		Layout.)
	Name	Gets a user-friendly name of the layout.
	NodeDistance	Gets or sets the desired distance between adjacent nodes in a layer.
	Orientation	Gets or sets the overall orientation of the arranged diagram when BaseLayout is set to Layered.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	PutEndPointsAtNodeBorders	Gets or sets a value indicating whether the end points of a link should be placed at the outlines of the nodes connected by that link.
	RandomSeed	Gets or sets the randomization seed to use for generating random node positions.
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	StartOrientation	Gets or sets the desired orientation of the first segments of routed links.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

OrthogonalRouter.BendDistance Property

Gets or sets how far from its adjacent node a link should bend.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double BendDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property BendDistance As Double
```

Property Value

A **double** value specifying the distance from a link's first bend to its adjacent node. The default is 0, specifying that the algorithm should automatically choose a value for this parameter.

Remarks

This should be a value between 0 and 1, specifying a distance proportional to the node size.

OrthogonalRouter Events

SpringLayout Class

Implements the Spring-Embedder graph layout algorithm.

Syntax

C# Copy Code

```
public class SpringLayout : Layout
```

Visual Basic Copy Code

```
Public Class SpringLayout
    Inherits Layout
```

Remarks

Spring-Embedder produces layouts having uniform distribution of nodes by simulating a physical system in which nodes repulse each other and the links between them act as confining springs. Nodes are moved around in an iterative process. The forces that act on a node are calculated, taking in account the positions of surrounding nodes and links from the previous iteration.

To apply this layout to a diagram, call the Arrange method of a **SpringLayout** instance. Arrange lays out all subgraphs in a diagram, unless the Root property is set.

If the LayoutTraits value associated with a node through SpringLayoutTraits.Frozen is **true**, **SpringLayout** considers the repulsion forces exerted by the node on other nodes, but ignores forces acting on the node and keeps it in place.

The final appearance of arranged graphs depends mostly on the values of EnableClusters and NodeDistance properties that specify how nodes are distributed by the layout routine. Enabling the MinimizeCrossings property helps to decrease the number of link crossings, though that makes the algorithm run somewhat slower.

The layout routine runs as much iterations as set in IterationCount, calculating better node positions at each step. When that stage of the algorithm completes, if Anchoring is enabled, link ends are aligned to nodes' anchor points.

The Spring-Embedder layout algorithm produces best results if it can place link ends at arbitrary positions over nodes' outlines, that is, when using the Ignore value. If your application logic requires links to be always attached to anchor points, use the other two values. In such cases **Reassign** would yield better results.

SpringLayout Members

Implements the Spring-Embedder graph layout algorithm.

The following tables list the members exposed by the SpringLayout type.

Public Constructors

	Name	Description
	SpringLayout	Overloaded. Initializes a new instance of the **SpringLayout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	EnableClusters	Gets or sets a value indicating whether to enable allocation of nodes to distinct clusters.
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	IterationCount	Gets or sets for how many iterations to run the layout routine.
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	Layout3D	Specifies whether the layout should set the 3D coordinates of nodes for display inside **DiagramView3D**.
	LayoutArea	Gets or sets the size of the layout area.
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutMethod	Specifies what energy model to use for the simulation.
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	LinkType	Gets or sets the appearance of the links in the final layout.

	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MinimizeCrossings	Gets or sets a value indicating whether crossing minimization mode is enabled.
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	NodeDistance	Gets or sets the desired distance between nodes.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	Randomize	Gets or sets a value indicating whether nodes should be placed at random positions when the layout routine starts.
	RandomSeed	Gets or sets the randomization seed to use for generating random node positions.
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	RepulsionFactor	Gets or sets the multiplier applied to repulsion forces between nodes.
	Root	Gets or sets a node indicating which subgraph of the diagram must be laid out.
	SplitGraph	Gets or sets a value indicating whether unconnected subgraphs should be laid out independently from each other.
	Stretch	Gets or sets the stretch factor.
	Surface	Specifies on what surface the nodes should be placed initially.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)
	BeginArrange	Initializes the layout object for a step-by-step execution.
	EndArrange	Completes the step-by-step execution started with a call to **BeginArrange**.
	Iterate	Overloaded.

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

SpringLayout Constructor (Int32, Double, Boolean)

Initializes a new instance of the SpringLayout class with the specified settings.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public SpringLayout (
    int iterationCount,
    double nodeDistance,
    bool minimizeCrossings
)
```

Visual Basic Copy Code

```
Public New ( _
    iterationCount As Integer, _
    nodeDistance As Double, _
    minimizeCrossings As Boolean _
)
```

Parameters

iterationCount
The number of iterations to perform.

nodeDistance
The distance between nodes.

minimizeCrossings
Specifies whether to try to minimize crossings while layouting.

See Also

SpringLayout Constructor Overload List
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout Constructor (Int32, Double, Boolean, Boolean)

Initializes a new instance of the SpringLayout class with the specified settings.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public SpringLayout (
    int iterationCount,
    double nodeDistance,
    bool minimizeCrossings,
    bool keepGroupLayout
)
```

Visual Basic Copy Code

```
Public New ( _
    iterationCount As Integer, _
    nodeDistance As Double, _
    minimizeCrossings As Boolean, _
    keepGroupLayout As Boolean _
)
```

Parameters

iterationCount
The number of iterations to perform.

nodeDistance
The distance between nodes.

minimizeCrossings
Specifies whether to try to minimize crossings while layouting.

keepGroupLayout
Specifies whether to keep the relative position of grouped items.

SpringLayout Methods

SpringLayout.BeginArrange Method

Initializes the layout object for a step-by-step execution.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool BeginArrange (
    Diagram diagram,
    DiagramItemCollection items
)
```

Visual Basic Copy Code

```
Public Function BeginArrange( _
    diagram As Diagram, _
    items As DiagramItemCollection _
) As Boolean
```

Parameters

diagram
The Diagram that should be arranged.

items
A collection of nodes and links from *diagram* that define the subgraph to arrange.

Return Value

true if the layout object has been initialized successfully; otherwise, **false**.

Remarks

You can use this method together with Iterate and EndArrange to display an animation of the layout process. To run all iterations of the process at once and display just the end result, call Arrange.

SpringLayout.Iterate Method

Overload List

Name	Description
SpringLayout.Iterate (Int32, Int32)	Runs one or more layout iterations.
SpringLayout.Iterate (Int32, Int32, Boolean)	Runs one or more layout iterations.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.Iterate Method (Int32, Int32)

Runs one or more layout iterations.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public void Iterate (
    int iterationFrom,
    int iterationTo
)
```

Visual Basic Copy Code

```
Public Sub Iterate( _
    iterationFrom As Integer, _
    iterationTo As Integer _
)
```

Parameters

iterationFrom
Specifies from which iteration to start.

iterationTo
Specifies at which iteration to stop.

Remarks

Use this method to create an animation of the layout process, for example, by calling it from a timer. Call BeginArrange to prepare the layout object for use of **Iterate**, and call EndArrange when done. Each call to **Iterate** should start from the iteration next to the one where the previous call has stopped.

See Also

Iterate Method Overload List
SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.Iterate Method (Int32, Int32, Boolean)

Runs one or more layout iterations.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public void Iterate (
    int iterationFrom,
    int iterationTo,
    bool asynchronous
)
```

Visual Basic Copy Code

```
Public Sub Iterate( _
    iterationFrom As Integer, _
    iterationTo As Integer, _
    asynchronous As Boolean _
)
```

Parameters

iterationFrom
Specifies from which iteration to start.

iterationTo
Specifies at which iteration to stop.

asynchronous
true to disable UI updates, or false otherwise.

Remarks

Use this method to create an animation of the layout process, for example, by calling it from a timer. Call BeginArrange to prepare the layout object for use of Iterate, and call EndArrange when done. Each call to Iterate starts from the iteration next to the one where the previous call has stopped.

SpringLayout Properties

SpringLayout.DefaultMarginValue Property

Gets the default value of the Margins property.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
protected override Size DefaultMarginValue { get; }
```

Visual Basic Copy Code

```
Protected Overrides ReadOnly Property DefaultMarginValue As Size
```

Property Value

Returns new Size(5, 5).

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.EnableClusters Property

Gets or sets a value indicating whether to enable allocation of nodes to distinct clusters.

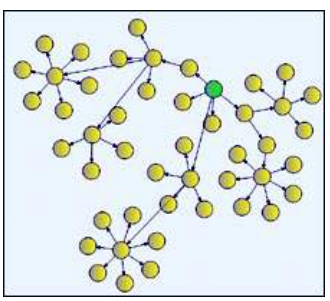
Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool EnableClusters { get; set; }
```

Visual Basic Copy Code



```
Public Property EnableClusters As Boolean
```

Property Value

true to detect and process node clusters; otherwise, **false**. The default is **false**.

Remarks

If enabled, the SpringLayout algorithm detects node clusters and places them at distinct positions. Each cluster consists of a center node surrounded by several local nodes. Clusters might be connected with other clusters by their center nodes. Best-looking results are achieved when there aren't links between the local nodes in a cluster.

SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.IterationCount Property

Gets or sets for how many iterations to run the layout routine.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public int IterationCount { get; set; }
```

Visual Basic Copy Code

```
Public Property IterationCount As Integer
```

Property Value

An integer value specifying the number of iterations. The default is 200.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.Layout3D Property

Specifies whether the layout should set the 3D coordinates of nodes for display inside **DiagramView3D**.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool Layout3D { get; set; }
```

Visual Basic Copy Code

```
Public Property Layout3D As Boolean
```

Property Value

Remarks

true to set the 3D coordinates of nodes; otherwise, **false**. The default value is **false**.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace
Surface Property

SpringLayout.LayoutArea Property

Gets or sets the size of the layout area.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Rect LayoutArea { get; set; }
```

Visual Basic Copy Code

```
Public Property LayoutArea As Rect
```

Property Value

A **Microsoft.Maui.Graphics.Rect** representing the boundaries of the layout area. The default is **Empty**.

Remarks

If the layout area is not explicitly set, the algorithm will choose one suitable for the graph size.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.LayoutMethod Property

Specifies what energy model to use for the simulation.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public SpringLayoutMethod LayoutMethod { get; set; }
```

Visual Basic Copy Code

```
Public Property LayoutMethod As SpringLayoutMethod
```

Property Value

A member of the SpringLayoutMethod enumeration. The default value is **FruchtermanReingold**.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.LinkType Property

Gets or sets the appearance of the links in the final layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public SpringLayoutLinkType LinkType { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkType As SpringLayoutLinkType
```

Property Value

A member of the SpringLayoutLinkType enumeration. The default value is **Straight**.

Remarks

If this property is set to Rounded, the layout method sets the links' Shape to Bezier and simulates repulsion forces exerted by their intermediate control points. The **Rounded** option produces better results when LayoutMethod is set to Classic.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.MinimizeCrossings Property

Gets or sets a value indicating whether crossing minimization mode is enabled.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool MinimizeCrossings { get; set; }
```

Visual Basic Copy Code

```
Public Property MinimizeCrossings As Boolean
```

Property Value

true to attempt crossing minimization; otherwise, **false**. The default is **true**.

Remarks

If enabled, SpringLayout tries to decrease number of crossing links. However this could lead to poor symmetry and node distribution. For better results, use greater IterationCount.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.Name Property

Gets a user-friendly name of the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public override string Name { get; }
```

Visual Basic Copy Code

```
Public Overrides ReadOnly Property Name As String
```

Property Value

Returns "Spring layout".

See Also

SpringLayout.NodeDistance Property

Gets or sets the desired distance between nodes.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double NodeDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property NodeDistance As Double
```

Property Value

A **double** value specifying the distance between nodes. The default is 30.

Remarks

The final distance between connected nodes is determined by multiplying the Weight of the link that connects them by the value of **NodeDistance**.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.Randomize Property

Gets or sets a value indicating whether nodes should be placed at random positions when the layout routine starts.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool Randomize { get; set; }
```

Visual Basic Copy Code

```
Public Property Randomize As Boolean
```

Property Value

true to start with random node positions, otherwise **false**. The default value is **false**.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace
RandomSeed Property

SpringLayout.RandomSeed Property

Gets or sets the randomization seed to use for generating random node positions.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public int RandomSeed { get; set; }
```

Visual Basic Copy Code

```
Public Property RandomSeed As Integer
```

Property Value

An integer value passed as a seed to the random number generator. The default value is 0.

Remarks

If set to 0, SpringLayout uses the current time as a seed value. Set a value greater than 0 to use a fixed seed. Random numbers are generated when nodes are at the same initial position or when Randomize is enabled. Using a fixed seed helps producing consistent layouts at each run of the Arrange method.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.RepulsionFactor Property

Gets or sets the multiplier applied to repulsion forces between nodes.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double RepulsionFactor { get; set; }
```

Visual Basic Copy Code

```
Public Property RepulsionFactor As Double
```

Property Value

A double value specifying the repulsion factor. The default value is 150.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.Root Property

Gets or sets a node indicating which subgraph of the diagram must be laid out.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public DiagramNode Root { get; set; }
```

Visual Basic Copy Code

```
Public Property Root As DiagramNode
```

Property Value

An instance of the DiagramNode class. The default is a **null** reference (**Nothing** in Visual Basic).

Remarks

All links and nodes that can be reached from the root by following recursively its links from a graph. If the root is specified, only the graph which it defines is laid out by Arrange.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.SplitGraph Property

Gets or sets a value indicating whether unconnected subgraphs should be laid out independently from each other.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool SplitGraph { get; set; }
```

Visual Basic Copy Code

```
Public Property SplitGraph As Boolean
```

Property Value

true if unconnected graphs in the diagram should be laid out independently; otherwise, **false**. The default is **false**.

Remarks

If this property is set to true, each independent graph in the diagram is laid out in its own layout area. Otherwise all subgraphs are arranged in the same layout area. If a Root node is specified and **SplitGraph** is **true**, only the graph that contains the root node will be arranged.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.Stretch Property

Gets or sets the stretch factor.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double Stretch { get; set; }
```

Visual Basic Copy Code

```
Public Property Stretch As Double
```

Property Value

A double value specifying the stretch factor used by the spring layout.

See Also

SpringLayout Members
SpringLayout Class
MindFusion.Diagramming.Layout Namespace

SpringLayout.Surface Property

Specifies on what surface the nodes should be placed initially.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Surface Surface { get; set; }
```

Visual Basic Copy Code

```
Public Property Surface As Surface
```

Property Value

A member of the **Surface** enumeration. The default value is Sphere.

Remarks

Specifies on what surface the graph nodes should be placed initially, when Layout3D is enabled.

See Also

SpringLayout Members
SpringLayout Class

SpringLayout Events

SpringLayoutLinkType Enumeration

Specifies the style of the diagram links after they are laid out.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum SpringLayoutLinkType
```

Visual Basic Copy Code

```
Public Enum SpringLayoutLinkType
```

Members

	Member name	Description
	Straight	Indicates straight links with a single segment.
	Rounded	Indicates Bézier links with a single segment.

See Also

MindFusion.Diagramming.Layout Namespace

SwimlaneLayout Class

Implements an algorithm which arranges nodes in lanes.

Syntax

C# Copy Code

```
public class SwimlaneLayout : Layout
```

Visual Basic Copy Code

```
Public Class SwimlaneLayout
    Inherits Layout
```

Remarks

This layout algorithm can be used to arrange process diagrams in which nodes representing activities are placed in swimlanes representing resources. The index of the resource allocated to an activity should be assigned to the corresponding node's LayoutTraits[SwimlaneLayoutTraits.Lane].

By default, the algorithm works with the diagram's LaneGrid, but its SwimlaneGrid property can be set to any class that implements ISwimlaneGrid. This allows applying the layout to a custom-drawn grid rendered through the DrawBackground event, or one composed of locked background nodes.

Inheritance Hierarchy

System.Object
  System.MarshalByRefObject
    System.ComponentModel.Component
      MindFusion.Diagramming.Layout.Layout
        MindFusion.Diagramming.Layout.SwimlaneLayout

SwimlaneLayout Members
MindFusion.Diagramming.Layout Namespace

SwimlaneLayout Members

Implements an algorithm which arranges nodes in lanes.

The following tables list the members exposed by the SwimlaneLayout type.

Public Constructors

	Name	Description
	SwimlaneLayout	Initializes a new instance of the **SwimlaneLayout** class with the default settings.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	CollapseEmptyLanes	Get or sets a value indicating whether lanes without associated nodes will shrink to zero size. By default, empty lanes will have size equal to LaneDistance.
	CompactNodes	Gets or sets a value indicating whether the nodes within individual lanes are compacted.
	CustomSortOrder	Gets or sets a value indicating whether the nodes in a lane should be arranged according to the custom sort order specified through LayoutTraits.
	Direction	Gets or sets the direction of the arranged diagram.
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	KeepLaneSizes	Gets or sets a value indicating whether the layout will attempt to preserve the original sizes of the lanes in the supplied grid.
	LaneDistance	Gets or sets the spacing between adjacent lanes in the final layout.
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	NodeDistance	Gets or sets the spacing between adjacent nodes within a lane in the final layout.
	Orientation	Gets or sets the overall orientation of the arranged diagram.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	SwimlaneGrid	Gets or sets the object through which the layout can manipulate the swimlane grid.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.

	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

See Also

SwimlaneLayout Constructor

Initializes a new instance of the SwimlaneLayout class with the default settings.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public SwimlaneLayout ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

SwimlaneLayout Class
MindFusion.Diagramming.Layout Namespace

SwimlaneLayout Properties

SwimlaneLayout.CollapseEmptyLanes Property

Get or sets a value indicating whether lanes without associated nodes will shrink to zero size. By default, empty lanes will have size equal to LaneDistance.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool CollapseEmptyLanes { get; set; }
```

Visual Basic Copy Code

```
Public Property CollapseEmptyLanes As Boolean
```

Property Value

true to collapse empty lanes, otherwise **false**. The default value is **false**.

Remarks

To be able to shrink the lanes of a LaneGrid to zero size, the MinHeaderSize property of the lane grid must be set to an appropriate value.

See Also

SwimlaneLayout Members
SwimlaneLayout Class
MindFusion.Diagramming.Layout Namespace

SwimlaneLayout.CompactNodes Property

Gets or sets a value indicating whether the nodes within individual lanes are compacted.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool CompactNodes { get; set; }
```

Visual Basic Copy Code

```
Public Property CompactNodes As Boolean
```

Property Value

true to compact nodes, otherwise **false**. The default value is **true**.

See Also

SwimlaneLayout Members
SwimlaneLayout Class
MindFusion.Diagramming.Layout Namespace

SwimlaneLayout.CustomSortOrder Property

Gets or sets a value indicating whether the nodes in a lane should be arranged according to the custom sort order specified through LayoutTraits.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool CustomSortOrder { get; set; }
```

Visual Basic Copy Code

```
Public Property CustomSortOrder As Boolean
```

Property Value

See Also

SwimlaneLayout Members
SwimlaneLayout Class
MindFusion.Diagramming.Layout Namespace

SwimlaneLayout.DefaultMarginValue Property

Gets the default value of the Margins property.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
protected override Size DefaultMarginValue { get; }
```

Visual Basic Copy Code

```
Protected Overrides ReadOnly Property DefaultMarginValue As Size
```

Property Value

Returns new Size(20, 20).

See Also

SwimlaneLayout Members
SwimlaneLayout Class
MindFusion.Diagramming.Layout Namespace

SwimlaneLayout.Direction Property

Gets or sets the direction of the arranged diagram.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Direction Direction { get; set; }
```

Visual Basic Copy Code

```
Public Property Direction As Direction
```

Property Value

A member of the Direction enumeration. The default value is **Straight**.

Remarks

If Orientation is set to Horizontal, Direction.Straight stands for "left to right" and Direction.Reversed for "right to left". If **Orientation** is set to Vertical, Direction.Straight stands for "top to bottom" and Direction.Reversed for "bottom to top".

See Also

SwimlaneLayout Members
SwimlaneLayout Class

SwimlaneLayout.KeepLaneSizes Property

Gets or sets a value indicating whether the layout will attempt to preserve the original sizes of the lanes in the supplied grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool KeepLaneSizes { get; set; }
```

Visual Basic Copy Code

```
Public Property KeepLaneSizes As Boolean
```

Property Value

true to preserve lane sizes, otherwise **false**. The default value is **false**.

See Also

SwimlaneLayout Members
SwimlaneLayout Class
MindFusion.Diagramming.Layout Namespace

SwimlaneLayout.LaneDistance Property

Gets or sets the spacing between adjacent lanes in the final layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double LaneDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property LaneDistance As Double
```

Property Value

A **double** value specifying the distance between swimlanes. The default value is 20.

Remarks

For each pair of swimlanes, this value specifies the distance between the bottommost node border from the upper swimlane and the topmost node border from the lower swimlane.

See Also

MindFusion.Diagramming.Layout Namespace

SwimlaneLayout.NodeDistance Property

Gets or sets the spacing between adjacent nodes within a lane in the final layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double NodeDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property NodeDistance As Double
```

Property Value

A **double** value specifying the distance between adjacent nodes in the same swimlane. The default is 25.

See Also

SwimlaneLayout Members
SwimlaneLayout Class
MindFusion.Diagramming.Layout Namespace

SwimlaneLayout.Orientation Property

Gets or sets the overall orientation of the arranged diagram.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Orientation Orientation { get; set; }
```

Visual Basic

```
Public Property Orientation As Orientation
```

Property Value

A member of the Orientation enumeration. The default value is **Horizontal**.

See Also

SwimlaneLayout Members
SwimlaneLayout Class
MindFusion.Diagramming.Layout Namespace

SwimlaneLayout.SwimlaneGrid Property

Gets or sets the object through which the layout can manipulate the swimlane grid.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
public ISwimlaneGrid SwimlaneGrid { get; set; }
```

Visual Basic

```
Public Property SwimlaneGrid As ISwimlaneGrid
```

Property Value

An instance of a class that implements the ISwimlaneGrid interface. The default is **null** (**Nothing** in VB.NET).

Remarks

If this property is set to **null**, the layout will operate on the diagram's LaneGrid.

SwimlaneLayout Events

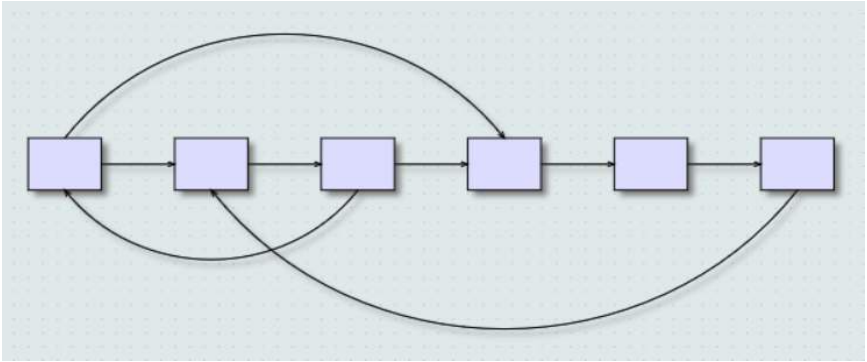
TopologicalLayout Class

Applies topological ordering to the graph. This layout makes it easy to discern graph features such as overall flow direction, cycles and nested cycles.

Syntax

C#

```
public class TopologicalLayout : Layout
```



Visual Basic

```
Public Class TopologicalLayout
    Inherits Layout
```

Remarks

Topological ordering of graph nodes is one where link's origin node is placed before link's destination. TopologicalLayout arranges nodes in a row or a column (depending on the value of the Orientation property) in such a way that there are no backward links when the graph is acyclic. If the graph contains cycles, the algorithms selects ordering with as few backward links as possible.

Links that connect non-adjacent nodes are rendered as arcs. Links connecting adjacent nodes can be rendered either as arcs or as straight lines, depending on the BendAdjacentLinks property. The amplitude of link arcs is proportional to the distance between respective connected nodes. All forward links are rendered at one side of the nodes and all back links are rendered at the opposite side. Thus, all bent links follow the same rotation direction.

Example

The following example applies **TopologicalLayout** to the diagram:

C# Copy Code

```
var layout = new TopologicalLayout();
layout.Orientation = MindFusion.Diagramming.Layout.Orientation.Horizontal;
diagram.Arrange(layout);
diagram.ResizeToFitItems(5);
```

Inheritance Hierarchy

TopologicalLayout Members

Applies topological ordering to the graph. This layout makes it easy to discern graph features such as overall flow direction, cycles and nested cycles.

The following tables list the members exposed by the TopologicalLayout type.

Public Constructors

	Name	Description
	TopologicalLayout	Initializes a new instance of the **TopologicalLayout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	BendAdjacentLinks	Gets or sets a value indicating whether to bend links connecting adjacent nodes or draw them as straight lines.

	Direction	Gets or sets the direction of the arranged diagram.
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.
	Name	Gets a user-friendly name of the layout.
	NodeDistance	Gets or sets the distance between adjacent nodes in the diagram.
	Orientation	Gets or sets the overall orientation of the arranged diagram.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	SplitGraph	Gets or sets a value indicating whether unconnected subgraphs should be laid out independently from each other.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
⚡	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

TopologicalLayout Class
MindFusion.Diagramming.Layout Namespace

TopologicalLayout Constructor

Initializes a new instance of the TopologicalLayout class.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public TopologicalLayout ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

TopologicalLayout Class
MindFusion.Diagramming.Layout Namespace

TopologicalLayout Properties

TopologicalLayout.BendAdjacentLinks Property

Gets or sets a value indicating whether to bend links connecting adjacent nodes or draw them as straight lines.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool BendAdjacentLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property BendAdjacentLinks As Boolean
```

Property Value

true to bend links connecting adjacent nodes; **false**, to draw them as straight lines. The default is **false**.

Remarks

This property applies only to forward link. Back links connecting adjacent nodes are always rendered as bent.

See Also

TopologicalLayout.DefaultMarginValue Property

Gets the default value of the Margins property.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
protected override Size DefaultMarginValue { get; }
```

Visual Basic Copy Code

```
Protected Overrides ReadOnly Property DefaultMarginValue As Size
```

Property Value

Returns new Size(5, 5).

See Also

TopologicalLayout Members
TopologicalLayout Class
MindFusion.Diagramming.Layout Namespace

TopologicalLayout.Direction Property

Gets or sets the direction of the arranged diagram.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Direction Direction { get; set; }
```

Visual Basic Copy Code

```
Public Property Direction As Direction
```

Property Value

A member of the Direction enumeration. The default is **Straight**.

Remarks

If Orientation is set to Horizontal, Direction.Straight stands for "left to right" and **Direction.Reversed** for "right to left". If **Orientation** is set to **Vertical**, **Direction.Straight** stands for "top to bottom" and **Direction.Reversed** for "bottom to top".

See Also

TopologicalLayout Members
TopologicalLayout Class
MindFusion.Diagramming.Layout Namespace

TopologicalLayout.MultipleGraphsPlacement Property

Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public new MultipleGraphsPlacement MultipleGraphsPlacement { get; set; }
```

Visual Basic Copy Code

```
Public Shadows Property MultipleGraphsPlacement As MultipleGraphsPlacement
```

Property Value

A member of the MultipleGraphsPlacement enumeration. The default value is **Vertical**.

Remarks

If the diagram contains several unconnected subgraphs and SplitGraph is set to **true**, each of them is processed by the algorithm independently from the others. This property specifies how such subgraphs should be placed one relatively to another. The possible options are to arrange them in a row, in a column, or in such a way that the diagram covers a minimal area.

TopologicalLayout.Name Property

Gets a user-friendly name of the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public override string Name { get; }
```

Visual Basic Copy Code

```
Public Overrides ReadOnly Property Name As String
```

Property Value

Returns "Topological layout".

TopologicalLayout.NodeDistance Property

Gets or sets the distance between adjacent nodes in the diagram.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double NodeDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property NodeDistance As Double
```

Property Value

A **double** value specifying the distance between adjacent nodes. The default is 20.

TopologicalLayout.Orientation Property

Gets or sets the overall orientation of the arranged diagram.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Orientation Orientation { get; set; }
```

Visual Basic Copy Code

```
Public Property Orientation As Orientation
```

Property Value

A member of the Orientation enumeration. The default is **Horizontal**.

See Also

TopologicalLayout Members
TopologicalLayout Class
MindFusion.Diagramming.Layout Namespace

TopologicalLayout.SplitGraph Property

Gets or sets a value indicating whether unconnected subgraphs should be laid out independently from each other.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool SplitGraph { get; set; }
```

Visual Basic Copy Code

```
Public Property SplitGraph As Boolean
```

Property Value

true if unconnected graphs in the diagram should be laid out independently; otherwise, **false**. The default is **true**.

Remarks

If this property is set to **true**, each independent graph in the diagram is laid out in its own layout area. Otherwise all subgraphs are arranged in the same layout area.

TopologicalLayout Events

TreeLayout Class

Implements several algorithms for arranging tree structures.

Syntax

C# Copy Code

```
public class TreeLayout : Layout
```

Visual Basic Copy Code

```
Public Class TreeLayout
    Inherits Layout
```

Remarks

Set the Type property of a **TreeLayout** instance to select which tree layout algorithm to run, and call the Arrange method to apply the layout on a tree/subtree in the current diagram.

As long as the graph is a tree, the algorithm can find the root node automatically. You can override it by setting the Root property, e.g. in order to arrange only a selected branch of the tree. The distance between the root and the second level and between all subsequent levels can be set through the LevelDistance property. The distance between adjacent nodes in the same level is set through NodeDistance.

In addition to arranging the tree nodes, **TreeLayout** also sets the shape of links as set through its LinkStyle property. Anchoring specifies whether the links should be attached to the anchor points of tree nodes. Note that links that are not part of the tree are ignored, e.g. graph links that go in opposite direction of the general parent-to-child flow or cross-links that connect different tree branches. The tree layout algorithm produces best results if it can place link ends at arbitrary positions over nodes' outlines, that is, when using the Ignore value. If your application logic requires links to be always attached to anchor points, use the other two values. In such cases **Reassign** would yield better results. You can post-process such links after calling **Arrange**, for example by setting their ControlPoints coordinates or by calling their Route method.

By default, the order of child nodes arranged under a parent corresponds to the order of links in the parent's **OutgoingLinks** collection. The Balance property can be set to Preserve to keep the original geometric order of child nodes when arranging them under their parent. This can be used to arrange tree branches in a specific order by first placing them in increasing horizontal or vertical positions. Another possibility is to apply **TreeLayout** from NodeModified handler to let users rearrange the tree branches by dragging and dropping a node.

TreeLayout Members

Implements several algorithms for arranging tree structures.

The following tables list the members exposed by the TreeLayout type.

Public Constructors

	Name	Description
	TreeLayout	Overloaded. Initializes a new instance of the **TreeLayout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	Balance	Gets or sets a value indicating the ordering of the child nodes in order to produce layouts with custom balance.
	CompactAssistants	Gets or sets a value indicating whether the "assistant" nodes on the same side of a single parent are arranged as close enough to each other as possible. Turning this off will force the nodes on one side to be aligned with their counterparts in the other and occasionally leaving space between adjacent branches.
	Direction	Gets or sets the tree direction.
	EnableAssistants	Gets or sets a value indicating whether the "assistant" trait is regarded when performing the layout.
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	IgnoreLinkDirection	Gets or sets a value indicating whether the tree layout algorithm should ignore the direction of links when arranging a tree.
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	KeepRootPosition	Gets or sets a value indicating whether to keep the root node at its original position.
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	LevelDistance	Gets or sets how much space to leave between levels of the tree.
	LinkOffset	Gets or sets the links' offset from the centers of the nodes. This property is applicable only for Centered tree layouts.
	LinkStyle	Gets or sets a value indicating how links in the arranged tree should look.
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.

	NodeDistance	Gets or sets how much space to leave between nodes on the same level.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	ReversedLinks	Gets or sets a value indicating the link direction that relates parent nodes to child nodes.
	Root	Gets or sets the root node of the tree.
	StretchFactor	Gets or sets the stretch factor applied on Radial tree layouts.
	Type	Gets or sets what type of tree layout to apply to the diagram.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)
	UpdateLink	Updates the style and position of the specified link.

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

TreeLayout Constructor Overload List
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout Constructor (DiagramNode, TreeLayoutType, Boolean, TreeLayoutLinkType, TreeLayoutDirections, Double, Double, Boolean, Size)

Initializes a new instance of the TreeLayout class with the specified settings.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public TreeLayout (
    DiagramNode root,
    TreeLayoutType type,
    bool reversedLinks,
    TreeLayoutLinkType linkStyle,
    TreeLayoutDirections direction,
    double levelDistance,
    double nodeDistance,
    bool keepRootPosition,
    Size margins
)
```

Visual Basic Copy Code

```
Public New ( _
    root As DiagramNode, _
    type As TreeLayoutType, _
    reversedLinks As Boolean, _
    linkStyle As TreeLayoutLinkType, _
    direction As TreeLayoutDirections, _
    levelDistance As Double, _
    nodeDistance As Double, _
    keepRootPosition As Boolean, _
    margins As Size _
)
```

Parameters

root
The root of the arranged tree.

type
The type of the tree layout.

reversedLinks
Specifies whether the parent-to-child direction in the tree is reversed, that is, from the end of the link towards its beginning.

linkStyle
The style of the links in the produced layout.

direction
The layout direction.

levelDistance
The distance between adjacent levels.

nodeDistance
The distance between adjacent nodes.

keepRootPosition
Specifies whether to keep the position of the tree root.

margins
The margin between the produced tree and the left side of the diagram bounding rectangle.

TreeLayout Constructor Overload List
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout Constructor (DiagramNode, TreeLayoutType, Boolean, TreeLayoutLinkType, TreeLayoutDirections, Double, Double, Boolean, Size, Boolean)

Initializes a new instance of the TreeLayout class with the specified settings.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public TreeLayout (
    DiagramNode root,
    TreeLayoutType type,
    bool reversedLinks,
    TreeLayoutLinkType linkStyle,
    TreeLayoutDirections direction,
    double levelDistance,
    double nodeDistance,
    bool keepRootPosition,
    Size margins,
    bool keepGroupLayout
)
```

Visual Basic Copy Code

```
Public New ( _
    root As DiagramNode, _
    type As TreeLayoutType, _
    reversedLinks As Boolean, _
    linkStyle As TreeLayoutLinkType, _
    direction As TreeLayoutDirections, _
    levelDistance As Double, _
    nodeDistance As Double, _
    keepRootPosition As Boolean, _
    margins As Size, _
    keepGroupLayout As Boolean _
)
```

Parameters

root
The root of the arranged tree.

type
The type of the tree layout.

reversedLinks
Specifies whether the parent-to-child direction in the tree should be reversed, that is, from the end of the link towards its beginning.

linkStyle
The style of the links in the produced layout.

direction
The layout direction.

levelDistance
The distance between adjacent levels.

nodeDistance
The distance between adjacent nodes.

keepRootPosition
Specifies whether to keep the position of the tree root.

margins
The margin between the produced tree and the left side of the diagram bounding rectangle.

keepGroupLayout
Specifies whether to keep the relative position of grouped items.

TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout Methods

TreeLayout.UpdateLink Method

Updates the style and position of the specified link.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public void UpdateLink (
    DiagramLink a,
    bool ignoredDirection
)
```

Visual Basic Copy Code

```
Public Sub UpdateLink( _
    a As DiagramLink, _
    ignoredDirection As Boolean _
)
```

Parameters

a
A DiagramLink that will be updated.

ignoredDirection

TreeLayout Properties

TreeLayout.Balance Property

Gets or sets a value indicating the ordering of the child nodes in order to produce layouts with custom balance.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public TreeLayoutBalance Balance { get; set; }
```

Visual Basic Copy Code

```
Public Property Balance As TreeLayoutBalance
```

Property Value

A member of the TreeLayoutBalance enumeration. The default value is **Original**.

Remarks

The LeftHeavy, **Original** and **RightHeavy** values are considered when Type is set to HorizontalVertical. The **Preserve** and **Reversed** values are considered by all other tree layout types, and will lead to sorting tree branches by the original horizontal, vertical or angular positions of nodes.

TreeLayout Members
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout.DefaultMarginValue Property

Gets the default value of the Margins property.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
protected override Size DefaultMarginValue { get; }
```

Visual Basic Copy Code

```
Protected Overrides ReadOnly Property DefaultMarginValue As Size
```

Property Value

Returns new Size(5, 5).

See Also

TreeLayout Members
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout.Direction Property

Gets or sets the tree direction.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public TreeLayoutDirections Direction { get; set; }
```

Visual Basic Copy Code

```
Public Property Direction As TreeLayoutDirections
```

Property Value

A member of the TreeLayoutDirections enumeration.

Remarks

This property must be set to a combination of two TreeLayoutDirections members when using Type is HorizontalVertical.

See Also

TreeLayout Members
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout.EnableAssistants Property

Gets or sets a value indicating whether the "assistant" trait is regarded when performing the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool EnableAssistants { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableAssistants As Boolean
```

Property Value

true to enable assistant nodes, otherwise **false**; the default value is **false**.

Remarks

Enabling this property lets you create organizational charts as in MS office. To designate some nodes as assistants, assign **true** as a value for the TreeLayoutTraits.Assistant key in the node's LayoutTraits.

See Also

TreeLayout Members
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout.IgnoreLinkDirection Property

Gets or sets a value indicating whether the tree layout algorithm should ignore the direction of links when arranging a tree.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool IgnoreLinkDirection { get; set; }
```

Visual Basic Copy Code

```
Public Property IgnoreLinkDirection As Boolean
```

Property Value

true to ignore link direction; otherwise, **false**. The default is **false**.

Remarks

Parent-child direction is considered the one in which nodes go further from the root, instead that of the links. If **IgnoreLinkDirection** is set to **true**, you must explicitly specify the tree Root.

See Also

TreeLayout Members
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout.KeepRootPosition Property

Gets or sets a value indicating whether to keep the root node at its original position.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool KeepRootPosition { get; set; }
```

Visual Basic

```
Public Property KeepRootPosition As Boolean
```

Property Value

true to keep the root position; otherwise, **false**.

Remarks

If the root position is not kept, that is, the value of this property is **false**, the entire tree is dispositioned after the layout is complete, according to the values of Margins.

TreeLayout.LinkOffset Property

Gets or sets the links' offset from the centers of the nodes. This property is applicable only for Centered tree layouts.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
public double LinkOffset { get; set; }
```

Visual Basic

```
Public Property LinkOffset As Double
```

Property Value

A **double** value specifying offset of links from the parent node's center. The default value is 0.

TreeLayout.LinkStyle Property

Gets or sets a value indicating how links in the arranged tree should look.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public TreeLayoutLinkType LinkStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property LinkStyle As TreeLayoutLinkType
```

Property Value

A member of the TreeLayoutLinkType enumeration.

Remarks

This property is ignored if Type is set to Radial.

TreeLayout Members
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout.Name Property

Gets a user-friendly name of the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public override string Name { get; }
```

Visual Basic Copy Code

```
Public Overrides ReadOnly Property Name As String
```

Property Value

Returns "Tree layout".

See Also

TreeLayout Members
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout.NodeDistance Property

Gets or sets how much space to leave between nodes on the same level.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double NodeDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property NodeDistance As Double
```

Property Value

A **double** value specifying the distance between adjacent nodes.

Remarks

This property is ignored if Type is set to Radial.

See Also

TreeLayout Members
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout.ReversedLinks Property

Gets or sets a value indicating the link direction that relates parent nodes to child nodes.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool ReversedLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property ReversedLinks As Boolean
```

Property Value

true to indicate reversed direction, that is, the parent node is the one the link points to; otherwise, **false**.

See Also

TreeLayout Members
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout.Root Property

Gets or sets the root node of the tree.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public DiagramNode Root { get; set; }
```

Visual Basic

```
Public Property Root As DiagramNode
```

Property Value

An instance of the DiagramNode class that represents the root node.

Remarks

If not set, MvcDiagram will try to find the root automatically. This root must be specified if IgnoreLinkDirection is set to **true**.

See Also

TreeLayout Members
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout.StretchFactor Property

Gets or sets the stretch factor applied on Radial tree layouts.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
public double StretchFactor { get; set; }
```

Visual Basic

```
Public Property StretchFactor As Double
```

Property Value

A real number specifying the ratio between the horizontal and vertical radii of radial layout outlines. The default is 1.

Remarks

When applying a radial layout, node layers are laid out in concentric circles around the Root node. Stretching them by changing this property makes layers laid out in elliptic outlines.

TreeLayout Members
TreeLayout Class
MindFusion.Diagramming.Layout Namespace

TreeLayout.Type Property

Gets or sets what type of tree layout to apply to the diagram.

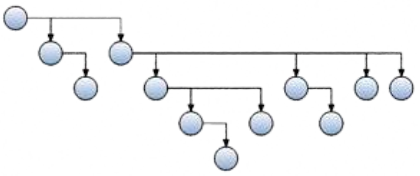
Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

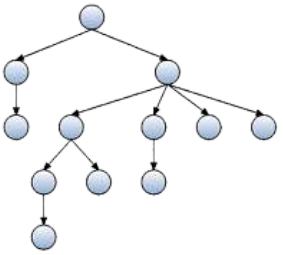
Syntax

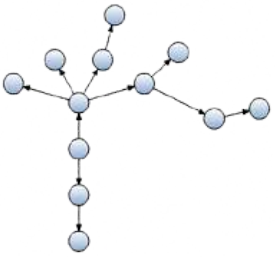
C#

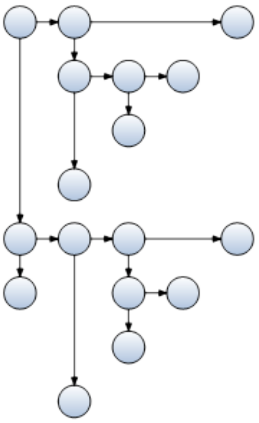
```
public TreeLayoutType Type { get; set; }
```

Visual Basic









```
Public Property Type As TreeLayoutType
```

Property Value

A member of the TreeLayoutType enumeration.

Remarks

The available tree layout types include the following:

Layout type	Appearance
Cascading	
Centered	
Radial	
HorizontalVertical

TreeLayoutBalance Enumeration

Specifies how to order child nodes in order to produce tree layouts with custom balance.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum TreeLayoutBalance
```

Visual Basic Copy Code

```
Public Enum TreeLayoutBalance
```

Members

	Member name	Description
	Original	Indicates that the child order should not be changed.
	Reversed	Indicates that the child order should be reversed.
	LeftHeavy	Indicates that the child nodes with most total children will be processed first, thus producing a left-heavy layout.
	RightHeavy	Indicates that the child nodes with least total children will be processed first, thus producing a right-heavy layout.
	Preserve	Indicates that the layout will attempt to preserve the initial relative ordering of nodes.

MindFusion.Diagramming.Layout Namespace

TreeMapLayout Class

Implements a tree map layout algorithm.

Syntax

C# Copy Code

```
public class TreeMapLayout : Layout
```

Visual Basic Copy Code

```
Public Class TreeMapLayout
    Inherits Layout
```

Remarks

Tree maps represent hierarchies by nesting child nodes within their parents, where the areas of leaf nodes are proportional to their Weight values. Unlike other layout algorithms, **TreeMapLayout** expects hierarchies to be defined via grouping or containment (see AttachTo method and ContainerNode class), and will ignore any links in the diagram.

The diagram area covered by the topmost nodes in a hierarchy is specified via the LayoutArea property. By default, the layout tries to keep the ratio of node sides as close as possible to one. However this could make it hard to distinguish separate levels of the hierarchy. To alleviate that, set Squarify to **false**, and child nodes will be arranged either as a row or a column inside their parent node, alternating directions for each level. The drawback is that when **Weight** ratios differ greatly or nodes contain many children, some nodes could end up with very narrow rectangles.

The padding size between parent nodes and their outermost children is specified via the ContainerPadding property. The padding size between child nodes is specified via Padding.

TreeMapLayout Members

Implements a tree map layout algorithm.

The following tables list the members exposed by the TreeMapLayout type.

Public Constructors

	Name	Description
	TreeMapLayout	Initializes a new instance of the TreeMapLayout class with the default settings.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	ContainerPadding	Gets or sets the padding inside containers.

	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayoutArea	Gets or sets the rectangle in which the layout will try to arrange the nodes, or null, to use the diagram bounds.
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	Orientation	Gets or sets the orientation of the arranged diagram.
	Padding	Gets or sets the distance between adjacent nodes.
	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)
	Squarify	Gets or sets a value indicating whether the layout should attempt to keep the dimension ratio of the nodes closer to 1.

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

TreeMapLayout.ContainerPadding Property

Gets or sets the padding inside containers.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double ContainerPadding { get; set; }
```

Visual Basic Copy Code

```
Public Property ContainerPadding As Double
```

Property Value

A **double** value specifying the padding size between parent nodes and their outermost children. The default value is 0.

Padding Property

TreeMapLayout.DefaultMarginValue Property

Gets the default value of the Margins property.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
protected override Size DefaultMarginValue { get; }
```

Visual Basic Copy Code

```
Protected Overrides ReadOnly Property DefaultMarginValue As Size
```

Property Value

Returns new Size(5, 5).

See Also

TreeMapLayout Members
TreeMapLayout Class
MindFusion.Diagramming.Layout Namespace

TreeMapLayout.LayoutArea Property

Gets or sets the rectangle in which the layout will try to arrange the nodes, or null, to use the diagram bounds.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Nullable<Rect> LayoutArea { get; set; }
```

Visual Basic Copy Code

```
Public Property LayoutArea As Nullable(Of Rect)
```

Property Value

A **Rect?** specifying the area where topmost nodes in the hierarchy are laid out. The default value is **null**.

Remarks

If this property is not set, the algorithm uses the value of diagram's Bounds property as target layout rectangle.

See Also

TreeMapLayout Members
TreeMapLayout Class
MindFusion.Diagramming.Layout Namespace

TreeMapLayout.Name Property

Gets a user-friendly name of the layout.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
public override string Name { get; }
```

Visual Basic

```
Public Overrides ReadOnly Property Name As String
```

Property Value

Returns "Tree map layout".

See Also

TreeMapLayout Members
TreeMapLayout Class
MindFusion.Diagramming.Layout Namespace

TreeMapLayout.Orientation Property

Gets or sets the orientation of the arranged diagram.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
public Orientation Orientation { get; set; }
```

Visual Basic

```
Public Property Orientation As Orientation
```

Property Value

A member of the Orientation enumeration. The default value is **Vertical**.

Remarks

This value is used only when Squarify is set to **false**, and specifies the orientation of the topmost level of the hierarchy. The algorithm alternates the orientation of each subsequent level, arranging its nodes either in rows or columns.

TreeMapLayout.Padding Property

Gets or sets the distance between adjacent nodes.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C#

```
public double Padding { get; set; }
```

Visual Basic

```
Public Property Padding As Double
```

Property Value

A **double** value specifying the padding size between sibling nodes. The default value is 1.

See Also

TreeMapLayout Members
TreeMapLayout Class
MindFusion.Diagramming.Layout Namespace
ContainerPadding Property

TreeMapLayout.Squarify Property

Gets or sets a value indicating whether the layout should attempt to keep the dimension ratio of the nodes closer to 1.

Namespace: MindFusion.Diagramming.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool Squarify { get; set; }
```

Visual Basic Copy Code

```
Public Property Squarify As Boolean
```

Property Value

true to keep the ratio of node sides as close as possible to one, or **false** otherwise. The default value is **true**.

Remarks

If set to **false**, each level of the hierarchy is arranged in rows or columns with same height/width, which might create very narrow rectangles when Weight values differ greatly or nodes have many children. The alternating orientation between levels however helps to distinguish between different levels in the hierarchy. The initial direction of nodes (in topmost level) depends on the value of Orientation.

TreeMapLayout Events

TriangularLayout Class

Performs triangular layout on simple, connected graphs.

Syntax

C# Copy Code

```
public class TriangularLayout : Layout
```

Visual Basic Copy Code

```
Public Class TriangularLayout
    Inherits Layout
```

Remarks

TriangularLayout places nodes on a virtual grid, such that if the source graph is planar, all links are guaranteed to have a single segment and not intersect. If the graph is not planar, its intersecting links can be optionally segmented and bended in order to improve readability. The layout method places the nodes from the external face on a triangle and recursively adds the rest of the nodes as vertices of internal triangles. As a result, it is very effective for near maximal-planar (a.k.a. triangular) graphs.

Inheritance Hierarchy

System.Object
  System.MarshalByRefObject
    System.ComponentModel.Component

TriangularLayout Members

Performs triangular layout on simple, connected graphs.

The following tables list the members exposed by the TriangularLayout type.

Public Constructors

	Name	Description
	TriangularLayout	Initializes a new instance of the **TriangularLayout** class.

Public Properties

	Name	Description
	Anchoring	Gets or sets a value indicating how to align links to the anchor points of graph nodes. (Inherited from Layout.)
	BendNonplanarLinks	Gets or sets a value indicating whether the intersecting links in a non-planar graphs will be segmented and bended to improve presentation.
	EnableParallelism	Gets or sets a value indicating whether to arrange subgraphs on separate threads. (Inherited from Layout.)
	GridSize	Gets or sets the size of the virtual grid the layout will place vertices on.
	GrowToFit	Gets or sets a value indicating whether the diagram boundaries should grow to fit the arranged content. (Inherited from Layout.)
	KeepGroupLayout	Gets or sets a value indicating whether to treat each Group of nodes as a single vertex in the arranged graph. (Inherited from Layout.)
	LayoutLink	Gets or sets a delegate, which is invoked when the position of a link is changed by the layout. (Inherited from Layout.)
	LayoutNode	Gets or sets a delegate, which is invoked when the position of a node is changed by the layout. (Inherited from Layout.)
	Margins	Gets or sets the distance between the top-left corner of the smallest rectangle containing the arranged diagram and the top-left point of the document bounds. (Inherited from Layout.)
	MaxDegreeOfParallelism	Gets or sets the maximum degree of parallelism. (Inherited from Layout.)
	MultipleGraphsPlacement	Gets or sets a value indicating how multiple independent graphs in the diagram should be positioned relatively to each other. (Inherited from Layout.)
	Name	Gets a user-friendly name of the layout.
	Orientation	Gets or sets the orientation of the arranged graph.

	Progress	Gets or sets a delegate, which is invoked regularly during the layout process to inform clients about the layout progress. (Inherited from Layout.)
	RepeatingLinksPadding	Specifies the padding distance between repeating links. (Inherited from Layout.)

Protected Properties

	Name	Description
	DefaultMarginValue	Gets the default value of the Margins property.
	SuppressCompleteEvent	Specifies whether raising the LayoutComplete event should be suppressed for this layout instance. (Inherited from Layout.)

Public Methods

	Name	Description
	Arrange	Overloaded. Applies the layout to a Diagram instance. (Inherited from Layout.)
	ArrangeAnimated	Overloaded. (Inherited from Layout.)
	ArrangeAsync	Overloaded. (Inherited from Layout.)

Protected Methods

	Name	Description
	OnLayoutComplete	Raises the LayoutComplete event. (Inherited from Layout.)

Public Events

	Name	Description
	LayoutComplete	Raised when a layout is finished arranging a graph. (Inherited from Layout.)

MindFusion.Diagramming.Mvc Namespace

ControlNode Class

Represents diagram nodes which can display custom HTML content.

Syntax

C#

```
public class ControlNode : DiagramNode
```

Visual Basic

```
Public Class ControlNode
    Inherits DiagramNode
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.DiagramItem
    MindFusion.Diagramming.DiagramNode
      MindFusion.Diagramming.Mvc.ControlNode

ControlNode Members

Represents diagram nodes which can display custom HTML content.

The following tables list the members exposed by the ControlNode type.

Public Constructors

	Name	Description
	ControlNode	Overloaded.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)

	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Template	Gets or sets the HTML string representing the DOM content rendered in this node.
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)

	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	Clone	Creates a copy of this item.
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)

	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)

	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)

	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFrom	Deserializes the object from the specified reader.
	LoadFromJson	Loads the item content from a JsonObject.
	LoadFromXml	Loads the item content from an XML element.
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)

	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveTo	Serializes the object to the specified writer.
	SaveToJson	Saves the item content into a JsonObject.
	SaveToXml	Saves the item content into an XML element.
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

ControlNode Constructor ()

Initializes a new instance of the ControlNode class.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ControlNode ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

ControlNode Constructor Overload List
ControlNode Class
MindFusion.Diagramming.Mvc Namespace

ControlNode Constructor (ControlNode)

Initializes a new instance of the ControlNode class.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ControlNode (
    ControlNode prototype
)
```

Visual Basic Copy Code

```
Public New ( _
    prototype As ControlNode _
)
```

Parameters

prototype

See Also

ControlNode Class
MindFusion.Diagramming.Mvc Namespace

ControlNode Constructor (Diagram)

Initializes a new instance of the ControlNode class.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ControlNode (
    Diagram diagram
)
```

Visual Basic Copy Code

```
Public New ( _
    diagram As Diagram _
)
```

Parameters

diagram

See Also

ControlNode Methods

ControlNode.Clone Method

Creates a copy of this item.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public override DiagramItem Clone (
    bool clipboard
)
```

Visual Basic Copy Code

```
Public Overrides Function Clone( _
    clipboard As Boolean _
) As DiagramItem
```

Parameters

clipboard

Return Value

See Also

ControlNode Members
ControlNode Class
MindFusion.Diagramming.Mvc Namespace

ControlNode.LoadFrom Method

Deserializes the object from the specified reader.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
protected override void LoadFrom (
    BinaryReader reader,
    PersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFrom( _
    reader As BinaryReader, _
    context As PersistContext _
)
```

Parameters

reader
A BinaryReader object from which to read the item's data.

context
A PersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

ControlNode Members
ControlNode Class
MindFusion.Diagramming.Mvc Namespace

ControlNode.LoadFromJson Method

Loads the item content from a JsonObject.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
protected override void LoadFromJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject containing the item's data.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

ControlNode Members
ControlNode Class
MindFusion.Diagramming.Mvc Namespace

ControlNode.LoadFromXml Method

Loads the item content from an XML element.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
protected override void LoadFromXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub LoadFromXml( _
    xmlElement As XmlElement, _
    context As XmlPersistContext _
)
```

Parameters

xmlElement

context

ControlNode.SaveTo Method

Serializes the object to the specified writer.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
protected override void SaveTo (
    BinaryWriter writer,
    PersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveTo( _
    writer As BinaryWriter, _
    context As PersistContext _
)
```

Parameters

writer
A BinaryWriter object the item's data should be written to.

context
A PersistContext object providing contextual information about the serialization process and some helper serialization methods.

ControlNode Members
ControlNode Class
MindFusion.Diagramming.Mvc Namespace

ControlNode.SaveToJson Method

Saves the item content into a JsonObject.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
protected override void SaveToJson (
    JsonObject obj,
    JsonPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToJson( _
    obj As JsonObject, _
    context As JsonPersistContext _
)
```

Parameters

obj
A JsonObject the item's data should be stored into.

context
A JsonPersistContext object providing contextual information about the serialization process and some helper serialization methods.

ControlNode.SaveToXml Method

Saves the item content into an XML element.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
protected override void SaveToXml (
    XmlElement xmlElement,
    XmlPersistContext context
)
```

Visual Basic Copy Code

```
Protected Overrides Sub SaveToXml( _
    xmlElement As XmlElement, _
```

```
    context As XmlPersistContext _
)
```

Parameters

xmlElement

context

ControlNode Properties

ControlNode.Template Property

Gets or sets the HTML string representing the DOM content rendered in this node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Template { get; set; }
```

Visual Basic Copy Code

```
Public Property Template As String
```

Property Value

ControlNodeConverter Methods

ControlNodeConverter.Deserialize Method

Deserialize override.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public override Object Deserialize (
    IDictionary<string, Object> dictionary,
    Type type,
    JavaScriptSerializer serializer
)
```

Visual Basic Copy Code

```
Public Overrides Function Deserialize( _
    dictionary As IDictionary(Of String, Object), _
    type As Type, _
    serializer As JavaScriptSerializer _
) As Object
```

Parameters

dictionary

type

serializer

Return Value

ControlNodeConverter.Serialize Method

Serialize override.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public override IDictionary<string, Object> Serialize (
    Object obj,
    JavaScriptSerializer serializer
)
```

Visual Basic Copy Code

```
Public Overrides Function Serialize( _
    obj As Object, _
```

```
    serializer As JavaScriptSerializer _
) As IDictionary(Of String, Object)
```

Parameters

obj

serializer

Return Value

ControlNodeStyle Members

Represents a reusable set of properties that define the appearance of control nodes.

The following tables list the members exposed by the ControlNodeStyle type.

Public Constructors

	Name	Description
	ControlNodeStyle	Initializes a new instance of the ControlNodeStyle class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to fill the interior of the item. (Inherited from DiagramItemStyle.)
	Effects	Gets a list of the effects applied to the node. (Inherited from DiagramNodeStyle.)
	FontFamily	Gets or sets the font family of the item text. (Inherited from DiagramItemStyle.)
	FontSize	Gets or sets the font size of the item text. (Inherited from DiagramItemStyle.)
	FontStyle	Gets or sets the font style of the item text. (Inherited from DiagramItemStyle.)
	FontUnit	Gets or sets the font unit of the item text. (Inherited from DiagramItemStyle.)
	ShadowBrush	Gets or sets the brush used to paint the shadow of the item. (Inherited from DiagramItemStyle.)
	Stroke	Gets or sets the brush used to paint the outline of the item. (Inherited from DiagramItemStyle.)
	StrokeDashStyle	Gets or sets the pattern of dashes and gaps used to outline items. (Inherited from DiagramItemStyle.)
	StrokeThickness	Gets or sets the thickness of the item's outline, expressed in the current units of measure. (Inherited from DiagramItemStyle.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItemStyle.)

Public Methods

	Name	Description
	GetProperties	Gets all properties in the style. (Inherited from Style.)
	GetProperty	Returns the property with the specified name, if any. (Inherited from Style.)
S	RegisterType	Associates a type with an alias. (Inherited from Style.)

Protected Methods

	Name	Description
	GetValue	Gets the value of the specified property. (Inherited from Style.)
	IsPropertySet	Checks whether the specified property has a value. (Inherited from Style.)
	LoadFromJson	Loads the style content from a JsonObject. (Inherited from DiagramNodeStyle.)
	LoadFromXml	Loads the style content from an XML element. (Inherited from Style.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from Style.)
	RegisterProperty	Registers a new property with the specified name and type. (Inherited from Style.)
	SaveToJson	Saves the style content into a JsonObject. (Inherited from DiagramNodeStyle.)
	SaveToXml	Saves the style content into an XML element. (Inherited from Style.)
	SetValue	Sets the value of the specified property. (Inherited from Style.)
	UnsetValue	Clears the value of the specified property. (Inherited from Style.)

Public Events

	Name	Description
	PropertyChanged	Raised when any of the registered style properties has changed. (Inherited from Style.)

DiagramView Class

A control that displays the contents of a Diagram on a web page.

Syntax

C# Copy Code

```
public class DiagramView
```

Visual Basic Copy Code

```
Public Class DiagramView
```

Remarks

Apart from rendering the diagram, **DiagramView** also controls most aspects of user interaction. The Behavior property specifies how the control responds to user actions with the mouse. AllowInplaceEdit specifies whether users are allowed to edit in-place the content of a diagram element by double-clicking it.

DiagramView can be created inside a Razor page either by invoking the DiagramView html helper, or by adding a <mindfusion-diagramview> tag helper:

Razor Copy Code

```
@addTagHelper *, MindFusion.Diagramming.Mvc
....
<mindfusion-diagramview
    component=(DiagramView)ViewBag.DiagramView
    style="width:100%; height:100%;">
</mindfusion-diagramview>
```

Inheritance Hierarchy

System.Object
  MindFusion.Diagramming.Mvc.DiagramView
    MindFusion.Diagramming.Mvc.TabbedDiagramView

DiagramView Members

A control that displays the contents of a Diagram on a web page.

The following tables list the members exposed by the DiagramView type.

Public Constructors

	Name	Description
	DiagramView	Overloaded. Creates an instance of **DiagramView**.

Public Properties

	Name	Description

	AddScriptReferences	Gets or sets a value indicating whether the control should render references to the client scripts.
	AllowInplaceEdit	Gets or sets a value indicating whether in-place editing of the text of objects is enabled.
	AutoClasses	Gets the registered client types with JSON templates.
	AutoScroll	Gets or sets a value indicating whether auto scrolling of the document area is enabled.
	Behavior	Gets or sets a value indicating how the control responds to user actions.
	ClientScriptLocation	Gets or sets the URL to the MindFusion.Diagramming.js file.
	Converters	Gets the registered custom converters.
	CustomLinkType	Gets the type of a MindFusion.Diagramming.DiagramLink derived class whose instance should be created when a user starts drawing.
	CustomNodeType	Gets the type of a MindFusion.Diagramming.DiagramNode derived class whose instance should be created when a user starts drawing.
	DefaultControlTemplate	Gets or sets the HTML string representing the DOM content, rendered by default in newly created ControlNode objects.
	DelKeyAction	Gets or sets a value indicating the action that should be performed when the user hits the DELETE key.
	Diagram	Gets or sets the **Diagram** object displayed by this view.
	Enabled	Gets or sets a value indicating whether handling of mouse events is enabled.
	EnableMultiTouch	Gets or sets a value indicating whether the control handles DOM pointer events to implement multi-touch interactions, such as zooming, node rotation or simultaneous drawing of multiple diagram items.
	FallbackContent	Gets or sets the HTML to be rendered as the canvas' fallback content.
	HandleTouchHitDistance	Gets or sets maximum distance between touch position and adjustment handle at which the handle can still be grabbed to modify its item.
	Height	Gets or sets the height of the view.
	Id	Gets or sets the id of the view.
	ItemTypes	Gets the registered item types.
	LicenseKey	Gets or sets the license key of the control.
	MagnifierEnabled	Gets or sets a value indicating whether the magnifier tool is currently enabled.
	MagnifierFactor	Gets or sets the zoom factor of the magnifier tool.
	MagnifierFrameColor	Gets or sets the color of the magnifier frame.
	MagnifierFrameThickness	Gets or sets the thickness of the magnifier frame, expressed in pixels.
	MagnifierHeight	Gets or sets the height of the magnifier tool, expressed in pixels.
	MagnifierSecondaryFrameColor	Gets or sets the secondary color of the magnifier frame.
	MagnifierShading	Gets or sets a value indicating whether to enhance the effect of a magnifier lense by using a gradient shading.
	MagnifierShape	Gets or sets the shape of the magnifier tool.
	MagnifierWidth	Gets or sets the width of the magnifier tool, expressed in pixels.
	MaxJsonLength	Gets or sets the maximum length of JSON strings that are accepted by internal JavaScriptSerializer instances.

	MinVisibleFontSize	Gets or sets a threshold value that hides text if scaled font sizes become smaller.
	ModificationStart	Gets or sets how users can start modifying diagram items.
	MouseWheelAction	Gets or sets what action to perform when users rotate the mouse wheel.
	MultiTouchDraw	Gets or sets a value indicating whether the control allows drawing multiple items simultaneously.
	MultiTouchModify	Gets or sets a value indicating whether multi-touch modifications are enabled.
	MultiTouchZoom	Gets or sets a value indicating whether multi-touch zoom is enabled.
	RecursionLimit	Gets or sets the limit for constraining the number of object levels to process by internal JavaScriptSerializer instances.
	ScrollLeft	Gets or sets the view's X scroll position.
	ScrollTop	Gets or sets the view's Y scroll position.
	ShapeLibraryLocation	The location of a shape library file containing custom shape definitions. It can be set to a full URL of the file, or a relative file path.
	TooltipDelay	Gets or sets the delay before a tooltip is shown.
	VirtualScroll	Gets or sets a value indicating whether virtual scroll mode is enabled.
	Width	Gets or sets the width of the view.
	ZoomFactor	Gets or sets the zoom of the view.

Public Methods

	Name	Description
	AnimatedLayoutCompletedScript	Sets the name of a JavaScript function that should be invoked when an animated layout completes.
	CellTextEditedScript	Sets the name of a JavaScript function that should be invoked when the user edits the text of a table cell.
	CellTextEditingScript	Sets the name of a JavaScript function that should be invoked when the user starts to edit the text of a table cell.
	ClickedScript	Sets the name of a JavaScript function that should be invoked when the user clicks the diagram at a point where no items are located.
	ContainerChildAddedScript	Sets the name of a JavaScript function that should be invoked when a child node is added to a container.
	ContainerChildAddingScript	Sets the name of a JavaScript function that should be invoked before a child node is added to a container.
	ContainerChildRemovedScript	Sets the name of a JavaScript function that should be invoked when a child node is removed from a container.
	ContainerChildRemovingScript	Sets the name of a JavaScript function that should be invoked before a child node is removed from a container.
	ContainerFoldedScript	Sets the name of a JavaScript function that should be invoked when the user folds a container by clicking the arrow-up button in the container's caption area.
	ContainerUnfoldedScript	Sets the name of a JavaScript function that should be invoked when the user unfolds a container by clicking the arrow-down button in the container's caption area.
	ControlLoadedScript	Sets the name of a JavaScript function that should be invoked when the control is loaded on the client side.

	CreateEditControlScript	Sets the name of a JavaScript function that should be invoked when when the inplace-edit control is created.
	DataLoadedScript	Sets the name of a JavaScript function that should be invoked when the diagram data is loaded.
	DeserializeTagScript	Sets the name of a JavaScript function that should be invoked when the Tag or Id of a diagram item must be deserialized from XML format.
	DiagramToView	Overloaded. Transforms points from the document coordinate space to the client coordinate space.
	DrawAdjustmentHandlesScript	Sets the name of a JavaScript function that should be invoked when item's adjustment handles must be custom drawn.
	EnterInplaceEditScript	Sets the name of a JavaScript function that should be invoked when when entering inplace-edit mode.
S	FromJson	Overloaded.
S	FromRequest	Overloaded.
	HeaderResizedScript	Sets the name of a JavaScript function that should be invoked when the user finished resizing a header.
	HeaderStartResizingScript	Sets the name of a JavaScript function that should be invoked when the user starts resizing a header.
	HitTestAdjustmentHandlesScript	Sets the name of a JavaScript function that should be invoked when custom hit testing of item's adjustment handles must be performed.
	HyperlinkClickedScript	Sets the name of a JavaScript function that should be invoked when the user clicks a hyperlink inside a node.
	Init	Renders the DiagramView's initializing scripts on a web page under the specified function name.
	InitializeLinkScript	Sets the name of a JavaScript function that should be invoked when the user starts drawing a new link, just after the DiagramLink instance is created.
	InitializeNodeScript	Sets the name of a JavaScript function that should be invoked when the user starts drawing a new node, just after the DiagramNode instance is created.
	ItemAddedScript	Sets the name of a JavaScript function that should be invoked when an item is added to the diagram.
	ItemRemovedScript	Sets the name of a JavaScript function that should be invoked when an item is removed from the diagram.
	LaneGridCellTextEditedScript	Sets the name of a JavaScript function that should be invoked hen the used edits the text of a grid cell.
	LeaveInplaceEditScript	Sets the name of a JavaScript function that should be invoked when when leaving inplace-edit mode.
	LinkClickedScript	Sets the name of a JavaScript function that should be invoked when the users clicks a link.
	LinkCreatedScript	Sets the name of a JavaScript function that should be invoked when the user draws a new link.
	LinkCreatingScript	Sets the name of a JavaScript function that should be invoked while the user is drawing a new link.
	LinkDeletedScript	Sets the name of a JavaScript function that should be invoked when a link is deleted, either programmatically or by the user.
	LinkDeletingScript	Sets the name of a JavaScript function that should be invoked when the user tries to delete a link.
	LinkDeselectedScript	Sets the name of a JavaScript function that should be invoked when a link is deselected, either programmatically or by the user.

	LinkDoubleClickedScript	Sets the name of a JavaScript function that should be invoked when the users double-clicks a link.
	LinkModifiedScript	Sets the name of a JavaScript function that should be invoked when the user moves any control point of a link.
	LinkModifyingScript	Sets the name of a JavaScript function that should be invoked while the user is modifying a link.
	LinkPastedScript	Sets the name of a JavaScript function that should be invoked when a diagram link is pasted from clipboard.
	LinkPointedScript	Sets the name of a JavaScript function that should be invoked when the mouse pointer hovers over a link.
	LinkSelectedScript	Sets the name of a JavaScript function that should be invoked when a link is selected, either programmatically or by the user.
	LinkSelectingScript	Sets the name of a JavaScript function that should be invoked when the user tries to select a link.
	LinkTextEditedScript	Sets the name of a JavaScript function that should be invoked when the user edits the text of a link.
	LinkTextEditingScript	Sets the name of a JavaScript function that should be invoked when the user starts to edit the text of a link.
	LoadFromJson	Overloaded.
	MouseWheelScript	Sets the name of a JavaScript function that should be invoked when the user rotates the mouse wheel while the cursor is positioned over the diagram surface.
	NodeClickedScript	Sets the name of a JavaScript function that should be invoked when the users clicks a node.
	NodeCreatedScript	Sets the name of a JavaScript function that should be invoked when the user draws a new node.
	NodeCreatingScript	Sets the name of a JavaScript function that should be invoked while the user is drawing a new node.
	NodeDeletedScript	Sets the name of a JavaScript function that should be invoked when a node is deleted, either programmatically or by the user.
	NodeDeletingScript	Sets the name of a JavaScript function that should be invoked when the user tries to delete a node.
	NodeDeselectedScript	Sets the name of a JavaScript function that should be invoked when a node is deselected, either programmatically or by the user.
	NodeDomCreatedScript	Sets the name of a JavaScript function that should be invoked when the content of a ControlNode is added to the page DOM.
	NodeDoubleClickedScript	Sets the name of a JavaScript function that should be invoked when the users double-clicks a node.
	NodeModifiedScript	Sets the name of a JavaScript function that should be invoked when the user moves or resizes a node.
	NodeModifyingScript	Sets the name of a JavaScript function that should be invoked while the user is moving or resizing a node.
	NodePastedScript	Sets the name of a JavaScript function that should be invoked when a diagram node is pasted from clipboard.
	NodePointedScript	Sets the name of a JavaScript function that should be invoked when the mouse pointer hovers over a node.
	NodeSelectedScript	Sets the name of a JavaScript function that should be invoked when a node is selected, either programmatically or by the user.
	NodeSelectingScript	Sets the name of a JavaScript function that should be invoked when the user tries to select a node.

	NodeTextEditedScript	Sets the name of a JavaScript function that should be invoked when the user edits the text of a node.
	NodeTextEditingScript	Sets the name of a JavaScript function that should be invoked when the user starts to edit the text of a node.
	RegisterConverters	Registers custom converters used for custom item types serialization.
	RegisterItemType	Overloaded.
	RegisterSession	Overloaded.
	Render	Renders the **DiagramView** on a web page.
	RepaintScript	Sets the name of a JavaScript function that should be invoked when the diagram has been repainted.
	SaveToJson	Serializes the DiagramView's data to JSON.
	SelectionChangedScript	Sets the name of a JavaScript function that should be invoked when the diagram selection has changed.
	SelectionModifyingScript	Sets the name of a JavaScript function that should be invoked while the user is moving or resizing multiple items.
	SerializeTagScript	Sets the name of a JavaScript function that should be invoked when the Tag or Id of a diagram item must be serialized in XML format.
	SetAddScriptReferences	Sets a value indicating whether the control should render references to the client scripts.
	SetAllowInplaceEdit	Sets a value indicating whether in-place editing of the text of objects is enabled.
	SetAutoScroll	Sets a value indicating whether auto scrolling of the document area is enabled.
	SetBehavior	Sets a value indicating how the control responds to user actions.
	SetCustomLinkType	Sets the type of a MindFusion.Diagramming.**DiagramLink** derived class whose instance should be created when a user starts drawing.
	SetCustomNodeType	Sets the type of a MindFusion.Diagramming.**DiagramNode** derived class whose instance should be created when a user starts drawing.
	SetDelKeyAction	Sets a value indicating the action that should be performed when the user hits the Del key.
	SetEnabled	Sets a value indicating whether handling of mouse events is enabled.
	SetEnableMultiTouch	Sets a value indicating whethr the control handles DOM pointer events to implement multi-touch interactions, such as zooming, node rotation or simultaneous drawing of multiple diagram items.
	SetFallbackContent	Sets the HTML to be rendered as the canvas' fallback content.
	SetHeight	Sets the height of the view.
	SetMagnifierEnabled	Sets a value indicating whether the magnifier tool is currently enabled.
	SetMagnifierFactor	Sets the zoom factor of the magnifier tool.
	SetMagnifierFrameColor	Sets the color of the magnifier frame.
	SetMagnifierFrameThickness	Sets the thickness of the magnifier frame, expressed in pixels.
	SetMagnifierHeight	Sets the height of the magnifier tool, expressed in pixels.
	SetMagnifierSecondaryFrameColor	Sets the secondary color of the magnifier frame.
	SetMagnifierShading	Sets a value indicating whether to enhance the effect of a magnifier lense by using a gradient shading.
	SetMagnifierShape	Sets the shape of the magnifier tool.

	SetMagnifierWidth	Sets the width of the magnifier tool, expressed in pixels.
	SetMaxJsonLength	Sets the maximum length of JSON strings that are accepted by internal JavaScriptSerializer instances.
	SetMinVisibleFontSize	Sets a threshold value that hides text if scaled font sizes become smaller.
	SetModificationStart	Sets how users can start modifying diagram items.
	SetMouseWheelAction	Sets a value indicating what action to perform when users rotate the mouse wheel.
	SetMultiTouchDraw	Sets a value indicating whether the control allows drawing multiple items simultaneously.
	SetMultiTouchModify	Sets a value indicating whether multi-touch modifications are enabled.
	SetMultiTouchZoom	Sets a value indicating whether multi-touch zoom is enabled.
	SetRecursionLimit	Sets the limit for constraining the number of object levels to process by internal JavaScriptSerializer instances.
	SetScrollLeft	Sets the view's X scroll position.
	SetScrollTop	Sets the view's Y scroll position.
	SetShowScrollbars	Sets a value indicating whether the scrollbars are visible.
	SetTooltipDelay	Sets the delay before a tooltip is shown.
	SetVirtualScroll	Sets a value indicating whether virtual scroll mode is enabled.
	SetWidth	Sets the width of the view.
	SetZoomFactor	Sets the zoom of the view.
	SizeChangedScript	Sets the name of a JavaScript function that should be invoked when the size of the diagram canvas has changed.
	TableColumnResizedScript	Sets the name of a JavaScript function that should be invoked when the user finishes resizing a column in a table interactively.
	TableColumnResizingScript	Sets the name of a JavaScript function that should be invoked when the user resizes a column in a table interactively.
	TableRowResizedScript	Sets the name of a JavaScript function that should be invoked when the user finishes resizing a row in a table interactively.
	TableRowResizingScript	Sets the name of a JavaScript function that should be invoked when the user resizes a row in a table interactively.
	ToJson	Serializes the DiagramView's data to JSON.
	TreeCollapsedScript	Sets the name of a JavaScript function that should be invoked when a user collapses a tree branch by clicking the [+] button of an Expandable node.
	TreeExpandedScript	Sets the name of a JavaScript function that should be invoked when a user expands a tree branch by clicking the [+] button of an Expandable node.
	TreeItemTextEditedScript	Sets the name of a JavaScript function that should be invoked when the user edits the text of a tree view item.
	TreeItemTextEditingScript	Sets the name of a JavaScript function that should be invoked when the user starts to edit the text of a tree view item.
	ViewToDiagram	Overloaded.

DiagramView Constructor (String)

Creates an instance of DiagramView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public DiagramView (
    string id
)
```

Visual Basic

```
Public New ( _
    id As String _
)
```

Parameters

id

The Id of the DiagramView.

See Also

DiagramView Constructor Overload List
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView Constructor (String, Diagram)

Creates an instance of DiagramView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public DiagramView (
    string id,
    Diagram diagram
)
```

Visual Basic

```
Public New ( _
    id As String, _
    diagram As Diagram _
)
```

Parameters

id

The Id of the DiagramView.

diagram

The Diagram displayed by the view.

MindFusion.Diagramming.Mvc Namespace

DiagramView Methods

DiagramView.AnimatedLayoutCompletedScript Method

Sets the name of a JavaScript function that should be invoked when an animated layout completes.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView AnimatedLayoutCompletedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function AnimatedLayoutCompletedScript( _
    value As String _
) As DiagramView
```

Parameters

value
Name of the animatedLayoutCompleted event handler function.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.CellTextEditedScript Method

Sets the name of a JavaScript function that should be invoked when the user edits the text of a table cell.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView CellTextEditedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function CellTextEditedScript( _
    value As String _
) As DiagramView
```

Parameters

value
Name of the cellTextEdited event handler function.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.CellTextEditingScript Method

Sets the name of a JavaScript function that should be invoked when the user starts to edit the text of a table cell.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView CellTextEditingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function CellTextEditingScript( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ClickedScript Method

Sets the name of a JavaScript function that should be invoked when the user clicks the diagram at a point where no items are located.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView ClickedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ClickedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ContainerChildAddedScript Method

Sets the name of a JavaScript function that should be invoked when a child node is added to a container.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView ContainerChildAddedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ContainerChildAddedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ContainerChildAddingScript Method

Sets the name of a JavaScript function that should be invoked before a child node is added to a container.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView ContainerChildAddingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ContainerChildAddingScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ContainerChildRemovedScript Method

Sets the name of a JavaScript function that should be invoked when a child node is removed from a container.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView ContainerChildRemovedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ContainerChildRemovedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ContainerChildRemovingScript Method

Sets the name of a JavaScript function that should be invoked before a child node is removed from a container.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView ContainerChildRemovingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ContainerChildRemovingScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ContainerFoldedScript Method

Sets the name of a JavaScript function that should be invoked when the user folds a container by clicking the arrow-up button in the container's caption area.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView ContainerFoldedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ContainerFoldedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ContainerUnfoldedScript Method

Sets the name of a JavaScript function that should be invoked when the user unfolds a container by clicking the arrow-down button in the container's caption area.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView ContainerUnfoldedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ContainerUnfoldedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView.ControlLoadedScript Method

Sets the name of a JavaScript function that should be invoked when the control is loaded on the client side.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView ControlLoadedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ControlLoadedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.CreateEditControlScript Method

Sets the name of a JavaScript function that should be invoked when when the inplace-edit control is created.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView CreateEditControlScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function CreateEditControlScript( _
    value As String _
) As DiagramView
```

Parameters

value
Name of the createEditControl event handler function.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.DataLoadedScript Method

Sets the name of a JavaScript function that should be invoked when the diagram data is loaded.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView DataLoadedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function DataLoadedScript( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.DeserializeTagScript Method

Sets the name of a JavaScript function that should be invoked when the Tag or Id of a diagram item must be deserialized from XML format.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView DeserializeTagScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function DeserializeTagScript( _
    value As String _
) As DiagramView
```

Parameters

value
Name of the deserializeTag event handler function.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.DiagramToView Method

Transforms points from the document coordinate space to the client coordinate space.

Overload List

Name	Description
DiagramView.DiagramToView (Point)	Converts the specified point from document to client coordinates.
DiagramView.DiagramToView (Rect)	Converts the specified rectangle from document to client coordinates.
DiagramView.DiagramToView (Single)	Converts the specified value from document to client coordinates.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.DiagramToView Method (Point)

Converts the specified point from document to client coordinates.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Point DiagramToView (
    Point docPoint
)
```

Visual Basic Copy Code

```
Public Function DiagramToView( _
    docPoint As Point _
) As Point
```

Parameters

docPoint
The **Microsoft.Maui.Graphics.Point** to convert.

Return Value

The converted point

See Also

DiagramToView Method Overload List
DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.DiagramToView Method (Rect)

Converts the specified rectangle from document to client coordinates.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Rect DiagramToView (
    Rect docRect
)
```

Visual Basic Copy Code

```
Public Function DiagramToView( _
    docRect As Rect _
) As Rect
```

Parameters

docRect
The **Microsoft.Maui.Graphics.Rect** to convert.

Return Value

The converted rectangle

See Also

DiagramToView Method Overload List
DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.DiagramToView Method (Single)

Converts the specified value from document to client coordinates.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public int DiagramToView (
    float value
)
```

Visual Basic Copy Code

```
Public Function DiagramToView( _
    value As Single _
) As Integer
```

Parameters

value

Return Value

See Also

DiagramToView Method Overload List
DiagramView Members

DiagramView.DrawAdjustmentHandlesScript Method

Sets the name of a JavaScript function that should be invoked when item's adjustment handles must be custom drawn.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView DrawAdjustmentHandlesScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function DrawAdjustmentHandlesScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.EnterInplaceEditScript Method

Sets the name of a JavaScript function that should be invoked when when entering inplace-edit mode.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView EnterInplaceEditScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function EnterInplaceEditScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView.FromJson Method

Overload List

Name	Description
DiagramView.FromJson (String)	Creates a DiagramView object from JSON.
DiagramView.FromJson (String, String)	Creates a Diagram object from JSON.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.FromJson Method (String)

Creates a DiagramView object from JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static DiagramView FromJson (
    string json
)
```

Visual Basic Copy Code

```
Public Shared Function FromJson( _
    json As String _
) As DiagramView
```

Parameters

json
The JSON string

Return Value

See Also

FromJson Method Overload List
DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.FromJson Method (String, String)

Creates a Diagram object from JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public static DiagramView FromJson (
    string id,
    string json
)
```

Visual Basic

```
Public Shared Function FromJson( _
    id As String, _
    json As String _
) As DiagramView
```

Parameters

id
The Id of the DiagramView

json
The JSON string

Return Value

See Also

FromJson Method Overload List
DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.FromRequest Method

Overload List

Name	Description
DiagramView.FromRequest (String, HttpRequest)	Creates an instance of DiagramView.
DiagramView.FromRequest (String, HttpRequestBase)	Creates an instance of DiagramView.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.FromRequest Method (String, HttpRequest)

Creates an instance of DiagramView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public static DiagramView FromRequest (
    string id,
    HttpRequest request
)
```

Visual Basic

```
Public Shared Function FromRequest( _
    id As String, _
    request As HttpRequest _
) As DiagramView
```

Parameters

id

The Id of the DiagramView

request

An HttpRequest object that contains the json data for the view.

Return Value

See Also

FromRequest Method Overload List
DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.FromRequest Method (String, HttpRequestBase)

Creates an instance of DiagramView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static DiagramView FromRequest (
    string id,
    HttpRequestBase request
)
```

Visual Basic Copy Code

```
Public Shared Function FromRequest( _
    id As String, _
    request As HttpRequestBase _
) As DiagramView
```

Parameters

id

The Id of the DiagramView

request

An **HttpRequest** object that contains the json data for the view.

Return Value

See Also

FromRequest Method Overload List
DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.GetAttributes Method

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
protected string GetAttributes ()
```

Visual Basic Copy Code

```
Protected Function GetAttributes () As String
```

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.HeaderResizedScript Method

Sets the name of a JavaScript function that should be invoked when the user finished resizing a header.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView HeaderResizedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function HeaderResizedScript( _
    value As String _
) As DiagramView
```

Parameters

value
A string specifying the name of the client-side event handler.

Return Value

Returns this instance for method chaining.

Remarks

This event is raised when AllowResizeHeaders is enabled and the user resizes a grid column or row.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.HeaderStartResizingScript Method

Sets the name of a JavaScript function that should be invoked when the user starts resizing a header.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView HeaderStartResizingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function HeaderStartResizingScript( _
    value As String _
) As DiagramView
```

Parameters

value

A string specifying the name of the client-side event handler.

Return Value

Returns this instance for method chaining.

Remarks

This is a validation event raised when AllowResizeHeaders is enabled and the user starts resizing a grid column or row.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.HitTestAdjustmentHandlesScript Method

Sets the name of a JavaScript function that should be invoked when custom hit testing of item's adjustment handles must be performed.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView HitTestAdjustmentHandlesScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function HitTestAdjustmentHandlesScript( _
    value As String _
) As DiagramView
```

Parameters

value

The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.HyperlinkClickedScript Method

Sets the name of a JavaScript function that should be invoked when the user clicks a hyperlink inside a node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView HyperlinkClickedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function HyperlinkClickedScript( _
    value As String _
) As DiagramView
```

Parameters

value
Name of the hyperlinkClicked event handler function.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.Init Method

Renders the DiagramView's initializing scripts on a web page under the specified function name.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public virtual string Init (
    string functionName
)
```

Visual Basic Copy Code

```
Public Overridable Function Init( _
    functionName As String _
) As String
```

Parameters

functionName

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.InitializeLinkScript Method

Sets the name of a JavaScript function that should be invoked when the user starts drawing a new link, just after the DiagramLink instance is created.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView InitializeLinkScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function InitializeLinkScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.InitializeNodeScript Method

Sets the name of a JavaScript function that should be invoked when the user starts drawing a new node, just after the DiagramNode instance is created.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView InitializeNodeScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function InitializeNodeScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ItemAddedScript Method

Sets the name of a JavaScript function that should be invoked when an item is added to the diagram.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView ItemAddedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ItemAddedScript( _
    value As String _
) As DiagramView
```

Parameters

value
A string specifying the name of the client-side event handler.

Return Value

Returns this instance for method chaining.

Remarks

This event is raised both when items are drawn interactively or added from code - unlike NodeCreated and LinkCreated which are only raised for interactively-created items.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ItemRemovedScript Method

Sets the name of a JavaScript function that should be invoked when an item is removed from the diagram.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView ItemRemovedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ItemRemovedScript( _
    value As String _
) As DiagramView
```

Parameters

value

A string specifying the name of the client-side event handler.

Return Value

Returns this instance for method chaining.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.LaneGridCellTextEditedScript Method

Sets the name of a JavaScript function that should be invoked hen the used edits the text of a grid cell.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LaneGridCellTextEditedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LaneGridCellTextEditedScript( _
    value As String _
) As DiagramView
```

Parameters

value
Name of the laneGridCellTextEdited event handler function.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.LeaveInplaceEditScript Method

Sets the name of a JavaScript function that should be invoked when when leaving inplace-edit mode.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LeaveInplaceEditScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LeaveInplaceEditScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.LinkClickedScript Method

Sets the name of a JavaScript function that should be invoked when the users clicks a link.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LinkClickedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkClickedScript( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.LinkCreatedScript Method

Sets the name of a JavaScript function that should be invoked when the user draws a new link.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LinkCreatedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkCreatedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.LinkCreatingScript Method

Sets the name of a JavaScript function that should be invoked while the user is drawing a new link.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LinkCreatingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkCreatingScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class

DiagramView.LinkDeselectedScript Method

Sets the name of a JavaScript function that should be invoked when a link is deselected, either programmatically or by the user.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LinkDeselectedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkDeselectedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.LinkDoubleClickedScript Method

Sets the name of a JavaScript function that should be invoked when the users double-clicks a link.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LinkDoubleClickedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkDoubleClickedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.LinkModifiedScript Method

Sets the name of a JavaScript function that should be invoked when the user moves any control point of a link.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LinkModifiedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkModifiedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

DiagramView.LinkModifyingScript Method

Sets the name of a JavaScript function that should be invoked while the user is modifying a link.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LinkModifyingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkModifyingScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.LinkPastedScript Method

Sets the name of a JavaScript function that should be invoked when a diagram link is pasted from clipboard.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LinkPastedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkPastedScript( _
    value As String _
) As DiagramView
```

Parameters

value
A string specifying JavaScript function name.

Return Value

This instance returned for method chaining.

Remarks

The handler function receives a LinkEventArgs object containing more information about the event.

DiagramView.LinkPointedScript Method

Sets the name of a JavaScript function that should be invoked when the mouse pointer hovers over a link.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LinkPointedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkPointedScript( _
    value As String _
) As DiagramView
```

Parameters

value
Name of the linkPointed event handler function.

Return Value

DiagramView.LinkSelectedScript Method

Sets the name of a JavaScript function that should be invoked when a link is selected, either programmatically or by the user.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LinkSelectedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkSelectedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

DiagramView.LinkSelectingScript Method

Sets the name of a JavaScript function that should be invoked when the user tries to select a link.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LinkSelectingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkSelectingScript( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

DiagramView.LinkTextEditedScript Method

Sets the name of a JavaScript function that should be invoked when the user edits the text of a link.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView LinkTextEditedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkTextEditedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

DiagramView.LoadFromJson Method

Overload List

Name	Description
DiagramView.LoadFromJson (String)	Loads the specified JSON data.
DiagramView.LoadFromJson (String, Boolean)	Loads the specified JSON data.

See Also

DiagramView.LoadFromJson Method (String)

Loads the specified JSON data.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public void LoadFromJson (
    string json
)
```

Visual Basic Copy Code

```
Public Sub LoadFromJson( _
    json As String _
)
```

Parameters

json
The JSON string

See Also

LoadFromJson Method Overload List
DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.LoadFromJson Method (String, Boolean)

Loads the specified JSON data.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public void LoadFromJson (
    string json,
    bool clearDiagram
)
```

Visual Basic Copy Code

```
Public Sub LoadFromJson( _
    json As String, _
    clearDiagram As Boolean _
)
```

Parameters

json
The JSON string

clearDiagram
true to remove all diagram items before loading, or **false** otherwise.

DiagramView.MouseWheelScript Method

Sets the name of a JavaScript function that should be invoked when the user rotates the mouse wheel while the cursor is positioned over the diagram surface.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView MouseWheelScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function MouseWheelScript( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class

DiagramView.NodeClickedScript Method

Sets the name of a JavaScript function that should be invoked when the users clicks a node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodeClickedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodeClickedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.NodeCreatedScript Method

Sets the name of a JavaScript function that should be invoked when the user draws a new node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodeCreatedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodeCreatedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class

DiagramView.NodeCreatingScript Method

Sets the name of a JavaScript function that should be invoked while the user is drawing a new node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodeCreatingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodeCreatingScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

DiagramView.NodeDeletedScript Method

Sets the name of a JavaScript function that should be invoked when a node is deleted, either programmatically or by the user.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodeDeletedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodeDeletedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.NodeDeletingScript Method

Sets the name of a JavaScript function that should be invoked when the user tries to delete a node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodeDeletingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodeDeletingScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class

DiagramView.NodeDeselectedScript Method

Sets the name of a JavaScript function that should be invoked when a node is deselected, either programmatically or by the user.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodeDeselectedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodeDeselectedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.NodeDomCreatedScript Method

Sets the name of a JavaScript function that should be invoked when the content of a ControlNode is added to the page DOM.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodeDomCreatedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodeDomCreatedScript( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class

DiagramView.NodeDoubleClickedScript Method

Sets the name of a JavaScript function that should be invoked when the users double-clicks a node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodeDoubleClickedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodeDoubleClickedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.NodeModifiedScript Method

Sets the name of a JavaScript function that should be invoked when the user moves or resizes a node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodeModifiedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodeModifiedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members

MindFusion.Diagramming.Mvc Namespace

DiagramView.NodeModifyingScript Method

Sets the name of a JavaScript function that should be invoked while the user is moving or resizing a node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodeModifyingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodeModifyingScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class

DiagramView.NodePastedScript Method

Sets the name of a JavaScript function that should be invoked when a diagram node is pasted from clipboard.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodePastedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodePastedScript( _
    value As String _
) As DiagramView
```

Parameters

value
A string specifying JavaScript function name.

Return Value

This instance returned for method chaining.

Remarks

The handler function receives a NodeEventArgs object containing more information about the event.

DiagramView.NodePointedScript Method

Sets the name of a JavaScript function that should be invoked when the mouse pointer hovers over a node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodePointedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodePointedScript( _
    value As String _
) As DiagramView
```

Parameters

value
Name of the nodePointed event handler function.

Return Value

DiagramView.NodeTextEditedScript Method

Sets the name of a JavaScript function that should be invoked when the user edits the text of a node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView NodeTextEditedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodeTextEditedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members

DiagramView.RegisterConverters Method

Registers custom converters used for custom item types serialization.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView RegisterConverters (
    JavaScriptConverter[] converters
)
```

Visual Basic Copy Code

```
Public Function RegisterConverters( _
    converters() As JavaScriptConverter _
) As DiagramView
```

Parameters

converters
The converters to register.

Return Value

DiagramView.RegisterItemType Method (Type, String, String, Int32)

Registers a custom item class for serialization support.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView RegisterItemType (
    Type itemClass,
    string classId,
    string clientClassId,
    int classVersion
)
```

Visual Basic Copy Code

```
Public Function RegisterItemType( _
    itemClass As Type, _
    classId As String, _
    clientClassId As String, _
    classVersion As Integer _
) As DiagramView
```

Parameters

itemClass
A Type instance identifying the item class.

classId
A class identifier to use when serializing, saving and loading items of the specified type.

clientClassId
A class identifier to use when serializing items of the specified type on the client side.

classVersion
A revision number of the item's class serialization format.

Return Value

DiagramView.RegisterItemType Method (Type, String, String, Int32, String)

Registers a custom item class for serialization support.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView RegisterItemType (
    Type itemClass,
    string classId,
    string clientClassId,
    int classVersion,
    string jsonTemplate
)
```

Visual Basic — Copy Code

```
Public Function RegisterItemType( _
    itemClass As Type, _
    classId As String, _
    clientClassId As String, _
    classVersion As Integer, _
    jsonTemplate As String _
) As DiagramView
```

Parameters

itemClass
A Type instance identifying the item class.

classId
A class identifier to use when serializing, saving and loading items of the specified type.

clientClassId
A class identifier to use when serializing items of the specified type on the client side.

classVersion
A revision number of the item's class serialization format.

jsonTemplate
A JSON string representation of the node contents.

DiagramView.RegisterSession Method (HttpSessionStateBase)

Registers the session instance with the ItemTypeResolver used in custom item serialization.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# — Copy Code

```
public DiagramView RegisterSession (
    HttpSessionStateBase session
)
```

Visual Basic Copy Code

```
Public Function RegisterSession( _
    session As HttpSessionStateBase _
) As DiagramView
```

Parameters

session
An HttpSessionStateBase instance.

Return Value

This DiagramView instance for method chaining.

DiagramView.RepaintScript Method

Sets the name of a JavaScript function that should be invoked when the diagram has been repainted.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView RepaintScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function RepaintScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SaveToJson Method

Serializes the DiagramView's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public virtual string SaveToJson ()
```

Visual Basic

```
Public Overridable Function SaveToJson () As String
```

Return Value

The JSON string.

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SelectionModifyingScript Method

Sets the name of a JavaScript function that should be invoked while the user is moving or resizing multiple items.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SelectionModifyingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function SelectionModifyingScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SerializeTagScript Method

Sets the name of a JavaScript function that should be invoked when the Tag or Id of a diagram item must be serialized in XML format.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SerializeTagScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function SerializeTagScript( _
    value As String _
) As DiagramView
```

Parameters

value
Name of the serializeTag event handler function.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetAddScriptReferences Method

Sets a value indicating whether the control should render references to the client scripts.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetAddScriptReferences (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetAddScriptReferences( _
    value As Boolean _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetAllowInplaceEdit Method

Sets a value indicating whether in-place editing of the text of objects is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetAllowInplaceEdit (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetAllowInplaceEdit( _
    value As Boolean _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetAutoScroll Method

Sets a value indicating whether auto scrolling of the document area is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetAutoScroll (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetAutoScroll( _
    value As Boolean _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetBehavior Method

Sets a value indicating how the control responds to user actions.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetBehavior (
    Behavior value
)
```

Visual Basic Copy Code

```
Public Function SetBehavior( _
    value As Behavior _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetCustomLinkType Method

Sets the type of a MindFusion.Diagramming.DiagramLink derived class whose instance should be created when a user starts drawing.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetCustomLinkType (
    Type value
)
```

Visual Basic Copy Code

```
Public Function SetCustomLinkType( _
    value As Type _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetCustomNodeType Method

Sets the type of a MindFusion.Diagramming.DiagramNode derived class whose instance should be created when a user starts drawing.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetCustomNodeType (
    Type value
)
```

Visual Basic Copy Code

```
Public Function SetCustomNodeType( _
    value As Type _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetDelKeyAction Method

Sets a value indicating the action that should be performed when the user hits the Del key.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetDelKeyAction (
    DelKeyAction value
)
```

Visual Basic Copy Code

```
Public Function SetDelKeyAction( _
    value As DelKeyAction _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetEnabled Method

Sets a value indicating whether handling of mouse events is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetEnabled (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetEnabled( _
    value As Boolean _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetEnableMultiTouch Method

Sets a value indicating whethr the control handles DOM pointer events to implement multi-touch interactions, such as zooming, node rotation or simultaneous drawing of multiple diagram items.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetEnableMultiTouch (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetEnableMultiTouch( _
    value As Boolean _
) As DiagramView
```

Parameters

value
true to enable multi-touch, or **false** otherwise.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetFallbackContent Method

Sets the HTML to be rendered as the canvas' fallback content.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetFallbackContent (
    string value
)
```

Visual Basic Copy Code

```
Public Function SetFallbackContent( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetHeight Method

Sets the height of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetHeight (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetHeight( _
    value As Integer _
) As DiagramView
```

Parameters

value
The height of the view in pixels.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMagnifierEnabled Method

Sets a value indicating whether the magnifier tool is currently enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMagnifierEnabled (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetMagnifierEnabled( _
    value As Boolean _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMagnifierFactor Method

Sets the zoom factor of the magnifier tool.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMagnifierFactor (
    float value
)
```

Visual Basic Copy Code

```
Public Function SetMagnifierFactor( _
    value As Single _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMagnifierFrameColor Method

Sets the color of the magnifier frame.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMagnifierFrameColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetMagnifierFrameColor( _
    value As Color _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMagnifierFrameThickness Method

Sets the thickness of the magnifier frame, expressed in pixels.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMagnifierFrameThickness (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetMagnifierFrameThickness( _
    value As Integer _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMagnifierHeight Method

Sets the height of the magnifier tool, expressed in pixels.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMagnifierHeight (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetMagnifierHeight( _
    value As Integer _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMagnifierSecondaryFrameColor Method

Sets the secondary color of the magnifier frame.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMagnifierSecondaryFrameColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetMagnifierSecondaryFrameColor( _
    value As Color _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMagnifierShading Method

Sets a value indicating whether to enhance the effect of a magnifier lense by using a gradient shading.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMagnifierShading (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetMagnifierShading( _
    value As Boolean _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMagnifierShape Method

Sets the shape of the magnifier tool.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMagnifierShape (
    Shape value
)
```

Visual Basic Copy Code

```
Public Function SetMagnifierShape( _
    value As Shape _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMagnifierWidth Method

Sets the width of the magnifier tool, expressed in pixels.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMagnifierWidth (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetMagnifierWidth( _
    value As Integer _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMaxJsonLength Method

Sets the maximum length of JSON strings that are accepted by internal JavaScriptSerializer instances.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMaxJsonLength (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetMaxJsonLength( _
    value As Integer _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMinVisibleFontSize Method

Sets a threshold value that hides text if scaled font sizes become smaller.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMinVisibleFontSize (
    float value
)
```

Visual Basic Copy Code

```
Public Function SetMinVisibleFontSize( _
    value As Single _
) As DiagramView
```

Parameters

value
A **float** value specifying the smallest visible font size.

Return Value

This DiagramView instance returned for chaining calls.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetModificationStart Method

Sets how users can start modifying diagram items.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetModificationStart (
    ModificationStart value
)
```

Visual Basic Copy Code

```
Public Function SetModificationStart( _
    value As ModificationStart _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMouseWheelAction Method

Sets a value indicating what action to perform when users rotate the mouse wheel.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMouseWheelAction (
    MouseWheelAction value
)
```

Visual Basic Copy Code

```
Public Function SetMouseWheelAction( _
    value As MouseWheelAction _
) As DiagramView
```

Parameters

value
A member of the MouseWheelAction enumeration.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace
MouseWheelAction Property

DiagramView.SetMultiTouchDraw Method

Sets a value indicating whether the control allows drawing multiple items simultaneously.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMultiTouchDraw (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetMultiTouchDraw( _
    value As Boolean _
) As DiagramView
```

Parameters

value
true to allow drawing multiple items simultaneously, or **false** otherwise.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetMultiTouchModify Method

Sets a value indicating whether multi-touch modifications are enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMultiTouchModify (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetMultiTouchModify( _
    value As Boolean _
) As DiagramView
```

Parameters

value
true to enable multi-touch node modification, or **false** otherwise.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace
MultiTouchModify Property

DiagramView.SetMultiTouchZoom Method

Sets a value indicating whether multi-touch zoom is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetMultiTouchZoom (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetMultiTouchZoom( _
    value As Boolean _
) As DiagramView
```

Parameters

value
true to enable multi-touch zoom, or **false** otherwise.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace
MultiTouchZoom Property

DiagramView.SetRecursionLimit Method

Sets the limit for constraining the number of object levels to process by internal JavaScriptSerializer instances.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetRecursionLimit (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetRecursionLimit( _
    value As Integer _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetScrollLeft Method

Sets the view's X scroll position.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetScrollLeft (
    float value
)
```

Visual Basic Copy Code

```
Public Function SetScrollLeft( _
    value As Single _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetScrollTop Method

Sets the view's Y scroll position.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetScrollTop (
    float value
)
```

Visual Basic Copy Code

```
Public Function SetScrollTop( _
    value As Single _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetShowScrolbars Method

Sets a value indicating whether the scrollbars are visible.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetShowScrolbars (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetShowScrolbars( _
    value As Boolean _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetTooltipDelay Method

Sets the delay before a tooltip is shown.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetTooltipDelay (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetTooltipDelay( _
    value As Integer _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetVirtualScroll Method

Sets a value indicating whether virtual scroll mode is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetVirtualScroll (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetVirtualScroll( _
    value As Boolean _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetWidth Method

Sets the width of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetWidth (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetWidth( _
    value As Integer _
) As DiagramView
```

Parameters

value
The width of the view in pixels.

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SetZoomFactor Method

Sets the zoom of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SetZoomFactor (
    float value
)
```

Visual Basic Copy Code

```
Public Function SetZoomFactor( _
    value As Single _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.SizeChangedScript Method

Sets the name of a JavaScript function that should be invoked when the size of the diagram canvas has changed.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView SizeChangedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function SizeChangedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.TableColumnResizedScript Method

Sets the name of a JavaScript function that should be invoked when the user finishes resizing a column in a table interactively.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView TableColumnResizedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function TableColumnResizedScript( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.TableColumnResizingScript Method

Sets the name of a JavaScript function that should be invoked when the user resizes a column in a table interactively.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView TableColumnResizingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function TableColumnResizingScript( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.TableRowResizedScript Method

Sets the name of a JavaScript function that should be invoked when the user finishes resizing a row in a table interactively.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView TableRowResizedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function TableRowResizedScript( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.TableRowResizingScript Method

Sets the name of a JavaScript function that should be invoked when the user resizes a row in a table interactively.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView TableRowResizingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function TableRowResizingScript( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ToJson Method

Serializes the DiagramView's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static string ToJson (
    DiagramView view
)
```

Visual Basic Copy Code

```
Public Shared Function ToJson( _
    view As DiagramView _
) As String
```

Parameters

view
An instance of the DiagramView class.

Return Value

The JSON string.

DiagramView.TreeCollapsedScript Method

Sets the name of a JavaScript function that should be invoked when a user collapses a tree branch by clicking the [+] button of an Expandable node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView TreeCollapsedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function TreeCollapsedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.TreeExpandedScript Method

Sets the name of a JavaScript function that should be invoked when a user expands a tree branch by clicking the [+] button of an Expandable node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView TreeExpandedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function TreeExpandedScript( _
    value As String _
) As DiagramView
```

Parameters

value
The name of the function

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.TreeItemTextEditedScript Method

Sets the name of a JavaScript function that should be invoked when the user edits the text of a tree view item.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView TreeItemTextEditedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function TreeItemTextEditedScript( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.TreeItemTextEditingScript Method

Sets the name of a JavaScript function that should be invoked when the user starts to edit the text of a tree view item.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramView TreeItemTextEditingScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function TreeItemTextEditingScript( _
    value As String _
) As DiagramView
```

Parameters

value

Return Value

DiagramView.ViewToDiagram Method

Overload List

Name	Description
DiagramView.ViewToDiagram (Int32)	Converts the specified value from client to document coordinates.
DiagramView.ViewToDiagram (Point)	Converts the specified point from client to document coordinates.
DiagramView.ViewToDiagram (Rect)	Converts the specified rectangle from client to document coordinates.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ViewToDiagram Method (Int32)

Converts the specified value from client to document coordinates.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public float ViewToDiagram (
    int value
)
```

Visual Basic Copy Code

```
Public Function ViewToDiagram( _
    value As Integer _
) As Single
```

Parameters

value

Return Value

ViewToDiagram Method Overload List
DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ViewToDiagram Method (Point)

Converts the specified point from client to document coordinates.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Point ViewToDiagram (
    Point clientPoint
)
```

Visual Basic Copy Code

```
Public Function ViewToDiagram( _
    clientPoint As Point _
) As Point
```

Parameters

clientPoint

Return Value

See Also

ViewToDiagram Method Overload List
DiagramView Members
DiagramView Class

DiagramView.ViewToDiagram Method (Rect)

Converts the specified rectangle from client to document coordinates.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Rect ViewToDiagram (
    Rect clientRect
)
```

Visual Basic Copy Code

```
Public Function ViewToDiagram( _
    clientRect As Rect _
) As Rect
```

Parameters

clientRect

Return Value

ViewToDiagram Method Overload List
DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView Properties

DiagramView.AddScriptReferences Property

Gets or sets a value indicating whether the control should render references to the client scripts.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool AddScriptReferences { get; set; }
```

Visual Basic Copy Code

```
Public Property AddScriptReferences As Boolean
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.AllowInplaceEdit Property

Gets or sets a value indicating whether in-place editing of the text of objects is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool AllowInplaceEdit { get; set; }
```

Visual Basic Copy Code

```
Public Property AllowInplaceEdit As Boolean
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.AutoClasses Property

Gets the registered client types with JSON templates.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Dictionary<string, string> AutoClasses { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property AutoClasses As Dictionary(Of String, String)
```

Property Value

A **Dictionary** containing registered JSON templates for automatic client-side node types.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.AutoScroll Property

Gets or sets a value indicating whether auto scrolling of the document area is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool AutoScroll { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoScroll As Boolean
```

Property Value

See Also

DiagramView Members
DiagramView Class

DiagramView.Behavior Property

Gets or sets a value indicating how the control responds to user actions.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Behavior Behavior { get; set; }
```

Visual Basic Copy Code

```
Public Property Behavior As Behavior
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ClientScriptLocation Property

Gets or sets the URL to the MindFusion.Diagramming.js file.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string ClientScriptLocation { get; set; }
```

Visual Basic Copy Code

```
Public Property ClientScriptLocation As String
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.Converters Property

Gets the registered custom converters.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public JavaScriptConverter[] Converters { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Converters As JavaScriptConverter()
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.CustomLinkType Property

Gets the type of a MindFusion.Diagramming.DiagramLink derived class whose instance should be created when a user starts drawing.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Type CustomLinkType { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property CustomLinkType As Type
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.CustomNodeType Property

Gets the type of a MindFusion.Diagramming.DiagramNode derived class whose instance should be created when a user starts drawing.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Type CustomNodeType { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property CustomNodeType As Type
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.DefaultControlTemplate Property

Gets or sets the HTML string representing the DOM content, rendered by default in newly created ControlNode objects.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string DefaultControlTemplate { get; set; }
```

Visual Basic Copy Code

```
Public Property DefaultControlTemplate As String
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.DelKeyAction Property

Gets or sets a value indicating the action that should be performed when the user hits the DELETE key.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DelKeyAction DelKeyAction { get; set; }
```

Visual Basic Copy Code

```
Public Property DelKeyAction As DelKeyAction
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.Diagram Property

Gets or sets the Diagram object displayed by this view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Diagram Diagram { get; set; }
```

Visual Basic Copy Code

```
Public Property Diagram As Diagram
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.Enabled Property

Gets or sets a value indicating whether handling of mouse events is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool Enabled { get; set; }
```

Visual Basic Copy Code

```
Public Property Enabled As Boolean
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.EnableMultiTouch Property

Gets or sets a value indicating whether the control handles DOM pointer events to implement multi-touch interactions, such as zooming, node rotation or simultaneous drawing of multiple diagram items.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool EnableMultiTouch { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableMultiTouch As Boolean
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.FallbackContent Property

Gets or sets the HTML to be rendered as the canvas' fallback content.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string FallbackContent { get; set; }
```

Visual Basic Copy Code

```
Public Property FallbackContent As String
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.HandleTouchHitDistance Property

Gets or sets maximum distance between touch position and adjustment handle at which the handle can still be grabbed to modify its item.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public float HandleTouchHitDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property HandleTouchHitDistance As Single
```

Property Value

A **float** value specifying the allowed hit distance, in diagram's current unit. The default value is 5.

Remarks

This value is considered only when handling touch events.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.Height Property

Gets or sets the height of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public int Height { get; set; }
```

Visual Basic Copy Code

```
Public Property Height As Integer
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.Id Property

Gets or sets the id of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Id { get; set; }
```

Visual Basic Copy Code

```
Public Property Id As String
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ItemTypes Property

Gets the registered item types.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Dictionary<Type, string> ItemTypes { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ItemTypes As Dictionary(Of Type, String)
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.LicenseKey Property

Gets or sets the license key of the control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string LicenseKey { get; set; }
```

Visual Basic Copy Code

```
Public Property LicenseKey As String
```

Property Value

A string containing the license key.

Remarks

Set this property to disable the component's evaluation mode and stop displaying trial messages. If your application contains more than one Diagram instance or other controls by MindFusion, you could call the MindFusion.Licensing.LicenseManager.AddLicense method to specify the key once instead of setting it per each control.

DiagramView.MagnifierEnabled Property

Gets or sets a value indicating whether the magnifier tool is currently enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool MagnifierEnabled { get; set; }
```

Visual Basic Copy Code

```
Public Property MagnifierEnabled As Boolean
```

Property Value

See Also

DiagramView Members
DiagramView Class

DiagramView.MagnifierFactor Property

Gets or sets the zoom factor of the magnifier tool.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public float MagnifierFactor { get; set; }
```

Visual Basic Copy Code

```
Public Property MagnifierFactor As Single
```

Property Value

See Also

DiagramView Members
DiagramView Class

DiagramView.MagnifierFrameColor Property

Gets or sets the color of the magnifier frame.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Color MagnifierFrameColor { get; set; }
```

Visual Basic Copy Code

```
Public Property MagnifierFrameColor As Color
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.MagnifierFrameThickness Property

Gets or sets the thickness of the magnifier frame, expressed in pixels.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public int MagnifierFrameThickness { get; set; }
```

Visual Basic Copy Code

```
Public Property MagnifierFrameThickness As Integer
```

Property Value

See Also

DiagramView Members
DiagramView Class

DiagramView.MagnifierShading Property

Gets or sets a value indicating whether to enhance the effect of a magnifier lense by using a gradient shading.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool MagnifierShading { get; set; }
```

Visual Basic Copy Code

```
Public Property MagnifierShading As Boolean
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.MagnifierShape Property

Gets or sets the shape of the magnifier tool.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Shape MagnifierShape { get; set; }
```

Visual Basic Copy Code

```
Public Property MagnifierShape As Shape
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.MagnifierWidth Property

Gets or sets the width of the magnifier tool, expressed in pixels.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public int MagnifierWidth { get; set; }
```

Visual Basic Copy Code

```
Public Property MagnifierWidth As Integer
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.MaxJsonLength Property

Gets or sets the maximum length of JSON strings that are accepted by internal JavaScriptSerializer instances.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static int MaxJsonLength { get; set; }
```

Visual Basic Copy Code

```
Public Shared Property MaxJsonLength As Integer
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.MinVisibleFontSize Property

Gets or sets a threshold value that hides text if scaled font sizes become smaller.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public float MinVisibleFontSize { get; set; }
```

Visual Basic Copy Code

```
Public Property MinVisibleFontSize As Single
```

Property Value

A **float** value specifying the smallest visible font size.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.ModificationStart Property

Gets or sets how users can start modifying diagram items.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ModificationStart ModificationStart { get; set; }
```

Visual Basic Copy Code

```
Public Property ModificationStart As ModificationStart
```

Property Value

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.MouseWheelAction Property

Gets or sets what action to perform when users rotate the mouse wheel.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public MouseWheelAction MouseWheelAction { get; set; }
```

Visual Basic Copy Code

```
Public Property MouseWheelAction As MouseWheelAction
```

Property Value

A member of the MouseWheelAction enumeration. The default value is **Scroll**.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace
MouseWheelScript Method

DiagramView.MultiTouchDraw Property

Gets or sets a value indicating whether the control allows drawing multiple items simultaneously.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool MultiTouchDraw { get; set; }
```

Visual Basic

```
Public Property MultiTouchDraw As Boolean
```

Property Value

true to allow drawing multiple items simultaneously, or **false** otherwise. The default value is **true**.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace

DiagramView.MultiTouchModify Property

Gets or sets a value indicating whether multi-touch modifications are enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public bool MultiTouchModify { get; set; }
```

Visual Basic

```
Public Property MultiTouchModify As Boolean
```

Property Value

true to enable multi-touch node modification, or **false** otherwise. The default value is **true**.

Remarks

If this property is enabled, two touches on same node will scale and rotate it. Otherwise each touch is handled independently according to current Behavior value, e.g. by drawing a new diagram link.

Multi-touch rotation is applied only if the Rotate handle bit in EnabledHandles is set.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming.Mvc Namespace
MultiTouchZoom Property

DiagramView.MultiTouchZoom Property

Gets or sets a value indicating whether multi-touch zoom is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public bool MultiTouchZoom { get; set; }
```

Visual Basic

```
Public Property MultiTouchZoom As Boolean
```

Property Value

true to enable multi-touch zoom, or **false** otherwise. The default value is **true**.

Remarks

If this property is disabled, each touch is handled independently according to current Behavior value, e.g. by drawing a new diagram item or moving an existing one.

DiagramView.RecursionLimit Property

Gets or sets the limit for constraining the number of object levels to process by internal JavaScriptSerializer instances.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static int RecursionLimit { get; set; }
```

Visual Basic Copy Code

```
Public Shared Property RecursionLimit As Integer
```

Property Value

DiagramViewExtensions Methods

DiagramViewExtensions.DiagramView Method

Returns a DiagramView by using the specified HTML helper.

Overload List

Name	Description
DiagramViewExtensions.DiagramView (IHtmlHelper, DiagramView)	Returns a **DiagramView** by using the specified HTML helper.
DiagramViewExtensions.DiagramView (IHtmlHelper, DiagramView, IDictionary(String, Object))	Returns a **DiagramView** by using the specified HTML helper.
DiagramViewExtensions.DiagramView (IHtmlHelper, DiagramView, Object)	Returns a **DiagramView** by using the specified HTML helper.
DiagramViewExtensions.DiagramView (IHtmlHelper, DiagramView, String)	Returns a DiagramView by using the specified HTML helper.
DiagramViewExtensions.DiagramView (IHtmlHelper, DiagramView, String, IDictionary(String, Object))	Returns a **DiagramView** by using the specified HTML helper.
DiagramViewExtensions.DiagramView (IHtmlHelper, DiagramView, String, Object)	Returns a **DiagramView** by using the specified HTML helper.
DiagramViewExtensions.DiagramView (IHtmlHelper, String, Diagram)	Returns a **DiagramView** by using the specified HTML helper.
DiagramViewExtensions.DiagramView (IHtmlHelper, String, Diagram, IDictionary(String, Object))	Returns a **DiagramView** by using the specified HTML helper.
DiagramViewExtensions.DiagramView (IHtmlHelper, String, Diagram, Object)	Returns a **DiagramView** by using the specified HTML helper.
DiagramViewExtensions.DiagramView (IHtmlHelper, String, Diagram, String)	Returns a **DiagramView** by using the specified HTML helper.
DiagramViewExtensions.DiagramView (IHtmlHelper, String, Diagram, String, IDictionary(String, Object))	Returns a **DiagramView** by using the specified HTML helper.
DiagramViewExtensions.DiagramView (IHtmlHelper, String, Diagram, String, Object)	Returns a **DiagramView** by using the specified HTML helper.

See Also

DiagramViewExtensions Members
DiagramViewExtensions Class
MindFusion.Diagramming.Mvc Namespace

DiagramViewExtensions.DiagramView Method (IHtmlHelper, DiagramView)

Returns a DiagramView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString DiagramView (
    HtmlHelper helper,
    DiagramView diagramView
)
```

Visual Basic Copy Code

```
Public Shared Function DiagramView( _
    helper As HtmlHelper, _
    diagramView As DiagramView _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

diagramView
The DiagramView.

Return Value

See Also

DiagramView Method Overload List
DiagramViewExtensions Members
DiagramViewExtensions Class
MindFusion.Diagramming.Mvc Namespace

DiagramViewExtensions.DiagramView Method (IHtmlHelper, DiagramView, IDictionary(String, Object))

Returns a DiagramView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString DiagramView (
    HtmlHelper helper,
    DiagramView diagramView,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function DiagramView( _
    helper As HtmlHelper, _
    diagramView As DiagramView, _
    htmlAttributes As IDictionary(Of String, Object) _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

diagramView
The DiagramView

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

Remarks

Use the **htmlAttributes** parameter to pass style data to the control's outer div element. The following example sets the control's width and height properties and hides the scrollbars.

Example

HTML

```
@Html.DiagramView(
    ((DiagramView)ViewBag.DiagramView),
    new { style = "width:500px;height:500px;overflow:hidden;"})
```

DiagramViewExtensions.DiagramView Method (IHtmlHelper, DiagramView, Object)

Returns a DiagramView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public static MvcHtmlString DiagramView (
    HtmlHelper helper,
    DiagramView diagramView,
    Object htmlAttributes
)
```

Visual Basic

```
Public Shared Function DiagramView( _
    helper As HtmlHelper, _
    diagramView As DiagramView, _
    htmlAttributes As Object _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

diagramView
The DiagramView

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

Remarks

Use the **htmlAttributes** parameter to pass style data to the control's outer div element. The following example sets the control's width and height properties and hides the scrollbars.

Example

HTML

```
@Html.DiagramView(
    ((DiagramView)ViewBag.DiagramView),
    new { style = "width:500px;height:500px;overflow:hidden;"})
```

DiagramViewExtensions.DiagramView Method (IHtmlHelper, DiagramView, String)

Returns a DiagramView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString DiagramView (
    HtmlHelper helper,
    DiagramView diagramView,
    string initFunction
)
```

Visual Basic Copy Code

```
Public Shared Function DiagramView( _
    helper As HtmlHelper, _
    diagramView As DiagramView, _
    initFunction As String _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

diagramView
The DiagramView

initFunction
The name of the function that will contain the initializing scripts for the view.

Return Value

DiagramViewExtensions.DiagramView Method (IHtmlHelper, DiagramView, String, IDictionary(String, Object))

Returns a DiagramView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString DiagramView (
    HtmlHelper helper,
    DiagramView diagramView,
    string initFunction,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function DiagramView( _
    helper As HtmlHelper, _
    diagramView As DiagramView, _
    initFunction As String, _
    htmlAttributes As IDictionary(Of String, Object) _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

diagramView
The DiagramView

initFunction
The name of the function that will contain the initializing scripts for the view.

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

See Also

Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString DiagramView (
    HtmlHelper helper,
    string id,
    Diagram diagram,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function DiagramView( _
    helper As HtmlHelper, _
    id As String, _
    diagram As Diagram, _
    htmlAttributes As IDictionary(Of String, Object) _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

id
The Id of the DiagramView

diagram
The Diagram displayed by the view

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

DiagramViewExtensions.DiagramView Method (IHtmlHelper, String, Diagram, Object)

Returns a DiagramView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString DiagramView (
    HtmlHelper helper,
    string id,
    Diagram diagram,
    Object htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function DiagramView( _
    helper As HtmlHelper, _
    id As String, _
    diagram As Diagram, _
    htmlAttributes As Object _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

id
The Id of the DiagramView

diagram
The Diagram displayed by the view

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

DiagramViewExtensions.DiagramView Method (IHtmlHelper, String, Diagram, String)

Returns a DiagramView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString DiagramView (
    HtmlHelper helper,
    string id,
    Diagram diagram,
    string initFunction
)
```

Visual Basic Copy Code

```
Public Shared Function DiagramView( _
    helper As HtmlHelper, _
    id As String, _
    diagram As Diagram, _
    initFunction As String _
) As MvcHtmlString
```

Parameters

helper

The HTML helper

id
The Id of the DiagramView

diagram
The Diagram displayed by the view

initFunction
The name of the function that will contain the initializing scripts for the view.

Return Value

DiagramViewExtensions.DiagramView Method (IHtmlHelper, String, Diagram, String, IDictionary(String, Object))

Returns a DiagramView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString DiagramView (
    HtmlHelper helper,
    string id,
    Diagram diagram,
    string initFunction,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function DiagramView( _
    helper As HtmlHelper, _
    id As String, _
    diagram As Diagram, _
    initFunction As String, _
    htmlAttributes As IDictionary(Of String, Object) _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

id
The Id of the DiagramView

diagram
The Diagram displayed by the view

initFunction
The name of the function that will contain the initializing scripts for the view.

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

ItemListView Class

ListBox control with support for hosting DiagramItems and dragging them to the Diagram control.

Syntax

C# Copy Code

```
public class ItemListView
```

Visual Basic Copy Code

```
Public Class ItemListView
```

Remarks

Call the AddItem method to add an item to the view.

Drag-and-drop operations create a copy of the dragged item, and set its size to NewInstanceSize. The copy is created by calling item's clone method. You can override **clone** to copy property values of custom item subclasses.

Icons in the list are drawn by scaling **NewInstanceSize** down to IconSize. E.g. if a list icon is half the size of the diagram item it creates, its graphic elements such as cells, labels, strokes would be rendered at half scale too (as opposed to rendering with same label / stroke sizes but in smaller bounding rectangle). The scaling code assumes MeasureUnit of the target diagram and the list view have matching values.

Configuring the control

ItemListView can be created inside a Razor page either by invoking the ItemListView html helper, or by adding a <mindfusion-itemlistview> tag helper:

Razor Copy Code

```
@addTagHelper *, MindFusion.Diagramming.Mvc
....
<mindfusion-itemlistview
    component=(ItemListView)ViewBag.ItemListView
    style="width:100%; height:100%;">
</mindfusion-itemlistview>
```

Palette Class

ItemListView Members

ListBox control with support for hosting DiagramItems and dragging them to the Diagram control.

The following tables list the members exposed by the ItemListView type.

Public Constructors

	Name	Description
	ItemListView	Overloaded.

Public Properties

	Name	Description
	AddScriptReferences	Gets or sets a value indicating whether the control should render references to the client scripts.
	AutoClasses	Gets the registered client types with JSON templates.
	AutoConnectDistance	Gets or sets the maximum distance to a node when auto connecting links.

	AutoConnectLinks	Gets or sets whether links should be automatically connected to the nearest node.
	BackColor	Gets or sets the background color of the ItemListView control.
	ClientScriptLocation	Gets or sets the URL to the MindFusion.Diagramming.js file.
	Columns	Gets or sets the number of columns in control's layout.
	Enabled	Gets or sets a value indicating whether handling of mouse events is enabled.
	Font	Gets or sets the font of the items captions.
	IconSize	Gets or sets the size of the items displayed in the view.
	Id	Gets or sets the id of the view.
	Items	Gets or sets the collection of items displayed in the view.
	LabelPosition	Gets or sets a value indicating the position of labels relative to item icons.
	MeasureUnit	Gets or sets the unit of measure used to specify item sizes.
	MinVisibleFontSize	Gets or sets a threshold value that hides text if scaled font sizes become smaller.
	NewInstanceSize	Gets or sets the default size of items created by drag-and-drop from this list view.
	Orientation	Gets or sets the layout orientation of the control.
	Padding	Gets or sets the padding space between item's slot bounds and its contents.
	ShapeLibraryLocation	The location of a shape library file containing custom shape definitions. It can be set to a full URL of the file, or a relative file path.
	TextColor	Gets or sets the color of the items captions.

Public Methods

	Name	Description
	AddItem	Overloaded.
	ControlLoadedScript	Sets the name of a JavaScript function that should be invoked when the control is loaded on the client side.
S	FromJson	Overloaded.
S	FromRequest	Initializes a new instance of the ItemListView class.
	Init	Renders the ItemListView's initializing scripts on a web page under the specified function name.
	LinkSelectedScript	Sets the name of a JavaScript function that should be invoked when a link is selected, either programmatically or by the user.
	LoadFromJson	Loads the specified JSON data.
	NodeSelectedScript	Sets the name of a JavaScript function that should be invoked when a node is selected, either programmatically or by the user.
	RegisterItemType	Overloaded.
	RegisterSession	Registers the session instance with the ItemTypeResolver used in custom item serialization.
	RemoveItem	Removes a DiagramItem from the displayed items collection.
	Render	Renders the ItemListView on a web page.

	SaveToJson	Serializes the ItemListView's data to JSON.
	SetAddScriptReferences	Sets a value indicating whether the control should render references to the client scripts.
	SetAutoConnectDistance	Sets the maximum distance to a node when auto connecting links.
	SetAutoConnectLinks	Sets whether links should be automatically connected to the nearest node.
	SetBackColor	Sets the background color of the ItemListView control.
	SetColumns	Sets the number of columns in control's layout.
	SetEnabled	Sets a value indicating whether handling of mouse events is enabled.
	SetFont	Sets the font of the items captions.
	SetIconSize	Sets the size of the items displayed in the view.
	SetLabelPosition	Sets a value indicating the position of labels relative to item icons.
	SetMinVisibleFontSize	Sets a threshold value that hides text if scaled font sizes become smaller.
	SetNewInstanceSize	Sets the default size with which items dragged onto a diagram will be created.
	SetOrientation	Sets the layout orientation of the control.
	SetTextColor	Sets the text color of the items captions.
	ShapeLibraryLoadedScript	Sets the name of a JavaScript function that should be invoked when a shape library is loaded.
	ToJson	Serializes the ItemListView's data to JSON.

FromJson Method Overload List
ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.FromRequest Method

Initializes a new instance of the ItemListView class.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static ItemListView FromRequest (
    string id,
    HttpRequest request
)
```

Visual Basic Copy Code

```
Public Shared Function FromRequest( _
    id As String, _
    request As HttpRequest _
) As ItemListView
```

Parameters

id
The Id of the ItemListView

request
An HttpRequest object that contains the json data for the view.

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.Init Method

Renders the ItemListView's initializing scripts on a web page under the specified function name.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Init (
    string functionName
)
```

Visual Basic Copy Code

```
Public Function Init( _
    functionName As String _
) As String
```

Parameters

functionName

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.LinkSelectedScript Method

Sets the name of a JavaScript function that should be invoked when a link is selected, either programmatically or by the user.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView LinkSelectedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function LinkSelectedScript( _
    value As String _
) As ItemListView
```

Parameters

value
The name of the function

Return Value

See Also

ItemListView Members

MindFusion.Diagramming.Mvc Namespace

ItemListView.RegisterItemType Method (Type, String, String, Int32)

Registers a custom item class for serialization support.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView RegisterItemType (
    Type itemClass,
    string classId,
    string clientClassId,
    int classVersion
)
```

Visual Basic Copy Code

```
Public Function RegisterItemType( _
    itemClass As Type, _
    classId As String, _
    clientClassId As String, _
    classVersion As Integer _
) As ItemListView
```

Parameters

itemClass
A Type instance identifying the item class.

classId
A class identifier to use when serializing, saving and loading items of the specified type.

clientClassId
A class identifier to use when serializing items of the specified type on the client side.

classVersion
A revision number of the item's class serialization format.

Return Value

ItemListView.RegisterItemType Method (Type, String, String, Int32, String)

Registers a custom item class for serialization support.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView RegisterItemType (
    Type itemClass,
    string classId,
    string clientClassId,
    int classVersion,
    string jsonTemplate
)
```

Visual Basic Copy Code

```
Public Function RegisterItemType( _
    itemClass As Type, _
    classId As String, _
    clientClassId As String, _
    classVersion As Integer, _
    jsonTemplate As String _
) As ItemListView
```

Parameters

itemClass
A Type instance identifying the item class.

classId
A class identifier to use when serializing, saving and loading items of the specified type.

clientClassId
A class identifier to use when serializing items of the specified type on the client side.

classVersion
A revision number of the item's class serialization format.

jsonTemplate
A JSON string representation of the node contents.

Return Value

ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.Render Method

Renders the ItemListView on a web page.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Render ()
```

Visual Basic Copy Code

```
Public Function Render () As String
```

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SaveToJson Method

Serializes the ItemListView's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string SaveToJson ()
```

Visual Basic Copy Code

```
Public Function SaveToJson () As String
```

Return Value

The JSON string.

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetAddScriptReferences Method

Sets a value indicating whether the control should render references to the client scripts.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetAddScriptReferences (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetAddScriptReferences( _
    value As Boolean _
) As ItemListView
```

Parameters

value

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetAutoConnectDistance Method

Sets the maximum distance to a node when auto connecting links.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetAutoConnectDistance (
    float value
)
```

Visual Basic Copy Code

```
Public Function SetAutoConnectDistance( _
    value As Single _
) As ItemListView
```

Parameters

value

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetAutoConnectLinks Method

Sets whether links should be automatically connected to the nearest node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetAutoConnectLinks (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetAutoConnectLinks( _
    value As Boolean _
) As ItemListView
```

Parameters

value

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetBackColor Method

Sets the background color of the ItemListView control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetBackColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetBackColor( _
    value As Color _
) As ItemListView
```

Parameters

value

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetColumns Method

Sets the number of columns in control's layout.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetColumns (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetColumns( _
    value As Integer _
) As ItemListView
```

Parameters

value

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetEnabled Method

Sets a value indicating whether handling of mouse events is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetEnabled (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetEnabled( _
    value As Boolean _
) As ItemListView
```

Parameters

value

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetFont Method

Sets the font of the items captions.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetFont (
    Font value
)
```

Visual Basic Copy Code

```
Public Function SetFont( _
    value As Font _
) As ItemListView
```

Parameters

value

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetIconSize Method

Sets the size of the items displayed in the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetIconSize (
    SizeF value
)
```

Visual Basic Copy Code

```
Public Function SetIconSize( _
    value As SizeF _
) As ItemListView
```

Parameters

value
The size of the items

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetLabelPosition Method

Sets a value indicating the position of labels relative to item icons.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetLabelPosition (
    LabelPosition value
)
```

Visual Basic Copy Code

```
Public Function SetLabelPosition( _
    value As LabelPosition _
) As ItemListView
```

Parameters

value

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetMinVisibleFontSize Method

Sets a threshold value that hides text if scaled font sizes become smaller.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetMinVisibleFontSize (
    float value
)
```

Visual Basic Copy Code

```
Public Function SetMinVisibleFontSize( _
    value As Single _
) As ItemListView
```

Parameters

value

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetNewInstanceSize Method

Sets the default size with which items dragged onto a diagram will be created.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetNewInstanceSize (
    SizeF value
)
```

Visual Basic Copy Code

```
Public Function SetNewInstanceSize( _
    value As SizeF _
) As ItemListView
```

Parameters

value
The size of the items

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetOrientation Method

Sets the layout orientation of the control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetOrientation (
    Orientation value
)
```

Visual Basic Copy Code

```
Public Function SetOrientation( _
    value As Orientation _
) As ItemListView
```

Parameters

value

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.SetTextColor Method

Sets the text color of the items captions.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView SetTextColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetTextColor( _
    value As Color _
) As ItemListView
```

Parameters

value

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.ShapeLibraryLoadedScript Method

Sets the name of a JavaScript function that should be invoked when a shape library is loaded.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ItemListView ShapeLibraryLoadedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ShapeLibraryLoadedScript( _
    value As String _
) As ItemListView
```

Parameters

value
The name of the function

Return Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.ToJson Method

Serializes the ItemListView's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static string ToJson (
    ItemListView view
)
```

Visual Basic Copy Code

```
Public Shared Function ToJson( _
    view As ItemListView _
) As String
```

Parameters

view

Return Value

The JSON string.

See Also

ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView Properties

ItemListView.AddScriptReferences Property

Gets or sets a value indicating whether the control should render references to the client scripts.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool AddScriptReferences { get; set; }
```

Visual Basic Copy Code

```
Public Property AddScriptReferences As Boolean
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.AutoClasses Property

Gets the registered client types with JSON templates.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Dictionary<string, string> AutoClasses { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property AutoClasses As Dictionary(Of String, String)
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.AutoConnectDistance Property

Gets or sets the maximum distance to a node when auto connecting links.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public float AutoConnectDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoConnectDistance As Single
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.AutoConnectLinks Property

Gets or sets whether links should be automatically connected to the nearest node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool AutoConnectLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoConnectLinks As Boolean
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.BackColor Property

Gets or sets the background color of the ItemListView control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Color BackColor { get; set; }
```

Visual Basic Copy Code

```
Public Property BackColor As Color
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.ClientScriptLocation Property

Gets or sets the URL to the MindFusion.Diagramming.js file.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string ClientScriptLocation { get; set; }
```

Visual Basic Copy Code

```
Public Property ClientScriptLocation As String
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.Columns Property

Gets or sets the number of columns in control's layout.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public int Columns { get; set; }
```

Visual Basic Copy Code

```
Public Property Columns As Integer
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.Enabled Property

Gets or sets a value indicating whether handling of mouse events is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool Enabled { get; set; }
```

Visual Basic Copy Code

```
Public Property Enabled As Boolean
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.Font Property

Gets or sets the font of the items captions.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Font Font { get; set; }
```

Visual Basic Copy Code

```
Public Property Font As Font
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.IconSize Property

Gets or sets the size of the items displayed in the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public SizeF IconSize { get; set; }
```

Visual Basic Copy Code

```
Public Property IconSize As SizeF
```

Property Value

See Also

ItemListView.Id Property

Gets or sets the id of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Id { get; set; }
```

Visual Basic Copy Code

```
Public Property Id As String
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.Items Property

Gets or sets the collection of items displayed in the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramItemCollection Items { get; set; }
```

Visual Basic Copy Code

```
Public Property Items As DiagramItemCollection
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.LabelPosition Property

Gets or sets a value indicating the position of labels relative to item icons.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public LabelPosition LabelPosition { get; set; }
```

Visual Basic

```
Public Property LabelPosition As LabelPosition
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.MeasureUnit Property

Gets or sets the unit of measure used to specify item sizes.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public MeasureUnit MeasureUnit { get; set; }
```

Visual Basic

```
Public Property MeasureUnit As MeasureUnit
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.MinVisibleFontSize Property

Gets or sets a threshold value that hides text if scaled font sizes become smaller.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public float MinVisibleFontSize { get; set; }
```

Visual Basic

```
Public Property MinVisibleFontSize As Single
```

Property Value

See Also

ItemListView.NewInstanceSize Property

Gets or sets the default size of items created by drag-and-drop from this list view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public SizeF NewInstanceSize { get; set; }
```

Visual Basic Copy Code

```
Public Property NewInstanceSize As SizeF
```

Property Value

See Also

ItemListView Members

ItemListView.Padding Property

Gets or sets the padding space between item's slot bounds and its contents.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public int Padding { get; set; }
```

Visual Basic Copy Code

```
Public Property Padding As Integer
```

Property Value

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming.Mvc Namespace

ItemListView.ShapeLibraryLocation Property

The location of a shape library file containing custom shape definitions. It can be set to a full URL of the file, or a relative file path.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string ShapeLibraryLocation { get; set; }
```

Visual Basic Copy Code

```
Public Property ShapeLibraryLocation As String
```

Property Value

See Also

ItemListView Members
ItemListView Class

ItemListViewExtensions.ItemListView Method

Overload List

Name	Description
ItemListViewExtensions.ItemListView (IHtmlHelper, ItemListView)	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, ItemListView, IDictionary(String, Object))	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, ItemListView, Object)	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, ItemListView, String)	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, ItemListView, String, IDictionary(String, Object))	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, ItemListView, String, Object)	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, String)	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, String, DiagramItemCollection)	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, String, DiagramItemCollection, IDictionary(String, Object))	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, String, DiagramItemCollection, Object)	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, String, DiagramItemCollection, String)	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, String, IDictionary(String, Object))	Returns an ItemListView by using the specified HTML helper.

ItemListViewExtensions.ItemListView (IHtmlHelper, String, Object)	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, String, String)	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, String, String, IDictionary(String, Object))	Returns an ItemListView by using the specified HTML helper.
ItemListViewExtensions.ItemListView (IHtmlHelper, String, String, Object)	Returns an ItemListView by using the specified HTML helper.

ItemListViewExtensions.ItemListView Method (IHtmlHelper, ItemListView)

Returns an ItemListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent ItemListView (
    IHtmlHelper helper,
    ItemListView view
)
```

Visual Basic Copy Code

```
Public Shared Function ItemListView( _
    helper As IHtmlHelper, _
    view As ItemListView _
) As IHtmlContent
```

Parameters

helper
The HTML helper

view
The ItemListView

Return Value

ItemListViewExtensions.ItemListView Method (IHtmlHelper, ItemListView, IDictionary(String, Object))

Returns an ItemListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent ItemListView (
    IHtmlHelper helper,
    ItemListView view,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function ItemListView( _
    helper As IHtmlHelper, _
    view As ItemListView, _
    htmlAttributes As IDictionary(Of String, Object) _
) As IHtmlContent
```

Parameters

helper
The HTML helper

view
The ItemListView

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

ItemListViewExtensions.ItemListView Method (IHtmlHelper, String, DiagramItemCollection, Object)

Returns an ItemListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent ItemListView (
    IHtmlHelper helper,
    string id,
    DiagramItemCollection items,
    Object htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function ItemListView( _
    helper As IHtmlHelper, _
    id As String, _
    items As DiagramItemCollection, _
    htmlAttributes As Object _
) As IHtmlContent
```

Parameters

helper
The HTML helper

id
The Id of the ItemListView

items
The items to be displayed

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

ItemListViewExtensions.ItemListView Method (IHtmlHelper, String, DiagramItemCollection, String)

Returns an ItemListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent ItemListView (
    IHtmlHelper helper,
    string id,
    DiagramItemCollection items,
    string initFunction
)
```

Visual Basic Copy Code

```
Public Shared Function ItemListView( _
    helper As IHtmlHelper, _
    id As String, _
    items As DiagramItemCollection, _
    initFunction As String _
) As IHtmlContent
```

Parameters

helper
The HTML helper

id
The Id of the ItemListView

items
The items to be displayed

initFunction
The name of the function that will contain the initializing scripts for the view.

Return Value

ItemListViewExtensions.ItemListView Method (IHtmlHelper, String, IDictionary(String, Object))

Returns an ItemListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent ItemListView (
    IHtmlHelper helper,
    string id,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function ItemListView( _
    helper As IHtmlHelper, _
    id As String, _
    htmlAttributes As IDictionary(Of String, Object) _
) As IHtmlContent
```

Parameters

helper
The HTML helper

id
The Id of the ItemListView

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

ItemListViewTagHelper Class

Tag helper of ItemListView.

Syntax

C# Copy Code

```
public class ItemListViewTagHelper : TagHelper
```

Visual Basic Copy Code

```
Public Class ItemListViewTagHelper
    Inherits TagHelper
```

Example

This class implements the <mindfusion-itemlistview> tag.

Inheritance Hierarchy

System.Object

ItemTypeResolver.GetResolver Method (HttpSessionStateBase)

Returns the ItemTypeResolver instance registered for the specified session.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static ItemTypeResolver GetResolver (
    HttpSessionStateBase session
)
```

Visual Basic Copy Code

```
Public Shared Function GetResolver( _
    session As HttpSessionStateBase _
) As ItemTypeResolver
```

Parameters

session
An HttpSessionStateBase instance.

Return Value

The ItemTypeResolver for this session.

ItemTypeResolver.RegisterConverters Method

Registers converters used for JSON serialization of custom item types.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public void RegisterConverters (
    JavaScriptConverter[] converters
)
```

Visual Basic Copy Code

```
Public Sub RegisterConverters( _
    converters() As JavaScriptConverter _
)
```

Parameters

converters
The converters to register.

ItemTypeResolver Class

ItemTypeResolver.RegisterItemType Method (Type, String)

Registers a custom item class for serialization support.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public void RegisterItemType (
    Type itemClass,
    string clientClassId
)
```

Visual Basic Copy Code

```
Public Sub RegisterItemType( _
    itemClass As Type, _
    clientClassId As String _
)
```

Parameters

itemClass
A Type instance identifying the item class.

clientClassId
A class identifier to use when serializing items of the specified type on the client side.

See Also

RegisterItemType Method Overload List
ItemTypeResolver Members
ItemTypeResolver Class
MindFusion.Diagramming.Mvc Namespace

ItemTypeResolver.RegisterItemType Method (Type, String, String)

Registers a custom item class for serialization support.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public void RegisterItemType (
    Type itemClass,
    string clientClassId,
    string jsonTemplate
)
```

Visual Basic Copy Code

```
Public Sub RegisterItemType( _
    itemClass As Type, _
    clientClassId As String, _
    jsonTemplate As String _
)
```

Parameters

itemClass

A Type instance identifying the item class.

clientClassId
A class identifier to use when serializing items of the specified type on the client side.

jsonTemplate
A JSON string representation of the node contents.

ItemTypeResolver.RegisterItemType Method (Type, String, String, Int32)

Registers a custom item class for serialization support.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public void RegisterItemType (
    Type itemClass,
    string classId,
    string clientClassId,
    int classVersion
)
```

Visual Basic Copy Code

```
Public Sub RegisterItemType( _
    itemClass As Type, _
    classId As String, _
    clientClassId As String, _
    classVersion As Integer _
)
```

Parameters

itemClass
A Type instance identifying the item class.

classId
A class identifier to use when serializing, saving and loading items of the specified type.

clientClassId
A class identifier to use when serializing items of the specified type on the client side.

classVersion
A revision number of the item's class serialization format.

ItemTypeResolver.RegisterItemType Method (Type, String, String, Int32, String)

Registers a custom item class for serialization support.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public void RegisterItemType (
    Type itemClass,
    string classId,
    string clientClassId,
    int classVersion,
    string jsonTemplate
)
```

Visual Basic Copy Code

```
Public Sub RegisterItemType( _
    itemClass As Type, _
    classId As String, _
    clientClassId As String, _
    classVersion As Integer, _
    jsonTemplate As String _
)
```

Parameters

itemClass
A Type instance identifying the item class.

classId
A class identifier to use when serializing, saving and loading items of the specified type.

clientClassId
A class identifier to use when serializing items of the specified type on the client side.

classVersion
A revision number of the item's class serialization format.

jsonTemplate
A JSON string representation of the node contents.

ItemTypeResolver.ResolveType Method

Returns the Type of the specified id.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public override Type ResolveType (
    string id
)
```

Visual Basic Copy Code

```
Public Overrides Function ResolveType( _
    id As String _
) As Type
```

Parameters

id

Return Value

See Also

ItemTypeResolver Members
ItemTypeResolver Class
MindFusion.Diagramming.Mvc Namespace

ItemTypeResolver.ResolveTypeId Method

Returns the id of the specified Type.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public override string ResolveTypeId (
    Type type
)
```

Visual Basic Copy Code

```
Public Overrides Function ResolveTypeId( _
    type As Type _
) As String
```

Parameters

type

Return Value

ItemTypeResolver.Unregister Method

Overload List

Name	Description
ItemTypeResolver.Unregister (HttpSessionStateBase)	Unregisters the ItemTypeResolver instance registered for the corresponding session.
ItemTypeResolver.Unregister (ISession)	Unregisters the ItemTypeResolver instance registered for the corresponding session.

See Also

ItemTypeResolver Members
ItemTypeResolver Class
MindFusion.Diagramming.Mvc Namespace

ItemTypeResolver.Unregister Method (HttpSessionStateBase)

Unregisters the ItemTypeResolver instance registered for the corresponding session.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static void Unregister (
    HttpSessionStateBase session
)
```

Visual Basic Copy Code

```
Public Shared Sub Unregister( _
    session As HttpSessionStateBase _
)
```

Parameters

session
An HttpSessionStateBase instance.

See Also

Unregister Method Overload List
ItemTypeResolver Members
ItemTypeResolver Class
MindFusion.Diagramming.Mvc Namespace

ItemTypeResolver.Unregister Method (ISession)

Unregisters the ItemTypeResolver instance registered for the corresponding session.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static void Unregister (
    ISession session
)
```

Visual Basic Copy Code

```
Public Shared Sub Unregister( _
    session As ISession _
)
```

Parameters

session
An ISession instance.

See Also

Unregister Method Overload List
ItemTypeResolver Members
ItemTypeResolver Class
MindFusion.Diagramming.Mvc Namespace

ItemTypeResolver Properties

ItemTypeResolver.AutoClasses Property

Gets the registered client types with JSON templates.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Dictionary<string, string> AutoClasses { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property AutoClasses As Dictionary(Of String, String)
```

Property Value

A Dictionary containing JSON templates as values for class names as keys.

See Also

ItemTypeResolver Members
ItemTypeResolver Class
MindFusion.Diagramming.Mvc Namespace

ItemTypeResolver.Converters Property

Gets the registered custom converters.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public JavaScriptConverter[] Converters { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Converters As JavaScriptConverter()
```

Property Value

An array containing converter instances.

See Also

ItemTypeResolver Members
ItemTypeResolver Class
MindFusion.Diagramming.Mvc Namespace

ItemTypeResolver.ItemTypes Property

Gets the registered item types.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Dictionary<Type, string> ItemTypes { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ItemTypes As Dictionary(Of Type, String)
```

Property Value

A dictionary containing JavaScript class names as values for their matching server .NET types as keys.

NodeListView Class

ListBox control with support for hosting Diagram nodes and dragging them to the **Diagram** control.

Syntax

C# Copy Code

```
public class NodeListView
```

Visual Basic Copy Code

```
Public Class NodeListView
```

Remarks

Obsolete

This component has been superseded by ItemListView, which can also display DiagramLink objects and supports multi-column layouts.

Call the AddNode method to add a node to the view.

Drag-and-drop operations create a clone of the dragged node by calling its clone method. You can override clone to copy property values of custom node subclasses.

Inheritance Hierarchy

System.Object
MindFusion.Diagramming.Mvc.NodeListView

See Also

NodeListView Members

ListBox control with support for hosting Diagram nodes and dragging them to the **Diagram** control.

The following tables list the members exposed by the NodeListView type.

Public Constructors

	Name	Description
	NodeListView	Overloaded. Creates an instance of **NodeListView**.

Public Properties

	Name	Description
	AddScriptReferences	Gets or sets a value indicating whether the control should render references to the client scripts.
	AutoClasses	Gets the registered client types with JSON templates.
	BackColor	Gets or sets the background color of the NodeListView control.
	ClientScriptLocation	Gets or sets the URL to the MindFusion.Diagramming.js file.
	Converters	Gets the registered custom converters.
	DefaultNodeSize	Gets or sets the default size with which nodes dragged onto a diagram will be created.
	Enabled	Gets or sets a value indicating whether handling of mouse events is enabled.
	Font	Gets or sets the font of the nodes captions.
	Height	Gets or sets the height of the view.
	Id	Gets or sets the id of the view.
	Items	Gets or sets the collection of nodes displayed in the view.
	ItemTypes	Gets the registered item types.
	MeasureUnit	Gets or sets the measure unit.
	MinVisibleFontSize	Gets or sets a threshold value that hides text if scaled font sizes become smaller.
	NodeSize	Gets or sets the size of the nodes displayed in the view.
	Orientation	Gets or sets the layout orientation of the control.
	Padding	Gets or sets the padding.
	TextColor	Gets or sets the color of the nodes captions.
	Width	Gets or sets the width of the view.

Public Methods

	Name	Description
	AddNode	Overloaded. Adds a DiagramNode to the displayed nodes collection.
	ControlLoadedScript	Sets the name of a JavaScript function that should be invoked when the control is loaded on the client side.

	FromJson	Overloaded.
	FromRequest	Overloaded.
	Init	Renders the NodeListView's initializing scripts on a web page under the specified function name.
	LoadFromJson	Loads the specified JSON data.
	NodeSelectedScript	Sets the name of a JavaScript function that should be invoked when a node is selected, either programmatically or by the user.
	RegisterConverters	Registers custom converters used for custom item types serialization.
	RegisterItemType	Overloaded.
	RegisterSession	Overloaded.
	RemoveNode	Removes a **DiagramNode** from the displayed nodes collection.
	Render	Renders the **NodeListView** on a web page.
	SaveToJson	Serializes the NodeListView's data to JSON.
	SetAddScriptReferences	Sets a value indicating whether the control should render references to the client scripts.
	SetBackColor	Sets the background color of the NodeListView control.
	SetDefaultNodeSize	Sets the default size with which nodes dragged onto a diagram will be created.
	SetEnabled	Sets a value indicating whether handling of mouse events is enabled.
	SetFont	Sets the font of the nodes captions.
	SetHeight	Sets the height of the view.
	SetMinVisibleFontSize	Sets a threshold value that hides text if scaled font sizes become smaller.
	SetNodeSize	Sets the size of the nodes displayed in the view.
	SetOrientation	Sets the layout orientation of the control.
	SetTextColor	Sets the text color of the nodes captions.
	SetWidth	Sets the width of the view.
	ToJson	Serializes the NodeListView's data to JSON.

NodeListView Constructor (String, DiagramNodeCollection)

Creates an instance of NodeListView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView (
    string id,
    DiagramNodeCollection items
)
```

Visual Basic Copy Code

```
Public New ( _
    id As String, _
    items As DiagramNodeCollection _
)
```

Parameters

id

The Id of the NodeListView.

items

The collection of nodes to be displayed in the **NodeListView**.

NodeListView.AddNode Method (DiagramNode)

Adds a DiagramNode to the displayed nodes collection.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView AddNode (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public Function AddNode( _
    node As DiagramNode _
) As NodeListView
```

Parameters

node
The DiagramNode instance to add.

Return Value

AddNode Method Overload List
NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.AddNode Method (DiagramNode, String)

Adds a DiagramNode to the displayed nodes collection.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView AddNode (
    DiagramNode node,
    string caption
)
```

Visual Basic Copy Code

```
Public Function AddNode( _
    node As DiagramNode, _
    caption As String _
) As NodeListView
```

Parameters

node
The DiagramNode instance to add.

caption
The caption to display for the node.

Return Value

See Also

AddNode Method Overload List
NodeListView Members
NodeListView Class

NodeListView.ControlLoadedScript Method

Sets the name of a JavaScript function that should be invoked when the control is loaded on the client side.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView ControlLoadedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ControlLoadedScript( _
    value As String _
) As NodeListView
```

Parameters

value
The name of the function

Return Value

NodeListView.FromJson Method (String)

Creates a NodeListView object from JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static NodeListView FromJson (
    string json
)
```

Visual Basic Copy Code

```
Public Shared Function FromJson( _
    json As String _
```

```
) As NodeListView
```

Parameters

json
The JSON string

Return Value

See Also

FromJson Method Overload List
NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.FromJson Method (String, String)

Creates a NodeListView object from JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static NodeListView FromJson (
    string id,
    string json
)
```

Visual Basic Copy Code

```
Public Shared Function FromJson( _
    id As String, _
    json As String _
) As NodeListView
```

Parameters

id
The Id of the NodeListView

json
The JSON string

Return Value

See Also

FromJson Method Overload List
NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.FromRequest Method

Overload List

Name	Description
NodeListView.FromRequest (String, HttpRequest)	Creates an instance of NodeListView.
NodeListView.FromRequest (String, HttpRequestBase)	Creates an instance of NodeListView.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.FromRequest Method (String, HttpRequest)

Creates an instance of NodeListView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static NodeListView FromRequest (
    string id,
    HttpRequest request
)
```

Visual Basic Copy Code

```
Public Shared Function FromRequest( _
    id As String, _
    request As HttpRequest _
) As NodeListView
```

Parameters

id
The Id of the NodeListView

request
An HttpRequest object that contains the json data for the view.

Return Value

See Also

FromRequest Method Overload List
NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.FromRequest Method (String, HttpRequestBase)

Creates an instance of NodeListView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static NodeListView FromRequest (
    string id,
    HttpRequestBase request
)
```

Visual Basic Copy Code

```
Public Shared Function FromRequest( _
    id As String, _
```

```
    request As HttpRequestBase _
) As NodeListView
```

Parameters

id
The Id of the NodeListView

request
An HttpRequest object that contains the json data for the view.

Return Value

See Also

FromRequest Method Overload List
NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.Init Method

Renders the NodeListView's initializing scripts on a web page under the specified function name.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Init (
    string functionName
)
```

Visual Basic Copy Code

```
Public Function Init( _
    functionName As String _
) As String
```

Parameters

functionName

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.LoadFromJson Method

Loads the specified JSON data.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public void LoadFromJson (
    string json
)
```

Visual Basic

```
Public Sub LoadFromJson( _
    json As String _
)
```

Parameters

json
The JSON string

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.NodeSelectedScript Method

Sets the name of a JavaScript function that should be invoked when a node is selected, either programmatically or by the user.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public NodeListView NodeSelectedScript (
    string value
)
```

Visual Basic

```
Public Function NodeSelectedScript( _
    value As String _
) As NodeListView
```

Parameters

value
The name of the function

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.RegisterConverters Method

Registers custom converters used for custom item types serialization.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public NodeListView RegisterConverters (
    JavaScriptConverter[] converters
)
```

Visual Basic

```
Public Function RegisterConverters( _
    converters() As JavaScriptConverter _
) As NodeListView
```

Parameters

converters
The converters to register.

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.RegisterItemType Method

Overload List

Name	Description
NodeListView.RegisterItemType (Type, String, String, Int32)	Registers a custom item class for serialization support.
NodeListView.RegisterItemType (Type, String, String, Int32, String)	Registers a custom item class for serialization support.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.RegisterItemType Method (Type, String, String, Int32)

Registers a custom item class for serialization support.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView RegisterItemType (
    Type itemClass,
    string classId,
    string clientClassId,
    int classVersion
)
```

Visual Basic Copy Code

```
Public Function RegisterItemType( _
    itemClass As Type, _
    classId As String, _
    clientClassId As String, _
    classVersion As Integer _
) As NodeListView
```

Parameters

itemClass
A Type instance identifying the item class.

classId
A class identifier to use when serializing, saving and loading items of the specified type.

clientClassId
A class identifier to use when serializing items of the specified type on the client side.

classVersion
A revision number of the item's class serialization format.

Return Value

See Also

RegisterItemType Method Overload List
NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.RegisterItemType Method (Type, String, String, Int32, String)

Registers a custom item class for serialization support.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView RegisterItemType (
    Type itemClass,
    string classId,
    string clientClassId,
    int classVersion,
    string jsonTemplate
)
```

Visual Basic Copy Code

```
Public Function RegisterItemType( _
    itemClass As Type, _
    classId As String, _
    clientClassId As String, _
    classVersion As Integer, _
    jsonTemplate As String _
) As NodeListView
```

Parameters

itemClass
A Type instance identifying the item class.

classId
A class identifier to use when serializing, saving and loading items of the specified type.

clientClassId
A class identifier to use when serializing items of the specified type on the client side.

classVersion
A revision number of the item's class serialization format.

jsonTemplate
A JSON string representation of the node contents.

Return Value

See Also

RegisterItemType Method Overload List
NodeListView Members

NodeListView.RegisterSession Method

Overload List

Name	Description
NodeListView.RegisterSession (HttpSessionStateBase)	Registers the session instance with the ItemTypeResolver used in custom item serialization.
NodeListView.RegisterSession (ISession)	Registers the session instance with the ItemTypeResolver used in custom item serialization.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.RegisterSession Method (HttpSessionStateBase)

Registers the session instance with the ItemTypeResolver used in custom item serialization.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView RegisterSession (
    HttpSessionStateBase session
)
```

Visual Basic Copy Code

```
Public Function RegisterSession( _
    session As HttpSessionStateBase _
) As NodeListView
```

Parameters

session
An HttpSessionStateBase instance.

Return Value

This NodeListView instance for method chaining.

See Also

RegisterSession Method Overload List
NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.RegisterSession Method (ISession)

Registers the session instance with the ItemTypeResolver used in custom item serialization.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView RegisterSession (
    ISession session
)
```

Visual Basic Copy Code

```
Public Function RegisterSession( _
    session As ISession _
) As NodeListView
```

Parameters

session
An ISession instance.

Return Value

See Also

RegisterSession Method Overload List
NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.RemoveNode Method

Removes a DiagramNode from the displayed nodes collection.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView RemoveNode (
    DiagramNode node
)
```

Visual Basic Copy Code

```
Public Function RemoveNode( _
    node As DiagramNode _
) As NodeListView
```

Parameters

node
The DiagramNode instance to remove.

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.Render Method

Renders the NodeListView on a web page.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Render ()
```

Visual Basic Copy Code

```
Public Function Render () As String
```

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.SaveToJson Method

Serializes the NodeListView's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string SaveToJson ()
```

Visual Basic Copy Code

```
Public Function SaveToJson () As String
```

Return Value

The JSON string.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.SetAddScriptReferences Method

Sets a value indicating whether the control should render references to the client scripts.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView SetAddScriptReferences (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetAddScriptReferences( _
    value As Boolean _
) As NodeListView
```

Parameters

value

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.SetBackColor Method

Sets the background color of the NodeListView control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView SetBackColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetBackColor( _
    value As Color _
) As NodeListView
```

Parameters

value

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.SetDefaultNodeSize Method

Sets the default size with which nodes dragged onto a diagram will be created.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView SetDefaultNodeSize (
    Size value
)
```

Visual Basic Copy Code

```
Public Function SetDefaultNodeSize( _
    value As Size _
) As NodeListView
```

Parameters

value
The size of the nodes

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.SetEnabled Method

Sets a value indicating whether handling of mouse events is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView SetEnabled (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetEnabled( _
    value As Boolean _
) As NodeListView
```

Parameters

value

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.SetFont Method

Sets the font of the nodes captions.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView SetFont (
    Font value
)
```

Visual Basic Copy Code

```
Public Function SetFont( _
    value As Font _
) As NodeListView
```

Parameters

value

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.SetHeight Method

Sets the height of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView SetHeight (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetHeight( _
    value As Integer _
) As NodeListView
```

Parameters

value
The height of the view in pixels

Return Value

NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.SetMinVisibleFontSize Method

Sets a threshold value that hides text if scaled font sizes become smaller.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView SetMinVisibleFontSize (
    float value
)
```

Visual Basic Copy Code

```
Public Function SetMinVisibleFontSize( _
    value As Single _
) As NodeListView
```

Parameters

value
A **float** value specifying the smallest visible font size.

Return Value

This NodeListView instance for chaining method calls.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.SetNodeSize Method

Sets the size of the nodes displayed in the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView SetNodeSize (
    Size value
)
```

Visual Basic Copy Code

```
Public Function SetNodeSize( _
    value As Size _
) As NodeListView
```

Parameters

value
The size of the nodes

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.SetOrientation Method

Sets the layout orientation of the control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public NodeListView SetOrientation (
    Orientation value
)
```

Visual Basic

```
Public Function SetOrientation( _
    value As Orientation _
) As NodeListView
```

Parameters

value

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.SetTextColor Method

Sets the text color of the nodes captions.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public NodeListView SetTextColor (
    Color value
)
```

Visual Basic

```
Public Function SetTextColor( _
    value As Color _
) As NodeListView
```

Parameters

value

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.SetWidth Method

Sets the width of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public NodeListView SetWidth (
    int value
)
```

Visual Basic

```
Public Function SetWidth( _
    value As Integer _
) As NodeListView
```

Parameters

value
The width of the view in pixels

Return Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.ToJson Method

Serializes the NodeListView's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static string ToJson (
    NodeListView view
)
```

Visual Basic Copy Code

```
Public Shared Function ToJson( _
    view As NodeListView _
) As String
```

Parameters

view

Return Value

The JSON string.

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView Properties

NodeListView.AddScriptReferences Property

Gets or sets a value indicating whether the control should render references to the client scripts.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool AddScriptReferences { get; set; }
```

Visual Basic

```
Public Property AddScriptReferences As Boolean
```

Property Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.AutoClasses Property

Gets the registered client types with JSON templates.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public Dictionary<string, string> AutoClasses { get; }
```

Visual Basic

```
Public ReadOnly Property AutoClasses As Dictionary(Of String, String)
```

Property Value

A **Dictionary** containing registered JSON templates for automatic client-side node types.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.BackColor Property

Gets or sets the background color of the NodeListView control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public Color BackColor { get; set; }
```

Visual Basic

```
Public Property BackColor As Color
```

Property Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.ClientScriptLocation Property

Gets or sets the URL to the MindFusion.Diagramming.js file.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string ClientScriptLocation { get; set; }
```

Visual Basic Copy Code

```
Public Property ClientScriptLocation As String
```

Property Value

See Also

NodeListView Members
NodeListView Class

NodeListView.Converters Property

Gets the registered custom converters.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public JavaScriptConverter[] Converters { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property Converters As JavaScriptConverter()
```

Property Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.DefaultNodeSize Property

Gets or sets the default size with which nodes dragged onto a diagram will be created.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Size DefaultNodeSize { get; set; }
```

Visual Basic Copy Code

```
Public Property DefaultNodeSize As Size
```

Property Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.Enabled Property

Gets or sets a value indicating whether handling of mouse events is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool Enabled { get; set; }
```

Visual Basic Copy Code

```
Public Property Enabled As Boolean
```

Property Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.Font Property

Gets or sets the font of the nodes captions.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Font Font { get; set; }
```

Visual Basic Copy Code

```
Public Property Font As Font
```

Property Value

See Also

NodeListView Members
NodeListView Class

NodeListView.Height Property

Gets or sets the height of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public int Height { get; set; }
```

Visual Basic Copy Code

```
Public Property Height As Integer
```

Property Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.Id Property

Gets or sets the id of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Id { get; set; }
```

Visual Basic Copy Code

```
Public Property Id As String
```

Property Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.Items Property

Gets or sets the collection of nodes displayed in the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public DiagramNodeCollection Items { get; set; }
```

Visual Basic Copy Code

```
Public Property Items As DiagramNodeCollection
```

Property Value

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming.Mvc Namespace

NodeListView.ItemTypes Property

Gets the registered item types.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Dictionary<Type, string> ItemTypes { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property ItemTypes As Dictionary(Of Type, String)
```

Property Value

See Also

NodeListView Members
NodeListView Class

NodeListView.MeasureUnit Property

Gets or sets the measure unit.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public MeasureUnit MeasureUnit { get; set; }
```

Visual Basic Copy Code

```
Public Property MeasureUnit As MeasureUnit
```

Property Value

See Also

NodeListView Members
NodeListView Class

NodeListView.MinVisibleFontSize Property

Gets or sets a threshold value that hides text if scaled font sizes become smaller.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public float MinVisibleFontSize { get; set; }
```

Visual Basic Copy Code

```
Public Property MinVisibleFontSize As Single
```

Property Value

A **float** value specifying the smallest visible font size.

See Also

NodeListViewExtensions Members

Contains extension methods of NodeListView

The following tables list the members exposed by the NodeListViewExtensions type.

Public Methods

	Name	Description
	NodeListView	Overloaded. Returns a **NodeListView** by using the specified HTML helper.

See Also

NodeListViewExtensions Methods

NodeListViewExtensions.NodeListView Method

Returns a NodeListView by using the specified HTML helper.

Overload List

Name	Description
NodeListViewExtensions.NodeListView (IHtmlHelper, NodeListView)	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, NodeListView, IDictionary(String, Object))	Returns a NodeListView by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, NodeListView, Object)	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, NodeListView, String)	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, NodeListView, String, IDictionary(String, Object))	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, NodeListView, String, Object)	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, String)	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, String, DiagramNodeCollection)	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, String, DiagramNodeCollection, IDictionary(String, Object))	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, String, DiagramNodeCollection, Object)	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, String, DiagramNodeCollection, String)	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, String, IDictionary(String, Object))	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, String, Object)	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, String, String)	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, String, String, IDictionary(String, Object))	Returns a **NodeListView** by using the specified HTML helper.
NodeListViewExtensions.NodeListView (IHtmlHelper, String, String, Object)	Returns a **NodeListView** by using the specified HTML helper.

See Also

NodeListViewExtensions.NodeListView Method (IHtmlHelper, NodeListView)

Returns a NodeListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString NodeListView (
    HtmlHelper helper,
    NodeListView view
)
```

Visual Basic Copy Code

```
Public Shared Function NodeListView( _
    helper As HtmlHelper, _
    view As NodeListView _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

view
The NodeListView.

Return Value

See Also

NodeListViewExtensions.NodeListView Method (IHtmlHelper, NodeListView, IDictionary(String, Object))

Returns a NodeListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString NodeListView (
    HtmlHelper helper,
    NodeListView view,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function NodeListView( _
    helper As HtmlHelper, _
    view As NodeListView, _
    htmlAttributes As IDictionary(Of String, Object) _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

view
The NodeListView

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

See Also

NodeListView Method Overload List

NodeListViewExtensions.NodeListView Method (IHtmlHelper, NodeListView, Object)

Returns a NodeListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString NodeListView (
    HtmlHelper helper,
    NodeListView view,
    Object htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function NodeListView( _
    helper As HtmlHelper, _
    view As NodeListView, _
    htmlAttributes As Object _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

view
The NodeListView

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

See Also

NodeListView Method Overload List
NodeListViewExtensions Members

NodeListViewExtensions.NodeListView Method (IHtmlHelper, NodeListView, String)

Returns a NodeListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString NodeListView (
    HtmlHelper helper,
    NodeListView view,
    string initFunction
)
```

Visual Basic Copy Code

```
Public Shared Function NodeListView( _
    helper As HtmlHelper, _
    view As NodeListView, _
    initFunction As String _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

view
The NodeListView

initFunction
The name of the function that will contain the initializing scripts for the view.

Return Value

See Also

NodeListView Method Overload List

NodeListViewExtensions.NodeListView Method (IHtmlHelper, NodeListView, String, IDictionary(String, Object))

Returns a NodeListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString NodeListView (
    HtmlHelper helper,
    NodeListView view,
    string initFunction,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function NodeListView( _
    helper As HtmlHelper, _
    view As NodeListView, _
    initFunction As String, _
    htmlAttributes As IDictionary(Of String, Object) _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

view
The NodeListView

initFunction
The name of the function that will contain the initializing scripts for the view.

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

NodeListViewExtensions.NodeListView Method (IHtmlHelper, NodeListView, String, Object)

Returns a NodeListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString NodeListView (
    HtmlHelper helper,
    NodeListView view,
    string initFunction,
    Object htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function NodeListView( _
    helper As HtmlHelper, _
    view As NodeListView, _
    initFunction As String, _
    htmlAttributes As Object _
) As MvcHtmlString
```

Parameters

helper

The HTML helper

view
The NodeListView

initFunction
The name of the function that will contain the initializing scripts for the view.

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

NodeListViewExtensions.NodeListView Method (IHtmlHelper, String, DiagramNodeCollection)

Returns a NodeListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString NodeListView (
    HtmlHelper helper,
    string id,
    DiagramNodeCollection items
)
```

Visual Basic Copy Code

```
Public Shared Function NodeListView( _
    helper As HtmlHelper, _
    id As String, _
    items As DiagramNodeCollection _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

id
The Id of the NodeListView.

items
The items to be displayed

Return Value

See Also

NodeListViewExtensions.NodeListView Method (IHtmlHelper, String, DiagramNodeCollection, IDictionary(String, Object))

Returns a NodeListView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString NodeListView (
    HtmlHelper helper,
    string id,
    DiagramNodeCollection items,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function NodeListView( _
    helper As HtmlHelper, _
    id As String, _
    items As DiagramNodeCollection, _
    htmlAttributes As IDictionary(Of String, Object) _
) As MvcHtmlString
```

Parameters

helper

The HTML helper

id
The Id of the NodeListView

items
The items to be displayed

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

Overview Members

Provides a scaled-down view of a DiagramView contents and lets the user scroll the bound view.

The following tables list the members exposed by the Overview type.

Public Constructors

	Name	Description
	Overview	Overloaded.

Public Properties

	Name	Description
	AddScriptReferences	Gets or sets a value indicating whether the control should render references to the client scripts.
	AllowZoom	Gets or sets a value indicating whether users are allowed to zoom the diagram by resizing the overview's viewport tracker rectangle.
	AutoScrollAmount	Gets or sets the amount by which to auto-scroll the view when the mouse leaves the view boundaries while drawing.
	BackColor	Gets or sets the background color of the overview control.
	ClientScriptLocation	Gets or sets the URL to the MindFusion.Diagramming.js file.
	DiagramView	Gets or sets the id of the **DiagramView**.
	DimColor	Gets or sets a color of the displayed diagram.
	Enabled	Gets or sets a value indicating whether handling of mouse events is enabled.
	Height	Gets or sets the height of the view.
	Id	Gets or sets the id of the view.
	MinVisibleFontSize	Gets or sets a threshold value that hides text if scaled font sizes become smaller.
	ScaleFactor	Gets or sets a fixed scale factor to be used when FitAll is disabled.
	ScaleMode	Gets or sets a value indicating whether to fit the whole diagram inside the overview control.
	Width	Gets or sets the width of the view.

Public Methods

	Name	Description
	ControlLoadedScript	Sets the name of a JavaScript function that should be invoked when the control is loaded on the client side.
	FromJson	Overloaded.

	FromRequest	Overloaded.
	Init	Renders the Overview's initializing scripts on a web page under the specified function name.
	LoadFromJson	Loads the specified JSON data.
	Render	Renders the **Overview** on a web page.
	SaveToJson	Serializes the Overview's data to JSON.
	SetAddScriptReferences	Sets a value indicating whether the control should render references to the client scripts.
	SetAllowZoom	Sets a value indicating whether users are allowed to zoom the diagram by resizing the overview's viewport tracker rectangle.
	SetAutoScrollAmount	Sets the amount by which to auto-scroll the view when the mouse leaves the view boundaries while drawing.
	SetBackColor	Sets the background color of the overview control.
	SetDiagramView	Sets the id of the DiagramView.
	SetDimColor	Sets a color of the displayed diagram.
	SetEnabled	Sets a value indicating whether handling of mouse events is enabled.
	SetHeight	Sets the height of the view.
	SetMinVisibleFontSize	Sets a threshold value that hides text if scaled font sizes become smaller.
	SetScaleFactor	Sets a fixed scale factor to be used when **FitAll** is disabled.
	SetScaleMode	Sets a value indicating whether to fit the whole diagram inside the overview control.
	SetWidth	Sets the width of the view.
	ToJson	Serializes the Overview's data to JSON.

Overview.Init Method

Renders the Overview's initializing scripts on a web page under the specified function name.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Init (
    string functionName
)
```

Visual Basic Copy Code

```
Public Function Init( _
    functionName As String _
) As String
```

Parameters

functionName

Return Value

See Also

Overview Members
Overview Class
MindFusion.Diagramming.Mvc Namespace

Overview.LoadFromJson Method

Loads the specified JSON data.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public void LoadFromJson (
    string json
)
```

Visual Basic Copy Code

```
Public Sub LoadFromJson( _
    json As String _
)
```

Parameters

json
The JSON string

See Also

Overview Members
Overview Class

Overview.Render Method

Renders the Overview on a web page.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Render ()
```

Visual Basic Copy Code

```
Public Function Render () As String
```

Return Value

See Also

Overview Members
Overview Class

Overview.SaveToJson Method

Serializes the Overview's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string SaveToJson ()
```

Visual Basic Copy Code

```
Public Function SaveToJson () As String
```

Return Value

The JSON string.

See Also

Overview Members
Overview Class

Overview.SetAddScriptReferences Method

Sets a value indicating whether the control should render references to the client scripts.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Overview SetAddScriptReferences (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetAddScriptReferences( _
    value As Boolean _
) As Overview
```

Parameters

value

Return Value

See Also

Overview Members
Overview Class
MindFusion.Diagramming.Mvc Namespace

Overview.SetAllowZoom Method

Sets a value indicating whether users are allowed to zoom the diagram by resizing the overview's viewport tracker rectangle.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Overview SetAllowZoom (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetAllowZoom( _
    value As Boolean _
) As Overview
```

Parameters

value

true to let users zoom by resizing the tracker rectangle, or **false** otherwise.

Return Value

This Overview instance for chaining method calls.

See Also

Overview Members
Overview Class
MindFusion.Diagramming.Mvc Namespace

Overview.SetAutoScrollAmount Method

Sets the amount by which to auto-scroll the view when the mouse leaves the view boundaries while drawing.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Overview SetAutoScrollAmount (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetAutoScrollAmount( _
    value As Integer _
) As Overview
```

Parameters

value

A number specifying the amount by which to auto-scroll.

Return Value

This Overview instance for chaining method calls.

See Also

Overview Members
Overview Class
MindFusion.Diagramming.Mvc Namespace

Overview.SetBackColor Method

Sets the background color of the overview control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Overview SetBackColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetBackColor( _
    value As Color _
) As Overview
```

Parameters

value

Return Value

See Also

Overview Members
Overview Class
MindFusion.Diagramming.Mvc Namespace

Overview.SetDiagramView Method

Sets the id of the DiagramView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Overview SetDiagramView (
    string value
)
```

Visual Basic Copy Code

```
Public Function SetDiagramView( _
    value As String _
) As Overview
```

Parameters

value

Return Value

See Also

Overview Members
Overview Class
MindFusion.Diagramming.Mvc Namespace

Overview.SetDimColor Method

Sets a color of the displayed diagram.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Overview SetDimColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetDimColor( _
    value As Color _
) As Overview
```

Parameters

value

Return Value

See Also

Overview Members
Overview Class
MindFusion.Diagramming.Mvc Namespace

Overview.SetEnabled Method

Sets a value indicating whether handling of mouse events is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Overview SetEnabled (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetEnabled( _
    value As Boolean _
) As Overview
```

Parameters

value

Return Value

See Also

Overview Members
Overview Class
MindFusion.Diagramming.Mvc Namespace

Overview.SetHeight Method

Sets the height of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Overview SetHeight (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetHeight( _
    value As Integer _
) As Overview
```

Parameters

value
The height of the view in pixels

Return Value

See Also

Overview Members
Overview Class
MindFusion.Diagramming.Mvc Namespace

Overview.SetMinVisibleFontSize Method

Sets a threshold value that hides text if scaled font sizes become smaller.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Overview SetMinVisibleFontSize (
    float value
)
```

Visual Basic Copy Code

```
Public Function SetMinVisibleFontSize( _
    value As Single _
) As Overview
```

Parameters

value
A **float** value specifying the smallest visible font size.

Return Value

This Overview instance for chaining method calls.

See Also

Overview Members
Overview Class
MindFusion.Diagramming.Mvc Namespace

Overview.SetScaleFactor Method

Sets a fixed scale factor to be used when FitAll is disabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Overview SetScaleFactor (
    float value
)
```

Visual Basic Copy Code

```
Public Function SetScaleFactor( _
    value As Single _
) As Overview
```

Parameters

value
A **float** value specifying the scale as percent of actual output. The default is 30.

Return Value

This Overview instance for chaining method calls.

See Also

Overview Members
Overview Class
MindFusion.Diagramming.Mvc Namespace

Overview.SetScaleMode Method

Sets a value indicating whether to fit the whole diagram inside the overview control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Overview SetScaleMode (
    ScaleMode value
)
```

Visual Basic Copy Code

```
Public Function SetScaleMode( _
    value As ScaleMode _
) As Overview
```

Parameters

value
One of the ScaleMode enumeration elements. The default value is **FitAll**.

Return Value

This Overview instance for chaining method calls.

Remarks

If fit all mode is enabled, the ScaleFactor is changed to a suitable value small enough to make the diagram's contents entirely visible.

See Also

Overview Members

Overview.SetWidth Method

Sets the width of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Overview SetWidth (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetWidth( _
    value As Integer _
) As Overview
```

Parameters

value
The width of the view in pixels

Return Value

See Also

Overview Members
Overview Class
MindFusion.Diagramming.Mvc Namespace

Overview.ToJson Method

Serializes the Overview's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static string ToJson (
    Overview view
)
```

Visual Basic Copy Code

```
Public Shared Function ToJson( _
    view As Overview _
) As String
```

Parameters

view

Return Value

The JSON string.

Palette Class

Represents a tool palette control that displays DiagramItem objects grouped into categories. Items from the palette can be added to a diagram by drag-and-drop.

Syntax

C# Copy Code

```
public class Palette
```

Visual Basic Copy Code

```
Public Class Palette
```

Remarks

Content Security Policy

To allow for stricter CSP rules, the library no longer loads CSS scripts automatically. If you use **Palette**, you must explicitly link the *common-ui.css* file from distribution's *themes* folder.

The **Palette** is an **Accordion** subclass that displays ItemListView components as its child panels. Each **ItemListView** displays the items of a palette category.

Call the AddCategory method to define a category and create its respective accordion pane. Call AddItem to add an item to specified category.

Drag-and-drop operations create a copy of the dragged item, and set its size to NewInstanceSize. The copy is created by calling item's clone method. You can override **clone** to copy property values of custom item subclasses.

Icons in the list are drawn by scaling **NewInstanceSize** down to IconSize. E.g. if a list icon is half the size of the diagram item it creates, its graphic elements such as cells, labels, strokes would be rendered at half scale too (as opposed to rendering with same label / stroke sizes but in smaller bounding rectangle). The scaling code assumes MeasureUnit of the target diagram and the palette have matching values.

Configuring the control

Palette can be created inside a Razor page either by invoking the Palette html helper, or by adding a <mindfusion-palette> tag helper:

Razor Copy Code

```
@addTagHelper *, MindFusion.Diagramming.Mvc
....
<mindfusion-palette
    component=(Palette)ViewBag.Palette
    style="width:100%; height:100%;">
</mindfusion-palette>
```

Inheritance Hierarchy

MindFusion.Diagramming.Mvc Namespace

Palette Members

Represents a tool palette control that displays DiagramItem objects grouped into categories. Items from the palette can be added to a diagram by drag-and-drop.

The following tables list the members exposed by the Palette type.

Public Constructors

	Name	Description
	Palette	Overloaded.

Public Properties

	Name	Description

	AddScriptReferences	Gets or sets a value indicating whether the control should render references to the client scripts.
	AutoClasses	Gets the registered client types with JSON templates.
	AutoConnectDistance	Gets or sets the maximum distance to a node when auto connecting links.
	AutoConnectLinks	Gets or sets whether links should be automatically connected to the nearest node.
	BackColor	Gets or sets the background color of the Palette control.
	CaptionFont	Gets or sets the font of the items captions.
	ClientScriptLocation	Gets or sets the URL to the MindFusion.Diagramming.js file.
	Columns	Gets or sets the number of columns in palette's layout.
	Enabled	Gets or sets a value indicating whether handling of mouse events is enabled.
	IconSize	Gets or sets the size of items displayed in the palette.
	Id	Gets or sets the id of the control.
	LabelPosition	Gets or sets a value indicating the position of labels relative to item icons.
	MeasureUnit	Gets or sets the unit of measure used to specify item sizes.
	MinVisibleFontSize	Gets or sets a threshold value that hides text if scaled font sizes become smaller.
	NewInstanceSize	Gets or sets the default size of items created by drag-and-drop from this palette.
	Orientation	Gets or sets the layout orientation of the control.
	Padding	Gets or sets the padding space between item's slot bounds and its contents.
	ShapeLibraryLocation	The location of a shape library file containing custom shape definitions. It can be set to a full URL of the file, or a relative file path.
	TextColor	Gets or sets the color of the items captions.
	Theme	Gets or sets the theme used to style the control.

Public Methods

	Name	Description
	AddCategory	Overloaded.
	AddItem	Adds a DiagramItem to the displayed items collection.
	ControlLoadedScript	Sets the name of a JavaScript function that should be invoked when the control is loaded on the client side.
S	FromJson	Overloaded.
S	FromRequest	Initializes a new instance of the Palette class.
	Init	Renders the Palette's initializing scripts on a web page under the specified function name.
	LinkSelectedScript	Sets the name of a JavaScript function that should be invoked when a link is selected, either programmatically or by the user.
	LoadFromJson	Loads the specified JSON data.
	NodeSelectedScript	Sets the name of a JavaScript function that should be invoked when a node is selected, either programmatically or by the user.

	RegisterItemType	Overloaded.
	RegisterSession	Registers the session instance with the ItemTypeResolver used in custom item serialization.
	RemoveCategory	Removes a category from the palette.
	RemoveItem	Removes a DiagramItem from the displayed items collection.
	Render	Renders the Palette on a web page.
	SaveToJson	Serializes the Palette's data to JSON.
	SetAddScriptReferences	Sets a value indicating whether the control should render references to the client scripts.
	SetAutoConnectDistance	Sets the maximum distance to a node when auto connecting links.
	SetAutoConnectLinks	Sets whether links should be automatically connected to the nearest node.
	SetBackColor	Sets the background color of the Palette control.
	SetCaptionFont	Sets the font of the items captions.
	SetColumns	Sets the number of columns in control's layout.
	SetEnabled	Sets a value indicating whether handling of mouse events is enabled.
	SetIconSize	Sets the size of the items displayed in the view.
	SetLabelPosition	Sets a value indicating the position of labels relative to item icons.
	SetMinVisibleFontSize	Sets a threshold value that hides text if scaled font sizes become smaller.
	SetNewInstanceSize	Sets the default size with which items dragged onto a diagram will be created.
	SetOrientation	Sets the layout orientation of the control.
	SetTextColor	Sets the text color of the items captions.
	SetTheme	Sets the theme used to style the control.
	ShapeLibraryLoadedScript	Sets the name of a JavaScript function that should be invoked when a shape library is loaded.
	ToJson	Serializes the Palette's data to JSON.

MindFusion.Diagramming.Mvc Namespace

Palette.NodeSelectedScript Method

Sets the name of a JavaScript function that should be invoked when a node is selected, either programmatically or by the user.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette NodeSelectedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function NodeSelectedScript( _
    value As String _
) As Palette
```

Parameters

value
The name of the function

Return Value

Palette.RegisterItemType Method (Type, String, String, Int32)

Registers a custom item class for serialization support.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette RegisterItemType (
    Type itemClass,
    string classId,
    string clientClassId,
    int classVersion
)
```

Visual Basic Copy Code

```
Public Function RegisterItemType( _
    itemClass As Type, _
    classId As String, _
    clientClassId As String, _
    classVersion As Integer _
) As Palette
```

Parameters

itemClass
A Type instance identifying the item class.

classId
A class identifier to use when serializing, saving and loading items of the specified type.

clientClassId
A class identifier to use when serializing items of the specified type on the client side.

classVersion
A revision number of the item's class serialization format.

Return Value

Palette.RegisterItemType Method (Type, String, String, Int32, String)

Registers a custom item class for serialization support.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette RegisterItemType (
    Type itemClass,
    string classId,
    string clientClassId,
    int classVersion,
    string jsonTemplate
)
```

Visual Basic Copy Code

```
Public Function RegisterItemType( _
    itemClass As Type, _
    classId As String, _
    clientClassId As String, _
    classVersion As Integer, _
    jsonTemplate As String _
) As Palette
```

Parameters

itemClass
A Type instance identifying the item class.

classId
A class identifier to use when serializing, saving and loading items of the specified type.

clientClassId
A class identifier to use when serializing items of the specified type on the client side.

classVersion
A revision number of the item's class serialization format.

jsonTemplate
A JSON string representation of the node contents.

Return Value

Palette.RegisterSession Method

Registers the session instance with the ItemTypeResolver used in custom item serialization.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette RegisterSession (
    ISession session
)
```

Visual Basic Copy Code

```
Public Function RegisterSession( _
    session As ISession _
) As Palette
```

Parameters

session
An ISession instance.

Return Value

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.RemoveCategory Method

Removes a category from the palette.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public void RemoveCategory (
    string title
)
```

Visual Basic Copy Code

```
Public Sub RemoveCategory( _
    title As String _
)
```

Parameters

title
The title of the category to remove.

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.RemoveItem Method

Removes a DiagramItem from the displayed items collection.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public void RemoveItem (
    DiagramItem item
)
```

Visual Basic Copy Code

```
Public Sub RemoveItem( _
    item As DiagramItem _
)
```

Parameters

item
The DiagramItem instance to remove.

See Also

Palette Members
Palette Class

Palette.Render Method

Renders the Palette on a web page.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Render ()
```

Visual Basic Copy Code

```
Public Function Render () As String
```

Return Value

See Also

Palette.SaveToJson Method

Serializes the Palette's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string SaveToJson ()
```

Visual Basic Copy Code

```
Public Function SaveToJson () As String
```

Return Value

The JSON string.

Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetAddScriptReferences Method

Sets a value indicating whether the control should render references to the client scripts.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetAddScriptReferences (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetAddScriptReferences( _
    value As Boolean _
) As Palette
```

Parameters

value

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetAutoConnectDistance Method

Sets the maximum distance to a node when auto connecting links.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetAutoConnectDistance (
    float value
)
```

Visual Basic Copy Code

```
Public Function SetAutoConnectDistance( _
    value As Single _
) As Palette
```

Parameters

value

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetAutoConnectLinks Method

Sets whether links should be automatically connected to the nearest node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetAutoConnectLinks (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetAutoConnectLinks( _
    value As Boolean _
) As Palette
```

Parameters

value

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetBackColor Method

Sets the background color of the Palette control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetBackColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetBackColor( _
    value As Color _
) As Palette
```

Parameters

value

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetCaptionFont Method

Sets the font of the items captions.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetCaptionFont (
    Font value
)
```

Visual Basic Copy Code

```
Public Function SetCaptionFont( _
    value As Font _
) As Palette
```

Parameters

value

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetColumns Method

Sets the number of columns in control's layout.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetColumns (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetColumns( _
    value As Integer _
) As Palette
```

Parameters

value

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetEnabled Method

Sets a value indicating whether handling of mouse events is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetEnabled (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetEnabled( _
    value As Boolean _
) As Palette
```

Parameters

value

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetIconSize Method

Sets the size of the items displayed in the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetIconSize (
    SizeF value
)
```

Visual Basic Copy Code

```
Public Function SetIconSize( _
    value As SizeF _
) As Palette
```

Parameters

value
The size of the items

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetLabelPosition Method

Sets a value indicating the position of labels relative to item icons.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetLabelPosition (
    LabelPosition value
)
```

Visual Basic Copy Code

```
Public Function SetLabelPosition( _
    value As LabelPosition _
) As Palette
```

Parameters

value

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetMinVisibleFontSize Method

Sets a threshold value that hides text if scaled font sizes become smaller.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetMinVisibleFontSize (
    float value
)
```

Visual Basic Copy Code

```
Public Function SetMinVisibleFontSize( _
    value As Single _
) As Palette
```

Parameters

value

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetNewInstanceSize Method

Sets the default size with which items dragged onto a diagram will be created.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetNewInstanceSize (
    SizeF value
)
```

Visual Basic Copy Code

```
Public Function SetNewInstanceSize( _
    value As SizeF _
) As Palette
```

Parameters

value
The size of the items

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetOrientation Method

Sets the layout orientation of the control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetOrientation (
    Orientation value
)
```

Visual Basic Copy Code

```
Public Function SetOrientation( _
    value As Orientation _
) As Palette
```

Parameters

value

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetTextColor Method

Sets the text color of the items captions.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetTextColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetTextColor( _
    value As Color _
) As Palette
```

Parameters

value

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.SetTheme Method

Sets the theme used to style the control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette SetTheme (
    string value
)
```

Visual Basic Copy Code

```
Public Function SetTheme( _
    value As String _
) As Palette
```

Parameters

value

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.ShapeLibraryLoadedScript Method

Sets the name of a JavaScript function that should be invoked when a shape library is loaded.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Palette ShapeLibraryLoadedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ShapeLibraryLoadedScript( _
    value As String _
) As Palette
```

Parameters

value
The name of the function

Return Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.ToJson Method

Serializes the Palette's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static string ToJson (
    Palette view
)
```

Visual Basic Copy Code

```
Public Shared Function ToJson( _
    view As Palette _
) As String
```

Parameters

view

Return Value

The JSON string.

Palette Properties

Palette.AddScriptReferences Property

Gets or sets a value indicating whether the control should render references to the client scripts.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool AddScriptReferences { get; set; }
```

Visual Basic Copy Code

```
Public Property AddScriptReferences As Boolean
```

Property Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.AutoClasses Property

Gets the registered client types with JSON templates.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Dictionary<string, string> AutoClasses { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property AutoClasses As Dictionary(Of String, String)
```

Property Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.AutoConnectDistance Property

Gets or sets the maximum distance to a node when auto connecting links.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public float AutoConnectDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoConnectDistance As Single
```

Property Value

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Mvc Namespace

Palette.AutoConnectLinks Property

Gets or sets whether links should be automatically connected to the nearest node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool AutoConnectLinks { get; set; }
```

Visual Basic Copy Code

```
Public Property AutoConnectLinks As Boolean
```

Property Value

See Also

PaletteExtensions.Palette Method (IHtmlHelper, Palette, IDictionary(String, Object))

Returns a Palette by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent Palette (
    IHtmlHelper helper,
    Palette view,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function Palette( _
    helper As IHtmlHelper, _
    view As Palette, _
    htmlAttributes As IDictionary(Of String, Object) _
) As IHtmlContent
```

Parameters

helper
The HTML helper

view
The Palette

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

    helper As IHtmlHelper, _
    view As Palette, _
    initFunction As String, _
    htmlAttributes As IDictionary(Of String, Object) _
) As IHtmlContent
```

Parameters

helper
The HTML helper

view
The Palette

initFunction
The name of the function that will contain the initializing scripts for the view.

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

Palette Method Overload List
PaletteExtensions Members
PaletteExtensions Class
MindFusion.Diagramming.Mvc Namespace

PaletteExtensions.Palette Method (IHtmlHelper, Palette, String, Object)

Returns a Palette by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent Palette (
    IHtmlHelper helper,
    Palette view,
    string initFunction,
    Object htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function Palette( _
    helper As IHtmlHelper, _
    view As Palette, _
    initFunction As String, _
    htmlAttributes As Object _
) As IHtmlContent
```

Parameters

helper
The HTML helper

view
The Palette

initFunction
The name of the function that will contain the initializing scripts for the view.

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

MindFusion.Diagramming.Mvc Namespace

PaletteExtensions.Palette Method (IHtmlHelper, String)

Returns a Palette by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent Palette (
    IHtmlHelper helper,
    string id
)
```

Visual Basic Copy Code

```
Public Shared Function Palette( _
    helper As IHtmlHelper, _
    id As String _
) As IHtmlContent
```

Parameters

helper
The HTML helper

id
The Id of the Palette

Return Value

See Also

Palette Method Overload List
PaletteExtensions Members
PaletteExtensions Class
MindFusion.Diagramming.Mvc Namespace

PaletteExtensions.Palette Method (IHtmlHelper, String, IDictionary(String, Object))

Returns a Palette by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent Palette (
    IHtmlHelper helper,
    string id,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function Palette( _
    helper As IHtmlHelper, _
    id As String, _
    htmlAttributes As IDictionary(Of String, Object) _
) As IHtmlContent
```

Parameters

helper
The HTML helper

id
The Id of the Palette

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

See Also

Palette Method Overload List
PaletteExtensions Members

MindFusion.Diagramming.Mvc Namespace

PaletteExtensions.Palette Method (IHtmlHelper, String, Object)

Returns a Palette by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent Palette (
    IHtmlHelper helper,
    string id,
```

```
    Object htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function Palette( _
    helper As IHtmlHelper, _
    id As String, _
    htmlAttributes As Object _
) As IHtmlContent
```

Parameters

helper
The HTML helper

id
The Id of the Palette

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

PaletteExtensions.Palette Method (IHtmlHelper, String, String, IDictionary(String, Object))

Returns a Palette by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent Palette (
    IHtmlHelper helper,
    string id,
    string initFunction,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function Palette( _
    helper As IHtmlHelper, _
    id As String, _
    initFunction As String, _
    htmlAttributes As IDictionary(Of String, Object) _
) As IHtmlContent
```

Parameters

helper
The HTML helper

id
The Id of the Palette

initFunction
The name of the function that will contain the initializing scripts for the view.

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

PaletteExtensions.Palette Method (IHtmlHelper, String, String, Object)

Returns a Palette by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent Palette (
    IHtmlHelper helper,
    string id,
    string initFunction,
    Object htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function Palette( _
    helper As IHtmlHelper, _
    id As String, _
    initFunction As String, _
    htmlAttributes As Object _
) As IHtmlContent
```

Parameters

helper
The HTML helper

id
The Id of the Palette

initFunction
The name of the function that will contain the initializing scripts for the view.

htmlAttributes
An object containing the HTML attributes for the control.

PaletteTagHelper Class

Tag helper of Palette.

Syntax

C# Copy Code

```
public class PaletteTagHelper : TagHelper
```

Visual Basic Copy Code

```
Public Class PaletteTagHelper
    Inherits TagHelper
```

Remarks

This class implements the <mindfusion-palette> tag.

Inheritance Hierarchy

System.Object
  Microsoft.AspNetCore.Razor.TagHelpers.TagHelper
    MindFusion.Diagramming.Mvc.PaletteTagHelper

Ruler Members

Provides horizontal and vertical scales that helps users measure diagram items.

The following tables list the members exposed by the Ruler type.

Public Constructors

	Name	Description
	Ruler	Overloaded.

Public Properties

	Name	Description
	AddScriptReferences	Gets or sets a value indicating whether the control should render references to the client scripts.
	BackColor	Gets or sets the background color of the Ruler control.
	ClientScriptLocation	Gets or sets the URL to the MindFusion.Diagramming.js file.
	DiagramView	Gets or sets the id of the DiagramView.
	EnableGuides	Gets or sets a value indicating whether alignment guides are active.
	ForeColor	Gets or sets the foreground color of the control.
	GuideColor	Gets or sets the color used to paint guides.
	HorizontalScaleVisible	Gets or sets a value indicating whether the horizontal ruler scale is visible.
	Id	Gets or sets the id of the view.
	NegatedX	Gets or sets whether the horizontal scale should show negated values, simulating that the coordinate system's X axis grows to the left.
	NegatedY	Gets or sets whether the vertical scale should show negated values, simulating that the coordinate system's Y axis grows to the top.
	PointerColor	Gets or sets the color used to paint cursor projections.
	ProjectionColor	Gets or sets the color used to paint the projection of the active node.
	ProjectRotatedBounds	Gets or sets whether the projection of nodes on ruler's scales rotates with them.
	TextColor	Gets or sets the color used to paint texts in the ruler.
	Unit	Gets or sets the measure unit used by the ruler.
	VerticalScaleVisible	Gets or sets a value indicating whether the vertical ruler scale is visible.

Public Methods

	Name	Description
	ControlLoadedScript	Sets the name of a JavaScript function that should be invoked when the control is loaded on the client side.
S	FromJson	Overloaded.
S	FromRequest	Overloaded.
	Init	Renders the Ruler's initializing scripts on a web page under the specified function name.
	LoadFromJson	Loads the specified JSON data.
	Render	Renders the **Ruler** on a web page.

	SaveToJson	Serializes the Ruler's data to JSON.
	SetAddScriptReferences	Sets a value indicating whether the control should render references to the client scripts.
	SetBackColor	Sets the background color of the **Ruler** control.
	SetDiagramView	Sets the id of the **DiagramView**.
	SetEnableGuides	Sets a value indicating whether alignment guides are active.
	SetForeColor	Sets the foreground color of the control.
	SetGuideColor	Sets the color used to paint guides.
	SetHorizontalScaleVisible	Sets a value indicating whether the horizontal ruler scale is visible.
	SetNegatedX	Sets whether the horizontal scale should show negated values, simulating that the coordinate system's X axis grows to the left.
	SetNegatedY	Sets whether the vertical scale should show negated values, simulating that the coordinate system's Y axis grows to the top.
	SetPointerColor	Sets the color used to paint cursor projections.
	SetProjectionColor	Sets the color used to paint the projection of the active node.
	SetProjectRotatedBounds	Sets whether the projection of nodes on ruler's scales rotates with them.
	SetTextColor	Sets the color used to paint texts in the ruler.
	SetUnit	Sets the measure unit used by the ruler.
	SetVerticalScaleVisible	Sets a value indicating whether the vertical ruler scale is visible.
	ToJson	Serializes the Ruler's data to JSON.

Ruler Constructor

Overload List

Name	Description
Ruler ()	Creates an instance of Ruler.
Ruler (String)	Creates an instance of **Ruler**.
Ruler (String, String)	Creates an instance of **Ruler** for a DiagramView.

See Also

Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler Constructor ()

Creates an instance of Ruler.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

Ruler Constructor Overload List
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler Constructor (String)

Creates an instance of Ruler.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler (
    string id
)
```

Visual Basic Copy Code

```
Public New ( _
    id As String _
)
```

Parameters

id

See Also

Ruler Constructor Overload List
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler Constructor (String, String)

Creates an instance of Ruler for a DiagramView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler (
    string id,
    string diagramViewId
)
```

Visual Basic Copy Code

```
Public New ( _
    id As String, _
    diagramViewId As String _
)
```

Parameters

id
The Id of the Ruler

diagramViewId
The Id of the DiagramView

See Also

Ruler Constructor Overload List
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler Methods

Ruler.ControlLoadedScript Method

Sets the name of a JavaScript function that should be invoked when the control is loaded on the client side.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler ControlLoadedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function ControlLoadedScript( _
    value As String _
) As Ruler
```

Parameters

value
The name of the function

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.FromJson Method

Overload List

Name	Description
Ruler.FromJson (String)	Creates a Ruler object from JSON.
Ruler.FromJson (String, String)	Creates a Ruler object from JSON.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.FromJson Method (String)

Creates a Ruler object from JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static Ruler FromJson (
    string json
)
```

Visual Basic Copy Code

```
Public Shared Function FromJson( _
    json As String _
) As Ruler
```

Parameters

json
The JSON string

Return Value

See Also

FromJson Method Overload List
Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.FromJson Method (String, String)

Creates a Ruler object from JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static Ruler FromJson (
    string id,
    string json
)
```

Visual Basic Copy Code

```
Public Shared Function FromJson( _
    id As String, _
    json As String _
) As Ruler
```

Parameters

id

The Id of the Ruler

json
The JSON string

Return Value

See Also

FromJson Method Overload List
Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.FromRequest Method

Overload List

Name	Description
Ruler.FromRequest (String, HttpRequest)	Creates an instance of Ruler.
Ruler.FromRequest (String, HttpRequestBase)	Creates an instance of Ruler.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.FromRequest Method (String, HttpRequest)

Creates an instance of Ruler.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static Ruler FromRequest (
    string id,
    HttpRequest request
)
```

Visual Basic Copy Code

```
Public Shared Function FromRequest( _
    id As String, _
    request As HttpRequest _
) As Ruler
```

Parameters

id
The Id of the Ruler

request
An HttpRequest object that contains the json data for the view.

Return Value

See Also

FromRequest Method Overload List
Ruler Members

Ruler.FromRequest Method (String, HttpRequestBase)

Creates an instance of Ruler.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static Ruler FromRequest (
    string id,
    HttpRequestBase request
)
```

Visual Basic Copy Code

```
Public Shared Function FromRequest( _
    id As String, _
    request As HttpRequestBase _
) As Ruler
```

Parameters

id
The Id of the Ruler

request
An HttpRequest object that contains the json data for the view.

Return Value

See Also

FromRequest Method Overload List
Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.Init Method

Renders the Ruler's initializing scripts on a web page under the specified function name.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Init (
    string functionName
)
```

Visual Basic Copy Code

```
Public Function Init( _
    functionName As String _
) As String
```

Parameters

functionName

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.LoadFromJson Method

Loads the specified JSON data.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public void LoadFromJson (
    string json
)
```

Visual Basic Copy Code

```
Public Sub LoadFromJson( _
    json As String _
)
```

Parameters

json
The JSON string

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.Render Method

Renders the Ruler on a web page.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Render ()
```

Visual Basic Copy Code

```
Public Function Render () As String
```

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SaveToJson Method

Serializes the Ruler's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string SaveToJson ()
```

Visual Basic Copy Code

```
Public Function SaveToJson () As String
```

Return Value

The JSON string.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetAddScriptReferences Method

Sets a value indicating whether the control should render references to the client scripts.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetAddScriptReferences (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetAddScriptReferences( _
    value As Boolean _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetBackColor Method

Sets the background color of the Ruler control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetBackColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetBackColor( _
    value As Color _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetDiagramView Method

Sets the id of the DiagramView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetDiagramView (
    string value
)
```

Visual Basic Copy Code

```
Public Function SetDiagramView( _
    value As String _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetEnableGuides Method

Sets a value indicating whether alignment guides are active.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetEnableGuides (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetEnableGuides( _
    value As Boolean _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetForeColor Method

Sets the foreground color of the control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetForeColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetForeColor( _
    value As Color _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetGuideColor Method

Sets the color used to paint guides.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetGuideColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetGuideColor( _
    value As Color _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetHorizontalScaleVisible Method

Sets a value indicating whether the horizontal ruler scale is visible.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetHorizontalScaleVisible (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetHorizontalScaleVisible( _
    value As Boolean _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetNegatedX Method

Sets whether the horizontal scale should show negated values, simulating that the coordinate system's X axis grows to the left.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetNegatedX (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetNegatedX( _
    value As Boolean _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetNegatedY Method

Sets whether the vertical scale should show negated values, simulating that the coordinate system's Y axis grows to the top.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetNegatedY (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetNegatedY( _
    value As Boolean _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetPointerColor Method

Sets the color used to paint cursor projections.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetPointerColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetPointerColor( _
    value As Color _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetProjectionColor Method

Sets the color used to paint the projection of the active node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetProjectionColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetProjectionColor( _
    value As Color _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetProjectRotatedBounds Method

Sets whether the projection of nodes on ruler's scales rotates with them.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetProjectRotatedBounds (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetProjectRotatedBounds( _
    value As Boolean _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetTextColor Method

Sets the color used to paint texts in the ruler.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetTextColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetTextColor( _
    value As Color _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetUnit Method

Sets the measure unit used by the ruler.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetUnit (
    MeasureUnit value
)
```

Visual Basic Copy Code

```
Public Function SetUnit( _
    value As MeasureUnit _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.SetVerticalScaleVisible Method

Sets a value indicating whether the vertical ruler scale is visible.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Ruler SetVerticalScaleVisible (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetVerticalScaleVisible( _
    value As Boolean _
) As Ruler
```

Parameters

value

Return Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.ToJson Method

Serializes the Ruler's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static string ToJson (
    Ruler ruler
)
```

Visual Basic Copy Code

```
Public Shared Function ToJson( _
    ruler As Ruler _
) As String
```

Parameters

ruler

Return Value

The JSON string.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler Properties

Ruler.AddScriptReferences Property

Gets or sets a value indicating whether the control should render references to the client scripts.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool AddScriptReferences { get; set; }
```

Visual Basic Copy Code

```

Ruler.BackColor Property

Gets or sets the background color of the Ruler control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public Color BackColor { get; set; }
```

Visual Basic

```
Public Property BackColor As Color
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.ClientScriptLocation Property

Gets or sets the URL to the MindFusion.Diagramming.js file.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public string ClientScriptLocation { get; set; }
```

Visual Basic

```
Public Property ClientScriptLocation As String
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.DiagramView Property

Gets or sets the id of the DiagramView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public string DiagramView { get; set; }
```

Visual Basic

```
Public Property DiagramView As String
```

Property Value

See Also

Ruler Members
Ruler Class

Ruler.EnableGuides Property

Gets or sets a value indicating whether alignment guides are active.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool EnableGuides { get; set; }
```

Visual Basic Copy Code

```
Public Property EnableGuides As Boolean
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.ForeColor Property

Gets or sets the foreground color of the control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Color ForeColor { get; set; }
```

Visual Basic Copy Code

```
Public Property ForeColor As Color
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.GuideColor Property

Gets or sets the color used to paint guides.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Color GuideColor { get; set; }
```

Visual Basic Copy Code

```
Public Property GuideColor As Color
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.HorizontalScaleVisible Property

Gets or sets a value indicating whether the horizontal ruler scale is visible.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool HorizontalScaleVisible { get; set; }
```

Visual Basic Copy Code

```
Public Property HorizontalScaleVisible As Boolean
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.Id Property

Gets or sets the id of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Id { get; set; }
```

Visual Basic Copy Code

```
Public Property Id As String
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.NegatedX Property

Gets or sets whether the horizontal scale should show negated values, simulating that the coordinate system's X axis grows to the left.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool NegatedX { get; set; }
```

Visual Basic Copy Code

```
Public Property NegatedX As Boolean
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.NegatedY Property

Gets or sets whether the vertical scale should show negated values, simulating that the coordinate system's Y axis grows to the top.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool NegatedY { get; set; }
```

Visual Basic Copy Code

```
Public Property NegatedY As Boolean
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.PointerColor Property

Gets or sets the color used to paint cursor projections.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Color PointerColor { get; set; }
```

Visual Basic Copy Code

```
Public Property PointerColor As Color
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.ProjectionColor Property

Gets or sets the color used to paint the projection of the active node.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Color ProjectionColor { get; set; }
```

Visual Basic Copy Code

```
Public Property ProjectionColor As Color
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.ProjectRotatedBounds Property

Gets or sets whether the projection of nodes on ruler's scales rotates with them.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool ProjectRotatedBounds { get; set; }
```

Visual Basic Copy Code

```
Public Property ProjectRotatedBounds As Boolean
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.TextColor Property

Gets or sets the color used to paint texts in the ruler.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Color TextColor { get; set; }
```

Visual Basic Copy Code

```
Public Property TextColor As Color
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.Unit Property

Gets or sets the measure unit used by the ruler.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public MeasureUnit Unit { get; set; }
```

Visual Basic Copy Code

```
Public Property Unit As MeasureUnit
```

Property Value

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming.Mvc Namespace

Ruler.VerticalScaleVisible Property

Gets or sets a value indicating whether the vertical ruler scale is visible.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool VerticalScaleVisible { get; set; }
```

Visual Basic Copy Code

```
Public Property VerticalScaleVisible As Boolean
```

Property Value

RulerExtensions.Ruler Method

Overload List

Name	Description

RulerExtensions.Ruler (IHtmlHelper, Ruler)	Returns a Ruler by using the specified HTML helper.
RulerExtensions.Ruler (IHtmlHelper, Ruler, IDictionary(String, Object))	Returns a **Ruler** by using the specified HTML helper.
RulerExtensions.Ruler (IHtmlHelper, Ruler, Object)	Returns a **Ruler** by using the specified HTML helper.
RulerExtensions.Ruler (IHtmlHelper, Ruler, String)	Returns a **Ruler** by using the specified HTML helper.
RulerExtensions.Ruler (IHtmlHelper, Ruler, String, IDictionary(String, Object))	Returns a **Ruler** by using the specified HTML helper.
RulerExtensions.Ruler (IHtmlHelper, Ruler, String, Object)	Returns a **Ruler** by using the specified HTML helper.
RulerExtensions.Ruler (IHtmlHelper, String, String)	Returns a **Ruler** by using the specified HTML helper.
RulerExtensions.Ruler (IHtmlHelper, String, String, IDictionary(String, Object))	Returns a **Ruler** by using the specified HTML helper.
RulerExtensions.Ruler (IHtmlHelper, String, String, Object)	Returns a **Ruler** by using the specified HTML helper.
RulerExtensions.Ruler (IHtmlHelper, String, String, String)	Returns a **Ruler** by using the specified HTML helper.
RulerExtensions.Ruler (IHtmlHelper, String, String, String, IDictionary(String, Object))	Returns a **Ruler** by using the specified HTML helper.
RulerExtensions.Ruler (IHtmlHelper, String, String, String, Object)	Returns a **Ruler** by using the specified HTML helper.

RulerExtensions.Ruler Method (IHtmlHelper, Ruler)

Returns a Ruler by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString Ruler (
    HtmlHelper helper,
    Ruler view
)
```

Visual Basic Copy Code

```
Public Shared Function Ruler( _
    helper As HtmlHelper, _
    view As Ruler _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

view
The Ruler

Return Value

RulerExtensions.Ruler Method (IHtmlHelper, Ruler, IDictionary(String, Object))

Returns a Ruler by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString Ruler (
    HtmlHelper helper,
    Ruler view,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function Ruler( _
    helper As HtmlHelper, _
    view As Ruler, _
    htmlAttributes As IDictionary(Of String, Object) _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

view
The Ruler

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

RulerExtensions.Ruler Method (IHtmlHelper, Ruler, Object)

Returns a Ruler by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString Ruler (
    HtmlHelper helper,
    Ruler view,
    Object htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function Ruler( _
    helper As HtmlHelper, _
    view As Ruler, _
    htmlAttributes As Object _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

view
The Ruler

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

RulerExtensions.Ruler Method (IHtmlHelper, Ruler, String)

Returns a Ruler by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString Ruler (
    HtmlHelper helper,
    Ruler view,
    string initFunction
)
```

Visual Basic Copy Code

```
Public Shared Function Ruler( _
    helper As HtmlHelper, _
    view As Ruler, _
    initFunction As String _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

view
The Ruler

initFunction
The name of the function that will contain the initializing scripts for the view.

Return Value

RulerExtensions.Ruler Method (IHtmlHelper, Ruler, String, IDictionary(String, Object))

Returns a Ruler by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString Ruler (
    HtmlHelper helper,
    Ruler view,
    string initFunction,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function Ruler( _
    helper As HtmlHelper, _
    view As Ruler, _
    initFunction As String, _
    htmlAttributes As IDictionary(Of String, Object) _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

view
The Ruler

initFunction
The name of the function that will contain the initializing scripts for the view.

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

C#

```
public override Object Deserialize (
    IDictionary<string, Object> dictionary,
    Type type,
    JavaScriptSerializer serializer
)
```

Visual Basic

```
Public Overrides Function Deserialize( _
    dictionary As IDictionary(Of String, Object), _
    type As Type, _
    serializer As JavaScriptSerializer _
) As Object
```

Parameters

dictionary

type

serializer

Return Value

See Also

SvgNodeConverter Members
SvgNodeConverter Class
MindFusion.Diagramming.Mvc Namespace

SvgNodeConverter.Serialize Method

Serialize override.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C#

```
public override IDictionary<string, Object> Serialize (
    Object obj,
    JavaScriptSerializer serializer
)
```

Visual Basic

```
Public Overrides Function Serialize( _
    obj As Object, _
    serializer As JavaScriptSerializer _
) As IDictionary(Of String, Object)
```

Parameters

obj

serializer

Return Value

SvgNodeConverter Properties

SvgNodeConverter.SupportedTypes Property

SupportedTypes override.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public override IEnumerable<Type> SupportedTypes { get; }
```

Visual Basic Copy Code

```
Public Overrides ReadOnly Property SupportedTypes As IEnumerable(Of Type)
```

Property Value

TabAlignment Enumeration

Specifies the alignment of a tab strip relative to its container control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public enum TabAlignment
```

Visual Basic Copy Code

```
Public Enum TabAlignment
```

Members

	Member name	Description
	None	The tab strip is not shown.
	Top	The tab strip is located at the top of the control.
	Bottom	The tab strip is located at the bottom of the control.

MindFusion.Diagramming.Mvc Namespace

TabbedDiagramView Class

Represents a DiagramView that can display DiagramDocument objects. The individual diagram pages can be activated through the tabs in the tray located at one of the view sides.

Syntax

C# Copy Code

```
public class TabbedDiagramView : DiagramView
```

Visual Basic Copy Code

```
Public Class TabbedDiagramView
    Inherits DiagramView
```

Remarks

Use the TabbedDiagramView html helper to add this control to a page:

Index.cshtml Copy Code

```
@Html.TabbedDiagramView(
    (TabbedDiagramView)ViewBag.DiagramView,
    new { style = "width:100%;height:100%;" })
```

Setting up the view from code-behind looks like this:

Controller.cs Copy Code

```
public IActionResult Index()
{
    TabbedDiagramView view = TabbedDiagramView.FromRequest("diagramView", Request);
    ViewBag.DiagramView = view;

    if (!Request.HasFormContentType)
    {
        view.TabAlignment = TabAlignment.Top;

        var doc = view.Document;

        var p1 = new DiagramPage();
        p1.Title = "diagram1";
        p1.TitleColor = Color.Red;
        var node = p1.Factory.CreateShapeNode(10, 10, 20, 20);
        doc.Pages.Add(p1);
    }

    return View();
}
```

TabbedDiagramView Members

Represents a DiagramView that can display DiagramDocument objects. The individual diagram pages can be activated through the tabs in the tray located at one of the view sides.

The following tables list the members exposed by the TabbedDiagramView type.

Public Constructors

	Name	Description

	TabbedDiagramView	Overloaded.

Public Properties

	Name	Description
	AddScriptReferences	Gets or sets a value indicating whether the control should render references to the client scripts. (Inherited from DiagramView.)
	AllowInplaceEdit	Gets or sets a value indicating whether in-place editing of the text of objects is enabled. (Inherited from DiagramView.)
	AllowReorder	Gets or sets a value indicating whether tabs can be rearranged interactively.
	AutoClasses	Gets the registered client types with JSON templates. (Inherited from DiagramView.)
	AutoScroll	Gets or sets a value indicating whether auto scrolling of the document area is enabled. (Inherited from DiagramView.)
	Behavior	Gets or sets a value indicating how the control responds to user actions. (Inherited from DiagramView.)
	ClientScriptLocation	Gets or sets the URL to the MindFusion.Diagramming.js file. (Inherited from DiagramView.)
	Converters	Gets the registered custom converters. (Inherited from DiagramView.)
	CustomLinkType	Gets the type of a MindFusion.Diagramming.DiagramLink derived class whose instance should be created when a user starts drawing. (Inherited from DiagramView.)
	CustomNodeType	Gets the type of a MindFusion.Diagramming.DiagramNode derived class whose instance should be created when a user starts drawing. (Inherited from DiagramView.)
	DefaultControlTemplate	Gets or sets the HTML string representing the DOM content, rendered by default in newly created ControlNode objects. (Inherited from DiagramView.)
	DelKeyAction	Gets or sets a value indicating the action that should be performed when the user hits the DELETE key. (Inherited from DiagramView.)
	Diagram	Gets or sets the Diagram object displayed by this view.
	Document	Gets or sets the DiagramDocument object displayed by this view.
	Enabled	Gets or sets a value indicating whether handling of mouse events is enabled. (Inherited from DiagramView.)
	EnableMultiTouch	Gets or sets a value indicating whether the control handles DOM pointer events to implement multi-touch interactions, such as zooming, node rotation or simultaneous drawing of multiple diagram items. (Inherited from DiagramView.)
	FallbackContent	Gets or sets the HTML to be rendered as the canvas' fallback content. (Inherited from DiagramView.)
	HandleTouchHitDistance	Gets or sets maximum distance between touch position and adjustment handle at which the handle can still be grabbed to modify its item. (Inherited from DiagramView.)
	Height	Gets or sets the height of the view. (Inherited from DiagramView.)
	Id	Gets or sets the id of the view. (Inherited from DiagramView.)
	ItemTypes	Gets the registered item types. (Inherited from DiagramView.)
	LicenseKey	Gets or sets the license key of the control. (Inherited from DiagramView.)
	MagnifierEnabled	Gets or sets a value indicating whether the magnifier tool is currently enabled. (Inherited from DiagramView.)

	MagnifierFactor	Gets or sets the zoom factor of the magnifier tool. (Inherited from DiagramView.)
	MagnifierFrameColor	Gets or sets the color of the magnifier frame. (Inherited from DiagramView.)
	MagnifierFrameThickness	Gets or sets the thickness of the magnifier frame, expressed in pixels. (Inherited from DiagramView.)
	MagnifierHeight	Gets or sets the height of the magnifier tool, expressed in pixels. (Inherited from DiagramView.)
	MagnifierSecondaryFrameColor	Gets or sets the secondary color of the magnifier frame. (Inherited from DiagramView.)
	MagnifierShading	Gets or sets a value indicating whether to enhance the effect of a magnifier lense by using a gradient shading. (Inherited from DiagramView.)
	MagnifierShape	Gets or sets the shape of the magnifier tool. (Inherited from DiagramView.)
	MagnifierWidth	Gets or sets the width of the magnifier tool, expressed in pixels. (Inherited from DiagramView.)
	MaxJsonLength	Gets or sets the maximum length of JSON strings that are accepted by internal JavaScriptSerializer instances. (Inherited from DiagramView.)
	MinVisibleFontSize	Gets or sets a threshold value that hides text if scaled font sizes become smaller. (Inherited from DiagramView.)
	ModificationStart	Gets or sets how users can start modifying diagram items. (Inherited from DiagramView.)
	MouseWheelAction	Gets or sets what action to perform when users rotate the mouse wheel. (Inherited from DiagramView.)
	MultiTouchDraw	Gets or sets a value indicating whether the control allows drawing multiple items simultaneously. (Inherited from DiagramView.)
	MultiTouchModify	Gets or sets a value indicating whether multi-touch modifications are enabled. (Inherited from DiagramView.)
	MultiTouchZoom	Gets or sets a value indicating whether multi-touch zoom is enabled. (Inherited from DiagramView.)
	RecursionLimit	Gets or sets the limit for constraining the number of object levels to process by internal JavaScriptSerializer instances. (Inherited from DiagramView.)
	ScrollLeft	Gets or sets the view's X scroll position. (Inherited from DiagramView.)
	ScrollTop	Gets or sets the view's Y scroll position. (Inherited from DiagramView.)
	SelectedIndex	Gets or sets the index of the currently selected tab page.
	ShapeLibraryLocation	The location of a shape library file containing custom shape definitions. It can be set to a full URL of the file, or a relative file path. (Inherited from DiagramView.)
	ShowAddButton	Gets or sets a value indicating whether to display the 'Add Tab' button.
	ShowNavigationButtons	Gets or sets a value indicating whether to show tab navigation buttons.
	ShowTabCloseButtons	Gets or sets a value indicating whether to display a close button for each tab.
	TabAlignment	Gets or sets the tab alignment.
	TabsSize	Gets or sets the height of the tab strip.
	ThemeId	Gets or sets the theme of the control.

	TooltipDelay	Gets or sets the delay before a tooltip is shown. (Inherited from DiagramView.)
	VirtualScroll	Gets or sets a value indicating whether virtual scroll mode is enabled. (Inherited from DiagramView.)
	Width	Gets or sets the width of the view. (Inherited from DiagramView.)
	ZoomFactor	Gets or sets the zoom of the view. (Inherited from DiagramView.)

Public Methods

	Name	Description
	AnimatedLayoutCompletedScript	Sets the name of a JavaScript function that should be invoked when an animated layout completes. (Inherited from DiagramView.)
	CellTextEditedScript	Sets the name of a JavaScript function that should be invoked when the user edits the text of a table cell. (Inherited from DiagramView.)
	CellTextEditingScript	Sets the name of a JavaScript function that should be invoked when the user starts to edit the text of a table cell. (Inherited from DiagramView.)
	ClickedScript	Sets the name of a JavaScript function that should be invoked when the user clicks the diagram at a point where no items are located. (Inherited from DiagramView.)
	ContainerChildAddedScript	Sets the name of a JavaScript function that should be invoked when a child node is added to a container. (Inherited from DiagramView.)
	ContainerChildAddingScript	Sets the name of a JavaScript function that should be invoked before a child node is added to a container. (Inherited from DiagramView.)
	ContainerChildRemovedScript	Sets the name of a JavaScript function that should be invoked when a child node is removed from a container. (Inherited from DiagramView.)
	ContainerChildRemovingScript	Sets the name of a JavaScript function that should be invoked before a child node is removed from a container. (Inherited from DiagramView.)
	ContainerFoldedScript	Sets the name of a JavaScript function that should be invoked when the user folds a container by clicking the arrow-up button in the container's caption area. (Inherited from DiagramView.)
	ContainerUnfoldedScript	Sets the name of a JavaScript function that should be invoked when the user unfolds a container by clicking the arrow-down button in the container's caption area. (Inherited from DiagramView.)
	ControlLoadedScript	Sets the name of a JavaScript function that should be invoked when the control is loaded on the client side. (Inherited from DiagramView.)
	CreateEditControlScript	Sets the name of a JavaScript function that should be invoked when when the inplace-edit control is created. (Inherited from DiagramView.)
	DataLoadedScript	Sets the name of a JavaScript function that should be invoked when the diagram data is loaded. (Inherited from DiagramView.)
	DeserializeTagScript	Sets the name of a JavaScript function that should be invoked when the Tag or Id of a diagram item must be deserialized from XML format. (Inherited from DiagramView.)
	DiagramToView	Overloaded. Transforms points from the document coordinate space to the client coordinate space. (Inherited from DiagramView.)
	DrawAdjustmentHandlesScript	Sets the name of a JavaScript function that should be invoked when item's adjustment handles must be custom drawn. (Inherited from DiagramView.)
	EnterInplaceEditScript	Sets the name of a JavaScript function that should be invoked when when entering inplace-edit mode. (Inherited from DiagramView.)
	FromJson	Overloaded.
	FromRequest	Creates an instance of TabbedDiagramView.

	HeaderResizedScript	Sets the name of a JavaScript function that should be invoked when the user finished resizing a header. (Inherited from DiagramView.)
	HeaderStartResizingScript	Sets the name of a JavaScript function that should be invoked when the user starts resizing a header. (Inherited from DiagramView.)
	HitTestAdjustmentHandlesScript	Sets the name of a JavaScript function that should be invoked when custom hit testing of item's adjustment handles must be performed. (Inherited from DiagramView.)
	HyperlinkClickedScript	Sets the name of a JavaScript function that should be invoked when the user clicks a hyperlink inside a node. (Inherited from DiagramView.)
	Init	Renders the TabbedDiagramView's initializing scripts on a web page under the specified function name.
	InitializeLinkScript	Sets the name of a JavaScript function that should be invoked when the user starts drawing a new link, just after the DiagramLink instance is created. (Inherited from DiagramView.)
	InitializeNodeScript	Sets the name of a JavaScript function that should be invoked when the user starts drawing a new node, just after the DiagramNode instance is created. (Inherited from DiagramView.)
	ItemAddedScript	Sets the name of a JavaScript function that should be invoked when an item is added to the diagram. (Inherited from DiagramView.)
	ItemRemovedScript	Sets the name of a JavaScript function that should be invoked when an item is removed from the diagram. (Inherited from DiagramView.)
	LaneGridCellTextEditedScript	Sets the name of a JavaScript function that should be invoked hen the used edits the text of a grid cell. (Inherited from DiagramView.)
	LeaveInplaceEditScript	Sets the name of a JavaScript function that should be invoked when when leaving inplace-edit mode. (Inherited from DiagramView.)
	LinkClickedScript	Sets the name of a JavaScript function that should be invoked when the users clicks a link. (Inherited from DiagramView.)
	LinkCreatedScript	Sets the name of a JavaScript function that should be invoked when the user draws a new link. (Inherited from DiagramView.)
	LinkCreatingScript	Sets the name of a JavaScript function that should be invoked while the user is drawing a new link. (Inherited from DiagramView.)
	LinkDeletedScript	Sets the name of a JavaScript function that should be invoked when a link is deleted, either programmatically or by the user. (Inherited from DiagramView.)
	LinkDeletingScript	Sets the name of a JavaScript function that should be invoked when the user tries to delete a link. (Inherited from DiagramView.)
	LinkDeselectedScript	Sets the name of a JavaScript function that should be invoked when a link is deselected, either programmatically or by the user. (Inherited from DiagramView.)
	LinkDoubleClickedScript	Sets the name of a JavaScript function that should be invoked when the users double-clicks a link. (Inherited from DiagramView.)
	LinkModifiedScript	Sets the name of a JavaScript function that should be invoked when the user moves any control point of a link. (Inherited from DiagramView.)
	LinkModifyingScript	Sets the name of a JavaScript function that should be invoked while the user is modifying a link. (Inherited from DiagramView.)
	LinkPastedScript	Sets the name of a JavaScript function that should be invoked when a diagram link is pasted from clipboard. (Inherited from DiagramView.)
	LinkPointedScript	Sets the name of a JavaScript function that should be invoked when the mouse pointer hovers over a link. (Inherited from DiagramView.)
	LinkSelectedScript	Sets the name of a JavaScript function that should be invoked when a link is selected, either programmatically or by the user. (Inherited from DiagramView.)

	LinkSelectingScript	Sets the name of a JavaScript function that should be invoked when the user tries to select a link. (Inherited from DiagramView.)
	LinkTextEditedScript	Sets the name of a JavaScript function that should be invoked when the user edits the text of a link. (Inherited from DiagramView.)
	LinkTextEditingScript	Sets the name of a JavaScript function that should be invoked when the user starts to edit the text of a link. (Inherited from DiagramView.)
	LoadFromJson	Overloaded. (Inherited from DiagramView.)
	MouseWheelScript	Sets the name of a JavaScript function that should be invoked when the user rotates the mouse wheel while the cursor is positioned over the diagram surface. (Inherited from DiagramView.)
	NodeClickedScript	Sets the name of a JavaScript function that should be invoked when the users clicks a node. (Inherited from DiagramView.)
	NodeCreatedScript	Sets the name of a JavaScript function that should be invoked when the user draws a new node. (Inherited from DiagramView.)
	NodeCreatingScript	Sets the name of a JavaScript function that should be invoked while the user is drawing a new node. (Inherited from DiagramView.)
	NodeDeletedScript	Sets the name of a JavaScript function that should be invoked when a node is deleted, either programmatically or by the user. (Inherited from DiagramView.)
	NodeDeletingScript	Sets the name of a JavaScript function that should be invoked when the user tries to delete a node. (Inherited from DiagramView.)
	NodeDeselectedScript	Sets the name of a JavaScript function that should be invoked when a node is deselected, either programmatically or by the user. (Inherited from DiagramView.)
	NodeDomCreatedScript	Sets the name of a JavaScript function that should be invoked when the content of a ControlNode is added to the page DOM. (Inherited from DiagramView.)
	NodeDoubleClickedScript	Sets the name of a JavaScript function that should be invoked when the users double-clicks a node. (Inherited from DiagramView.)
	NodeModifiedScript	Sets the name of a JavaScript function that should be invoked when the user moves or resizes a node. (Inherited from DiagramView.)
	NodeModifyingScript	Sets the name of a JavaScript function that should be invoked while the user is moving or resizing a node. (Inherited from DiagramView.)
	NodePastedScript	Sets the name of a JavaScript function that should be invoked when a diagram node is pasted from clipboard. (Inherited from DiagramView.)
	NodePointedScript	Sets the name of a JavaScript function that should be invoked when the mouse pointer hovers over a node. (Inherited from DiagramView.)
	NodeSelectedScript	Sets the name of a JavaScript function that should be invoked when a node is selected, either programmatically or by the user. (Inherited from DiagramView.)
	NodeSelectingScript	Sets the name of a JavaScript function that should be invoked when the user tries to select a node. (Inherited from DiagramView.)
	NodeTextEditedScript	Sets the name of a JavaScript function that should be invoked when the user edits the text of a node. (Inherited from DiagramView.)
	NodeTextEditingScript	Sets the name of a JavaScript function that should be invoked when the user starts to edit the text of a node. (Inherited from DiagramView.)
	PageAddedScript	Sets the name of a JavaScript function that should be invoked when the a page has been added to a TabbedDiagramView control.
	PageAddingScript	Sets the name of a JavaScript function that should be invoked before a page is added to a TabbedDiagramView control.

	PageChangedScript	Sets the name of a JavaScript function that should be invoked when the selected page in a TabbedDiagramView control has changed.
	PageChangingScript	Sets the name of a JavaScript function that should be invoked before the selected page in a TabbedDiagramView control is changed.
	PageRemovedScript	Sets the name of a JavaScript function that should be invoked when the a page has been removed from a TabbedDiagramView control.
	PageRemovingScript	Sets the name of a JavaScript function that should be invoked before a page is removed from a TabbedDiagramView control.
	RegisterConverters	Registers custom converters used for custom item types serialization. (Inherited from DiagramView.)
	RegisterItemType	Overloaded. (Inherited from DiagramView.)
	RegisterSession	Overloaded. (Inherited from DiagramView.)
	Render	Renders the **DiagramView** on a web page. (Inherited from DiagramView.)
	RepaintScript	Sets the name of a JavaScript function that should be invoked when the diagram has been repainted. (Inherited from DiagramView.)
	SaveToJson	Serializes the TabbedDiagramView's data to JSON.
	SelectionChangedScript	Sets the name of a JavaScript function that should be invoked when the diagram selection has changed. (Inherited from DiagramView.)
	SelectionModifyingScript	Sets the name of a JavaScript function that should be invoked while the user is moving or resizing multiple items. (Inherited from DiagramView.)
	SerializeTagScript	Sets the name of a JavaScript function that should be invoked when the Tag or Id of a diagram item must be serialized in XML format. (Inherited from DiagramView.)
	SetAddScriptReferences	Sets a value indicating whether the control should render references to the client scripts. (Inherited from DiagramView.)
	SetAllowInplaceEdit	Sets a value indicating whether in-place editing of the text of objects is enabled. (Inherited from DiagramView.)
	SetAllowReorder	Sets a value indicating whether tabs can be rearranged interactively.
	SetAutoScroll	Sets a value indicating whether auto scrolling of the document area is enabled. (Inherited from DiagramView.)
	SetBehavior	Sets a value indicating how the control responds to user actions. (Inherited from DiagramView.)
	SetCustomLinkType	Sets the type of a MindFusion.Diagramming.**DiagramLink** derived class whose instance should be created when a user starts drawing. (Inherited from DiagramView.)
	SetCustomNodeType	Sets the type of a MindFusion.Diagramming.**DiagramNode** derived class whose instance should be created when a user starts drawing. (Inherited from DiagramView.)
	SetDelKeyAction	Sets a value indicating the action that should be performed when the user hits the Del key. (Inherited from DiagramView.)
	SetEnabled	Sets a value indicating whether handling of mouse events is enabled. (Inherited from DiagramView.)
	SetEnableMultiTouch	Sets a value indicating whethr the control handles DOM pointer events to implement multi-touch interactions, such as zooming, node rotation or simultaneous drawing of multiple diagram items. (Inherited from DiagramView.)
	SetFallbackContent	Sets the HTML to be rendered as the canvas' fallback content. (Inherited from DiagramView.)
	SetHeight	Sets the height of the view. (Inherited from DiagramView.)

	SetMagnifierEnabled	Sets a value indicating whether the magnifier tool is currently enabled. (Inherited from DiagramView.)
	SetMagnifierFactor	Sets the zoom factor of the magnifier tool. (Inherited from DiagramView.)
	SetMagnifierFrameColor	Sets the color of the magnifier frame. (Inherited from DiagramView.)
	SetMagnifierFrameThickness	Sets the thickness of the magnifier frame, expressed in pixels. (Inherited from DiagramView.)
	SetMagnifierHeight	Sets the height of the magnifier tool, expressed in pixels. (Inherited from DiagramView.)
	SetMagnifierSecondaryFrameColor	Sets the secondary color of the magnifier frame. (Inherited from DiagramView.)
	SetMagnifierShading	Sets a value indicating whether to enhance the effect of a magnifier lense by using a gradient shading. (Inherited from DiagramView.)
	SetMagnifierShape	Sets the shape of the magnifier tool. (Inherited from DiagramView.)
	SetMagnifierWidth	Sets the width of the magnifier tool, expressed in pixels. (Inherited from DiagramView.)
	SetMaxJsonLength	Sets the maximum length of JSON strings that are accepted by internal JavaScriptSerializer instances. (Inherited from DiagramView.)
	SetMinVisibleFontSize	Sets a threshold value that hides text if scaled font sizes become smaller. (Inherited from DiagramView.)
	SetModificationStart	Sets how users can start modifying diagram items. (Inherited from DiagramView.)
	SetMouseWheelAction	Sets a value indicating what action to perform when users rotate the mouse wheel. (Inherited from DiagramView.)
	SetMultiTouchDraw	Sets a value indicating whether the control allows drawing multiple items simultaneously. (Inherited from DiagramView.)
	SetMultiTouchModify	Sets a value indicating whether multi-touch modifications are enabled. (Inherited from DiagramView.)
	SetMultiTouchZoom	Sets a value indicating whether multi-touch zoom is enabled. (Inherited from DiagramView.)
	SetRecursionLimit	Sets the limit for constraining the number of object levels to process by internal JavaScriptSerializer instances. (Inherited from DiagramView.)
	SetScrollLeft	Sets the view's X scroll position. (Inherited from DiagramView.)
	SetScrollTop	Sets the view's Y scroll position. (Inherited from DiagramView.)
	SetShowAddButton	Sets a value indicating whether to display the 'Add Tab' button.
	SetShowNavigationButtons	Sets a value indicating whether to show tab navigation buttons.
	SetShowScrollbars	Sets a value indicating whether the scrollbars are visible. (Inherited from DiagramView.)
	SetShowTabCloseButtons	Sets a value indicating whether to display a close button for each tab.
	SetTabAlignment	Sets the tab alignment.
	SetTabsSize	Sets the height of the tab strip.
	SetTooltipDelay	Sets the delay before a tooltip is shown. (Inherited from DiagramView.)
	SetVirtualScroll	Sets a value indicating whether virtual scroll mode is enabled. (Inherited from DiagramView.)
	SetWidth	Sets the width of the view. (Inherited from DiagramView.)
	SetZoomFactor	Sets the zoom of the view. (Inherited from DiagramView.)

	SizeChangedScript	Sets the name of a JavaScript function that should be invoked when the size of the diagram canvas has changed. (Inherited from DiagramView.)
	TableColumnResizedScript	Sets the name of a JavaScript function that should be invoked when the user finishes resizing a column in a table interactively. (Inherited from DiagramView.)
	TableColumnResizingScript	Sets the name of a JavaScript function that should be invoked when the user resizes a column in a table interactively. (Inherited from DiagramView.)
	TableRowResizedScript	Sets the name of a JavaScript function that should be invoked when the user finishes resizing a row in a table interactively. (Inherited from DiagramView.)
	TableRowResizingScript	Sets the name of a JavaScript function that should be invoked when the user resizes a row in a table interactively. (Inherited from DiagramView.)
	ToJson	Serializes the DiagramView's data to JSON.
	ToJson	Serializes the DiagramView's data to JSON. (Inherited from DiagramView.)
	TreeCollapsedScript	Sets the name of a JavaScript function that should be invoked when a user collapses a tree branch by clicking the [+] button of an Expandable node. (Inherited from DiagramView.)
	TreeExpandedScript	Sets the name of a JavaScript function that should be invoked when a user expands a tree branch by clicking the [+] button of an Expandable node. (Inherited from DiagramView.)
	TreeItemTextEditedScript	Sets the name of a JavaScript function that should be invoked when the user edits the text of a tree view item. (Inherited from DiagramView.)
	TreeItemTextEditingScript	Sets the name of a JavaScript function that should be invoked when the user starts to edit the text of a tree view item. (Inherited from DiagramView.)
	ViewToDiagram	Overloaded. (Inherited from DiagramView.)

TabbedDiagramView Constructor (String)

Creates an instance of TabbedDiagramView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public TabbedDiagramView (
    string id
)
```

Visual Basic Copy Code

```
Public New ( _
    id As String _
)
```

Parameters

id
The Id of the TabbedDiagramView

TabbedDiagramView Constructor (String, DiagramDocument)

Creates an instance of TabbedDiagramView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public TabbedDiagramView (
    string id,
    DiagramDocument document
)
```

Visual Basic Copy Code

```
Public New ( _
    id As String, _
    document As DiagramDocument _
)
```

Parameters

id
The Id of the TabbedDiagramView

document
The DiagramDocument displayed by the view

MindFusion.Diagramming.Mvc Namespace

TabbedDiagramView.FromRequest Method

Creates an instance of TabbedDiagramView.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public new static TabbedDiagramView FromRequest (
    string id,
    HttpRequest request
)
```

Visual Basic Copy Code

```
Public Shadows Shared Function FromRequest( _
    id As String, _
    request As HttpRequest _
) As TabbedDiagramView
```

Parameters

id

The Id of the TabbedDiagramView

request

An HttpRequest object that contains the json data for the view.

Return Value

TabbedDiagramView.Init Method

Renders the TabbedDiagramView's initializing scripts on a web page under the specified function name.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public override string Init (
    string functionName
)
```

Visual Basic Copy Code

```
Public Overrides Function Init( _
    functionName As String _
) As String
```

Parameters

functionName

Return Value

TabbedDiagramView.PageAddedScript Method

Sets the name of a JavaScript function that should be invoked when the a page has been added to a TabbedDiagramView control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public TabbedDiagramView PageAddedScript (
    string value
)
```

Visual Basic Copy Code

```
Public Function PageAddedScript( _
    value As String _
) As TabbedDiagramView
```

Parameters

value
The name of the function

Return Value

TabbedDiagramViewExtensions.TabbedDiagramView Method

Overload List

Name	Description
TabbedDiagramViewExtensions.TabbedDiagramView (IHtmlHelper, String, DiagramDocument)	Returns a TabbedDiagramView by using the specified HTML helper.
TabbedDiagramViewExtensions.TabbedDiagramView (IHtmlHelper, String, DiagramDocument, IDictionary(String, Object))	Returns a TabbedDiagramView by using the specified HTML helper.
TabbedDiagramViewExtensions.TabbedDiagramView (IHtmlHelper, String, DiagramDocument, Object)	Returns a TabbedDiagramView by using the specified HTML helper.
TabbedDiagramViewExtensions.TabbedDiagramView (IHtmlHelper, String, DiagramDocument, String)	Returns a TabbedDiagramView by using the specified HTML helper.

TabbedDiagramViewExtensions.TabbedDiagramView (IHtmlHelper, String, DiagramDocument, String, IDictionary(String, Object))	Returns a TabbedDiagramView by using the specified HTML helper.
TabbedDiagramViewExtensions.TabbedDiagramView (IHtmlHelper, String, DiagramDocument, String, Object)	Returns a TabbedDiagramView by using the specified HTML helper.
TabbedDiagramViewExtensions.TabbedDiagramView (IHtmlHelper, TabbedDiagramView)	Returns a TabbedDiagramView by using the specified HTML helper.
TabbedDiagramViewExtensions.TabbedDiagramView (IHtmlHelper, TabbedDiagramView, IDictionary(String, Object))	Returns a TabbedDiagramView by using the specified HTML helper.
TabbedDiagramViewExtensions.TabbedDiagramView (IHtmlHelper, TabbedDiagramView, Object)	Returns a TabbedDiagramView by using the specified HTML helper.
TabbedDiagramViewExtensions.TabbedDiagramView (IHtmlHelper, TabbedDiagramView, String)	Returns a TabbedDiagramView by using the specified HTML helper.
TabbedDiagramViewExtensions.TabbedDiagramView (IHtmlHelper, TabbedDiagramView, String, IDictionary(String, Object))	Returns a TabbedDiagramView by using the specified HTML helper.
TabbedDiagramViewExtensions.TabbedDiagramView (IHtmlHelper, TabbedDiagramView, String, Object)	Returns a TabbedDiagramView by using the specified HTML helper.

TabbedDiagramViewExtensions.TabbedDiagramView Method (IHtmlHelper, String, DiagramDocument)

Returns a TabbedDiagramView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent TabbedDiagramView (
    IHtmlHelper helper,
    string id,
    DiagramDocument document
)
```

Visual Basic Copy Code

```
Public Shared Function TabbedDiagramView( _
    helper As IHtmlHelper, _
    id As String, _
    document As DiagramDocument _
) As IHtmlContent
```

Parameters

helper
The HTML helper

id
The Id of the TabbedDiagramView

document
The DiagramDocument displayed by the view

Return Value

See Also

TabbedDiagramViewExtensions.TabbedDiagramView Method (IHtmlHelper, String, DiagramDocument, IDictionary(String, Object))

Returns a TabbedDiagramView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent TabbedDiagramView (
    IHtmlHelper helper,
    string id,
    DiagramDocument document,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function TabbedDiagramView( _
    helper As IHtmlHelper, _
    id As String, _
    document As DiagramDocument, _
    htmlAttributes As IDictionary(Of String, Object) _
) As IHtmlContent
```

Parameters

helper
The HTML helper

id
The Id of the TabbedDiagramView

document
The DiagramDocument displayed by the view

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

See Also

TabbedDiagramViewExtensions Class
MindFusion.Diagramming.Mvc Namespace

TabbedDiagramViewExtensions.TabbedDiagramView Method (IHtmlHelper, TabbedDiagramView, String, Object)

Returns a TabbedDiagramView by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent TabbedDiagramView (
    IHtmlHelper helper,
    TabbedDiagramView tabbedDiagramView,
    string initFunction,
    Object htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function TabbedDiagramView( _
    helper As IHtmlHelper, _
    tabbedDiagramView As TabbedDiagramView, _
    initFunction As String, _
    htmlAttributes As Object _
) As IHtmlContent
```

Parameters

helper
The HTML helper

tabbedDiagramView
The TabbedDiagramView

initFunction
The name of the function that will contain the initializing scripts for the view.

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

TabbedDiagramViewTagHelper Class

Tag helper of TabbedDiagramView.

Syntax

C# Copy Code

```
public class TabbedDiagramViewTagHelper : TagHelper
```

Visual Basic Copy Code

```
Public Class TabbedDiagramViewTagHelper
    Inherits TagHelper
```

Remarks

This class implements the <mindfusion-tabbeddiagramview> tag.

Inheritance Hierarchy

System.Object
  Microsoft.AspNetCore.Razor.TagHelpers.TagHelper
    MindFusion.Diagramming.Mvc.TabbedDiagramViewTagHelper

ZoomControl Members

ZoomControl lets users zoom and pan a target DiagramView interactively.

The following tables list the members exposed by the **ZoomControl** type.

Public Constructors

	Name	Description
	ZoomControl	Overloaded.

Public Properties

	Name	Description
	ActiveColor	Gets or sets the color used to render depressed buttons.
	AddScriptReferences	Gets or sets a value indicating whether the control should render references to the client scripts.
	BackColor	Gets or sets the background color of the control.
	BorderColor	Gets or sets the color of ZoomControl elements' borders.
	ClientScriptLocation	Gets or sets the URL to the MindFusion.Diagramming.js file.
	CornerRadius	Gets or sets the corner radius of rounded child elements.
	Enabled	Gets or sets a value indicating whether handling of mouse events is enabled.
	Fill	Gets or sets the brush used to fill the **ZoomControl** elements.
	Height	Gets or sets the height of the control.
	Id	Gets or sets the id of the view.
	InnerColor	Gets or sets the color of plus, minus and arrow icons.
	MaxZoomFactor	The maximum zoom level allowed to set through this control.
	MinZoomFactor	The minimum zoom level allowed to set through this control.
	Padding	Gets or sets the padding of the control's contents.
	ScrollStep	Gets or sets the scroll offset added when users click the pan arrows.
	ShadowColor	Gets or sets the shadow color.
	ShowLabel	Gets or sets a value indicating whether the label that shows the current zoom level should be visible.
	SnapToZoomStep	Gets or sets a value indicating whether the trackbar should snap to ZoomStep values when dragged.
	TargetId	Gets or sets the id of the target view.
	TextColor	Gets or sets the brush of the the label that shows the current zoom level.
	TickPosition	Gets or sets the current tick position of the trackbar.
	Width	Gets or sets the width of the control.
	ZoomFactor	Gets or sets the current zoom level.

	ZoomStep	Gets or sets the amount by which to change zoom level when + and - buttons are clicked.

Public Methods

	Name	Description
	FromJson	Overloaded.
	FromRequest	Overloaded.
	Init	Renders the **ZoomControl's** initializing scripts on a web page under the specified function name.
	LoadFromJson	Loads the specified JSON data.
	Render	Renders the **ZoomControl** on a web page.
	SaveToJson	Serializes the ZoomControl's data to JSON.
	SetActiveColor	Sets the color used to render depressed buttons.
	SetAddScriptReferences	Sets a value indicating whether the control should render references to the client scripts.
	SetBackColor	Sets the background color of the control.
	SetBorderColor	Sets the color of **ZoomControl** elements' borders.
	SetCornerRadius	Sets the corner radius of rounded child elements.
	SetEnabled	Sets a value indicating whether handling of mouse events is enabled.
	SetFill	Sets the brush used to fill the **ZoomControl** elements.
	SetHeight	Sets the height of the view.
	SetInnerColor	Sets the color of plus, minus and arrow icons.
	SetMaxZoomFactor	Sets the maximum zoom level allowed to set through this control.
	SetMinZoomFactor	Sets the minimum zoom level allowed to set through this control.
	SetPadding	Sets the padding of the control's contents.
	SetScrollStep	Sets the scroll offset added when users click the pan arrows.
	SetShadowColor	Sets the shadow color.
	SetShowLabel	Sets a value indicating whether the label that shows the current zoom level should be visible.
	SetSnapToZoomStep	Sets a value indicating whether the trackbar should snap to **ZoomStep** values when dragged.
	SetTargetId	Sets the id of the target view.
	SetTextColor	Sets the brush of the the label that shows the current zoom level.
	SetTickPosition	Sets the current tick position of the trackbar.
	SetWidth	Sets the width of the view.
	SetZoomFactor	Sets the id of the target view.
	SetZoomStep	Sets the amount by which to change zoom level when + and - buttons are clicked.
	ToJson	Serializes the ZoomControl's data to JSON.

ZoomControl.Render Method

Renders the ZoomControl on a web page.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Render ()
```

Visual Basic Copy Code

```
Public Function Render () As String
```

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SaveToJson Method

Serializes the ZoomControl's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string SaveToJson ()
```

Visual Basic Copy Code

```
Public Function SaveToJson () As String
```

Return Value

The JSON string.

ZoomControl.SetBackColor Method

Sets the background color of the control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetBackColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetBackColor( _
    value As Color _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetBorderColor Method

Sets the color of ZoomControl elements' borders.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetBorderColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetBorderColor( _
    value As Color _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetCornerRadius Method

Sets the corner radius of rounded child elements.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetCornerRadius (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetCornerRadius( _
    value As Integer _
) As ZoomControl
```

Parameters

value

Return Value

MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetEnabled Method

Sets a value indicating whether handling of mouse events is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetEnabled (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetEnabled( _
    value As Boolean _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetFill Method

Sets the brush used to fill the ZoomControl elements.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetFill (
    Brush value
)
```

Visual Basic Copy Code

```
Public Function SetFill( _
    value As Brush _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetHeight Method

Sets the height of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetHeight (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetHeight( _
    value As Integer _
) As ZoomControl
```

Parameters

value
The height of the view in pixels

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetInnerColor Method

Sets the color of plus, minus and arrow icons.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetInnerColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetInnerColor( _
    value As Color _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetMaxZoomFactor Method

Sets the maximum zoom level allowed to set through this control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetMaxZoomFactor (
    double value
)
```

Visual Basic Copy Code

```
Public Function SetMaxZoomFactor( _
    value As Double _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetMinZoomFactor Method

Sets the minimum zoom level allowed to set through this control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetMinZoomFactor (
    double value
)
```

Visual Basic Copy Code

```
Public Function SetMinZoomFactor( _
    value As Double _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetPadding Method

Sets the padding of the control's contents.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetPadding (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetPadding( _
    value As Integer _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetScrollStep Method

Sets the scroll offset added when users click the pan arrows.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetScrollStep (
    double value
)
```

Visual Basic Copy Code

```
Public Function SetScrollStep( _
    value As Double _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetShadowColor Method

Sets the shadow color.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetShadowColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetShadowColor( _
    value As Color _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetShowLabel Method

Sets a value indicating whether the label that shows the current zoom level should be visible.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetShowLabel (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetShowLabel( _
    value As Boolean _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetSnapToZoomStep Method

Sets a value indicating whether the trackbar should snap to ZoomStep values when dragged.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetSnapToZoomStep (
    bool value
)
```

Visual Basic Copy Code

```
Public Function SetSnapToZoomStep( _
    value As Boolean _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetTargetId Method

Sets the id of the target view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetTargetId (
    string value
)
```

Visual Basic Copy Code

```
Public Function SetTargetId( _
    value As String _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetTextColor Method

Sets the brush of the the label that shows the current zoom level.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetTextColor (
    Color value
)
```

Visual Basic Copy Code

```
Public Function SetTextColor( _
    value As Color _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetTickPosition Method

Sets the current tick position of the trackbar.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetTickPosition (
    TickPosition value
)
```

Visual Basic Copy Code

```
Public Function SetTickPosition( _
    value As TickPosition _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetWidth Method

Sets the width of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetWidth (
    int value
)
```

Visual Basic Copy Code

```
Public Function SetWidth( _
    value As Integer _
) As ZoomControl
```

Parameters

value
The width of the view in pixels

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetZoomFactor Method

Sets the id of the target view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetZoomFactor (
    double value
)
```

Visual Basic Copy Code

```
Public Function SetZoomFactor( _
    value As Double _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SetZoomStep Method

Sets the amount by which to change zoom level when + and - buttons are clicked.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public ZoomControl SetZoomStep (
    double value
)
```

Visual Basic Copy Code

```
Public Function SetZoomStep( _
    value As Double _
) As ZoomControl
```

Parameters

value

Return Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.ToJson Method

Serializes the ZoomControl's data to JSON.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static string ToJson (
    ZoomControl view
)
```

Visual Basic Copy Code

```
Public Shared Function ToJson( _
    view As ZoomControl _
) As String
```

Parameters

view

Return Value

The JSON string.

ZoomControl Properties

ZoomControl.ActiveColor Property

Gets or sets the color used to render depressed buttons.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Color ActiveColor { get; set; }
```

Visual Basic Copy Code

```
Public Property ActiveColor As Color
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.AddScriptReferences Property

Gets or sets a value indicating whether the control should render references to the client scripts.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool AddScriptReferences { get; set; }
```

Visual Basic Copy Code

```
Public Property AddScriptReferences As Boolean
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.BackColor Property

Gets or sets the background color of the control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Color BackColor { get; set; }
```

Visual Basic Copy Code

```
Public Property BackColor As Color
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.BorderColor Property

Gets or sets the color of ZoomControl elements' borders.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Color BorderColor { get; set; }
```

Visual Basic Copy Code

```
Public Property BorderColor As Color
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.ClientScriptLocation Property

Gets or sets the URL to the MindFusion.Diagramming.js file.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string ClientScriptLocation { get; set; }
```

Visual Basic Copy Code

```
Public Property ClientScriptLocation As String
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.CornerRadius Property

Gets or sets the corner radius of rounded child elements.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public int CornerRadius { get; set; }
```

Visual Basic Copy Code

```
Public Property CornerRadius As Integer
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.Enabled Property

Gets or sets a value indicating whether handling of mouse events is enabled.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool Enabled { get; set; }
```

Visual Basic Copy Code

```
Public Property Enabled As Boolean
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.Fill Property

Gets or sets the brush used to fill the ZoomControl elements.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Brush Fill { get; set; }
```

Visual Basic Copy Code

```
Public Property Fill As Brush
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.Height Property

Gets or sets the height of the control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public int Height { get; set; }
```

Visual Basic Copy Code

```
Public Property Height As Integer
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.Id Property

Gets or sets the id of the view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string Id { get; set; }
```

Visual Basic Copy Code

```
Public Property Id As String
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.InnerColor Property

Gets or sets the color of plus, minus and arrow icons.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Color InnerColor { get; set; }
```

Visual Basic Copy Code

```
Public Property InnerColor As Color
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.MaxZoomFactor Property

The maximum zoom level allowed to set through this control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public double MaxZoomFactor { get; set; }
```

Visual Basic Copy Code

```
Public Property MaxZoomFactor As Double
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.MinZoomFactor Property

The minimum zoom level allowed to set through this control.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public double MinZoomFactor { get; set; }
```

Visual Basic Copy Code

```
Public Property MinZoomFactor As Double
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.Padding Property

Gets or sets the padding of the control's contents.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public int Padding { get; set; }
```

Visual Basic Copy Code

```
Public Property Padding As Integer
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.ScrollStep Property

Gets or sets the scroll offset added when users click the pan arrows.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public double ScrollStep { get; set; }
```

Visual Basic Copy Code

```
Public Property ScrollStep As Double
```

Property Value

See Also

ZoomControl Members

ZoomControl.ShadowColor Property

Gets or sets the shadow color.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public Color ShadowColor { get; set; }
```

Visual Basic Copy Code

```
Public Property ShadowColor As Color
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.ShowLabel Property

Gets or sets a value indicating whether the label that shows the current zoom level should be visible.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool ShowLabel { get; set; }
```

Visual Basic Copy Code

```
Public Property ShowLabel As Boolean
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.SnapToZoomStep Property

Gets or sets a value indicating whether the trackbar should snap to ZoomStep values when dragged.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public bool SnapToZoomStep { get; set; }
```

Visual Basic Copy Code

```
Public Property SnapToZoomStep As Boolean
```

Property Value

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Diagramming.Mvc Namespace

ZoomControl.TargetId Property

Gets or sets the id of the target view.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public string TargetId { get; set; }
```

Visual Basic Copy Code

```
Public Property TargetId As String
```

Property Value

See Also

ZoomControl Members

ZoomControlExtensions.ZoomControl Method

Overload List

Name	Description
ZoomControlExtensions.ZoomControl (IHtmlHelper, String, String)	Returns a ZoomControl by using the specified HTML helper.
ZoomControlExtensions.ZoomControl (IHtmlHelper, String, String, IDictionary(String, Object))	Returns a **ZoomControl** by using the specified HTML helper.
ZoomControlExtensions.ZoomControl (IHtmlHelper, String, String, Object)	Returns a **ZoomControl** by using the specified HTML helper.
ZoomControlExtensions.ZoomControl (IHtmlHelper, String, String, String)	Returns a **ZoomControl** by using the specified HTML helper.
ZoomControlExtensions.ZoomControl (IHtmlHelper, String, String, String, IDictionary(String, Object))	Returns a **ZoomControl** by using the specified HTML helper.
ZoomControlExtensions.ZoomControl (IHtmlHelper, String, String, String, Object)	Returns a **ZoomControl** by using the specified HTML helper.
ZoomControlExtensions.ZoomControl (IHtmlHelper, ZoomControl)	Returns a **ZoomControl** by using the specified HTML helper.
ZoomControlExtensions.ZoomControl (IHtmlHelper, ZoomControl, IDictionary(String, Object))	Returns a **ZoomControl** by using the specified HTML helper.
ZoomControlExtensions.ZoomControl (IHtmlHelper, ZoomControl, Object)	Returns a **ZoomControl** by using the specified HTML helper.
ZoomControlExtensions.ZoomControl (IHtmlHelper, ZoomControl, String)	Returns a **ZoomControl** by using the specified HTML helper.
ZoomControlExtensions.ZoomControl (IHtmlHelper, ZoomControl, String, IDictionary(String, Object))	Returns a **ZoomControl** by using the specified HTML helper.
ZoomControlExtensions.ZoomControl (IHtmlHelper, ZoomControl, String, Object)	Returns a **ZoomControl** by using the specified HTML helper.

ZoomControlExtensions.ZoomControl Method (IHtmlHelper, String, String)

Returns a ZoomControl by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString ZoomControl (
    HtmlHelper helper,
    string id,
    string diagramViewId
)
```

Visual Basic Copy Code

```
Public Shared Function ZoomControl( _
    helper As HtmlHelper, _
    id As String, _
    diagramViewId As String _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

id
The Id of the ZoomControl

diagramViewId
The Id of the DiagramView

Return Value

See Also

ZoomControlExtensions.ZoomControl Method (IHtmlHelper, String, String, IDictionary(String, Object))

Returns a ZoomControl by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent ZoomControl (
    IHtmlHelper helper,
    string id,
    string diagramViewId,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function ZoomControl( _
    helper As IHtmlHelper, _
    id As String, _
    diagramViewId As String, _
    htmlAttributes As IDictionary(Of String, Object) _
) As IHtmlContent
```

Parameters

helper
The HTML helper

id
The Id of the ZoomControl

diagramViewId
The Id of the DiagramView

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

See Also

ZoomControlExtensions.ZoomControl Method (IHtmlHelper, String, String, String)

Returns a ZoomControl by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString ZoomControl (
    HtmlHelper helper,
    string id,
    string diagramViewId,
    string initFunction
)
```

Visual Basic Copy Code

```
Public Shared Function ZoomControl( _
    helper As HtmlHelper, _
    id As String, _
    diagramViewId As String, _
    initFunction As String _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

id
The Id of the ZoomControl

diagramViewId
The Id of the DiagramView

initFunction
The name of the function that will contain the initializing scripts for the control.

Return Value

ZoomControlExtensions Class
MindFusion.Diagramming.Mvc Namespace

ZoomControlExtensions.ZoomControl Method (IHtmlHelper, ZoomControl, IDictionary(String, Object))

Returns a ZoomControl by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent ZoomControl (
    IHtmlHelper helper,
    ZoomControl control,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function ZoomControl( _
    helper As IHtmlHelper, _
    control As ZoomControl, _
    htmlAttributes As IDictionary(Of String, Object) _
) As IHtmlContent
```

Parameters

helper
The HTML helper

control
The ZoomControl

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

ZoomControlExtensions.ZoomControl Method (IHtmlHelper, ZoomControl, Object)

Returns a ZoomControl by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent ZoomControl (
    IHtmlHelper helper,
    ZoomControl control,
```

```
    Object htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function ZoomControl( _
    helper As IHtmlHelper, _
    control As ZoomControl, _
    htmlAttributes As Object _
) As IHtmlContent
```

Parameters

helper
The HTML helper

control
The ZoomControl

htmlAttributes
An object containing the HTML attributes for the control.

Return Value

ZoomControlExtensions.ZoomControl Method (IHtmlHelper, ZoomControl, String)

Returns a ZoomControl by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static MvcHtmlString ZoomControl (
    HtmlHelper helper,
    ZoomControl control,
    string initFunction
)
```

Visual Basic Copy Code

```
Public Shared Function ZoomControl( _
    helper As HtmlHelper, _
    control As ZoomControl, _
    initFunction As String _
) As MvcHtmlString
```

Parameters

helper
The HTML helper

control
The ZoomControl

initFunction
The name of the function that will contain the initializing scripts for the control.

Return Value

ZoomControlExtensions.ZoomControl Method (IHtmlHelper, ZoomControl, String, IDictionary(String, Object))

Returns a ZoomControl by using the specified HTML helper.

Namespace: MindFusion.Diagramming.Mvc
Assembly: MindFusion.Diagramming.Mvc

Syntax

C# Copy Code

```
public static IHtmlContent ZoomControl (
    IHtmlHelper helper,
    ZoomControl control,
    string initFunction,
    IDictionary<string, Object> htmlAttributes
)
```

Visual Basic Copy Code

```
Public Shared Function ZoomControl( _
    helper As IHtmlHelper, _
    control As ZoomControl, _
    initFunction As String, _
    htmlAttributes As IDictionary(Of String, Object) _
) As IHtmlContent
```

Parameters

helper
The HTML helper

control
The ZoomControl

initFunction
The name of the function that will contain the initializing scripts for the control.

htmlAttributes
An object containing the HTML attributes for the control.

The following tables list the members exposed by the Brushes type.

Public Fields

	Name	Description
	AliceBlue	A solid brush with the AntiqueWhite color.
	AntiqueWhite	A solid brush with the AntiqueWhite color.
	Aqua	A solid brush with the Aqua color.
	Aquamarine	A solid brush with the Aquamarine color.
	Azure	A solid brush with the Azure color.
	Beige	A solid brush with the Beige color.
	Bisque	A solid brush with the Bisque color.
	Black	A solid brush with the Black color.
	BlanchedAlmond	A solid brush with the BlanchedAlmond color.
	Blue	A solid brush with the Blue color.
	BlueViolet	A solid brush with the BlueViolet color.
	Brown	A solid brush with the Brown color.
	BurlyWood	A solid brush with the BurlyWood color.
	CadetBlue	A solid brush with the CadetBlue color.
	Chartreuse	A solid brush with the Chartreuse color.
	Chocolate	A solid brush with the Chocolate color.
	Coral	A solid brush with the Coral color.
	CornflowerBlue	A solid brush with the CornflowerBlue color.
	Cornsilk	A solid brush with the Cornsilk color.
	Crimson	A solid brush with the Crimson color.
	Cyan	A solid brush with the Cyan color.
	DarkBlue	A solid brush with the DarkBlue color.
	DarkCyan	A solid brush with the DarkCyan color.
	DarkGoldenrod	A solid brush with the DarkGoldenrod color.
	DarkGray	A solid brush with the DarkGray color.
	DarkGreen	A solid brush with the DarkGreen color.
	DarkKhaki	A solid brush with the DarkKhaki color.
	DarkMagenta	A solid brush with the DarkMagenta color.
	DarkOliveGreen	A solid brush with the DarkOliveGreen color.
	DarkOrange	A solid brush with the DarkOrange color.
	DarkOrchid	A solid brush with the DarkOrchid color.
	DarkRed	A solid brush with the DarkRed color.
	DarkSalmon	A solid brush with the DarkSalmon color.
	DarkSeaGreen	A solid brush with the DarkSeaGreen color.

	DarkSlateBlue	A solid brush with the DarkSlateBlue color.
	DarkSlateGray	A solid brush with the DarkSlateGray color.
	DarkTurquoise	A solid brush with the DarkTurquoise color.
	DarkViolet	A solid brush with the DarkViolet color.
	DeepPink	A solid brush with the DeepPink color.
	DeepSkyBlue	A solid brush with the DeepSkyBlue color.
	DimGray	A solid brush with the DimGray color.
	DodgerBlue	A solid brush with the DodgerBlue color.
	Firebrick	A solid brush with the Firebrick color.
	FloralWhite	A solid brush with the FloralWhite color.
	ForestGreen	A solid brush with the ForestGreen color.
	Fuchsia	A solid brush with the Fuchsia color.
	Gainsboro	A solid brush with the Gainsboro color.
	GhostWhite	A solid brush with the GhostWhite color.
	Gold	A solid brush with the Gold color.
	Goldenrod	A solid brush with the Goldenrod color.
	Gray	A solid brush with the Gray color.
	Green	A solid brush with the Green color.
	GreenYellow	A solid brush with the GreenYellow color.
	Honeydew	A solid brush with the Honeydew color.
	HotPink	A solid brush with the HotPink color.
	IndianRed	A solid brush with the IndianRed color.
	Indigo	A solid brush with the Indigo color.
	Ivory	A solid brush with the Ivory color.
	Khaki	A solid brush with the Khaki color.
	Lavender	A solid brush with the Lavender color.
	LavenderBlush	A solid brush with the LavenderBlush color.
	LawnGreen	A solid brush with the LawnGreen color.
	LemonChiffon	A solid brush with the LemonChiffon color.
	LightBlue	A solid brush with the LightBlue color.
	LightCoral	A solid brush with the LightCoral color.
	LightCyan	A solid brush with the LightCyan color.
	LightGoldenrodYellow	A solid brush with the LightGoldenrodYellow color.
	LightGray	A solid brush with the LightGray color.
	LightGreen	A solid brush with the LightGreen color.
	LightPink	A solid brush with the LightPink color.
	LightSalmon	A solid brush with the LightSalmon color.

	LightSeaGreen	A solid brush with the LightSeaGreen color.
	LightSkyBlue	A solid brush with the LightSkyBlue color.
	LightSlateGray	A solid brush with the LightSlateGray color.
	LightSteelBlue	A solid brush with the LightSteelBlue color.
	LightYellow	A solid brush with the LightYellow color.
	Lime	A solid brush with the Lime color.
	LimeGreen	A solid brush with the LimeGreen color.
	Linen	A solid brush with the Linen color.
	Magenta	A solid brush with the Magenta color.
	Maroon	A solid brush with the Maroon color.
	MediumAquamarine	A solid brush with the MediumAquamarine color.
	MediumBlue	A solid brush with the MediumBlue color.
	MediumOrchid	A solid brush with the MediumOrchid color.
	MediumPurple	A solid brush with the MediumPurple color.
	MediumSeaGreen	A solid brush with the MediumSeaGreen color.
	MediumSlateBlue	A solid brush with the MediumSlateBlue color.
	MediumSpringGreen	A solid brush with the MediumSpringGreen color.
	MediumTurquoise	A solid brush with the MediumTurquoise color.
	MediumVioletRed	A solid brush with the MediumVioletRed color.
	MidnightBlue	A solid brush with the MidnightBlue color.
	MintCream	A solid brush with the MintCream color.
	MistyRose	A solid brush with the MistyRose color.
	Moccasin	A solid brush with the Moccasin color.
	NavajoWhite	A solid brush with the NavajoWhite color.
	Navy	A solid brush with the Navy color.
	OldLace	A solid brush with the OldLace color.
	Olive	A solid brush with the Olive color.
	OliveDrab	A solid brush with the OliveDrab color.
	Orange	A solid brush with the Orange color.
	OrangeRed	A solid brush with the OrangeRed color.
	Orchid	A solid brush with the Orchid color.
	PaleGoldenrod	A solid brush with the PaleGoldenrod color.
	PaleGreen	A solid brush with the PaleGreen color.
	PaleTurquoise	A solid brush with the PaleTurquoise color.
	PaleVioletRed	A solid brush with the PaleVioletRed color.
	PapayaWhip	A solid brush with the PapayaWhip color.
	PeachPuff	A solid brush with the PeachPuff color.

	Peru	A solid brush with the Peru color.
	Pink	A solid brush with the Pink color.
	Plum	A solid brush with the Plum color.
	PowderBlue	A solid brush with the PowderBlue color.
	Purple	A solid brush with the Purple color.
	Red	A solid brush with the Red color.
	RosyBrown	A solid brush with the RosyBrown color.
	RoyalBlue	A solid brush with the RoyalBlue color.
	SaddleBrown	A solid brush with the SaddleBrown color.
	Salmon	A solid brush with the Salmon color.
	SandyBrown	A solid brush with the SandyBrown color.
	SeaGreen	A solid brush with the SeaGreen color.
	SeaShell	A solid brush with the SeaShell color.
	Sienna	A solid brush with the Sienna color.
	Silver	A solid brush with the Silver color.
	SkyBlue	A solid brush with the SkyBlue color.
	SlateBlue	A solid brush with the SlateBlue color.
	SlateGray	A solid brush with the SlateGray color.
	Snow	A solid brush with the Snow color.
	SpringGreen	A solid brush with the SpringGreen color.
	SteelBlue	A solid brush with the SteelBlue color.
	Tan	A solid brush with the Tan color.
	Teal	A solid brush with the Teal color.
	Thistle	A solid brush with the Thistle color.
	Tomato	A solid brush with the Tomato color.
	Transparent	A solid brush with the Transparent color.
	Turquoise	A solid brush with the Turquoise color.
	Violet	A solid brush with the Violet color.
	Wheat	A solid brush with the Wheat color.
	White	A solid brush with the White color.
	WhiteSmoke	A solid brush with the WhiteSmoke color.
	Yellow	A solid brush with the Yellow color.
	YellowGreen	A solid brush with the YellowGreen color.

Brushes.Plum Field

A solid brush with the Plum color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static readonly Brush Plum
```

Visual Basic Copy Code

```
Public Shared ReadOnly Plum As Brush
```

See Also

Brushes Members
Brushes Class
MindFusion.Drawing Namespace

Brushes.PowderBlue Field

A solid brush with the PowderBlue color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static readonly Brush PowderBlue
```

Visual Basic Copy Code

```
Public Shared ReadOnly PowderBlue As Brush
```

See Also

Brushes Members
Brushes Class
MindFusion.Drawing Namespace

Brushes.Purple Field

A solid brush with the Purple color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static readonly Brush Purple
```

Visual Basic Copy Code

```
Public Shared ReadOnly Purple As Brush
```

See Also

Brushes Members
Brushes Class
MindFusion.Drawing Namespace

Brushes.Red Field

A solid brush with the Red color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static readonly Brush Red
```

Visual Basic Copy Code

```
Public Shared ReadOnly Red As Brush
```

See Also

Brushes Members
Brushes Class
MindFusion.Drawing Namespace

Brushes.RosyBrown Field

A solid brush with the RosyBrown color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static readonly Brush RosyBrown
```

Visual Basic Copy Code

```
Public Shared ReadOnly RosyBrown As Brush
```

See Also

Brushes Members
Brushes Class
MindFusion.Drawing Namespace

Brushes.RoyalBlue Field

A solid brush with the RoyalBlue color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static readonly Brush RoyalBlue
```

Visual Basic Copy Code

```
Public Shared ReadOnly RoyalBlue As Brush
```

See Also

Brushes Members
Brushes Class
MindFusion.Drawing Namespace

Brushes.SaddleBrown Field

A solid brush with the SaddleBrown color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static readonly Brush SaddleBrown
```

Visual Basic Copy Code

```
Public Shared ReadOnly SaddleBrown As Brush
```

See Also

Brushes Members
Brushes Class
MindFusion.Drawing Namespace

Brushes.Salmon Field

A solid brush with the Salmon color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static readonly Brush Salmon
```

Visual Basic Copy Code

```
Public Shared ReadOnly Salmon As Brush
```

See Also

Brushes Members
Brushes Class
MindFusion.Drawing Namespace

Brushes.SandyBrown Field

A solid brush with the SandyBrown color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static readonly Brush SandyBrown
```

Visual Basic Copy Code

```
Public Shared ReadOnly SandyBrown As Brush
```

See Also

Brushes Members
Brushes Class
MindFusion.Drawing Namespace

Brushes.SeaGreen Field

A solid brush with the SeaGreen color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static readonly Brush SeaGreen
```

Visual Basic Copy Code

```
Public Shared ReadOnly SeaGreen As Brush
```

See Also

Brushes Members
Brushes Class
MindFusion.Drawing Namespace

Brushes.SeaShell Field

A solid brush with the SeaShell color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static readonly Brush SeaShell
```

Visual Basic Copy Code

```
Public Shared ReadOnly SeaShell As Brush
```

See Also

Brushes Members
Brushes Class

CombineMode Enumeration

Specifies how different clipping regions can be combined.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public enum CombineMode
```

Visual Basic Copy Code

```
Public Enum CombineMode
```

Members

	Member name	Description
	Replace	One clipping region is replaced by another.
	Intersect	Two clipping regions are combined by taking their intersection.
	Union	Two clipping regions are combined by taking the union of both.
	Xor	Two clipping regions are combined by taking only the areas enclosed by one or the other region, but not both.
	Exclude	Specifies that the existing region is replaced by the result of the new region being removed from the existing region. Said differently, the new region is excluded from the existing region.
	Complement	Specifies that the existing region is replaced by the result of the existing region being removed from the new region. Said differently, the existing region is excluded from the new region.

MindFusion.Drawing Namespace

ContentAlignment Enumeration

Specifies alignment of content on the drawing surface.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public enum ContentAlignment
```

Visual Basic Copy Code

```
Public Enum ContentAlignment
```

Members

	Member name	Description
	BottomCenter	Content is vertically aligned at the bottom, and horizontally aligned at the center.
	BottomLeft	Content is vertically aligned at the bottom, and horizontally aligned on the left.
	BottomRight	Content is vertically aligned at the bottom, and horizontally aligned on the right.
	MiddleCenter	Content is vertically aligned in the middle, and horizontally aligned at the center.

	MiddleLeft	Content is vertically aligned in the middle, and horizontally aligned on the left.
	MiddleRight	Content is vertically aligned in the middle, and horizontally aligned on the right.
	TopCenter	Content is vertically aligned at the top, and horizontally aligned at the center.
	TopLeft	Content is vertically aligned at the top, and horizontally aligned on the left.
	TopRight	Content is vertically aligned at the top, and horizontally aligned on the right.

CursorHint Enumeration

Specifies what mouse cursor to display while a user interacts with the diagram.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public enum CursorHint
```

Visual Basic Copy Code

```
Public Enum CursorHint
```

Members

	Member name	Description
	Move	Indicates the cursor specified by the MoveCursor property.
	Rotate	Indicates the cursor specified by the RotateCursor property.
	HorizontalResize	Indicates the cursor specified by the HorizontalResizeCursor property.
	VerticalResize	Indicates the cursor specified by the VerticalResizeCursor property.
	DiagonalResize	Indicates the cursor specified by the DiagonalResizeCursor property.
	CounterDiagonalResize	Indicates the cursor specified by the CounterDiagonalResizeCursor property.
	DrawLink	Indicates the cursor specified by the DrawLinkCursor property.
	Pointer	Indicates the cursor specified by the PointerCursor property.
	AllowLink	Indicates the cursor specified by the AllowLinkCursor property.
	DisallowLink	Indicates the cursor specified by the DisallowLinkCursor property.
	Disallow	Indicates the cursor specified by the DisallowCursor property.
	DontChange	Indicates the cursor specified by the Cursor property.
	EditText	Indicates the cursor specified by the EditTextCursor property.

See Also

DashStyle Enumeration

Specifies the style of dashed lines.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public enum DashStyle
```

Visual Basic Copy Code

```
Public Enum DashStyle
```

Members

	Member name	Description
	Solid	Specifies a solid line.
	Dash	Specifies a line consisting of dashes.
	Dot	Specifies a line consisting of dots.
	DashDot	Specifies a line consisting of a repeating pattern of dash-dot.
	DashDotDot	Specifies a line consisting of a repeating pattern of dash-dot-dot.
	Custom	Specifies a user-defined dash style.

MindFusion.Drawing Namespace

FillMode Enumeration

Specifies how the interior of a closed path is filled.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public enum FillMode
```

Visual Basic Copy Code

```
Public Enum FillMode
```

Members

	Member name	Description
	Alternate	Specifies the alternate fill mode.
	Winding	Specifies the winding fill mode.

GraphicsFactory.CreateImageGraphics Method ()

Creates an IGraphics object specifically to output to an image.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static IGraphics CreateImageGraphics ()
```

Visual Basic Copy Code

```
Public Shared Function CreateImageGraphics () As IGraphics
```

Return Value

An instance of the IGraphics interface.

GraphicsFactory.CreateImageGraphics Method (Rect)

Creates an IGraphics object specifically to output to an image.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static IGraphics CreateImageGraphics (
    Rect bounds
)
```

Visual Basic

```
Public Shared Function CreateImageGraphics( _
    bounds As Rect _
) As IGraphics
```

Parameters

bounds

Return Value

An instance of the IGraphics interface.

GraphicsFactory.CreateImageGraphics Method (Rect, SKBitmap@)

Creates an IGraphics object specifically to output to an image.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C#

```
public static IGraphics CreateImageGraphics (
    Rect bounds,
    out SKBitmap bitmap
)
```

Visual Basic

```
Public Shared Function CreateImageGraphics( _
    bounds As Rect, _
    <System.Runtime.InteropServices.Out()> ByRef bitmap As SKBitmap _
) As IGraphics
```

Parameters

bounds

bitmap

Return Value

An instance of the IGraphics interface.

GraphicsFactory.CreateMatrix Method (Single, Single, Single, Single, Single, Single)

Creates an IMatrix object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static IMatrix CreateMatrix (
    float m11,
    float m12,
    float m21,
    float m22,
    float m31,
    float m32
)
```

Visual Basic Copy Code

```
Public Shared Function CreateMatrix( _
    m11 As Single, _
    m12 As Single, _
    m21 As Single, _
    m22 As Single, _
    m31 As Single, _
```

```
    m32 As Single _
) As IMatrix
```

Parameters

m11

m12

m21

m22

m31

m32

Return Value

An instance of the IMatrix interface.

GraphicsFactory.CreatePath Method (FillMode)

Creates an IGraphicsPath object with the specified fill mode.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public static IGraphicsPath CreatePath (
    FillMode fillMode
)
```

Visual Basic Copy Code

```
Public Shared Function CreatePath( _
    fillMode As FillMode _
) As IGraphicsPath
```

Parameters

fillMode
A member of the FillMode enumeration.

Return Value

An instance of the IGraphicsPath interface.

GraphicsUnit Enumeration

Specifies unit of measure.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public enum GraphicsUnit
```

Visual Basic Copy Code

```
Public Enum GraphicsUnit
```

Members

	Member name	Description
	World	Match the measure unit of parent object.
	Display	Specifies the unit of measure of the display device.
	Pixel	Specifies a device pixel as the unit of measure.

	Point	A point (1/72 inch) as the unit of measure.
	Inch	Specifies the inch as the unit of measure.
	Document	Document unit (1/300 inch) as the unit of measure.
	Millimeter	Specifies the millimeter as the unit of measure.
	WpfPoint	WPF point (1/96 inch) as the unit of measure.
	Percent	Specifies percents as the unit of measure.
	Centimeter	Specifies the centimeter as the unit of measure.

HatchBrush Members

HatchBrush fills shapes using a hatch style, a foreground color, and a background color.

The following tables list the members exposed by the **HatchBrush** type.

Public Constructors

	Name	Description
	HatchBrush	Initializes a new instance of the **HatchBrush** class with the specified style, foreground color and background color.

Public Properties

	Name	Description
	BackgroundColor	Gets or sets the color of spaces between the hatch lines drawn by this brush.
	ForegroundColor	Gets or sets the color of hatch lines drawn by this brush.

	Style	Gets the hatch style of this brush.

Public Methods

	Name	Description
	Clone	Creates an exact copy of this brush.
	Equals	Brush.Equals override.
	GetHashCode	Brush.GetHashCode override.
	ToColor	Brush.ToColor override.

HatchBrush Constructor

Initializes a new instance of the HatchBrush class with the specified style, foreground color and background color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public HatchBrush (
    HatchStyle style,
    Color foregroundColor,
    Color backgroundColor
)
```

Visual Basic Copy Code

```
Public New ( _
    style As HatchStyle, _
    foregroundColor As Color, _
    backgroundColor As Color _
)
```

Parameters

style

foregroundColor

backgroundColor

HatchBrush.Equals Method

Brush.Equals override.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public override bool Equals (
    Brush other
)
```

Visual Basic Copy Code

```
Public Overrides Function Equals( _
    other As Brush _
) As Boolean
```

Parameters

other
The Brush to compare with the current Brush.

Return Value

true if the specified Brush is equal to the current Brush; otherwise, false.

HatchBrush Properties

HatchBrush.BackgroundColor Property

Gets or sets the color of spaces between the hatch lines drawn by this brush.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public Color BackgroundColor { get; set; }
```

Visual Basic Copy Code

```
Public Property BackgroundColor As Color
```

Property Value

A **Microsoft.Maui.Graphics.Color** that represents the background color of this brush.

```

Visual Basic Copy Code

```
Public Enum HatchStyle
```

Members

	Member name	Description
	Min	Specifies hatch style Horizontal.
	Horizontal	A pattern of horizontal lines.
	Vertical	A pattern of vertical lines.
	ForwardDiagonal	A pattern of lines on a diagonal from upper left to lower right.
	BackwardDiagonal	A pattern of lines on a diagonal from upper right to lower left.
	Cross	Specifies horizontal and vertical lines that cross.
	Max	Specifies hatch style SolidDiamond.
	LargeGrid	Specifies the hatch style Cross.
	DiagonalCross	A pattern of crisscross diagonal lines.
	Percent05	Specifies a 5-percent hatch. The ratio of foreground color to background color is 5:100.
	Percent10	Specifies a 10-percent hatch. The ratio of foreground color to background color is 10:100.
	Percent20	Specifies a 20-percent hatch. The ratio of foreground color to background color is 20:100.
	Percent25	Specifies a 25-percent hatch. The ratio of foreground color to background color is 25:100.
	Percent30	Specifies a 30-percent hatch. The ratio of foreground color to background color is 30:100.
	Percent40	Specifies a 40-percent hatch. The ratio of foreground color to background color is 40:100.
	Percent50	Specifies a 50-percent hatch. The ratio of foreground color to background color is 50:100.
	Percent60	Specifies a 60-percent hatch. The ratio of foreground color to background color is 60:100.
	Percent70	Specifies a 70-percent hatch. The ratio of foreground color to background color is 70:100.
	Percent75	Specifies a 75-percent hatch. The ratio of foreground color to background color is 75:100.
	Percent80	Specifies a 80-percent hatch. The ratio of foreground color to background color is 80:100.
	Percent90	Specifies a 90-percent hatch. The ratio of foreground color to background color is 90:100.
	LightDownwardDiagonal	Specifies diagonal lines that slant to the right from top points to bottom points and are spaced 50 percent closer together than ForwardDiagonal, but are not antialiased.

LightUpwardDiagonal	Specifies diagonal lines that slant to the left from top points to bottom points and are spaced 50 percent closer together than BackwardDiagonal.
DarkDownwardDiagonal	Specifies diagonal lines that slant to the right from top points to bottom points, are spaced 50 percent closer together than, and are twice the width of ForwardDiagonal.
DarkUpwardDiagonal	Specifies diagonal lines that slant to the left from top points to bottom points, are spaced 50 percent closer together than BackwardDiagonal, and are twice its width.
WideDownwardDiagonal	Specifies diagonal lines that slant to the right from top points to bottom points, have the same spacing as hatch style ForwardDiagonal, and are triple its width.
WideUpwardDiagonal	Specifies diagonal lines that slant to the left from top points to bottom points, have the same spacing as hatch style BackwardDiagonal, and are triple its width.
LightVertical	Specifies vertical lines that are spaced 50 percent closer together than Vertical.
LightHorizontal	Specifies horizontal lines that are spaced 50 percent closer together than Horizontal.
NarrowVertical	Specifies vertical lines that are spaced 75 percent closer together than hatch style Vertical.
NarrowHorizontal	Specifies horizontal lines that are spaced 75 percent closer together than hatch style Horizontal.
DarkVertical	Specifies vertical lines that are spaced 50 percent closer together than Vertical and are twice its width.
DarkHorizontal	Specifies horizontal lines that are spaced 50 percent closer together than Horizontal and are twice the width of Horizontal.
DashedDownwardDiagonal	Specifies dashed diagonal lines, that slant to the right from top points to bottom points.
DashedUpwardDiagonal	Specifies dashed diagonal lines, that slant to the left from top points to bottom points.
DashedHorizontal	Specifies dashed horizontal lines.
DashedVertical	Specifies dashed vertical lines.
SmallConfetti	Specifies a hatch that has the appearance of confetti.
LargeConfetti	Specifies a hatch that has the appearance of confetti, and is composed of larger pieces than SmallConfetti.
ZigZag	Specifies horizontal lines that are composed of zigzags.
Wave	Specifies horizontal lines that are composed of tildes.
DiagonalBrick	Specifies a hatch that has the appearance of layered bricks that slant to the left from top points to bottom points.
HorizontalBrick	Specifies a hatch that has the appearance of horizontally layered bricks.
Weave	Specifies a hatch that has the appearance of a woven material.
Plaid	Specifies a hatch that has the appearance of a plaid material.
Divot	Specifies a hatch that has the appearance of divots.
DottedGrid	Specifies horizontal and vertical lines, each of which is composed of dots, that cross.
DottedDiamond	Specifies forward diagonal and backward diagonal lines, each of which is composed of dots, that cross.

	Shingle	Specifies a hatch that has the appearance of diagonally layered shingles that slant to the right from top points to bottom points.
	Trellis	Specifies a hatch that has the appearance of a trellis.
	Sphere	Specifies a hatch that has the appearance of spheres laid adjacent to one another.
	SmallGrid	Specifies horizontal and vertical lines that cross and are spaced 50 percent closer together than hatch style Cross.
	SmallCheckerBoard	Specifies a hatch that has the appearance of a checkerboard.
	LargeCheckerBoard	Specifies a hatch that has the appearance of a checkerboard with squares that are twice the size of SmallCheckerBoard.
	OutlinedDiamond	Specifies forward diagonal and backward diagonal lines that cross.
	SolidDiamond	Specifies a hatch that has the appearance of a checkerboard placed diagonally.

MindFusion.Drawing Namespace

HorizontalAlignment Enumeration

Specifies the horizontal alignment of an element.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public enum HorizontalAlignment
```

Visual Basic Copy Code

```
Public Enum HorizontalAlignment
```

Members

	Member name	Description
	Left	Indicates that an element is left-aligned to its container.
	Center	Indicates that an element is centered in its container.
	Right	Indicates that an element is right-aligned in its container.

IGraphics Members

This interface exposes methods for drawing graphics primitives used to render MindFusion.Diagramming objects.

The following tables list the members exposed by the IGraphics type.

Public Properties

	Name	Description
	Clip	Gets or sets an IGraphicsPath object that limits the drawing region of this **IGraphics** object.
	DpiX	Gets the horizontal resolution of this **IGraphics** object.
	DpiY	Gets the vertical resolution of this **IGraphics** object.
	EnableAntialiasing	Gets or sets whether to anti-alias the graphics primitives.
	SupportsPenWidth0	Gets a value indicating whether the IGraphics object supports pens with zero width.
	Transform	Gets or sets the world transformation for this **IGraphics** object.
	UnitScale	Gets the scale for current unit.

Public Methods

	Name	Description
	BeginHyperLink	
	ClipImage	Overloaded.
	CreateImage	Creates an image from the current drawing associated with this IGraphics object.
	DrawArc	Overloaded. Draws an arc representing a portion of an ellipse specified by a pair of coordinates, a width, and a height.
	DrawBezier	Draws a Bézier spline defined by four **Point** structures.
	DrawBeziers	Draws a series of Bézier splines from an array of Point structures.
	DrawCurve	Draws a cardinal spline through a specified array of **Point** structures.
	DrawEllipse	Overloaded. Draws an ellipse defined by a bounding rectangle specified by a pair of coordinates, a height, and a width.
	DrawImage	Overloaded. Draws the specified **IImage** object at the specified location and with the original size.
	DrawLine	Overloaded. Draws a line segment connecting two points.

	DrawLines	Draws a series of line segments that connect an array of Point structures.
	DrawPath	Draws an **IGraphicsPath** object.
	DrawPoint	Draws a point at the specified coordinates.
	DrawPolygon	Draws a polygon specified by a poins list.
	DrawRectangle	Overloaded. Draws a rectangle specified by a coordinate pair, a width, and a height.
	DrawString	Overloaded. Draws the specified text string at the specified location with the specified **Brush** and **Font** objects.
	EndHyperLink	
	FillEllipse	Overloaded. Fills the interior of an ellipse defined by a bounding rectangle specified by a pair of coordinates, a width, and a height.
	FillPath	Fills the interior of a **GraphicsPath** object.
	FillPolygon	Fills the interior of a polygon specified by a points list.
	FillRectangle	Overloaded. Fills the interior of a rectangle specified by a pair of coordinates, a width, and a height.
	GetFontHeight	Gets the height of the specified font.
	GetImageSize	Returns the physical size of the specified image.
	MeasureString	Overloaded. Measures the specified string when drawn with the specified **Font** object.
	MultiplyTransform	Multiplies the world transformation of this **IGraphics** object and specified the **Matrix** object in the specified order.
	PopOpacity	Restores global opacity.
	PushOpacity	Sets global opacity.
	ResetTransform	Resets the world transformation matrix of this **IGraphics** object to the identity matrix.
	Restore	Restores the state of this **IGraphics** object to the specified state argument.
	RotateTransform	Applies the specified rotation to the transformation matrix of this **IGraphics** object.
	Save	Saves the current state of this **IGraphics** object.
	ScaleTransform	Applies the specified scaling operation to the transformation matrix of this **IGraphics** object by prepending it to the object's transformation matrix.
	SetClip	Overloaded. Sets the clipping region of this **IGraphics** object to the **Clip** property of the specified **IGraphics** object.
	SetTransform	Sets the current transformation.
	TranslateTransform	Prepends the specified translation to the transformation matrix of this **IGraphics** object.

IGraphics Methods

IGraphics.BeginHyperLink Method

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void BeginHyperLink (
    string hyperlink,
    string target
)
```

Visual Basic Copy Code

```
Sub BeginHyperLink( _
    hyperlink As String, _
    target As String _
)
```

Parameters

hyperlink

target

IGraphics.ClipImage Method (IImage, IGraphicsPath)

Applies a clipping path to an image.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
IImage ClipImage (
    IImage sourceImage,
    IGraphicsPath clip
)
```

Visual Basic

```
Function ClipImage( _
    sourceImage As IImage, _
    clip As IGraphicsPath _
) As IImage
```

Parameters

sourceImage
The image to clip.

clip
The path used for the clip.

Return Value

The clipped image.

See Also

ClipImage Method Overload List
IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.ClipImage Method (IImage, Point[])

Applies a clipping path to an image.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C#

```
IImage ClipImage (
    IImage sourceImage,
    Point[] clipPoly
)
```

Visual Basic

```
Function ClipImage( _
    sourceImage As IImage, _
    clipPoly() As Point _
) As IImage
```

Parameters

sourceImage
The image to clip.

clipPoly
A polygon defined by a point collection used for the clip.

Return Value

The clipped image.

See Also

ClipImage Method Overload List
IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.CreateImage Method

Creates an image from the current drawing associated with this IGraphics object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
IImage CreateImage (
    IGraphicsPath clip = null
)
```

Visual Basic Copy Code

```
Function CreateImage( _
    Optional clip As IGraphicsPath = Nothing _
) As IImage
```

Parameters

clip
Optional.
An optional clip path.

Return Value

IGraphics.DrawArc Method

Draws an arc representing a portion of an ellipse specified by a pair of coordinates, a width, and a height.

Overload List

Name	Description
IGraphics.DrawArc (Pen, Double, Double, Double, Double, Double, Double)	Draws an arc representing a portion of an ellipse specified by a pair of coordinates, a width, and a height.
IGraphics.DrawArc (Pen, Rect, Double, Double)	Draws an arc representing a portion of an ellipse specified by a **Rect** structure.

See Also

IGraphics Members

MindFusion.Drawing Namespace

IGraphics.DrawArc Method (Pen, Double, Double, Double, Double, Double, Double)

Draws an arc representing a portion of an ellipse specified by a pair of coordinates, a width, and a height.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawArc (
    Pen pen,
    double x,
    double y,
    double width,
    double height,
    double startAngle,
    double sweepAngle
)
```

Visual Basic Copy Code

```
Sub DrawArc( _
    pen As Pen, _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double, _
    startAngle As Double, _
    sweepAngle As Double _
)
```

Parameters

pen
A Pen object that determines the color, width, and style of the arc.

x
The x-coordinate of the upper-left corner of the rectangle that defines the ellipse.

y
The y-coordinate of the upper-left corner of the rectangle that defines the ellipse.

width
The width of the rectangle that defines the ellipse.

height
The height of the rectangle that defines the ellipse.

startAngle
Angle in degrees measured clockwise from the x-axis to the starting point of the arc.

sweepAngle
Angle in degrees measured clockwise from the *startAngle* parameter to ending point of the arc.

See Also

DrawArc Method Overload List
IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.DrawArc Method (Pen, Rect, Double, Double)

Draws an arc representing a portion of an ellipse specified by a **Rect** structure.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawArc (
    Pen pen,
    Rect rect,
    double startAngle,
    double sweepAngle
)
```

Visual Basic Copy Code

```
Sub DrawArc( _
    pen As Pen, _
    rect As Rect, _
    startAngle As Double, _
    sweepAngle As Double _
)
```

Parameters

pen

A Pen object that determines the color, width, and style of the arc.

rect

A **Microsoft.Maui.Graphics.Rect** that defines the boundaries of the ellipse.

startAngle

Angle in degrees measured clockwise from the x-axis to the starting point of the arc.

sweepAngle

Angle in degrees measured clockwise from the *startAngle* parameter to ending point of the arc.

See Also

IGraphics.DrawBezier Method

Draws a Bézier spline defined by four **Point** structures.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawBezier (
    Pen pen,
    Point pt1,
    Point pt2,
    Point pt3,
    Point pt4
)
```

Visual Basic Copy Code

```
Sub DrawBezier( _
    pen As Pen, _
    pt1 As Point, _
    pt2 As Point, _
    pt3 As Point, _
    pt4 As Point _
)
```

Parameters

pen

A Pen object that determines the color, width, and style of the curve.

pt1

A **Microsoft.Maui.Graphics.Point** that represents the starting point of the curve.

pt2

A **Microsoft.Maui.Graphics.Point** that represents the first control point for the curve.

pt3

A **Microsoft.Maui.Graphics.Point** that represents the second control point for the curve.

pt4

A **Microsoft.Maui.Graphics.Point** that represents the ending point of the curve.

IGraphics.DrawBeziers Method

Draws a series of Bézier splines from an array of Point structures.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawBeziers (
    Pen pen,
    IList<Point> points
)
```

Visual Basic Copy Code

```
Sub DrawBeziers( _
    pen As Pen, _
    points As IList(Of Point) _
)
```

Parameters

pen
A Pen object that determines the color, width, and style of the curve.

points
An array of Point structures that represent the points that determine the curve.

See Also

MindFusion.Drawing Namespace

IGraphics.DrawCurve Method

Draws a cardinal spline through a specified array of **Point** structures.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawCurve (
    Pen pen,
    Point[] points
)
```

Visual Basic Copy Code

```
Sub DrawCurve( _
    pen As Pen, _
    points() As Point _
)
```

Parameters

pen
A Pen object that determines the color, width, and height of the curve.

points
A **Microsoft.Maui.Graphics.Point** array that defines the spline.

IGraphics.DrawEllipse Method (Pen, Double, Double, Double, Double)

Draws an ellipse defined by a bounding rectangle specified by a pair of coordinates, a height, and a width.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawEllipse (
    Pen pen,
    double x,
    double y,
    double width,
    double height
)
```

Visual Basic Copy Code

```
Sub DrawEllipse( _
    pen As Pen, _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double _
)
```

Parameters

pen
A Pen object that determines the color, width, and style of the ellipse.

x
The x-coordinate of the upper-left corner of the bounding rectangle that defines the ellipse.

y
The y-coordinate of the upper-left corner of the bounding rectangle that defines the ellipse.

width
The width of the bounding rectangle that defines the ellipse.

height
The height of the bounding rectangle that defines the ellipse.

IGraphics.DrawEllipse Method (Pen, Rect)

Draws an ellipse defined by a bounding rectangle.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawEllipse (
    Pen pen,
    Rect rect
)
```

Visual Basic Copy Code

```
Sub DrawEllipse( _
    pen As Pen, _
    rect As Rect _
)
```

Parameters

pen
A Pen object that determines the color, width, and style of the ellipse.

rect
A **Microsoft.Maui.Graphics.Rect** that defines the boundaries of the ellipse.

IGraphics.DrawImage Method (IImage, Double, Double)

Draws the specified image, using its original physical size, at the specified location.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawImage (
    IImage image,
    double x,
    double y
)
```

Visual Basic Copy Code

```
Sub DrawImage( _
    image As IImage, _
    x As Double, _
    y As Double _
)
```

Parameters

image
A **Microsoft.Maui.Graphics.IImage** to draw.

x
The x-coordinate of the upper-left corner of the drawn image.

y
The y-coordinate of the upper-left corner of the drawn image.

IGraphics.DrawImage Method (IImage, Rect, ImageAlign, Double, Point)

Draws the image represented by the specified IImage object at the specified location, with the specified alignment and rotation.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C#

```
void DrawImage (
    IImage image,
    Rect rect,
    ImageAlign imageAlign,
    double rotationAngle,
    Point pivot
)
```

Visual Basic

```
Sub DrawImage( _
    image As IImage, _
    rect As Rect, _
    imageAlign As ImageAlign, _
    rotationAngle As Double, _
    pivot As Point _
)
```

Parameters

image

A **Microsoft.Maui.Graphics.IImage** representing the image to draw.

rect

A **Microsoft.Maui.Graphics.Rect** that specifies the location and size of the drawn image.

imageAlign

The alignment of the image within the specified rectangle.

rotationAngle

The rotation angle of the drawn image.

pivot

The pivot of the rotation.

IGraphics.DrawLine Method (Pen, Double, Double, Double, Double)

Draws a line segment connecting the two points specified by coordinate pairs.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawLine (
    Pen pen,
    double x1,
    double y1,
    double x2,
    double y2
)
```

Visual Basic Copy Code

```
Sub DrawLine( _
    pen As Pen, _
    x1 As Double, _
    y1 As Double, _
    x2 As Double, _
    y2 As Double _
)
```

Parameters

pen
A Pen object that determines the color, width, and style of the line.

x1
The x-coordinate of the first point.

y1
The y-coordinate of the first point.

x2
The x-coordinate of the second point.

y2
The y-coordinate of the second point.

Syntax

C# Copy Code

```
void DrawLine (
    Pen pen,
    Point p1,
    Point p2
)
```

Visual Basic Copy Code

```
Sub DrawLine( _
    pen As Pen, _
    p1 As Point, _
    p2 As Point _
)
```

Parameters

pen
A Pen object that determines the color, width, and style of the line.

p1
A **Microsoft.Maui.Graphics.Point** that represents the first point to connect.

p2
A **Microsoft.Maui.Graphics.Point** that represents the second point to connect.

IGraphics.DrawLines Method

Draws a series of line segments that connect an array of Point structures.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawLines (
    Pen pen,
    IList<Point> points
)
```

Visual Basic Copy Code

```
Sub DrawLines( _
    pen As Pen, _
```

```
    points As IList(Of Point) _
)
```

Parameters

pen
A Pen object that determines the color, width, and style of the line segments.

points
An array of Point structures that represent the points to connect.

IGraphics.DrawPath Method

Draws an IGraphicsPath object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawPath (
    Pen pen,
    IGraphicsPath path
)
```

Visual Basic Copy Code

```
Sub DrawPath( _
    pen As Pen, _
    path As IGraphicsPath _
)
```

Parameters

pen
A Pen object that determines the color, width, and style of the path.

path
An IGraphicsPath object to draw.

IGraphics.DrawPoint Method

Draws a point at the specified coordinates.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawPoint (
    SolidBrush brush,
    double x,
```

```
    double y,
    double size
)
```

Visual Basic Copy Code

```
Sub DrawPoint( _
    brush As SolidBrush, _
    x As Double, _
    y As Double, _
    size As Double _
)
```

Parameters

brush
A SolidBrush object that determines the color of the point.

x
The x-coordinate of the point.

y
The y-coordinate of the point.

size
The points' size.

IGraphics.DrawPolygon Method

Draws a polygon specified by a poins list.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawPolygon (
    Pen pen,
    IList<Point> points
)
```

Visual Basic Copy Code

```
Sub DrawPolygon( _
    pen As Pen, _
    points As IList(Of Point) _
)
```

Parameters

pen
A Pen object that determines the color, width, and style of the polygon.

points
A list of points that represents the polygon to draw.

IGraphics.DrawRectangle Method (Pen, Double, Double, Double, Double)

Draws a rectangle specified by a coordinate pair, a width, and a height.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawRectangle (
    Pen pen,
    double x,
    double y,
    double width,
    double height
)
```

Visual Basic Copy Code

```
Sub DrawRectangle( _
    pen As Pen, _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double _
)
```

Parameters

pen
A Pen object that determines the color, width, and style of the rectangle.

x
The x-coordinate of the upper-left corner of the rectangle to draw.

y
The y-coordinate of the upper-left corner of the rectangle to draw.

width
The width of the rectangle to draw.

height
The height of the rectangle to draw.

IGraphics.DrawString Method

Draws the specified text string at the specified location with the specified **Brush** and **Font** objects.

Overload List

Name	Description
IGraphics.DrawString (String, Font, Brush, Double, Double)	Draws the specified text string at the specified location with the specified **Brush** and **Font** objects.
IGraphics.DrawString (String, Font, Brush, Point, StringFormat)	Draws the specified text string at the specified location with the specified **Brush** and **Font** objects using the formatting attributes of the specified **StringFormat** object.
IGraphics.DrawString (String, Font, Brush, Rect)	Draws the specified text string in the specified rectangle with the specified **Brush** and **Font** objects.
IGraphics.DrawString (String, Font, Brush, Rect, StringFormat)	Draws the specified text string in the specified rectangle with the specified **Brush** and **Font** objects using the formatting attributes of the specified **StringFormat** object.

See Also

IGraphics.DrawString Method (String, Font, Brush, Double, Double)

Draws the specified text string at the specified location with the specified **Brush** and **Font** objects.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawString (
    string text,
    Font font,
    Brush brush,
    double x,
    double y
)
```

Visual Basic Copy Code

```
Sub DrawString( _
    text As String, _
    font As Font, _
    brush As Brush, _
    x As Double, _
    y As Double _
)
```

Parameters

text
The string to draw.

font
A Font object that defines the text format of the string.

brush
A Brush object that determines the color and texture of the drawn text.

x
The x-coordinate of the upper-left corner of the drawn text.

y
The y-coordinate of the upper-left corner of the drawn text.

IGraphics.DrawString Method (String, Font, Brush, Point, StringFormat)

Draws the specified text string at the specified location with the specified **Brush** and **Font** objects using the formatting attributes of the specified **StringFormat** object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void DrawString (
    string text,
    Font font,
    Brush brush,
    Point location,
    StringFormat format
)
```

Visual Basic Copy Code

```
Sub DrawString( _
    text As String, _
    font As Font, _
    brush As Brush, _
    location As Point, _
    format As StringFormat _
)
```

Parameters

text
The string to draw.

font
A Font object that defines the text format of the string.

brush
A Brush object that determines the color and texture of the drawn text.

location
A Point structure that specifies the upper-left corner of the drawn text.

format
A StringFormat object that specifies formatting attributes, such as line spacing and alignment, that are applied to the drawn text.

IGraphics.FillEllipse Method (Brush, Double, Double, Double, Double)

Fills the interior of an ellipse defined by a bounding rectangle specified by a pair of coordinates, a width, and a height.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void FillEllipse (
    Brush brush,
    double x,
    double y,
    double width,
```

```
    double height
)
```

Visual Basic Copy Code

```
Sub FillEllipse( _
    brush As Brush, _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double _
)
```

Parameters

brush

A Brush object that determines the characteristics of the fill.

x

The x-coordinate of the upper-left corner of the bounding rectangle that defines the ellipse.

y

The y-coordinate of the upper-left corner of the bounding rectangle that defines the ellipse.

width

The width of the bounding rectangle that defines the ellipse.

height

The height of the bounding rectangle that defines the ellipse.

IGraphics.FillRectangle Method (Brush, Double, Double, Double, Double)

Fills the interior of a rectangle specified by a pair of coordinates, a width, and a height.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void FillRectangle (
    Brush brush,
    double x,
    double y,
    double width,
    double height
)
```

Visual Basic Copy Code

```
Sub FillRectangle( _
    brush As Brush, _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double _
)
```

Parameters

brush

A Brush object that determines the characteristics of the fill.

x

The x-coordinate of the upper-left corner of the rectangle to fill.

y

The y-coordinate of the upper-left corner of the rectangle to fill.

width
The width of the rectangle to fill.

height
The height of the rectangle to fill.

IGraphics.MeasureString Method (String, Font)

Measures the specified string when drawn with the specified Font object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
Size MeasureString (
    string text,
    Font font
)
```

Visual Basic Copy Code

```
Function MeasureString( _
    text As String, _
    font As Font _
) As Size
```

Parameters

text
The string to measure.

font
A Font object that defines the text format of the string.

Return Value

This method returns a **Microsoft.Maui.Graphics.Size** that represents the size, in pixels, of the string specified by the *text* parameter as drawn with the *font* parameter.

See Also

IGraphics.MeasureString Method (String, Font, Double, StringFormat)

Measures the specified string when drawn with the specified Font object and formatted with the specified StringFormat object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
Size MeasureString (
    string text,
    Font font,
    double maxWidth,
```

```
    StringFormat format
)
```

Visual Basic Copy Code

```
Function MeasureString( _
    text As String, _
    font As Font, _
    maxWidth As Double, _
    format As StringFormat _
) As Size
```

Parameters

text

The string to measure.

font

A Font object that defines the text format of the string.

maxWidth

The maximum width of the string.

format

A StringFormat object that represents formatting information, such as line spacing, for the string.

Return Value

This method returns a **Microsoft.Maui.Graphics.Size** that represents the size, in pixels, of the string specified in the *text* parameter as drawn with the *font* parameter and the *stringFormat* parameter.

IGraphics.MeasureString Method (String, Font, Size, StringFormat, Int32@, Int32@)

Measures the specified string when drawn with the specified Font object and formatted with the specified StringFormat object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
Size MeasureString (
    string text,
    Font font,
    Size layoutArea,
    StringFormat stringFormat,
    out int charactersFitted,
    out int linesFilled
)
```

Visual Basic Copy Code

```
Function MeasureString( _
    text As String, _
    font As Font, _
    layoutArea As Size, _
    stringFormat As StringFormat, _
    <System.Runtime.InteropServices.Out()> ByRef charactersFitted As Integer, _
    <System.Runtime.InteropServices.Out()> ByRef linesFilled As Integer _
) As Size
```

Parameters

text

The string to measure.

font

A Font object that defines the text format of the string.

layoutArea

A **Microsoft.Maui.Graphics.Size** that specifies the maximum layout area for the text.

stringFormat

A StringFormat object that represents formatting information, such as line spacing, for the string.

charactersFitted

Number of characters in the string.

linesFilled

Number of text lines in the string.

Return Value

This method returns a **Microsoft.Maui.Graphics.Size** that represents the size of the string, in pixels, of the *text* parameter as drawn with the *font* parameter and the *stringFormat* parameter.

MeasureString Method Overload List
IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.MultiplyTransform Method

Multiplies the world transformation of this IGraphics object and specified the **Matrix** object in the specified order.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void MultiplyTransform (
    IMatrix m,
    MatrixOrder order = MatrixOrder.Append
)
```

Visual Basic Copy Code

```
Sub MultiplyTransform( _
    m As IMatrix, _
    Optional order As MatrixOrder = MatrixOrder.Append _
)
```

Parameters

m

The multipler matrix.

order

Optional. Member of the MatrixOrder enumeration that determines the order of the multiplication.

MindFusion.Drawing Namespace

IGraphics.PopOpacity Method

Restores global opacity.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void PopOpacity ()
```

Visual Basic Copy Code

```
Sub PopOpacity ()
```

See Also

IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.PushOpacity Method

Sets global opacity.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void PushOpacity (
    double opacity
)
```

Visual Basic Copy Code

```
Sub PushOpacity( _
    opacity As Double _
)
```

Parameters

opacity

See Also

IGraphics Members

MindFusion.Drawing Namespace

IGraphics.ResetTransform Method

Resets the world transformation matrix of this IGraphics object to the identity matrix.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void ResetTransform ()
```

Visual Basic Copy Code

```
Sub ResetTransform ()
```

See Also

IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.Restore Method

Restores the state of this IGraphics object to the specified state argument.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void Restore (
    Object state
)
```

Visual Basic Copy Code

```
Sub Restore( _
    state As Object _
)
```

Parameters

state
An object that represents the state to which to restore this IGraphics object.

See Also

IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.RotateTransform Method

Applies the specified rotation to the transformation matrix of this IGraphics object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void RotateTransform (
    double angle
)
```

Visual Basic Copy Code

```
Sub RotateTransform( _
    angle As Double _
)
```

Parameters

angle
The angle of rotation in degrees.

See Also

RotateTransform Method Overload List
IGraphics Members

IGraphics.Save Method

Saves the current state of this IGraphics object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
Object Save ()
```

Visual Basic Copy Code

```
Function Save () As Object
```

Return Value

An object that represents the saved state of this IGraphics object.

See Also

IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.ScaleTransform Method

Applies the specified scaling operation to the transformation matrix of this IGraphics object by prepending it to the object's transformation matrix.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void ScaleTransform (
    double sx,
    double sy
)
```

Visual Basic Copy Code

```
Sub ScaleTransform( _
    sx As Double, _
    sy As Double _
)
```

Parameters

sx
The scale factor in the x direction.

sy
The scale factor in the y direction.

See Also

ScaleTransform Method Overload List
IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.SetClip Method

Sets the clipping region of this IGraphics object to the Clip property of the specified **IGraphics** object.

Overload List

Name	Description
IGraphics.SetClip (IGraphicsPath)	Sets the clipping region of this **IGraphics** object to the specified IGraphicsPath object.
IGraphics.SetClip (IGraphicsPath, CombineMode)	Sets the clipping region of this **IGraphics** object to the result of the specified operation combining the current clip region and the specified **GraphicsPath** object.
IGraphics.SetClip (Rect)	Sets the clipping region of this **IGraphics** object to the rectangle specified by a **Rect** structure.
IGraphics.SetClip (Rect, CombineMode)	Sets the clipping region of this **IGraphics** object to the result of the specified operation combining the current clip region and the rectangle specified by a **Rect** structure.

See Also

IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.SetClip Method (IGraphicsPath)

Sets the clipping region of this IGraphics object to the specified IGraphicsPath object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void SetClip (
    IGraphicsPath path
)
```

Visual Basic Copy Code

```
Sub SetClip( _
    path As IGraphicsPath _
)
```

Parameters

path
An IGraphicsPath object that represents the new clip region.

See Also

SetClip Method Overload List
IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.SetClip Method (IGraphicsPath, CombineMode)

Sets the clipping region of this IGraphics object to the result of the specified operation combining the current clip region and the specified **GraphicsPath** object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void SetClip (
    IGraphicsPath path,
    CombineMode mode
)
```

Visual Basic Copy Code

```
Sub SetClip( _
    path As IGraphicsPath, _
    mode As CombineMode _
)
```

Parameters

path

A **GraphicsPath** object to combine.

mode

Member of the CombineMode enumeration that specifies the combining operation to use.

See Also

SetClip Method Overload List
IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.SetClip Method (Rect)

Sets the clipping region of this IGraphics object to the rectangle specified by a **Rect** structure.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void SetClip (
    Rect rect
)
```

Visual Basic Copy Code

```
Sub SetClip( _
    rect As Rect _
)
```

Parameters

rect

A **Microsoft.Maui.Graphics.Rect** that represents the new clip region.

See Also

SetClip Method Overload List
IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.SetClip Method (Rect, CombineMode)

Sets the clipping region of this IGraphics object to the result of the specified operation combining the current clip region and the rectangle specified by a **Rect** structure.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void SetClip (
    Rect rect,
    CombineMode mode
)
```

Visual Basic Copy Code

```
Sub SetClip( _
    rect As Rect, _
    mode As CombineMode _
)
```

Parameters

rect

A **Microsoft.Maui.Graphics.Rect** to combine.

mode

Member of the CombineMode enumeration that specifies the combining operation to use.

See Also

IGraphics.SetTransform Method

Sets the current transformation.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void SetTransform (
    IMatrix m
)
```

Visual Basic Copy Code

```
Sub SetTransform( _
    m As IMatrix _
)
```

Parameters

m

See Also

IGraphics Members
IGraphics Interface

IGraphics.TranslateTransform Method

Prepends the specified translation to the transformation matrix of this IGraphics object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void TranslateTransform (
    double dx,
    double dy
)
```

Visual Basic Copy Code

```
Sub TranslateTransform( _
    dx As Double, _
    dy As Double _
)
```

Parameters

dx
The x component of the translation.

dy
The y component of the translation.

IGraphics Properties

IGraphics.Clip Property

Gets or sets an IGraphicsPath object that limits the drawing region of this IGraphics object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
IGraphicsPath Clip { get; }
```

Visual Basic Copy Code

```
ReadOnly Property Clip As IGraphicsPath
```

Property Value

This property specifies an IGraphicsPath object that limits the portion of this IGraphics object that is currently available for drawing.

See Also

IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.DpiX Property

Gets the horizontal resolution of this IGraphics object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
double DpiX { get; set; }
```

Visual Basic Copy Code

```
Property DpiX As Double
```

Property Value

This property indicates a value, in dots per inch, for the horizontal resolution supported by this IGraphics object.

See Also

IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.DpiY Property

Gets the vertical resolution of this IGraphics object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
double DpiY { get; set; }
```

Visual Basic Copy Code

```
Property DpiY As Double
```

Property Value

This property indicates a value, in dots per inch, for the vertical resolution supported by this IGraphics object.

IGraphics.EnableAntialiasing Property

Gets or sets whether to anti-alias the graphics primitives.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
bool EnableAntialiasing { get; set; }
```

Visual Basic Copy Code

```
Property EnableAntialiasing As Boolean
```

Property Value

See Also

IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.SupportsPenWidth0 Property

Gets a value indicating whether the IGraphics object supports pens with zero width.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
bool SupportsPenWidth0 { get; }
```

Visual Basic Copy Code

```
ReadOnly Property SupportsPenWidth0 As Boolean
```

Property Value

See Also

IGraphics Members
IGraphics Interface
MindFusion.Drawing Namespace

IGraphics.Transform Property

Gets or sets the world transformation for this IGraphics object.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
IMatrix Transform { get; }
```

Visual Basic Copy Code

```
ReadOnly Property Transform As IMatrix
```

Property Value

This property specifies a Matrix object that represents the world transformation for this IGraphics object.

IGraphicsPath Interface

Represents a series of connected lines and curves.

Syntax

C# Copy Code

```
public interface IGraphicsPath
```

Visual Basic Copy Code

```
Public Interface IGraphicsPath
```

See Also

IGraphicsPath Members
MindFusion.Drawing Namespace

IGraphicsPath Members

Represents a series of connected lines and curves.

The following tables list the members exposed by the IGraphicsPath type.

Public Properties

	Name	Description
	FillMode	Gets or sets the path fill mode.
	PathPoints	Gets the points in the path.
	PointCount	Gets the number of points in the path.

Public Methods

	Name	Description

	AddArc	Overloaded.
	AddBezier	Overloaded.
	AddBeziers	Adds a sequence of connected cubic Bézier curves to the current figure.
	AddEllipse	Overloaded.
	AddLine	Overloaded.
	AddLines	Appends a series of connected line segments to the end of this IGraphicsPath.
	AddPath	Appends specified path to this path.
	AddPolygon	Adds a polygon to the current figure.
	AddRectangle	Overloaded.
	AddRoundRect	Adds a rounded rectangle to this path.
	AddString	Adds a string to this path.
	Clone	Clones this GraphicsPath.
	CloseFigure	Closes the current figure and starts a new figure. If the current figure contains a sequence of connected lines and curves, the method closes the loop by connecting a line from the endpoint to the starting point.
	Dispose	Disposes the path.
	Flatten	Overloaded.
	GetBounds	Returns a rectangle that bounds this IGraphicsPath.
	GetLastPoint	Gets the current last point in the path, if any, otherwise, null.
	IntersectsWith	Checks whether this IGraphicsPath intersects with the specified IGraphicsPath.
	IsVisible	Indicates whether the specified point is contained within this IGraphicsPath.
	StartFigure	Starts a new figure without closing the current figure. All subsequent points added to the path are added to this new figure.
	Transform	Applies a transform matrix to this IGraphicsPath.
	Widen	Widens the path.

IGraphicsPath Methods

IGraphicsPath.AddArc Method

Overload List

Name	Description
IGraphicsPath.AddArc (Double, Double, Double, Double, Double, Double)	Appends an elliptical arc to the current figure.

IGraphicsPath.AddArc (Rect, Double, Double)	Appends an elliptical arc to the current figure.

See Also

IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.AddArc Method (Double, Double, Double, Double, Double, Double)

Appends an elliptical arc to the current figure.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void AddArc (
    double x,
    double y,
    double width,
    double height,
    double startAngle,
    double sweepAngle
)
```

Visual Basic Copy Code

```
Sub AddArc( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double, _
    startAngle As Double, _
    sweepAngle As Double _
)
```

Parameters

x
The x-coordinate of the upper-left corner of the rectangular region that defines the ellipse from which the arc is drawn.

y
The y-coordinate of the upper-left corner of the rectangular region that defines the ellipse from which the arc is drawn.

width
The width of the rectangular region that defines the ellipse from which the arc is drawn.

height
The height of the rectangular region that defines the ellipse from which the arc is drawn.

startAngle
The starting angle of the arc, measured in degrees clockwise from the x-axis.

sweepAngle
The angle between startAngle and the end of the arc.

See Also

AddArc Method Overload List
IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.AddArc Method (Rect, Double, Double)

Appends an elliptical arc to the current figure.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void AddArc (
    Rect rect,
    double startAngle,
    double sweepAngle
)
```

Visual Basic Copy Code

```
Sub AddArc( _
    rect As Rect, _
    startAngle As Double, _
    sweepAngle As Double _
)
```

Parameters

rect
A Rectangle that represents the rectangular bounds of the ellipse from which the arc is taken.

startAngle
The starting angle of the arc, measured in degrees clockwise from the x-axis.

sweepAngle
The angle between startAngle and the end of the arc.

IGraphicsPath.AddBezier Method

Overload List

Name	Description
IGraphicsPath.AddBezier (Double, Double, Double, Double, Double, Double, Double, Double)	Adds a cubic Bézier curve to the current figure.
IGraphicsPath.AddBezier (Point, Point, Point, Point)	Adds a cubic Bézier curve to the current figure.

See Also

IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.AddBezier Method (Double, Double, Double, Double, Double, Double, Double, Double)

Adds a cubic Bézier curve to the current figure.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void AddBezier (
    double x1,
    double y1,
    double x2,
    double y2,
    double x3,
    double y3,
    double x4,
    double y4
)
```

Visual Basic Copy Code

```
Sub AddBezier( _
    x1 As Double, _
    y1 As Double, _
    x2 As Double, _
    y2 As Double, _
    x3 As Double, _
    y3 As Double, _
    x4 As Double, _
    y4 As Double _
)
```

Parameters

x1
The x-coordinate of the starting point of the curve.

y1
The y-coordinate of the starting point of the curve.

x2
The x-coordinate of the first control point for the curve.

y2
The y-coordinate of the first control point for the curve.

x3
The x-coordinate of the second control point for the curve.

y3
The y-coordinate of the second control point for the curve.

x4
The x-coordinate of the endpoint of the curve.

y4
The y-coordinate of the endpoint of the curve.

IGraphicsPath.AddBezier Method (Point, Point, Point, Point)

Adds a cubic Bézier curve to the current figure.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void AddBezier (
    Point p1,
    Point p2,
    Point p3,
    Point p4
)
```

Visual Basic Copy Code

```
Sub AddBezier( _
    p1 As Point, _
    p2 As Point, _
    p3 As Point, _
    p4 As Point _
)
```

Parameters

p1
A Point that represents the starting point of the curve.

p2
A Point that represents the first control point for the curve.

p3
A Point that represents the second control point for the curve.

p4
A Point that represents the endpoint of the curve.

IGraphicsPath.AddBeziers Method

Adds a sequence of connected cubic Bézier curves to the current figure.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void AddBeziers (
    IList<Point> points
)
```

Visual Basic Copy Code

```
Sub AddBeziers( _
    points As IList(Of Point) _
)
```

Parameters

points
An array of Point structures that represents the points that define the curves.

IGraphicsPath.AddEllipse Method (Double, Double, Double, Double)

Adds an ellipse to the current path.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void AddEllipse (
    double x,
    double y,
    double width,
    double height
)
```

Visual Basic Copy Code

```
Sub AddEllipse( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double _
)
```

Parameters

x
The x-coordinate of the upper-left corner of the bounding rectangle that defines the ellipse.

y
The y-coordinate of the upper-left corner of the bounding rectangle that defines the ellipse.

width
The width of the bounding rectangle that defines the ellipse.

height
The height of the bounding rectangle that defines the ellipse.

IGraphicsPath.AddLine Method (Double, Double, Double, Double)

Appends a line segment to the current figure.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C#

Copy Code

```
void AddLine (
    double x1,
    double y1,
    double x2,
    double y2
)
```

Visual Basic

Copy Code

```
Sub AddLine( _
    x1 As Double, _
    y1 As Double, _
    x2 As Double, _
    y2 As Double _
)
```

Parameters

x1
The x-coordinate of the starting point of the line.

y1
The y-coordinate of the starting point of the line.

x2
The x-coordinate of the endpoint of the line.

y2
The y-coordinate of the endpoint of the line.

IGraphicsPath.AddPath Method

Appends specified path to this path.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void AddPath (
    IGraphicsPath path,
    bool connect = true
)
```

Visual Basic Copy Code

```
Sub AddPath( _
    path As IGraphicsPath, _
    Optional connect As Boolean = True _
)
```

Parameters

path

connect
Optional.

IGraphicsPath.AddPolygon Method

Adds a polygon to the current figure.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void AddPolygon (
    IList<Point> points
)
```

Visual Basic Copy Code

```
Sub AddPolygon( _
    points As IList(Of Point) _
)
```

Parameters

points
A list of points that define the polygon.

IGraphicsPath.AddRectangle Method (Double, Double, Double, Double)

Adds a rectangle to this path.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void AddRectangle (
    double x,
    double y,
    double width,
    double height
)
```

Visual Basic Copy Code

```
Sub AddRectangle( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double _
)
```

Parameters

x
The x-coordinate of the upper-left corner of the rectangle to add.

y
The y-coordinate of the upper-left corner of the rectangle to add.

width
The width of the rectangle to add.

height
The height of the rectangle to add.

IGraphicsPath.AddRectangle Method (Rect)

Adds a rectangle to this path.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void AddRectangle (
    Rect rect
)
```

Visual Basic Copy Code

```
Sub AddRectangle( _
    rect As Rect _
)
```

Parameters

rect
The rectangle to add.

See Also

AddRectangle Method Overload List
IGraphicsPath Members

IGraphicsPath.AddRoundRect Method

Adds a rounded rectangle to this path.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void AddRoundRect (
    double x,
    double y,
    double width,
    double height,
    double radius
)
```

Visual Basic Copy Code

```
Sub AddRoundRect( _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double, _
    radius As Double _
)
```

Parameters

x
The x-coordinate of the upper-left corner of the rectangle to add.

y
The y-coordinate of the upper-left corner of the rectangle to add.

width
The width of the rectangle to add.

height
The height of the rectangle to add.

radius
The roundness of the rectangle corners.

IGraphicsPath.AddString Method

Adds a string to this path.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void AddString (
    string text,
    Font font,
    Point point,
```

```
    StringFormat format
)
```

Visual Basic Copy Code

```
Sub AddString( _
    text As String, _
    font As Font, _
    point As Point, _
    format As StringFormat _
)
```

Parameters

text

font

point

format

IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.Clone Method

Clones this GraphicsPath.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
IGraphicsPath Clone ()
```

Visual Basic Copy Code

```
Function Clone () As IGraphicsPath
```

Return Value

See Also

IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.CloseFigure Method

Closes the current figure and starts a new figure. If the current figure contains a sequence of connected lines and curves, the method closes the loop by connecting a line from the endpoint to the starting point.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void CloseFigure ()
```

Visual Basic Copy Code

```
Sub CloseFigure ()
```

See Also

IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.Dispose Method

Disposes the path.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void Dispose ()
```

Visual Basic Copy Code

```
Sub Dispose ()
```

See Also

IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.Flatten Method

Overload List

Name	Description
IGraphicsPath.Flatten ()	Converts each curve in this path into a sequence of connected line segments.
IGraphicsPath.Flatten (Double)	Converts each curve in this path into a sequence of connected line segments using the specified factor.

See Also

IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.Flatten Method ()

Converts each curve in this path into a sequence of connected line segments.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void Flatten ()
```

Visual Basic Copy Code

```
Sub Flatten ()
```

See Also

Flatten Method Overload List
IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.Flatten Method (Double)

Converts each curve in this path into a sequence of connected line segments using the specified factor.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void Flatten (
    double flatness
)
```

Visual Basic Copy Code

```
Sub Flatten( _
    flatness As Double _
)
```

Parameters

flatness
Specifies the factor of the flatness. This value ranges between 1 and 100. Reducing the flatness value will increase the number of line segments in the approximation.

See Also

Flatten Method Overload List
IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.GetBounds Method

Returns a rectangle that bounds this IGraphicsPath.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
Rect GetBounds ()
```

Visual Basic Copy Code

```
Function GetBounds () As Rect
```

Return Value

A Rectangle that represents a rectangle that bounds this IGraphicsPath.

See Also

IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.GetLastPoint Method

Gets the current last point in the path, if any, otherwise, null.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
Nullable<Point> GetLastPoint ()
```

Visual Basic Copy Code

```
Function GetLastPoint () As Nullable(Of Point)
```

Return Value

A Point object representing the last point in the path or null.

See Also

IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.IntersectsWith Method

Checks whether this IGraphicsPath intersects with the specified IGraphicsPath.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
bool IntersectsWith (
    IGraphicsPath path
)
```

Visual Basic Copy Code

```
Function IntersectsWith( _
    path As IGraphicsPath _
) As Boolean
```

Parameters

path
The IGraphicsPath to test.

Return Value

true if the two paths intersect; otherwise, false.

See Also

IGraphicsPath Members
IGraphicsPath Interface

IGraphicsPath.IsVisible Method

Indicates whether the specified point is contained within this IGraphicsPath.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
bool IsVisible (
    Point point
)
```

Visual Basic Copy Code

```
Function IsVisible( _
    point As Point _
) As Boolean
```

Parameters

point
The point to test.

Return Value

true if the specified point is contained within this IGraphicsPath; otherwise, false.

See Also

IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.StartFigure Method

Starts a new figure without closing the current figure. All subsequent points added to the path are added to this new figure.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void StartFigure ()
```

Visual Basic Copy Code

```
Sub StartFigure ()
```

See Also

IGraphicsPath Members

IGraphicsPath.Transform Method

Applies a transform matrix to this IGraphicsPath.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void Transform (
    IMatrix matrix
)
```

Visual Basic Copy Code

```
Sub Transform( _
    matrix As IMatrix _
)
```

Parameters

matrix
An IMatrix that represents the transformation to apply.

See Also

IGraphicsPath Members
IGraphicsPath Interface
MindFusion.Drawing Namespace

IGraphicsPath.Widen Method

Widens the path.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void Widen (
    float width,
    float flatness = 0
)
```

Visual Basic Copy Code

```
Sub Widen( _
    width As Single, _
    Optional flatness As Single = 0 _
)
```

Parameters

width

flatness
Optional.

ImageAlign Enumeration

Specifies the position and alignment of a picture relative to its destination rectangle.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public enum ImageAlign
```

Visual Basic Copy Code

```
Public Enum ImageAlign
```

Members

	Member name	Description
	Unspecified	Invalid image alignment.
	Center	The image is centered.
	Fit	The image is resized to fit the size the destination rectangle.
	Stretch	The image is stretched to fill the destination rectangle.
	Tile	The image is tiled across the destination rectangle.
	TopLeft	The image is aligned to the top left corner.
	BottomLeft	The image is aligned to the bottom left corner.
	TopRight	The image is aligned o the top right corner.
	BottomRight	The image is aligned to the bottom right corner.
	TopCenter	The image is centered horizontally and aligned to the top side.
	BottomCenter	The image is centered horizontally and aligned to the bottom side.
	MiddleLeft	The image is centered vertically and aligned to the left-hand side.
	MiddleRight	The image is centered vertically and aligned to the right-hand side.
	FitLeft	The image is resized to fit the size of the object and aligned to left side.
	FitTop	The image is resized to fit the size of the object and aligned to top side.
	FitRight	The image is resized to fit the size of the object and aligned to right side.
	FitBottom	The image is resized to fit the size of the object and aligned to bottom side.

MindFusion.Drawing Namespace

IMatrix Members

Encapsulates an affine matrix that represents a geometric transform.

The following tables list the members exposed by the IMatrix type.

Public Properties

	Name	Description
	Elements	
	IsIdentity	Gets a value indicating whether this IMatrix is the identity matrix.
	OffsetX	Gets the translation of this matrix along the x-axis.
	OffsetY	Gets the translation of this matrix along the y-axis.

Public Methods

	Name	Description
	Clone	Creates an exact clone of this matrix.
	Inverse	Inverts this IMatrix, if it is invertible.
	Multiply	
	Reset	Reset this matrix.
	RotateAt	Overloaded.
	Scale	Applies the specified scale vector to this IMatrix by prepending the scale vector.
	Shear	
	TransformPoint	Applies the geometric transform represented by this IMatrix to the specified point.

	TransformPoints	Applies the geometric transform represented by this IMatrix to the specified array of points.
	TransformRect	Applies the geometric transform represented by this IMatrix to the specified rectangle.
	Translate	Applies the specified translation to this IMatrix by prepending the translation.

IMatrix Methods

IMatrix.Clone Method

Creates an exact clone of this matrix.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
IMatrix Clone ()
```

Visual Basic Copy Code

```
Function Clone () As IMatrix
```

Return Value

See Also

IMatrix Members
IMatrix Interface
MindFusion.Drawing Namespace

IMatrix.Inverse Method

Inverts this IMatrix, if it is invertible.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
IMatrix Inverse ()
```

Visual Basic Copy Code

```
Function Inverse () As IMatrix
```

Return Value

An instance of the IMatrix interface.

See Also

IMatrix.Multiply Method

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void Multiply (
    IMatrix m,
    MatrixOrder order = MatrixOrder.Append
)
```

Visual Basic Copy Code

```
Sub Multiply( _
    m As IMatrix, _
    Optional order As MatrixOrder = MatrixOrder.Append _
)
```

Parameters

m

order
Optional.

See Also

IMatrix Members
IMatrix Interface
MindFusion.Drawing Namespace

IMatrix.Reset Method

Reset this matrix.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void Reset ()
```

Visual Basic Copy Code

```
Sub Reset ()
```

IMatrix.RotateAt Method

Overload List

Name	Description
IMatrix.RotateAt (Double)	Prepend to this IMatrix a clockwise rotation by the specified angle.
IMatrix.RotateAt (Double, Point)	Applies a clockwise rotation to this IMatrix around the point specified in the point parameter, and by prepending the rotation.

See Also

IMatrix Members
IMatrix Interface
MindFusion.Drawing Namespace

IMatrix.RotateAt Method (Double)

Prepend to this IMatrix a clockwise rotation by the specified angle.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void RotateAt (
    double angle
)
```

Visual Basic Copy Code

```
Sub RotateAt( _
    angle As Double _
)
```

Parameters

angle
The angle of the rotation, in degrees.

See Also

RotateAt Method Overload List
IMatrix Members
IMatrix Interface
MindFusion.Drawing Namespace

IMatrix.RotateAt Method (Double, Point)

Applies a clockwise rotation to this IMatrix around the point specified in the point parameter, and by prepending the rotation.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void RotateAt (
    double angle,
    Point point
)
```

Visual Basic Copy Code

```
Sub RotateAt( _
    angle As Double, _
    point As Point _
)
```

Parameters

angle

The angle of the rotation, in degrees.

point

A Point that represents the center of the rotation.

See Also

RotateAt Method Overload List
IMatrix Members
IMatrix Interface
MindFusion.Drawing Namespace

IMatrix.Scale Method

Applies the specified scale vector to this IMatrix by prepending the scale vector.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void Scale (
    double sx,
    double sy
)
```

Visual Basic Copy Code

```
Sub Scale( _
    sx As Double, _
    sy As Double _
)
```

Parameters

sx

The value by which to scale this IMatrix in the x-axis direction.

sy

The value by which to scale this IMatrix in the y-axis direction.

See Also

IMatrix Members
IMatrix Interface
MindFusion.Drawing Namespace

IMatrix.Shear Method

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
void Shear (
    double sx,
    double sy
)
```

Visual Basic Copy Code

```
Sub Shear( _
    sx As Double, _
    sy As Double _
)
```

Parameters

sx

sy

See Also

IMatrix Members
IMatrix Interface
MindFusion.Drawing Namespace

IMatrix.TransformPoint Method

Applies the geometric transform represented by this IMatrix to the specified point.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
Point TransformPoint (
    Point point
)
```

Visual Basic Copy Code

```
Function TransformPoint( _
    point As Point _
) As Point
```

Parameters

point
The point to transform.

Return Value

The transformed point.

See Also

IMatrix Members
IMatrix Interface
MindFusion.Drawing Namespace

IMatrix.TransformPoints Method

Applies the geometric transform represented by this IMatrix to the specified array of points.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C#

```
void TransformPoints (
    IList<Point> points
)
```

Visual Basic

```
Sub TransformPoints( _
    points As IList(Of Point) _
)
```

Parameters

points
A list of Point structures that represents the points to transform.

See Also

IMatrix Members
IMatrix Interface
MindFusion.Drawing Namespace

IMatrix.TransformRect Method

Applies the geometric transform represented by this IMatrix to the specified rectangle.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C#

```
Rect TransformRect (
    Rect rect
)
```

Visual Basic

```
Function TransformRect( _
    rect As Rect _
) As Rect
```

Parameters

rect
The rectangle to transform.

Return Value

The transformed rectangle.

See Also

IMatrix Members
IMatrix Interface
MindFusion.Drawing Namespace

IMatrix.Translate Method

Applies the specified translation to this IMatrix by prepending the translation.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C#

```
void Translate (
    double dx,
    double dy
)
```

Visual Basic

```
Sub Translate( _
    dx As Double, _
    dy As Double _
)
```

Parameters

dx
The x value by which to translate this IMatrix.

dy
The y value by which to translate this IMatrix.

LinearGradientBrush Members

LinearGradientBrush objects represent brushes that fill the interiors of geometric shapes with a linear gradient.

The following tables list the members exposed by the **LinearGradientBrush** type.

Public Constructors

	Name	Description
	LinearGradientBrush	Overloaded. Initializes a new instance of the **LinearGradientBrush** class.

Public Properties

	Name	Description
	Angle	Gets or sets the angle of the gradient's orientation line.
	Colors	Gets or sets an array of colors that represents the colors to use at corresponding positions along a gradient.
	EndPoint	
	Positions	Gets or sets the positions along a gradient line.
	StartPoint	
	Transform	
	WrapMode	

Public Methods

	Name	Description
	Clone	Creates an exact copy of this brush.
	Equals	Brush.Equals override.
	GetHashCode	Brush.GetHashCode override.

	ToColor	Brush.ToColor override.

LinearGradientBrush Constructor

Initializes a new instance of the LinearGradientBrush class.

Overload List

Name	Description
LinearGradientBrush (Color, Color, Double)	Initializes a new instance of the **LinearGradientBrush** class with the specified start and end colors and an orientation angle measured in degrees.
LinearGradientBrush (Double[], Color[], Double)	Initializes a new instance of the LinearGradientBrush class.
LinearGradientBrush (Point, Point, Color, Color)	Initializes a new instance of the LinearGradientBrush class.

See Also

LinearGradientBrush Class
MindFusion.Drawing Namespace

LinearGradientBrush Constructor (Color, Color, Double)

Initializes a new instance of the LinearGradientBrush class with the specified start and end colors and an orientation angle measured in degrees.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public LinearGradientBrush (
    Color startColor,
    Color endColor,
    double angle
)
```

Visual Basic Copy Code

```
Public New ( _
    startColor As Color, _
    endColor As Color, _
    angle As Double _
)
```

Parameters

startColor
The start color of the gradient.

endColor
The end color of the gradient.

angle
The angle of the gradient.

See Also

LinearGradientBrush Constructor Overload List
LinearGradientBrush Class
MindFusion.Drawing Namespace

LinearGradientBrush Constructor (Double[], Color[], Double)

Initializes a new instance of the LinearGradientBrush class.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public LinearGradientBrush (
    double[] positions,
    Color[] colors,
    double angle
)
```

Visual Basic Copy Code

```
Public New ( _
    positions() As Double, _
    colors() As Color, _
    angle As Double _
)
```

Parameters

positions
The positions of the colors of the gradient.

colors
The colors of the gradient.

angle
The angle of the gradient.

LinearGradientBrush Constructor (Point, Point, Color, Color)

Initializes a new instance of the LinearGradientBrush class.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public LinearGradientBrush (
    Point p1,
    Point p2,
    Color color1,
    Color color2
)
```

Visual Basic Copy Code

```
Public New ( _
    p1 As Point, _
```

```
    p2 As Point, _
    color1 As Color, _
    color2 As Color _
)
```

Parameters

p1

p2

color1

color2

LinearGradientBrush Methods

LinearGradientBrush.Clone Method

Creates an exact copy of this brush.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public override Brush Clone ()
```

Visual Basic Copy Code

```
Public Overrides Function Clone () As Brush
```

Return Value

An instance of the LinearGradientBrush class.

See Also

LinearGradientBrush Members

LinearGradientBrush.Equals Method

Brush.Equals override.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public override bool Equals (
    Brush other
)
```

Visual Basic Copy Code

```
Public Overrides Function Equals( _
    other As Brush _
) As Boolean
```

Parameters

other
The Brush to compare with the current Brush.

Return Value

true if the specified Brush is equal to the current Brush; otherwise, false.

MauiGraphics Constructor

Overload List

Name	Description
MauiGraphics (ICanvas)	
MauiGraphics (ICanvas, SkiaBitmapExportContextEx)	

See Also

MauiGraphics Constructor (ICanvas)

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public MauiGraphics (
    ICanvas canvas
)
```

Visual Basic Copy Code

```
Public New ( _
    canvas As ICanvas _
)
```

Parameters

canvas

See Also

MauiGraphics Constructor Overload List
MauiGraphics Class
MindFusion.Drawing Namespace

MauiGraphics Constructor (ICanvas, SkiaBitmapExportContextEx)

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public MauiGraphics (
    ICanvas canvas,
    SkiaBitmapExportContextEx skiaBitmapExportContext
)
```

Visual Basic Copy Code

```
Public New ( _
    canvas As ICanvas, _
    skiaBitmapExportContext As SkiaBitmapExportContextEx _
)
```

Parameters

canvas

skiaBitmapExportContext

See Also

MauiGraphics Constructor Overload List
MauiGraphics Class
MindFusion.Drawing Namespace

MauiGraphics Methods

MauiGraphics.BeginHyperLink Method

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public void BeginHyperLink (
    string hyperlink,
    string target
)
```

Visual Basic Copy Code

```
Public Sub BeginHyperLink( _
    hyperlink As String, _
    target As String _
)
```

Parameters

hyperlink

target

See Also

MauiGraphics.ClipImage Method

Overload List

Name	Description
MauiGraphics.ClipImage (IImage, IGraphicsPath)	
MauiGraphics.ClipImage (IImage, Point[])	

See Also

MauiGraphics Members
MauiGraphics Class
MindFusion.Drawing Namespace

MauiGraphics.ClipImage Method (IImage, IGraphicsPath)

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public IImage ClipImage (
    IImage sourceImage,
    IGraphicsPath clip
)
```

Visual Basic Copy Code

```
Public Function ClipImage( _
    sourceImage As IImage, _
    clip As IGraphicsPath _
) As IImage
```

Parameters

sourceImage

clip

Return Value

See Also

ClipImage Method Overload List
MauiGraphics Members
MauiGraphics Class
MindFusion.Drawing Namespace

MauiGraphics.ClipImage Method (IImage, Point[])

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public IImage ClipImage (
    IImage sourceImage,
    Point[] clipPoly
)
```

Visual Basic Copy Code

```
Public Function ClipImage( _
    sourceImage As IImage, _
    clipPoly() As Point _
) As IImage
```

Parameters

sourceImage

clipPoly

Return Value

See Also

ClipImage Method Overload List
MauiGraphics Members
MauiGraphics Class
MindFusion.Drawing Namespace

MauiGraphics.CreateImage Method

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public IImage CreateImage (
    IGraphicsPath clip = null
)
```

Visual Basic Copy Code

```
Public Function CreateImage( _
    Optional clip As IGraphicsPath = Nothing _
) As IImage
```

Parameters

clip
Optional.

Return Value

MauiGraphics.DrawArc Method (Pen, Double, Double, Double, Double, Double, Double)

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public void DrawArc (
    Pen pen,
    double x,
    double y,
    double width,
    double height,
    double startAngle,
    double sweepAngle
)
```

Visual Basic Copy Code

```
Public Sub DrawArc( _
    pen As Pen, _
    x As Double, _
    y As Double, _
    width As Double, _
    height As Double, _
    startAngle As Double, _
    sweepAngle As Double _
)
```

Parameters

pen

x

y

width

height

startAngle

sweepAngle

PathGradientBrush Members

PathGradientBrush represents a brush that fills the interiors of geometric shapes with a gradient.

The following tables list the members exposed by the **PathGradientBrush** type.

Public Constructors

	Name	Description
	PathGradientBrush	Initializes a new instance of the PathGradientBrush class.

Public Properties

	Name	Description
	Colors	Gets or sets an array of colors that represents the colors to use at corresponding positions along a gradient.
	Path	Gets or sets the IGraphicsPath that defines the area filled by this brush.
	Positions	Gets or sets the positions along a gradient line.
	Transform	
	WrapMode	

Public Methods

	Name	Description
	Clone	Creates an exact copy of this brush.
	Equals	Brush.Equals override.
	GetHashCode	Brush.GetHashCode override.
	ToColor	Brush.ToColor override.

PathGradientBrush Constructor

Initializes a new instance of the PathGradientBrush class.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public PathGradientBrush (
    IGraphicsPath path
)
```

Visual Basic Copy Code

```
Public New ( _
    path As IGraphicsPath _
)
```

Parameters

path
The IGraphicsPath that defines the area filled by this brush.

See Also

PathGradientBrush Class
MindFusion.Drawing Namespace

PathGradientBrush Methods

PathGradientBrush.Clone Method

Creates an exact copy of this brush.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public override Brush Clone ()
```

Visual Basic Copy Code

```
Public Overrides Function Clone () As Brush
```

Return Value

An instance of the PathGradientBrush class.

See Also

PathGradientBrush Members
PathGradientBrush Class
MindFusion.Drawing Namespace

PathGradientBrush.Equals Method

Brush.Equals override.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public override bool Equals (
    Brush other
)
```

Visual Basic Copy Code

```
Public Overrides Function Equals( _
    other As Brush _
) As Boolean
```

Parameters

other

The Brush to compare with the current Brush.

Return Value

true if the specified Brush is equal to the current Brush; otherwise, false.

PathGradientBrush Properties

PathGradientBrush.Colors Property

Gets or sets an array of colors that represents the colors to use at corresponding positions along a gradient.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public Color[] Colors { get; set; }
```

Visual Basic Copy Code

```
Public Property Colors As Color()
```

Property Value

See Also

PathGradientBrush Members
PathGradientBrush Class
MindFusion.Drawing Namespace

PathGradientBrush.Path Property

Gets or sets the IGraphicsPath that defines the area filled by this brush.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public IGraphicsPath Path { get; set; }
```

Visual Basic Copy Code

```
Public Property Path As IGraphicsPath
```

Property Value

Pen Class

Pen objects are used to draw the outline of geometric shapes.

Syntax

C# Copy Code

```
public class Pen
```

Visual Basic Copy Code

```
Public Class Pen
```

Inheritance Hierarchy

System.Object
  MindFusion.Drawing.Pen

See Also

Pen Members
MindFusion.Drawing Namespace

Pen Members

Pen objects are used to draw the outline of geometric shapes.

The following tables list the members exposed by the Pen type.

Public Constructors

	Name	Description
	Pen	Overloaded. Initialize a new instance of the **Pen** class.

Public Properties

	Name	Description
	Alignment	
	Brush	Gets or sets the Brush object that determines attributes of this pen.
	Color	Gets or sets the color of this pen.
	DashOffset	Gets or sets the distance from the start of a line to the beginning of a dash pattern.
	DashPattern	Gets or sets an array of custom dashes and spaces.
	DashStyle	Gets or sets the style used for dashed lines drawn with this pen.
	EndCap	
	LineJoin	Gets or sets the join style for the ends of two consecutive lines drawn with this pen.

	MiterLimit	Gets or sets the limit of the thickness of the join on a mitered corner.
	StartCap	
	Transform	
	Unit	Gets or sets the unit of the pen width.
	Width	Gets or sets the width of the pen.

Public Methods

	Name	Description
	Clone	Creates an exact copy of this pen.

See Also

Pen Class
MindFusion.Drawing Namespace

Pen Constructor

Initialize a new instance of the **Pen** class.

Overload List

Name	Description
Pen (Brush, Double)	Initializes a new instance of the Pen class with the specified Brush object and the specified width.
Pen (Color)	Initializes a new instance of the **Pen** class with the specified color.
Pen (Color, Double)	Initializes a new instance of the **Pen** class with the specified color and width.
Pen (Color, Double, PenUnit)	Initializes a new instance of the **Pen** class.

See Also

Pen Class
MindFusion.Drawing Namespace

Pen Constructor (Brush, Double)

Initializes a new instance of the Pen class with the specified Brush object and the specified width.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public Pen (
    Brush brush,
    double width
)
```

Visual Basic Copy Code

```
Public New ( _
    brush As Brush, _
```

```
    width As Double _
)
```

Parameters

brush

A Brush instance that determines the fill properties of the new pen.

width

The width of the new pen.

See Also

Pen Constructor Overload List
Pen Class
MindFusion.Drawing Namespace

Pen Constructor (Color)

Initializes a new instance of the Pen class with the specified color.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public Pen (
    Color color
)
```

Visual Basic Copy Code

```
Public New ( _
    color As Color _
)
```

Parameters

color

A Color structure that specifies the color of the new pen.

)
```

Parameters

color

A Color structure that specifies the color of the new pen.

width

The width of the new pen.

See Also

Pen Constructor Overload List
Pen Class
MindFusion.Drawing Namespace

Pen Constructor (Color, Double, PenUnit)

Initializes a new instance of the Pen class.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public Pen (
    Color color,
    double width,
    PenUnit unit
)
```

Visual Basic Copy Code

```
Public New ( _
    color As Color, _
    width As Double, _
    unit As PenUnit _
)
```

Parameters

color

The initial color of the pen.

width

The initial width of the pen.

unit

The initial unit of the pen width.

MindFusion.Drawing Namespace

Pen Methods

Pen.Clone Method

Creates an exact copy of this pen.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public Pen Clone ()
```

Visual Basic Copy Code

```
Public Function Clone () As Pen
```

Return Value

An instance of the **Pen** class.

See Also

Pen Members
Pen Class
MindFusion.Drawing Namespace

Pen Properties

Pen.Alignment Property

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public PenAlignment Alignment { get; set; }
```

Visual Basic Copy Code

```
Public Property Alignment As PenAlignment
```

Property Value

See Also

Pen Members
Pen Class
MindFusion.Drawing Namespace

Pen.Brush Property

Gets or sets the Brush object that determines attributes of this pen.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public Brush Brush { get; set; }
```

Visual Basic Copy Code

```
Public Property Brush As Brush
```

Property Value

An instance of the Brush class that determines attributes of this pen.

Remarks

Setting this property causes the pen to draw filled lines and curves. It overrides the Color property of the pen.

Pen Members
Pen Class
MindFusion.Drawing Namespace

Pen.Color Property

Gets or sets the color of this pen.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public Color Color { get; set; }
```

Visual Basic Copy Code

```
Public Property Color As Color
```

Property Value

A **Microsoft.Maui.Graphics.Color** that represents the color of this pen.

Pen Members
Pen Class
MindFusion.Drawing Namespace

Pen.DashOffset Property

Gets or sets the distance from the start of a line to the beginning of a dash pattern.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public float DashOffset { get; set; }
```

Visual Basic Copy Code

```
Public Property DashOffset As Single
```

Property Value

A float value representing the distance from the start of a line to the beginning of a dash pattern.

See Also

Pen Members
Pen Class
MindFusion.Drawing Namespace

Pen.DashPattern Property

Gets or sets an array of custom dashes and spaces.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public double[] DashPattern { get; set; }
```

Visual Basic Copy Code

```
Public Property DashPattern As Double()
```

Property Value

An array of real numbers that specify the lengths of alternating dashes and spaces in dashed lines.

Remarks

The elements in the array set the length of each dash and space in the dash pattern. The first element sets the length of a dash, the second element sets the length of a space, the third element sets the length of a dash, and so on.The length of each dash and space in the dash pattern is the product of the element value in the array and the width of the pen.

Pen Members
Pen Class
MindFusion.Drawing Namespace

Pen.DashStyle Property

Gets or sets the style used for dashed lines drawn with this pen.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public DashStyle DashStyle { get; set; }
```

Visual Basic Copy Code

```
Public Property DashStyle As DashStyle
```

Property Value

A member of the DashStyle enumeration that represents the style used for dashed lines.

Remarks

A value of **DashStyle.Custom** for this property specifies that a custom pattern of dashes and spaces, defined by the DashPattern property, make up lines drawn with this pen.

Pen.EndCap Property

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public LineCap EndCap { get; set; }
```

Visual Basic Copy Code

```
Public Property EndCap As LineCap
```

Property Value

See Also

Pen Members
Pen Class
MindFusion.Drawing Namespace

Pen.LineJoin Property

Gets or sets the join style for the ends of two consecutive lines drawn with this pen.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public LineJoin LineJoin { get; set; }
```

Visual Basic Copy Code

```
Public Property LineJoin As LineJoin
```

Property Value

A member of the LineJoin enumeration that represents the join style for the ends of two consecutive lines.

See Also

Pen Members
Pen Class
MindFusion.Drawing Namespace

Pen.MiterLimit Property

Gets or sets the limit of the thickness of the join on a mitered corner.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public double MiterLimit { get; set; }
```

Visual Basic Copy Code

```
Public Property MiterLimit As Double
```

Property Value

A floag value representing the limit of the thickness of the join on a mitered corner. The default is 10.0f.

Remarks

The miter length is the distance from the intersection of the line walls on the inside of the join to the intersection of the line walls outside of the join. The miter length can be large when the angle between two lines is small. The miter limit is the maximum allowed ratio of miter length to stroke width. If the miter length of the join of the intersection exceeds the limit of the join, then the join will be beveled to keep it within the limit of the join of the intersection.

StringAlignment Enumeration

Specifies the alignment of text relative to a point or inside a rectangle.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public enum StringAlignment
```

Visual Basic Copy Code

```
Public Enum StringAlignment
```

Members

	Member name	Description
	Near	Left side of text is aligned to target point, or to the left side of the layout rectangle.
	Center	Center of text is aligned to target point, or to the center of the layout rectangle.
	Far	Right side of text is aligned to target point, or to the Right side of the layout rectangle.

StringFormat Members

Encapsulates text layout information (such as alignment).

The following tables list the members exposed by the StringFormat type.

Public Constructors

	Name	Description
	StringFormat	Overloaded.

Public Fields

	Name	Description
	Default	The default string format.

Public Properties

	Name	Description
	Alignment	Gets or sets horizontal alignment of the string.
	ClipText	Gets or sets a value indicating whether to clip the text to bounds.
	LineAlignment	Gets or sets the vertical alignment of the string.
	WrapText	Gets or sets a value indicating whether to wrap the text.

Public Methods

	Name	Description
	Clone	Creates an exact clone of this object.
	Equals	Determines whether the specified object is equal to the current StringFormat.
	GetHashCode	Serves as a hash function for a StringFormat object.

TextAlignment Enumeration

Specifies the alignment of text on the drawing surface.

Namespace: MindFusion.Drawing
Assembly: MindFusion.Common

Syntax

C# Copy Code

```
public enum TextAlignment
```

Visual Basic Copy Code

```
Public Enum TextAlignment
```

Members

	Member name	Description
	Unspecified	No alignment is specified.
	TopLeft	Text is vertically aligned at the top, and horizontally aligned on the left.
	TopCenter	Text is vertically aligned at the top, and horizontally aligned at the center.
	TopRight	Text is vertically aligned at the top, and horizontally aligned on the right.
	MiddleLeft	Text is vertically aligned in the middle, and horizontally aligned on the left.
	MiddleCenter	Text is vertically aligned in the middle, and horizontally aligned at the center.
	MiddleRight	Text is vertically aligned in the middle, and horizontally aligned on the right.

	BottomLeft	Text is vertically aligned at the bottom, and horizontally aligned on the left.
	BottomCenter	Text is vertically aligned at the bottom, and horizontally aligned at the center.
	BottomRight	Text is vertically aligned at the bottom, and horizontally aligned on the right.
	AlignmentFlag	For internal use only.
	NoWrap	The only flag that can be combines with any of the alignment flags. Specifies that the drawn text should not wrap when the text does not fit in a single line.

AnnealLayoutStatistics.EdgeLengthsCost Property

The total edge lengths cost of a graph configuration.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double EdgeLengthsCost { get; set; }
```

Visual Basic Copy Code

```
Public Property EdgeLengthsCost As Double
```

Property Value

See Also

AnnealLayoutStatistics Members
AnnealLayoutStatistics Class
MindFusion.Layout Namespace

AnnealLayoutStatistics.NodeEdgeDistance Property

The total node-to-edge-distance cost of a graph configuration.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double NodeEdgeDistance { get; set; }
```

Visual Basic Copy Code

```
Public Property NodeEdgeDistance As Double
```

Property Value

See Also

AnnealLayoutStatistics Members
AnnealLayoutStatistics Class
MindFusion.Layout Namespace

AssistantType Enumeration

Indicates the type of an assistant node in a tree.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum AssistantType
```

Visual Basic Copy Code

```
Public Enum AssistantType
```

Members

	Member name	Description
	None	The node is not an assistant.
	Normal	The node is an assistant and its relative position is determined automatically by the layout.
	Left	The node is an assistant and it is always positioned to the left of its parent.
	Right	The node is an assistant and it is always positioned to the right of its parent.

See Also

MindFusion.Layout Namespace

BaseLayout Enumeration

Specifies how OrthogonalRouter should arrange nodes.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum BaseLayout
```

Visual Basic Copy Code

```
Public Enum BaseLayout
```

Members

	Member name	Description
	Layered	Use LayeredLayout to arrange nodes.
	Grid	Use GridLayout to arrange nodes.
	Custom	Use the current node configuration.
	Cascading	Use TreeLayout to arrange nodes.

See Also

ConnectorRules Class

Represents a set of rules that are applied according to the logic identifiers of links.

Syntax

C# Copy Code

```
public class ConnectorRules : LayoutRules
```

Visual Basic Copy Code

```
Public Class ConnectorRules
    Inherits LayoutRules
```

Inheritance Hierarchy

System.Object
  MindFusion.Layout.LayoutRules

MindFusion.Layout Namespace

ConnectorRules Members

Represents a set of rules that are applied according to the logic identifiers of links.

The following tables list the members exposed by the ConnectorRules type.

Public Properties

	Name	Description
	DownOriented	Specifies a set of link identifiers for which nodes connected through such links will be placed downwards from already arranged nodes. You can assign a single logic identifier or an array of identifiers to this property.
	HorizontalBendOrientation	Specifies whether links should start with a horizontal segment.
	LeftOriented	Specifies a set of link identifiers for which nodes connected through such links will be placed leftwards from already arranged nodes. You can assign a single logic identifier or an array of identifiers to this property.
	RightOriented	Specifies a set of link identifiers for which nodes connected through such links will be placed rightwards from already arranged nodes. You can assign a single logic identifier or an array of identifiers to this property.
	UpOriented	Specifies a set of link identifiers for which nodes connected via such links will be placed upwards from already arranged nodes. You can assign a single logic identifier or an array of identifiers to this property.

Public Methods

	Name	Description
	AddLayoutRule	Overloaded. (Inherited from LayoutRules.)
	BuildKey	Builds a key - object for the new rule, as a pair of two objects: *obj1* and *obj2*. (Inherited from LayoutRules.)

	GetLayoutRule	If there is rule with key - Key initializes - Value otherwise fails; (Inherited from LayoutRules.)
	ValidateRules	Checks if there is a rule for each key in KeyList (Inherited from LayoutRules.)

MindFusion.Layout Namespace

FlowLayoutKeys Members

Defines keys that can be used to define FlowLayout rules.

The following tables list the members exposed by the FlowLayoutKeys type.

Public Constructors

	Name	Description
	FlowLayoutKeys	Initializes a new instance of the **FlowLayoutKeys** class.

Public Fields

	Name	Description
	ConnectorTypes	Specifies a list of connector identifiers. (Inherited from SimpleKeys.)
	FirstGroupLevelNegative	A rule defining which nodes should be placed above the "Control Flow" line. Associate an array of the node types logic identifiers with this key.

		(Inherited from SimpleKeys.)
	FirstGroupLevelPositive	A rule defining which nodes should be placed below the "Control Flow" line. Associate an array of the node types logic identifiers with this key. (Inherited from SimpleKeys.)
	GroupEndNodes	Specifies which nodes should be considered the end of the current sub-group. Associate an array of the node types logic identifiers with this key. (Inherited from SimpleKeys.)
	GroupStartNodes	Specifies which nodes should be considered the start of a new sub-group. Associate an array of the node types logic identifiers with this key. (Inherited from SimpleKeys.)
	MainConnectorOrientation	Specifies the orientation of the "Control Flow" sequence of links, and thus the main orientation for the layout. (Inherited from SimpleKeys.)
	MainSubgroupConnector	Defines which type of connectors can be used as guideline (defining the graph control flow). (Inherited from SimpleKeys.)
	PossibleConnection	Specifies what kind of node connections are allowed. (Inherited from SimpleKeys.)
	PossibleNodeLogic	Specifies a list of identifiers for nodes that should be processed by FlowLayout.
	SemiLevel	Specifies a list of identifiers for nodes that should be placed with some offset from the main sequence line.

Public Properties

	Name	Description
	AllKeys	A list of all keys defined in this class. (Inherited from SimpleKeys.)

Public Methods

	Name	Description
	ValidateRules	Checks if there is a rule for each key in the key list. (Inherited from SimpleKeys.)

FlowLayoutRules Members

A class representing a set of rules that define the behavior of the **FlowLayout** class.

The following tables list the members exposed by the FlowLayoutRules type.

Public Constructors

	Name	Description
	FlowLayoutRules	Initializes a new instance of the **FlowLayoutRules** class.

Public Properties

	Name	Description
	ConnectorRules	A set of rules that are applied according to the logic identifiers of links.
	NodeRules	A set of rules that are applied according to the logic identifiers of node pairs.
	PreferredRules	Specifies which set of rules to use.

Public Methods

	Name	Description
	AddBendRule	Overloaded.
	AddIncomingBendRule	Overloaded.
	AddLayoutRule	Overloaded. (Inherited from LayoutRules.)
	AddOutgoingBendRule	Overloaded.
	BuildKey	Builds a key - object for the new rule, as a pair of two objects: *obj1* and *obj2*. (Inherited from LayoutRules.)
	GetLayoutRule	If there is rule with key - Key initializes - Value otherwise fails; (Inherited from LayoutRules.)
	UseRuleManagedLinkBend	Specifies whether FlowLayout should use custom link-bending rules specified through the various Add*BendRule methods.
	ValidateRules	Checks if there is a rule for each key in KeyList (Inherited from LayoutRules.)

FlowLayoutRules.AddBendRule Method

Overload List

Name	Description
FlowLayoutRules.AddBendRule (String, String, OrderDirection)	Adds a rule for the orientation of the starting or ending segment of a link according to the type of the node connected to that link.
FlowLayoutRules.AddBendRule (String, String, OrderDirection[])	Adds a rule for the orientation of the starting or ending segments of a link according to the type of the node connected to that link.
FlowLayoutRules.AddBendRule (String, String[], OrderDirection)	Adds a rule for the orientation of the starting or ending segment of a link according to the type of the node connected to that link.
FlowLayoutRules.AddBendRule (String, String[], OrderDirection[])	Adds a rule for the orientation of the starting or ending segments of a link according to the type of the node connected to that link.
FlowLayoutRules.AddBendRule (String[], String, OrderDirection)	Adds a rule for the orientation of the starting or ending segment of a link according to the type of the node connected to that link.
FlowLayoutRules.AddBendRule (String[], String, OrderDirection[])	Adds a rule for the orientation of the starting or ending segments of a link according to the type of the node connected to that link.

FlowLayoutRules.AddBendRule Method (String, String, OrderDirection)

Adds a rule for the orientation of the starting or ending segment of a link according to the type of the node connected to that link.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool AddBendRule (
    string nodeType,
    string linkType,
    OrderDirection direction
)
```

Visual Basic Copy Code

```
Public Function AddBendRule( _
    nodeType As String, _
    linkType As String, _
    direction As OrderDirection _
) As Boolean
```

Parameters

nodeType
The logic identifier of nodes this rule should be applied to.

linkType
The logic identifier of links this rule should be applied to.

direction
An OrderDirection value defining the orientation of the links starting or ending segment.

Return Value

true if this rule has been added successfully; otherwise, **false**.

FlowLayoutRules.AddBendRule Method (String, String, OrderDirection[])

Adds a rule for the orientation of the starting or ending segments of a link according to the type of the node connected to that link.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool AddBendRule (
    string nodeType,
    string linkType,
    OrderDirection[] directions
)
```

Visual Basic Copy Code

```
Public Function AddBendRule( _
    nodeType As String, _
    linkType As String, _
    directions() As OrderDirection _
) As Boolean
```

Parameters

nodeType
The logic identifier of nodes this rule should be applied to.

linkType
The logic identifier of links this rule should be applied to.

directions
An array of OrderDirection values defining the orientation of the links starting or ending segments.

Return Value

true if this rule has been added successfully; otherwise, **false**.

Adds a rule for the orientation of the starting or ending segment of a link according to the type of the node connected to that link.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool AddBendRule (
    string nodeType,
    string[] linkTypes,
    OrderDirection direction
)
```

Visual Basic Copy Code

```
Public Function AddBendRule( _
    nodeType As String, _
    linkTypes() As String, _
    direction As OrderDirection _
) As Boolean
```

Parameters

nodeType
The logic identifier of nodes this rule should be applied to.

linkTypes
The logic identifiers of links this rule should be applied to.

direction
An OrderDirection value defining the orientation of the links starting or ending segment.

Return Value

true if this rule has been added successfully; otherwise, **false**.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool AddIncomingBendRule (
    string destNodeType,
    string linkType,
```

```
    string[] originNodeTypes,
    OrderDirection[] directions
)
```

Visual Basic Copy Code

```
Public Function AddIncomingBendRule( _
    destNodeType As String, _
    linkType As String, _
    originNodeTypes() As String, _
    directions() As OrderDirection _
) As Boolean
```

Parameters

destNodeType
The logic identifier of nodes this rule should be applied to.

linkType
The logic identifier of links this rule should be applied to.

originNodeTypes
The logic identifiers of nodes this rule should be applied to.

directions
An array of OrderDirection values defining the orientation of the links ending segments.

Return Value

true if this rule has been added successfully; otherwise, **false**.

FlowLayoutRules.AddIncomingBendRule Method (String, String[], OrderDirection)

Adds a rule for the orientation of the ending segment of an incoming link according to the type of the link's destination node.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool AddIncomingBendRule (
    string destNodeType,
    string[] linkTypes,
    OrderDirection direction
)
```

Visual Basic Copy Code

```
Public Function AddIncomingBendRule( _
    destNodeType As String, _
    linkTypes() As String, _
    direction As OrderDirection _
) As Boolean
```

Parameters

destNodeType
The logic identifier of nodes this rule should be applied to.

linkTypes
The logic identifiers of links this rule should be applied to.

direction

An OrderDirection value defining the orientation of the link's ending segment.

Return Value

true if this rule has been added successfully; otherwise, **false**.

FlowLayoutRules.AddOutgoingBendRule Method (String, String, OrderDirection)

Adds a rule for the orientation of the starting segment of an outgoing link according to the type of the link's origin node.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool AddOutgoingBendRule (
    string originNodeType,
    string linkType,
    OrderDirection direction
)
```

Visual Basic Copy Code

```
Public Function AddOutgoingBendRule( _
    originNodeType As String, _
    linkType As String, _
    direction As OrderDirection _
) As Boolean
```

Parameters

originNodeType
The logic identifier of nodes this rule to be applied to.

linkType
The logic identifier of links this rule will be applied to.

direction
An OrderDirection value defining the orientation of the link's starting segment.

Return Value

true if this rule has been added successfully; otherwise, **false**.

MindFusion.Layout Namespace

FlowLayoutRules.AddOutgoingBendRule Method (String, String, String, OrderDirection[])

Adds a rule for the orientation of the starting segments of an outgoing link according to the type of the link's origin node.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool AddOutgoingBendRule (
    string originNodeType,
    string linkType,
    string destNodeType,
    OrderDirection[] directions
)
```

Visual Basic Copy Code

```
Public Function AddOutgoingBendRule( _
    originNodeType As String, _
    linkType As String, _
    destNodeType As String, _
    directions() As OrderDirection _
) As Boolean
```

Parameters

originNodeType
The logic identifier of nodes this rule should be applied to.

linkType
The logic identifier of links this rule should be applied to.

destNodeType
The logic identifier of nodes this rule should be applied to.

directions
An array of OrderDirection values defining the orientation of the links starting segments.

Return Value

true if this rule has been added successfully; otherwise, **false**.

FlowLayoutRules.AddOutgoingBendRule Method (String, String, String[], OrderDirection)

Adds a rule for the orientation of the starting segment of an outgoing link according to the type of the link's origin node.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool AddOutgoingBendRule (
    string originNodeType,
    string linkType,
    string[] destNodeTypes,
    OrderDirection direction
)
```

Visual Basic Copy Code

```
Public Function AddOutgoingBendRule( _
    originNodeType As String, _
    linkType As String, _
    destNodeTypes() As String, _
    direction As OrderDirection _
) As Boolean
```

Parameters

originNodeType
The logic identifier of nodes this rule will be applied to.

linkType
The logic identifier of links this rule will be applied to.

destNodeTypes
The logic identifiers of nodes this rule will be applied to.

direction
An OrderDirection value defining the orientation of the link's starting segment.

Return Value

true if this rule has been added successfully; otherwise, **false**.

FlowLayoutTraits Enumeration

Values used as keys in FlowLayout rules.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum FlowLayoutTraits
```

Visual Basic Copy Code

```
Public Enum FlowLayoutTraits
```

Members

	Member name	Description
	PossibleConnection	For internal use.
	OrderingRule	Specified the preferred order for nodes.
	NodeDirection	For internal use.
	NodeDistance	Specifies the distance left between this node and the next in the sequence.
	LaneNode	Specifies that FlowLayout should treat a node as a lane.
	LogicID	Specifies a string used to identify items in FlowLayout rules.
	Lane	Specifies the lane to which a node should be assigned.
	VerticalSubgroupsAlignment	A boolean value specifying the alignment of nodes within a group.
	StandardLinkBend	For internal use.
	InLink	Identifies possible incoming links in FlowLayout rules.
	OutLink	Identifies possible outgoing links in FlowLayout rules.
	NotSpecified	For internal use.
	VerticalDisconnectedGroupsAlignment	A boolean value specifying the alignment of nodes within a group.

MindFusion.Layout Namespace

HierarchicalLayoutTraits Enumeration

Indicates item traits specific to hierarchical layouts. Members of this enumeration can be used as keys in the DiagramItem.LayoutTraits hashtable.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum HierarchicalLayoutTraits
```

Visual Basic Copy Code

```
Public Enum HierarchicalLayoutTraits
```

Members

	Member name	Description
	Level	The number associated with this key specifies the index of the level of the item in the level-planar graph.

See Also

MindFusion.Layout Namespace

LayeredLayoutTraits Enumeration

Indicates item traits specific to layered layouts. Members of this enumeration can be used as keys in the DiagramItem.LayoutTraits hashtable.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum LayeredLayoutTraits
```

Visual Basic Copy Code

```
Public Enum LayeredLayoutTraits
```

Members

	Member name	Description
	Layer	The number associated with this key specifies the index of the layer the layout should attempt to place the node to. Specifying a negative number indicates a layer starting from the last. For example, -1 would indicate the last layer, -2 - the layer before the last, and so on.

LayoutRules Members

Summary description for LayoutRules.

The following tables list the members exposed by the **LayoutRules** type.

Public Constructors

	Name	Description
	LayoutRules	Initializes a new instance of the LayoutRules class.

Public Methods

	Name	Description
	AddLayoutRule	Overloaded.
	BuildKey	Builds a key - object for the new rule, as a pair of two objects: *obj1* and *obj2*.
	GetLayoutRule	If there is rule with key - Key initializes - Value otherwise fails;
	ValidateRules	Checks if there is a rule for each key in KeyList

MindFusion.Layout Namespace

LayoutRules Constructor

Initializes a new instance of the LayoutRules class.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public LayoutRules ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

LayoutRules Class
MindFusion.Layout Namespace

LayoutRules Methods

LayoutRules.AddLayoutRule Method

Overload List

Name	Description
LayoutRules.AddLayoutRule (Object, Object)	Adds or sets a new rule, depending on if the rule with key - Key already exists or no;
LayoutRules.AddLayoutRule (Object, Object, Object)	Builds a key as a pair of the objects Object1 and Object2 and adds or sets a new rule, with this key and value - Value;

See Also

LayoutRules Members
LayoutRules Class
MindFusion.Layout Namespace

LayoutRules.AddLayoutRule Method (Object, Object)

Adds or sets a new rule, depending on if the rule with key - Key already exists or no;

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool AddLayoutRule (
    Object Key,
    Object Value
)
```

Visual Basic Copy Code

```
Public Function AddLayoutRule( _
    Key As Object, _
    Value As Object _
) As Boolean
```

Parameters

Key

Value

Return Value

See Also

AddLayoutRule Method Overload List
LayoutRules Members
LayoutRules Class
MindFusion.Layout Namespace

LayoutRules.AddLayoutRule Method (Object, Object, Object)

Builds a key as a pair of the objects Object1 and Object2 and adds or sets a new rule, with this key and value - Value;

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool AddLayoutRule (
    Object Object1,
    Object Object2,
    Object Value
)
```

Visual Basic Copy Code

```
Public Function AddLayoutRule( _
    Object1 As Object, _
    Object2 As Object, _
    Value As Object _
) As Boolean
```

Parameters

Object1

Object2

Value

Return Value

See Also

AddLayoutRule Method Overload List
LayoutRules Members
LayoutRules Class
MindFusion.Layout Namespace

LayoutRules.BuildKey Method

Builds a key - object for the new rule, as a pair of two objects: *obj1* and *obj2*.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Object BuildKey (
    Object obj1,
    Object obj2
)
```

Visual Basic Copy Code

```
Public Function BuildKey( _
    obj1 As Object, _
    obj2 As Object _
) As Object
```

Parameters

obj1

obj2

Return Value

See Also

LayoutRules.GetLayoutRule Method

If there is rule with key - Key initializes - Value otherwise fails;

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public virtual bool GetLayoutRule (
    Object Key,
    out Object Value
)
```

Visual Basic Copy Code

```
Public Overridable Function GetLayoutRule( _
    Key As Object, _
    <System.Runtime.InteropServices.Out()> ByRef Value As Object _
) As Boolean
```

Parameters

Key

Value

Return Value

See Also

LayoutRules Members
LayoutRules Class
MindFusion.Layout Namespace

LayoutRules.ValidateRules Method

Checks if there is a rule for each key in KeyList

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool ValidateRules (
    ArrayList KeyList
)
```

Visual Basic Copy Code

```
Public Function ValidateRules( _
    KeyList As ArrayList _
) As Boolean
```

Parameters

KeyList

Return Value

LayoutRules Members
LayoutRules Class
MindFusion.Layout Namespace

NodeRules Class

Represents a set of rules that are applied according to the logic identifiers of node pairs.

Syntax

C# Copy Code

```
public class NodeRules : LayoutRules
```

Visual Basic Copy Code

```
Public Class NodeRules
    Inherits LayoutRules
```

Inheritance Hierarchy

System.Object
  MindFusion.Layout.LayoutRules
    MindFusion.Layout.NodeRules

NodeRules Members

Represents a set of rules that are applied according to the logic identifiers of node pairs.

The following tables list the members exposed by the NodeRules type.

Public Properties

	Name	Description
	FirstGroupLevelNegative	A rule defining which nodes should be placed above the "Control Flow" line. Assign an array of the node types logic identifiers to this property.
	FirstGroupLevelPositive	A rule defining which nodes should be placed below the "Control Flow" line. Assign an array of the node types logic identifiers to this property.
	GroupEndNodes	Specifies which nodes should be considered the end of the current sub-group. Assign an array of the node types logic identifiers to this property.
	GroupStartNodes	Specifies which nodes should be considered the start of a new sub-group. Assign an array of the node types logic identifiers to this property.
	MainConnectorId	Specifies which type of connectors define the control flow in the process represented by the arranged diagram.
	MainConnectorOrientation	Specifies the orientation of the "Control Flow" sequence of links, and thus the main orientation for the layout.
	VerticalDisconnectedGroupsAlignment	Specifies whether disconnected subgroups from the same lane should be aligned and arranged vertically.
	VerticalSubgroupsAlignment	Specifies whether connected subgroups from the same lane should be aligned and arranged vertically.

Public Methods

	Name	Description
	AddLayoutRule	Overloaded. (Inherited from LayoutRules.)
	BuildKey	Builds a key - object for the new rule, as a pair of two objects: *obj1* and *obj2*. (Inherited from LayoutRules.)
	GetLayoutRule	If there is rule with key - Key initializes - Value otherwise fails; (Inherited from LayoutRules.)
	ValidateRules	Checks if there is a rule for each key in KeyList (Inherited from LayoutRules.)

NodeRules Properties

NodeRules.FirstGroupLevelNegative Property

A rule defining which nodes should be placed above the "Control Flow" line. Assign an array of the node types logic identifiers to this property.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Object FirstGroupLevelNegative { get; set; }
```

Visual Basic Copy Code

```
Public Property FirstGroupLevelNegative As Object
```

Property Value

See Also

NodeRules Members
NodeRules Class
MindFusion.Layout Namespace

NodeRules.FirstGroupLevelPositive Property

A rule defining which nodes should be placed below the "Control Flow" line. Assign an array of the node types logic identifiers to this property.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Object FirstGroupLevelPositive { get; set; }
```

Visual Basic Copy Code

```
Public Property FirstGroupLevelPositive As Object
```

Property Value

See Also

NodeRules Members
NodeRules Class
MindFusion.Layout Namespace

NodeRules.GroupEndNodes Property

Specifies which nodes should be considered the end of the current sub-group. Assign an array of the node types logic identifiers to this property.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Object GroupEndNodes { get; set; }
```

Visual Basic Copy Code

```
Public Property GroupEndNodes As Object
```

Property Value

See Also

NodeRules Members
NodeRules Class
MindFusion.Layout Namespace

NodeRules.GroupStartNodes Property

Specifies which nodes should be considered the start of a new sub-group. Assign an array of the node types logic identifiers to this property.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Object GroupStartNodes { get; set; }
```

Visual Basic Copy Code

```
Public Property GroupStartNodes As Object
```

Property Value

See Also

NodeRules Members
NodeRules Class
MindFusion.Layout Namespace

NodeRules.MainConnectorId Property

Specifies which type of connectors define the control flow in the process represented by the arranged diagram.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public string MainConnectorId { get; set; }
```

Visual Basic Copy Code

```
Public Property MainConnectorId As String
```

Property Value

See Also

NodeRules Members
NodeRules Class
MindFusion.Layout Namespace

NodeRules.MainConnectorOrientation Property

Specifies the orientation of the "Control Flow" sequence of links, and thus the main orientation for the layout.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public SimpleOrientation MainConnectorOrientation { get; set; }
```

Visual Basic Copy Code

```
Public Property MainConnectorOrientation As SimpleOrientation
```

Property Value

See Also

NodeRules Members
NodeRules Class
MindFusion.Layout Namespace

NodeRules.VerticalDisconnectedGroupsAlignment Property

Specifies whether disconnected subgroups from the same lane should be aligned and arranged vertically.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool VerticalDisconnectedGroupsAlignment { get; set; }
```

Visual Basic Copy Code

```
Public Property VerticalDisconnectedGroupsAlignment As Boolean
```

Property Value

See Also

NodeRules Members
NodeRules Class
MindFusion.Layout Namespace

NodeRules.VerticalSubgroupsAlignment Property

Specifies whether connected subgroups from the same lane should be aligned and arranged vertically.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public bool VerticalSubgroupsAlignment { get; set; }
```

Visual Basic Copy Code

```
Public Property VerticalSubgroupsAlignment As Boolean
```

Property Value

See Also

NodeRules Members
NodeRules Class
MindFusion.Layout Namespace

OrderDirection Enumeration

Values controlling the direction of link segments in FlowLayout rules.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum OrderDirection
```

Visual Basic Copy Code

```
Public Enum OrderDirection
```

Members

	Member name	Description
	Leftward	Specifies leftward link direction.
	Rightward	Specifies rightward link direction.
	Upward	Specifies upward link direction.
	Downward	Specifies downward link direction.

	NotSpecified	Unspecified link direction.

MindFusion.Layout Namespace

Pair Members

Represents a coupling between two arbitrary objects.

The following tables list the members exposed by the Pair type.

Public Constructors

	Name	Description
	Pair	Overloaded.

Public Properties

	Name	Description
	FirstObject	Gets or sets the first pair object.
	PairElements	Gets the elements of the pair as an arraylist.
	SecondObject	Gets or sets the second pair object.

Public Methods

	Name	Description
	CompareTo	Implements IComparable.CompareTo.
	Equals	Object.Equals override.
	GetHashCode	Object.GetHashCode override.

MindFusion.Layout Namespace

Pair Constructor

Overload List

Name	Description
Pair ()	Initializes a new instance of the Pair class.
Pair (Object, Object)	Initializes a new instance of the Pair class.

See Also

Pair Class
MindFusion.Layout Namespace

Pair Constructor ()

Initializes a new instance of the Pair class.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Pair ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

Pair Constructor Overload List
Pair Class
MindFusion.Layout Namespace

Pair Constructor (Object, Object)

Initializes a new instance of the Pair class.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Pair (
    Object obj1,
    Object obj2
)
```

Visual Basic Copy Code

```
Public New ( _
    obj1 As Object, _
    obj2 As Object _
)
```

Parameters

obj1

obj2

See Also

Pair Constructor Overload List
Pair Class
MindFusion.Layout Namespace

Pair Methods

Pair.CompareTo Method

Implements IComparable.CompareTo.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public int CompareTo (
    Object obj
)
```

Visual Basic Copy Code

```
Public Function CompareTo( _
    obj As Object _
) As Integer
```

Parameters

obj

Return Value

See Also

Pair Members
Pair Class
MindFusion.Layout Namespace

Pair.Equals Method

Object.Equals override.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public override bool Equals (
    Object obj
)
```

Visual Basic Copy Code

```
Public Overrides Function Equals( _
    obj As Object _
) As Boolean
```

Parameters

obj

Return Value

See Also

Pair Members
Pair Class
MindFusion.Layout Namespace

Pair.GetHashCode Method

Object.GetHashCode override.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public override int GetHashCode ()
```

Visual Basic Copy Code

```
Public Overrides Function GetHashCode () As Integer
```

Return Value

See Also

Pair Members
Pair Class
MindFusion.Layout Namespace

Pair Properties

Pair.FirstObject Property

Gets or sets the first pair object.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Object FirstObject { get; set; }
```

Visual Basic Copy Code

```
Public Property FirstObject As Object
```

Property Value

See Also

Pair Members
Pair Class
MindFusion.Layout Namespace

Pair.PairElements Property

Gets the elements of the pair as an arraylist.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public ArrayList PairElements { get; }
```

Visual Basic Copy Code

```
Public ReadOnly Property PairElements As ArrayList
```

Property Value

See Also

Pair Members
Pair Class
MindFusion.Layout Namespace

Pair.SecondObject Property

Gets or sets the second pair object.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Object SecondObject { get; set; }
```

Visual Basic Copy Code

```
Public Property SecondObject As Object
```

Property Value

See Also

Pair Members
Pair Class
MindFusion.Layout Namespace

PartitionMethod Enumeration

Identifies graph partitioning methods supported by CompositeLayout.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum PartitionMethod
```

Visual Basic Copy Code

```
Public Enum PartitionMethod
```

Members

	Member name	Description
	BiconnectedComponents	Partition graphs by their biconnected components.
	ShortestPath	Partition graphs by node paths distance.
	Custom	Custom partitioning.
	LinkDensity	

See Also

MindFusion.Layout Namespace

PathNode Class

Represents a path node, used by the link routing algorithm.

Syntax

C# Copy Code

```
public class PathNode : IComparable
```

Visual Basic Copy Code

```
Public Class PathNode
    Implements IComparable
```

Inheritance Hierarchy

System.Object
  MindFusion.Layout.PathNode

PathNode Members
MindFusion.Layout Namespace

PathNode Members

Represents a path node, used by the link routing algorithm.

The following tables list the members exposed by the PathNode type.

Public Constructors

	Name	Description
	PathNode	Initializes a new instance of the PathNode class.

Public Methods

	Name	Description
	CompareTo	IComparable.CompareTo implementation.

See Also

PathNode Class
MindFusion.Layout Namespace

PathNode Constructor

Initializes a new instance of the PathNode class.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public PathNode (
    int x,
    int y
)
```

Visual Basic Copy Code

```
Public New ( _
    x As Integer, _
    y As Integer _
)
```

Parameters

x

y

See Also

PathNode Class
MindFusion.Layout Namespace

PathNode Methods

PathNode.CompareTo Method

IComparable.CompareTo implementation.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public int CompareTo (
    Object obj
)
```

Visual Basic Copy Code

```
Public Function CompareTo( _
    obj As Object _
) As Integer
```

Parameters

obj

Return Value

See Also

PathNode Members
PathNode Class
MindFusion.Layout Namespace

Point3D Structure

Represents the coordinates of a point in a 3-dimensional space.

Syntax

C# Copy Code

```
public struct Point3D
```

Visual Basic Copy Code

```
Public Structure Point3D
```

See Also

Point3D Members
MindFusion.Layout Namespace

Point3D Members

Represents the coordinates of a point in a 3-dimensional space.

The following tables list the members exposed by the Point3D type.

Public Constructors

	Name	Description
	Point3D	Initializes a new instance of the Point3D class.

Public Properties

	Name	Description
	X	Gets or sets the X coordinate of this point.
	Y	Gets or sets the Y coordinate of this point.
	Z	Gets or sets the Z coordinate of this point.

See Also

Point3D Structure
MindFusion.Layout Namespace

Point3D Constructor

Initializes a new instance of the Point3D class.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Point3D (
    double x,
    double y,
    double z
)
```

Visual Basic Copy Code

```
Public New ( _
    x As Double, _
    y As Double, _
    z As Double _
)
```

Parameters

x

y

z

See Also

Point3D Structure
MindFusion.Layout Namespace

Point3D Properties

Point3D.X Property

Gets or sets the X coordinate of this point.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double X { get; set; }
```

Visual Basic Copy Code

```
Public Property X As Double
```

Property Value

See Also

Point3D Members
Point3D Structure
MindFusion.Layout Namespace

Point3D.Y Property

Gets or sets the Y coordinate of this point.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double Y { get; set; }
```

Visual Basic Copy Code

```
Public Property Y As Double
```

Property Value

See Also

Point3D Members
Point3D Structure
MindFusion.Layout Namespace

Point3D.Z Property

Gets or sets the Z coordinate of this point.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public double Z { get; set; }
```

Visual Basic Copy Code

```
Public Property Z As Double
```

Property Value

See Also

Point3D Members
Point3D Structure
MindFusion.Layout Namespace

PointList Class

Syntax

C# Copy Code

```
public class PointList : List<Point>
```

Visual Basic Copy Code

```
Public Class PointList
    Inherits List(Of Point)
```

Inheritance Hierarchy

System.Object
  System.Collections.Generic.List(Point)
    MindFusion.Layout.PointList

See Also

PointList Members
MindFusion.Layout Namespace

PointList Members

The following tables list the members exposed by the PointList type.

Public Constructors

	Name	Description
	PointList	Overloaded.

Public Properties

	Name	Description
	First	Gets or sets the first point in the collection.
	Last	Gets or sets the last point in the collection.

Public Methods

	Name	Description
	AddRange	
	Clone	Creates a shallow copy of this collection.

MindFusion.Layout Namespace

PointList Constructor

Overload List

Name	Description
PointList ()	Initializes a new instance of the PointList class.
PointList (ICollection)	Initializes a new instance of the PointList class with the specified point values.
PointList (Int32)	Initializes a new instance of the PointList class.

See Also

PointList Class
MindFusion.Layout Namespace

PointList Constructor ()

Initializes a new instance of the PointList class.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public PointList ()
```

Visual Basic Copy Code

```
Public Sub New ()
```

See Also

PointList Constructor Overload List
PointList Class
MindFusion.Layout Namespace

PointList Constructor (ICollection)

Initializes a new instance of the PointList class with the specified point values.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public PointList (
    ICollection points
)
```

Visual Basic Copy Code

```
Public New ( _
    points As ICollection _
)
```

Parameters

points

See Also

PointList Constructor Overload List
PointList Class
MindFusion.Layout Namespace

PointList Constructor (Int32)

Initializes a new instance of the PointList class.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public PointList (
    int size
)
```

Visual Basic Copy Code

```
Public New ( _
    size As Integer _
)
```

Parameters

size

See Also

PointList Constructor Overload List
PointList Class
MindFusion.Layout Namespace

PointList Methods

PointList.AddRange Method

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public void AddRange (
    ICollection points
)
```

Visual Basic Copy Code

```
Public Sub AddRange( _
    points As ICollection _
)
```

Parameters

points

See Also

PointList Members
PointList Class
MindFusion.Layout Namespace

PointList.Clone Method

Creates a shallow copy of this collection.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public PointList Clone ()
```

Visual Basic Copy Code

```
Public Function Clone () As PointList
```

Return Value

See Also

PointList Members
PointList Class
MindFusion.Layout Namespace

PointList Properties

PointList.First Property

Gets or sets the first point in the collection.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public Point First { get; set; }
```

Visual Basic Copy Code

```
Public Property First As Point
```

Property Value

Remarks

An IndexOutOfRangeException will be thrown if the collection is empty.

See Also

PointList Members
PointList Class

RouteHeuristics Delegate

The link routing algorithm uses a heuristic function of this type in its prediction steps.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public delegate int RouteHeuristics (
    Point start,
    Point end
)
```

Visual Basic Copy Code

```
Public Delegate Function RouteHeuristics( _
    start As Point, _
    end As Point _
) As Integer
```

Parameters

start
A Point specifying the first of the points, between which the distance is calculated.

end
A Point specifying the first of the points, between which the distance is calculated.

Return Value

An integer value indicating the calculated distance between the specified points.

Remarks

Functions of this type can be assigned to the RouteHeuristics property of the RoutingOptions class.

RouteHeuristics Delegate

The link routing algorithm uses a heuristic function of this type in its prediction steps.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public delegate int RouteHeuristics (
    PointI start,
    PointI end
)
```

Visual Basic Copy Code

```
Public Delegate Function RouteHeuristics( _
    start As PointI, _
    end As PointI _
) As Integer
```

Parameters

start
A Point specifying the first of the points, between which the distance is calculated.

end
A Point specifying the first of the points, between which the distance is calculated.

Return Value

An integer value indicating the calculated distance between the specified points.

Remarks

Functions of this type can be assigned to the RouteHeuristics property of the RoutingOptions class.

RoutingOptions Members

Allows customization of various aspects of the link routing algorithm.

The following tables list the members exposed by the RoutingOptions type.

Public Properties

	Name	Description
	GridSize	Gets or sets the size of the pieces of the routing grid.

	IgnoreAnchoring	For internal use.
	LengthCost	Gets or sets a value added to the total cost of a route for each piece of the routing grid occupied by the route.
	NodeVicinityCost	Gets or sets the size of a buffer zone around a node for which routes get a penalty cost if they pass through it.
	TurnCost	Gets or sets a value added to the total cost of a route if it makes a turn.

SimpleKeys Members

Defines keys that can be used to define FlowLayout rules.

The following tables list the members exposed by the SimpleKeys type.

Public Constructors

	Name	Description
	SimpleKeys	Initializes a new instance of the SimpleKeys class.

Public Fields

	Name	Description
	ConnectorTypes	Specifies a list of connector identifiers.
	FirstGroupLevelNegative	A rule defining which nodes should be placed above the "Control Flow" line. Associate an array of the node types logic identifiers with this key.
	FirstGroupLevelPositive	A rule defining which nodes should be placed below the "Control Flow" line. Associate an array of the node types logic identifiers with this key.

	GroupEndNodes	Specifies which nodes should be considered the end of the current sub-group. Associate an array of the node types logic identifiers with this key.
	GroupStartNodes	Specifies which nodes should be considered the start of a new sub-group. Associate an array of the node types logic identifiers with this key.
	MainConnectorOrientation	Specifies the orientation of the "Control Flow" sequence of links, and thus the main orientation for the layout.
	MainSubgroupConnector	Defines which type of connectors can be used as guideline (defining the graph control flow).
	PossibleConnection	Specifies what kind of node connections are allowed.

Public Properties

	Name	Description
	AllKeys	A list of all keys defined in this class.

Public Methods

	Name	Description
	ValidateRules	Checks if there is a rule for each key in the key list.

SimpleRules Members

Class of simple rules applicable to the Flowlayout algorithm.

The following tables list the members exposed by the SimpleRules type.

Public Constructors

	Name	Description
	SimpleRules	Overloaded.

Public Properties

	Name	Description
	EndSubgpouNode	Defines which type of nodes will be used as a "sub group end" node;
	MainConnectorOrientation	A key defining the space orientation of a "Control Flow" and respectively for the layout;
	MainSubgpouConnector	Defines which type of connectors can be used as guideline (defining the graph control flow).
	StartSubgpouNode	Defines which type of nodes will be used as a "sub group" start node.

Public Methods

	Name	Description
	AddLayoutRule	Overloaded. (Inherited from LayoutRules.)
	BuildKey	Builds a key - object for the new rule, as a pair of two objects: *obj1* and *obj2*. (Inherited from LayoutRules.)
	GetLayoutRule	If there is rule with key - Key initializes - Value otherwise fails; (Inherited from LayoutRules.)
	ValidateRules	Checks if there is a rule for each key in KeyList (Inherited from LayoutRules.)

SpringLayoutMethod Enumeration

Specifies what energy model SpringLayout should use for the simulation.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum SpringLayoutMethod
```

Visual Basic Copy Code

```
Public Enum SpringLayoutMethod
```

Members

	Member name	Description
	Classic	Use Hooke's law of elasticity to treat links as springs, and Coulomb's inverse square law to implement repulsion between nodes.
	FruchtermanReingold	Use artificial attraction forces for links and repulsion forces for nodes that cancel each other at about the distance specified in NodeDistance, along with a simulated cooling schedule used for fine-tuning. Based on the method of Thomas Fruchterman and Edward Reingold.

See Also

MindFusion.Layout Namespace

SpringLayoutTraits Enumeration

Indicates item traits specific to SpringLayout. Members of this enumeration can be used as keys in the DiagramItem.LayoutTraits hashtable.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum SpringLayoutTraits
```

Visual Basic Copy Code

```
Public Enum SpringLayoutTraits
```

Members

	Member name	Description
	Frozen	If the LayoutTraits value associated with a node through this key is true, SpringLayout considers the repulsion forces exerted by the node to other nodes, but ignores forces acting on the node and keeps it in place.

See Also

MindFusion.Layout Namespace

SwimlaneLayoutTraits Enumeration

Indicates item traits specific to swimlane layouts. Members of this enumeration can be used as keys in the DiagramItem.LayoutTraits hashtable.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum SwimlaneLayoutTraits
```

Visual Basic Copy Code

```
Public Enum SwimlaneLayoutTraits
```

Members

	Member name	Description
	Lane	Specifies the lane to which a node should be assigned.
	SortOrder	Specifies custom sort order of nodes in the same lane.

See Also

MindFusion.Layout Namespace

TreeLayoutTraits Enumeration

Indicates item traits specific to tree layouts. Members of this enumeration can be used as keys in the DiagramItem.LayoutTraits hashtable.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum TreeLayoutTraits
```

Visual Basic Copy Code

```
Public Enum TreeLayoutTraits
```

Members

	Member name	Description
	Assistant	If the LayoutTraits value associated with a node through this key is **true**, centered TreeLayout treats this node as an "assistant" during the arrangement. If the value is **false** or is not present, the node is treated as "subordinate". The associated value can also be of type AssistantType if it is required to specify the position of the assistant node relative to its parent. This value is considered when the EnableAssistants property of **TreeLayout** is set to **true**.

MindFusion.Layout Namespace

TreeMapLayoutTraits Enumeration

Indicates item traits specific to tree map layouts. Members of this enumeration can be used as keys in the DiagramItem.LayoutTraits hashtable.

Namespace: MindFusion.Layout
Assembly: MindFusion.Diagramming.Layout

Syntax

C# Copy Code

```
public enum TreeMapLayoutTraits
```

Visual Basic Copy Code

```
Public Enum TreeMapLayoutTraits
```

Members

	Member name	Description
	HeaderSize	The header size of a master node in a tree-map layout.

Table of Predefined Shapes

Shape	Identifier	Common Uses
	Actor	A user An actor in use case model
	Alternative	An alternative in SDL An extraction in flowcharts Storage in quality management
	Arrow1	Use as desired
	Arrow2	Use as desired
	Arrow3	Transportation in quality management A reference point
	Arrow4	Use as desired
	Arrow5	Use as desired
	Arrow6	Use as desired

	Arrow7	A signal Electronic transmission of data
	Arrow8	Use as desired
	Arrow9	Use as desired
	BeginLoop	Begin of a loop
	BpmnComplex	BPMN Gateways: Complex Decision/Merge
	BpmnDataBasedXor	BPMN Gateways: Data-Based Exclusive Decision/Merge (XOR)
	BpmnEndCancel	BPMN Events: Cancel (End)
	BpmnEndCompensation	BPMN Events: Compensation (End)
	BpmnEndError	BPMN Events: Error (End)
	BpmnEndLink	BPMN Events: Link (End)
	BpmnEndMessage	BPMN Events: Message (End)
	BpmnEndMultiple	BPMN Events: Multiple (End)
	BpmnEndTerminate	BPMN Events: Terminate (End)
	BpmnEventBasedXor	BPMN Gateways: Event-Based Exclusive Decision/Merge (XOR)
	BpmnInclusive	BPMN Gateways: Inclusive Decision/Merge (OR)

	BpmnIntermediateCancel	BPMN Events: Cancel (Intermediate)
	BpmnIntermediateCompensation	BPMN Events: Compensation (Intermediate)
	BpmnIntermediateError	BPMN Events: Error (Intermediate)
	BpmnIntermediateLink	BPMN Events: Link (Intermediate)
	BpmnIntermediateMessage	BPMN Events: Message (Intermediate)
	BpmnIntermediateMultiple	BPMN Events: Multiple (Intermediate)
	BpmnIntermediateRule	BPMN Events: Rule (Intermediate)
	BpmnIntermediateTimer	BPMN Events: Timer (Intermediate)
	BpmnParallelFork	BPMN Gateways: Parallel Fork/Join (AND)
	BpmnStartLink	BPMN Events: Link (Start)
	BpmnStartMessage	BPMN Events: Message (Start)
	BpmnStartMultiple	BPMN Events: Multiple (Start)
	BpmnStartRule	BPMN Events: Rule (Start)
	BpmnStartTimer	BPMN Events: Timer (Start)
	Cloud	Object instance in data flow diagrams

	Collate	A collation in flowcharts
	ConeDown	Use as desired
	ConeUp	Use as desired
	ConnectedIssues	Connected issues in quality management
	CreateRequest	Request to create in SDL
	Cross	Use as desired
	Cube	Use as desired
	Cylinder	Use as desired
	Database	A database in flowcharts
	DataTransmition	Electronic transmission of data
	DDelay	Use as desired
	Decagon	Use as desired
	Decision	Decision in flowcharts A comparison in flowcharts Relationship in data flow diagrams
	Decision2	A decision in SDL
	Delay	A delay in process diagrams
	DInDelay	Use as desired
	DirectAccessStorage	A direct access storage

	DiskStorage	Data stored on disk in flowcharts
	Display	Data that is displayed for human use
	DividedEvent	An event
	DividedProcess	A process or document in flowcharts Entity in data flow diagrams
	Document	A document
	Donut	Use as desired
	DOutDelay	Use as desired
	Ellipse	A cross-reference within the same page of a flowchart Process in data flow diagrams State in data flow diagrams A continuation of the flowchart in SDL An use case Operation in quality management
	EndLoop	End of a loop
	ExternalOrganization	An external organization
	ExternalProcess	An external process
	File	A file
	FramedRectangle	Use as desired
	Gate	A gateway
	Heart	Use as desired
	Heptagon	Use as desired

	Hourglass	Use as desired
	Input	Data that is input by manual means
	InternalStorage	An internal storage
	Interrupt	An interrupt
	Interrupt2	An interrupt
	IsoProcess	Iso9000 process
	Junction	A summing junction A return in SDL
	Lightning	Use as desired
	LinedDocument	A document in flowcharts
	ManualOperation	Operation performed by a human
	Merge	A merger in flowcharts Inbound goods in quality management Non-electronic file Stop state in data flow diagrams
	MessageFromUser	A message from user side in SDL
	MessageToUser	A message to user side in SDL
	Microform	A microform
	MicroformProcessing	A microform processing
	MicroformRecording	A microform recording
	MultiDocument	A multiple document in flowcharts

	MultiProc	A multiple process or document in flowcharts
	Octagon	Use as desired
	OfflineStorage	An offline storage
	OffpageConnection	A cross-reference to another page of a flowchart
	OffpageReference	A cross-reference to another page of a flowchart A foreign module
	Or	An 'or' statement
	Pentagon	Use as desired
	Plaque	Use as desired
	PrimitiveFromCall	A primitive from call control in SDL
	PrimitiveToCall	A primitive to call control in SDL
	Procedure	Procedure in SDL
	Process	A process or document in flowcharts A file or data storage
	Prysm	Use as desired
	PunchedCard	A punched card
	PyramidDown	Use as desired
	PyramidUp	Use as desired
	Rectangle	A metric operation 'External interactor' in data flow diagrams Inspection in quality management

	RightTriangle	Use as desired
	RoundRect	A process or item in flowcharts An event An issue in quality management
	RSave	Input or output data in flowcharts
	Save	A save in SDL Input or output data in flowcharts
	Sort	A sort operation
	Sphere	Use as desired
	Star	Use as desired
	Star4Pointed	Use as desired
	Star5Pointed	Use as desired
	Star6Pointed	Use as desired
	Star7Pointed	Use as desired
	Star16Pointed	Use as desired
	Star24Pointed	Use as desired
	Star32Pointed	Use as desired
	Start	Start of a program flow A starting point in SDL
	Tape	Sequentially accessible data
	Terminator	Start or end of a program flow

	TransmittalTape	A transmittal tape
	Trapezoid	Use as desired

Technical Support

Detailed information about everything connected with software products offered by MindFusion - online documentation, demos, information about forthcoming products can be found at https://mindfusion.dev/. The site is updated every day, so make sure you visit it regularly to catch up with the newest from us.

Apart from that, MindFusion employs a dedicated and technically proficient support team. This guarantees that all your questions and inquiries will be answered in quick and professional manner. They can be reached by e-mail at mailto:support@mindfusion.eu or by phone at +359 889 199 729.

You can post a question about MvcDiagram on the discussion board:

https://mindfusion.dev/Forum/YaBB.pl?board=mvcdg_disc

or visit our help desk site:

https://mindfusion.dev/HelpDesk/index.php

We will be happy to hear any suggestions and recommendations you might have regarding MvcDiagram. We do take in account the opinion of every single person who has shown interest in our products.

MindFusion Products

MindFusion offers various programming components for different platforms. Below is a list of our products with links to their sections on our website as well link to download a trial version. Clients that have already purchased a product use an increasing discount for each subsequent one.

Acknowledgements

Our thanks to:

- Joe Stegman, who permitted us to use his PNGEncoder class in the MvcDiagram implementation.
- Jon Harris, who permitted us to port his PQTree Java code for the MindFusion.GraphLib implementation.
- Nader Alkhatib, who contributed his LogicGates project as a sample for the MvcDiagram package.
- Mark James for the Silk icon set (http://www.famfamfam.com/lab/icons/silk/)
- ic#code for their #ziplib, used for implementing some custom MSI actions in MindFusion setup kits.
