Introduction

MvcDiagram is a general-purpose software component that can be used to display various types of diagrams and charts in web applications. It can be easily integrated into any project targeting the Microsoft ASP.NET MVC platform. By providing your software with ready to use capabilities for visualizing and editing relational data, MvcDiagram saves you from hundreds of hours of coding and debugging efforts.

MvcDiagram can give graphical representation to:

- Workflow processes
- Object hierarchies and relationships
- Graphs and networks
- Entity-relationship / database diagrams
- IVR systems
- Industrial automation processes
- Genealogy trees
- Algorithms and flowcharts
- Organizational charts
- XML documents
- Classification hierarchies
- Data mappings

MvcDiagram provides intuitive user-interaction model for creating or editing diagrams. In addition, its programmatic interface places at your disposal many useful functions, ranging from printing and XML serialization to path-finding and automatic layout algorithms.

What's New in this Release

The list below describes recent changes and additions to MvcDiagram:

New in version 4.6

CSS Styling

The styling system now supports defining item appearance through external CSS files. You can style different item types using custom element selectors such as **mfd-shapenode**, **mfd-diagramlink**, or **mfd-tablenode**. The system maps CSS Custom Properties to the internal Style properties. For example, use **--brush** for backgrounds, **--stroke** for outlines, and **--font-size** for text. The new cssClass property on DiagramItem allows for more granular styling using standard class selectors in your CSS. To ensure high performance, computed styles are cached globally, and the system automatically resolves style inheritance across class hierarchies (e.g., a ShapeNode will resolve styles from **mfd-shapenode**, **mfd-diagramnode**, and **mfd-diagramitem** selectors in that order).

CSS Copy Code

```
/* Style all shape nodes */
mfd-shapenode {
    --brush: #f9f9f9;
    --stroke: #333;
    --stroke-thickness: 1px;
    --font-name: 'Verdana';
}

/* Specific styling via the new cssClass property */
mfd-shapenode.urgent {
    --brush: #ffcccc;
    --stroke: #ff0000;
    --stroke-thickness: 2px;
}

/* Style table captions using custom properties */
mfd-tablenode {
    --caption-brush: #e0e0e0;
    --text-color: #000066;
}
```

Compact Multi-graph Layout

A new MinimalArea option has been added to the **MultipleGraphsPlacement** enumeration, which uses a bin-packing algorithm to arrange connected components in a compact, square-like area. This ensures a more efficient use of space compared to horizontal or vertical arrangements when laying out multiple independent graphs.

Polygonal Text Layout

The ShapeNode class now supports a polygonalTextLayout property, enabling text to wrap and align precisely within the geometric boundaries of non-rectangular shapes like triangles, diamonds, and custom polygons. This feature supports both plain and styled text across all alignment modes.

Version History

The list below describes past changes and additions to MvcDiagram:

New in version 4.5.1

Server-side Tag serialization

- Complex Tag and Id objects (class or struct instances) are now saved using **System.Text.Json.JsonSerializer** when saving a diagram to JSON and are automatically preserved during round-trips without having to handle serialization events. JsonSerializeTag and JsonDeserializeTag still allow you to implement custom serialization.
- Due to the removal of BinaryFormatter in .NET 9+, complex **Tag** and **Id** objects (class or struct instances) are now saved using **System.Xml.Serialization.XmlSerializer** when saving a diagram to XML. SerializeTag and DeserializeTag events still allow you to implement custom serialization.

Miscellaneous

- generateShortestRoute and findShortestRoute methods added to PathFinder.
- Table row anchorPattern fixes.
- Coordinates in vertical Ruler scale are now rotated in opposite direction to read from bottom to top, which is the accepted standard for rotated labels and consistent with MindFusion components for other platforms.

API changes

- **XmlSerializer** used to save Tag and Id objects could be a breaking change if the tag types are not serializable to XML out of the box. You can continue to serialize tags in binary format by setting the UseXmlSerializer property of XmlOptions to **false** (and adding the *BinaryFormatter* NuGet package to .NET 9+ projects).

New in version 4.5

Paged containers

PagedContainerNode is a ContainerNode subclass that organizes its child nodes into a collection of pages, represented by ContainerPage objects. This allows for the creation of more organized diagrams where nodes can be grouped into logical views within a single container. Only the nodes belonging to the currently active page, specified by currentPage property, are rendered and participate in user interactions.

Navigation between pages is handled by scroll arrows in the caption bar, allowing users to cycle through the pages sequentially. For faster access, users can also double-click the container's caption to open an in-place combo box listing available page titles, enabling direct navigation to any page. The node's text value is automatically set to the title of newly activated **ContainerPage**.

Client-side link routers

PatternRouter and CompositeRouter are now available in JavaScript front-end (previously only on server side / .NET). Diagram's default router is now set to a **CompositeRouter** instance containing a **PatternRouter** and Router sequence. This applies the several standard pattern paths when possible, and otherwise routes links using a simple cost-minimizing router.

Miscellaneous

- Improved BPMN shapes.
- Spatial indexing fixes.
- Visio2013Exporter improvements.

API changes

Default Diagram.linkRouter changed from Router to CompositeRouter instance.

New in version 4.4

ItemListView component

ItemListView supersedes NodeListView and lets you show both nodes and links in the list. Items can be added by calling AddItem method, and removed by calling RemoveItem. DefaultNodeSize property from **NodeListView** is called NewInstanceSize in the new class. The AutoConnectLinks and AutoConnectDistance properties control whether links created via drag-and-drop should connect to nearby nodes in the target diagram. **ItemListView** also provides more properties for customizing the list layout, such as Columns and LabelPosition. For compatibility with legacy code, **NodeListView** won't be removed from the library, bit it won't be getting any new improvements.

Palette component

The Palette control represents a tool palette that displays DiagramItem objects grouped into categories. It implements **Accordion** user interface that displays ItemListView components as its child panels, and category icon, title and collapse/expand button in pane headers. Each child **ItemListView** displays the items added to its corresponding category. Call the AddCategory method to define a category and create its respective accordion pane. Call AddItem to add an item to specified category. Palette provides same layout and appearance properties as the **ItemListView** class.

ItemLabel image

New Image and ImageUrl properties added to ItemLabel let you display icons along a link's geometry, or add more images to a ShapeNode. If a label contains both Text and **Image**, their relative position is specified by ImageAlign property (by default the image is placed on left side of text), and distance by ContentPadding. The image is rendered using bitmap's intrinsic size, unless you override it by setting ImageSize property. You can treat label images as clickable icons by handling linkClicked or nodeClicked events and checking label argument passed to their handlers.

Miscellaneous

- Locked property added to ItemLabel. It lets you prevent users from editing label's text, and moving it when Behavior is set to MoveLabels.
- label argument now provided with item click and double click events.
- Improved repaint speed of Overview component.

New in version 4.3.1

Node constraints

The constraints property lets you apply size and direction constraints to a node. It returns a NodeConstraints object with following properties:

- keepRatio: a bool value indicating whether the initial width/height ratio of a node should be preserved.
- maxHeight: the maximum node height allowed.
- maxWidth: the maximum node width allowed.
- minHeight: the minimum node height allowed.
- minWidth: the minimum node width allowed.
- moveDirection: a member of the DirectionConstraint enumeration. Set it to Horizontal or Vertical to let users move a node only in specified direction.

These constraints are considered when a user modifies the node interactively. They are ignored if node placement is changed programmatically by using API methods and properties.

Tag Helpers

The following tag helpers can now be imported from MindFusion.Diagramming.Mvc namespace:

- <mindfusion-diagramview> creates a DiagramView instance.
- <mindfusion-ruler> creates a Ruler instance.
- <mindfusion-zoomcontrol> creates a ZoomControl instance.
- <mindfusion-overview> creates an Overview instance.
- <mindfusion-nodelistview> creates a NodeListView instance.

Razor Copy Code

```
@addTagHelper *, MindFusion.Diagramming.Mvc
....
<mindfusion-diagramview
    component=(DiagramView)ViewBag.DiagramView
    style="width:100%; height:100%;">
</mindfusion-diagramview>
```

New in version 4.3

Multi-platform support

Multi-platform **System.Drawing** support has been deprecated in .NET 8. To allow hosting on non-Windows servers, we have moved server-side diagram code to **Microsoft.Maui.Graphics** API.

.NET 8 support

Added assemblies and sample projects for .NET 8. Distribution no longer includes assemblies for older .NET versions. If bug fixes are required, we will be patching version 4.2 branch for clients that host on old .NET versions, but no new features will be added to it.

Shape design enhancements

- The anchorPattern property of Shape lets you associate anchor points with shape definitions. That pattern is shared between all nodes of same shape, but can be overridden by setting node's own anchorPattern.
- Individual segments of a shape's geometry can be styled independently by setting stroke and fill attributes of ShapeElement and ShapeDecoration objects.
- We have replaced the Windows -only shape designer tool with an online shape editor at https://mindfusion.dev/tools/shape-designer.html
- The shape editor is implemented as a reusable ShapeDesigner control, which can be integrated into your own applications.

New client-side event system

Event emitter objects are now exposed as properties of Diagram and DiagramView, and you can register handlers by calling their addEventListener method:

JavaScript Copy Code

```
diagram.nodeCreated.addEventListener(
    (sender, args) =>
    {
        if (sender.defaultShape.id == "Rectangle")
            args.node.anchorPattern = pattern1;
        else
            args.node.anchorPattern = pattern2;
    });
```

Legacy event handling syntax will remain supported for compatibility with old code.

Collapse and expand table rows

Table rows can be assigned to distinct sections of the table. Each section can be collapsed or expanded, hiding or showing all rows in the section except the header one. To define a section, set the header property of a row. A section consists of all rows after a header row and spans to the next header. Each header row displays a [±] button that allows expanding or collapsing the section interactively. Clicking that button raises the tableSectionCollapsed and tableSectionExpanded events. Sections can be collapsed or expanded programmatically by setting the expanded property of their header rows.

New mouse events

- **nodePointed** event has been replaced by a set of more specific events: nodePointerEnter and nodePointerLeave are raised when the mouse pointer respectively enters or leaves the boundaries of a node. nodeHovered fires if the pointer rests over a node for hoverDelay milliseconds.
- **linkPointed** event has been replaced by a set of more specific events: linkPointerEnter and linkPointerLeave are raised when the mouse pointer respectively enters or leaves the boundaries of a link. linkHovered fires if the pointer rests over a link for **hoverDelay** milliseconds.

Miscellaneous

- dividerStroke properties added to ContainerNode, TableNode and TreeViewNode classes. It lets you customize the appearance of the divider line drawn between a node's caption bar and content area.
- Set the autoDeleteLinks property to **false** to prevent deleting links along with a node they connect, and disconnect the links instead.
- Enable the autoDeleteChildren property to automatically delete child nodes when a container is deleted.
- Removed an **eval** call used for creating custom components from CompositeNode Json templates, allowing for stricter Content Security Policy rules. Now custom components must be registered by calling registerComponent method to allow instantiating them from a template.
- linkRouted event raised when links are modified by automatic routing.

API changes

- To allow for stricter Content Security Policy rules, the library no longer loads CSS scripts automatically. If you use components from the Diagramming.Controls package, you must now explicitly link the common-ui.css file from distribution's *themes* folder.
- **linkPointed** and **nodePointed** events replaced by linkHovered and nodeHovered.

.NET API changes

- All properties and method parameters of **RectangleF**, **PointF**, **SizeF** and **Color** types from **System.Drawing** namespace have been changed to respective **Rect**, **Point**, **Size** and **Color** from **Microsoft.Maui.Graphics** namespace.
- Due to **BinaryFormatter** deprecation and runtime exceptions in non-desktop applications, binary **SaveToFile** and **LoadFromFile** methods have been removed. Remaining serialization methods allow storing diagrams in JSON and XML formats.
- **SwfExporter** (Adobe Flash format) and **WmfExporter** (Windows Metafile) classes have been removed.

New in version 4.2

Multiple diagram pages

The DiagramDocument class represents a collection of diagram pages or sheets, represented by DiagramPage objects. New pages can be added to the document and existing pages can be removed and reordered by modifying the Pages collection.
The SaveToJsonFile, SaveToXml and SaveToString methods of **DiagramDocument** save all pages in a single file, and respectively the LoadFromJsonFile, LoadFromXml and LoadFromString methods load all pages from the file.

DiagramPage is derived from Diagram and only adds a few properties, so any code that processes **Diagram** objects will work with **DiagramPage** objects too. A diagram document forwards each event raised by its pages, giving you a chance to use the same handler for events raised by different pages. If a page should implement distinct user interaction or validation logic, it is also possible to attach handlers to the **Diagram** events inherited by **DiagramPage**.

A single **DiagramPage** could be assigned to the Diagram property of DiagramView, and that lets you create your own user interface for presenting a list of pages to the user and selecting a current page. The package also includes a TabbedDiagramView that presents all pages of a document in a tabbed user interface where each tab corresponds to a page. The page displayed in the active tab is exposed by the selectedPage property of TabbedDiagramView. The active page can be changed interactively by activating its associated tab. New pages can be added and removed to / from the document through buttons in the tab strip and the pages can be rearranged by dragging their associated tabs with the mouse.

Tabbed diagram view

The TabbedDiagramView control is a view that displays DiagramDocument objects. Individual diagram pages can be activated through the tabs located at the top or at the bottom of the control. The appearance and behavior of the tab strip can be customized using various properties. The location and visibility of the strip is specified through the TabAlignment property. Its height can be changed via the TabsSize property. ShowAddButton and ShowNavigationButtons determine the visibility of the buttons for

interactive tab creation and tab navigation respectively. ShowTabCloseButtons specifies whether the tabs can be closed interactively, by clicking on the small 'x' button displayed in each tab. AllowReorder enables interactive tab rearrangement by mouse dragging.

Async serialization

Files can now be saved and loaded asynchronously. Async methods create a copy of the diagram to process it in a worker thread, and custom item classes must implement Clone method or copy constructor in order to serialize them as expected.

- async SaveToFileAsync and LoadFromFileAsync methods of Diagram and DiagramDocument implement serialization in binary format.
- async SaveToXmlAsync and LoadFromXmlAsync methods of **Diagram** and **DiagramDocument** implement serialization in XML format.
- async SaveToJsonFileAsync, SaveToJsonAsync, LoadFromJsonFileAsync, LoadFromJsonAsync methods of **Diagram** and **DiagramDocument** implement serialization in JSON format.

Reversed tree layouts

(client side / JavaScript)

The reversedLinks property of TreeLayout, RadialTreeLayout and BorderedTreeLayout lets you arrange trees where links point from child to parent nodes, instead of the default parent to child direction.

Miscellaneous

- column, row and node property getters added to CellEventArgs.
- fixed RaiseEvents mode of expandButtonAction; it no longer collapses or expands clicked node's subtree.
- ContainerNode now sorts its child nodes by zIndex instead of insertion order.

New in version 4.1.1

Client-side radial layout

The RadialTreeLayout class arranges tree levels in concentric circles around the root. The levelDistance property specifies the distance between adjacent circles. The direction property specifies placement of first child node. Set stretchFactor to a value larger than 1 in order to stretch level circles into ellipses, providing more space for the layout when using wider nodes.

Miscellaneous

- strokeDashArray and strokeDashOffset properties let you set custom dash patterns when strokeDashStyle is set to Custom.
- Styled text now supports <size=N> element letting you set font size.
- enableStyledText property added to ItemLabel lets you format labels using HTML-like format flags.
- enableWrap and maxWidth properties of **ItemLabel** let you wrap label's text.
- The ArrowHeads class exposes arrowhead shapes as static methods returning respective predefined shape.
- Fixed linkTextStyle exception.
- Fix for NodeListView not working correctly when hosted nodes contain NodeLabel objects.
- New PatternRouter constructor accepts string definitions of link routes.
- EnableParallelism and MaxDegreeOfParallelism layout properties now available in CoreCLR assemblies (.NET Core 3 and 5+ versions).
- New Export overloads of exporter classes allow writing to **System.IO.Stream**.

New in version 4.1

Multiple labels per node

The NodeLabel class allows multiple captions to be displayed for a single DiagramNode of any type. Node labels provide a set of properties allowing full customization of their display and positioning. Label position is defined by specifying a pin point and offset from it, set through SetCornerPosition, SetEdgePosition, SetCenterPosition methods. In addition, the HorizontalAlign and VerticalAlign properties of **NodeLabel** specify on which side of pin point to draw the label's caption.

For example, following code adds extra labels to top-left and bottom-right corners of a ShapeNode:

C# Copy Code

```
var node = diagram.Factory.CreateShapeNode(10, 50, 40, 30);
node.Text = "text"; // centered main text

var lb1 = node.AddLabel("label 1");
lb1.SetCornerPosition(0, 0, 0);
lb1.HorizontalAlign = StringAlignment.Near;
lb1.VerticalAlign = StringAlignment.Near;
lb1.Brush = new SolidBrush(Color.Red);
lb1.TextBrush = new SolidBrush(Color.White);

var lb2 = node.AddLabel("label 2");
lb2.SetCornerPosition(2, 0, 0);
lb2.HorizontalAlign = StringAlignment.Far;
lb2.VerticalAlign = StringAlignment.Far;
lb2.Brush = new SolidBrush(Color.Yellow);
lb2.TextBrush = new SolidBrush(Color.Red);
```

Multi-touch improvements

- The MultiTouchDraw property of DiagramView lets you prevent drawing multiple items simultaneously, while keeping other multitouch gestures enabled.
- The HandleTouchHitDistance property of **DiagramView** makes it easier to grab adjustment handles on mobile devices, without increasing the AdjustmentHandlesSize value.

Miscellaneous

- The MoveLabels behavior lets user move link and node labels interactively.
- HorizontalOffset and VerticalOffset now work for link labels positioned using SetLinkLengthPosition method.
- ExcelExporter exports pen width of links.
- **ExcelExporter** sets more precise positions of link end points.
- LinkEventArgs now includes origin and destination properties that report respective candidate nodes to LinkCreating and LinkModifying client-side event handlers.
- SvgNode.ContentAlign property specifies alignment of SVG drawing inside the node.
- DiagramLink.lineAlignment property sets the vertical position of link's text.
- Horizontal scroll gestures should now work on Macbook trackpad when using virtual scroll mode.

New in version 4

ES6 classes and properties

(client side / JavaScript)

Client side scripts have been refactored to use ES6 classes, properties and native collections. **ArrayList**, **Dictionary** and **Set** classes from MindFusion.Collections namespace have been removed, and replaced by respective JavaScript native **Array**, **Map** and **Set**. Get/set functions have been replaced by getter/setter properties, which should help using the diagram API with binding expressions of various JS frameworks. You could enable propFunctions in CompatConfig in order to continue using legacy get/set functions during migration.

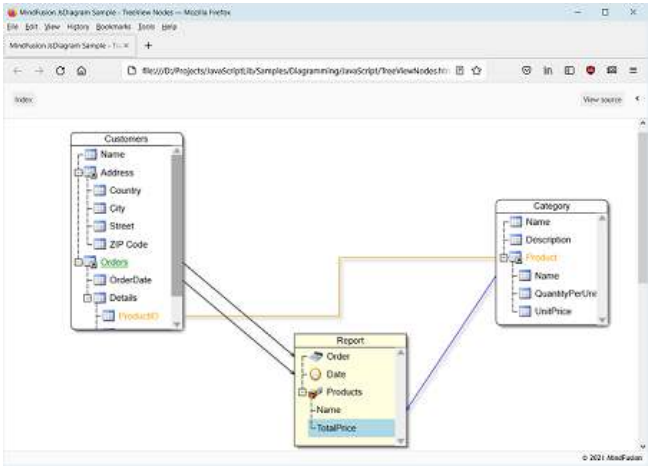

Diagram view

(client side / JavaScript)

The Diagram JavaScript class has been refactored into separate **Diagram** and DiagramView classes, matching respective server-side .NET classes that the library already provided in older versions. What remains of **Diagram** is now just a model class that defines diagram structure and implements serialization. The new **DiagramView** class deals with rendering and user interaction. You can show the same diagram in several views, each one rendering at different scroll positions and zoom levels. Note that you can no longer call *Diagram.find(id)* on client-side, but instead call *DiagramView.find(id).diagram* to access the **Diagram** object.

TreeView nodes

The TreeViewNode class represents nodes that can display hierarchical data. The root items displayed in the node can be accessed through the rootItems property. Items can be added and removed individually by using the addItem and removeItem methods, or in bulk by calling the fromObject method, which loads the tree view items from an array of objects.

Print pagination

(client side / JavaScript)

The printPreview and print methods of DiagramView let you export the diagram as a list of smaller images in HTML page. Supported options include **printArea** (defaults to diagram's content bounds) and pageSize (defaults to DiagramView's viewport). Note that print methods use HTMLCanvasElement.toDataURL() internally, so any limitations it has will apply (such as canvas size and CORS).

.NET 6 support

Added assemblies and sample projects for .NET 6. The distribution still includes assemblies and samples for .NET 4.5+ and .NET Core 3.1.

Multi-touch support

- If MultiTouchZoom property is enabled (default), the view can be zoomed or panned using two-touch pinch / flick gestures.
- If MultiTouchModify property is enabled (default), diagram nodes can be moved, scaled and rotated using two-touch pinch / flick gestures.
- If **MultiTouchZoom** property is disabled, each touch draws diagram items corresponding to current behavior.
- If **MultiTouchModify** property is disabled, each touch started from a node draws a diagram link.

- Latter modes can be used for collaborative whiteboarding / classroom scenarios.

Mouse input improvements

- MouseWheelAction property of DiagramView lets you choose between Scroll (default) and **Zoom** as the default behavior of the control in response of a wheel event.
- The MoveNodes behavior allows grabbing nodes to drag them without using adjustment handles.
- The control now captures mouse events and completes drag / drawing operations even if mouse is released outside the diagram view.

New events

- NodeSelectingScript, LinkSelectingScript, SelectionChangedScript events allow handling of selection interactions.
- NodeTextEditingScript, LinkTextEditingScript and CellTextEditingScript validation events let you prevent users from editing a specific item
- DataLoadedScript is raised when the diagram data is loaded from JSON or XML.
- MouseWheelScript is raised when the user rotates the mouse wheel while the cursor is positioned over the diagram surface.
- TreeItemTextEditingScript, TreeItemTextEditedScript allow handling of inplace-edit operations in TreeViewNode.

Miscellaneous

- Client side createDiagramLink method now accepts two, three or four arguments, letting you specify row index for origin or destination TableNode, or TreeViewItem for origin or destination TreeViewNode.
- OrthogonalLayout can now be applied on client-side.
- Clipboard methods now use modern **Navigator.clipboard** API when their *systemClipboard* argument is enabled.
- Rotation of FreeFormNode instances.
- ImageAlign supports new **FitLeft**, **FitTop**, **FitRight** and **FitBottom** alignment styles, which resize image to fit node's boundaries and align it to respective border.
- Fix for resizeToFitText not calculating correct size when cells have text padding applied.
- ArrangeAsync method is now available in CoreCLR assemblies (.NET Core 3 and 6 versions).
- The EnumAllPaths method of PathFinder yields each path immediately when found.

JavaScript API changes

- getProperty/setProperty function pairs from client-side API have been replaced by ES6 getters/setters. Set CompatConfig.propFunctions to **true** in order to continue using legacy get/set functions in your code.
- **Diagram.find** method has been removed. Call DiagramView.find instead, and get the view's diagram property.
- Client-side scroll and zoom properties moved from Diagram to DiagramView: autoScroll, scrollZoneSize, autoScrollAmount, scrollX, scrollY, viewport, virtualScroll, zoomFactor.
- Client-side input related properties moved from **Diagram** to **DiagramView**: allowInplaceEdit, delKeyAction, behavior, tooltipDelay, modificationStart, modifierKeyActions, leftButtonActions, middleButtonActions, rightButtonActions.
- Client-side magnifier properties moved from **Diagram** to **DiagramView**: magnifierEnabled, magnifierFactor, magnifierWidth, magnifierHeight, magnifierFrameThickness, magnifierShading, magnifierShape,magnifierFrameColor, magnifierSecondaryFrameColor.
- Client-side methods moved from **Diagram** class to **DiagramView** class: create, **find**, record, stopRecording, replay, clearTooltip, beginEdit, copyToClipboard, pasteFromClipboard, cutToClipboard, scrollTo, zoomToRect, zoomToFit, setZoomFactorPivot.
- **MindFusion.AbstractionLayer** class has been removed.
- EventArgs and CancelEventArgs classes have been moved to the MindFusion.Controls namespace.
- **ArrayList**, **Dictionary**, **ObservableCollection**, **Set** classes have been removed from MindFusion.Collections namespace.
- Due to **Navigator.clipboard** API being asynchronous, pasted items are not available immediately after calling **pasteFromClipboard** with *systemClipboard* enabled. You will be able to access them only after nodePasted and linkPasted events are raised.

.NET API changes

- Server-side ContainerNode API is now consistent with client-side one. Containment is no longer implemented via a Group object and SubordinateGroup / MasterGroup properties. Instead, child nodes are now stored in the dedicated Children collection, and a node's container is returned by the Container property.
- **Suspend** and **Resume** methods removed from ILinkRouter. Call Diagram's SuspendLinkRouter and ResumeLinkRouter methods instead.
- Default LinkRouter changed from QuickRouter to CompositeRouter instance.
- bool **SmartPolylineEnds** property of RoutingOptions replaced by PolylineRouting enum property, which also provides an option to prevent inclined link segments for Polyline routes.
- Removed **ClientSideMode**, **MsAjaxLocation** and **JQueryLocation** properties.

New in version 3.3.1

Adjustment handles styling

Appearance of adjustment handles can be customized via ActiveItemHandlesStyle, SelectedItemHandlesStyle and DisabledHandlesStyle properties. The HandlesVisualStyle objects returned by them provide sub-properties corresponding to graphic attributes of the different handle types. Adjustment handles can now be painted not only in solid color but with arbitrary brushes such as LinearGradientBrush.

Miscellaneous

- TopologicalLayout can now be applied on client-side.
- The diagram canvas now automatically expands to fill the area freed up when a scrollbar auto-hides.
- Fix for scroll position serialization in virtual scroll mode.
- ActiveItem reference is now serialized in JSON format.
- Fixed Overview flickering when the tracker rectangle is being dragged near the control's borders.
- Client-side XML serialization fixes.
- Fix for shadow style serialization in .NET Core and .NET 5.

New in version 3.3

.NET 5 support

MindFusion.Diagramming for ASP.NET MVC distribution now includes assemblies for .NET 5. The programming interface is the same as the one of .NET Core Assemblies.

Control nodes

ControlNode objects display custom HTML content, specified via their Template property. A node's DOM structure is created inside the Content div element, which is then rendered on top of the diagram canvas. Note that this prevents **ControlNode**s drawing in diagram' usual Z order, and they will always appear on top of other diagram items.

By default the diagram intercepts mouse events of all hosted html elements to enable moving nodes or drawing links. You can specify that interactive elements, such as buttons or text boxes, should receive input instead by setting their **data-interactive** attribute to **true**.

You can register event handlers for elements in the template by assigning function names to **data-event** attributes in the form data-event-'eventName'='handlerName'. Alternatively, you can attach event listeners using DOM API once nodeDomCreated is raised to signify that **content** is available. E.g. access child elements by calling args.getNode().getContent().querySelector(...) and attach handlers via elements' **addEventListener** method.

ControlNodes create DOM elements from their template only in the main diagram, and render images instead when shown in Overview or NodeListView. Note that in this case image elements in the template will render only if specified in base64 format. The Utils.toDataUrl method helps you convert an image URL to base64 data URL.

Video nodes

VideoNode objects display video streams, along with UI elements to play, pause, seek and change volume. Call node's setVideoLocation method to specify its video URL. Auto-playing is not supported at this time, and the video can be started only by users clicking the play button. **VideoNode** is built around Video component, which can also be used in CompositeNode templates.

Button components

Composite nodes can now contain buttons. Button components respond to user clicks by calling the JavaScript function whose name is assigned to their **clickHandler** attribute. A button can show a text label assigned to the **text** attribute, or an image whose URL is assigned to **imageLocation**. The following example adds a button to CompositeNode template:

JavaScript Copy Code

```
{
    component: "Button",
    brush: "#ccc",
    text: "Delete",
    width: 30,
    cornerRadius: 3.5,
    clickHandler: "onDeleteClick"
}
```

Virtual scroll improvements

- The control now handles mouse wheel events to scroll the diagram when virtual scrolling is enabled.
- DOM elements that implement virtual scroll mode now use CSS grid layout. You might need to adjust page layout to apply size constraints on the diagram div or its parent. For compatibility with older browsers, you can set CompatConfig.gridLayout = **false** to fall back to the absolute positioning from previous versions.
- VirtualScroll mode is now enabled by default.

Miscellaneous

- Mouse pointer position is now provided as argument to nodeCreated and linkCreated events.
- Visibility property added to CompositeNode components lets you keep invisible components in the template.
- General performance improvements.
- Collapse / expand icon is now drawn correctly for **CompositeNode** when Expandable is enabled.
- Json deserialization no longer creates undo records.
- Content of **CompositeNode**s is now clipped by default if Shape in the template is marked with **isOutline** attribute. To disable that, set ClipToOutline to **false**.
- Set ExpandButtonAction to RaiseEvents and +/- buttons of Expandable nodes will only raise an expandButtonClicked event instead of expand or collapse the tree under that node. You can use this to implement custom logic for the +/- button.

New in version 3.2.2

.NET Core support

MindFusion.Diagramming for ASP.NET MVC distribution now includes assemblies for .NET Core 2.1 and newer versions. The programming interface is mostly the same, except for a few differences listed in .NET Core Assemblies help topic. Tutorial help topics have been updated for .NET Core as well.

Shape components

The Shape class used to specify ShapeNode geometry can also be used as a component in CompositeNode. When its **isOutline** attribute is set, the shape will control **CompositeNode**'s geometry too, defining hit test and clip area, and link alignment points along node's border. If **isOutline** is disabled, the shape will serve mostly as a decorative element. The code below shows a sample fragment from node's template specifying shape component's properties:

Json template

Copy Code

```
{
    component: "Shape",
    id: "Cloud",
    autoProperty: true,
    name: "OutlineShape",
    pen: "gray",
    brush: "Transparent",
    isOutline: true
},
```

Miscellaneous

- TableNode.resizeToFitText improvements and fixes.
- containerChildAdding event handlers can stop propagation of the event up in the container hierarchy by calling setHandled.
- LayeredLayout now uses stable sorting and should always create same results when applied to same graph.
- For consistency with client side API, the .NET Diagram class now provides Arrange methods that take a layout object as argument.
- Arrange method of .NET ContainerNode arranges the child items inside a container using the specified layout class.

API changes

- The AutoJson attribute has been moved from MindFusion.Diagramming.Mvc namespace to MindFusion.Diagramming namespace.
- LoadFromJson now clears the diagram by default. A new LoadFromJson overload lets you specify whether loaded items are merged into current diagram or the old diagram is cleared first.

New in version 3.2.1

Improved performance

Diagram rendering and user interactions are now faster. The control redraws the smallest possible area after diagram changes, and compresses refresh operations into a single batch when possible. Custom node classes that need to draw outside of their Bounds should override the getRepaintBounds method to specify the repaint area.

Custom type registration

Custom item types registry is now stored in the session and is handled by the ItemTypeResolver class. It is no longer required to call the RegisterItemType method
for every DiagramView and NodeListView instance, but instead call **RegisterItemType** method only once on the first **DiagramView** control and register the current session by calling its RegisterSession method. Then call the RegisterSession method for any subsequent controls that will use the custom item types. You can access the **ItemTypeResolver** registered for the current session through the static GetResolver method and unregister it by using the Unregister static method.

Miscellaneous

- The Border component draws frame lines around and background behind other components in CompositeNode templates.
- NodeListView now displays nodes' ToolTip texts when the mouse hovers over an item in the list view.
- Fix for FlowchartLayout creating node overlaps in some situations.

New in version 3.2

Flowchart graph layout

(client side / JavaScript)
FlowchartLayout recognizes program code-like patterns in the graph, such as loops, sequences and if/switch branchings, and arranges them recursively. **FlowchartLayout** could be used to arrange other types of graphs as well, though with some restrictions. For example it treats all back links as loops in the code, and expects that they are nested - loop links starting closer to the stop node should end closer to the start node. Another similar restriction is that there shouldn't be any cross-links that connect different branches of a decision sub-graph.

Path finding

(client side / JavaScript)
The PathFinder class provides methods that help you find paths and cycles in a graph:

- findShortestPath finds the shortest path between two DiagramNode objects.
- findLongestPath finds the longest path between the specified **DiagramNode** objects.
- findCycle detects whether the specified **DiagramNode** participates in a cycle.
- findAllPaths finds all paths that exist between two **DiagramNode** objects.
- findAllCycles finds all cycles in the underlying diagram.

Path objects returned by these methods contain nodes, links and items arrays containing sequences of elements in the path. The new PathFinder sample page included in distribution demonstrates path finding and animations over the found paths.

Embedded hyperlinks

Nodes and Text components with style text enabled can now contain <a> tags to create hyperlinks. When a link is clicked, the control raises hyperlinkClicked event to let you implement navigation:

JavaScript

Copy Code

```
// node is a ShapeNode instance
node.setText("test <a='https://mindfusion.dev'>link</a> test");
node.setEnableStyledText(true);

// attach an event listener to the hyperlinkClicked event
diagram.addEventListener(Events.hyperlinkClicked, onHyperlinkClicked);

function onHyperlinkClicked(sender, args)
{
    window.open(args.getHyperlink());
}
```

Container improvements

- resizeToFitText method and EnableStyledText property added to the ContainerNode class.
- containerChildRemoved event now also raised when dragging multiple selected child nodes out of a container.
- Improved handling of folded containers by automatic layout classes and link routing methods.

Visio2013Exporter improvements

- Visio2013Exporter now does full rendering for table, container and composite nodes.
- **Visio2013Exporter** renders custom nodes that draw themselves through the IGraphics interface.
- Coordinates of exported link end points are now assigned Visio formulas and follow the borders of resized nodes.

Miscellaneous

- The Text property of nodes and links has been moved to the base DiagramItem class, allowing for easier text search and edit operations in the diagram. The Caption property of container and table nodes now only wraps the base **Text** property. Map and Visio nodes now render **Text** too.
- Typescript definitions now available for the Diagramming.Lanes namespace.
- Auto-arranged link labels now can optionally be placed over link segments and containers by setting diagram's AutoArrangeAvoidSegments and AutoArrangeAvoidContainers properties to **false**.
- The dispose method of Diagram class now removes a focus-proxy DIV element from the page.
- Improved text alignment for DiagramLink texts.
- The serializeTag event lets you save complex Tag and Id objects in XML format.
- Various arrowhead rendering fixes.

API Changes

FromJson methods now require id argument.

New in version 3.1

Composite nodes

The CompositeNode class implements nodes whose appearance can be defined via composition of components and layout containers. The content of a composite node can be created by building a tree of components programmatically, or by loading a JSON template. This initial release includes layout containers such as StackPanel and GridPanel. Objects from the MindFusion.Drawing namespace now double as **CompositeNode** components (Image, Text, Path, Rect). Future versions will add interactive components like buttons and text editors.

Animated layout

arrangeAnimated methods added to Diagram and ContainerNode classes display movement of items from their original locations to new locations assigned by the layout object. This can be used to create an explode effect by starting new layout from overlapping nodes on same position, or an insertion effect by adding a new node to an existing layout.

Export Excel files

The ExcelExporter class from *MindFusion.Diagramming.Export.Excel.dll* assembly exports diagrams to Excel Open XML format (XSLX) files. Diagrams are exported as Excel AutoShapes drawings. The Export overload that takes a DiagramDocument parameter creates a sheet for each DiagramPage in the document. The Export(Diagram) overload creates a single Excel sheet.

Overview improvements

- ScaleMode enumeration and properties added to Overview control implement several scaling modes. The FitAll element corresponds to the original behavior where the Overview always fits diagram's contents. **FixedScale** mode applies the scale specified via overview's ScaleFactor property. **CombinedScales** mode multiples overview's **ScaleFactor** by diagram's current ZoomFactor.
- If AllowZoom is enabled, users can zoom the diagram by resizing the overview's viewport tracking rectangle.
- MinVisibleFontSize specifies a threshold value that hides text if scaled font sizes become smaller.

Visio2013Exporter improvements

- Visio2013Exporter processes links' arrowheads.
- **Visio2013Exporter** preserves the diagram Z order.
- **Visio2013Exporter** exports links' Text and Labels.
- **Visio2013Exporter** exports Image of ShapeNode objects.

LayeredLayout improvements

- The KeepLinkShapes property of LayeredLayout lets you preserve initial Shape value of links when LinkType is set to Cascading. The orthogonal path applied by latter property is approximated using respective link shape.
- Fix for wrong link positions when the diagram contains folded containers.

- Fix for unnecessarily large distance between subsequent layers after a long node appears in a layer.
- LinkPadding property added to **LayeredLayout** specifies how much space to leave between links when **LinkType** is set to **Cascading**.

PathFinder improvements

- Speed of FindAllCycles and EnumAllCycles methods improved.
- **FindAllCycles** and **EnumAllCycles** no longer report mirrored versions of cycles in undirected mode.

Miscellaneous

- ImagePadding property of ShapeNode and Cell lets you set padding space between elements' borders and their Image.
- Export overloads that write to **System.IO.Stream** objects added to PdfExporter, VisioExporter and Visio2013Exporter.
- Non-blocking ArrangeAsync methods run layout calculations in a background task. This is only available in .NET 4.5 build of the diagram assemblies.

New in version 3

User-interaction controllers

All kinds of user interaction are now carried out by controller objects. The **startDraw** method of BehaviorBase-derived classes that returned an opaque **InteractionState** instance has been replaced by createController method returning a controller of class specific to the modified item and interaction types. Built-in controllers include CreateNodeController, CreateLinkController, ModifyNodeController, ModifyLinkController, PanController. You can also create custom controllers by deriving and overriding the methods of SinglePointerController:

JavaScript Copy Code

```
SinglePointerController.prototype =
{
    start: function (position) {},
    move: function (position) {},
    validate: function (position) {},
    commit: function (position) {},
    cancel: function (position) {},
    drawInteraction: function (context) {}
}
```

Record and replay

The Diagram class provides record, stopRecording and replay methods that can be used to save and replay all user actions with keyboard and mouse. The replay method takes *recording*, *timer* and *diagramJson* parameters. The *recording* argument is an array of records returned by stopRecording. If the *timer* argument is set to **true**, events are replayed from a timer preserving their original timing, otherwise they are replayed immediately. Timer mode can be used to show tutorials played directly in the diagram. Immediate mode could be used to automate user interaction testing where an assertion is checked after replaying series of events. Recorded events could also be replayed as macros if ran on a diagram with items placed on same initial coordinates.

Improved testability

User interaction can now be tested automatically in several ways outlined below.

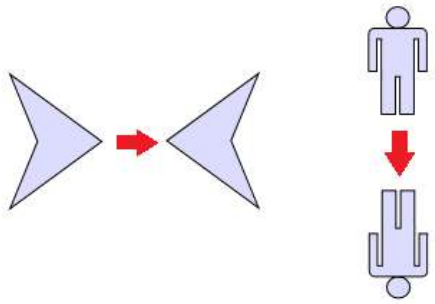
- Create a MouseInputDispatcher instance and call its methods

  JavaScript Copy Code

  ```
  onMouseDown: function (position, button)
  onMouseMove: function (position)
  onMouseUp: function (position, button)
  ```

  where position is a Point instance specifying logical coordinates in the diagram (in current measure unit, not scaled by zoom factor). The results of called mouse methods will depend on diagram's current Behavior, e.g. you could assert that a sequence of down, move and up events creates a ShapeNode when Behavior is set to DrawShapes.
- Create an instance of controller class and call its start, move and commit methods. This would not depend on the value of diagram's Behavior, but could be still affected by other behavioral properties such as AllowSelfLoops and AllowUnconnectedLinks.
- Check assertions after replaying a recording on a saved diagram.

Ruler control



The Ruler control provides horizontal and vertical scales that help users measure and align diagram items.

3rd party dependencies now optional

The diagram can now be used without JQuery and Microsoft Ajax libraries. To enable that mode, set **ClientSideMode** to **StandAlone** for DiagramView. Stand-alone mode requires relatively modern browsers, the base feature-set against we test it is the one of IE11.

Flip shapes

The shape of a ShapeNode can be flipped horizontally or vertically. Enable the AllowFlip property and the shape flips when an edge is dragged over its opposite edge. You can get or set current flip state using FlipX and FlipY properties.

Revamped item dependency system

Dependencies between diagram items are now expressed by rule objects and applied in sequence by the DiagramMediator class. Built-in dependencies are implemented by ItemFollowsContainerRule, AttachedFollowsMasterRule, LinkFollowsNodesRule, NodeFollowsSelectionRule rules. You can create custom rule objects with following API and add them to DiagramMediator.AllRules array to make items follow other items during user interaction -

JavaScript — Copy Code

```
var MyRule =
{
    dependencies: function (master) {}, // return array of items that should follow master
    dependentUpon: function (dependency) {},  // return array of items that should be followed by
dependency
    recognize: function (dependency) {},  // return true or false if this rule should be applied
on an item
    updateFromMasters: function (dependency, originalStates) // set new position or size of
dependency
}
```

Miscellaneous

- CaptionBackBrush and FoldIconSize properties added to ContainerNode.
- Multiple rotation of nodes improved, now node angles are modified by same rotation delta calculated from mouse position instead of pointing all rotation handles in mouse direction.
- Xml serialization improved.
- LinkSegments property of Diagram specifies initial number of link segments.

New in version 2.8

Fluent API

Extension methods in MindFusion.Diagramming.Fluent and MindFusion.Diagramming.Layout.Fluent namespaces add support for fluent programming style:

C# — Copy Code

```
using MindFusion.Diagramming.Fluent;
using MindFusion.Diagramming.Layout.Fluent;
//...

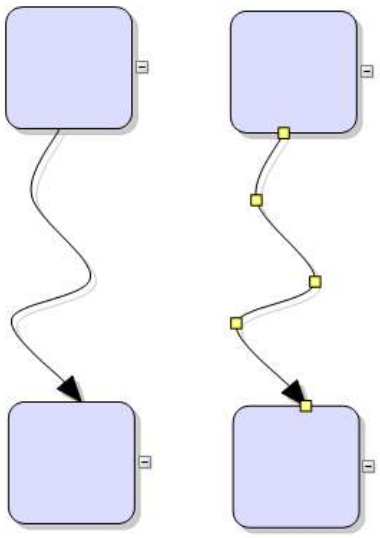


diagram.Factory
 .CreateShapeNode(10, 10, 20, 20)
  .Brush(Color.LightGray)
  .Font("Arial", 12)
  .EnableStyledText(true)
  .Text("Task <i>1</i>")
  .ToolTip("This is the task");

new TreeLayout()
 .LevelDistance(20)
 .NodeDistance(20)
 .LinkStyle(TreeLayoutLinkType.Cascading3)
 .Arrange(diagram);
```

DiagramLink improvements

- The component no longer keeps a separate segmentCount field, removing a common source of errors. The SegmentCount property now calculates its value from ControlPoints elements. The UpdateFromPoints(updateGroups, updateSegments) overload has been removed too.
- **SegmentCount** setter no longer refuses changing number of segments if auto-routing is enabled or the link is a self-loop.
- The HeadPen property lets you customize arrowhead strokes independently of line segments strokes.

- The new **Spline** element of LinkShape enumeration draws links as interpolating splines that pass through all of their control points:

Miscellaneous

- CaptionFormat properties of TableNode and ContainerNode let you set alignment for table and container captions.
- Enable the AllowResizeHeaders property of swimlanes Grid to let users resize grid rows and columns interactively. The control raises HeaderStartResizingScript validation event when the user tries to resize, and HeaderResizedScript event when the operation completes.
- NodeSize and DefaultNodeSize properties of NodeListView can be set to **SizeF.Empty**, in which case the control will use the sizes stored in nodes' Bounds.
- The control now supports cyclic attachment created using DiagramNode.attachTo method, where moving any of the attached nodes will move all other nodes in the cycle.
- Shapes.RoundRect corner arcs keep constant radius and no longer deform when the node size changes to non-rectangular.
- ItemAddedScript and ItemRemovedScript events raised when an item is added or removed, either from code or interactively.

New in version 2.7

Free-form nodes

A FreeFormNode collects all points from users' mouse or touch input and displays them as node's outline. To let users draw free-form nodes interactively, set Behavior to DrawFreeForms or **LinkFreeForms**. Use the Points property of **FreeFormNode** to get or set outline points programmatically. If the Closed property is set, the node is drawn as a closed shape and its interior filled, or otherwise the node is drawn as a poly-line. If the distance between first and last points drawn by user is shorter than AutoCloseDistance, the node's Closed property is automatically set to **true**. AutoCloseDistance default value is Number.MAX_VALUE, so free-form nodes are always closed.

Convert free-form drawings to ShapeNodes

Additional drawing modes, convenient for touch input, convert FreeFormNode objects drawn by user to ShapeNode objects with matching shapes. To enable them, set Behavior to DrawFreeShapes or **LinkFreeShapes**. The shapes against which the user's input is matched are set via diagram's FreeFormTargets property. By default it contains Rectangle, Decision and Ellipse shapes.

Miscellaneous

- TypeScript definitions for the Diagramming API are now provided in *jsdiag.d.ts* file.
- The MaxJsonLength and RecursionLimit static properties of DiagramView class let you configure the corresponding settings of internal **JavaScriptSerializer** instances.
- PdfExporter now creates page hyperlinks if HyperLink is set to a value in "page://{number}" format, e.g. set "page://1" to open the second PDF page when the item is clicked
- VirtualScroll mode fixed for parent div size specified in percent units.
- Fixed bug where the ExpandOnIncoming property specifying link direction for collapse/expand actions did not work correctly.
- Removed several global variables created inadvertently by the control.

New in version 2.6.1

- NodePastedScript and LinkPastedScript client-side events raised when items are pasted from the clipboard.
- **System3D** member added to CellFrameStyle enumeration. If it's assigned to the CellFrameStyle property of a TableNode, cell frames are rendered using 3D effect.
- Resize and move interaction cursors now remain visible until the user releases mouse button.
- Fixed bug where auto-handles mouse hint cursor would not match the item type.
- Fixed bug where multiple lines in link's Text were drawn overlapped.
- Fixed bug where BaseShape arrowhead would point in wrong direction for strictly vertical links.

New in version 2.6

Resize table columns and rows

Columns and rows of a TableNode can now be resized interactively if its AllowResizeColumns or AllowResizeRows properties are enabled. In order to resize, move the mouse pointer to the border line on column's right side or row's bottom side until it shows resize cursor and start dragging. The control raises tableColumnResizing and tableRowResizing events to let you validate new size or prevent resizing some elements. The tableColumnResized and tableRowResized events are raised after the operation completes.

Shape libraries

The ShapeLibrary class lets you use custom geometric shapes created using MindFusion ShapeDesigner tool. Call the ShapeLibrary.loadFromXml(url) method to load a library XML file. ShapeLibrary.getShapes() returns an array of the loaded Shape objects. The NodeListView.setShapeLibraryLocation(url) method creates a prototype ShapeNode object for each shape from the specified library. Location of a shape library can also be specified server-side through the DiagramView's ShapeLibraryLocation property.

Miscellaneous

- TextStroke and TextStrokeThickness properties of DiagramItem let you set color and thickness of text outlines;
- Items can now be deleted using Backspace key when running on Mac;
- Caption divider line in TableNode and ContainerNode is now rendered clipped when caption height is smaller than corner radius;
- Diagram.TooltipDelay property specifies the delay in milliseconds before showing tooltips;
- The NodeListView.Orientation property lets you set the view's orientation to Horizontal or Vertical (members of **MindFusion.Diagramming.Orientation** enum);
- Fixed overlaps in TreeLayout when arranging nodes of different sizes;
- Anchor points indices are now serialized;
- Deserialization of custom item classes now works regardless of whether names contain Node or Link suffix;

New in version 2.5

Appearance improvements

- Set the Shape property of tables and containers to RoundedRectangle to render them with rounded corners.
- Hide the frames of table cells by setting the CellFrameStyle property to None.
- Set the EnableStyledText property of TableNode class to render styled text in tables.

New events

- The control raises cellTextEdited event when users edit the text of table cells.
- The createEditControl event lets you create custom DOM element or fragment to use as in-place text editor.
- NodeListView raises nodeSelected event when the user selects a node.

Miscellaneous

- Width and Height properties and the corresponding setter methods for DiagramView, NodeListView, Overview and ZoomControl are now obsolete. You can use the new helper methods of the controls to pass an HTML attributes object, containing style data.
- Stop the controls from adding references to the client scripts by disabling the AddScriptReferences property.
- the loadFromXml method of Diagram class lets you load XML files from client side.
- fixed setZoomFactorPivot bug in virtual scroll mode.

New in version 2.4

Styled text

The EnableStyledText property of ShapeNode allows using HTML-like formatting tags to apply various attributes to the node's text. At this time the component supports the following formatting tags:

- <b> specifies bold text
- <i> specifies italic text
- <u> specifies underlined text
- <color=value> specifies text color
-
 specifies line break

Improved text rendering

- General text rendering quality improved. The component removes scale transformations applied for MeasureUnit and ZoomFactor before drawing text on the canvas, and instead specifies a scaled font size, which helps improve text appearance in Firefox and older versions of Chrome.
- Now items' text can be drawn underlined. To enable this, set the underline attribute of the Font class.
- Font styles can be specified via Style instance by setting its FontStyle property.

License keys

There is no separate trial build of the control assemblies anymore. Instead, set the LicenseKey property to disable the component's evaluation mode and stop displaying trial messages. If your application contains more than one **DiagramView** instance or other controls by MindFusion, you could call **MindFusion.Licensing.LicenseManager.AddLicense(key)** to specify the key once instead of setting it per each control. License key strings are listed on the Keys & Downloads page at MindFusion's customer portal.

Miscellaneous

- Items can be rendered using dashed lines in browsers that support the **setLineDash** function. To enable this, set pen's DashStyle property for DiagramItem or the StrokeDashStyle property of Style.
- Client-side TreeLayout supports organizational charts with assistant nodes as in Microsoft Office diagrams. To mark nodes as assistants, set node.LayoutTraits[TreeLayout.Assistant] to a member of the AssistantType enumeration . Set TreeLayout.enableAssistants = true to arrange assistant nodes in a separate branch between the main node levels.
- Specify if separate connected components of a graph should be arranged horizontally or vertically relatively to each other by setting the multipleGraphsPlacement attribute of layout classes.
- The type of Margin property of LinkLabel has been changed from number to Thickness, letting you specify different margin sizes at each side of the label.
- Masters for Start and Arrow7 shapes added to VisioExporter template file.
- VisioImporter now tries to preserve Shape of ShapeNode objects when importing from files created by **VisioExporter**.

New in version 2.3

Import diagrams from SVG

The SvgImporter class allows importing Scalable Vector Graphics files (*.svg) into MindFusion.Diagramming. Each top-level SVG group element is imported as a separate SvgNode, whose Content is set to the group's child elements. If the SVG file was exported from Visio or OpenOffice Draw, **SvgImporter** will create DiagramLink objects for groups it recognizes as connectors in order to recreate the original diagram model, though in this case it will not preserve fully the original appearance of connectors in SVG.

Zoom control

The ZoomControl class lets users change interactively the current zoom level and scroll position of a Diagram. Bind the **ZoomControl** to the corresponding Diagram by setting its TargetId property. Set the ZoomStep and ScrollStep properties to specify the amount added to diagram's zoom level or scroll position by ZoomControl's buttons. You can customize the control's appearance by setting properties such as Fill, BorderColor, CornerRadius and TickPosition.

Shadow styles

The Diagram.ShadowsStyle property and ShadowsStyle enumeration let you switch shadow rendering order between rendering all shadows in a single background layer (OneLevel) and drawing each shadow close to its node, possibly overlapping other nodes (**ZOrder**). **ShadowsStyle.None** lets you disable shadows altogether.

Miscellaneous

- Set the LinkLabel.Brush property to fill the background of link labels.
- Number of link segments can now be set by calling the DiagramLink.setSegmentCount() method.
- The BackgroundImageAlign property specifies the alignment of diagram's BackgroundImage.
- The TextPadding property specifies the padding distance between the borders of a node and its text.
- Nodes of all classes can be rotated.
- VisioExporter export speed has been improved greatly for large diagrams.
- For consistence with MindFusion libraries for other platforms, BackBrush in default diagram style has been changed to white brush.
- Fixed KeepInsideParent constraint for rotated parent nodes.
- Set the AutoGrow property to **false** to prevent containers from resizing automatically when they would not fit newly added nodes.
- The Brush property of LinkLabel class lets you set background color for link labels.
- Now the NodeModified event is raised after the undo record for that modification has been added to the command history. This makes it easier to merge the ModifyItemCmd with custom commands created from **NodeModified** handler.
- The ChangeUnit method sets a new MeasureUnit and rescales the coordinates of diagram items to keep them the same size.
- OrthogonalLayout no longer ignores repeating links, and will now place them at a distance specified via RepeatingLinksPadding property.

New in version 2.2

SVG Nodes

The SvgNode class represents nodes that can display SVG drawings. SVG graphics are rendered instead of Image, and on top of the geometry rendered by the base ShapeNode class. The SVG drawing of the node is specified through its SvgUrl property.

jQuery support

Now the control can use jQuery for browser abstraction instead of Microsoft Ajax. To choose between Microsoft Ajax and jQuery support use the **ClientSideMode** property.

Visio2013Exporter improvements

- Support for multi-segment links
- Bezier links are now exported as NURBS lines
- Support for rotated nodes
- Proper scale for all MeasureUnit values
- Support for semi-transparent colors

Miscellaneous

- Set the BackgroundImageUrl property to draw an image as Diagram's background.
- The TextStyle property of links provides support for several different text position and orientation styles, defined by the LinkTextStyle enumeration.
- Set the AllowUnconnectedLinks property to true to let users draw links without connecting them to nodes.

- OrthogonalLayout no longer ignores repeating links, and will now place them at a distance specified via RepeatingLinksPadding property.

New in version 2.1

Tree map layout

Tree maps represent hierarchies by nesting child nodes within their parents, where the areas of leaf nodes are proportional to their Weight values. Unlike other layout algorithms, TreeMapLayout expects hierarchies to be defined via grouping or containment (see AttachTo method and ContainerNode class), and will ignore any links in the diagram. The diagram area covered by the topmost nodes in a hierarchy is specified via the LayoutArea property. By default, the layout tries to keep the ratio of node sides as close as possible to one. However this could make it hard to distinguish separate levels of the hierarchy. To alleviate that, set Squarify to **false**, and child nodes will be arranged either as a row or a column inside their parent node, alternating directions for each level. The drawback is that when **Weight** ratios differ greatly or nodes contain many children, some nodes could end up with very narrow rectangles.

Decision flowchart layout

DecisionLayout arranges simple flowcharts consisting of decision boxes with up to three outgoing links per node and activity boxes with a single outgoing link per node. The nodes are arranged in columns and rows, whose distance depends on the HorizontalPadding and VerticalPadding property values. When links share the same row or column, they are placed at a distance specified via LinkPadding. The layout arranges nodes recursively starting from StartNode. If **StartNode** is not specified, the algorithm selects the root of the deepest branch of the graph's spanning tree as start node.

Miscellaneous

- Layout algorithms now automatically resize diagram's Bounds if it's not large enough to fit the arranged content. To revert to old behavior and keep fixed **Bounds** size, set GrowToFit to **false**.
- Fixed hit-testing offset bug when using version 4 of Microsoft Ajax in Chrome browser.
- Fixed error when using gradient brushes for painting swimlane grid cells.

New in version 2.0

Export Visio 2013 files

The Visio2013Exporter class can export the contents of Diagram and DiagramDocument objects to Visio 2013 VSDX files. In order to use it, add a reference to the *MindFusion.Diagramming.Export.Visio.dll* assembly. Similarly to the VDX format exporter, **Visio2013Exporter** relies on a template file, called *Visio2013.vxt*, containing some boilerplate Visio XML code. The template must be either located in same folder as the application assemblies, or its path must be specified via the TemplatePath property. At this time the exporter supports shapes from Visio basic and flowchart stencils.

Visio2013Importer improvements

- The importer now supports Visio group shapes. Child shapes in groups are no longer lost when importing, and their corresponding diagram nodes are attached to the corresponding group node.
- Visio NURBS curves are now imported as Bezier-style links.
- Fix for importing connectors with applied rotation transform.
- Shapes with a 'hidden' attribute in master definition are now imported as invisible items.

Headers and footers in PDF

PdfExporter can now add headers and footers to exported pages. To specify their contents and font, set the HeaderFormat, HeaderFont, FooterFormat and FooterFont properties. Adding a %P placeholder to **HeaderFormat** or **FooterFormat** will render the current page number at its position.

Resize multiple nodes

Now it is possible to resize multiple selected nodes simultaneously. To enable that, set the AllowMultipleResize property to true. When enabled, dragging a corner or side adjustment handle of any node resizes all nodes in the selection. The operation will be cancelled for all nodes if any of them does not accept its new size, e.g. if it's smaller than MinimumNodeSize value. The operation can be cancelled on the client side for all nodes by handling the selectionModifying validation event.

Undo / redo support

If the UndoEnabled property is set to **true**, the Diagram control tracks changes done to its items and allows undoing and redoing them later by calling the undo and redo methods respectively. Multiple changes could be recorded as a single undoable operation by enclosing them between startCompositeOperation and commitCompositeOperation calls. It is also possible to create custom undoable operations by deriving from the Command class and calling executeCommand with the custom command as argument.

Animations

Diagram items can now be animated through the Animation class in the MindFusion.Animations namespace. The class implements several built-in animation and easing types, and allows definition of custom animation functions, to create fluid and pleasing animation effects. The new Animations example demonstrates how to apply several animation types to both nodes and links.

Clipboard support

A single item or a selection of items can be copied or cut to a clipboard maintained by the diagram control. This is done programmatically using the copyToClipboard and cutToClipboard methods. To paste the clipboard contents into the current diagram, call pasteFromClipboard. If running under Internet Explorer, it is also possible to copy to the system clipboard by passing a **true** argument to clipboard methods.

Swimlanes

The lane grid lets you emphasize the relationship between a group of diagram items by displaying them in a distinct lane or cell within the grid. To display the lane grid, set the ShowLaneGrid property of the Diagram class to **true**. In order to customize the grid, set the various attributes exposed by the LaneGrid property, which lets you specify the number of rows and columns, add headers, customize the cell appearance, etc. The new Lanes sample page uses the lane grid to let users draw Gantt charts.

Magnifier

The new magnifier tool allows users to interactively zoom in (or out) portions of the diagram by holding down a modifier key or pressing a mouse button. The magnifier's appearance can be customized via properties such as MagnifierShape and MagnifierFrameColor. Its size and magnification can be set via MagnifierWidth, MagnifierHeight and MagnifierFactor properties. The magnifier appears when users press the mouse button mapped to MouseButtonActions.**Magnify**. It can also be shown programmatically by setting the MagnifierEnabled property.

Intellisense support

The package now includes a MindFusion.Diagramming-vsdoc.js file providing code completion information. To load it in Visual Studio, add e /// <reference path="MindFusion.Diagramming-vsdoc.js" /> tag to the top of your script files. Use the static Diagram.create and Diagram.find methods instead of $create and $find to let Visual Studio infer the type of returned Diagram objects correctly.

Miscellaneous

- Several new **shapes** added for better compatibility with Visio 2013 basic stencil: RightTriangle, Decagon, Trapezoid, Star4Pointed, Star5Pointed, Star6Pointed, Star7Pointed, Star16Pointed, Star24Pointed, Star32Pointed, Donut, Plaque.
- Set the ModificationStart property to AutoHandles to let users start moving or resizing an item without selecting it first.
- The diagram area can be resized automatically to fit the current diagram items as set through the AutoResize property.
- The AutoScroll property enables automatic scrolling when the mouse is dragged near the diagram edges.
- enterInplaceEditMode and leaveInplaceEditMode events raised when the control shows or hides the in-place edit box.
- linkPointed and nodePointed events raised when the mouse hovers over an item.
- The control displays a scaled-down copy of the node being dragged from the NodeListView control.
- Set Behavior to SelectOnly to let users select existing items but not to modify them or draw new ones.
- Added chainable Set* methods for all DiagramView properties.

API changes

- The HitTestHandle method now returns an AdjustmentHandle result instead of **bool** and **ref int** values.
- The type of HitResult argument of the HitTestAdjustmentHandles event has been changed to **AdjustmentHandle**.
- **AnchorUnitType** enumeration has been renamed to UnitType.
- The **SelectionMoved** event has been renamed to SelectionModified, and is also raised if nodes are resized when AllowMultipleResize is enabled. Event handlers now receive SelectionEventArgs parameter instead of **EventArgs**.
- The **SelectionMoving** event has been renamed to SelectionModifying, and is also raised if nodes are resized when **AllowMultipleResize** is enabled. Event handlers now receive SelectionValidationEventArgs parameter instead of **ValidationEventArgs**

New in version 1.8

Rounded links

Links whose Shape is set to Polyline or **Cascading** can be rendered with rounded joints between their segments. To enable that, set the diagram's RoundedLinks property to true. The RoundedLinksRadius property lets you specify the radius of joint arcs.

Link crossings

The component can represent the crossing point of two links either as an arc (bridge) drawn for the link with higher Z index, or as a cut in the link with lower Z index. To enable that, set the diagram's LinkCrossings property to either Arcs or **Cut** member of **LinkCrossings** enumeration. Set CrossingRadius to specify the radius of crossing arcs.

Visio2013Importer improvements

- The Item argument of ImportItem event handlers is now pre-set to a DiagramItem instance created for the imported Visio shape, letting you avoid parsing some standard data such as Bounds or Text. You can either modify this item's properties, or replace it with a new instance of a different type.
- Fixed a crash when a shape master does not have a name attribute (this happens with custom stencils).
- Fixed a crash when theme1.xml is missing from the imported vsdx archive (this happens with files converted from old Visio versions to 2013 format).
- Fixed a parse exception for some non-English locales.
- Fixed a bug where one-segment connectors were imported at wrong positions.

Miscellaneous

- Node rotation was ignored by link routing algorithm; now links are routed around the rotated node's boundaries.
- The routeAllLinks function pulls apart link segments when they would overlap.
- Set Behavior to Pan to only let users pan the view when dragging the mouse.
- The component now raises clicked event for the diagram when there isn't any item at the click location (which would cause nodeClicked or linkClicked event).

New in version 1.7

Import Visio .vsdx files

The Visio2013Importer class can import .vsdx files, created by Visio 2013. In order to use it, you must add a reference to the *MindFusion.Diagramming.Import.Visio.dll* assembly. Various overloads of the Import method can be used to import the file into a

DiagramDocument whose pages correspond to the Visio drawing pages, or into a single Diagram whose content is merged from all imported pages. **Visio2013Importer** supports the basic flowchart and data flow Visio stencils. For each node shape from the .vsdx file, the importer creates a ShapeNode object whose Shape, Text, Brush and Pen properties are set to values corresponding to the imported Visio shape. For each connector shape, the importer creates a DiagramLink object whose Origin and Destination are set to the corresponding imported nodes, and whose ControlPoints reflect the geometry of the connector.

Adjustment handle styles

Appearance of nodes' adjustment handles can be customized by setting the HandlesStyle property. Supported styles include round and square handles, dashed and hatched frames, and some combinations. Apart from appearance, the handles style also controls what part of a node can be dragged to move or resize it. It is also possible to render custom handles by handling the drawAdjustmentHandles event, and implement custom hit-testing by handling the hitTestAdjustmentHandles event.

Dynamic links

A dynamic link automatically orients its end segments so that they point to the target nodes' centers while the link's nodes are dragged around. If a node's AnchorPattern is set, link ends will align to the closest anchor point instead. Positions of the link's end points are also updated when the next-to-last control points are being modified. To enable this, set the Dynamic property to **true**.

ContainerNode enhancements

- Apply layout algorithms to content of a ContainerNode by calling its arrange method.
- Selectively prevent adding or removing child nodes to/from a container by handling the containerChildAdding and containerChildRemoving events.

Miscellaneous

- The Dirty flag is automatically set when a serializable property of an item or the diagram has been modified. It lets you determine where there are any changes that need to be saved.
- The AdjustmentHandlesSize property specifies the size of adjustment handles.
- The ShowDisabledHandles property controls whether disabled adjustment handles are draw on screen.
- Several new predefined shapes available in the Shapes class - RightTriangle, Decagon, Trapezoid, Star4Pointed, Star5Pointed, Star6Pointed, Star7Pointed, Star16Pointed, Star24Pointed, Star32Pointed, Donut and Plaque.

New in version 1.6

Import OpenOffice Draw files

The DrawImporter class can import .odg files, created by the OpenOffice Draw vector graphics editor. In order to use it, you must add a reference to the *MindFusion.Diagramming.Import.Draw.dll* assembly. Various overloads of the Import method can be used to import the OpenOffice drawing into a DiagramDocument whose pages correspond to the Draw pages, or into a single Diagram whose content is merged from all imported pages. **DrawImporter** supports shapes from the General and Flowchart shape palettes in Draw. For each node shape from the .odg file, the importer creates a ShapeNode object whose Shape, Text, Brush and Pen properties are set to values corresponding to the imported OpenOffice shape. For each connector shape, the importer creates a DiagramLink object whose Origin and Destination are set to the corresponding imported nodes, and whose ControlPoints reflect the geometry of the connector.

ContainerNode improvements

- Child nodes are now drawn by their containers; when containers overlap, the children of a lower container cannot appear in front of the upper container anymore.
- The ClipChildren property specifies whether to clip child items to container's boundaries.
- The ZIndex property no longer changes automatically when dropping nodes into a container.
- The Visible property of child items no longer changes when folding or unfolding containers; this lets you keep invisible items inside containers.
- When selection including a container and its child node is dropped into another container, the child node now remains in its original container.

PdfExporter improvements

- Improved handling of clip regions in custom drawing code.
- PdfExporter now honors the target Rectangle property of linear gradients.
- PDF shadings now include all colors from a ColorBlend.
- More precise character widths set when text includes both eastern glyphs and Latin characters.
- More precise widths set for Cyrillic characters.

Miscellaneous

- New overloads of the DiagramView, Overview and NodeListView extension methods have been added. The **initFunction** parameter can be used to set the name of the javascript function, which will contain the initialization code for the corresponding control.
- controlLoaded event is now raised when a control is loaded on the client-side.
- Added support for Diagram.LinkHitDistance, DiagramItem.HyperLink and DiagramNode.EnabledHandles properties.
- Added support for custom node and link types - check the new CustomNodes sample on how to use them.
- Two new measure units - **Centimeter** and **WpfPoint** are now available.

New in version 1.5

Server Side

Miscellaneous

- DiagramView's *Script properties have been modified to chainable methods.

- Use the FromRequest method of the DiagramView for easier recreation of the view's data after postback.
- FallbackContent property allows specifying of a fallback content for the DiagramView.
- NodeSelectedScript, NodeDeselectedScript, NodeDoubleClickedScript, LinkSelectedScript, LinkDeselectedScript and LinkDoubleClickedScript methods have been added to support the corresponding client-side events.

Client Side

Node effects

Two visual effects, represented by GlassEffect and AeroEffect classes, can be applied to nodes. To apply an effect, create an instance of the respective class, set up its properties, then add the instance to the Effects collection of a node (or to Diagram.NodeEffects collection to apply it to all nodes). Effects can be added, removed or modified at any time and this will immediately reflect on the diagram. Effects of different types can be applied simultaneously. It is also possible to apply more than one effect of the same type.

Radial gradients

Nodes can be filled using radial gradients by passing objects in following format to setBrush. If the gradient should blend only two colors, they can be specified using **color1** and **color2** fields instead of **colorStops**.

JavaScript Copy Code

```
var brush =
{
 type: "RadialGradientBrush",
 colorStops:
 [
  { position: 0, color: "white" },
  { position: 0.5, color: "lightGray" },
  { position: 1, color: "blue" }
 ],
 x1: 20, y1: 20, radius1: 30,
 x2: 40, y2: 20, radius2: 80
};
node.setBrush(brush);
```

Multiple labels per link

The LinkLabel class allows multiple captions to be displayed for a single DiagramLink object. Link labels provide a set of properties allowing full customization of their display and positioning. Labels can also be arranged automatically to avoid overlapping nodes and other labels by setting LinkLabel.AutoArrange to true.

New events

- nodeSelected and linkSelected events are now raised when an item is selected, either programmatically or by the user.
- nodeDeselected and linkDeselected events are now raised when an item is deselected, either programmatically or by the user.
- nodeDoubleClicked and linkDoubleClicked events raised when the user double clicks an item.
- nodeCreating is now also raised while the user drags a node from the NodeListView control.

Miscellaneous

- Call setVirtualScroll to enable virtual scrolling mode. In this mode, the canvas stays as big as its containing div, and its content is drawn with a translation bound to the div's scrollbar positions. This allow displaying large diagrams in browsers and on mobile devices where the size of HTML canvas elements is limited.
- resizeToFitText method added to ShapeNode.
- Improved support for nested containers.

New in version 1.4

Server side

Styles and themes

The appearance of the items in a diagram can now be modified using styles. The style represents a set of properties, which can be applied to an individual diagram item (by assigning it to the DiagramItem.Style property) or to all items of a specific type (by using a Theme).
The theme represents a collection of styles. Each style in the theme is associated with the diagram items of a specific type and affects all items of this type. Themes can be loaded from XML files.
For more information about this new feature, check Styles and Themes.

One-way graph Layout

The OneWayLayout class ensures that links enter into nodes from the same general direction and exit them from the opposite side. If the graph contains cycles, some links bend around the nodes to keep the enter/exit direction consistent. The algorithm aims to minimize the number of such links.

Composite layout improvements

The CompositeLayout exposes several new properties. The UseAdditionalPartitioning property can be set to true in order to enable additional partitioning pass after the default partition. This is especially useful when the initial partitioning produces a graph with nodes with many leaf children.

Parallel layouts

The .NET 4 version of **MindFusion.Diagramming** takes advantage of the **Task Parallel Library (TPL)** to enable parallelism on the different layout algorithms. Set the EnableParallelism property on the Layout class to true to enable arranging different subgraphs on different threads to possibly improve performance on multiprocessor systems. In addition, the maximum degree of concurrency can be manipulated through the MaxDegreeOfParallelism property. Note that only independent subgraphs are processed in parallel, so the **SplitGraph** property of layout classes that provide it must also be set.

Preserve order in tree layout

The Balance property of TreeLayout can be set to **Preserve** to keep the original geometric order of child nodes when arranging them under their parent. This can be used to arrange tree branches in a specific order by first positioning them in increasing horizontal or vertical positions.

Export improvements

- RenderOptions property added to PdfExporter, SvgExporter and **WmfExporter** allows controlling various aspects of exported diagrams.
- Speed of PDF generation by **PdfExporter** greatly improved.
- VisioExporter.DynamicsOff can be used to disable dynamic link routing in Visio 2010 in order to preserve the position of control points from the exported diagram;
- **PdfExporter** now creates PDF Bezier objects for Bezier curves in the diagram instead of approximating them with lines;
- If VisioImporter.ApplyVisioUnit is enabled, the diagram's unit will be set to the one from the imported VDX file;

Miscellaneous

- The value of DiagramItem.ZIndex property is no longer required to be unique and smaller than the number of items;
- Diagram item collection types now implement the generic **IList** interface;
- The last row in a TableNode will now be rendered clipped if it fits only partially inside the node, whereas in previous versions the row would not be rendered at all.
- The AllowAddChildren and AllowRemoveChildren properties of ContainerNode specify whether users are allowed to add or remove child nodes to / from the container.
- The GetNearestBorderPoint method of DiagramNode can be used to find a point from the node's border closest to a specified point.

API changes

- RotationAngle property moved from ShapeNode to base DiagramNode;
- Type of Group.FollowMasterRotation changed from boolean to enum GroupRotation;
- **LinkStyle** enum renamed to LinkShape;
- **DiagramLink.Style** property renamed to Shape;
- The type of **TextColor** and **CaptionColor** properties have been changed to Brush; the properties have been renamed to TextBrush and CaptionBrush;
- The default value of **Pen**, **Brush** and **Font** properties of items is now **null** (**Nothing** in Visual Basic) to allow for inheritance from DiagramItem.Style or Diagram.Theme.
- ZIndex no longer corresponds to the position of items within Diagram.Items collection. Items however still contains the items sorted by Z order, as defined by item's **ZIndex**;
- Event handler delegates have been removed; events are now defined as generic EventHandler specialized via EventArgs type. For example the type of NodeCreated is now EventHandler<NodeEventArgs>;
- InitializeNodeScript and InitializeLinkScript properties have been added to support initializeNode and initializeLink client-side events.
- **NodeListView.AddShapeNode** method renamed to **AddNode**.

Client side

Table Nodes

A TableNode displays tabular data, and can be used to represent table schemas in database diagrams or classes in class-hierarchies. A table contains cells arranged in a grid, and every cell can display text and/or image. Cells, columns and rows can be customized in various ways - there are properties available for setting their extents, style, image and text alignment. The number of cells in a table's grid can be programmatically changed by calling methods such as redimTable, insertRow and insertColumn. If a table contains many rows, you can let users scroll them up or down by calling the setScrollable method.

Container Nodes

A ContainerNode can contain other diagram nodes. When a container is moved, its child nodes move too. Containers can be nested one within another to unlimited depth. They can be folded to a smaller size, hiding their child items, and unfolded to show content again. Nodes inside a container can be linked to nodes both inside and outside of it. If a link connects items in the same container, the container is not considered an obstacle by the auto-routing algorithm.

Styles and Themes

An instance of the Style class can be used to set items' appearance properties as a single unit via the setStyle method. In order for style attributes to be used, the respective local appearance properties of a DiagramItem objects must have undefined or null values. If an item's Style does not define a value for some attribute, it is looked up in the styling hierarchy, first in the diagram's Style, next in the current Theme, and finally in the set of default styles defined for each item class.

Shadows

Diagram items can now cast shadows. The shadow color is specified via the setShadowColor method and the offset of a shadow from its item is set via setShadowOffsetX and setShadowOffsetY methods. Shadows aren't rendered if getEffectiveShadowColor returns null or undefined value.

Miscellaneous

- The Locked property can be used to disable interaction with a diagram item.
- Improved rendering speed when changing items' appearance properties.

- Call the setTooltip method to associate tooltip text with an item. The tooltip appears when the mouse pointer hovers over an item for a second.
- Specify the line width of item frames via the setStrokeThickness method.
- initializeNode and initializeLink events are raised when users start drawing a node or a link interactively.
- The NodeListView control can now host table and containers. The **addBox** and **selectBox** methods have been replaced by addNode and selectItem methods.
- The setStartPoint and setEndPoint methods of links provide shortcuts for setting the first and last points in ControlPoints.

New in version 1.3

Attaching and grouping items

MvcDiagram allows attaching a node to another node, establishing a subordinate - master relationship between them. The easiest way to attach nodes is to call the attachTo method. When a master node is moved, all of its subordinates follow it, so that the initial distance between them stays constant. This happens both when a user moves the master node around, and when the node's position is changed using a method or a property.

Collapse and expand tree branches

If a diagram represents a tree structure, the tree branch starting from a node can be collapsed or expanded again in order to hide or display hierarchy details. To enable this, call the setExpandable method. There is a [±] button displayed beside an expandable node to allow users to collapse or expand the tree branch starting there. By default, pressing that button automatically toggles the Expanded property of the node and raises the TreeExpanded or TreeCollapsed events.

User interaction modes

Call setBehavior with one of the Behavior members as argument to specify how the diagram should handle mouse input.

- DoNothing: the diagram is read-only, but nodeClicked and linkClicked events are still raised.
- Modify: existing diagram items can be selected and modified, but no new items can be created interactively.
- DrawLinks: existing nodes can be linked interactively, but no new nodes can be drawn.
- DrawShapes: drawing with the mouse creates new ShapeNode objects; links cannot be created interactively.
- LinkShapes: this is the default behavior, where drawing over an empty spot of the diagram creates a **ShapeNode**, and drawing over a node creates a link.

Touch input

When running under the iOS Safari web browser, the control handles one-finger touch events to allow drawing and selecting items interactively. In addition, the hit-test area around adjustment handles is larger to make touch modifications easier. Two-finger gestures are delegated to the browser - they either scroll the canvas when dragging in the same direction or zoom the page when dragging in opposite directions. The preventDefaultTouch flag can be set to false to revert to the default one-finger touch behavior (scroll the whole page).

Miscellaneous

- The Visible property specifies whether an item should be shown on screen.
- Validation events added: NodeCreating, LinkCreating, NodeDeleting, LinkDeleting, NodeModifying and LinkModifying.
- The ScrollX and ScrollY properties and scrollTo method lets you set the diagram's scroll position.
- getViewport returns the currently visible part of the diagram.
- setZoomFactorPivot sets the zoom level in such way that the pivot point's screen position does not change.
- zoomToRect zooms and scrolls the view to fit the specified document rectangle in the Diagram's visible area.
- zoomToFit zooms the view to fit the document contents into the current view size.
- getContentBounds returns the smallest rectangle that bounds all diagram objects.
- keepGroupLayout indicates whether to treat each group of attached nodes as a single vertex in the arranged graph.
- Extension methods are modified to add MVC3 Razor support.

New in version 1.2

Server side

Fractal tree Layout

FractalLayout is a tree layout algorithm that places child nodes symmetrically around their parent node. Nodes at the lowest level are arranged directly in a circle around their parent. At upper levels, the already arranged nodes form branches that are arranged in a circle around the new parent node. The algorithm is recursively repeated till the highest level is reached. If nodes in the tree have uniform number of children, the end result has fractal-like appearance (subsets of the graph look like scaled-down copies of the whole graph). You can choose which node should be displayed at the center of the topmost circle by setting the Root property. If it is not specified, the algorithm automatically selects a root that leads to more balanced distribution of nodes.

LayeredLayout enhancements

- Specify start and end nodes in LayeredLayout via the StartNode and EndNode properties.
- EnforceLinkFlow specifies whether to attempt to force all links to go in the same direction. If the graph being arranged contains cycles, some of the links will still go backward.

Client side

Alignment grid

The alignment grid help users place the diagram items more precisely. To activate the grid, set the AlignToGrid property to true. If the grid is active while an item is being created or modified, the item's control-points are aligned to the nearest grid points. The distance between adjacent grid points is set via the GridSizeX and GridSizeY properties. The grid can be either visible or invisible,

depending on whether the ShowGrid value is true or false. If visible, the grid is painted as a matrix of points or as series of crossing lines, as specified by the GridStyle property. GridColor defines the color with which the alignment points or lines are painted.

Bordered tree layout

In contrast to **TreeLayout**, which centers the parent node above its child nodes, BorderedTreeLayout arranges children in columns at a horizontal offset form their parent. **BorderedTreeLayout** members control the tree direction, how much space to leave between tree levels, and between nodes on the same level.

Anchor points

The AnchorPattern class represents a set of AnchorPoint objects, which specify the exact locations where links are allowed to connect to nodes. A pattern can be assigned to nodes by calling their setAnchorPattern method. The **AnchorPattern** class exposes several predefined patterns as static fields: decision2In2Out, decision1In3Out, leftInRightOut, topInBottomOut.

MvcDiagram Fundamentals

MvcDiagram consists of two main components, a .NET class library running on the server and a client side control implemented in JavaScript.

Server side

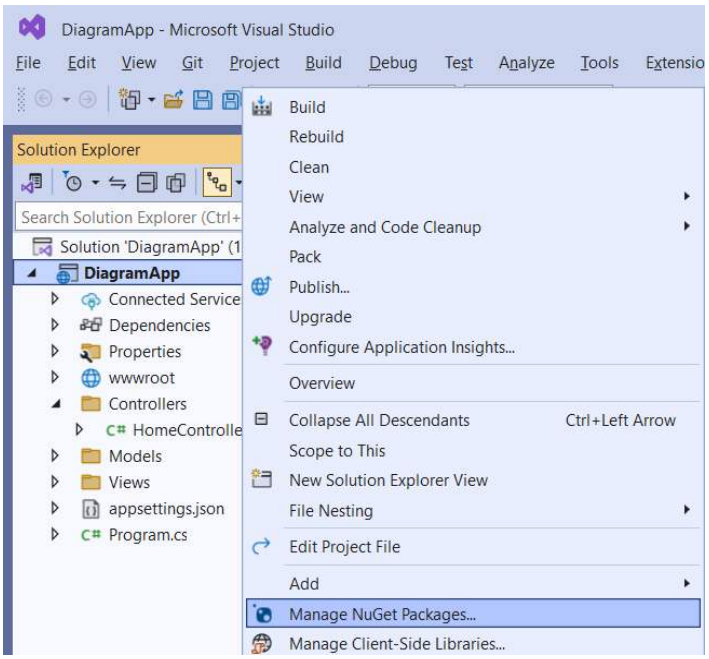
The .NET library implements a flow-diagramming object model that lets you define structures such as trees, flowcharts and graphs. The most important classes from the library are Diagram, ShapeNode, TableNode, ContainerNode, SvgNode and DiagramLink. A **Diagram** instance serves as the container for relational graph data, whose content is accessed through the Nodes and Links collections. **Nodes** contain DiagramNode instances that represent the nodes (a.k.a. vertices) in a graph or tree, and **Links** contain **DiagramLink** instances that represents the links (a.k.a. edges/arcs) between nodes in the graph. Usually a **Diagram** instance will be a part of a Model class in an MVC application, or will be used as an intermediate object that only maps the model data to the client-side diagram view.

Once the **Diagram** is populated and DiagramView configured to draw it and specify interaction mode, it can be rendered as part of an HTML page by calling the DiagramView extension method from the MVC view code.

There are also various export classes you can use on the server to export diagrams to PDF, SVG, Flash, DXF, Visio and WMF formats.

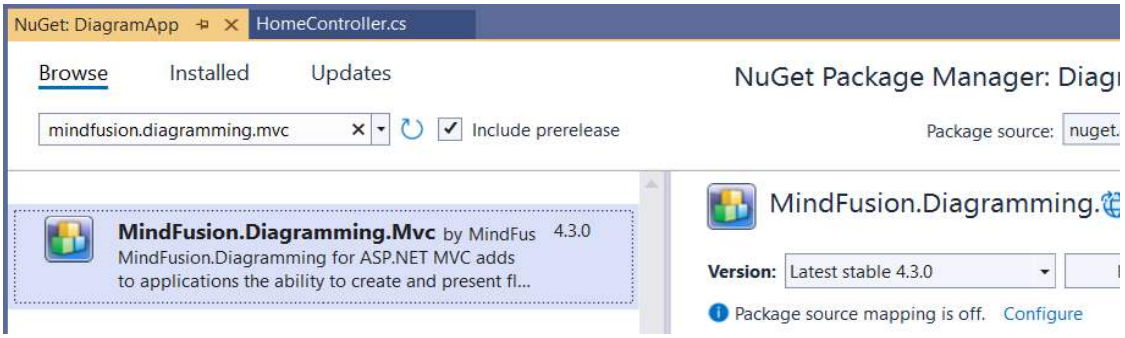
Client side

On the client side, a diagram model is represented by the Diagram JavaScript class, and rendered by the DiagramView control that draws the diagram content on an HTML Canvas. The view also allows users to add new nodes and links to the diagram by drawing them with the mouse. New nodes can also be created via drag-and-drop from the NodeListView control.



Some of the automatic layout features you might know from other MindFusion diagramming controls are implemented on the client side, including Layered, Tree, Spring and Fractal layouts.

Getting Started



The following topics describe how to integrate the Diagramming API into ASP.NET Core Web App projects (either MVC or Razor Pages), and create an instance of the DiagramView control.

Add Nuget Package

In order to integrate the Diagramming API into your ASP.NET Core Web App (either MVC or Razor Pages), select Manage Nuget Packages from Project menu:

Open the Browse tab, and enter *MindFusion.Diagramming.Mvc* in the search field. Select the *MindFusion.Diagramming.Mvc* package and click Install.

Once the package is installed, you should be able to add components from the library to your UI (DiagramView, NodeListView, etc).

Create DiagramView in MVC Project

After following the previous topic, you should be able to add a DiagramView component to your ASP.NET MVC (Model-View-Controller) user interface.

1. Create a DiagramView component

In *HomeController.cs* add a reference to the MindFusion.Diagramming.Mvc namespace:

C# Copy Code

```
using MindFusion.Diagramming.Mvc;
```

In the body of the **Index** method, create a DiagramView instance and store it in the **ViewBag**:

C# Copy Code

```
DiagramView view = new DiagramView("diagramView1");
ViewBag.DiagramView = view;
```

2. Render DiagramView inside a view

In *Index.cshtml* add a reference to the MindFusion.Diagramming.Mvc namespace:

Razor Copy Code

```
@using MindFusion.Diagramming.Mvc
```

If you want to use tag helpers for adding MindFusion components to views, import them with the @addTagHelper directive:

Razor Copy Code

```
@addTagHelper *, MindFusion.Diagramming.Mvc
```

Add the component by using either the DiagramView HTML helper:

Razor Copy Code

```
@Html.DiagramView(
    (DiagramView)ViewBag.DiagramView,
    new { style = "width:100%; height:100%;" })
```

or alternatively using its Tag helper:

Razor Copy Code

```
<mindfusion-diagramview
    component=(DiagramView)ViewBag.DiagramView
    style="width:100%; height:100%;">
</mindfusion-diagramview>
```

3. Create diagram items

You can create nodes and links programmatically either by calling Factory methods, or by instantiating objects of respective class and adding them to Items collection:

C# Copy Code

```
// in controller

DiagramView view = new DiagramView("diagramView1");

var df = view.Diagram.Factory;

var node1 = df.CreateShapeNode(10, 10, 30, 30);
node1.Text = "Hello";

var node2 = df.CreateShapeNode(60, 25, 30, 30);
node2.Text = "ASP.NET MVC";

df.CreateDiagramLink(node1, node2);

ViewBag.DiagramView = view;
```

4. Preserve data between postbacks

The DiagramView component can preserve its data between postbacks by serializing and deserializing to JSON internally. Call the static FromRequest method
to get this functionality. You can check the request's content type to handle the initial setup of the view and its diagram.

C# Copy Code

```
// read from request
DiagramView view = DiagramView.FromRequest("diagramView1", Request);

// initial setup
if (!Request.HasFormContentType)
{
     var df = view.Diagram.Factory;

     var node1 = df.CreateShapeNode(10, 10, 30, 30);
     node1.Text = "Hello";

     var node2 = df.CreateShapeNode(60, 25, 30, 30);
     node2.Text = "ASP.NET MVC";

     df.CreateDiagramLink(node1, node2);
}

ViewBag.DiagramView = view;
```

Browse the other sections of this help file to learn more about the functionality provided by the MindFusion.Diagramming classes, methods and properties. Follow the tutorials to learn how to populate the diagram model programmatically or create custom item types.

Create DiagramView in Razor Pages Project

After adding the nuget package, you should be able to add a DiagramView component to your ASP.NET Razor Pages user interface.

1. Create a DiagramView component

In *Index.cshtml.cs*, add a reference to the MindFusion.Diagramming.Mvc namespace:

C# Copy Code

```
using MindFusion.Diagramming.Mvc;
```

In the body of the **Index** method, create a DiagramView instance and store it in the **ViewData**:

C# Copy Code

```
DiagramView view = new DiagramView("diagramView1");
ViewData["DiagramView"] = view;
```

2. Render DiagramView inside a view

In *Index.cshtml*, add a reference to the MindFusion.Diagramming.Mvc namespace:

Razor Copy Code

```
@using MindFusion.Diagramming.Mvc
```

If you want to use tag helpers for adding MindFusion components to views, import them with the @addTagHelper directive:

Razor Copy Code

```
@addTagHelper *, MindFusion.Diagramming.Mvc
```

Add the component by using either the DiagramView HTML helper:

Razor Copy Code

```
@Html.DiagramView(
    (DiagramView)ViewBag.DiagramView,
    new { style = "width:100%; height:100%;" })
```

or alternatively using its Tag helper:

Razor Copy Code

```
<mindfusion-diagramview
    component=(DiagramView)ViewBag.DiagramView
    style="width:100%; height:100%;">
</mindfusion-diagramview>
```

3. Create diagram items

You can create nodes and links programmatically either by calling Factory methods, or by instantiating objects of respective class and adding them to Items collection:

C# Copy Code

```
// in controller

DiagramView view = new DiagramView("diagramView1");

var df = view.Diagram.Factory;

var node1 = df.CreateShapeNode(10, 10, 30, 30);
node1.Text = "Hello";

var node2 = df.CreateShapeNode(60, 25, 30, 30);
node2.Text = "ASP.NET Razor Pages";

df.CreateDiagramLink(node1, node2);

ViewData["DiagramView"] = view;
```

4. Preserve data between postbacks

The DiagramView component can preserve its data between postbacks by serializing and deserializing to JSON internally. Call the static FromRequest method from the page's **OnPost** method to get this functionality.

C# Copy Code

```
public void OnPost()
{
    DiagramView view = DiagramView.FromRequest("diagramView1", Request);
    ViewData["DiagramView"] = view;
}
```

Browse the other sections of this help file to learn more about the functionality provided by the MindFusion.Diagramming classes, methods and properties. Follow the tutorials to learn how to populate the diagram model programmatically or create custom item types.

User Interaction

Most likely an application will use MvcDiagram to enable users to interactively create diagrams, flowcharts and other kinds of presentation documents. A user composes or edits a diagram by drawing its elements on the diagram canvas area. With the help of a mouse or another pointing device users draw shapes and links, possibly connecting them in complex hierarchies, graphs, trees or other structures they might need.

Creating New Items

New items can be created by drawing them with the mouse. While a user drags the mouse, the view of the control is updated to show what the new item would look like at the pointer location. If the operation cannot be completed at the current mouse position, the cursor changes to a crossed out circle. When the user releases the button, the item is created. The control does not let users create very tiny nodes which would be hard to select and modify. By default links can be drawn only between nodes, unless the AllowUnconnectedLinks property is enabled. Users can cancel item creation by pressing the right mouse button while drawing.

A node can also be created via drag-and-drop from the NodeListView control. Its instance can be added to the html page by calling the NodeListView extension method and specifying a collection of prototype nodes that should be listed in the palette.

Modifying Items

A user modifies an item by dragging its manipulation handles. The **ModificationStart** property specifies when these handles appear. The first option, AutoHandles, makes the handles appear when the mouse hovers over an item; modification of the item can start immediately by pointing it and dragging a handle. The second option is **SelectedOnly**: in order to be modified, an item should first be selected. Manipulation handles appear around the item to indicate that now it can be moved or resized. Number and functionality of those handles depend on the item type and the value of the corresponding HandlesStyle property.

Modifying a Node

Usually nodes have nine adjustment handles. The one at the center can be used to move the node. When dragged, each corner handle resizes the node by moving the two edges adjacent to the corresponding corner. The edge handles placed at the center of each side can be used to resize a node either horizontally or vertically. Shape nodes can be rotated using an additional round handle drawn above them. Each handle can be enabled or disabled by setting or clearing the respective bit in EnabledHandles.

Modifying a Link

Variety and behavior of link adjustment handles depend on the link's Shape and SegmentCount. Control-points stay at both ends of each segment that constitutes a link. MvcDiagram offers three link styles. Following sections discuss how to modify links of each style.

- The first style called Polyline defines links, which consist of a series of straight segments, drawn between control-points. There are no restrictions as to the number of segments. Dragging a control-point modifies each segment adjacent to the point. If the AllowSplitLinks property is enabled, users are allowed to insert new control points or to remove existing ones. Inserting a control point is done by pressing the left mouse button over a segment and dragging. The new point appears at the mouse location and splits the pointed segment in two.
- If link's style is set to **Bezier**, each segment has 4 manipulation handles that define a curve. Each curve goes through the end-points, which are shaped as circles. Bend of the curve is defined by the middle two points shaped as rectangles. If a user drags an end-point modification handle, the adjacent control points will be moved with same translation vector as that of the end-point. If a bend control point is dragged, the symmetric control point of the neighboring curve is also moved to ensure the two stay on the same line with the end-point and on the same distance from it.
- **Cascading** links consist of straight horizontal and vertical segments, each one orthogonal to its neighbors. If a control-point is dragged, the segments adjacent to it are moved and resized preserving their orthogonal orientation to each other. If the **AllowSplitLinks** property is enabled, users are allowed to insert new control points to **Cascading** links or remove existing ones. The orientation of the link segments can be changed if CascadeOrientation is set to Auto.

Selecting Items

Multiple items are selected by dragging while CTRL key is down. Selection can also be toggled with CTRL + clicking an item. A rectangle appears around selected items, allowing a user to move all of them at once.

Multi-touch Support

- If MultiTouchZoom property is enabled (default), the view can be zoomed or panned using two-touch pinch / flick gestures.
- If MultiTouchModify property is enabled (default), diagram nodes can be moved, scaled and rotated using two-touch pinch / flick gestures.
- If **MultiTouchZoom** property is disabled, each touch draws diagram items corresponding to current behavior.
- If **MultiTouchModify** property is disabled, each touch started from a node draws a diagram link.

Latter modes can be used for collaborative whiteboarding / classroom scenarios.

Programming Interface Overview

Model-View Architecture

Apart from targeting the ASP.NET MVC framework, MvcDiagram also implements the Model-View-Controller (MVC) architectural pattern internally. As applied to MindFusion.Diagramming classes, it separates the diagram data (model) from its representation to the user (view) and controlling it by the user (controller).

Single Diagram Canvas

The Diagram class represents the diagram data model and provides operations to process the data. It exposes properties and methods for adding new diagram elements, finding and accessing existing elements, or removing them.

The DiagramView class presents the relevant data from the **Diagram** class by drawing on the screen using the **CanvasRenderingContext2D** API. When the diagram changes, the view automatically redraws the affected part of the image to reflect the changes. Multiple views can display the same diagram, set by their Diagram property. Each view can have a different zoom level and scroll position.

The **DiagramView** class creates Controller objects when user starts interacting with the diagram, depending on the value of view's Behavior property. That property specifies how GUI actions to manipulate the data should be interpreted.

Multiple Diagram Pages

The DiagramDocument class represents a collection of diagram pages or sheets, represented by DiagramPage objects. New pages can be added to the document and existing pages can be removed and reordered by modifying the Pages collection.
The SaveToJsonFile, SaveToXml and SaveToString methods of **DiagramDocument** save all pages in a single file, and respectively the LoadFromJsonFile, LoadFromXml and LoadFromString methods load all pages from the file.

DiagramPage is derived from Diagram and only adds a few properties, so any code that processes **Diagram** objects will work with **DiagramPage** objects too. A diagram document forwards each event raised by its pages, giving you a chance to use the same handler for events raised by different pages. If a page should implement distinct user interaction or validation logic, it is also possible to attach handlers to the **Diagram** events inherited by **DiagramPage**.

A single **DiagramPage** could be assigned to the Diagram property of DiagramView, and that lets you create your own user interface for presenting a list of pages to the user and selecting a current page. The package also includes a TabbedDiagramView that presents all pages of a document in a tabbed user interface where each tab corresponds to a page. The page displayed in the active tab is exposed by the selectedPage property of TabbedDiagramView. The active page can be changed interactively by activating its associated tab. New pages can be added and removed to / from the document through buttons in the tab strip and the pages can be rearranged by dragging their associated tabs with the mouse.

User Interface Components

The following UI components from the library can be added to a page to let users create and view diagrams:

DiagramView

DiagramView renders the contents of a Diagram, and lets users draw new items by drawing with mouse or touch on the canvas. The Behavior property indicates how the control should interpret users' actions. Additional properties allow scrolling and zooming the view.

TabbedDiagramView

TabbedDiagramView displays multi-page DiagramDocuments. Each DiagramPage is displayed in its own tab. Apart from base DiagramView members, the control includes properties for customizing the tab strip, and to specify whether users are allowed add or remove pages.

Palette

The Palette control represents a tool palette that displays DiagramItem objects grouped into categories, and is implemented as accordion UI. Call the AddCategory method to define a category and create its respective accordion pane (an ItemListView). Call AddItem to add an item to specified category. **Palette** provides same layout and appearance properties as the **ItemListView** class.

ItemListView

ItemListView represents a tool palette that contains uncategorized list of diagram items. Items can be added to the list by calling AddItem method, and removed by calling RemoveItem. Drag-and-drop operations from **ItemListView** to DiagramView create a copy of the dragged item, and set its size to NewInstanceSize.

Overview

Overview provides a scaled-down view of a target DiagramView, helping users work with larger diagrams. A tracker rectangle shows current viewport of the main **DiagramView**, and by dragging it users can change the scroll position. It can also be resized to zoom the target view.

ZoomControl

ZoomControl lets users change the zoom level of a target DiagramView by dragging a slider. It also includes arrow buttons for scrolling the view.

Ruler

The Ruler control displays horizontal and vertical scales that let users measure and align diagram nodes.

Diagram Structure

Standard Item Types

Diagram elements in MvcDiagram are represented by ShapeNode, TableNode, ContainerNode and DiagramLink instances. Combined and linked together, they can form complex data structures such as process or entity-relationship diagrams, class hierarchies, networks and graphs. Each of their rich features can be customized through numerous methods and properties.

Shape Nodes

ShapeNode objects can represent geometric shapes, flowchart elements, icons in network diagrams, and so on. They can display both graphics and text in different fonts, sizes and colors. There are more than 100 predefined node shapes (you can preview them here) and apart from them, MvcDiagram offers an easy way to define custom shapes. Shape nodes can be rotated, either interactively using the round selection handle drawn above them, or programmatically using the RotationAngle property. Each node can also display a distinct bitmap image specified via its ImageUrl property.

Table Nodes

A TableNode displays tabular data, and can be used to represent table schemas in database diagrams or classes in class-hierarchies. A table contains cells arranged in a grid, and every cell can display text and/or image. Cells, columns and rows can be customized in various ways - there are properties available for setting their extents, style, image and text alignment. Tables' dimensions can be programmatically changed; inserting, appending or deleting rows and columns can be done in a very comprehensive, intuitive way whenever you might need it. Tables can also display background images and graphics.

Container Nodes

A ContainerNode can contain other diagram nodes. When a container is moved, its child nodes move too. Containers can be nested one within another to unlimited depth. They can be folded to a smaller size, hiding their child items, and unfolded to show content again. Nodes inside a container can be linked to nodes both inside and outside of it. If a link connects items in the same container, the container is not considered an obstacle by the auto-routing algorithm.

Diagram elements in MvcDiagram are represented by ShapeNode, TableNode, **ControlNode** and DiagramLink instances. Combined and linked together, they can form complex data structures such as process or entity-relationship diagrams, class hierarchies, networks and graphs. Each of their rich features can be customized through numerous methods and properties. MvcDiagram also offers intuitive user interface for drawing and editing diagram items interactively.

SVG Nodes

The SvgNode class represents nodes that can display SVG drawings. SVG graphics are rendered instead of Image, and on top of the geometry rendered by the base ShapeNode class. The SVG drawing of the node is specified through its SvgUrl property.

Composite Nodes

Diagram nodes can be composed from components. Components are graphical widgets similar to controls, which can be arranged in hierarchies and added to a Diagram through instances of the CompositeNode class. The component system contains various built-in components, such as Text and Image. Component hierarchies can be defined and loaded through Json templates using loadTemplate and classFromTemplate methods.

Links

DiagramLink objects are used to represent various types of connections and relations in diagrams. MvcDiagram offers three basic link types:

- polyline links composed of straight-line segments;
- curved links composed of Bézier-spline segments;
- links composed of horizontal and vertical segments, alternating their orientation so that every segment is orthogonal to its neighbor.

A link can be connected to a node at each of the link's ends. It is also possible to have unconnected links - having one or both of their ends not connected to nodes.

Custom Composite Nodes

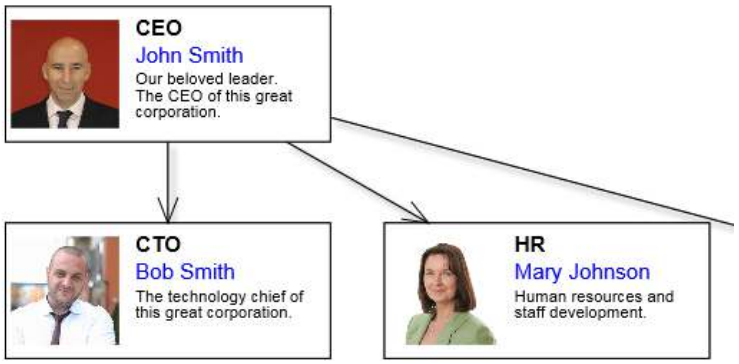
The CompositeNode class makes it easier to add custom graphics primitives to nodes. Appearance of composite nodes is defined by a tree of layout panels and child components. Unlike MindFusion's desktop diagram libraries, node templates are specified using JSON notation instead of XML. A sample client-side node class derived from **CompositeNode** can now be created declaratively using template as below.

C# Copy Code

```
@{
string template = @"{
 ""component"": ""GridPanel"",
 ""rowDefinitions"": [""*""],
 ""columnDefinitions"": [""22"", ""*""],
 ""children"":
 [
  {
   ""component"": ""Rect"",
   ""name"": ""Background"",
   ""pen"": ""black"",
   ""brush"": ""white"",
   ""columnSpan"": 2
  },
  {
   ""component"": ""Image"",
   ""name"": ""Image"",
   ""autoProperty"": true,
   ""location"": ""Images/icon4.png"",
   ""margin"": ""1"",
   ""imageAlign"": ""Fit""
  },
  {
   ""component"": ""StackPanel"",
   ""orientation"": ""Vertical"",
   ""gridColumn"": 1,
   ""margin"": ""1"",
   ""verticalAlignment"": ""Near"",
   ""children"":
   [
    {
     ""component"": ""Text"",
     ""name"": ""Title"",
     ""autoProperty"": true,
```

```
     ""text"": ""title"",
     ""font"": ""Arial bold""
    },
    {
     ""component"": ""Text"",
     ""name"": ""FullName"",
     ""autoProperty"": true,
     ""text"": ""full name"",
     ""pen"": ""blue"",
     ""padding"": ""1,0,1,0""
    },
    {
     ""component"": ""Text"",
     ""name"": ""Details"",
     ""autoProperty"": true,
     ""text"": ""details"",
     ""font"": ""Arial 3""
    }
   ]
  }
 ]
}
";
```

Objects from the MindFusion.Drawing namespace double as **CompositeNode** components. Apart from JSON templates, the visual tree can also be created by adding panels and drawing objects programmatically from JavaScript, starting from the node's root field.



Panel classes include:

- SimplePanel, laying out its children to overlap each other, taking up all available space (useful for background graphics or images).
- StackPanel, laying out its children side by side, either horizontally or vertically.
- GridPanel, laying out its children in rows and columns, where children in same cell overlap. Rows and columns can be either set to a fixed size, auto-size to their child preferred size, or take up all space remaining unoccupied by other rows and columns.

Named components (with specified name value) can be accessed by calling the getComponent method. Components whose autoProperty attribute is enabled will have a pair of get/set property methods generated automatically by classFromTemplate method. The auto-properties from above template can be used as below.

JavaScript Copy Code

```
var node1 = new OrgChartNode(diagram);
node1.setBounds(new Rect(25, 15, 60, 25));
node1.setTitle("CEO");
node1.setFullName("John Smith");
node1.setDetails(
    "Our beloved leader. \r\n" +
    "The CEO of this great corporation.");
node1.setImage("ceo.png");
diagram.addItem(node1);
```

Auto properties are also automatically serialized in JSON format, cloned by node.clone() method and saved/restored by undo commands.

The Shape class used to specify ShapeNode geometry can also be used as a component. When its **isOutline** attribute is set, the shape will control **CompositeNode**'s geometry too, defining hit test and clip area, and link alignment points along node's border. If **isOutline** is disabled, the shape will serve mostly as a decorative element. The code below shows a sample fragment specifying shape component in template:

JavaScript Copy Code

```
{
    component: "Shape",
    id: "Cloud",
    autoProperty: true,
    name: "OutlineShape",
    pen: "gray",
    brush: "Transparent",
    isOutline: true
},
```

If custom nodes will be posted back to server, you must still declare a matching node class as a data container for the custom nodes:

C# Copy Code

```
using MindFusion.Diagramming;
using MindFusion.Diagramming.Mvc;

public class OrgChartNode : CompositeNode
{
    public OrgChartNode()
    {
    }

    public OrgChartNode(Diagram diagram)
        : base(diagram)
    {
    }

    [AutoJson]
    public string Image { get; set; }

    [AutoJson]
    public string Title { get; set; }

    [AutoJson]
    public string FullName { get; set; }

    [AutoJson]
    public string Details { get; set; }
}
```

but unlike older methods of creating custom nodes, you no longer have to create client-script code. The latter is generated automatically from the template and bound to server class properties using a single call to RegisterItemType:

C# Copy Code

```
// register custom item type
view.RegisterItemType(typeof(OrgChartNode), "OrgChartNode", "OrgChartNode", 100, template);
view.LoadFromJson(Request.Form["diagramView1_PostData"]);
ViewBag.DiagramView = view;
```

This is demonstrated in Tutorial 8 sample project installed with the component.

Creating and Deleting Items

Creating Items Programmatically

In order to add a new node or link to a diagram, create an instance of the item class via the new operator and add it to the diagram's Nodes or Links collection. This works the same way for adding both items from your custom class or ones from the MvcDiagram predefined types.
There are several shortcut methods provided for creating instances of the predefined node and link types. The methods are members of the diagram's Factory object:

- The CreateShapeNode method creates a ShapeNode at the specified position.
- There are several overloads of the CreateDiagramLink method that allow connecting two nodes of the same type or of different types.

Drawing New Items

Users can draw diagram elements with the mouse. This creates either a node or a link, depending on whether there is already another diagram item under the mouse cursor. When a user starts drawing, an item is created and its appearance is initialized from the default-value properties of the Diagram, such as ShapePen and ShapeBrush. When the user releases the mouse button, the item is added to the collection that contains items from the same type - either Nodes or Links.

Deleting Items

Call the Remove method of the Nodes or Links collection to delete an item from the diagram. The ClearAll method clears diagram contents by deleting all items.

Accessing Items

One of the most common tasks when using the component is iterating over all items in the diagram document or navigating through the connections between items - from a node to the incoming or outgoing links, or from a link to its origin and destination nodes. To enumerate items of a diagram use the Items, Links or Nodes collections. The nodes that a link connects are referenced by the link's Destination and Origin properties. To access the links that are connected to a node, use its IncomingLinks and OutgoingLinks collections. The first collection contains references to all links pointing to the node, the second - to the links that start from it. Links can connect to rows of a table; to find such links use table's Rows collection and the IncomingLinks and OutgoingLinks collections. A shortcut for accessing the other end of a relation in entity-relationship diagrams is provided by the RelatedOneToMany and RelatedManyToOne properties of the Row class.

Selected Items

If only one item is selected, it is considered the active item and can be accessed with the ActiveItem property. The type of this property is DiagramItem; you can get the actual type of the selected item through .NET reflection. Multiple items can be selected when clicking or dragging with the CTRL key pressed at the same time. Multiple selection is represented by the Selection property of the Diagram class. The Selection object provides collections to access the selected Links and Nodes.

Finding Items

You can search for diagram items by their Tag or Id using the FindLink, FindNode, FindLinkById and FindNodeById methods. Tag and id objects are compared by calling the **Equals** method of the **System.Object** class. Thus if they are of value type, they are compared by value (that is bitwise equality). If they are of reference type their **Equals** method is used. If there are more items with the same tag, the first one will be returned. If no item with the specified tag or id exists, a **null** reference (**Nothing** in Visual Basic) will be returned. Groups can also be searched by tag using FindGroup.

Relationship Queries

The Query method traverses the graph by following node/link connections and group's parent/child relationships to find items in specific relation to the current one. The method receives a string argument consisting of selectors and optional predicates. The query is executed in several steps. In each step the result set is constructed from the previous result set by following the relationship specified by the current selector. If a predicate is specified after the selector identifier, the result set is filtered to include only items for which the predicate evaluates to **true**.

Attaching and Grouping Items

MvcDiagram allows attaching a node to another diagram element, establishing a subordinate - master relationship between the two items. The easiest way to attach nodes is to call the AttachTo method. When a master element is moved or resized, any subordinated node follows it, so that the initial distance between the two items stays constant. This happens both when a user moves the master item around, and when the item position is changed using a method or a property.

> **Note**
>
> Recent versions of the API include NodeLabel and LinkLabel classes, which address several of the scenarios described below. We recommend using these classes when appropriate, as they offer a more lightweight and easily configurable alternative to attached nodes.

Possible Uses

- Attach a Transparent shape node to another item and set its Text, so that the shape node acts as an additional label assigned to the main item.
- Attach a shape node to another item and set the node's Image, so it acts as an additional icon displayed inside or near the main item.
- In all previous cases, the Locked property can be set for attached nodes, which are used only as decorations embellishing the main item. That prevents users from selecting, modifying or drawing links to the subordinates.

Hierarchical Grouping

A unit of attached items is represented by an instance of the Group class. To create a group, instantiate a **Group** object and add it to the diagram's Groups collection, or call the CreateGroup method passing the master object as argument. Attach items to the group

using the various **Group** methods. The AttachTo method of nodes is a shortcut to creating a group and attaching an item to it.

Every member of a group can be the master item of another group, that is, an item can be subordinate in one group and meanwhile be another group's master. MvcDiagram doesn't impose any limits to the depth and width of group hierarchies built that way. However, it is not possible to put an item as a subordinate in more than one groups because the hierarchy relations would become ambiguous.

Unions

It is possible to create such groups, that if any item in the hierarchy is modified, all other items are updated too. This can be done by putting the items in circular chain of dependencies - that is, item1 is attached to item2, item2 to item3 ... itemN to item1. If any of these items is modified, the change will propagate through the chain until it reaches its originator.

Attaching Items to a Group

Links cannot be attached to groups but can be master items of groups. If a group's master item is a link, nodes can be attached to the control points or segments of the link. See the AttachToLinkPoint and AttachToLinkSegment methods for details. If the master item is a node, other nodes can be attached to any of its corners, or to an area specified as percent of master-node's bounding rectangle. Check AttachToCorner and AttachProportional for details. A shortcut to creating Group instance and calling the appropriate AttachTo* methods is provided by the AttachTo method of the DiagramNode class.

Accessing Group Items

Group members can be accessed using the MainItem property and the AttachedNodes collection. To get the groups in which an item participates, use its MasterGroup and SubordinateGroup properties.

Destroying Groups

If a user deletes the master item of a group, the group is destroyed automatically and the GroupDestroyed event is raised. If AutoDeleteItems is enabled, subordinated items in the group are deleted too. If **AutoDeleteItems** is disabled, subordinated items are just detached from their master and remain intact. Groups can be destroyed programmatically by removing them from the diagram's Groups collection.

Laying Out Diagrams Automatically

Applications that process hierarchical or more complex entity-relationship data might need to present that data to end-users in an aesthetical and visually appealing manner. Such applications would store their data as graph of connected nodes possibly having additional information attached to them. However, position and size coordinates of nodes might be unnecessary and/or unavailable. MvcDiagram provides a way to automatically arrange the nodes of a diagram, applying attractive layouts on the overall structure of the diagram. To utilize that functionality, an application can create a diagram by assigning generic coordinates to its nodes, instantiating a layout object and invoking the layout's Arrange method. Non-blocking ArrangeAsync method is available in the .NET 4.5 build of *diagramming.dll* assembly. Arrange methods can be prevented from changing positions of individual items by setting the IgnoreLayout property of those items to **true**.

The classes that implement automatic layout algorithms are located in the MindFusion.Diagramming.Layout namespace. The following sections list the available algorithms categorized by their general implementation strategy: **force-directed algorithms**, **graph topology based algorithms** and **semantics based algorithms**.

Diagram Serialization and Output

Serializing the Diagram

JSON Serialization

To serialize a diagram as a JSON string, call its SaveToJson method. To deserialize a diagram back from its JSON representation, call the LoadFromJson method. The SaveToJsonFile and LoadFromJsonFile methods serialize the JSON strings to / from files.

Custom item classes can implement JSON serialization for their additional properties by overriding the SaveToJson and LoadFromJson methods. Such classes must be registered for serialization by calling the RegisterItemClass method and providing a string identifier for the *clientClass* parameter.

The control raises JsonSerializeTag and JsonDeserializeTag to enable serialization of complex Id and Tag objects without overriding the item classes. The PropertyName event argument specifies which property is being serialized.

JSON serialization is handled internally by the classes from MindFusion.Json namespace. The JsonValue class represents a property value. Property names and values are stored in instances of the JsonObject dictionary class. The JsonContext class handles the serialization of the Diagram properties. The Serialize method is a wrapper over the Serializer class' Serialize method. It takes a

JsonObject and serializes it to a string. The Parse method is a wrapper over the Parser class' ReadJsonObject method. It takes a JSON-formatted string and returns a **JsonObject** with the parsed data.

XML Serialization

It is possible to save a diagram as an XML document. To do that, call the SaveToXml method of the Diagram class. To deserialize a diagram back from its XML representation, call the LoadFromXml method.

Custom item classes can implement XML serialization for their additional properties by overriding the SaveToXml and LoadFromXml methods. In addition, such classes must specify a string to use as their identifier in the XML document by calling RegisterItemClass.

The control raises SerializeTag and DeserializeTag to enable serialization of complex Id and Tag objects without overriding the item classes. The PropertyName event argument specifies which property is being serialized.

Exporting the Diagram

Export Bitmap Images

You can create a bitmap image representing the current diagram using the CreateImage method. The method returns a **Microsoft.Maui.Graphics.IImage** instance. The following example shows how to export a diagram to a Png image file :

C# Copy Code

```
var image = diagram.CreateImage();
image.SaveAsync(stream, ImageFormat.Png);
```

The MindFusion.Diagramming.Export Namespace contains classes for exporting to Dxf, Pdf, Svg, Wmf, Swf and Visio formats.

Export DXF files

Add a reference to the *MindFusion.Diagramming.Export.dll* to your project. Create a DxfExporter instance and call its Export method, specifying a Diagram object and a file path as arguments. Raster images can be used in DXF by referencing external image files. To export the images displayed in diagram elements, enable the ExportImages property. If your application supports the multiple-line text DXF entity - MTEXT, use the ExportTextAsMultiline property. The following example shows how to create a **DxfExporter** instance and export a diagram:

C# Copy Code

```
var dxfExporter = new MindFusion.Diagramming.Export.DxfExporter();
dxfExporter.Export(diagram, exportPath + "diagram.dxf");
```

Export PDF files

Add a reference to the *MindFusion.Diagramming.Export.dll* to your project. Create a PdfExporter instance and call its Export method. Margins specifies the page margins for all pages in the document. If you need to set the page size and orientation, use the PageSize, and PageOrientation properties. The AutoScale property allows scaling the diagram to fit in one or more PDF pages. If invisible items should be displayed in the PDF, enable the InvisibleItems property. The following example shows how to export a diagram to PDF:

C# Copy Code

```
var pdfExporter = new MindFusion.Diagramming.Export.PdfExporter();
pdfExporter.Export(diagram, exportPath + "diagram.pdf");
```

Export SVG files

Add a reference to the *MindFusion.Diagramming.Export.dll* to your project. Create an SvgExporter instance and call its Export method, passing a Diagram object and either a file path or stream as parameters.

C# Copy Code

```
var svgExporter = new MindFusion.Diagramming.Export.SvgExporter();
svgExporter.Export(diagram, exportPath + "diagram.svg");
```

Export Visio files

Add a reference to the *MindFusion.Diagramming.Export.dll* to your project. Create a new instance of the VisioExporter class and call its Export method passing a Diagram object and the full path to the exported Visio .vdx file as parameters. The exporter requires the *VisioExport.vxt* file to be present in the application's directory or the path specified by TemplatePath. This file contains an XML template data used by the component to generate Visio documents.

ShapeNode objects are mapped to their closest Visio counterparts and DiagramLink instances are exported as Visio connectors of a similar style. In addition, most of the attributes of diagram items such as text, text formatting, fill and line colors and styles are preserved.

TableNode objects are exported as groups of Visio shapes or as Entity shapes. If TableNodes should be exported as groups of Visio rectangular shapes, enable the ExportTablesAsGroups property.

C# Copy Code

```
var visioExporter = new VisioExporter();
visioExporter.Export(diagram, exportPath + "diagram.vdx");
```

Export Excel files

The ExcelExporter class from *MindFusion.Diagramming.Export.dll* assembly exports diagrams to Excel Open XML Format (XLSX) files. Diagrams are exported as Excel AutoShapes drawings. The Export overload that takes a DiagramDocument parameter creates a sheet for each DiagramPage in the document. The Export(Diagram) overload creates a single Excel sheet.

Appearance

Styles and Themes

The style and theme system provides a consistent way to customize the appearance of a Diagram and its items. By using styles and themes, it is easier to achieve coherent look and feel across the entire diagram. In addition, changing the look and feel can be achieved by simply replacing the current theme.

Styles

The style is a set of properties. Styles can be applied to diagrams and individual diagram items and this can potentially affect the values of some properties of the target object. More specifically, if the value of a style-affected property in the target object is **null**, then the value is obtained from the associated style. The style does not necessarily need to provide values for all of its properties. If a styled property is **null** and it is not defined in the associated style, the style system searches for a value in the current theme. A complete value precedence list can be found later in this topic.

The styles are represented by the Style class and its various subclasses. Styles can be applied to diagram objects through the Style property of the Diagram class and to diagram items through the Style property of the DiagramItem class. Styles can also participate in themes, in which case they affect all objects of specific type.

Themes

The theme is a set of styles, each associated with specific diagram or item type. When the theme is applied to a diagram, the styles registered in the theme affect all objects of their associated type.

Themes are represented by the Theme class and can be assigned to Diagram objects through the Theme property. Styles are associated with types within the theme through the RegisterStyle method. The following code creates a new theme, with a single style for ShapeNode items and applies this theme to an existing diagram.

C# Copy Code

```
Theme theme = new Theme();
ShapeNodeStyle style = new ShapeNodeStyle();
style.FontFamily = "Courier New";
theme.RegisterStyle(typeof(ShapeNode), style);
diagram.Theme = theme;
```

VB.NET Copy Code

```
Dim theme As New Theme()
Dim style As New ShapeNodeStyle()
style.FontFamily = "Courier New"
theme.RegisterStyle(GetType(ShapeNode), style)
diagram.Theme = theme
```

Alternatively, themes can be loaded from XML files by calling the LoadFromXml method. Such XML files can be produced by calling the SaveToXml method of an existing theme.

Value Precedence

The style and theme system is hierarchical. This means that, when a value of a styled property is requested, the system starts searching for this value along a chain of defined styles. The system returns the first valid value encountered. If no valid value is encountered along the chain, the system returns a globally defined default value for the property. The following list explains the search order in more details:

1. If the local value of the object is not **null**, the local value is returned.
2. If the object has a style and the property in this style has value, this value is returned.
3. If the object is an item, which is part of a diagram, the local style of the diagram is searched.
4. If the object is an item, which is part of a diagram and the diagram has associated theme, the theme is searched for styles registered for the item's type or its base types. If a style with a defined property value is found, this value is returned.
5. Similar search as the previous one is performed for a theme-registered style for the Diagram class.
6. If the above steps do not produce value; the system returns a globally define default for the property.

For example, if the effective value of the text brush property of a ShapeNode is requested (through the EffectiveTextBrush property), the style system performs the following search, according to the above rules:

1. If ShapeNode.TextBrush is not **null**, **ShapeNode.TextBrush** is returned.
2. If ShapeNode.Style is set and the DiagramItemStyle.TextBrush property in this style has value, this value is returned.
3. If the node is part of a diagram, the Diagram.Style is set, and the DiagramStyle.TextBrush property of this style has value, this value is returned.
4. If the node is part of a diagram and the Diagram.Theme is set, the theme is searched for a style registered for the **ShapeNode** type. If there is such style and its **DiagramItemStyle.TextBrush** property has value, this value is returned.
5. Similar search as the previous one is performed for a theme-registered style for the **Diagram** type.
6. Finally, the system returns a globally-defined default value for the **TextBrush** property (which is a solid Black brush).

Brush and Pen Classes

MindFusion.Diagramming defines Brush and Pen classes to represent drawing attributes of shape backgrounds and outlines. Instances of those classes can be assigned to the Brush and Pen properties of each diagram element. There are five specific brush classes that inherit the abstract class **Brush**, namely HatchBrush, LinearGradientBrush, PathGradientBrush, SolidBrush and TextureBrush.

You can set default pen and brush properties like this:

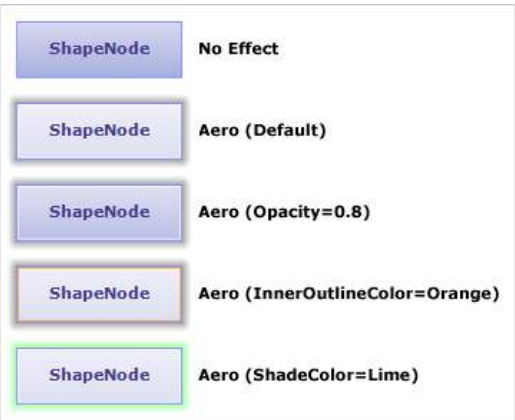
C# Copy Code

```
diagram.ShapeBrush = new MindFusion.Drawing.LinearGradientBrush(
    Color.Yellow, Color.BurlyWood, 20);

MindFusion.Drawing.Brush penBrush = new MindFusion.Drawing.LinearGradientBrush(
    Color.Bisque, Color.Blue, 0);
diagram.ShapePen = new MindFusion.Drawing.Pen(penBrush);
```

After that code runs, every new shape node created will draw with specified pen and gradient background.

Node Effects



To apply an effect to the nodes in a diagram, create an instance of one of the effect classes and add this instance to the Diagram.NodeEffects collection. To apply the effect to individual nodes, add the instance to the node's Effects collection. To discard the diagram effects for a particular node, add a **null** reference (**Nothing** in Visual Basic) at position 0 in the node's **Effects** collection. Effects can also be applied through styles by adding them to the DiagramStyle.NodeEffects and DiagramNodeStyle.Effects collections respectively.

It is possible to combine different effects by adding instances of their appropriate types to the effect collections. If is also admissible to apply more than one effect of the same type.

The currently supplied effect types are Aero and Glass. They are examined in more details in the sections below.

Aero Effect

The Aero effect is represented by the AeroEffect class. The effect is designed to roughly resemble the Aero theme of Windows. More specifically, the effect adds semi transparency to the nodes, a smooth shade at the outside and a thin inset stroke. The semi transparency is specified through the Opacity property. Opacity varies from 0 to 1 inclusive, where 0 indicates full transparency and 1 indicates the original node color. The semi transparency is applied only on the node brush. The colors of the shade and the inner stroke are specified through the ShadeColor and InnerOutlineColor properties respectively. The following image illustrates how these properties affect the output:

The following example applies the Aero effect on the nodes of an existing diagram:

C# Copy Code

```
AeroEffect effect = new AeroEffect();
effect.Opacity = 0.5f;
effect.InnerOutlineColor = Color.FromArgb(100, Color.White);
diagram.NodeEffects.Add(effect);
```

Visual Basic Copy Code

```
Dim effect As New AeroEffect()
effect.Opacity = 0.5F
effect.InnerOutlineColor = Color.FromArgb(100, Color.White)
diagram.NodeEffects.Add(effect)
```

Tips

- The Aero effect works very well in scenarios with overlapping nodes or in cases where the background is more complex than solid color, due to the effect of semi transparency.
- Aero combines well with the Glass effect. There are some examples at the end of this topic.
- The ShadeColor is usually black or another dark color. However, some nice glow effects can be achieved by setting bright **ShadeColor** on a diagram with dark background.
- The Aero effect can impact performance if there are many nodes visible in the diagram.

Glass Effect

The Glass effect is represented by the GlassEffect class. The Glass effect adds visuals on top of the nodes in order to give the impression of a reflective surface. There are several variations of this effect, which can be selected through the Type property. The color of the reflection and the ambient color can be specified through the ReflectionColor and GlowColor properties respectively. When UsePenAsGlow is set to **true** the color of the node's pen is used as the ambient color. The following image illustrates the differences between the distinct effect types:

The following example applies a Glass effect with the default settings to the nodes of a diagram:

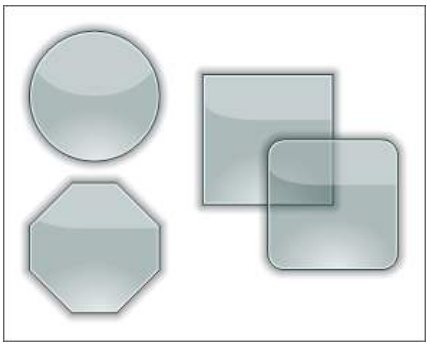
C# Copy Code

```
diagram.NodeEffects.Add(new GlassEffect());
```

Visual Basic Copy Code

```
diagram.NodeEffects.Add(New GlassEffect())
```

Tips



- The GlowColor is usually white. However, for Type4 glass effects it is often more suitable to use black glow.
- The Glass effect combines well with the Aero effect. There are some examples at the end of this topic.
- Several glass effects of different types can be applied simultaneously for emphasized effect.

Examples

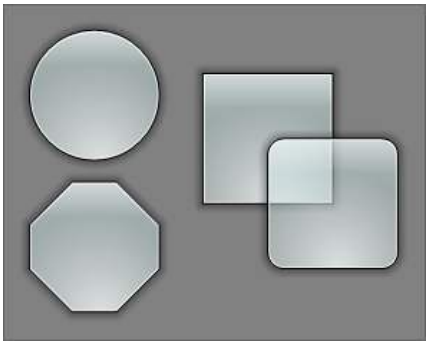
The values of the effect properties are usually selected in accordance with the color scheme of the target diagram and the desired end result. In addition different types of effects can be applied simultaneously to achieve more interesting results. The examples below demonstrate possible effect combinations in various color contexts.

Aero & Glass (Dark on Light)

In this example the Aero and Glass effects are combined. The Aero effect is useful in scenarios when dark nodes are placed on light background or vice versa, in order to emphasize the contrast.

Here is the code that applies the above effects:

C# Copy Code



```
diagram.NodeEffects.Add(new GlassEffect());
diagram.NodeEffects.Add(new AeroEffect());
```

Visual Basic Copy Code

```
diagram.NodeEffects.Add(New GlassEffect())
diagram.NodeEffects.Add(New AeroEffect())
```

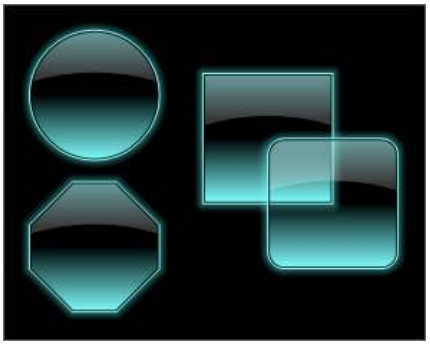
Aero & Glass (Light on Dark)

This example is similar to the first one, only this time the nodes are painted in light colors and the background is dark.

Here is the code that applies the above effect:

C# Copy Code

```
GlassEffect glassEffect = new GlassEffect();
glassEffect.Type = GlassEffectType.Type3;
diagram.NodeEffects.Add(glassEffect);
diagram.NodeEffects.Add(new AeroEffect());
```



Visual Basic Copy Code

```
Dim glassEffect As New GlassEffect()
glassEffect.Type = GlassEffectType.Type3
```

```
diagram.NodeEffects.Add(glassEffect)
diagram.NodeEffects.Add(New AeroEffect())
```

Glow Effect

This example uses bright colors on black background to create a glow effect. The example utilizes an Aero effect with ShadeColor set to the color of the nodes' pens.

Here is the code that applies the above effects:

C# Copy Code

```
GlassEffect glassEffect = new GlassEffect();
glassEffect.Type = GlassEffectType.Type2;
glassEffect.UsePenAsGlow = true;
diagram.NodeEffects.Add(glassEffect);
AeroEffect aeroEffect = new AeroEffect();
aeroEffect.Opacity = 0;
aeroEffect.InnerOutlineColor = Color.Black;
aeroEffect.ShadeColor = Color.FromArgb(128, 255, 255);
diagram.NodeEffects.Add(aeroEffect);
```

Visual Basic Copy Code

```
Dim glassEffect As New GlassEffect()
glassEffect.Type = GlassEffectType.Type2
glassEffect.UsePenAsGlow = True
diagram.NodeEffects.Add(glassEffect)
Dim aeroEffect As New AeroEffect()
aeroEffect.Opacity = 0
aeroEffect.InnerOutlineColor = Color.Black
aeroEffect.ShadeColor = Color.FromArgb(128, 255, 255)
diagram.NodeEffects.Add(aeroEffect)
```

Programming Interface Overview

The *Scripts/esm* folder from distribution contains ES6 code that lets you import JsDiagram classes from respective modules, which are also available as scoped *@mindfusion/diagramming* package on npm. There are also ES5-compatible scripts located in *Scripts/umd* folder, which are transpiled from ES6 code, and whose classes are exposed as members of global MindFusion namespace object.

The **Reference** section of this help file lists the classes under namespaces (i.e. ES5 compatible hierarchy) whose names you can easily translate to scoped module names when coding for ES6. E.g. if a class is listed under MindFusion.Graphs namespace, you can import it from respective @mindfusion/graphs package.

Diagram Structure

Standard Item Types

Diagram elements in MvcDiagram are represented by DiagramNode and DiagramLink instances. Combined and linked together, they can form complex data structures such as process or entity-relationship diagrams, class hierarchies, networks and graphs. Each of their rich features can be customized through numerous methods and properties.

Shape Nodes

ShapeNode objects can represent geometric shapes, flowchart elements, icons in network diagrams, and so on. They can display both graphics and text in different fonts, sizes and colors. A node's shape is specified by setting its shape property. There are more than 100 predefined node shapes and apart from them, MvcDiagram offers an easy way to define custom shapes. Shape nodes can be rotated, either interactively using the round selection handle drawn above them, or programmatically by setting their rotationAngle property.

SVG Nodes

The SvgNode class represents nodes that can display SVG drawings. SVG graphics are rendered instead of image, and on top of the geometry rendered by the base ShapeNode class. Enable the transparent property to hide the node's geometry and leave only the drawing visible. The SVG file is loaded and associated with the node through an SvgContent object, which should be initialized and then assigned to the content property.

Composite Nodes

Nodes in MindFusion.Diagramming can be composed from components. Components are graphical widgets similar to controls, which can be arranged in hierarchies and added to a Diagram through instances of the CompositeNode class. The component system contains various built-in components, such as Text and Image. Component hierarchies can be defined and loaded through Json templates using loadTemplate and classFromTemplate methods.

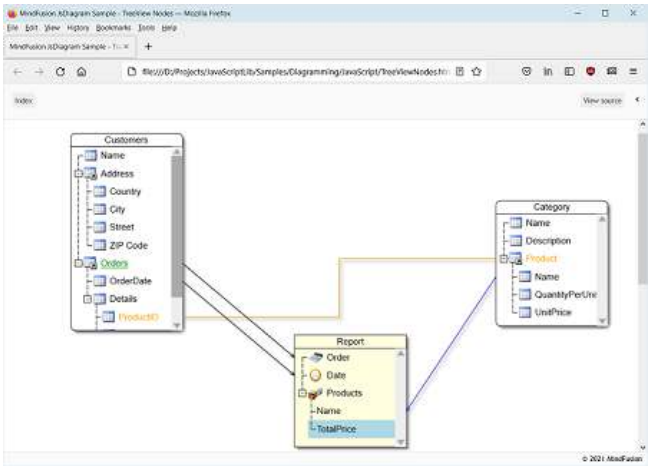
Table Nodes

A TableNode displays tabular data, and can be used to represent table schemas in database diagrams or classes in class-hierarchies. A table contains cells arranged in a grid, and every cell can display text and/or image. Cells, columns and rows can be customized in various ways - there are properties available for setting their extents, style, image and text alignment. Tables' dimensions can be programmatically changed; inserting, appending or deleting rows and columns can be done in a very comprehensive, intuitive way whenever you might need it. Tables can also display background images and graphics.

Free-form Nodes

A FreeFormNode collects all points from users' mouse or touch input and displays them as node's outline. To let users draw free-form nodes interactively, set behavior to DrawFreeForms. Use the points property of **FreeFormNode** to get or set outline points programmatically. If the closed property is enabled, the node is drawn as a closed shape and its interior filled, or otherwise the node is drawn as a poly-line. If the distance between first and last points drawn by user is shorter than autoCloseDistance, the node gets closed automatically.

Container Nodes



A ContainerNode can contain other diagram nodes. When a container is moved, its child nodes move too. Containers can be nested within each other to unlimited depth. They can be folded to a smaller size, hiding their child items, and unfolded to show content again. Nodes inside a container can be linked to nodes both inside and outside of it. If a link connects items in the same container, the container is not considered an obstacle by the auto-routing algorithm.

Paged Containers

PagedContainerNode is a ContainerNode subclass that organizes its child nodes into a collection of pages, represented by ContainerPage objects. This allows for the creation of more orgainzed diagrams where nodes can be grouped into logical views within a single container. Only the nodes belonging to the currently active page, specified by currentPage property, are rendered and participate in user interactions.

TreeView nodes

The TreeViewNode class represents nodes that can display hierarchical data. The root items displayed in the node can be accessed through the rootItems property. Items can be added and removed individually by using the addItem and removeItem methods, or in bulk by calling the fromObject method, which loads the tree view items from an array of objects.

Video Nodes

VideoNode objects display video streams, along with UI elements to play, pause, seek and change volume. Set node's videoLocation property to specify its video URL. Auto-playing is not supported at this time, and the video can be started only by users clicking the play button. **VideoNode** is built around Video component, which can also be used in CompositeNode templates.

Control Nodes

ControlNode objects display custom HTML content, specified via their template property. A node's DOM structure is created inside the Content div element, which is then rendered on top of the diagram canvas. Note that this prevents **ControlNode**s drawing in diagram' usual Z order, and they will always appear on top of other diagram items. By default the diagram intercepts mouse events of all hosted html elements to enable moving nodes or drawing links. You can specify that interactive elements, such as buttons or text boxes, should receive input instead by setting their **data-interactive** attribute to **true**.

Links

DiagramLink objects are used to represent various types of connections and relations in diagrams. MvcDiagram offers three basic link shapes, which can be assigned to links' shape property:

- polyline links composed of straight-line segments;
- curved links composed of Bézier-spline segments;
- cascading links composed of horizontal and vertical segments, alternating their orientation so that every segment is orthogonal to its neighbor.

A link can be connected to a node at each of the link's ends. It is also possible to have unconnected links - having one or both of their ends not connected to nodes. Some customizable link's properties are: arrowheads, style, text, pen width and style, modification behavior and number of segments.

Controlling User Interaction

Composite Nodes

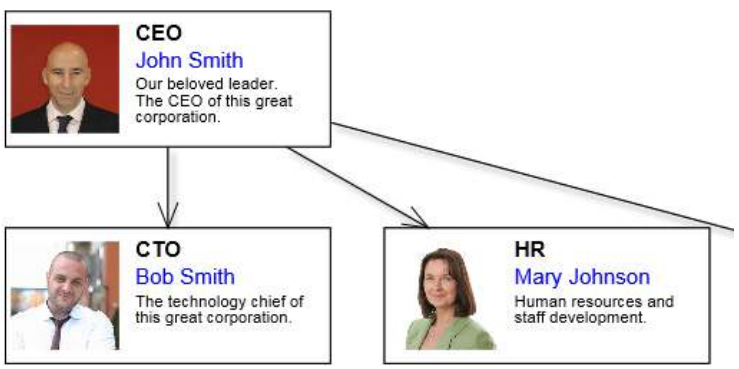
The CompositeNode class makes it easier to add custom graphics primitives to nodes. Appearance of composite nodes is defined by a tree of layout panels and child components. Unlike MindFusion's desktop diagram libraries, node templates are specified using JSON notation instead of XML. A sample node class derived from **CompositeNode** can be defined declaratively as below.

JavaScript Copy Code

```
var OrgChartNode = CompositeNode.classFromTemplate("OrgChartNode",
{
 component: "GridPanel",
 rowDefinitions: ["*"],
 columnDefinitions: ["22", "*"],
 children:
 [
  {
   component: "Rect",
   name: "Background",
   pen: "black",
   brush: "white",
   columnSpan: 2
  },
  {
   component: "Image",
   name: "Image",
   autoProperty: true,
   location: "icon4.png",
   margin: "1",
   imageAlign: "Fit"
  },
  {
   component: "StackPanel",
   orientation: "Vertical",
   gridColumn: 1,
   margin: "1",
   verticalAlignment: "Near",
   children:
   [
    {
     component: "Text",
     name: "Title",
```

```
     autoProperty: true,
     text: "title",
     font: "Arial bold"
    },
    {
     component: "Text",
     name: "FullName",
     autoProperty: true,
     text: "full name",
     pen: "blue",
     padding: "1,0,1,0"
    },
    {
     component: "Text",
     name: "Details",
     autoProperty: true,
     text: "details",
     font: "Arial 3"
    }
   ]
  }
 ]
});
```

Objects from the MindFusion.Drawing namespace, such as Rect, Image, Path, Video, double as **CompositeNode** components. You can create custom components by deriving from ComponentBase and assigning a name to the custom class by calling registerComponent. Apart from JSON templates, the visual tree can also be created by adding panels and drawing objects programmatically starting from CompositeNode.root.



Panel classes include:

- SimplePanel, laying out its children to overlap each other, taking up all available space (useful for background graphics or images).
- StackPanel, laying out its children side by side, either horizontally or vertically.
- GridPanel, laying out its children in rows and columns, where children in same cell overlap. Rows and columns can be either set to a fixed size, auto-size to their child preferred size, or take up all space remaining unoccupied by other rows and columns.

Named components (with specified name value) can be accessed by calling the getComponent method. Components whose autoProperty attribute is enabled will have a pair of get/set property methods generated automatically by classFromTemplate method. The auto-properties from above template can be used as below.

JavaScript Copy Code

```
var node1 = new OrgChartNode(diagram);
node1.setBounds(new Rect(25, 15, 60, 25));
node1.setTitle("CEO");
node1.setFullName("John Smith");
node1.setDetails(
    "Our beloved leader. \r\n" +
    "The CEO of this great corporation.");
node1.setImage("ceo.png");
diagram.addItem(node1);
```

Auto properties are also automatically serialized in JSON format, cloned by node.clone() method and saved/restored by undo commands.

The Shape class used to specify ShapeNode geometry can also be used as a component. When its **isOutline** attribute is set, the shape will control **CompositeNode**'s geometry too, defining hit test and clip area, and link alignment points along node's border. If

isOutline is disabled, the shape will serve mostly as a decorative element. The code below shows a sample fragment specifying shape component in template:

JavaScript Copy Code

```
{
    component: "Shape",
    id: "Cloud",
    autoProperty: true,
    name: "OutlineShape",
    pen: "gray",
    brush: "Transparent",
    isOutline: true
},
```

A Button component that raises event when clicked can be added to template like this:

JavaScript Copy Code

```
{
    component: "Button",
    brush: "#ccc",
    text: "Delete",
    width: 30,
    cornerRadius: 3.5,
    clickHandler: "onDeleteClick"
}
```

Creating and Deleting Items

New items can be added programmatically to the diagram by calling the constructors of the item's class, such as ShapeNode or DiagramLink, and adding the new instance via the addItem method. A shortcut to creating new items is provided by the methods of the Factory class. An instance of that class is returned by the factory property of Diagram. Factory methods such as createShapeNode and createDiagramLink accept respectively node position or link's origin and destination arguments, create an instance of the class and add it to the diagram. The **Factory** class can create instances of JsDiagram predefined item types, while **addItem** can be used to add instances of custom types as well.

JavaScript Copy Code

```
var ShapeNode = MindFusion.Diagramming.ShapeNode;
var Rect = MindFusion.Drawing.Rect;

function initDiagram(diagram)
{
    // create the start node
    var startNode = diagram.factory.createShapeNode(10, 10, 30, 20);
    startNode.text = "start";

    // create the end node
    var endNode = new ShapeNode(diagram);
    endNode.bounds = new Rect(10, 60, 30, 20);
    endNode.text = "end";
    diagram.addItem(endNode);

    // connect the nodes
    diagram.factory.createDiagramLink(startNode, endNode);
}
```

If an existing item should be removed from the diagram, call the removeItem method. The clearAll method clears diagram contents by deleting all items.

By default, deleting a node also removes its links. Set the autoDeleteLinks property to **false** to prevent that, and disconnect the links instead.

Accessing Items

Items in the diagram are exposed via its nodes and links members. **nodes** contains all DiagramNode -derived objects that have been added to the diagram, and **links** contains all DiagramLink objects. By iterating these arrays, you can access all diagram elements and

apply common attributes to them:

JavaScript Copy Code

```
// paint all nodes with light blue color
for (var node of diagram.nodes)
{
    node.brush = "lightBlue";
}

// set the links' arrowheads to triangles
for (var link of diagram.links)
{
    link.headShape = "Triangle";
}
```

Individual items provide methods that let you access their related items in the diagram. **DiagramNode** exposes the links coming into or going out of nodes via the incomingLinks and outgoingLinks properties. The nodes connected by a link can be accessed by means of the origin and destination properties of **DiagramLink**.

The component lets users select multiple diagram items of interest. The selection method of Diagram returns a Selection instance representing currently selected items. The **Selection** class provides nodes and links arrays containing respectively **DiagramNode** and **DiagramLink** -derived objects.

Collapsing and Expanding Tree Branches

If a diagram represents a tree structure, the tree branch starting from a node can be collapsed or expanded again in order to hide or display hierarchy details. To enable this, set the expandable property. To get or set whether a tree branch is expanded or collapsed, use the expanded property of its root node.

Displaying Expand/Collapse Button

If the expandable property of a node is set to true, there is a [±] button displayed beside the node to allow users to collapse or expand the tree branch starting there. By default, pressing that button automatically toggles the expanded property of the node and raises the treeExpanded or treeCollapsed events.

Defining Tree Direction

A node can be connected to other nodes through outgoing and incoming links. Setting the expandOnIncoming property specifies which items connected to a node will be regarded as its descendants. If **expandOnIncoming** is **false** (default value) then each node will be regarded as a parent of its outgoing links and the items attached to them. If **expandOnIncoming** is set to **true**, the node's incoming links define its children. So, this property specifies the direction of parent-children relationship between diagram items and respectively the overall direction in which collapsing / expanding is done.

Attaching and Grouping Items

MvcDiagram allows attaching a node to another node, establishing a subordinate - master relationship between them. The easiest way to attach nodes is to call the attachTo method. When a master node is moved, its subordinated nodes follow it, so that the initial distance between the nodes stays constant. This happens both when a user moves the master node around, and when the node position is changed using a method or a property.

Note

Recent versions of the API include NodeLabel and LinkLabel classes, which address several of the scenarios described below. We recommend using these classes when appropriate, as they offer a more lightweight and easily configurable alternative to attached nodes.

Possible Uses

- Attach a transparent shape node to another node and set its text, so that the shape node acts as an additional label assigned to the master node.
- Attach a shape node to another node and set its image, so it acts as an additional icon displayed inside or near the master node.
- Attach a node to another node and handle nodeClicked or similar events to perform some action on the master node. This makes the subordinated node act as a button or another type of UI element attached to the master node.
- Attach child elements in a tree branch to the branch root, so that when a user moves a tree node, the node's children moves simultaneously with it. Modifying an item in such hierarchical group makes the modification pervade through all dependant subordinated items.
- In all previous scenarios, the locked property can be set for attached nodes which are used only as decorations embellishing the main item. That prevents users from selecting, modifying or drawing links to the subordinate nodes.

Hierarchical Grouping

Every node in a group can be the master node of another group, that is, a node can be subordinate in one group and meanwhile be another group's master. MvcDiagram doesn't impose any limits to the depth and width of group hierarchies built that way. However, it is not possible to put a node as a subordinate in more than one groups because the hierarchy relations would become ambiguous.

Unions

It is possible to create such groups, that if any item in the hierarchy is modified, all other items are updated too. This can be done by putting the items in circular chain of dependencies - that is, item1 is attached to item2, item2 to item3 ... itemN to item1. If any of these items is modified, the change will propagate through the chain until it reaches its originator.

Accessing Group Items

The master node in a group can be accessed using the masterNode property of attached nodes. The array returned by attachedNodes getter on a master node contains references to all subordinate nodes attached to it.

User Interaction

Diagram Events

The diagram raises various events to notify you of the effects of user's actions, such as nodeCreated, nodeModified, nodeDeleted, etc. Events are represented by the EventDispatcher class and are accessible as properties of the corresponding objects (Diagram or DiagramView). Event listeners are attached through the addEventListener method and removed through the removeEventListener method.

The following sample code attaches an event listener to the **nodeCreated** event of a Diagram control. The variable diagram identifies a **Diagram** instance and **onNodeCreated** is the name of the event handler function:

JavaScript Copy Code

```
diagram.nodeCreated.addEventListener(onNodeCreated);
```

All event handlers receive two arguments. The first '*sender*' argument specifies the object that emits the event, and the second '*args*' argument is an instance of an EventArgs -derived class:

JavaScript Copy Code

```
function onNodeCreated(sender, args)
{
    // ...
}
```

While some events are raised to notify you that the user has performed an action, like the **nodeCreated** event, validation events let you accept or reject user actions before actually changing the diagram. Validation event names usually end in '-ing' suffix, such as nodeCreating. The *args* parameter passed to their handler functions is an instance of a CancelEventArgs -derived class. Validation event handlers are expected to set the value of args' cancel property either to **true** if it should be rejected or **false** (the default) if it should be accepted.

The following code handles the nodeDeleting event and, if the node to be deleted is a TableNode instance, cancels the action:

JavaScript Copy Code

```
diagram.nodeDeleting.addEventListener(
    (sender, args) =>
    {
        args.cancel = args.node instanceof TableNode;
    });
```

Controlling User Interaction

There are several ways to control user actions on the diagram as a whole, or on individual items in the diagram.

Drawing Modes

The behavior property of DiagramView provides several predefined sets of rules specifying how to interpret user input through pointing device. The default **behavior** is LinkShapes, where drawing with mouse or touch from an unoccupied point of the document is processed as a ShapeNode creation request, and drawing from a node creates a DiagramLink. Additional members of the **Behavior** enumeration provide modes for drawing different node types, and ones that allow only limited interactions, such as **SelectOnly** or **Modify**.

Item Constraints

Constraints upon how users are allowed to modify a node are set through the constraints and enabledHandles properties. The former can be used to constrain the move direction, node size and aspect ratio. The latter enables or disables specific manipulation handles of a node. That allows making the node non-moveable, non-resizable, or resizable only horizontally/vertically.

Items can be locked by setting their locked property. Locked items are excluded from selection and users cannot select, move or modify them.

In-place Text Editing

The text of nodes and links can be edited in-place by double-clicking the respective items. To enable this feature, set the allowInplaceEdit property to **true**. Depending on the type of item, the control raises either the nodeTextEdited, cellTextEdited or linkTextEdited event when its text has been edited. In-place editing mode is exited when users click outside the text entry control. Pressing ENTER or ESC exits inplace-edit mode if respectively inplaceEditAcceptOnEnter and inplaceEditCancelOnEsc are enabled.

By default, the control creates a **textarea** DOM element over an item to allow editing the item's text. If you prefer using a different type of element as in-place editor, handle the createEditControl event and set the control property of the provided InplaceEditEventArgs object.

Validation Events

While the user draws new nodes or links, the control raises the nodeCreating or linkCreating events after each change of the mouse position. By setting the cancel property of the event object, you can prevent the operation from being completed at the current position but let the user continue drawing. Calling the cancelDrag method immediately stops the operation. The nodeModifying and linkModifying events provide the same functionality during modification of existing objects. Finally, if the user tries to delete an item, you can handle the nodeDeleting or linkDeleting event to prevent this.

Interaction Properties

- allowSelfLoops property of Diagram specifies whether users can draw reflexive / self-loop links.
- allowUnconnectedLinks property specifies whether users can create links without connecting them to nodes (e.g. for simple line or curve graphics in a drawing).
- allowLinksRepeat specifies whether user can draw a second link between same pair of nodes.
- delKeyAction specifies how the DiagramView handles the *Delete* key.
- modifierKeyActions allows changing the function of modifier keys.
- leftButtonActions, middleButtonActions and rightButtonActions allow mapping interaction types to mouse buttons.
- mouseWheelAction allows changing the function of the mouse wheel.
- allowIncomingLinks and allowOutgoingLinks properties of DiagramNode specify if a node accepts respective types of links.
- setting the locked property of a DiagramItem prevents users from interacting with it altogether.

Multi-touch Support

The control handles DOM Pointer events to implement multi-touch interactions, such as zooming, node rotation or simultaneous drawing of multiple diagram items:

- If multiTouchZoom property is enabled (default), the view can be zoomed or panned using two-touch pinch / flick gestures.
- If multiTouchModify property is enabled (default), diagram nodes can be moved, scaled and rotated using two-touch pinch / flick gestures.
- If **multiTouchZoom** property is disabled, each touch draws diagram items corresponding to current behavior.
- If **multiTouchModify** property is disabled, each touch started from a node draws a diagram link.

Latter modes can be used for collaborative whiteboarding / classroom scenarios.

Built-in multi-touch can be disabled altogether by setting enableMultiTouch to **false**, e.g. if you need to handle touch events yourself or through a third-party gesture library. If disabled, the control will revert to its mouse event handling code from previous versions. It will also no longer be able to capture mouse input during drag operations (to detect mouse pointer leaving the view), which is handled through DOM Pointers API.

User-interaction controllers

All kinds of user interaction are carried out by controller objects. Built-in controllers include CreateNodeController, CreateLinkController, ModifyNodeController, ModifyLinkController, PanController. You can also create custom controllers by deriving and overriding the methods of SinglePointerController:

JavaScript Copy Code

```
SinglePointerController.prototype =
{
    start: function (position) {},
    move: function (position) {},
```

```
    validate: function (position) {},
    commit: function (position) {},
    cancel: function (position) {},
    drawInteraction: function (context) {}
}
```

The controller instance used by the diagram when interaction starts is returned by createController method of BehaviorBase -derived classes. You can replace the method of standard behavior classes with a custom function to return a different controller, or inherit a new class from **BehaviorBase** that implements it and assign it to the **currentBehavior** property of DiagramView.

Alignment Grid

MindFusion.Diagramming provides an alignment grid to help users place the diagram items more precisely. To activate the grid, set the alignToGrid property to **true**. If the grid is active while an item is being created or modified, the item's control-points are aligned to the nearest grid points. The distance between adjacent grid points is set by the gridSizeX and gridSizeY properties. The gridOffsetX and gridOffsetY properties allow specifying the horizontal and vertical offset of the first point in the alignment grid.

Items created or modified by a user are automatically aligned to the grid. However, if items are placed in the diagram programmatically, their coordinates are set to the specified positions without aligning. In such cases use the alignPointToGrid method if items must be placed exactly at grid points.

The grid can be either visible or invisible, depending on whether the showGrid property is enabled. If visible, the grid is painted as a matrix of points or as series of crossing lines, as specified by the gridStyle property. gridColor defines the color with which the alignment points or lines are painted.

Undo and Redo

If the undoEnabled property is set to **true**, the control records users actions and allows undoing them later. The records are stored in a list, and can be undone consecutively by calling the undo method. An action that has been undone can be redone by calling the redo method. You can enable or disable UI elements that undo or redo commands by binding them to the **canUndo** and **canRedo** properties.

The control also runs and saves in the undo history AddItemCommand and RemoveItemCommand commands when items are programmatically added or removed from the Items collection of the Diagram. No other changes are recorded automatically when done from code. If support for undo/redo of such changes is required, they must be done through the executeCommand method.

To allow undoing changes of DiagramItem properties, create a ChangeItemCommand instance before setting the property values, and call **executeCommand** afterwards. Any other types of undoable changes can be implemented by deriving from the Command class and overriding its execute, undo and redo methods.

Scrolling and Zooming

The DiagramView control implements scroll and zoom support. If diagram's size is larger than current viewport, scrollbars appear and let the user scroll to clipped parts of the diagram.

Diagram Size

The diagram size is set through the bounds property. Its value is a Rect instance that specifies the origin of the diagram coordinate system and the diagram size. Scrollbar ranges also depend on the current zoomFactor.

Automatic Scrolling

The autoScroll property controls automatic scrolling. If it is enabled and the user drags an adjustment handle near the DiagramView edges while manipulating an item, the control will scroll the viewport towards the mouse position. The scrollZoneSize property defines the size of the area near the view borders that triggers automatic scrolling.

Programmatic Scrolling

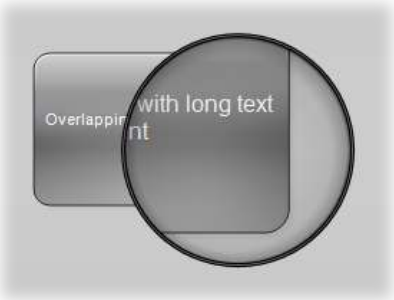
In order to scroll the document content programmatically, you can call the scrollTo method or set scrollX and scrollY properties. The latter can also be used to access the current scroll position in case you need it. The bringIntoView method scrolls the view to ensure that a specific diagram item can be seen inside the viewport.

Zooming

Zooming is controlled via the zoomFactor property. The zoom level is expressed as a percentage, 100% meaning no zoom. Higher than 100% makes the diagram items look closer and bigger on the screen - zooming in. Less than 100% makes items look further and smaller on screen - zooming out. To zoom and scroll the view to fit the diagram contents to the control's client area, call zoomToFit. To zoom and scroll the view so it fits a specified rectangular document area to the control's client area, call zoomToRect.

Lasso Zoom Tool

The control supports several ways to zoom using lasso tool:



- Set the behavior property to Zoom to always draw zoom lasso.
- Set the Zoom flag for one of the keys in modifierKeyActions to let users draw zoom-lasso with respective modifier key pressed and the left mouse button.
- Assign Zoom value to rightButtonActions or middleButtonActions property to zoom using respective mouse button.

Zoom control

The ZoomControl class lets user change interactively the current zoom level and scroll position of a DiagramView. To set it up, add a <canvas> element to the page (possibly placing it on top of **DiagramView**'s one), call ZoomControl.create to instantiate, and set the control's target property to that view. Set the zoomStep and scrollStep properties to specify the amount added to view's zoom level or scroll position by **ZoomControl**'s buttons. You can customize the control's appearance by setting properties such as fill, borderColor, cornerRadius and tickPosition. For an example, see the *Controls.html* and *Controls.js* sample files from distribution.

Magnifying

The DiagramView provides an option for zooming in (or out) portions of the diagram through the Magnifier tool. The magnifier tool can be permanently activated by setting magnifierEnabled to **true**. Alternatively, on-demand magnification through the right mouse button or by pressing a modifier key can be enabled be setting the appropriate value to the rightButtonActions or modifierKeyActions properties respectively.

The magnification factor can be specified through the magnifierFactor property. The size of the tool and its border thickness can be set through the magnifierWidth, magnifierHeight and magnifierFrameThickness properties.

Panning

The diagram view can be panned by holding ALT while dragging the mouse with the left button down. Another modifier key can be used for panning by setting modifierKeyActions. The middleButtonActions and rightButtonActions properties let you use the middle or right mouse button to start panning. To let users pan the view with the left mouse button without using a modifier key, set the behavior property of DiagramView to Pan or **PanAndModify**.

Testability

User interaction can be tested automatically in several ways outlined below.

- Create a MouseInputDispatcher instance and call its methods

  JavaScript Copy Code

  ```
  onMouseDown: function (position, button)
  onMouseMove: function (position)
  onMouseUp: function (position, button)
  ```

  where position is a Point instance specifying logical coordinates in the diagram (in current measure unit, not scaled by zoom factor). The results of called mouse methods will depend on diagram's current behavior, e.g. you could assert that a sequence of down, move andup events creates a ShapeNode when **behavior** is set to DrawShapes.
- Create an instance of controller class and call its start, move and commit methods. This would not depend on the value of diagram's **behavior**, but could be still affected by other behavioral properties such as allowSelfLoops and allowUnconnectedLinks.
- Check assertions after replaying a recording on a saved diagram, using record, stopRecording and replay methods.

Placement and Layout

Items Placement and Z-order

Measure Unit

The measureUnit property specifies the unit of measure for all location and size-related values assigned to JsDiagram properties or passed as arguments to its methods.

Location and Size of Nodes

Set the bounds method to change the location and size of a node. Its values are Rect objects that contain coordinates and dimension properties. The **bounds** getter lets you find the current location and size of a node as set by users or layout algorithms.

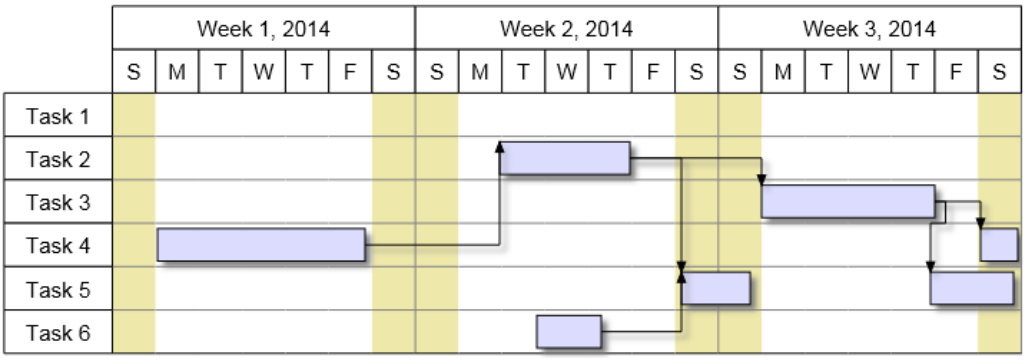
Links Control Points

Links must have two or more control points, depending on their shape property. You can get access to the control points via link's controlPoints collection. You must call updateFromPoints after programmatically moving control points of a link; that's needed in order to repaint the link and update its internal state variables, such as arrowhead angles.

Link Dynamics

The dynamic property of a link can be enabled to make the link automatically recalculate its end point positions if the nodes connected to the link are moved or resized; the end points are moved in such a way that the link points to the centers of the connected nodes. Links also expose an autoRoute property that enables or disables automatic routing for a link. Routed links avoid nodes by finding the shortest path between their origin and destination that does not cross any other nodes.

Interactive Moving or Resizing



End-users of your application can move or resize the diagram elements. They do this by selecting an item and dragging any of its adjustment handles, a point inside its interior, any of its sides or a selection frame. The handlesStyle property of nodes controls how interaction can be performed. Additionally it defines the representation of selected items on screen. enabledHandles lets you disable specific manipulations users are allowed to perform on a node, for example resizing the item horizontally or moving it. If an item is modified interactively, the nodeModified or linkModified event is raised, depending on the item's type.

Controlling Z-order

The Z-order defines how items are ordered along the Z-axis, so that one item appears in front of or behind another one. Diagram items are sorted by the value of their zIndex property, and rendered on screen in ascending order. You can change the Z index of a DiagramItem by setting **zIndex** (values don't have to be consecutive).

Lane Grid

The classes from the MindFusion.Diagramming.Lanes namespace let you develop process maps and lane diagrams, useful in business process planning and reporting. Processes consist of consecutive operations accomplished by people involved, technical installations, means of contact, and flow of information. The MvcDiagram lane grid features allow indicating and arranging related diagram items in complicated processes and systems, that is, Swim lane diagrams (known as Rummler-Brache diagram), Gantt Charts (planning and scheduling of projects). A lane in the grid can visually contain nodes, links, shapes or images, that represent tasks fulfilled in specified periods of time by people, companies or departments.

The **MindFusion.Diagramming.Lanes** namespace provides the Grid, Header, Cell and Style classes, and the ResizeType enumeration. These types expose additional properties and methods that let you define your own grids as required by your application logic. Grids can include varying number of lanes, divided into child rows and columns whose intersections form cells. The cell color and style can be customized too.

Use the showLaneGrid property of the Diagram class to display lanes in your application. The laneGrid lets you setup the rows and columns in the grid by defining horizontal and vertical lanes, where each lane can be titled by its own header and/or subheadings. The grid can be resized by setting the columnCount and rowCount properties or by adding headers via the addColumnHeader and addRowHeader methods. A column or row can be divided into child elements by adding subheaders, which lets you form a complex hierarchy of unlimited depth. The intersection of rows and columns can be either a simple cell for bottommost elements in the hierarchy, or a group of cells for parent rows and columns. Cells or cell groups can be accessed via the **Grid**'s get method, that lets you index cells either by their integer positions, or by their **Header** objects.

The position of the grid and grid headers within the diagram is defined via topMargin and leftMargin, which specify the grid offset relative to the diagram bounds. hookHeaders enables lane headers to be anchored to the left or right side of the control's visible area. The sizes of headers at different levels in the lane hierarchy can be set in a single operation by setting rowHeadersWidths and columnHeadersHeights properties.

The appearance of the lanes grid can be customized further via the headersOnTop poperty, which specifies whether headers should appear on top of the Z-order, and the topLeftAreaStyle specifying the appearance of the grid's top-left corner.

The **Grid** class provides many miscellaneous properties and methods that can be used to find grid elements, for determining their bounds and for hit-testing: findColumn, findRow, getCellBounds, getCellColumn, getCellFromPoint, getCellRow, getColumn, getRow, getRowIndex, columnHeaderBounds, getColumnIndex, getHeaderBounds, getRowHeaderBounds, getHeaderFromPoint.

Headers in the lanes grid can be customized by using the following members of the **Header** class:

Member name	Description
height	Gets or sets the height of the header and the related row in the grid.
resizeType	Gets or sets the resize type of the header.
rotateTitle	Gets or sets a value indicating whether rotating of the header caption at 90 degree is enabled.
style	Gets or sets the style of the header.
subHeaders	Gets a collection with the subheaders of the header.
title	Gets or sets the header caption.
width	Gets or sets the width of the header and the related column in the grid.

Anchor Points and Patterns

Anchor Points

For each node you can define one or more points to which links should dock when connecting to that node. Such points are represented by instances of the AnchorPoint class. The position of an anchor point relative to node's bounding rectangle is specified via the x and y properties. Their values are expressed as percentage of the node's width and height to accommodate for moving and resizing.

You can control whether an anchor point accepts incoming or outgoing links or both. That is done via the allowIncoming and allowOutgoing properties. When a link is drawn, its ends are aligned to the nearest anchors allowing docking of the respective end type. Another way to control whether links can be connected to an anchor point is to handle the validateAnchorPoint event.

Anchor Patterns

An AnchorPattern instance defines a set of anchor points to be used together. When creating a pattern, pass to its constructor an array of AnchorPoint objects. The **AnchorPattern** class exposes several predefined patterns as static properties. A pattern can be assigned as an integral entity to the anchorPattern property of nodes. Setting the anchorPattern property of a Shape object lets you define the connection points for all ShapeNodes of that shape. The following example creates a pattern of four anchor points:

JavaScript Copy Code

```
var AnchorPattern = MindFusion.Diagramming.AnchorPattern;
var AnchorPoint = MindFusion.Diagramming.AnchorPoint;

var apat1 = new AnchorPattern([
    new AnchorPoint(50, 0, true, true),
    new AnchorPoint(100, 50, true, true),
    new AnchorPoint(50, 100, true, true),
    new AnchorPoint(0, 50, true, true)
    ]);
```

The points are located at the middles of bounding rectangle sides of nodes to which the pattern is assigned. All four points accept both incoming and outgoing links.

Link Routing

Routed links avoid nodes marked as obstacles by finding the shortest path between their origin and destination that does not cross any other nodes.

Setting Up a Link Router

The control finds paths for links affected by modifications of nearby nodes by calling methods of an object that implements the Router interface. This object can be get or set through the linkRouter property of the Diagram class. JsDiagram provides several classes that implement **Router** - PatternRouter, GridRouter and CompositeRouter. By default **linkRouter** is set to a **CompositeRouter** instance.

Automatic or Explicit Routing

The routeAllLinks method can be invoked to explicitly rearrange links in a way they do not cross nodes. In addition, DiagramLink defines an autoRoute property that enables or disables automatic routing of a link, applied when user moves link's adjacent nodes or draws a new node in its vicinity. **autoRoute** is initialized with the value of diagram's routeLinks property.

Tuning the Routing Algorithm

Router classes define properties that let you fine-tune their specific algorithms. For a reference, see specific CompositeRouter, PatternRouter or GridRouter.

Performance Consideration

The default router is designed to produce visually optimal link paths that avoid overlapping with nodes and minimize bends. However, it is computationally intensive and can impact performance in diagrams with a large number of links or frequent layout changes. For improved performance, you could set linkRouter to a simple Router instance. This will reduce CPU usage and improve responsiveness, though the resulting link paths may be less visually refined.

Laying out the Diagram

The diagram can be arranged automatically by calling its arrange method and specifying a layout algorithm. Different layout algorithms are implemented by the various Layout classes from the MindFusion.Graphs namespace. To apply one of them, create an instance of the respective class, customize its properties and pass it as an argument to **arrange**. It is also possible to lay out the contents of an individual ContainerNode by calling the container's arrange method.

Layered Graph Layout

The LayeredLayout algorithm arranges diagram nodes in layers according to several criteria, most important of which are: connected nodes must be placed close together; links must flow in one direction if possible; links must cross as few layers as possible; links must not cross other links. To apply the layout to a diagram, create a **LayeredLayout** instance, set its members and invoke the arrange method.

Spring-Embedder Graph Layout

Spring-Embedder is force-directed layout algorithm. It simulates a physical system in which nodes repulse each other, and the links between them act as confining springs. Graphs processed by Spring-Embedder have their nodes distributed uniformly across the diagram area. The algorithm can be applied on a graph by creating a SpringLayout object and calling the arrange method. Members of **SpringLayout** allow you to set the desired distance between graph nodes and the number of iteration steps to run while processing the simulation.

Tree Layout

If application's data is structured hierarchically, it is appropriate to apply tree layout on it. To do this, create a TreeLayout or BorderedTreeLayout instance and call the arrange method. The difference between two classes is where they place child nodes in relation to their parent; the former centers the parent above its children, the latter arranges children in columns at a horizontal offset form their parent (see **Tutorial 2**). Members of both classes control the tree direction, how much space to leave between tree levels and between nodes on the same level.

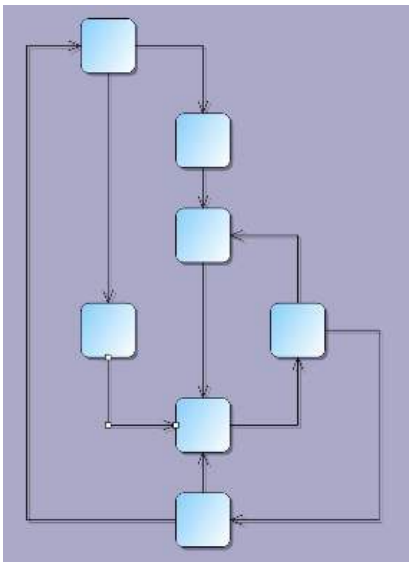
Fractal Layout

The FractalLayout tree layout algorithm places child nodes symmetrically around their parent node. Nodes at the lowest level are arranged directly in a circle around their parent. At the upper level, the already arranged nodes form branches that are arranged in a circle around the new parent node. The algorithm is recursively repeated till the highest level is reached.

Treemap Layout

Tree maps represent hierarchies by nesting child nodes within their parents, where the areas of leaf nodes are proportional to their weight values. Unlike other layout algorithms, TreeMapLayout expects hierarchies to be defined via grouping or containment (see attachTo method and ContainerNode class), and will ignore any links in the diagram.

Flowchart Layout



FlowchartLayout recognizes program code -like patterns in the graph, such as loops, sequences and if/switch branchings, and arranges them recursively. **FlowchartLayout** could be used to arrange other types of graphs as well, though with some restrictions. For example it treats all back links as loops in the code, and expects that they are nested - loop links starting closer to the stop node should end closer to the start node. Another similar restriction is that there shouldn't be any cross-links that connect different branches of a decision sub-graph.

Topological Layout

TopologicalLayout applies graph topological ordering to the diagram (topological ordering of a graph is one where link's origin node is placed before link's destination node). The layout algorithm arranges nodes in a row or a column, depending on the value of the direction property, in such a way that there are no backward links when the graph is acyclic. If the graph contains cycles, the algorithms selects ordering with as few backward links as possible. Links that connect non-adjacent nodes are rendered as arcs, whose amplitude is proportional to the distance between respective connected nodes. Forward links are rendered at one side of the nodes and back links are rendered at the opposite side. All that makes it easy to discern graph features such as overall flow direction, cycles and nested cycles.

Orthogonal Layout

The OrthogonalLayout class implements an orthogonal graph layout algorithm. Each link is drawn as a chain of alternating horizontal and vertical segments. Nodes are placed in a way that facilitates few links bends and crossings. This algorithm was designed for planar graphs where the nodes have at most four incident links, and produces best results with such graphs as input. It can arrange any arbitrary graph as well, by adding some dummy nodes and links to planarize the graph and reduce its vertex degree, and removing them after the layout.

Radial Tree Layout

The RadialTreeLayout class arranges tree levels in concentric circles around the root. The levelDistance property specifies the distance between adjacent circles. The direction property specifies placement of first child node. Set stretchFactor to a value larger than 1 in order to stretch level circles into ellipses, providing more space for the layout when using wider nodes.

Grid Layout

The GridLayout algorithm arranges diagram nodes in a grid, keeping connected nodes close to each other. The algorithm strives to achieve a small number of link crossings. It is based on an iterative process whose initial steps shuffle the grid nodes randomly. That can lead to very different results each time the algorithm is run.

Appearance

Customizing Node Appearance

Nodes can have different shape, background image or color. They can also have differently aligned text.

Geometric Shapes

ShapeNode exposes a shape property that specifies the geometric shape of the node. Its value can be set to either a Shape object (returned by one of the static methods of the Shapes class), or a string id of the shape, which coincides with the name of the method that gets it. Here is an example:

JavaScript Copy Code

```
myNode.shape = "Arrow1";
```

TableNode and ContainerNode provide shape properties too, but their shapes can only be set to either rectangle or rounded rectangle, as specified via SimpleShape enumeration.

Bitmap Images

Each node can display a bitmap image as its content. The image can be set either via the image or imageContent properties, where the former accepts DOM Image instances, and the latter accepts base64-encoded bitmaps. By default the bitmap is drawn centered inside the node. You can change the alignment by setting imageAlign. Images can also be loaded by URL via the imageLocation property.

Fill Color

Nodes can be painted in any color that you choose. Set the brush property to specify how a node is painted.

JavaScript Copy Code

```
myNode.brush = "Red";
```

Linear Gradients

Nodes can be filled using linear gradients by assigning objects in following format to brush. If the gradient should blend only two colors, they can be specified using **color1** and **color2** fields instead of **colorStops**.

JavaScript Copy Code

```
var brush1 =
{
 type: "LinearGradientBrush",
 colorStops:
 [
  { position: 0, color: "red" },
  { position: 0.5, color: "green" },
  { position: 1, color: "blue" }
 ],
 angle: 30
};
myNode.brush = brush1;
```

Radial Gradients

Nodes can be filled using radial gradients by assigning objects in following format to brush. If the gradient should blend only two colors, they can be specified using **color1** and **color2** fields instead of **colorStops**.

JavaScript Copy Code

```
var brush2 =
{
 type: "RadialGradientBrush",
 colorStops:
 [
  { position: 0, color: "white" },
  { position: 0.5, color: "lightGray" },
  { position: 1, color: "blue" }
 ],
 x1: 20, y1: 20, radius1: 30,
 x2: 40, y2: 20, radius2: 80
};
myNode.brush = brush2;
```

Text and Font

Nodes can display text with customizable font and horizontal/vertical alignment. Set the text property to specify the text label for a node, and textColor to change its color. textAlignment and lineAlignment properties let you set respectively horizontal and vertical alignment. The font property lets you specify a distinct font for each node:

JavaScript Copy Code

```
var Font = MindFusion.Drawing.Font;

//the bool arguments specify whether the font is bold and italic
startNode.font = new Font("sans-serif", 5, true, false);
```

Apart from main text content, the NodeLabel class lets you display additional labels and pin them to node's edges or corners. Call the addLabel method to create such supplementary labels, and use **NodeLabel** (and base ItemLabel) properties and methods to customize their appearance and position.

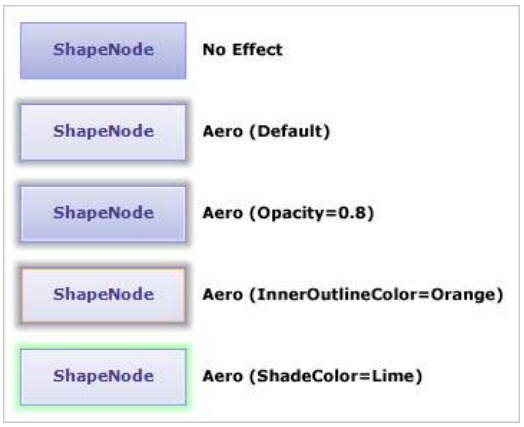
The text of ShapeNodes can be laid out and rendered inside a polygonal outline; that depends on the value of polygonalTextLayout.

Styled Text

The enableStyledText property of shape nodes and tables enables or disables styled text rendering. Styled text can have various attributes applied to the characters it contains. The attributes are specified using HTML-like formatting tags embedded in the raw text. The following table lists the currently supported style tags:

Tag	Description
text	Indicates italic text.
text	Indicates bold text.
<u>text</u>	Indicates underlined text.
_{text}	Indicates subscript.
^{text}	Indicates superscript.
<color=#RRGGBB>text</color>	Changes the color of the text. The red, green and blue color channels are specified as two-digit hexadecimal numbers.
 	Indicates line break.
<a=url>text	Renders specified text as a hyperlink and raises hyperlinkClicked event when link has been clicked.
<size=N>text</size>	Changes the font size.

Node Effects



To apply an effect to the nodes in a diagram, create an instance of one of the effect classes and add this instance to the Diagram.nodeEffects array. To apply the effect to individual nodes, add the instance to a node's own effects array. To ignore the global diagram effects for a particular node, add a **null** reference at position 0 in the node's **effects**. Effects can also be applied through styles by adding them to the Style.nodeEffects array of the diagram or a node.

It is possible to combine different effects by adding instances of their appropriate types to the effect collections. If is also admissible to apply more than one effect of the same type.

The currently supplied effect types are Aero and Glass. They are examined in more details in the sections below.

Aero Effect

The Aero effect is represented by the AeroEffect class. The effect is designed to roughly resemble the Aero theme of Windows. More specifically, the effect adds semi transparency to the nodes, a smooth shade at the outside and a thin inset stroke. The semi transparency is specified through the opacity property. Opacity varies from 0 to 1 inclusive, where 0 indicates full transparency and 1 indicates the original node color. The semi transparency is applied only on the node's brush. The colors of the shade and the inner stroke are specified through the shadeColor and innerOutlineColor properties respectively. The following image illustrates how these properties affect the output:

The following example applies the Aero effect on the nodes of an existing diagram:

JavaScript Copy Code

```
var AeroEffect = MindFusion.Diagramming.AeroEffect;

var effect = new AeroEffect();
effect.opacity = 0.5;
effect.innerOutlineColor = "rgba(255,255,255,0.5)";
diagram.nodeEffects.push(effect);
```

Tips

- The Aero effect works very well in scenarios with overlapping nodes or in cases where the background is more complex than solid color, due to the effect of semi transparency.
- Aero combines well with the Glass effect. There are some examples at the end of this topic.
- The shadeColor is usually black or another dark color. However, some nice glow effects can be achieved by setting bright **shadeColor** on a diagram with dark background.
- The Aero effect can impact performance if there are many nodes visible in the diagram.

Glass Effect

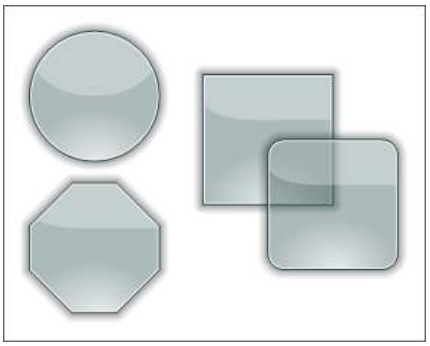
The Glass effect is represented by the GlassEffect class. The Glass effect adds visuals on top of the nodes in order to give the impression of a reflective surface. There are several variations of this effect, which can be selected through the type property. The color of the reflection and the ambient color can be specified through the reflectionColor and glowColor properties respectively. When usePenAsGlow is set to **true**, the color of the node's pen is used as the ambient color. The following image illustrates the differences between the distinct effect types:

The following example applies a Glass effect with the default settings to the nodes of a diagram:

JavaScript Copy Code

```
var GlassEffect = MindFusion.Diagramming.GlassEffect;
diagram.nodeEffects.push(new GlassEffect());
```

Tips



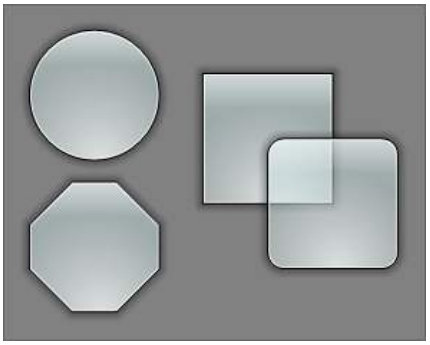
- The glowColor is usually white. However, for Type4 glass effects it is often more suitable to use black glow.
- The Glass effect combines well with the Aero effect. There are some examples at the end of this topic.
- Several glass effects of different types can be applied simultaneously for emphasized effect.

Examples

The values of the effect properties are usually selected in accordance with the color scheme of the target diagram and the desired end result. In addition different types of effects can be applied simultaneously to achieve more interesting results. The examples below demonstrate possible effect combinations in various color contexts.

Aero & Glass (Dark on Light)

In this example the Aero and Glass effects are combined. The Aero effect is useful in scenarios when dark nodes are placed on light background or vice versa, in order to emphasize the contrast.



Here is the code that applies the above effects:

JavaScript Copy Code

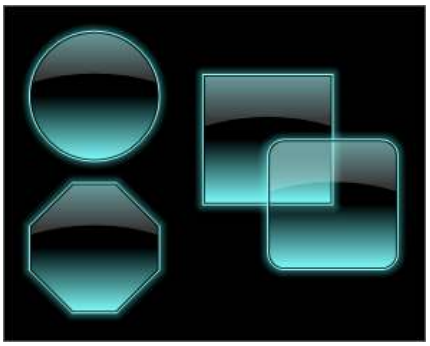
```
diagram.nodeEffects.push(new GlassEffect());
diagram.nodeEffects.push(new AeroEffect());
```

Aero & Glass (Light on Dark)

This example is similar to the first one, only this time the nodes are painted in light colors and the background is dark.

Here is the code that applies the above effect:

JavaScript Copy Code



```
var AeroEffect = MindFusion.Diagramming.AeroEffect;
var GlassEffect = MindFusion.Diagramming.GlassEffect;
var GlassEffectType = MindFusion.Diagramming.GlassEffectType;

var glassEffect = new GlassEffect();
glassEffect.type = GlassEffectType.Type3;

diagram.nodeEffects.push(glassEffect);
diagram.nodeEffects.push(new AeroEffect());
```

Glow Effect

This example uses bright colors on black background to create a glow effect. The example utilizes an Aero effect with shadeColor set to the color of the nodes' pens.

Here is the code that applies the above effects:

JavaScript Copy Code

```
var AeroEffect = MindFusion.Diagramming.AeroEffect;
var GlassEffect = MindFusion.Diagramming.GlassEffect;
var GlassEffectType = MindFusion.Diagramming.GlassEffectType;

var glassEffect = new GlassEffect();
glassEffect.type = GlassEffectType.Type2;
glassEffect.usePenAsGlow = true;
diagram.nodeEffects.push(glassEffect);

var aeroEffect = new AeroEffect();
aeroEffect.opacity = 0;
aeroEffect.innerOutlineColor = "black";
aeroEffect.shadeColor = "rgb(128, 255, 255)";
diagram.nodeEffects.push(aeroEffect);
```

Customizing Link Appearance

DiagramLinks-s consist of series of straight or Bezier segments and arrowhead shapes. The link and arrowhead shapes, and also color attributes and text can be customized as detailed below:

Link Geometry

Links can be straight or curved and can contain one or more segments. Set DiagramLink.shape to change the shape. It takes as an argument one of the LinkShape enumeration values:

JavaScript Copy Code

```
myLink.shape = LinkShape.Cascading;
```

The link can be customized further by changing its controlPoints array, whose elements specify the position of the link segments. The number of control points per segment depends on the link's **shape**: **Bezier** links have four control points per segment. Each straight segment has two control points. Adjacent segments share a control point.

The following code sets three control points of a polyline link, which results in two segments:

JavaScript Copy Code

```
var Point = MindFusion.Drawing.Point;
myLink.controlPoints = [new Point(10, 10), new Point(30, 30), new Point(30, 50)];
```

Note

Always call DiagramLink.updateFromPoints() after you change coordinates of individual control points in the array.

Rounded Links

Links comprising straight segments (ones whose shape is set to Polyline or **Cascading**) can draw arcs as joints between their adjacent segments. To enable that feature, set roundedLinks to **true**. Use roundedLinksRadius to specify the radius of the joining arcs.

Link Crossings

Intersection points where links cross their paths can be rendered as arcs or cuts, as specified via linkCrossings. It depends on the Z-order, which links jump over the others, or which links appear cut by the others. If **linkCrossings** is set to Arcs, links with higher

ZIndex jump over those with lower ZIndex. If set to **Cut**, links at lower Z position are cut by links at higher Z. Radius of arcs and breaks can be set through the crossingRadius property.

Customizing Arrowheads

Each link can display arrowhead shapes at its ends. The shape at the start is specified via baseShape property, the shape at the end is specified via headShape. Arrowheads can also be displayed at middles of segments, helping users follow the path of long links. They are defined by the intermediateShape property. Arrowhead values can be set to either a Shape instance or a string that identifies it:

JavaScript Copy Code

```
myLink.headShape = "BowArrow";
```

Shape objects designed specifically as arrowheads are exposed as static members of the ArrowHeads class.

Specifying Colors

Link segments are rendered according to stroke, strokeThickness and strokeDashStyle attributes. The arrowheads at the head and base are filled using headBrush and baseBrush properties:

JavaScript Copy Code

```
// paints the link head with red brush
myLink.headBrush = "Red";
```

Setting Text

Set the text property to specify text label of a link, and font to customize its font. Here is an example how to do this:

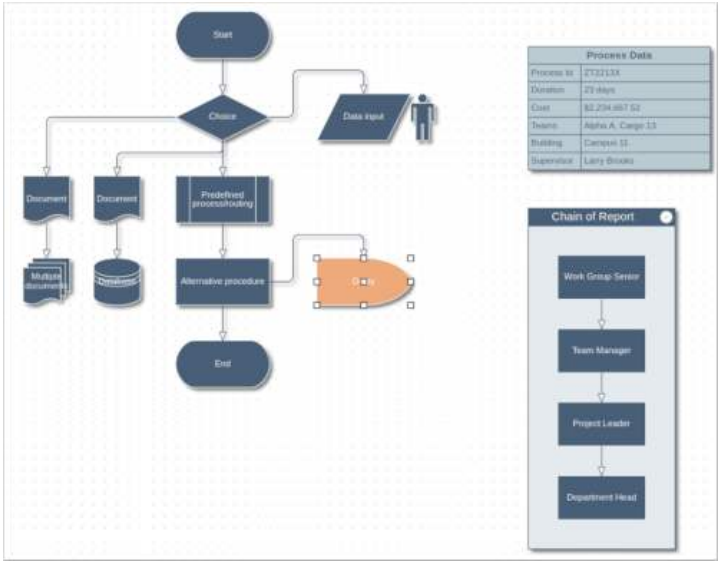
JavaScript Copy Code

```
myLink.text = "myLabel";

var Font = MindFusion.Drawing.Font;

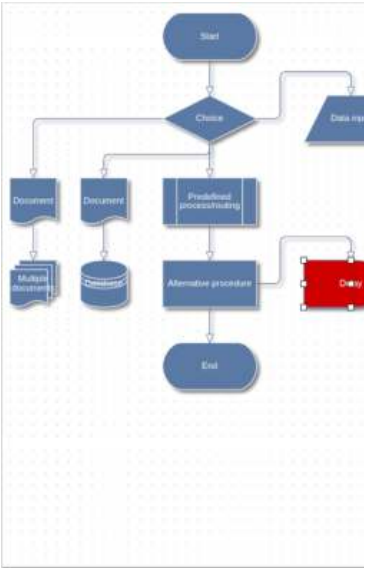
// the bool arguments specify whether the font is bold and italic
myLink.font = new Font("sans-serif", 5, true, false);
```

The font size is specified in the diagram's current measure unit, which is millimeter by default.



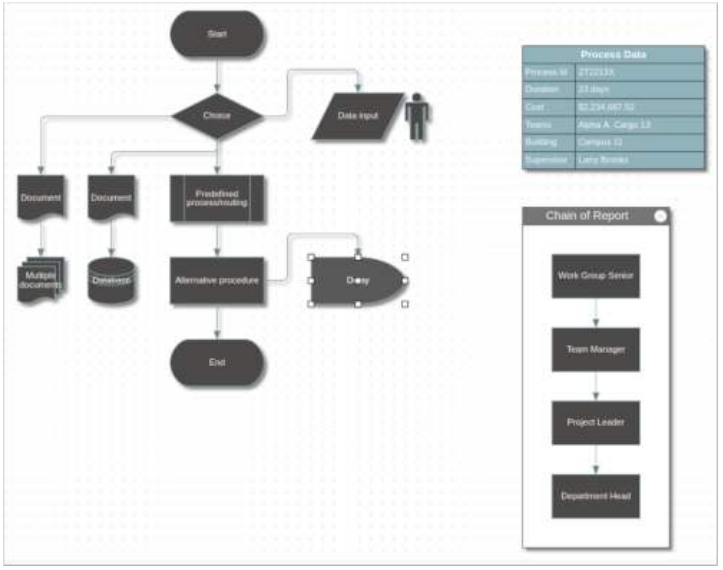
Apart from main text content, the LinkLabel class lets you display additional labels and pin them to link's points or segments. Call the addLabel method to create such supplementary labels, and use **LinkLabel** (and base ItemLabel) properties and methods to customize their appearance and position.

Styles and Themes

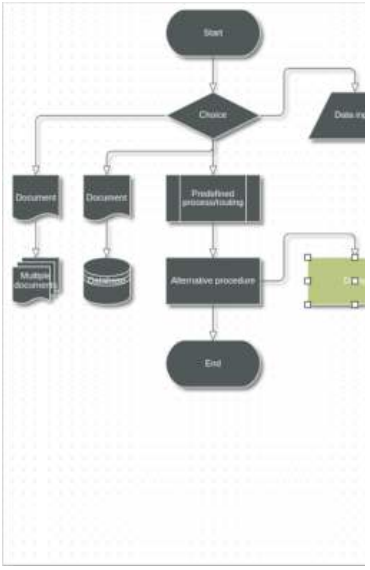


Appearance of items can be customized using Style objects assigned to respective style property of DiagramItem. The attributes from a style are applied only when item's own corresponding properties do not contain values.

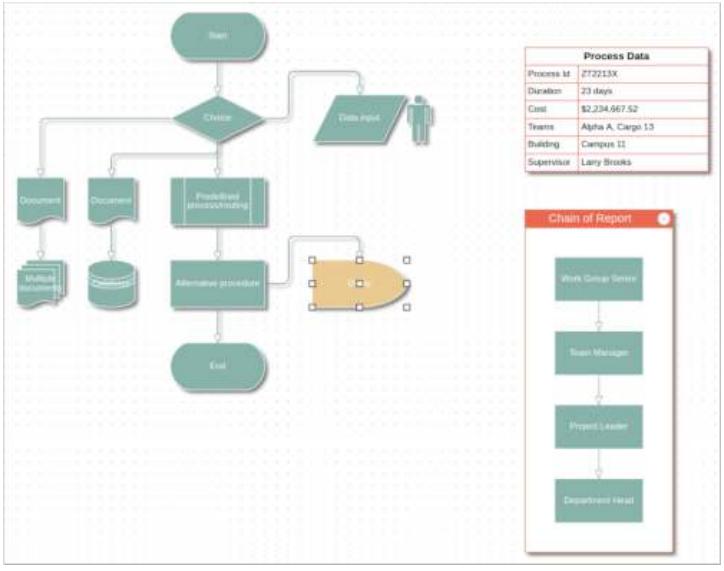
Style objects can also be collected into a Theme and applied as a set to the whole diagram by assigning it to the theme property. The library includes nine stock themes listed below, accessible via respective static methods of the **Theme** class.



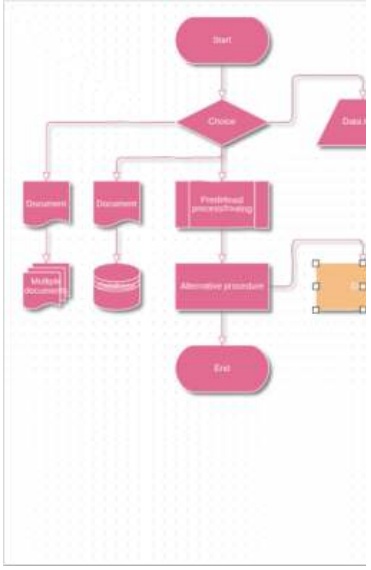
Blue	Business



Gray



Green



Pastel

Peach

Creating and applying a custom theme looks like this:

JavaScript Copy Code

```
var theme = new Theme();

var shapeNodeStyle = new Style();
shapeNodeStyle.brush = { type: 'LinearGradientBrush', color1: '#e0e9e9', color2: '#9caac6', angle:
90 };
shapeNodeStyle.stroke = "#7F7F7F";
shapeNodeStyle.textColor = "#585A5C";
shapeNodeStyle.fontName = "Verdana";
shapeNodeStyle.fontSize = 3;
theme.styles.set("std:ShapeNode", shapeNodeStyle);

var linkStyle = new Style();
linkStyle.stroke = "#7F7F7F";
linkStyle.textColor = "#585A5C";
linkStyle.fontName = "Verdana";
linkStyle.fontSize = 3;
theme.styles.set("std:DiagramLink", linkStyle);

var tableStyle = new Style();
tableStyle.brush = { type: 'LinearGradientBrush', color1: '#FCFCFC', color2: '#9DABB4', angle: 90
};
tableStyle.stroke = "#7F7F7F";
tableStyle.textColor = "#585A5C";
tableStyle.fontName = "Verdana";
tableStyle.fontSize = 3;
theme.styles.set("std:TableNode", tableStyle);

diagram.theme = theme;
```

CSS Styling

The styling system also lets you define item appearance through external CSS files. You can style different item types using custom element selectors such as **mfd-shapenode**, **mfd-diagramlink**, or **mfd-tablenode**. The system maps CSS Custom Properties to the internal Style properties. For example, use **--brush** for backgrounds, **--stroke** for outlines, and **--font-size** for text. The new cssClass property on DiagramItem allows for more granular styling using standard class selectors in your CSS. To ensure high performance, computed styles are cached globally, and the system automatically resolves style inheritance across class hierarchies (e.g., a ShapeNode will resolve styles from **mfd-shapenode**, **mfd-diagramnode**, and **mfd-diagramitem** selectors in that order).

CSS Copy Code

```
/* Style all shape nodes */
mfd-shapenode {
    --brush: #f9f9f9;
    --stroke: #333;
    --stroke-thickness: 1px;
    --font-name: 'Verdana';
}

/* Specific styling via the new cssClass property */
mfd-shapenode.urgent {
    --brush: #ffcccc;
    --stroke: #ff0000;
    --stroke-thickness: 2px;
}

/* Style table captions using custom properties */
mfd-tablenode {
    --caption-brush: #e0e0e0;
    --text-color: #000066;
}
```

Here is the complete list of **mfd-** prefixed CSS element selectors available for styling items:

Base Elements

- **mfd-diagramitem**: The base selector for all diagram items. Styles applied here will be inherited by all other items unless overridden.
- **mfd-diagramnode**: The base selector for all node types. Inherits from **mfd-diagramitem**.

Specific Node Types

(all inherit from **mfd-diagramnode**)

- **mfd-shapenode**: Styles ShapeNode instances.
- **mfd-svgnode**: Styles SvgNode instances.
- **mfd-compositenode**: Styles CompositeNode instances.
- **mfd-controlnode**: Styles ControlNode instances.
- **mfd-videonode**: Styles VideoNode instances.
- **mfd-freeformnode**: Styles FreeFormNode instances.

Container & Complex Nodes

- **mfd-containernode**: Styles ContainerNode instances (inherits from **mfd-captionednode**).
- **mfd-captionednode**: The base selector for nodes with captions like Tables and TreeViews. Inherits from **mfd-diagramnode**.
- **mfd-tablenode**: Styles TableNode instances (inherits from **mfd-captionednode**).
- **mfd-treeviewnode**: Styles TreeViewNode instances (inherits from **mfd-captionednode**).

Links

- **mfd-diagramlink**: Styles DiagramLink instances. Inherits from **mfd-diagramitem**.

Sample Inheritance Chains

- **mfd-shapenode** ? **mfd-diagramnode** ? **mfd-diagramitem**
- **mfd-tablenode** ? **mfd-captionednode** ? **mfd-diagramnode** ? **mfd-diagramitem**
- **mfd-diagramlink** ? **mfd-diagramitem**

Properties

Here is the list of custom CSS properties (variables) available for diagram items. These properties should be defined within the **mfd-** element selectors, and possibly assigned to specific items via the cssClass property.

Primary Appearance

- **--brush**: Specifies the background / fill color. Supports CSS color strings (e.g., `#FF0000`, `rgba(...)`, `lightblue`).
- **--stroke**: Specifies the outline / border color.
- **--stroke-thickness**: Specifies the width of the outline. Supports units like px, mm, pt, or in (values are converted to diagram's measureUnit).
- **--shadow-color**: Specifies the color of the item's shadow.

Typography & Text

- **--text-color**: Specifies the color of the text label.
- **--font-name**: Specifies the font family (e.g., 'Verdana', 'Arial').
- **--font-size**: Specifies the size of the font. Supports CSS units (values are converted to diagram's measureUnit).
- **--font-weight**: Use 'bold' to apply bold styling.
- **--font-style**: Use 'italic' to apply italic styling.
- **--text-decoration**: Use 'underline' to apply underline styling.

Selection States

- **--selected-brush**: Specifies the fill brush used when the item is selected.
- **--selected-stroke**: Specifies the outline color used when the item is selected.

Specialized Properties

- **--caption-brush**: Specifies the background color of captions (used by **mfd-tablenode**, **mfd-containernode**, and **mfd-treeviewnode**).
- **--vertical-border-stroke**: Specifies the color of vertical grid lines/borders (primarily for TableNode).
- **--horizontal-border-stroke**: Specifies the color of horizontal grid lines/borders (primarily for **TableNode**).

Define Shape Geometries

Diagrams can display geometric shapes by setting the shape property of ShapeNode instances.

Shape Templates

The Shape class provides the means for defining complex node shapes, made of straight lines, arcs and Bézier curves. A shape template must always contain an outline to be used for hit testing, clipping and finding intersections with other items. Optionally shapes can contain decoration elements, which are visual elements that do not take part in hit testing and clipping. JsDiagram provides a set of over a 100 **predefined shape templates**, which can be accessed by the Shapes collection or fromId method of the **Shape** class. A shape is assigned to a node by means of the shape property.

JavaScript Copy Code

```
shapeNode.shape = MindFusion.Diagramming.Shapes.Actor();
shapeNode.shape = MindFusion.Diagramming.Shape.fromId("Actor");
```

Custom Shapes

You can define your own shapes by using the static createShape method of the Diagramming.Controls.ShapeBuilder class. The shape geometry is specified as an array of ShapeElements. The ShapeElement class constructor expects a command and an array of command parameters, and optionally styling. The list of supported commands matches the HTML Canvas drawing API (e.g moveTo, lineTo, bezierCurveTo, arc, roundRect). Coordinates are defined as percentage of a node's bounding rectangle.

JavaScript Copy Code

```
var outline = [];
outline.push(new ShapeElement("moveTo", [0, 33]));
outline.push(new ShapeElement("lineTo", [33, 0]));
outline.push(new ShapeElement("lineTo", [66, 0]));
outline.push(new ShapeElement("lineTo", [100, 33]));
outline.push(new ShapeElement("lineTo", [100, 100]));
outline.push(new ShapeElement("bezierCurveTo", [66, 112, 33, 87, 0, 100]));
outline.push(new ShapeElement("lineTo", [0, 33]));
var shape = MindFusion.Diagramming.Controls.ShapeBuilder.createShape("MyShape", outline);
shapeNode.shape = shape;
```

The Shape definition can also contain decorations and shape decorations. A decoration is a geometry that consists of one or more lines or curves. A shape decoration is a closed path of lines and/or curves, that can also have a fill. A shape can have one decoration and a number of shape decorations, that are specified through the decorationElements and shapeDecorationElements parameters as follows:

JavaScript Copy Code

```
var decoration = [];
decoration.push(new ShapeElement("moveTo", [0, 33]));
decoration.push(new ShapeElement("lineTo", [33, 0], "red"));
decoration.push(new ShapeElement("lineTo", [66, 33], "blue", 4));

var shapeDecorationElements = [];
shapeDecorationElements.push(new ShapeElement("roundRect", [50, 50, 80, 80, 2]));
var shapeDecoration = new ShapeDecoration(shapeDecorationsElements, "red");

var shape = MindFusion.Diagramming.Controls.ShapeBuilder.createShape(
    "MyShape", outline, decoration, [shapeDecoration]);
```

If you don't need the per-element styling options, another way to create a shape is by creating an instance of the **Shape** class providing the outline definition using SVG Path syntax.

JavaScript Copy Code

```
var shape = new Shape({
    id: "MyShape"
    outline: "M100,50 A50,50,0,1,1,0,50 A50,50,0,1,1,100,50",
    decoration: "M98,50 A48,48,0,1,1,2,50 A48,48,0,1,1,98,50"});
```

A string identifier must be specified for every shape so they will be accessible via the Shape.fromId method.

Shape Libraries

You can use a Shape Library xml file to store your collection of custom shapes. Set the shapeLibraryLocation property to specify the path to the file.

JavaScript Copy Code

```
diagram.shapeLibraryLocation = "MyShapes.sl";
```

The shapes in the Shape Library file will be automatically added to the shared list of shapes kept in the Shape class, which lets you access them by calling the fromId method.

Shape Designer Tool

The ShapeDesigner tool that comes with JsDiagram lets you create and edit custom shapes interactively and save them to Shape Library files. When the tool starts, a new shape library is created by default with a single basic rectangular shape in it. To modify the shape, drag and drop shape elements from the palette to the right onto the shape canvas. The following drop operations are supported:

- dropping an element over existing element of a shape outline replaces the element (the element to be replaced will be marked in red)
- dropping an element over the joint of two outline elements inserts the element between them (the joint will be marked in blue)
- dropping an element on an empty area of the canvas adds a decoration to the Shape
- dropping a decoration over the shape outline replaces all elements of the outline with ones from the decoration
- dropping a decoration on an empty area of the canvas adds a filled ShapeDecoration to the **Shape**
- dropping a decoration over a **ShapeDecoration** replaces its elements

Elements/decorations can be further customized by dragging their control points.
You can delete, copy and paste dropped elements/decorations, as well as undo and redo drop actions via the options in the Edit menu.
Styling can be specified to elements/decorations by using the controls in the property panel, that is shown when an element/decoration is selected.
The Preview panel lets you see how your shape will look and behave in a real DiagramView control.
New shapes can be added from the Shape/New menu option.
The finished library can be exported to an .sl file from the File/Save Library menu option.

Animations

Item Animations

The animate method of DiagramItem can run following animations:

- FillColorAnimation animates the fill color of nodes or link arrowheads.
- StrokeColorAnimation animates the color of node borders or link segments.
- OpacityAnimation animates items' opacity for fade-in and fade-out effects.

The following animations can be applied to DiagramNodes:

- BounceAnimation animates vertical position of nodes.
- ShakeAnimation animates horizontal position of nodes.
- PulseAnimation animates node's local scale factor.
- PathAnimation moves nodes along specified path.

Item's animated values are considered transient and do not change actual property values. If you want to assign last value from animation to actual property such as bounds or opacity, set the *keepLastValue* flag in animation parameters:

JavaScript Copy Code

```
node.animate(
    new PathAnimation(
        [
            new Point(30, 30),
            new Point(50, 30),
            new Point(75, 66),
            new Point(125, 88)
        ],
        {
            keepLastValue: true
        }));
```

Other animation parameters include duration, repeat, repeatCount, from / to values, animation curve and easing options:

JavaScript Copy Code

```
node.animate(
    new OpacityAnimation(
        {
            fromValue: 1,
            toValue: 0.5,
            duration: 250,
            repeat: true,
            repeatCount: 4,
            reverse: true,
            animationType: Animations.AnimationType.BackBow
        }));
```

Item and view animations that affect different properties can run simultaneously.

View Animations

The animate method of DiagramView can run following animations:

- ScrollAnimation animates the scroll position of a view.

- ZoomAnimation animates the zoom factor of a view.

```
JavaScript                                                    Copy Code
diagramView.animate(
        new ScrollAnimation(
        {
            fromValue: new Point(0, 0),
            toValue: new Point(100, 60),
            animationType: Animations.AnimationType.Power,
            easingType: Animations.EasingType.EaseInOut
        }));
```

View animations are not transient and always set the scroll* or zoomFactor properties.

Looping Animations

To create looping animations, use the repeat and reverse properties. To stop an animation, call its stop method.

```
JavaScript                                                    Copy Code
// Use this property to repeat the animation until stopped.
animation.repeat = true;
// Use this property to reverse the to and from values.
animation.reverse = true;

// Use the stop method to complete the animation.
animation.stop();
```

Custom Animations

To animate arbitrary attributes of any type, an Animation instance can receive an **updateCallback** function as a parameter to the constructor. This callback function can be used to set item coordinates or property values of the object being animated. The callback signature should contain two arguments - the animation object instance and a value representing the animated property delta. This callback is called at every animation timer "tick". The following example creates a pulse-like effect, using an update callback:

```
JavaScript                                                    Copy Code
var Animation = MindFusion.Animations.Animation;
var Utils = MindFusion.Diagramming.Utils;

var options =
    {
        duration: 550,
        fromValue: -0.15,
        toValue: 0.15,
        repeat: true,
        reverse: true
    };

/**
* @param [Animation] animation The animation object instance.
* @param [Number] animationDelta A number representing the percentage of displacement
* of the animated property's value in the [fromValue, toValue] range.
*/
function pulse(animation, animationDelta)
{
    var bounds = animation.item.bounds.clone();
    var to = animation.toValue;
    bounds = Utils.inflate(bounds, to * animationDelta, to * animationDelta);
    animation.item.setBounds(bounds, true);
}

var animation = new Animation(node, options, pulse);
animation.start();
```

Alternatively, a class derived from **Animation** could override the virtual **onUpdate** method.

Default Animation and Easing Functions

There are seven default animation type functions that can be used to animate items, designated by respective elements of AnimationType enumeration:

- Linear: represents an animation that accelerates / decelerates using a linear function.

- Power: represents an animation that accelerates / decelerates through exponentiation formula - x^n where n can be set through the animation's param property. The default exponent value is 2.
- Exponential: represents an animation that accelerates / decelerates using an exponential function. The exponent can be set through the animation's **param** property. The default exponent value is 10.
- Circular: represents an animation that accelerates / decelerates using a circular function.
- BackBow: represents an effect that simulates a retraction in the motion of the animation. The amplitude of the retraction can be controlled through the animation's **param** property. The default param value is 1.5.
- Bounce: represents a bouncing effect animation.
- Elastic: represents an oscillating effect animation. The oscillation frequency can be controlled through the animation's **param** property. The default param value is 0.5.

The default animations can be additionally customized by an easing function, specified via EasingType enumeration:

- EaseIn: follows the animation function associated with the Animation.
- EaseOut: inverses the animation function associated with the **Animation**.
- EaseInOut: uses **EaseIn** for the first half of the **Animation**'s duration and **EaseOut** for the second half.
- EaseOutIn: uses **EaseOut** for the first half of the **Animation**'s duration and **EaseIn** for the second half.

Custom Animation Functions

In addition to the provided default animation functions, it is also possible to define custom animation effects. Set the animationType property to Custom and pass a custom animation function callback to the Animation constructor. The callback signature should contain two arguments - the time progressed as a percentage from the start of the animation and the user-set parameter, used in the animation function. The following example uses a custom function where x is a value between 0 and 1 and y is a parameter, passed as an argument to the **Animation** constructor.

JavaScript Copy Code

```
var Animation = MindFusion.Animations.Animation;
var AnimationType = MindFusion.Animations.AnimationType;

var options =
    {
        duration: 500,
        fromValue: 5,
        toValue: 100,
        param: 5,
        animationType: AnimationType.Custom
    };

/**
* @param [Number] progress The time progress in the animation loop. A value between 0 and 1.
* @param [Object] param The user-set value, used to parameterize the animation function.
*/
function custom(progress, param)
{
    return Math.pow(Math.E, 1 - (1 / Math.pow(progress, param)));
}

var animation = new Animation(node, options, null, custom);
animation.start();
```

.NET Core Assemblies

The .NET Core assemblies included in Diagramming / MVC distribution provide mostly the same API as ASP.NET MVC 5 builds of the library, with a few missing features and differences listed below:

JSON converters

Since ASP.NET Core does not provide JSON converters -based serialization, the diagramming assemblies for .NET Core do not include converter classes and associated properties and methods - RegisterConverters, ItemTypes, MaxJsonLength, RecursionLimit, SetMaxJsonLength, SetRecursionLimit. In order to serialize custom node types, you must override their SaveToJson and LoadFromJson methods instead of implementing converters, and call the RegisterItemType method or its overload taking composite node template as an argument. ItemTypeResolver does not have a base class and does not include ResolveType, ResolveTypeId, RegisterConverters, Converters and ItemTypes members.

Other differences

- DiagramViewExtensions methods return **IHtmlContent** instead of **MvcHtmlString**.
- Width and Height properties, SetWidth and SetHeight extension methods which have been declared obsolete in MVC 5 version are not available in .NET Core assemblies.

Initial Values of Item Properties

Each new item, created either by the user or programmatically, is initialized with some kind of default property values.

If you create items by using the **new** operator and adding them the diagram's Nodes or Links collection, you can initialize the items by passing a Diagram reference to the respective constructor, or by passing another item to the copy constructor. In the former case, item properties are initialized from the default-property values defined in **Diagram**. In the latter case, properties are copied from the prototype item.

When users draw new items, the items are initialized from the **Diagram** properties, but you can change the default values by handling the initializeNode and initializeLink events.

Items created via the diagram's Factory object are always initialized from the default-property values defined in **Diagram**.

Below are listed item properties and the corresponding constants or **Diagram** properties through which they are initialized.

Note that some properties in the tables below are marked as *styled*. Styled properties usually default to **null** (**Nothing** in Visual Basic), unless the item is created through the prototype constructor, in which case the values of the styled properties are obtained from the prototype item. When a style property is **null**, its effective value is determined by the style associated with the item or the theme applied to the diagram. For more information on how the style system works, check Styles and Themes.

DiagramItem Property	Initialized With
Brush (*styled*)	**null** (affected by Brush of the corresponding DiagramItemStyle)
Locked	**false**
Font (*styled*)	**null** (affected by FontFamily, FontSize, FontStyle, and FontUnit of the corresponding DiagramItemStyle)
Pen (*styled*)	**null** (affected by Stroke and StrokeThickness of the corresponding DiagramItemStyle)
ShadowBrush (*styled*)	**null** (affected by ShadowBrush of the corresponding DiagramItemStyle)
ShadowOffsetX	ShadowOffsetX
ShadowOffsetY	ShadowOffsetY
Tag	**null**
TextBrush (*styled*)	**null** (affected by TextBrush of the corresponding DiagramItemStyle)
ToolTip	(empty string)
Visible	**true**

ShapeNode Property	Initialized With
EnabledHandles	AdjustmentHandles.All
Expandable	NodesExpandable
ImageUrl	**(empty string)**
ImageAlign	ImageAlign.Fit
Text	ShapeText
TextFormat	TextFormat
Transparent	**false**

ContainerNode Property	Initialized With
Caption	ContainerCaption
CaptionHeight	ContainerCaptionHeight
Foldable	ContainersFoldable

Folded	**false**
Margin	ContainerMargin

TableNode Property	Initialized With
Caption	TableCaption
ConnectionStyle	TableConnectionStyle
Scrollable	TablesScrollable

DiagramLink Property	Initialized With
BaseShape	LinkBaseShape
HeadShape	LinkHeadShape
Shape	LinkShape
Text	LinkText

Tutorials

Tutorial 1: Getting started

This tutorial will show you how to set up your project to use MvcDiagram.

1. Creating an ASP.NET Core Application

Go to File->New->Project. From the list of installed templates, choose ASP.NET Core Web App (Model-View-Controller) and hit Next. Enter "Tutorial1" as name of the application and press Next. On the next screen just press Create.

2. Installing the package

From Solution Explorer menu -> Dependencies -> Manage NuGet Packages, install the MindFusion.Diagramming.Mvc package.

3. Referencing the client scripts

The client script *MindFusion.Diagramming.js* should appear automatically in the *wwwroot/js* subfolder once the project is built. If you need to change the location of the *MindFusion.Diagramming.js* script, set the ClientScriptLocation property to configure the control:

C# Copy Code

```
view.ClientScriptLocation = "/SomeFolder/MindFusion.Diagramming.js";
```

4. Adding a DiagramView to the page

Open the Index.cshtml page, which is located below the Views->Home node in the Solution Explorer tree. Add references to the MindFusion.Diagramming.Mvc namespace:

HTML Copy Code

```
@using MindFusion.Diagramming.Mvc
```

Add a call to the HTML helper's DiagramView method by typing the following line:

HTML Copy Code

```
@Html.DiagramView((DiagramView)ViewBag.DiagramView, new { style = "width:800px; height:700px;" })
```

5. Creating the diagram

Open the controller class HomeController.cs, which is located in the Controllers node in the Solution Explorer tree. On top add the following references:

C# Copy Code

```
using Microsoft.Maui.Graphics;
using MindFusion.Diagramming;
using MindFusion.Diagramming.Mvc;
using SolidBrush = MindFusion.Drawing.SolidBrush;
using LinearGradientBrush = MindFusion.Drawing.LinearGradientBrush;
```

In the body of the Index method add

C# Copy Code

```
DiagramView view = new DiagramView("diagramView1");
```

The code above creates a new DiagramView object with Id set to "diagramView1".

Change some properties of the view's Diagram object:

C# Copy Code

```
Diagram diagram = view.Diagram;
diagram.BackBrush = new SolidBrush(Colors.White);
diagram.LinkHeadShape = ArrowHeads.Triangle;
diagram.LinkHeadShapeSize = 3;

DiagramStyle style = new DiagramStyle();
style.FontFamily = "Verdana";
style.Brush = new LinearGradientBrush(Colors.LightBlue, Colors.Blue, 90);
style.Stroke = new SolidBrush(Colors.Black);
diagram.Style = style;
```

Diagram's BackBrush property defines the default color with which the interior of the diagram will be filled. Diagram's LinkHeadShape and LinkHeadShapeSize properties define the default base shape and size for links' ending arrowhead. Additional styles can be applied to the diagram items by using the diagram's Style property.

Add the following code to add some ShapeNodes to the diagram. ShapeNode objects can be drawn as various geometric shapes, as set through their Shape property. There are over 100 predefined shapes exposed as static members of the Shapes class. The **Shape** property can be set to one of the predefined shapes: RoundRect, Rectangle, Ellipse, Process, Procedure, Delay and much more.

C# Copy Code

```
// add some nodes and links to the view's Diagram
ShapeNode node1 = diagram.Factory.CreateShapeNode(new Rect(55, 10, 40, 15));
node1.Shape = Shapes.Terminator;
node1.Text = "Start";
node1.Brush = new LinearGradientBrush(Colors.Yellow, Colors.Orange, 90);

ShapeNode node2 = diagram.Factory.CreateShapeNode(new Rect(50, 40, 50, 20));
node2.Text = "Receive order via e-mail";

ShapeNode node3 = diagram.Factory.CreateShapeNode(new Rect(50, 70, 50, 20));
node3.Text = "Copy and paste e-mail data into database";

ShapeNode node4 = diagram.Factory.CreateShapeNode(new Rect(55, 100, 40, 40));
node4.Shape = Shape.FromId("Decision");
node4.Text = "Shipping involved?";
node4.Brush = new LinearGradientBrush(Colors.White, Colors.Fuchsia, 90);

ShapeNode node5 = diagram.Factory.CreateShapeNode(new Rect(100, 135, 50, 20));
node5.Shape = Shape.FromId("Save");
node5.Text = "Print invoice and UPS label";
node5.Brush = new SolidBrush(Colors.Chartreuse);

ShapeNode node6 = diagram.Factory.CreateShapeNode(new Rect(100, 165, 50, 20));
node6.Text = "Send e-mail to confirm shipping";
diagram.Nodes.Add(node6);

ShapeNode node7 = diagram.Factory.CreateShapeNode(new Rect(100, 195, 50, 20));
node7.Text = "Assemble package and ship";

ShapeNode node8 = diagram.Factory.CreateShapeNode(new Rect(55, 230, 40, 15));
node8.Shape = Shapes.Terminator;
node8.Text = "End";
node8.Brush = new LinearGradientBrush(Colors.Yellow, Colors.Orange, 90);
```

Add the following code to add some DiagramLinks to the diagram:

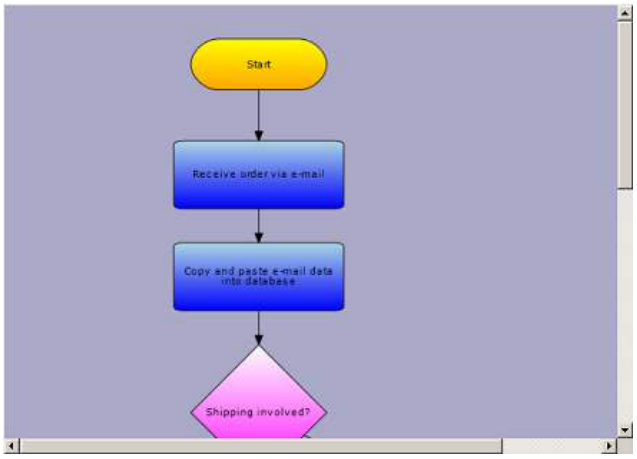
C# Copy Code

```
diagram.Factory.CreateDiagramLink(node1, node2);
diagram.Factory.CreateDiagramLink(node2, node3);
diagram.Factory.CreateDiagramLink(node3, node4);

DiagramLink link4 = diagram.Factory.CreateDiagramLink(node4, node5);
link4.Text = "Yes";

diagram.Factory.CreateDiagramLink(node5, node6);
diagram.Factory.CreateDiagramLink(node6, node7);
diagram.Factory.CreateDiagramLink(node7, node8);

DiagramLink link8 = diagram.Factory.CreateDiagramLink(node4, node8);
link8.Text = "No";
```



Finally, store the newly created view in the **ViewBag** dictionary:

C# Copy Code

```
ViewBag.DiagramView = view;
```

6. Running the application

From the main menu choose Debug->Start without debugging or press CTRL+F5. The image below depicts how the application would look like:

Tutorial 2: Handling client-side events

This tutorial will show you how to use client events in MvcDiagram.

1. Create a new ASP.NET Core MVC Application and add a DiagramView control to the page

Follow steps 1-4 from Tutorial 1: Getting started.

2. Create and arrange the diagram

Open the HomeController.cs file and add a reference to the MindFusion.Diagramming.Layout namespace in the 'using' section of the page:

C# Copy Code

```
using MindFusion.Diagramming.Layout;
```

Add the following code block to create a new DiagramView object and add some nodes and links to its Diagram.

C# Copy Code

```
// initialize the DiagramView
DiagramView view = new DiagramView("diagramView1");
```

```
Diagram diagram = view.Diagram;

// add some nodes and links
for (var i = 0; i < 5; i++)
{
    var node = diagram.Factory.CreateShapeNode(new Rect(0, 0, 25, 25));
    node.Text = "node " + i;
    diagram.Nodes.Add(node);
    if (i > 0)
    {
        var link = diagram.Factory.CreateDiagramLink(diagram.Nodes[0], node);
        diagram.Links.Add(link);
    }
}
```

Set the Brush property of the first node to DarkRed and its Text to "Root":

C# Copy Code

```
var rootNode = diagram.Nodes[0];
rootNode.Brush = new SolidBrush(Colors.DarkRed);
((ShapeNode)rootNode).Text = "Root";
```

Create a FractalLayout object and apply it to the Diagram:

C# Copy Code

```
var layout = new FractalLayout();
layout.Root = rootNode;
layout.Arrange(diagram);
```

Add the newly created view to the **ViewData** dictionary:

C# Copy Code

```
ViewBag.DiagramView = view;
```

Modify the call to the DiagramView HTML helper method as following to set the NodeCreatedScript to "nodeCreated" and NodeDeletedScript to "nodeDeleted". These are the names of the JavaScript functions that will handle the corresponding events. We will define them a bit later in the *Index.cshtml* file.

HTML Copy Code

```
@Html.DiagramView(
    ((DiagramView)ViewBag.DiagramView)
    .NodeCreatedScript("nodeCreated")
    .NodeDeletedScript("nodeDeleted"),
    new { style="width:700px; height:500px;" }
)
```

3. Handling client events

Open the site.js file, located in the wwwroot/js folder and add the following JavaScript block:

JavaScript Copy Code

```
function nodeCreated(sender, args)
{
    if (args.node)
    {
        // send an ajax request to the Controller's Test action method
        $.ajax(
        {
            type: "POST", url: "/Home/Test",
            data: { json: sender.toJson(), index: sender.nodes.indexOf(args.node) },
            dataType: 'json',
            success: function (result) {
                sender.fromJson(result.success);
            },
            error: function (req, status, error) {
                alert(error);
            }
        });
    }
```

```
}

function nodeDeleted(sender, args)
{
    if (args.node.zIndex == 0)
    {
        if (sender.nodes.length > 0)
        {
            // set the root node to the first node in the diagram.nodes collection
            var rootNode = sender.nodes[0];
            rootNode.brush = { type: 'SolidBrush', color: 'firebrick' };
            rootNode.text = "root";
            rootNode.zIndex = 0;

            // create links between the root and children nodes
            for (var i = 1; i < sender.nodes.length; i++)
            {
                sender.factory.createDiagramLink(
                    sender.nodes[0], sender.nodes[i]);
            }
        }
    }
}
```

Open the *HomeController.cs* file and add the Test action method:

C# Copy Code

```
public JsonResult Test(string json, string index)
{
    DiagramView view = DiagramView.FromJson(json);
    Diagram diagram = view.Diagram;
    var newNode = ((ShapeNode)diagram.Nodes[Int32.Parse(index)]);
    newNode.Text = "node " + (diagram.Nodes.Count-1).ToString();
    if (diagram.Nodes.Count > 1)
    {
        // create a link between the root node and the newly created node and apply the layout to
the diagram
        var link = diagram.Factory.CreateDiagramLink(diagram.Nodes[0], newNode);
        var layout = new FractalLayout();
        layout.Root = diagram.Nodes[0];
        layout.Arrange(diagram);
    }
    else
    {
        // set the newly created node as a root node
        newNode.Brush = new SolidBrush(Colors.DarkRed);
        ((ShapeNode)newNode).Text = "Root";
    }
    return Json(new { success = DiagramView.ToJson(view) });
}
```

When a new node is added to the diagram the **nodeCreated** function will be called. It will send an ajax request, containing the serialized to JSON view and the index of the new node to the controller's Test action method. Within the Test method the view will be recreated from the JSON string and depending of the number of nodes in the diagram either a link between the root node and the new node will be created or the new node will be set as root.

The **nodeDeleted** function is called upon node deletion. If the deleted node is the root node a new root node will be assigned and will be linked to all other nodes in the diagram.

4. Run the application

Run the application. Try adding and deleting some nodes to see how the events will be handled.

Tutorial 3: Overview and NodeListView

This tutorial shows how to use the Overview and NodeListView components.

1. Create a new ASP.NET Core MVC Application and add a

DiagramView control to the page

Follow steps 1-5 from Tutorial 1: Getting started.

2. Add the controls to the page

Add the following initialization code for the DiagramView, Overview, and NodeListView controls in the Index method of the HomeController.cs:

HTML Copy Code

```
diagram.ShowGrid = true;
diagram.GridColor = Colors.Red;
diagram.AlignToGrid = true;
view.AllowInplaceEdit = true;

Overview overview = new Overview("overview1", "diagramView1");
overview.BackColor = Colors.LightGray;
overview.DimColor = Colors.White;
ViewBag.Overview = overview;

NodeListView nodelist = new NodeListView("nodelist1");
for (var i = 0; i < Shape.Shapes.Count; ++i)
{
    if (Shape.Shapes[i].Id != "RoundRect1" && !Shape.Shapes[i].IsArrowhead)
    {
        var node = new MindFusion.Diagramming.ShapeNode();
        node.Brush = new MindFusion.Drawing.SolidBrush(Colors.LightBlue);
        node.Shape = Shape.Shapes[i];
        nodelist.AddNode(node);
    }
}
ViewBag.NodeListView = nodelist;
```

Setting the Diagram's ShowGrid property to true will display the alignment grid, and setting the AlignToGrid property will ensure the that the sides newly created nodes will be aligned to the nearest grid point.

The view's AllowInplaceEdit property defines whether items' text can be edited inplace.

The **Overview**'s BackColor property defines the background color of the control and the DimColor property sets the color of the displayed diagram.

Use the **NodeListView** control's AddNode method to add an arbitrary number of nodes to its nodes collection.

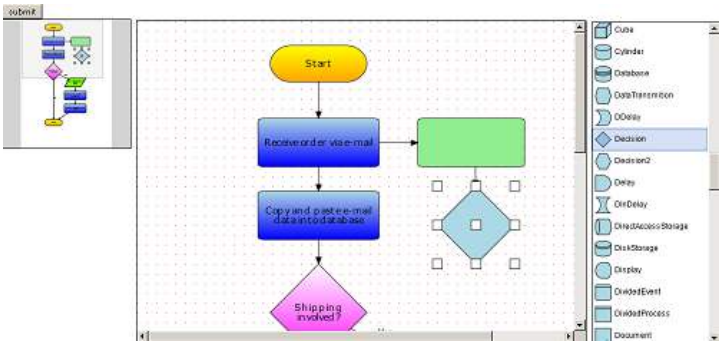
Remove the call to the Diagram's HTML Helper method and add the following form declaration instead:

HTML Copy Code

```
@using (Html.BeginForm())
{
    <input type="submit" name="submitButton" value="submit" />

    <div style="display:flex;">
        @Html.DiagramView(((DiagramView)ViewBag.DiagramView), new { style="width:700px;
height:700px;" })
        @Html.Overview(((Overview)ViewBag.Overview), new { style="width:200px; height:200px;" })
        @Html.NodeListView(((NodeListView)ViewBag.NodeListView), new { style="width:200px;
height:500px;" })
    </div>
}
```

3. Submitting the form



Upon form submission the DiagramView control will serialize itself in JSON format and will store the serialized string in a hidden field. This field will be added automatically to the form by the **DiagramView** control and will have a name matching the following pattern: DiagramViewId + "_PostData" e.g. "diagramView1_PostData". You can access the field through the **Request.Form** collection and pass the data to the DiagramView's FromJson method in order to keep the changes made from the client. The view's FromRequest static method can be used as a shortcut to achieve the same effect. Change the **DiagramView** control initializer as follows to persist the changes:

C# Copy Code

```
DiagramView view = DiagramView.FromRequest("diagramView1", Request);
```

4. Running the application

Run the application. Try drawing some nodes and/or links. Double-click on an object to inplace-edit it's text. Drag items from the **NodeListView** control onto the **Diagram** to create new nodes. Submit the form to see how the control will store your changes. The image below depicts how the application would look like with some nodes and links added to the diagram.

Tutorial 4: Loading graph data

This tutorial shows how to load graph data from XML and create diagram objects corresponding to the graph nodes and edges.

1. Create a new ASP.NET MVC Application and add a DiagramView control to the page

Follow steps 1-5 from Tutorial 1: Getting started.

2. Create the XML file

From the project's context menu choose Add -> New Item. Create a new XML file called *SampleGraph.xml* and add the following markup to its content.

XML Copy Code

```
<?xml version="1.0" encoding="utf-8" ?>
<Graph>
    <Nodes>
        <Node id="0" name="start" />
        <Node id="1" name="activity 1" />
        <Node id="2" name="task 1" />
        <Node id="3" name="task 2" />
        <Node id="4" name="activity 2" />
        <Node id="5" name="task 3" />
        <Node id="6" name="task 4" />
        <Node id="7" name="activity 3" />
        <Node id="8" name="task 5" />
        <Node id="9" name="task 6" />
        <Node id="10" name="end" />
    </Nodes>
    <Links>
        <Link origin="0" target="1" />
        <Link origin="1" target="2" />
        <Link origin="1" target="3" />
        <Link origin="2" target="4" />
        <Link origin="3" target="4" />
        <Link origin="4" target="5" />
        <Link origin="4" target="6" />
        <Link origin="5" target="10" />
        <Link origin="6" target="10" />
        <Link origin="0" target="7" />
        <Link origin="7" target="8" />
        <Link origin="8" target="9" />
        <Link origin="1" target="9" />
        <Link origin="9" target="10" />
    </Links>
</Graph>
```

Move the xml file to the wwwroot/js subfolder. Set the file's "Build Action" property to "Content" and "Copy to Output Directory" to "Copy if newer".

3. Load the XML document

Open HomeController.cs file and and the following references

C# Copy Code

```
using Microsoft.AspNetCore.Hosting;
using System.Xml.Linq;
using MindFusion.Diagramming.Layout;
```

We will get access to the SampleGraph.xml file, located in the wwwroot/js folder by injecting and querying the **IHostingEnvironment** service. Add a private variable
and a constructor method to the HomeController class as follows:

C# Copy Code

```
public class HomeController : Controller
{
    private readonly IWebHostEnvironment env;
    public HomeController(IWebHostEnvironment hostEnvironment)
    {
        env = hostEnvironment;
    }
```

Delete the code for creating nodes and links in the code block and add declarations for the following variables. "nodeMap" maps diagram nodes to their identifiers, and "bounds" contains the default node size.

C# Copy Code

```
Dictionary<string, DiagramNode> nodeMap = new Dictionary<string, DiagramNode>();
Rect bounds = new Rect(0, 0, 60, 20);
```

Load the XML document and its root element using the **Linq for XML** API:

C# Copy Code

```
var path = env.WebRootFileProvider.GetFileInfo("js//SampleGraph.xml")?.PhysicalPath;
var xml = XDocument.Load(path);
var graph = xml.Element("Graph");
```

4. Create the Shape nodes

Load the graph node elements and create their corresponding ShapeNode objects by calling the CreateShapeNode method of the Factory class. **CreateShapeNode** is just a shortcut to creating a **ShapeNode** instance using the "new" operator and adding it to the Nodes collection of the diagram. Additionally, this code maps the new node to the "id" attribute of the XML element, and sets the node's Text to the value of the "name" attribute.

C# Copy Code

```
var nodes = xml.Descendants("Node");
foreach (var node in nodes)
{
    var diagramNode = diagram.Factory.CreateShapeNode(bounds);
    nodeMap[node.Attribute("id").Value] = diagramNode;
    diagramNode.Text = node.Attribute("name").Value;
}
```

5. Create the Diagram links

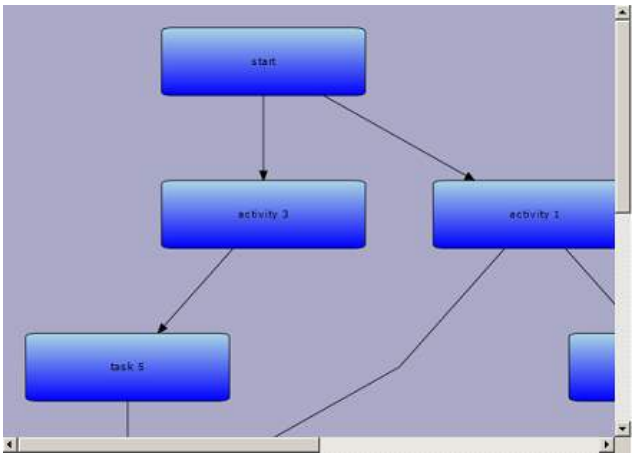
Load the graph links and create corresponding DiagramLink objects. The Origin and Destination of the links are accessed by their ids through the "nodeMap" dictionary.

C# Copy Code

```
var links = xml.Descendants("Link");
foreach (var link in links)
{
    diagram.Factory.CreateDiagramLink(
    nodeMap[link.Attribute("origin").Value],
```

```
    nodeMap[link.Attribute("target").Value]);
}
```

6. Arrange the diagram



Arrange the diagram using the LayeredLayout class. Call the Diagram's ResizeToFitItems method to ensure that its bounds will fit all diagram items.

C# Copy Code

```
var layout = new LayeredLayout();
layout.NodeDistance = 80;
layout.Arrange(diagram);
diagram.ResizeToFitItems(5);
```

7. Run the application

Build and run the project. If everything is fine, you should see this representation of the graph:

Tutorial 5: Loading hierarhical data

This tutorial shows how to load hierarchical data recursively from XML and create diagram items corresponding to the hierarchy.

1. Create a new ASP.NET MVC Application and add a DiagramView control to the page

Follow steps 1-4 from Tutorial 1: Getting started.

2. Create the XML file

From the project's context menu choose Add -> New Item. Create a new XML file called *SampleTree.xml* and add the following markup to its content.

XML Copy Code

```
<?xml version="1.0" encoding="utf-8" ?>
<Project>
    <Activity Name="Activity 1">
        <Activity  Name="sub-activity 1">
            <Activity  Name="sub-activity 1-1" />
            <Activity  Name="sub-activity 1-2" />
        </Activity>
        <Activity  Name="sub-activity 2">
            <Activity  Name="sub-activity 2-1" />
            <Activity  Name="sub-activity 2-2" />
            <Activity  Name="sub-activity 2-3" />
        </Activity>
        <Activity  Name="sub-activity 3">
            <Activity  Name="sub-activity 3-1" />
            <Activity  Name="sub-activity 3-2" />
        </Activity>
    </Activity>
```

```
    <Activity Name="Activity 2">
        <Activity  Name="sub-activity 1">
            <Activity  Name="sub-activity 1-1" />
            <Activity  Name="sub-activity 1-2" />
            <Activity  Name="sub-activity 1-3" />
        </Activity>
        <Activity  Name="sub-activity 2">
            <Activity  Name="sub-activity 2-1" />
            <Activity  Name="sub-activity 2-2" />
        </Activity>
    </Activity>
    <Activity Name="Activity 3">
        <Activity  Name="sub-activity 1">
            <Activity  Name="sub-activity 1-1" />
            <Activity  Name="sub-activity 1-2" />
            <Activity  Name="sub-activity 1-3" />
            <Activity  Name="sub-activity 1-4" />
        </Activity>
        <Activity  Name="sub-activity 2" />
        <Activity  Name="sub-activity 3">
            <Activity  Name="sub-activity 3-1" />
            <Activity  Name="sub-activity 3-2" />
        </Activity>
    </Activity>
</Project>
```

Move the xml file to the wwwroot/js subfolder. Set the file's "Build Action" property to "Content" and "Copy to Output Directory" to "Copy if newer".

3. Load the XML document

Open *HomeController.cs* file and and the following references:

C# Copy Code

```
using System.Xml.Linq;
using Microsoft.Maui.Graphics;
using MindFusion.Diagramming;
using MindFusion.Diagramming.Mvc;
using MindFusion.Diagramming.Layout;
using SolidBrush = MindFusion.Drawing.SolidBrush;
using LinearGradientBrush = MindFusion.Drawing.LinearGradientBrush;
```

Add the following member to the page class to hold the default node size:

C# Copy Code

```
var nodeBounds = new Rect(0, 0, 30, 10);
```

Add the diagram's initialization code to the body of the Index method.

C# Copy Code

```
DiagramView view = new DiagramView("diagramView1");

Diagram diagram = view.Diagram;
diagram.LinkHeadShape = ArrowHeads.Triangle;
diagram.LinkHeadShapeSize = 3;

DiagramStyle style = new DiagramStyle();
style.FontFamily = "Verdana";
style.BackBrush = new SolidBrush(Colors.White);
style.Brush = new LinearGradientBrush(Colors.LightBlue, Colors.Blue, 90);
style.Stroke = new SolidBrush(Colors.Black);
diagram.Style = style;

ViewBag.DiagramView = view;
return View();
```

4. Define CreateChildren method

Define *CreateChildren* as follows. It takes as parameters the parent DiagramNode and parent XML element, iterates the child XML elements to build the next level of the hierarchy, and creates corresponding diagram items by calling CreateShapeNode and CreateDiagramLink.

C# Copy Code

```
private void CreateChildren(Diagram diagram, DiagramNode parentDiagNode, XElement
parentXmlElement)
{
    foreach (var element in parentXmlElement.Elements("Activity"))
    {
        var node = diagram.Factory.CreateShapeNode(nodeBounds);
        node.Text = element.Attribute("Name").Value;
        diagram.Factory.CreateDiagramLink(parentDiagNode, node);
        CreateChildren(diagram, node, element);
    }
}
```

Add the following block to the Index method to create the tree root node, and add a call to the CreateChildren method, which builds the tree recursively.

C# Copy Code

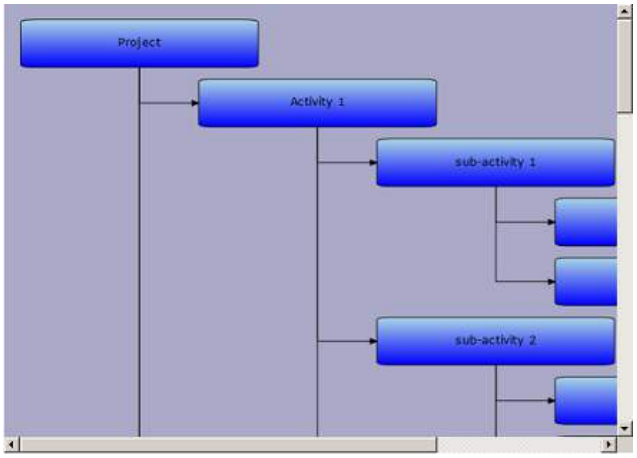
```
var root = diagram.Factory.CreateShapeNode(nodeBounds);
root.Text = "Project";
var path = env.WebRootFileProvider.GetFileInfo("js//SampleTree.xml")?.PhysicalPath;
var document = XDocument.Load(path);
CreateChildren(diagram, root, document.Element("Project"));
```

5. Arrange the diagram

Use TreeLayout to arrange the diagram. Add the following code to the end of the Index method.

C# Copy Code

```
var layout = new TreeLayout();
layout.Type = TreeLayoutType.Cascading;
layout.Direction = TreeLayoutDirections.LeftToRight;
layout.LinkStyle = TreeLayoutLinkType.Cascading2;
layout.NodeDistance = 5;
layout.LevelDistance = -25; // let horizontal positions overlap
layout.Arrange(diagram);
```



Call the Diagram's ResizeToFitItems method to ensure that its bounds will fit all diagram items. Set the ZoomFactor property of the view to 70.

C# Copy Code

```
diagram.ResizeToFitItems(5);
```

6. Run the application

Build and run the project. If everything is fine, you should see this representation of the hierarchy:

Tutorial 6: Create a Custom Node Type

This tutorial shows how to define a custom node class that adds several new properties.

1. Create a new ASP.NET Core MVC Application and add a DiagramView control to the page

Follow steps 1-4 from Tutorial 1: Getting started.

2. Create the custom node type

Create a new js file in the wwwroot/js folder named OrgChartNode.js with the following content:

JavaScript — Copy Code

```
class OrgChartNode extends MindFusion.Diagramming.ShapeNode
{
    constructor(parent)
    {
        super(parent);

        this.title = 'title';
        this.fullName = 'full name';
        this.nodeImageLocation = '../images/icon4.png';

        this.shape = 'Rectangle';
        this.text = 'node text';
        this.brush = '#fff';
    }

    // drawing logic
    updateCanvasElements()
    {
        super.updateCanvasElements();

        // add the node image;
        if (this.nodeImage)
        {
            this.nodeImage.bounds = new Rect(
                this.bounds.x, this.bounds.y + (this.bounds.height - 20) / 2, 20, 20);
            this.graphicsContainer.content.push(this.nodeImage);
        }

        // add the title label
        var titleFont = Font.copy(this.effectiveFont);
        var titleLabel = new Text(this.title,
            new Rect(this.bounds.x + 21, this.bounds.y + 5, this.bounds.width - 22,
titleFont.size));
        titleLabel.font = titleFont;
        titleLabel.font.fontStyle = MindFusion.Drawing.FontStyle.Bold;
        titleLabel.fitInBounds = false;
        this.graphicsContainer.content.push(titleLabel);

        // add the name label
        var nameFont = Font.copy(this.effectiveFont);
        var nameLabel = new Text(this.fullName, new Rect(
            this.bounds.x + 21, this.bounds.y + 5 + titleFont.size, this.bounds.width - 22,
nameFont.size));
        nameLabel.font = nameFont;
        nameLabel.pen = "blue";
        nameLabel.fitInBounds = false;
        this.graphicsContainer.content.push(nameLabel);

        // adjust the text label properties
        var textFont = Font.copy(this.effectiveFont);
        textFont.size = 3;
        var textRect = new Rect(
            this.bounds.x + 21, this.bounds.y + 3 + titleFont.size + nameFont.size,
            this.bounds.width - 22, this.bounds.height - 2 - titleFont.size - nameFont.size);
        this._text.font = textFont;
        this._text.textAlignment = Alignment.Near;
        this._text.lineAlignment = Alignment.Near;
```

```
        this._text.margin = new MindFusion.Drawing.Thickness(0, 0, 0, 0);
        this._text.bounds = textRect;
    }

    loadNodeImage()
    {
        this.nodeImage.loaded = true;
        if (this.parent)
            this.invalidate();
    }

    // properties
    get title()
    {
        return this._title;
    }

    set title(value)
    {
        if (this._title !== value)
        {
            this._title = value;
        }
    }

    get fullName()
    {
        return this._fullName;
    }

    set fullName(value)
    {
        if (this._fullName !== value)
        {
            this._fullName = value;
        }
    }

    get nodeImageLocation()
    {
        return this._nodeImageLocation;
    }

    set nodeImageLocation(value)
    {
        if (this._nodeImageLocation != value)
        {
            this._nodeImageLocation = value;
            if (value)
            {
                this.nodeImage = new MindFusion.Drawing.Image(
                    new Rect(this.bounds.x, this.bounds.y + (this.bounds.height - 20) / 2, 20,
20));

                this.nodeImage.image.addEventListener("load", () => { this.loadNodeImage(); })
                this.nodeImage.image.src = value;
            }
        }
    }
}
```

The code above declares a new class called **OrgChartNode**, inheriting it from ShapeNode. It adds getters and setters for custom title, full name and image properties. **OrgChartNode** also exposes an updateCanvasElements override with the custom draw logic.

Add a reference to the new file to the end of the Index.cshtml:

HTML Copy Code

```
@section scripts {
    <script type="text/javascript" src="~/js/OrgChartNode.js"></script>
}
```

3. Register the custom type and create some test data

Modify the DiagramView declaration to set the value of the ControlLoadedScript property.

HTML

```
@Html.DiagramView(
    ((DiagramView)ViewBag.DiagramView).ControlLoadedScript("onLoaded"),
    new { style = "width:700px;height:500px;"})
```

Add the **onLoaded** function to *site.js*. The below code registers the **OrgChartNode** type, enables the interactive drawing of custom nodes and adds a couple of **OrgChartNode** instances to the diagram.

JavaScript

```
var Diagram = MindFusion.Diagramming.Diagram;
var Behavior = MindFusion.Diagramming.Behavior;
var Alignment = MindFusion.Diagramming.Alignment;

var Font = MindFusion.Drawing.Font;
var Rect = MindFusion.Drawing.Rect;
var Text = MindFusion.Drawing.Text;

var diagram = null;

function onLoaded(sender) {
    Diagram.registerClass(OrgChartNode, "OrgChartNode");

    diagram = sender.diagram;

    // enable drawing of custom nodes interactively
    diagram.customNodeType = OrgChartNode;
    sender.behavior = Behavior.Custom;

    var node1 = new OrgChartNode(diagram);
    node1.bounds = new Rect(25, 15, 60, 25);
    node1.title = "CEO";
    node1.fullName = "John Smith";
    node1.text =
        "Our beloved leader. \r\n" +
        "The CEO of this great corporation.";
    node1.nodeImageLocation = "../images/icon4.png";
    diagram.addItem(node1);

    var node2 = new OrgChartNode(diagram);
    node2.bounds = new Rect(55, 55, 60, 25);
    node2.title = "CIO";
    node2.fullName = "Bob Smith";
    node2.text = "The CIO of this great corporation.";
    node2.nodeImageLocation = "../images/icon5.png";
    diagram.addItem(node2);

    diagram.factory.createDiagramLink(node1, node2);
}
```

4. Running the application

Build and run. The image below depicts how the application would look like:

Tutorial 7: Custom Nodes Integration

This tutorial shows how to fully integrate the custom type with other MvcDiagram features, such as clipboard support, undo support, creating nodes by drag-and-drop or drawing with the mouse on the canvas.

1. Create a custom node type

Follow steps 1-3 from Tutorial 6: Create a Custom Node Type.

2. Modify OrgChartNode class

Add the following methods to the **OrgChartNode**'s declaration:

JavaScript — Copy Code

```
// support for the NodeListView drag'n'drop
clone()
{
    Diagram.suppressSetDirty = true;
    var copy = super.clone();

    copy.title = this.title;
    copy.fullName = this.fullName;
    copy.nodeImageLocation = this.nodeImageLocation;

    Diagram.suppressSetDirty = false;
    return copy;
}

// clipboard support
toJson()
{
    var json = super.toJson();

    json.title = this.title;
    json.fullName = this.fullName;
    json.nodeImageLocation = this.nodeImageLocation;

    return json;
}

fromJson(json)
{
    super.fromJson(json);

    this.title = json.title;
    this.fullName = json.fullName;
    this.nodeImageLocation = json.nodeImageLocation;
}

// undo/redo
saveState()
{
    var state = super.saveState();
```

```
    state.title = this.title;
    state.fullName = this.fullName;
    state.nodeImageLocation = this.nodeImageLocation;

    return state;
}

restoreState(state)
{
    super.restoreState(state);

    this.title = state.title;
    this.fullName = state.fullName;
    this.nodeImageLocation = state.nodeImageLocation;
}
```

3. Add a NodeListView control

Add a **NodeListView** control to the page:

HTML Copy Code

```
@Html.NodeListView(
    ((NodeListView)ViewBag.NodeListView),
    new { style = "width:300px;height:500px;"})
```

Add the initialization code for the **NodeListView** to the **onLoaded** handler:

JavaScript Copy Code

```
var Size = MindFusion.Drawing.Size;
...
nodeListView = MindFusion.Diagramming.NodeListView.find("nodeListView1");
nodeListView.measureUnit = 6;
nodeListView.padding = 1;
nodeListView.iconSize = new Size(50, 25);
nodeListView.defaultNodeSize = new Size(50, 25);

nodeListView.addNode(node1.clone());
nodeListView.addNode(node2.clone());
```

4. Enable the undo/redo support

Set the diagram's undoEnabled property value to true in the **onLoaded** handler:

JavaScript Copy Code

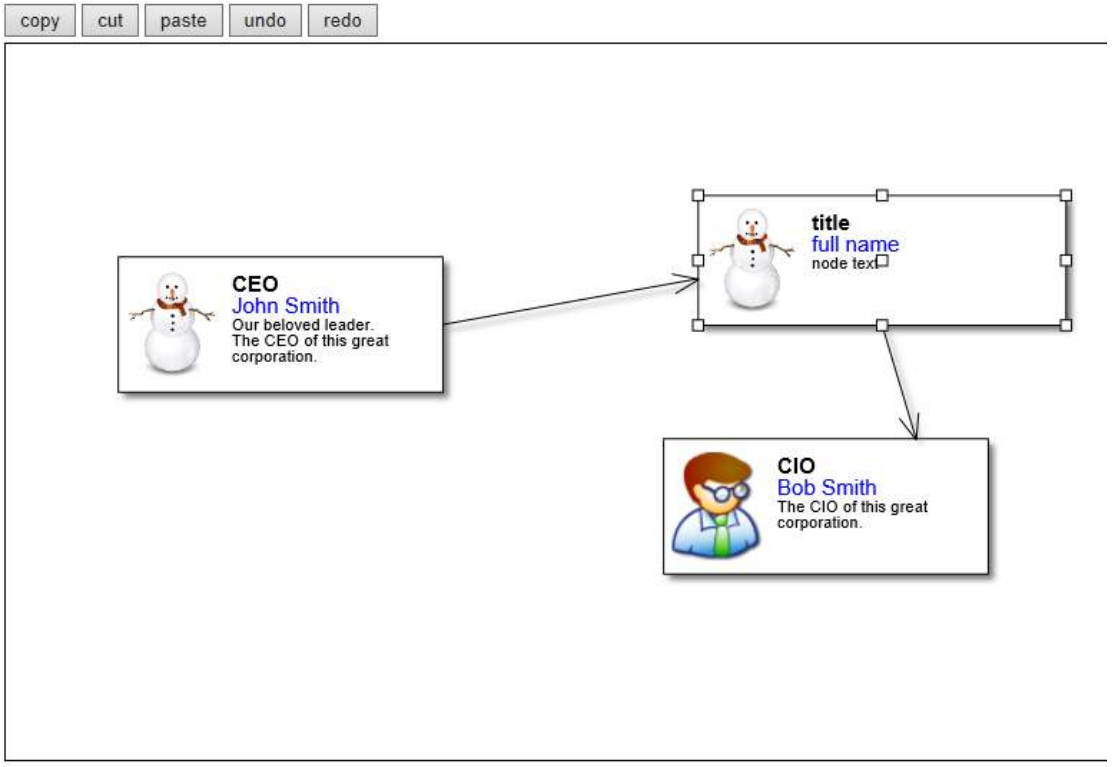
```
// enable undo/redo support
diagram.undoEnabled = true;
```

5. Call diagram methods

In *site.js*, add a global variable that will hold a reference to the diagramView object, so we can call its methods from the *Index* page. Set its value in the *onLoaded* handler.

JavaScript Copy Code

```
var diagramView = null;
...
diagramView = sender;
```



Add five buttons to the page - copy, cut, paste, undo and redo and define click handlers that will be used to call the corresponding diagram methods.

HTML Copy Code

```
<button onclick="diagramView.copyToClipboard()">copy</button>
<button onclick="diagramView.cutToClipboard()">cut</button>
<button onclick="diagramView.pasteFromClipboard(5, 5)">paste</button>
<button onclick="diagram.undo()">undo</button>
<button onclick="diagram.redo()">redo</button>
```

6. Running the application

Build and run. The image below depicts how the application would look like after adding some nodes and links:

Tutorial 8: Custom Composite Nodes

1. Create a new ASP.NET MVC Application and add a DiagramView control to the page. Follow steps 1-4 from Tutorial 1: Getting started. Add a NodeListView control to the page:

C# Copy Code

```
@Html.NodeListView(((NodeListView)ViewBag.NodeListView), new { style = "width:300px;height:500px;"
})
```

2. In the HomeController.cs file define a node template string that lists layout containers and graphics primitives from which nodes should be composed.

C# Copy Code

```
string template = @"{
 ""component"": ""SimplePanel"",
 ""children"":
 [
  {
   ""component"": ""Shape"",
   ""name"": ""Frame"",
   ""pen"": ""black"",
   ""brush"": ""white"",
   ""strokeThickness"": 0.2,
   ""isOutline"": true,
   ""autoProperty"": true
  },
 {
  ""component"": ""GridPanel"",
  ""rowDefinitions"": [""*""],
  ""columnDefinitions"": [""22"", ""*""],
  ""children"":
  [
   {
    ""component"": ""Image"",
    ""name"": ""Image"",
    ""autoProperty"": true,
```

```
    ""location"": ""../Content/icon4.png"",
    ""margin"": ""1"",
    ""imageAlign"": ""Fit""
   },
   {
    ""component"": ""StackPanel"",
    ""orientation"": ""Vertical"",
    ""gridColumn"": 1,
    ""margin"": ""1"",
    ""verticalAlignment"": ""Near"",
    ""children"":
    [
     {
      ""component"": ""Text"",
      ""name"": ""Title"",
      ""autoProperty"": true,
      ""text"": ""title"",
      ""font"": ""Arial bold""
     },
     {
      ""component"": ""Text"",
      ""name"": ""FullName"",
      ""autoProperty"": true,
      ""text"": ""full name"",
      ""pen"": ""blue"",
      ""padding"": ""1,0,1,0"",
      ""enableStyledText"": true
     },
     {
      ""component"": ""Text"",
      ""name"": ""Details"",
      ""autoProperty"": true,
      ""text"": ""details"",
      ""font"": ""Arial 3""
     }
    ]
   }
  ]
}]}
";
```

3. Add a new OrgChartNode class to the project and implement it as below. Its instances will represent the custom nodes posted back fro client side. The AutoJson attribute generates automatic JSON serialization .NET code to transfer values of properties defined in the template.

C# Copy Code

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;

using MindFusion.Diagramming;
using MindFusion.Diagramming.Mvc;
using MindFusion.Json;

namespace Tutorial8.Models
{
    public class OrgChartNode : CompositeNode
    {
        public OrgChartNode()
        {
            Frame = "RoundRect";
        }

        public OrgChartNode(Diagram diagram)
            : base(diagram)
        {
            Frame = "RoundRect";
        }

        public OrgChartNode(OrgChartNode prototype): base(prototype)
        {
            Image = prototype.Image;
```

```
            Title = prototype.Title;
            FullName = prototype.FullName;
            Details = prototype.Details;
            Frame = prototype.Frame;
        }

        [AutoJson]
        public string Image { get; set; }

        [AutoJson]
        public string Title { get; set; }

        [AutoJson]
        public string FullName { get; set; }

        [AutoJson]
        public string Details { get; set; }

        [AutoJson]
        public string Frame { get; set; }
    }
}
```

4. Switch back to HomeController.cs. Set up the **DiagramView** and **NodeListView** controls. Custom item types registry is stored in the session. Call RegisterItemType once to register the custom class, and RegisterSession method for any control that will use the custom item type.

C# Copy Code

```
DiagramView view = new DiagramView("diagramView1");
view.Behavior = Behavior.Custom;
view.SetCustomNodeType(typeof(OrgChartNode));
view.Diagram.UndoManager.UndoEnabled = true;

// register current session
view.RegisterSession(HttpContext.Session);

// register custom item type
view.RegisterItemType(typeof(OrgChartNode), "OrgChartNode", "OrgChartNode", 100, template);

NodeListView nodeView = new NodeListView("nodeListView1");
nodeView.NodeSize =
nodeView.DefaultNodeSize = new Size(60, 25);

// register current session
nodeView.RegisterSession(HttpContext.Session);
```

To enable session support in the application, open *Program.cs* and add the following lines:

C# Copy Code

```
builder.Services.AddSession();
...
app.UseSession();
```

5. Initialize the diagram with some OrgChartNodes:

C# Copy Code

```
if (Request.HasFormContentType)
{
    view.LoadFromJson(Request.Form["diagramView1_PostData"]);
    nodeView.LoadFromJson(Request.Form["nodeListView1_PostData"]);
}
else
{
    Diagram diagram = view.Diagram;
    var node1 = new OrgChartNode();
    node1.Bounds = new Rect(25, 15, 60, 25);
    node1.Title = "CEO";
    node1.FullName = "John Smith";
    node1.Details =
        "Our beloved leader.\r\n" +
        "The CEO of this great corporation.";
```

```
    node1.Image = "./images/ceo.png";
    diagram.Nodes.Add(node1);
    nodeView.AddNode(node1);

    var node2 = new OrgChartNode();
    node2.Bounds = new Rect(25, 55, 60, 25);
    node2.Title = "CTO";
    node2.FullName = "Bob Smith";
    node2.Details = "The technology chief of this great corporation.";
    node2.Image = "./images/cto.png";
    diagram.Nodes.Add(node2);
    nodeView.AddNode(node2);

    var node3 = new OrgChartNode();
    node3.Bounds = new Rect(95, 55, 60, 25);
    node3.Title = "HR";
    node3.FullName = "Mary Johnson";
    node3.Details = "Human resources and staff development.";
    node3.Image = "./images/hr.png";
    diagram.Nodes.Add(node3);
    nodeView.AddNode(node3);

    var node4 = new OrgChartNode();
    node4.Bounds = new Rect(175, 55, 60, 25);
    node4.Title = "PR";
    node4.FullName = "Diana Brandson";
    node4.Details = "Public relations and media.";
    node4.Image = "./images/pr.png";
    diagram.Nodes.Add(node4);
    nodeView.AddNode(node4);

    diagram.Factory.CreateDiagramLink(node1, node2);
    diagram.Factory.CreateDiagramLink(node1, node3);
    diagram.Factory.CreateDiagramLink(node3, node4);
}

ViewBag.DiagramView = view;
ViewBag.NodeListView = nodeView;
```

6. If you run the tutorial now, you should see this in your web browser:

Reference

Reference

MindFusion.Animations Namespace

Animation Class

Represents an object that is used to animate diagram items on the canvas.

Syntax

JavaScript — Copy Code

```
// class
Animation.prototype = {}
```

Remarks

For more information on how to use the **Animation** class, please refer to the Animations topic in the **Programming Interface Overview**.

Inheritance Hierarchy

MindFusion.Animations.Animation

See Also

Animation Members
MindFusion.Animations Namespace

Animation Members

Represents an object that is used to animate diagram items on the canvas.

The following tables list the members exposed by the Animation type.

Public Constructors

	Name	Description
	Animation	Initializes a new instance of the **Animation** class.

Public Properties

	Name	Description
	animationType	Gets or sets the type of the animation.
	duration	Gets or sets the duration of the animation function in milliseconds.
	easingType	Gets or sets the easing type of the animation.
	fromValue	Gets or sets the initial value of the property that will be animated.
	isRunning	Indicates whether the animation is currently running.
	param	Gets or sets an optional value passed to the animation function.
	progress	Gets the progress of the current animation iteration.
	repeat	Gets or sets a value indicating whether to restart the animation after it completes.
	reverse	Gets or sets a value indicating whether to swap the from and to values after an animation loop completes.
	toValue	Gets or sets the target value of the property that will be animated.

Public Methods

	Name	Description
	addEventListener	Registers a single event listener on the **Animation**.
	dispose	Sys.IDisposable implementation.
	raiseEvent	Raises an event.
	removeEventListener	Removes a single event listener attached to the **Animation**.
	start	Starts or resumes the animation.
	stop	Stops the animation.

Animation Class
MindFusion.Animations Namespace

Animation Constructor

Initializes a new instance of the Animation class.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

JavaScript Copy Code

```
function Animation (item, [options, [onUpdateCallback, [onCustomFunctionCallback]]])
```

Parameters

item
The diagram item to animate.

options
Optional.
An object used to specify various property values for the animation.

onUpdateCallback
Optional.
A callback function called on every animation tick.

onCustomFunctionCallback
Optional.
A callback function called when the animation type is set to Custom.

Animations
MindFusion.Animations Namespace

Animation Methods

Animation.addEventListener Method

Registers a single event listener on the Animation.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

JavaScript Copy Code

```
function addEventListener (eventName, handler)
```

Parameters

eventName
The name of the event.

handler
Represents the method that will handle the event specified with eventName.

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

Animation.dispose Method

Sys.IDisposable implementation.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

JavaScript Copy Code

```
function dispose ()
```

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

Animation.raiseEvent Method

Raises an event.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

JavaScript Copy Code

```
function raiseEvent (eventName, args)
```

Parameters

eventName
The name of the event to raise.

args
An instance of type EventArgs that holds data for the event specified with eventName.

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

Animation.removeEventListener Method

Removes a single event listener attached to the Animation.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

JavaScript Copy Code

```
function removeEventListener (eventName, handler)
```

Parameters

eventName
The name of the event.

handler
Represents the method that handles the event specified with eventName.

Animation Properties

Animation.animationType Property

Gets or sets the type of the animation.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

JavaScript — Copy Code

```
get animationType() {}
set animationType(value) {}
```

Property Value

AnimationType

A member of the AnimationType enumeration. The default value is **Linear**.

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

Animation.duration Property

Gets or sets the duration of the animation function in milliseconds.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

JavaScript — Copy Code

```
get duration() {}
set duration(value) {}
```

Property Value

Number

The duration of the animation. The default value is 1000.

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

Animation.easingType Property

Gets or sets the easing type of the animation.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

JavaScript — Copy Code

```
get easingType() {}
set easingType(value) {}
```

Property Value

EasingType

A member of the EasingType enumeration. The default value is **EaseIn**.

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

Animation.fromValue Property

Gets or sets the initial value of the property that will be animated.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

JavaScript Copy Code

```
get fromValue() {}
set fromValue(value) {}
```

Property Value

Object

The initial value.

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

Animation.isRunning Property

Indicates whether the animation is currently running.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

JavaScript Copy Code

```
get isRunning() {}
set isRunning(value) {}
```

Property Value

Boolean

true if animation currently in progress, or **false** otherwise.

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

Animation.param Property

Gets or sets an optional value passed to the animation function.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

```
JavaScript
get param() {}
set param(value) {}
```

Property Value

Object

The optional parameter. The default value is **null**.

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

Animation.progress Property

Gets the progress of the current animation iteration.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

```
JavaScript
get progress() {}
set progress(value) {}
```

Property Value

Number

Animation progress in 0-1 range.

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

Animation.repeat Property

Gets or sets a value indicating whether to restart the animation after it completes.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

```
JavaScript
get repeat() {}
set repeat(value) {}
```

Property Value

Boolean

true to loop the animation, or **false** otherwise. The default value is **false**.

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

Animation.reverse Property

Gets or sets a value indicating whether to swap the from and to values after an animation loop completes.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

JavaScript Copy Code

```
get reverse() {}
set reverse(value) {}
```

Property Value

Boolean

true to reverse the animation, or **false** otherwise. The default value is **false**.

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

Animation.toValue Property

Gets or sets the target value of the property that will be animated.

Namespace: MindFusion.Animations
Assembly: Animation.js

Syntax

JavaScript Copy Code

```
get toValue() {}
set toValue(value) {}
```

Property Value

Object

The target value.

See Also

Animation Members
Animation Class
MindFusion.Animations Namespace

AnimationType Enumeration

Specifies the animation function used by an Animation object.

Namespace: MindFusion.Animations
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
AnimationType = {}
```

Members

	Member name	Description
	Linear	Represents an animation that accelerates/deccelerates using a linear function.
	Power	Represents an animation that accelerates/deccelerates through exponentiation formula - x^n where n can be set through the Animation's param property. The default exponent equals 2.
	Exponential	Represents an animation that accelerates/deccelerates using an exponential function. The exponent can be set through the Animation's param property. The default exponent equals 10.
	Circular	Represents an animation that accelerates/deccelerates using a circular function.
	BackBow	Represents an effect that simulates a retraction in the motion of the animation. The amplitude of the retraction can be controlled through the Animation's param property. The default param value is 1.5;
	Bounce	Represents a bouncing effect animation.
	Elastic	Represents an oscillating effect animation. The oscillation frequency can be controlled through the Animation's param property. The default param value is 0.5;
	Custom	Specifies a user-set function. When this value is used the actual animation function must be set through the Animation's custom function callback.

Remarks

Members of this enumeration can be assigned to the animationType property of Animation.

See Also

MindFusion.Animations Namespace

EasingType Enumeration

Specifies the easing applied to an animation.

Namespace: MindFusion.Animations
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
EasingType = {}
```

Members

	Member name	Description
	EaseIn	Follows the animation function associated with the Animation.
	EaseOut	Inverses the animation function associated with the **Animation**.
	EaseInOut	Uses EaseIn for the first half the the Animation's duration and EaseOut for the second half.

	EaseOutIn	Uses EaseOut for the first half the the Animation's duration and EaseIn for the second half.

Remarks

Members of this enumeration can be assigned to the easingType property of **Animation**.

Queue Members
MindFusion.Collections Namespace

Queue Members

Represents a first-in, first-out collection of objects.

The following tables list the members exposed by the Queue type.

Public Constructors

	Name	Description
	Queue	Initializes a new instance of the **Queue** class.

Public Methods

	Name	Description
	dequeue	Removes and returns the object at the beginning of the queue.
	enqueue	Adds an object to the end of the queue.
	getSize	Gets the number of elements in the queue.

See Also

Queue Class
MindFusion.Collections Namespace

Queue Constructor

Initializes a new instance of the Queue class.

Namespace: MindFusion.Collections
Assembly: Queue.js

Syntax

JavaScript Copy Code

```
function Queue ()
```

See Also

Queue Class
MindFusion.Collections Namespace

Queue Methods

Queue.dequeue Method

Removes and returns the object at the beginning of the queue.

Namespace: MindFusion.Collections
Assembly: Queue.js

Syntax

JavaScript Copy Code

```
function dequeue ()
```

Return Value

The object that is removed from the beginning of the queue.

Remarks

If the queue is empty this method will throw an exception.

See Also

Queue Members
Queue Class
MindFusion.Collections Namespace

Queue.enqueue Method

Adds an object to the end of the queue.

Namespace: MindFusion.Collections
Assembly: Queue.js

Syntax

JavaScript Copy Code

```
function enqueue (value)
```

Parameters

value
The object to add.

See Also

Queue Members
Queue Class
MindFusion.Collections Namespace

Queue.getSize Method

Gets the number of elements in the queue.

Namespace: MindFusion.Collections
Assembly: Queue.js

Syntax

JavaScript Copy Code

```
function getSize ()
```

Return Value

See Also

Queue Members
Queue Class

MindFusion.Controls Namespace

Alignment Enumeration

Specifies the alignment of text relative to its layout rectangle.

Namespace: MindFusion.Controls
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
Alignment = {}
```

Members

	Member name	Description
	Near	The text is drawn in the near corner of the layout rectangle.
	Center	The text is drawn in the center of the layout rectangle.
	Far	The text is drawn in the far corner of the layout rectangle.

CancelEventArgs Members

Provides a value to use with cancellable events.

The following tables list the members exposed by the CancelEventArgs type.

Public Constructors

	Name	Description
	CancelEventArgs	Initializes a new instance of the CancelEventArgs class.

Public Properties

	Name	Description
	cancel	Gets or sets a value indicating whether to allow the current operation.
	handled	Gets or sets a value indicating whether the event has been handled. (Inherited from EventArgs.)

See Also

CancelEventArgs Class
MindFusion.Controls Namespace

CancelEventArgs Constructor

Initializes a new instance of the CancelEventArgs class.

Namespace: MindFusion.Controls
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
function CancelEventArgs ()
```

See Also

CancelEventArgs Class
MindFusion.Controls Namespace

CancelEventArgs Properties

CancelEventArgs.cancel Property

Gets or sets a value indicating whether to allow the current operation.

Namespace: MindFusion.Controls
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get cancel() {}
set cancel(value) {}
```

Property Value

Boolean

true to cancel the operation, or **false** otherwise. The default value is **false**.

Canvas Class

Handles drawing on a CanvasRenderingContext2D.

Syntax

JavaScript Copy Code

```
// class
Canvas.prototype = {}
```

Inheritance Hierarchy

MindFusion.Controls.Disposable
  MindFusion.Controls.Canvas

See Also

Canvas Members
MindFusion.Controls Namespace

Canvas Members

Handles drawing on a CanvasRenderingContext2D.

The following tables list the members exposed by the Canvas type.

Public Constructors

	Name	Description
	Canvas	Initializes a new instance of the Canvas class.

Public Properties

	Name	Description

	bounds	Gets the underlying **Canvas** element's logical bounds.
	element	Returns a reference to the control's DOM element. (Inherited from Disposable.)
	enabled	Gets or sets whether mouse events are enabled. (Inherited from Disposable.)
	measureUnit	Gets or sets the unit of measure used for logical coordinates.
	minVisibleFontSize	Gets or sets a threshold value that hides text if scaled font sizes become smaller.
	scale	Gets the current scale of this **Canvas**.

Public Methods

	Name	Description
	addEventListener	Registers a single event listener on the instance. (Inherited from Disposable.)
	dispose	Overrides Disposable.dispose
	invalidate	Invalidates the canvas or a region of the canvas, causing it to be repainted.
	raiseEvent	Raises an event. (Inherited from Disposable.)
	removeEventListener	Removes a single event listener attached to the instance. (Inherited from Disposable.)
	repaint	Repaints the canvas.

Canvas.invalidate Method

Invalidates the canvas or a region of the canvas, causing it to be repainted.

Namespace: MindFusion.Controls
Assembly: Canvas.js

Syntax

JavaScript Copy Code

```
function invalidate ([rect, [force]])
```

Parameters

rect
Optional.
Rect. A Rect instance specifying the region that should be repainted. If not specified, the whole diagram will be repainted.

force
Optional.
Boolean. **true** to force redraw even if currently painting, or **false** otherwise.

See Also

Canvas Members
Canvas Class
MindFusion.Controls Namespace

Canvas.repaint Method

Repaints the canvas.

Namespace: MindFusion.Controls
Assembly: Canvas.js

Syntax

JavaScript Copy Code

```
function repaint ([printOptions])
```

Parameters

printOptions
Optional.
Object. For internal use.

See Also

Canvas.measureUnit Property

Gets or sets the unit of measure used for logical coordinates.

Namespace: MindFusion.Controls
Assembly: Canvas.js

Syntax

JavaScript — Copy Code

```
get measureUnit() {}
set measureUnit(value) {}
```

Property Value

GraphicsUnit

A member of the GraphicsUnit enumeration.

See Also

Canvas Members
Canvas Class
MindFusion.Controls Namespace

Canvas.minVisibleFontSize Property

Gets or sets a threshold value that hides text if scaled font sizes become smaller.

Namespace: MindFusion.Controls
Assembly: Canvas.js

Syntax

JavaScript — Copy Code

```
get minVisibleFontSize() {}
set minVisibleFontSize(value) {}
```

Property Value

Number

A value specifying the smallest visible font size.

See Also

Canvas Members
Canvas Class
MindFusion.Controls Namespace

Canvas.scale Property

Gets the current scale of this Canvas.

Namespace: MindFusion.Controls
Assembly: Canvas.js

Syntax

JavaScript Copy Code

```
get scale() {}
set scale(value) {}
```

Property Value

Number

The canvas scale.

CanvasControl Members

The CanvasControl class represents a wrapper class for the HTML5 Canvas element.

The following tables list the members exposed by the CanvasControl type.

Public Constructors

	Name	Description
	CanvasControl	Initializes a new instance of the CanvasControl class.

Public Properties

	Name	Description
	element	Returns a reference to the control's DOM element. (Inherited from Control.)
	enabled	Gets or sets whether mouse events are enabled. (Inherited from Control.)
	licenseLocation	Gets or sets the location of the license key file. (Inherited from Control.)
	measureUnit	Gets the unit of measure used for logical coordinates.

Public Methods

	Name	Description
	addEventListener	Registers a single event listener on the instance. (Inherited from Disposable.)
S	addHandlers	Adds an event listener to a DOM element. (Inherited from Control.)
S	clearHandlers	Removes all event listeners from a DOM element. (Inherited from Control.)
	clientToDoc	Transforms a point from client to document coordinates.
	docToClient	Transforms a point from document to client coordinates.
S	fromJson	Constructs a JavaScript object from a JSON string. (Inherited from Control.)
	raiseEvent	Raises an event. (Inherited from Disposable.)
	registerForSubmit	Registers an onsubmit handler for the Control's parent html form to flush postback data. (Inherited from Control.)
	removeEventListener	Removes a single event listener attached to the instance. (Inherited from Disposable.)
S	toJson	Converts a JavaScript object to a JSON string. (Inherited from Control.)

Public Events

	Name	Description
	controlLoaded	Raised when the control is loaded. (Inherited from Control.)
	controlUnloaded	Raised when the control is unloaded. (Inherited from Control.)
	controlUnloading	Raised when the control is unloading. (Inherited from Control.)

See Also

CanvasControl Class
MindFusion.Controls Namespace

CanvasControl Constructor

Initializes a new instance of the CanvasControl class.

Namespace: MindFusion.Controls
Assembly: CanvasControl.js

Syntax

JavaScript Copy Code

```
function CanvasControl (element, [canvas])
```

Parameters

element
HTMLCanvasElement. The Canvas DOM Element this CanvasControl is associated with.

canvas
Optional.
Canvas. The Canvas instance this CanvasControl is associated with.

See Also

CanvasControl Class
MindFusion.Controls Namespace

CanvasControl Methods

CanvasControl.clientToDoc Method

Transforms a point from client to document coordinates.

Namespace: MindFusion.Controls
Assembly: CanvasControl.js

Syntax

JavaScript Copy Code

```
function clientToDoc (point)
```

Parameters

point
Point. The point to transform.

Return Value

Point. The transformed point.

See Also

CanvasControl Members
CanvasControl Class
MindFusion.Controls Namespace

CanvasControl.docToClient Method

Transforms a point from document to client coordinates.

Namespace: MindFusion.Controls
Assembly: CanvasControl.js

Syntax

JavaScript Copy Code

```
function docToClient (point)
```

Parameters

point
Point. The point to transform.

Return Value

Point. The transformed point.

See Also

CanvasControl Members
CanvasControl Class
MindFusion.Controls Namespace

CanvasControl Properties

CanvasControl.measureUnit Property

Gets the unit of measure used for logical coordinates.

Namespace: MindFusion.Controls
Assembly: CanvasControl.js

Syntax

JavaScript Copy Code

```
get measureUnit() {}
set measureUnit(value) {}
```

Property Value

GraphicsUnit

An instance of the GraphicsUnit class.

See Also

CanvasControl Members
CanvasControl Class
MindFusion.Controls Namespace

CanvasControl Events

Control.controlLoaded Event

Raised when the control is loaded.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript Copy Code

```
diagramView.controlLoaded.addEventListener(onViewLoaded);

function onViewLoaded(sender, args)
{
}
```

See Also

Control Members
Control Class
MindFusion.Controls Namespace

Control.controlUnloaded Event

Raised when the control is unloaded.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript Copy Code

```
diagramView.controlUnloaded.addEventListener(onViewUnloaded);

function onViewUnloaded(sender, args)
{
}
```

Remarks

This event is raised by the dispose method. In vanilla component, that usually happens when the page unloads. In diagram wrapper components for JavaScrript UI frameworks, it's raised by component's lifecycle hooks indicating that DOM element is being detached, such as **ngOnDestroy**.

See Also

Control Members
Control Class
MindFusion.Controls Namespace

Control.controlUnloading Event

Raised when the control is unloading.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript Copy Code

```
diagramView.controlUnloading.addEventListener(onViewUnloading);

function onViewUnloading(sender, args)
{
}
```

Remarks

This event is raised by the dispose method, before detaching DOM elements. In vanilla component, that usually happens when the page unloads. In diagram wrapper components for JavaScrript UI frameworks, it's raised by component's lifecycle hooks indicating that DOM element is being detached, such as **ngOnDestroy**.

Control Members

A base class for MindFusion controls.

The following tables list the members exposed by the Control type.

Public Constructors

	Name	Description
	Control	Initializes a new instance of the Control class.

Public Properties

	Name	Description
	element	Returns a reference to the control's DOM element.
	enabled	Gets or sets whether mouse events are enabled.
	licenseLocation	Gets or sets the location of the license key file.

Public Methods

	Name	Description
	addEventListener	Registers a single event listener on the instance. (Inherited from Disposable.)
S	addHandlers	Adds an event listener to a DOM element.
S	clearHandlers	Removes all event listeners from a DOM element.
S	fromJson	Constructs a JavaScript object from a JSON string.
	raiseEvent	Raises an event. (Inherited from Disposable.)
	registerForSubmit	Registers an onsubmit handler for the Control's parent html form to flush postback data.
	removeEventListener	Removes a single event listener attached to the instance. (Inherited from Disposable.)
S	toJson	Converts a JavaScript object to a JSON string.

Public Events

	Name	Description
	controlLoaded	Raised when the control is loaded.
	controlUnloaded	Raised when the control is unloaded.
	controlUnloading	Raised when the control is unloading.

Control Methods

Control.addHandlers Method

Adds an event listener to a DOM element.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript Copy Code

```
function addHandlers ()
```

See Also

Control Members
Control Class
MindFusion.Controls Namespace

Control.clearHandlers Method

Removes all event listeners from a DOM element.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

```
JavaScript
function clearHandlers ()
```

See Also

Control Members
Control Class
MindFusion.Controls Namespace

Control.fromJson Method

Constructs a JavaScript object from a JSON string.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

```
JavaScript
function fromJson ()
```

Return Value

Object. object The corresponding to the given JSON text.

See Also

Control Members
Control Class
MindFusion.Controls Namespace

Control.registerForSubmit Method

Registers an onsubmit handler for the Control's parent html form to flush postback data.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

```
JavaScript
function registerForSubmit (id)
```

Parameters

id
String. The id of the hidden field to flush the data to.

See Also

Control Members
Control Class
MindFusion.Controls Namespace

Control.toJson Method

Converts a JavaScript object to a JSON string.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript Copy Code

```
function toJson (object)
```

Parameters

object
Object. The object to stringify.

Return Value

String. The JSON string.

See Also

Control Members
Control Class
MindFusion.Controls Namespace

Control Properties

Control.element Property

Returns a reference to the control's DOM element.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript Copy Code

```
get element() {}
set element(value) {}
```

Property Value

HTMLElement

The HTML element wrapped by this control.

See Also

Control Members
Control Class
MindFusion.Controls Namespace

Control.enabled Property

Gets or sets whether mouse events are enabled.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript Copy Code

```
get enabled() {}
set enabled(value) {}
```

Property Value

Boolean

true if the control should respond to mouse events, or false otherwise.

See Also

Control Members
Control Class
MindFusion.Controls Namespace

Control.licenseLocation Property

Gets or sets the location of the license key file.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript Copy Code

```
get licenseLocation() {}
set licenseLocation(value) {}
```

Property Value

String

the location of license key file.

Remarks

Control.licenseLocation can also be set as a static property, which applies the key to all instances of controls from MindFusion.JavaScript Pack.

MindFusion.Controls Namespace

Disposable Members

Disposable abstract class.

The following tables list the members exposed by the Disposable type.

Public Properties

	Name	Description
	element	Returns a reference to the control's DOM element.
	enabled	Gets or sets whether mouse events are enabled.

Public Methods

	Name	Description
	addEventListener	Registers a single event listener on the instance.
	raiseEvent	Raises an event.
	removeEventListener	Removes a single event listener attached to the instance.

See Also

Disposable Class
MindFusion.Controls Namespace

Disposable Methods

Disposable.addEventListener Method

Registers a single event listener on the instance.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript Copy Code

```
function addEventListener (eventName, handler, [element])
```

Parameters

eventName
String. The name of the event.

handler
Method. Represents the method that will handle the event specified with eventName.

element
Optional.
Object. For internal use.

See Also

Disposable Members
Disposable Class
MindFusion.Controls Namespace
removeEventListener Method

Disposable.raiseEvent Method

Raises an event.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript — Copy Code

```
function raiseEvent (eventName, args, [element])
```

Parameters

eventName
String. The name of the event to raise.

args
EventArgs. An instance of type EventArgs that holds data for the event specified with eventName.

element
Optional.
Object. For internal use.

See Also

Disposable Members
Disposable Class
MindFusion.Controls Namespace

Disposable.removeEventListener Method

Removes a single event listener attached to the instance.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript — Copy Code

```
function removeEventListener (eventName, handler, [element])
```

Parameters

eventName
String. The name of the event.

handler
Method. Represents the method that handles the event specified with eventName.

element
Optional.
Object. For internal use.

See Also

Disposable Members
Disposable Class
MindFusion.Controls Namespace
addEventListener Method

Disposable Properties

Disposable.element Property

Returns a reference to the control's DOM element.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript Copy Code

```
get element() {}
set element(value) {}
```

Property Value

HTMLElement

The HTML element wrapped by this control.

See Also

Disposable Members
Disposable Class
MindFusion.Controls Namespace

Disposable.enabled Property

Gets or sets whether mouse events are enabled.

Namespace: MindFusion.Controls
Assembly: Control.js

Syntax

JavaScript Copy Code

```
get enabled() {}
set enabled(value) {}
```

Property Value

Boolean

true if the control should respond to mouse events, or false otherwise.

See Also

Disposable Members
Disposable Class

DomUtils Class

Contains DOM-related helper functions.

Syntax

JavaScript Copy Code

```
// class
DomUtils.prototype = {}
```

Inheritance Hierarchy

MindFusion.Controls.DomUtils

See Also

DomUtils Members
MindFusion.Controls Namespace

DomUtils Members

Contains DOM-related helper functions.

The following tables list the members exposed by the DomUtils type.

Public Methods

	Name	Description
	formatString	Formats the specified string according to the specified parameters.
	getBounds	Gets the bounds of the specified element.
	getElementAttributes	Gets an object containing element attributes that have values.
	HTMLtoXHTML	Converts HTML to XHMTL.
	loadImageList	Loads the images from the specified list of image url-s.
	setBounds	Sets the bounds of the specified element.
	setSize	Sets the size of the specified element.
	toDataUrl	Converts an image to base64 string.

See Also

DomUtils Class
MindFusion.Controls Namespace

DomUtils Methods

DomUtils.formatString Method

Formats the specified string according to the specified parameters.

Namespace: MindFusion.Controls
Assembly: DomUtils.js

Syntax

JavaScript Copy Code

```
function formatString ()
```

See Also

DomUtils Members
DomUtils Class
MindFusion.Controls Namespace

DomUtils.getBounds Method

Gets the bounds of the specified element.

Namespace: MindFusion.Controls
Assembly: DomUtils.js

Syntax

JavaScript Copy Code

```
function getBounds (element, [parent, [includeScroll]])
```

Parameters

element
HTMLElement. The element to check.

parent
Optional.
HTMLElement. The parent of the element. If supplied, the returned bounds will be relative to the parent element bounds.

includeScroll
Optional.
Boolean. For internal use.

Return Value

Rect. The bounding rectangle.

See Also

DomUtils Members
DomUtils Class
MindFusion.Controls Namespace

DomUtils.getElementAttributes Method

Gets an object containing element attributes that have values.

Namespace: MindFusion.Controls
Assembly: DomUtils.js

Syntax

JavaScript Copy Code

```
function getElementAttributes ()
```

See Also

DomUtils Members
DomUtils Class
MindFusion.Controls Namespace

DomUtils.HTMLtoXHTML Method

Converts HTML to XHMTL.

Namespace: MindFusion.Controls
Assembly: DomUtils.js

Syntax

JavaScript Copy Code

```
function HTMLtoXHTML (html)
```

Parameters

html
String. The HTML to convert.

Return Value

String. The resulting XHTML.

See Also

DomUtils Members
DomUtils Class
MindFusion.Controls Namespace

DomUtils.loadImageList Method

Loads the images from the specified list of image url-s.

Namespace: MindFusion.Controls
Assembly: DomUtils.js

Syntax

JavaScript Copy Code

```
function loadImageList (images)
```

Parameters

images
Array. An array of image url-s.

Return Value

Promise. Promise object contaning an array of images in base64 format.

See Also

DomUtils Members
DomUtils Class
MindFusion.Controls Namespace

DomUtils.setBounds Method

Sets the bounds of the specified element.

Namespace: MindFusion.Controls
Assembly: DomUtils.js

Syntax

JavaScript Copy Code

```
function setBounds (element, bounds)
```

Parameters

element
HTMLElement. The element.

bounds
Rect. The bounding rectangle.

See Also

DomUtils Members
DomUtils Class
MindFusion.Controls Namespace

DomUtils.setSize Method

Sets the size of the specified element.

Namespace: MindFusion.Controls
Assembly: DomUtils.js

Syntax

JavaScript Copy Code

```
function setSize (element, size)
```

Parameters

element
HTMLElement. The element.

size
Size. The new size.

See Also

DomUtils Members
DomUtils Class
MindFusion.Controls Namespace

DomUtils.toDataUrl Method

Converts an image to base64 string.

Namespace: MindFusion.Controls
Assembly: DomUtils.js

Syntax

JavaScript Copy Code

```
function toDataUrl (url, callback)
```

Parameters

url
String. The url of the image.

callback
function. The callback function.

Return Value

String. The base64-encoded string, representing the image.

EventArgs Members
MindFusion.Controls Namespace

EventArgs Members

The base type of classes that define arguments passed to event handler functions.

The following tables list the members exposed by the EventArgs type.

Public Constructors

	Name	Description
	EventArgs	Initializes a new instance of the EventArgs class.

Public Properties

	Name	Description
	handled	Gets or sets a value indicating whether the event has been handled.

See Also

EventArgs Class
MindFusion.Controls Namespace

EventArgs Constructor

Initializes a new instance of the EventArgs class.

Namespace: MindFusion.Controls
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
function EventArgs ()
```

See Also

EventArgs Class
MindFusion.Controls Namespace

EventArgs Properties

EventArgs.handled Property

Gets or sets a value indicating whether the event has been handled.

Namespace: MindFusion.Controls
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get handled() {}
set handled(value) {}
```

Property Value

Boolean

true to indicate that the event has been handled, or false otherwise.

See Also

EventArgs Members
EventArgs Class

EventDispatcher Class

Represents a dispatcher for an event.

Syntax

JavaScript Copy Code

```
// class
EventDispatcher.prototype = {}
```

Inheritance Hierarchy

MindFusion.Controls.EventDispatcher

See Also

EventDispatcher Members
MindFusion.Controls Namespace

EventDispatcher Members

Represents a dispatcher for an event.

The following tables list the members exposed by the EventDispatcher type.

Public Constructors

	Name	Description
	EventDispatcher	Creates a new instance of the EventDispatcher class.

Public Methods

	Name	Description
	addEventListener	Subcribes an event listener to this event.
	raiseEvent	Raises the event.
	raiseEventAsync	Raises the event asynchronously.
	removeEventListener	Removes an event listener from this event.

See Also

EventDispatcher Class
MindFusion.Controls Namespace

EventDispatcher Constructor

Creates a new instance of the EventDispatcher class.

Namespace: MindFusion.Controls
Assembly: EventDispatcher.js

Syntax

JavaScript Copy Code

```
function EventDispatcher ()
```

See Also

EventDispatcher Class
MindFusion.Controls Namespace

EventDispatcher Methods

EventDispatcher.addEventListener Method

Subcribes an event listener to this event.

Namespace: MindFusion.Controls
Assembly: EventDispatcher.js

Syntax

JavaScript Copy Code

```
function addEventListener ()
```

See Also

EventDispatcher Members
EventDispatcher Class
MindFusion.Controls Namespace

EventDispatcher.raiseEvent Method

Raises the event.

Namespace: MindFusion.Controls
Assembly: EventDispatcher.js

Syntax

JavaScript Copy Code

```
function raiseEvent ()
```

See Also

EventDispatcher Members
EventDispatcher Class
MindFusion.Controls Namespace

EventDispatcher.raiseEventAsync Method

Raises the event asynchronously.

Namespace: MindFusion.Controls
Assembly: EventDispatcher.js

Syntax

JavaScript Copy Code

```
function raiseEventAsync ()
```

See Also

EventDispatcher Members
EventDispatcher Class
MindFusion.Controls Namespace

EventDispatcher.removeEventListener Method

Removes an event listener from this event.

Namespace: MindFusion.Controls
Assembly: EventDispatcher.js

Syntax

JavaScript Copy Code

```
function removeEventListener ()
```

See Also

EventDispatcher Members
EventDispatcher Class
MindFusion.Controls Namespace

Events Class

Defines all events raised in the Controls namespace.

Syntax

JavaScript Copy Code

```
// class
Events.prototype = {}
```

Inheritance Hierarchy

MindFusion.Controls.Events

See Also

Events Members
MindFusion.Controls Namespace

Events Members

Defines all events raised in the Controls namespace.

The following tables list the members exposed by the Events type.

Public Properties

	Name	Description

	controlLoaded	Raised when the control is loaded.
	controlUnloaded	Raised when the control is unloaded.
	controlUnloading	Raised before the control is unloaded.

See Also

Events Class
MindFusion.Controls Namespace

Events Properties

Events.controlLoaded Property

Raised when the control is loaded.

Namespace: MindFusion.Controls
Assembly: EventDispatcher.js

Syntax

JavaScript Copy Code

```
get controlLoaded() {}
set controlLoaded(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Controls Namespace

Events.controlUnloaded Property

Raised when the control is unloaded.

Namespace: MindFusion.Controls
Assembly: EventDispatcher.js

Syntax

JavaScript Copy Code

```
get controlUnloaded() {}
set controlUnloaded(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Controls Namespace

Events.controlUnloading Property

Raised before the control is unloaded.

Namespace: MindFusion.Controls
Assembly: EventDispatcher.js

Syntax

JavaScript — Copy Code

```
get controlUnloading() {}
set controlUnloading(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Controls Namespace

MouseButton Enumeration

Specifies which button was pressed to trigger the event.

Namespace: MindFusion.Controls
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
MouseButton = {}
```

Members

	Member name	Description
	Main	Main button pressed, usually the left button or the un-initialized state.
	Auxiliary	Auxiliary button pressed, usually the wheel button or the middle button.
	Secondary	Secondary button pressed, usually the right button.
	Fourth	Fourth button, typically the Browser Back button.
	Fifth	Fifth button, typically the Browser Forward button.

See Also

MindFusion.Controls Namespace

MouseCursors Enumeration

Specifies the type of the mouse cursor.

Namespace: MindFusion.Controls
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
MouseCursors = {}
```

See Also

MindFusion.Controls Namespace

TickPosition Enumeration

Specifies the position of trackbar ticks.

Namespace: MindFusion.Controls
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
TickPosition = {}
```

Members

	Member name	Description
	None	There are no ticks rendered.
	Left	Ticks are rendered on the left side of the trackbar.
	Right	Ticks are rendered on the right side of the trackbar.
	Both	Ticks are rendered on both sides of the trackbar.

Remarks

Members of this enumeration can be assigned to the tickPosition property of ZoomControl.

See Also

MindFusion.Controls Namespace

WebComponents Class

Implements registration of web components.

Syntax

JavaScript Copy Code

```
// class
WebComponents.prototype = {}
```

Inheritance Hierarchy

MindFusion.Controls.WebComponents

See Also

WebComponents Members
MindFusion.Controls Namespace

WebComponents Members

Implements registration of web components.

The following tables list the members exposed by the WebComponents type.

Public Methods

	Name	Description
	register	Registers the controls in the package as web components.

See Also

WebComponents Class
MindFusion.Controls Namespace

WebComponents Methods

WebComponents.register Method

Registers the controls in the package as web components.

Namespace: MindFusion.Controls
Assembly: WebComponents.js

Syntax

JavaScript Copy Code

```
function register ()
```

See Also

WebComponents Members
WebComponents Class
MindFusion.Controls Namespace

ZoomControl Class

The **ZoomControl** lets users zoom and pan a target view control interactively.

Syntax

JavaScript Copy Code

```
// class
ZoomControl.prototype = {}
```

Inheritance Hierarchy

MindFusion.Dom.Control
  MindFusion.Controls.ZoomControl

See Also

ZoomControl Members
MindFusion.Controls Namespace

ZoomControl Members

The ZoomControl lets users zoom and pan a target view control interactively.

The following tables list the members exposed by the **ZoomControl** type.

Public Constructors

	Name	Description
	ZoomControl	Creates an instance of **ZoomControl**.

Public Properties

	Name	Description
	activeColor	Gets or sets the color used to render depressed buttons.
	autoPostBack	Gets or sets a value indicating whether the control will post back to the server when the control's value has changed.
	backColor	Gets or sets the background color of the control.
	borderColor	Gets or sets the color of **ZoomControl** elements' borders.
	cornerRadius	Gets or sets the corner radius of rounded child elements.
	element	Returns a reference to the control's DOM element. (Inherited from Control.)
	enabled	Gets or sets whether mouse events are enabled.
	fill	Gets or sets the color used to fill the **ZoomControl** elements.
	innerColor	Gets or sets the color of plus, minus and arrow icons.
	licenseLocation	Gets or sets the location of the license key file. (Inherited from Control.)
	maxZoomFactor	Gets or sets the maximum zoom level allowed to set through this control.
	measureUnit	Gets the unit of measure used for logical coordinates. (Inherited from CanvasControl.)
	minZoomFactor	Gets or sets the minimum zoom level allowed to set through this control.
	padding	Gets or sets the padding of the control's contents.
	scrollStep	Gets or sets the scroll offset added when users click the pan arrows.
	shadowColor	Gets or sets the color of the control elements' shadow.
	showLabel	Gets or sets a value indicating whether the label that shows the current zoom level should be visible.
	snapToZoomStep	Gets or sets a value indicating whether the trackbar should snap to zoomStep values when dragged.
	target	Gets or sets the control modified by this **ZoomControl**.
	textColor	Gets or sets the color of the the label that shows the current zoom level.
	tickPosition	Gets or sets the current tick position of the trackbar.
	zoomFactor	Gets or sets the zoom factor.
	zoomStep	Gets or sets the amount by which to change zoom level when + and - buttons are clicked.

Public Methods

	Name	Description

	addEventListener	Registers a single event listener on the instance. (Inherited from Disposable.)
S	addHandlers	Adds an event listener to a DOM element. (Inherited from Control.)
S	clearHandlers	Removes all event listeners from a DOM element. (Inherited from Control.)
	clientToDoc	Transforms a point from client to document coordinates. (Inherited from CanvasControl.)
S	create	Creates and initializes a new **ZoomControl** from the specified element. This method is static and can be called without creating an instance of the class.
	docToClient	Transforms a point from document to client coordinates. (Inherited from CanvasControl.)
S	find	Returns the specified **ZoomControl** object. This member is static and can be invoked without creating an instance of the class.
S	fromJson	Constructs a JavaScript object from a JSON string. (Inherited from Control.)
	raiseEvent	Raises an event. (Inherited from Disposable.)
	registerForSubmit	Registers an onsubmit handler for the Control's parent html form to flush postback data. (Inherited from Control.)
	removeEventListener	Removes a single event listener attached to the instance. (Inherited from Disposable.)
S	toJson	Converts a JavaScript object to a JSON string. (Inherited from Control.)

Public Events

	Name	Description
	controlLoaded	Raised when the control is loaded. (Inherited from Control.)
	controlUnloaded	Raised when the control is unloaded. (Inherited from Control.)
	controlUnloading	Raised when the control is unloading. (Inherited from Control.)

See Also

ZoomControl Class
MindFusion.Controls Namespace

ZoomControl Constructor

Creates an instance of ZoomControl.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
function ZoomControl (element)
```

Parameters

element
HTMLCanvasElement. The Canvas DOM Element this ZoomControl is associated with.

See Also

ZoomControl Methods

ZoomControl.create Method

Creates and initializes a new ZoomControl from the specified element. This method is static and can be called without creating an instance of the class.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
function create (element)
```

Parameters

element
HTMLCanvasElement. The DOM element that the zoomControl should be attached to.

Return Value

A ZoomControl object that represents the newly created zoom control.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.find Method

Returns the specified ZoomControl object. This member is static and can be invoked without creating an instance of the class.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
function find (id)
```

Parameters

id
String. The id of the ZoomControl's DOM element.

Return Value

A **ZoomControl** object with the specified id, if found, or **null** otherwise.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl Properties

ZoomControl.activeColor Property

Gets or sets the color used to render depressed buttons.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get activeColor() {}
set activeColor(value) {}
```

Property Value

String

The color used to render depressed buttons.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.autoPostBack Property

Gets or sets a value indicating whether the control will post back to the server when the control's value has changed.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get autoPostBack() {}
set autoPostBack(value) {}
```

Property Value

Boolean

true if the control should post back, or **false** otherwise.

Remarks

Used to implement auto-post back mode in MindFusion ASP.NET controls.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.backColor Property

Gets or sets the background color of the control.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get backColor() {}
set backColor(value) {}
```

Property Value

String

The color of the control background.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.borderColor Property

Gets or sets the color of ZoomControl elements' borders.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get borderColor() {}
set borderColor(value) {}
```

Property Value

String

The color of ZoomControl elements' borders.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.cornerRadius Property

Gets or sets the corner radius of rounded child elements.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get cornerRadius() {}
set cornerRadius(value) {}
```

Property Value

Number

The corner radius of rounded child elements.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.enabled Property

Gets or sets whether mouse events are enabled.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get enabled() {}
set enabled(value) {}
```

Property Value

Boolean

true to respond to mouse events, or **false** otherwise.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.fill Property

Gets or sets the color used to fill the ZoomControl elements.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get fill() {}
set fill(value) {}
```

Property Value

String

The color used to fill the ZoomControl elements.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.innerColor Property

Gets or sets the color of plus, minus and arrow icons.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get innerColor() {}
set innerColor(value) {}
```

Property Value

String

The color of plus, minus and arrow icons.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.maxZoomFactor Property

Gets or sets the maximum zoom level allowed to set through this control.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get maxZoomFactor() {}
set maxZoomFactor(value) {}
```

Property Value

Number

The maximum zoom level, specified as percentage. The default value is 200.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.minZoomFactor Property

Gets or sets the minimum zoom level allowed to set through this control.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get minZoomFactor() {}
set minZoomFactor(value) {}
```

Property Value

Number

The minimum zoom level.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.padding Property

Gets or sets the padding of the control's contents.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get padding() {}
set padding(value) {}
```

Property Value

Number

The padding of the control's contents.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.scrollStep Property

Gets or sets the scroll offset added when users click the pan arrows.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get scrollStep() {}
set scrollStep(value) {}
```

Property Value

Number

The scroll step.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.shadowColor Property

Gets or sets the color of the control elements' shadow.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get shadowColor() {}
set shadowColor(value) {}
```

Property Value

String

The color of the control elements' shadow.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.showLabel Property

Gets or sets a value indicating whether the label that shows the current zoom level should be visible.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get showLabel() {}
set showLabel(value) {}
```

Property Value

Boolean

true if the label is visible, or **false** otherwise.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.snapToZoomStep Property

Gets or sets a value indicating whether the trackbar should snap to zoomStep values when dragged.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get snapToZoomStep() {}
set snapToZoomStep(value) {}
```

Property Value

Boolean

true if snapping is enabled, or **false** otherwise.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.target Property

Gets or sets the control modified by this ZoomControl.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get target() {}
set target(value) {}
```

Property Value

Control

The control modified by this ZoomControl.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.textColor Property

Gets or sets the color of the the label that shows the current zoom level.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get textColor() {}
set textColor(value) {}
```

Property Value

String

The color of the the label that shows the current zoom level.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.tickPosition Property

Gets or sets the current tick position of the trackbar.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get tickPosition() {}
set tickPosition(value) {}
```

Property Value

TickPosition

A member of the TickPosition enumeration.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.zoomFactor Property

Gets or sets the zoom factor.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get zoomFactor() {}
set zoomFactor(value) {}
```

Property Value

Number

The current zoom factor, specified as percentage.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl.zoomStep Property

Gets or sets the amount by which to change zoom level when + and - buttons are clicked.

Namespace: MindFusion.Controls
Assembly: ZoomControl.js

Syntax

JavaScript Copy Code

```
get zoomStep() {}
set zoomStep(value) {}
```

Property Value

Number

The zoom step. The default value is 10.

See Also

ZoomControl Members
ZoomControl Class
MindFusion.Controls Namespace

ZoomControl Events

MindFusion.Diagramming Namespace

Action Enumeration

Specifies the possible actions a user can carry out on diagram items.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
Action = {}
```

Members

	Member name	Description
	None	Do not perform any action.
	Create	Draw a new item.
	Modify	Modify an existing item.
	Split	Split a link's segment.

See Also

MindFusion.Diagramming Namespace

AddItemCommand Class

Implements creation of new diagram items.

Syntax

JavaScript Copy Code

```
// class
AddItemCommand.prototype = {}
```

Remarks

The control automatically creates instances of this class when items are added either interactively or from code.

Inheritance Hierarchy

MindFusion.Diagramming.Command
  MindFusion.Diagramming.AddItemCommand

See Also

AddItemCommand Members
MindFusion.Diagramming Namespace
RemoveItemCommand Class
ChangeItemCommand Class

AddItemCommand Members

Implements creation of new diagram items.

The following tables list the members exposed by the AddItemCommand type.

Public Constructors

	Name	Description
	AddItemCommand	Initializes a new instance of the **AddItemCommand** class.

Public Methods

	Name	Description
	execute	Command.execute override.
	redo	Command.redo override.
	undo	Command.undo override.

See Also

AddItemCommand Constructor

Initializes a new instance of the AddItemCommand class.

Namespace: MindFusion.Diagramming
Assembly: AddItemCommand.js

Syntax

JavaScript Copy Code

```
function AddItemCommand (diagram, item)
```

Parameters

diagram
The Diagram modified by this command.

item
A new DiagramItem that should be added to the **Diagram**.

See Also

AddItemCommand Class
MindFusion.Diagramming Namespace

AddItemCommand Methods

AddItemCommand.execute Method

Command.execute override.

Namespace: MindFusion.Diagramming
Assembly: AddItemCommand.js

Syntax

JavaScript Copy Code

```
function execute ()
```

See Also

AddItemCommand Members
AddItemCommand Class

AdjustmentHandles Enumeration

Identifies the distinct selection handles of a node.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
AdjustmentHandles = {}
```

Members

	Member name	Description
	None	Specifies that none of the selection handles can be used to modify the node.
	ResizeTopLeft	The top-left handle is enabled and can be used to resize the node.
	ResizeTopRight	The top-right handle is enabled and can be used to resize the node.
	ResizeBottomRight	The bottom-right handle is enabled and can be used to resize the node.
	ResizeBottomLeft	The bottom-left handle is enabled and can be used to resize the node.
	ResizeTopCenter	The top-center handle is enabled and can be used to resize the node vertically.
	ResizeMiddleRight	The middle-right handle is enabled and can be used to resize the node horizontally.
	ResizeBottomCenter	The bottom-center handle is enabled and can be used to resize the node vertically.
	ResizeMiddleLeft	The middle-left handle is enabled and can be used to resize the node horizontally.

	Move	The center selection handle is enabled and can be used to move the node.
	Rotate	The rotation handle is enabled and can be used to rotate the node.
	All	All selection handles are enabled and can be used to modify the node.

Remarks

A combination of **AdjustmentHandles** elements can be assigned to the enabledHandles property of nodes.

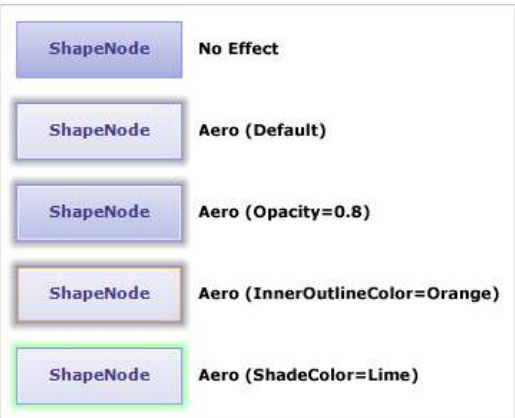
HandlesStyle Enumeration

AeroEffect Class

Represents an effect that adds semitransparency to the node and emphasizes its outline by adding a shade and an inner stroke.

Syntax



JavaScript Copy Code

```
// class
AeroEffect.prototype = {}
```

Remarks

This effect can be applied to all nodes in a Diagram by adding **AeroEffect** instance to the nodeEffects collection, or to individual nodes by adding it to their effects array.

The following image illustrates the Aero effect applied to a rectangular node as well as how the different properties affect the output:

Example

The following example demonstrates how to apply aero effect to the nodes of an existing diagram.

JavaScript Copy Code

```
var AeroEffect = MindFusion.Diagramming.AeroEffect;

var effect = new AeroEffect();
effect.opacity = 0.5;
effect.innerOutlineColor = "rgba(255,255,255,0.5)";
diagram.nodeEffects.push(effect);
```

Inheritance Hierarchy

GlassEffect Class

AeroEffect Members

Represents an effect that adds semitransparency to the node and emphasizes its outline by adding a shade and an inner stroke.

The following tables list the members exposed by the AeroEffect type.

Public Constructors

	Name	Description
	AeroEffect	Initializes a new instance of the AeroEffect class.

Public Properties

	Name	Description
	innerOutlineColor	Gets or sets the color of the inner outline.
	opacity	Gets or sets the opacity to apply to node's background.
	shadeColor	Gets or sets the color of the shade.

Public Methods

	Name	Description
	Clone	**ICloneable.Clone** implementation. (Inherited from NodeEffect.)

Public Events

	Name	Description
	PropertyChanged	INotifyPropertyChanged.PropertyChanged implementation. (Inherited from NodeEffect.)

AeroEffect Constructor

Initializes a new instance of the AeroEffect class.

Namespace: MindFusion.Diagramming
Assembly: NodeEffects.js

Syntax

JavaScript — Copy Code

```
function AeroEffect ()
```

See Also

AeroEffect Properties

AeroEffect.innerOutlineColor Property

Gets or sets the color of the inner outline.

Namespace: MindFusion.Diagramming
Assembly: NodeEffects.js

Syntax

JavaScript Copy Code

```
get innerOutlineColor() {}
set innerOutlineColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value. The default value is "white".

See Also

AeroEffect Members

MindFusion.Diagramming Namespace

AeroEffect.opacity Property

Gets or sets the opacity to apply to node's background.

Namespace: MindFusion.Diagramming
Assembly: NodeEffects.js

Syntax

JavaScript Copy Code

```
get opacity() {}
set opacity(value) {}
```

Property Value

Number

A floating point value between 0 and 1.

See Also

AeroEffect Members
AeroEffect Class
MindFusion.Diagramming Namespace

AeroEffect.shadeColor Property

Gets or sets the color of the shade.

Namespace: MindFusion.Diagramming
Assembly: NodeEffects.js

Syntax

JavaScript

```
get shadeColor() {}
set shadeColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value. The default value is "black".

Alignment Enumeration

Specifies the alignment of text relative to its layout rectangle.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript

```
// enum
Alignment = {}
```

Members

	Member name	Description
	Near	The text is drawn in the near corner of the layout rectangle.
	Center	The text is drawn in the center of the layout rectangle.

	Far	The text is drawn in the far corner of the layout rectangle.

Remarks

Members of this enumeration can be assigned to textAlignment and lineAlignment properties of diagram items.

AnchorPattern Class

The **AnchorPattern** class represents a set of anchor points, which specify the exact locations where links are allowed to connect to nodes.

Syntax

JavaScript Copy Code

```
// class
AnchorPattern.prototype = {}
```

Remarks

A pattern can be assigned to nodes by setting their anchorPattern property. The **AnchorPattern** class exposes several predefined patterns as static fields: decision2In2Out, decision1In3Out, leftInRightOut, topInBottomOut.

Inheritance Hierarchy

MindFusion.Diagramming.AnchorPattern

AnchorPoint Class

AnchorPattern Members

The AnchorPattern class represents a set of anchor points, which specify the exact locations where links are allowed to connect to nodes.

The following tables list the members exposed by the **AnchorPattern** type.

Public Constructors

	Name	Description
	AnchorPattern	Initializes a new instance of the **AnchorPattern** class.

Public Fields

	Name	Description
	decision1In3Out	Gets the predefined anchor pattern decision1In3Out.
	decision2In2Out	Gets the predefined anchor pattern decision2In2Out.
	leftInRightOut	Gets the predefined anchor pattern leftInRightOut.
	topInBottomOut	Gets the predefined anchor pattern topInBottomOut.

Public Properties

	Name	Description
	id	Gets the unique identifier of this AnchorPattern.
	points	Gets or sets the anchor points in this pattern.

Public Methods

	Name	Description
	fromId	Returns a reference to the anchor pattern with the specified string identifier.

See Also

AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern Fields

AnchorPattern.decision1In3Out Field

Gets the predefined anchor pattern decision1In3Out.

Namespace: MindFusion.Diagramming
Assembly: AnchorPattern.js

Syntax

JavaScript Copy Code

```
var decision1In3Out
```

Remarks

Incoming links connect to the top vertex; outgoing links can start from the other vertices.

See Also

AnchorPattern Members
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern.decision2In2Out Field

Gets the predefined anchor pattern decision2In2Out.

Namespace: MindFusion.Diagramming
Assembly: AnchorPattern.js

Syntax

JavaScript Copy Code

```
var decision2In2Out
```

Remarks

Incoming links can connect with the top and left vertices; outgoing links can start from the right and bottom vertices.

See Also

AnchorPattern Members
AnchorPattern Class

AnchorPattern.leftInRightOut Field

Gets the predefined anchor pattern leftInRightOut.

Namespace: MindFusion.Diagramming
Assembly: AnchorPattern.js

Syntax

JavaScript Copy Code

```
var leftInRightOut
```

Remarks

The middle point of a node's bounding rectangle left side is anchor for incoming links; that on the right side - for outgoing.

See Also

AnchorPattern Members
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern.topInBottomOut Field

Gets the predefined anchor pattern topInBottomOut.

Namespace: MindFusion.Diagramming
Assembly: AnchorPattern.js

Syntax

JavaScript Copy Code

```
var topInBottomOut
```

Remarks

The middle point of a node's bounding rectangle top side is anchor for incoming links; that on the bottom - for outgoing.

AnchorPattern Constructor

Initializes a new instance of the AnchorPattern class.

Namespace: MindFusion.Diagramming
Assembly: AnchorPattern.js

Syntax

JavaScript Copy Code

```
function AnchorPattern (points, [patternId])
```

Parameters

points
Contains the initial set of AnchorPoint instances for the new pattern.

patternId
Optional.
String. An unique identifier for this anchor pattern.

See Also

AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern Methods

AnchorPattern.fromId Method

Returns a reference to the anchor pattern with the specified string identifier.

Namespace: MindFusion.Diagramming
Assembly: AnchorPattern.js

Syntax

JavaScript Copy Code

```
function fromId (id)
```

Parameters

id
A string identifying an AnchorPattern instance.

Return Value

AnchorPattern. The AnchorPattern object whose Id is equal to the id parameter.

Remarks

The id argument should match an identifier passed to the constructor of an existing AnchorPattern object.

See Also

AnchorPattern Members
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern Properties

AnchorPattern.id Property

Gets the unique identifier of this AnchorPattern.

Namespace: MindFusion.Diagramming
Assembly: AnchorPattern.js

Syntax

JavaScript Copy Code

```
get id() {}
```

Property Value

String

A string containing the AnchorPattern id.

See Also

AnchorPattern Members
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPattern.points Property

Gets or sets the anchor points in this pattern.

Namespace: MindFusion.Diagramming
Assembly: AnchorPattern.js

Syntax

JavaScript Copy Code

```
get points() {}
set points(value) {}
```

Property Value

Array

An array of AnchorPoint objects.

See Also

AnchorPattern Members
AnchorPattern Class
MindFusion.Diagramming Namespace

AnchorPoint Class

The **AnchorPoint** class represents a location in a node to which links are allowed to connect.

Syntax

JavaScript Copy Code

```
// class
AnchorPoint.prototype = {}
```

Remarks

Anchor points can be assigned to nodes only as constituent elements of an AnchorPattern object.

An anchor point can accept incoming or outgoing links, or both, as specified via the allowIncoming and allowOutgoing properties. The position of the anchor point inside a node's bounding rectangle is set through the x and y properties, expressed as percentage of rectangle's width and height.

How anchor points are marked on the display can be set using markStyle and color properties.

Inheritance Hierarchy

AnchorPattern Class

AnchorPoint Members

The AnchorPoint class represents a location in a node to which links are allowed to connect.

The following tables list the members exposed by the **AnchorPoint** type.

Public Constructors

	Name	Description
	AnchorPoint	Initializes a new instance of the AnchorPoint class.

Public Properties

	Name	Description
	allowIncoming	Gets or sets a value indicating whether the anchor point accepts incoming connections.
	allowOutgoing	Gets or sets a value indicating whether the anchor point accepts outgoing connections.
	color	Gets or sets the color of the anchor point mark.
	column	Gets or sets the column index of a cell with which the anchor point is associated.
	markStyle	Gets or sets the appearance of the anchor point mark.
	size	Gets or sets the size of the anchor point mark.
	tag	Gets or sets custom data tag associated with this anchor point.
	toolTip	Gets or sets tooltip text that should be displayed when the mouse hovers over an anchor point mark.
	x	Gets or sets the horizontal position of the anchor point expressed as percentage of a node's width.
	y	Gets or sets the vertical position of the anchor point expressed as percentage of a node's height.

See Also

AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint Constructor

Initializes a new instance of the AnchorPoint class.

Namespace: MindFusion.Diagramming
Assembly: AnchorPoint.js

Syntax

JavaScript Copy Code

```
function AnchorPoint (x, y, [allowIncoming, [allowOutgoing, [style, [color, [size]]]]])
```

Parameters

x
Number. The horizontal position of the anchor expressed as percent of the width of a node.

y
Number. The vertical position of the anchor expressed as percent of the height of a node.

allowIncoming
Optional.
Boolean. Specifies whether incoming links can connect to this anchor.

allowOutgoing
Optional.
Boolean. Specifies whether outgoing links can connect to this anchor.

style

Optional.
MarkStyle. Defines how the anchor point is marked visually.

color

Optional.
String. Defines the color with which the anchor mark is painted.

size

Optional.
Number. Defines the size of the anchor mark.

See Also

AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint Properties

AnchorPoint.allowIncoming Property

Gets or sets a value indicating whether the anchor point accepts incoming connections.

Namespace: MindFusion.Diagramming
Assembly: AnchorPoint.js

Syntax

JavaScript Copy Code

```
get allowIncoming() {}
set allowIncoming(value) {}
```

Property Value

Boolean

true to accept incoming connections, or **false** otherwise.

Remarks

If no incoming anchor points are defined for a node, link end points can be placed anywhere inside that node.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace
allowOutgoing Property
validateAnchorPoint Event

AnchorPoint.allowOutgoing Property

Gets or sets a value indicating whether the anchor point accepts outgoing connections.

Namespace: MindFusion.Diagramming
Assembly: AnchorPoint.js

Syntax

JavaScript Copy Code

```
get allowOutgoing() {}
set allowOutgoing(value) {}
```

Property Value

Boolean

true to accept outgoing connections, or **false** otherwise.

Remarks

If no outgoing anchor points are defined for a node, link start points can be placed anywhere inside that node.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace

validateAnchorPoint Event

AnchorPoint.color Property

Gets or sets the color of the anchor point mark.

Namespace: MindFusion.Diagramming
Assembly: AnchorPoint.js

Syntax

JavaScript Copy Code

```
get color() {}
set color(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

Remarks

The anchor mark shape specified via MarkStyle is painted with this color.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint.column Property

Gets or sets the column index of a cell with which the anchor point is associated.

Namespace: MindFusion.Diagramming
Assembly: AnchorPoint.js

Syntax

JavaScript Copy Code

```
get column() {}
set column(value) {}
```

Property Value

Number

The column index of a cell with which the anchor point is associated.

Remarks

If **column** is set to -1, the point relative coordinates specify percentage of row's extents. Otherwise the point coordinates specify percentage of cell's extents.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint.markStyle Property

Gets or sets the appearance of the anchor point mark.

Namespace: MindFusion.Diagramming
Assembly: AnchorPoint.js

Syntax

JavaScript Copy Code

```
get markStyle() {}
set markStyle(value) {}
```

Property Value

MarkStyle

A member of the MarkStyle enumeration.

Remarks

Specifies how anchor points are marked visually on the screen.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint.size Property

Gets or sets the size of the anchor point mark.

Namespace: MindFusion.Diagramming
Assembly: AnchorPoint.js

Syntax

JavaScript Copy Code

```
get size() {}
set size(value) {}
```

Property Value

Number

A number specifying the size.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint.tag Property

Gets or sets custom data tag associated with this anchor point.

Namespace: MindFusion.Diagramming
Assembly: AnchorPoint.js

Syntax

JavaScript Copy Code

```
get tag() {}
set tag(value) {}
```

Property Value

Object

An Object containing custom data.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint.toolTip Property

Gets or sets tooltip text that should be displayed when the mouse hovers over an anchor point mark.

Namespace: MindFusion.Diagramming
Assembly: AnchorPoint.js

Syntax

JavaScript Copy Code

```
get toolTip() {}
set toolTip(value) {}
```

Property Value

String

A string containing the tooltip text.

Remarks

Tooltip text is displayed in a small popup window near the cursor when the mouse rests for a while over an anchor point.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint.x Property

Gets or sets the horizontal position of the anchor point expressed as percentage of a node's width.

Namespace: MindFusion.Diagramming
Assembly: AnchorPoint.js

Syntax

JavaScript Copy Code

```
get x() {}
set x(value) {}
```

Property Value

Number

The horizontal position of the anchor point expressed as percentage of a node's width.

Remarks

Keep the property value within 0-100 range, or otherwise it will lead to unexpected behavior.

See Also

AnchorPoint Members
AnchorPoint Class
MindFusion.Diagramming Namespace

AnchorPoint.y Property

Gets or sets the vertical position of the anchor point expressed as percentage of a node's height.

Namespace: MindFusion.Diagramming
Assembly: AnchorPoint.js

Syntax

JavaScript Copy Code

```
get y() {}
set y(value) {}
```

Property Value

Number

The vertical position of the anchor point expressed as percentage of a node's height.

Remarks

Keep the property value within 0-100 range, or otherwise it will lead to unexpected behavior.

AutoResize Enumeration

Defines in which directions automatic resizing can enlarge the diagram scrollable area.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
AutoResize = {}
```

Members

	Member name	Description
	None	Do not enlarge the diagram area automatically.
	RightAndDown	Enlarge the diagram area to the right and down if an item is moved outside the boundaries in these directions.
	AllDirections	Enlarge the diagram area in any direction if an item is moved outside the boundaries.

Remarks

Members of this enumeration can be assigned to the autoResize property of Diagram.

See Also

MindFusion.Diagramming Namespace

Behavior Enumeration

Defines values that specify how the component responds to actions performed by the user.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
Behavior = {}
```

Members

	Member name	Description
	Modify	Objects can be selected and modified. New objects cannot be created.
	DrawShapes	Drawing with the mouse creates ShapeNode instances.
	DrawLinks	Drawing started over a node creates a DiagramLink. Otherwise a lasso rectangle is displayed allowing the selection of items.
	LinkShapes	A mode that is suitable for creating flowcharts and process diagrams. Drawing over empty document area creates a **ShapeNode** instance. Drawing started over a node creates a **DiagramLink**.
	LinkTables	A mode that is suitable for creating entity-relationship diagrams. Drawing over empty document area creates a TableNode instance. Drawing started over a node creates a **DiagramLink**.
	DrawTables	Drawing with the mouse creates **TableNode** instances.

	DrawControls	Drawing with the mouse creates ControlNode instances.
	LinkControls	Drawing over empty document area creates a **ControlNode** instance. Drawing started over a node creates a **DiagramLink**.
	DoNothing	The control ignores users actions with the mouse, but raises the appropriate mouse events. This mode allows applications to implement their own mouse-drawing behavior, disabling the default response to users actions.
	Custom	Drawing with the mouse creates instances of the type assigned to CustomNodeType.
	DrawContainers	Drawing with the mouse creates ContainerNode instances.
	LinkContainers	Drawing over empty document area creates a **ContainerNode** instance. Drawing started over a node creates a **DiagramLink**.
	Pan	Dragging with depressed mouse button pans the view.
	DrawTreeViews	Drawing with the mouse creates TreeViewNode instances.
	LinkTreeViews	Drawing over empty document area creates a **TreeViewNode** instance. Drawing started over a node creates a **DiagramLink**.
	DrawSvgNodes	Drawing with the mouse creates SvgNode instances.
	LinkSvgNodes	Drawing over empty document area creates an **SvgNode** instance. Drawing started over a node creates a **DiagramLink**.
	SelectOnly	Allow only selection of existing items. Modifying them or drawing new ones is disabled.
	Magnify	Dragging the mouse magnifies the view. Modifying them or drawing new ones is disabled.
	DrawFreeForms	Drawing with the mouse creates FreeFormNode instances.
	LinkFreeForms	Drawing over empty document area creates a **FreeFormNode** instance. Drawing started over a node creates a **DiagramLink**.
	DrawFreeShapes	Points from user input are shown using a **FreeFormNode** instance. Once the user finishes drawing, the **FreeFormNode** is replaced by a **ShapeNode** with a matching shape from Diagram.FreeFormTargets list.
	LinkFreeShapes	Points from user input are shown using a **FreeFormNode** instance. Once the user finishes drawing, the **FreeFormNode** is replaced by a **ShapeNode** with a matching shape from Diagram.FreeFormTargets list. Drawing started over a node creates a **DiagramLink**.
	PanAndModify	Items can be selected and modified. New items cannot be created, and dragging without grabbing an adjustment handle pans the view.
	MoveNodes	Dragging with the mouse moves the node under mouse pointer.
	Zoom	Dragging with the mouse draws a lasso tool that zooms the DiagramView to selected rectangular area.
	MoveLabels	Dragging with the mouse moves an ItemLabel at mouse pointer's location.

Remarks

Members of this enumeration can be assigned to the behavior property of **DiagramView**.

BehaviorBase Class

An abstract base class for types that define how the control reacts to users' actions with a mouse or other pointing devices.

Syntax

JavaScript — Copy Code

```
// class
BehaviorBase.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.BehaviorBase
- MindFusion.Diagramming.DoNothingBehavior
- MindFusion.Diagramming.DrawLinksBehavior
- MindFusion.Diagramming.DrawNodesBehavior
- MindFusion.Diagramming.LinkNodesBehavior
- MindFusion.Diagramming.MagnifyBehavior
- MindFusion.Diagramming.ModifyBehavior
- MindFusion.Diagramming.MoveNodesBehavior

BehaviorBase Class
MindFusion.Diagramming Namespace

BehaviorBase Constructor (Diagram)

Initializes a new instance of the BehaviorBase class.

Namespace: MindFusion.Diagramming
Assembly: BehaviorBase.js

Syntax

JavaScript Copy Code

```
function BehaviorBase (parent)
```

Parameters

parent
The Diagram this behavior will be associated with.

See Also

BehaviorBase Constructor Overload List
BehaviorBase Class
MindFusion.Diagramming Namespace

BehaviorBase Constructor (DiagramView)

Initializes a new instance of the BehaviorBase class.

Namespace: MindFusion.Diagramming
Assembly: BehaviorBase.js

Syntax

JavaScript Copy Code

```
function BehaviorBase (parent)
```

Parameters

parent
DiagramView. The DiagramView this behavior will be associated with.

BehaviorBase Methods

BehaviorBase.createController Method

Creates a controller appropriate for current context and pointer position.

Namespace: MindFusion.Diagramming
Assembly: BehaviorBase.js

Syntax

JavaScript Copy Code

```
function createController (state)
```

Parameters

state
Object. An object representing current context and input event.

Return Value

SinglePointerController. An instance of SinglePointerController -derived class.

BehaviorBase Properties

BehaviorBase.diagram Property

Gets the target diagram of this behavior object.

Namespace: MindFusion.Diagramming
Assembly: BehaviorBase.js

Syntax

JavaScript Copy Code

```
get diagram() {}
set diagram(value) {}
```

Property Value

Diagram

An instance of the Diagram class.

Border Class

Represents a panel that draws a border around its child components.

Syntax

JavaScript Copy Code

```
// class
Border.prototype = {}
```

Remarks

Border objects can be used as components of CompositeNode.

Example

This part of a custom **CompositeNode**'s JSON template shows Text component inside a **Border**:

JavaScript Copy Code

```
{
    component: "Border",
    gridColumn: 0,
    name: "SurnameBorder",
    pen: "yellow",
    strokeThickness: 2,
    brush: "green",
    margin: "2, 0, 0, 0",
    children:
    [
        {
            component: "Text",
            name: "Surname",
            autoProperty: true,
            text: "",
            font: "Arial"
        }
    ]
},
```

Border Members

Represents a panel that draws a border around its child components.

The following tables list the members exposed by the Border type.

Public Constructors

	Name	Description
	Border	Initializes a new instance of the Border class.

Public Fields

	Name	Description
	brush	The panel background color.
	pen	The border color.
	strokeThickness	The border thickness.

Public Properties

	Name	Description
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)

	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

Public Methods

	Name	Description
	getComponents	Gets the child components of this panel. (Inherited from Panel.)

Button Class

Represents a button component for CompositeNodes.

Syntax

JavaScript Copy Code

```
// class
Button.prototype = {}
```

Remarks

Buttons respond to user clicks by calling the JavaScript function whose name is assigned to their **clickHandler** attribute. A button can show a text label assigned to the **text** attribute, or an image whose URL is assigned to **imageLocation**.

Example

The following example adds a button to CompositeNode template:

JavaScript Copy Code

```
{
    component: "Button",
    brush: "#ccc",
    text: "Delete",
    width: 30,
    cornerRadius: 3.5,
    clickHandler: "onDeleteClick"
}
```

The following tables list the members exposed by the Button type.

Public Constructors

	Name	Description
	Button	Initializes a new instance of the Button class.

Public Fields

	Name	Description
	brush	The button background color.
	font	A MindFusion.Drawing.Font instance specifying button's font.
	height	The desired height of the button.
	pen	The border color.
	strokeThickness	The border thickness.
	textColor	The text color.
	width	The desired width of the button.

Public Properties

	Name	Description
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	text	Gets or sets the text caption displayed in this button.
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

CaptionedNode Members

CaptionedNode is an abstract base class from which the TableNode, ContainerNode and TreeViewNode classes derive.

The following tables list the members exposed by the CaptionedNode type.

Public Constructors

	Name	Description
	CaptionedNode	Initializes a new instance of the CaptionedNode class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	captionBackBrush	Gets or sets an object specifying how to fill the caption bar.
	captionFont	Gets or sets the font used to render the node's caption text.
	captionHeight	Gets or sets the height of the node's caption bar.
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	dividerStroke	Gets or sets the color used to stroke the divider line between node's caption bar and content area.
	dividerStrokeDashArray	Gets or sets an array of values specifying the dash pattern of the node's divider line.
	dividerStrokeDashOffset	Gets or sets the the distance between the line start and the beginning of the dash pattern.
	dividerStrokeDashStyle	Gets or sets the line dash pattern applied when stroking node's divider line.

	dividerStrokeThickness	Gets or sets the width of the divider line between node's caption bar and content area.
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	effectiveDividerStrokeThickness	Gets the effective line thickness that should be applied when stroking this node's divider line.
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)

	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	shape	Gets or sets the shape of the node's outline.
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	clone	DiagramItem.clone override.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	fromJson	DiagramItem.fromJson override.
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)

GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
loadFromXml	DiagramItem.LoadFromXml override. Loads the node's content from an XML element.
Move	Moves the node to the specified location. (Inherited from DiagramNode.)
NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)

	Resize	Resizes the node. (Inherited from DiagramNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	restoreState	DiagramItem.restoreState override.
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveState	DiagramItem.saveState override.
	saveToXml	Saves the item content into an XML element.
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	toJson	DiagramItem.toJson override.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)

	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
	LoadFromXml	DiagramItem.LoadFromXml override. (Inherited from DiagramNode.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramNode.)
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)

	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode Constructor

Initializes a new instance of the CaptionedNode class.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
function CaptionedNode ([parent])
```

Parameters

parent
Optional.
Diagram. A Diagram instance whose default node attributes are copied to this node.

See Also

CaptionedNode Methods

CaptionedNode.clone Method

DiagramItem.clone override.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript — Copy Code

```
function clone ()
```

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode.fromJson Method

DiagramItem.fromJson override.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript — Copy Code

```
function fromJson ()
```

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode.loadFromXml Method

DiagramItem.LoadFromXml override. Loads the node's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript — Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the item's data.

context

XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode.restoreState Method

DiagramItem.restoreState override.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
function restoreState ()
```

See Also

CaptionedNode Members
CaptionedNode Class

CaptionedNode.saveState Method

DiagramItem.saveState override.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
function saveState ()
```

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode.saveToXml Method

Saves the item content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context

XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode.toJson Method

DiagramItem.toJson override.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
function toJson ()
```

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode Properties

CaptionedNode.captionBackBrush Property

Gets or sets an object specifying how to fill the caption bar.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
get captionBackBrush() {}
set captionBackBrush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace
dividerStroke Property

CaptionedNode.captionFont Property

Gets or sets the font used to render the node's caption text.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
get captionFont() {}
set captionFont(value) {}
```

Property Value

Font

An object specifying the font of the caption bar.

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode.captionHeight Property

Gets or sets the height of the node's caption bar.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
get captionHeight() {}
set captionHeight(value) {}
```

Property Value

Number

A number specifying the height of the caption bar. The default value is 6.

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode.dividerStroke Property

Gets or sets the color used to stroke the divider line between node's caption bar and content area.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
get dividerStroke() {}
set dividerStroke(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

Remarks

If **dividerStroke** is not set, the divider line is drawn using the color assigned to stroke property.

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace
captionBackBrush Property

CaptionedNode.dividerStrokeDashArray Property

Gets or sets an array of values specifying the dash pattern of the node's divider line.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
get dividerStrokeDashArray() {}
set dividerStrokeDashArray(value) {}
```

Property Value

Array

The pattern.

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode.dividerStrokeDashOffset Property

Gets or sets the the distance between the line start and the beginning of the dash pattern.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
get dividerStrokeDashOffset() {}
set dividerStrokeDashOffset(value) {}
```

Property Value

Number

The offset.

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode.dividerStrokeDashStyle Property

Gets or sets the line dash pattern applied when stroking node's divider line.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
get dividerStrokeDashStyle() {}
set dividerStrokeDashStyle(value) {}
```

Property Value

DashStyle

A member of the DashStyle enumeration.

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode.dividerStrokeThickness Property

Gets or sets the width of the divider line between node's caption bar and content area.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
get dividerStrokeThickness() {}
set dividerStrokeThickness(value) {}
```

Property Value

Number

A number specifying the stroke thickness.

See Also

CaptionedNode Members
CaptionedNode Class
MindFusion.Diagramming Namespace

CaptionedNode.effectiveDividerStrokeThickness Property

Gets the effective line thickness that should be applied when stroking this node's divider line.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
get effectiveDividerStrokeThickness() {}
set effectiveDividerStrokeThickness(value) {}
```

Property Value

Number

A number specifying the item's divider line stroke thickness.

See Also

CaptionedNode Members
CaptionedNode Class

CaptionedNode.shape Property

Gets or sets the shape of the node's outline.

Namespace: MindFusion.Diagramming
Assembly: CaptionedNode.js

Syntax

JavaScript Copy Code

```
get shape() {}
set shape(value) {}
```

Property Value

SimpleShape

A member of the SimpleShape enumeration.

See Also

CaptionedNode Members
CaptionedNode Class

Cell Class

Represents a cell of a TableNode.

Syntax

JavaScript Copy Code

```
// class
Cell.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.Cell

See Also

Cell Members
MindFusion.Diagramming Namespace

Cell Members

Represents a cell of a TableNode.

The following tables list the members exposed by the Cell type.

Public Constructors

	Name	Description
	Cell	Initializes a new instance of the **Cell** class.

Public Properties

	Name	Description
	brush	Gets or sets the brush used to paint the cell's background.
	columnSpan	Gets or sets the number of columns spanned by this cell.

	font	Gets or sets the font used to render cell's text.
	image	Gets or sets the image displayed by this cell.
	imageAlign	Gets or sets the alignment of cell's image.
	imageContent	Gets or sets a Base64-encoded image to display inside this cell.
	imageLocation	Gets or sets URL of the image to display inside this cell.
	imagePadding	Gets or sets the padding distance between cell's borders and image.
	lineAlignment	Gets or sets the vertical alignment of cell's text.
	rowSpan	Gets or sets the number of rows spanned by this cell.
	tag	Gets or sets custom data tag associated with this cell.
	text	Gets or sets the text label displayed by this cell.
	textAlignment	Gets or sets the horizontal alignment of cell's text.
	textColor	Gets or sets the cell's text color.
	textPadding	Gets or sets the padding distance between cell's borders and its text.
	tooltip	Gets or sets the tooltip text that should be displayed when the mouse hovers over this cell.

Public Methods

	Name	Description
	loadFromXml	Loads the cell's content from an XML element.
	saveToXml	Saves the cell's content into an XML element.

Cell Class
MindFusion.Diagramming Namespace

Cell Constructor

Initializes a new instance of the Cell class.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
function Cell ()
```

See Also

Cell Class
MindFusion.Diagramming Namespace

Cell Methods

Cell.loadFromXml Method

Loads the cell's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript — Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the cell's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.saveToXml Method

Saves the cell's content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript — Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the cell's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell Properties

Cell.brush Property

Gets or sets the brush used to paint the cell's background.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

```
JavaScript
get brush() {}
set brush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.columnSpan Property

Gets or sets the number of columns spanned by this cell.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

```
JavaScript
get columnSpan() {}
set columnSpan(value) {}
```

Property Value

Number

An integer value specifying the number of spanned columns.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.font Property

Gets or sets the font used to render cell's text.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

```
JavaScript
get font() {}
set font(value) {}
```

Property Value

Font

An instance of the Font class.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.image Property

Gets or sets the image displayed by this cell.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get image() {}
set image(value) {}
```

Property Value

HTMLImageElement

An image object to render as cell's content.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.imageAlign Property

Gets or sets the alignment of cell's image.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get imageAlign() {}
set imageAlign(value) {}
```

Property Value

ImageAlign

A member of the ImageAlign enumeration.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.imageContent Property

Gets or sets a Base64-encoded image to display inside this cell.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get imageContent() {}
set imageContent(value) {}
```

Property Value

String

A Base64-encoded representation of an image.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.imageLocation Property

Gets or sets URL of the image to display inside this cell.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get imageLocation() {}
set imageLocation(value) {}
```

Property Value

String

A URL string that identifies the image to be loaded.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.imagePadding Property

Gets or sets the padding distance between cell's borders and image.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get imagePadding() {}
set imagePadding(value) {}
```

Property Value

Thickness

A Thickness instance specifying image padding.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.lineAlignment Property

Gets or sets the vertical alignment of cell's text.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get lineAlignment() {}
set lineAlignment(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.rowSpan Property

Gets or sets the number of rows spanned by this cell.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get rowSpan() {}
set rowSpan(value) {}
```

Property Value

Number

An integer value specifying the number of spanned rows.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.tag Property

Gets or sets custom data tag associated with this cell.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get tag() {}
set tag(value) {}
```

Property Value

Object

An Object containing custom data.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.text Property

Gets or sets the text label displayed by this cell.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get text() {}
set text(value) {}
```

Property Value

String

A string containing the cell's text. The default value is empty string "".

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.textAlignment Property

Gets or sets the horizontal alignment of cell's text.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get textAlignment() {}
set textAlignment(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.textColor Property

Gets or sets the cell's text color.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get textColor() {}
set textColor(value) {}
```

Property Value

String

A string value identifying the text color.

Remarks

If this property is not set, cell's text is painted using table's cellTextColor or textColor properties.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.textPadding Property

Gets or sets the padding distance between cell's borders and its text.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get textPadding() {}
set textPadding(value) {}
```

Property Value

Thickness

A Thickness instance specifying text padding.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

Cell.tooltip Property

Gets or sets the tooltip text that should be displayed when the mouse hovers over this cell.

Namespace: MindFusion.Diagramming
Assembly: Cell.js

Syntax

JavaScript Copy Code

```
get tooltip() {}
set tooltip(value) {}
```

Property Value

String

A string containing the tooltip text.

See Also

Cell Members
Cell Class
MindFusion.Diagramming Namespace

CellEventArgs Class

Contains the arguments passed to handlers of table cell -related events.

Syntax

JavaScript Copy Code

```
// class
CellEventArgs.prototype = {}
```

Inheritance Hierarchy

MindFusion.Controls.CancelEventArgs
  MindFusion.Diagramming.CellEventArgs

See Also

CellEventArgs Members
MindFusion.Diagramming Namespace
Events Class

CellEventArgs Members

Contains the arguments passed to handlers of table cell -related events.

The following tables list the members exposed by the CellEventArgs type.

Public Constructors

	Name	Description
	CellEventArgs	Initializes a new instance of the CellEventArgs class.

Public Properties

	Name	Description
	cell	Gets the cell related to the event.
	column	Gets the column index of the cell related to the event.
	context	Gets the canvas rendering context.
	mouseButton	Gets which mouse button has been pressed.
	newText	Gets the text that has just been entered by the user.
	node	Gets the node related to the event.
	oldText	Gets the text that had been displayed in the node before the user edited it.
	row	Gets the row index of the cell related to the event.

Public Methods

	Name	Description
	cancelDrag	Cancels the resize of the node's row or column.

See Also

CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs Constructor

Initializes a new instance of the CellEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
function CellEventArgs ()
```

See Also

CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs Methods

CellEventArgs.cancelDrag Method

Cancels the resize of the node's row or column.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
function cancelDrag ()
```

Remarks

Calling this method immediately stops the operation.

See Also

allowResizeColumns Property

CellEventArgs Properties

CellEventArgs.cell Property

Gets the cell related to the event.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get cell() {}
```

Property Value

Cell

A Cell instance.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.column Property

Gets the column index of the cell related to the event.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get column() {}
set column(value) {}
```

Property Value

Number

The column index.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.context Property

Gets the canvas rendering context.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get context() {}
set context(value) {}
```

Property Value

CanvasRenderingContext2D

A rendering context used to draw on the Canvas element.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.mouseButton Property

Gets which mouse button has been pressed.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get mouseButton() {}
set mouseButton(value) {}
```

Property Value

Number

An integer mouse button id.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.newText Property

Gets the text that has just been entered by the user.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get newText() {}
set newText(value) {}
```

Property Value

String

A string containing newly entered text.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.node Property

Gets the node related to the event.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get node() {}
set node(value) {}
```

Property Value

TableNode

A TableNode instance.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.oldText Property

Gets the text that had been displayed in the node before the user edited it.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript — Copy Code

```
get oldText() {}
set oldText(value) {}
```

Property Value

String

A string containing item's original text.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellEventArgs.row Property

Gets the row index of the cell related to the event.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript — Copy Code

```
get row() {}
set row(value) {}
```

Property Value

Number

The row index.

See Also

CellEventArgs Members
CellEventArgs Class
MindFusion.Diagramming Namespace

CellFrameStyle Enumeration

Specifies the style of the cells' frame lines.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
CellFrameStyle = {}
```

Members

	Member name	Description
	None	Table cells have no border.
	Simple	The border of table cells is simple line.
	System3D	The border has 3D look.

Remarks

Members of this enumeration can be assigned to cellFrameStyle property of TableNode.

See Also

MindFusion.Diagramming Namespace

ChangeItemCommand Class

Handles undo / redo of property changes.

Syntax

JavaScript Copy Code

```
// class
ChangeItemCommand.prototype = {}
```

Remarks

The ChangeItemCommand constructor records the state of an item, and its undo and redo methods restore the item to either its old or new state.

Example

See executeCommand for an example showing how item's state is saved for later undo / redo.

Inheritance Hierarchy

MindFusion.Diagramming.Command
  MindFusion.Diagramming.ChangeItemCommand

ChangeItemCommand Members

Handles undo / redo of property changes.

The following tables list the members exposed by the ChangeItemCommand type.

Public Constructors

	Name	Description
	ChangeItemCommand	Initializes a new instance of the **ChangeItemCommand** class.

Public Methods

	Name	Description
	execute	Command.execute override.
	redo	Command.redo override.
	undo	Command.undo override.

See Also

ChangeItemCommand Class
MindFusion.Diagramming Namespace

ChangeItemCommand Constructor

Initializes a new instance of the ChangeItemCommand class.

Namespace: MindFusion.Diagramming
Assembly: ChangeItemCommand.js

Syntax

JavaScript Copy Code

```
function ChangeItemCommand (diagram, item)
```

Parameters

diagram
The Diagram modified by this command.

item
The DiagramItem that will be modified.

See Also

ChangeItemCommand Class
MindFusion.Diagramming Namespace

ChangeItemCommand Methods

ChangeItemCommand.execute Method

Command.execute override.

Namespace: MindFusion.Diagramming
Assembly: ChangeItemCommand.js

Syntax

function undo ()
```

See Also

ChangeItemCommand Members
ChangeItemCommand Class
MindFusion.Diagramming Namespace

ColumnStyle Enumeration

Specifies how table columns' width is set.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
ColumnStyle = {}
```

Members

	Member name	Description
	FixedWidth	The columns has fixed, unchangeable width.
	AutoWidth	The columns' width changes when the table is resized.

See Also

MindFusion.Diagramming Namespace

Command Class

Represents an action that changes the diagram and whose effects can be undone.

Syntax

JavaScript — Copy Code

```
// class
Command.prototype = {}
```

Inheritance Hierarchy

Public Fields

	Name	Description
	gridLayout	Indicates whether to use CSS grid layout for diagram DOM.
	pixelThickness	Indicates whether stroke thickness values are specified in pixels or diagram units.

Public Properties

	Name	Description
	propFunctions	Gets or sets whether the control should generate get/set functionsfor properties to keep compatibility with older versions of the diagramming API.

CompatConfig Fields

CompatConfig.gridLayout Field

Indicates whether to use CSS grid layout for diagram DOM.

Namespace: MindFusion.Diagramming
Assembly: CompatConfig.js

Syntax

JavaScript Copy Code

```
CompatConfig.gridLayout = true;
```

Remarks

This is a static field. Set it to **false** in order to use VirtualScroll mode in older browsers that don't support grid layout. Note that **false** value applies absolute positioning to the diagram's parent div, which could entail further layout changes in the html page.

CompatConfig Class
MindFusion.Diagramming Namespace

CompatConfig.pixelThickness Field

Indicates whether stroke thickness values are specified in pixels or diagram units.

Namespace: MindFusion.Diagramming
Assembly: CompatConfig.js

Syntax

JavaScript Copy Code

```
CompatConfig.pixelThickness = false;
```

Remarks

This is a static field. Set it to **true** to make StrokeThickness of DiagramItem and Style objects regardes as pixels instead of MeasureUnit values.

StrokeThickness was changed from pixels to MeasureUnit in version 3.5.1 of the library.

CompatConfig Properties

CompatConfig.propFunctions Property

Gets or sets whether the control should generate get/set functionsfor properties to keep compatibility with older versions of the diagramming API.

Namespace: MindFusion.Diagramming
Assembly: CompatConfig.js

Syntax

JavaScript Copy Code

```
get propFunctions() {}
set propFunctions(value) {}
```

Property Value

Boolean

true to generate get/set function pairs, or false otherwise.

Events Class

ComponentEventArgs Members

Contains the arguments passed to handlers of component-related events.

The following tables list the members exposed by the ComponentEventArgs type.

Public Constructors

	Name	Description
	ComponentEventArgs	Initializes a new instance of the **ComponentEventArgs** class.

Public Properties

	Name	Description
	AdjustmentHandle	Gets or sets the adjustment handle being moved by the user. (Inherited from NodeEventArgs.)
	component	Gets the component for which the event was raised.
	Label	Gets or sets a NodeLabel related to this event. (Inherited from NodeEventArgs.)
	MouseButton	Gets which mouse button has been pressed. (Inherited from NodeEventArgs.)

	MousePosition	Gets or sets the current mouse pointer position. (Inherited from NodeEventArgs.)
	Node	Gets the node for which the event was raised. (Inherited from NodeEventArgs.)

ComponentEventArgs Properties

ComponentEventArgs.component Property

Gets the component for which the event was raised.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get component() {}
```

Property Value

Component

An instance of the Component class.

Composite Nodes

CompositeNode Members

CompositeNode implements nodes whose appearance can be defined via composition of components and layout containers.

The following tables list the members exposed by the **CompositeNode** type.

Public Constructors

	Name	Description
	CompositeNode	Initializes a new instance of the **CompositeNode** class with default values supplied from the specified Diagram.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	clipToOutline	Gets or sets whether contents should clip to node's outline, when outline component is set.
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)

	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)

	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
S	classFromTemplate	Generates a node class whose appearance and properties are defined using JSON template.
	clone	DiagramNode.clone override.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)

	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	fromJson	DiagramNode.fromJson override.
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getComponent	Returns the component created for the template element with specified name.
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)

	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	loadTemplate	Load a JSON template defining node's appearance.
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	restoreState	DiagramNode.restoreState override.
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveState	DiagramNode.saveState override.
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	toJson	DiagramNode.toJson override.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
	LoadFromXml	DiagramItem.LoadFromXml override. (Inherited from DiagramNode.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)

	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramNode.)
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)

	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

CompositeNode Class
MindFusion.Diagramming Namespace

CompositeNode Constructor

Initializes a new instance of the CompositeNode class with default values supplied from the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: CompositeNode.js

Syntax

JavaScript Copy Code

```
function CompositeNode ([parent])
```

Parameters

parent
Optional.
The Diagram from which to obtain default values for the node properties.

See Also

CompositeNode Class
MindFusion.Diagramming Namespace

CompositeNode Methods

CompositeNode.classFromTemplate Method

Generates a node class whose appearance and properties are defined using JSON template.

Namespace: MindFusion.Diagramming
Assembly: CompositeNode.js

Syntax

JavaScript Copy Code

```
function classFromTemplate (className, jsonTemplate, [init])
```

Parameters

className
String. Fully qualified name of the class to generate.

jsonTemplate
Object. A JavaScript object literal containing template of node's component hierarchy.

init
Optional.
function. Optional.

Return Value

CompositeNode. A constructor function that creates instances of the new class.

CompositeNode.getComponent Method

Returns the component created for the template element with specified name.

Namespace: MindFusion.Diagramming
Assembly: CompositeNode.js

Syntax

JavaScript Copy Code

```
function getComponent (name)
```

Parameters

name
String. A string specifying the value of the name attribute in node's template.

Return Value

Component. The component created for specified element in the template.

See Also

CompositeNode Members
CompositeNode Class

CompositeNode.loadTemplate Method

Load a JSON template defining node's appearance.

Namespace: MindFusion.Diagramming
Assembly: CompositeNode.js

Syntax

JavaScript Copy Code

```
function loadTemplate (jsonTemplate)
```

Parameters

jsonTemplate
Object. A JavaScript object literal containing template of node's component hierarchy.

CompositeNode Properties

CompositeNode.clipToOutline Property

Gets or sets whether contents should clip to node's outline, when outline component is set.

Namespace: MindFusion.Diagramming
Assembly: CompositeNode.js

Syntax

JavaScript Copy Code

```
get clipToOutline() {}
set clipToOutline(value) {}
```

Property Value

Boolean

true to clip contents, or **false** otherwise.

Remarks

To specify the clip path, mark a Shape component in the template with **isOutline** attribute.

MindFusion.Diagramming Namespace

CompositeRouter Class

Implements a chain of link routers so that a link passes through the sequence until it gets routed successfully.

Syntax

JavaScript Copy Code

```
// class
CompositeRouter.prototype = {}
```

Remarks

By default diagram's linkRouter is set to a **CompositeRouter** instance that chains PatternRouter and Router. You can insert additional link routers into the routers list, including custom implementations of **Router** if target diagram should favor some specific link paths.

Inheritance Hierarchy

MindFusion.Diagramming.Router
  MindFusion.Diagramming.CompositeRouter

CompositeRouter Members
MindFusion.Diagramming Namespace

CompositeRouter Members

Implements a chain of link routers so that a link passes through the sequence until it gets routed successfully.

The following tables list the members exposed by the CompositeRouter type.

Public Constructors

	Name	Description
	CompositeRouter	Initializes a new instance of the **CompositeRouter** class.

Public Properties

	Name	Description
	avoidOverlaps	Gets or sets a value indicating whether to avoid overlapping links. (Inherited from Router.)
	diagram	Gets or sets the diagram associated with this router and all its sub-routers.
	routers	A list of router objects forming a chain through whichlinks pass until they are routed successfully.

Public Methods

	Name	Description
	route	Overrides Router.route.
	routeInternal	Overrides Router.routeInternal.
	routeLinks	Overrides Router.routeLinks.

CompositeRouter Methods

CompositeRouter.route Method

Overrides Router.route.

Namespace: MindFusion.Diagramming
Assembly: CompositeRouter.js

Syntax

JavaScript Copy Code

```
function route (link)
```

Parameters

link
DiagramLink. The link to route.

See Also

CompositeRouter Members
CompositeRouter Class
MindFusion.Diagramming Namespace

CompositeRouter.routeInternal Method

Overrides Router.routeInternal.

Namespace: MindFusion.Diagramming
Assembly: CompositeRouter.js

Syntax

JavaScript Copy Code

```
function routeInternal (link)
```

Parameters

link
DiagramLink. The link to route.

Return Value

Array.<Point>. An array of points representing the link's new shape, or null if routing fails.

See Also

CompositeRouter.routeLinks Method

Overrides Router.routeLinks.

Namespace: MindFusion.Diagramming
Assembly: CompositeRouter.js

Syntax

JavaScript Copy Code

```
function routeLinks (links)
```

Parameters

links
Array.<DiagramLink>. A list of links to route.

See Also

CompositeRouter Members
CompositeRouter Class
MindFusion.Diagramming Namespace

CompositeRouter Properties

CompositeRouter.diagram Property

Gets or sets the diagram associated with this router and all its sub-routers.

Namespace: MindFusion.Diagramming
Assembly: CompositeRouter.js

Syntax

JavaScript Copy Code

```
get diagram() {}
set diagram(value) {}
```

Property Value

Diagram

An instance of the Diagram class.

See Also

CompositeRouter Members
CompositeRouter Class
MindFusion.Diagramming Namespace

CompositeRouter.routers Property

A list of router objects forming a chain through whichlinks pass until they are routed successfully.

Namespace: MindFusion.Diagramming
Assembly: CompositeRouter.js

Syntax

JavaScript Copy Code

```
get routers() {}
set routers(value) {}
```

Property Value

Array

An array of Router -derived objects.

Remarks

By default the list contains PatternRouter and Router objects

ConnectionPoint Class

A class that represents a connection between an edge and a node in a graph. It decouples the DiagramLink class from the DiagramNode class, allowing edges to connect different types of nodes without knowing anything of their implementation details. Each **DiagramLink** object contains two **ConnectionPoint** instances describing the connections at both ends of the link.

Syntax

JavaScript Copy Code

```
// class
ConnectionPoint.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.ConnectionPoint

ConnectionPoint Members
MindFusion.Diagramming Namespace

ConnectionPoint Members

A class that represents a connection between an edge and a node in a graph. It decouples the DiagramLink class from the DiagramNode class, allowing edges to connect different types of nodes without knowing anything of their implementation details. Each **DiagramLink** object contains two ConnectionPoint instances describing the connections at both ends of the link.

The following tables list the members exposed by the **ConnectionPoint** type.

Public Constructors

	Name	Description
	ConnectionPoint	Initializes a new instance of the **ConnectionPoint** class between the specified node and link.

Public Properties

	Name	Description
	endPoint	Calculates the coordinates of this connection point expressed in document coordinates.

Public Methods

	Name	Description
	addLinkToNode	Adds the **DiagramLink** associated with this connection point to the associated **DiagramNode**.
	getInitialPoint	Returns a Point (usually the center of the bounding rectangle) contained within the associated node.
	getIntersection	Calculates the intersection point between the specified line segment and the contour of the node associated with this connection point.
	getNearestAnchorPoint	Returns the nearest anchor **Point** pertinent to this connection.
	getNearestBorderPoint	Returns the nearest point lying on the **DiagramNode** border.
	getNodeRect	Returns the bounding rectangle of the node associated with this connection point.
	linkChanges	Checks whether the link would change if attached to the specified node at the specified point.
	nodesIntersect	Checks whether the node associated with the current connection point and the node associated with the specified connection point intersect.
	removeLinkFromNode	Removes the link associated with this connection point from the associated node.
	saveEndRelative	Updates the coordinates of the connection point represented by this link, relative to the bounding rectangle of the associated node.

ConnectionPoint Constructor

Initializes a new instance of the ConnectionPoint class between the specified node and link.

Namespace: MindFusion.Diagramming
Assembly: ConnectionPoint.js

Syntax

JavaScript Copy Code

```
function ConnectionPoint ([node, [link, [incoming]]])
```

Parameters

node
Optional. The node whose connection to a link is managed by this ConnectionPoint.

link
Optional. The link whose connection to a node is managed by this **ConnectionPoint**.

incoming
Optional. Specifies which end of the link is represented by this **ConnectionPoint**.

ConnectionPoint Methods

ConnectionPoint.addLinkToNode Method

Adds the DiagramLink associated with this connection point to the associated DiagramNode.

Namespace: MindFusion.Diagramming
Assembly: ConnectionPoint.js

Syntax

JavaScript — Copy Code

```
function addLinkToNode ()
```

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.getInitialPoint Method

Returns a Point (usually the center of the bounding rectangle) contained within the associated node.

Namespace: MindFusion.Diagramming
Assembly: ConnectionPoint.js

Syntax

JavaScript — Copy Code

```
function getInitialPoint ()
```

Return Value

A Point contained within the node.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.getIntersection Method

Calculates the intersection point between the specified line segment and the contour of the node associated with this connection point.

Namespace: MindFusion.Diagramming
Assembly: ConnectionPoint.js

Syntax

JavaScript — Copy Code

```
function getIntersection (point1, point2)
```

Parameters

point1
The first Point of the segment.

point2
The second **point** of the segment.

Return Value

A **Point** object representing the intersection point.

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.getNearestAnchorPoint Method

Returns the nearest anchor Point pertinent to this connection.

Namespace: MindFusion.Diagramming
Assembly: ConnectionPoint.js

Syntax

JavaScript Copy Code

```
function getNearestAnchorPoint (point)
```

Parameters

point
A Point instance specifying location in the diagram.

Return Value

AnchorPointDetails. An AnchorPointDetails specifying the anchor point properties.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.getNearestBorderPoint Method

Returns the nearest point lying on the DiagramNode border.

Namespace: MindFusion.Diagramming
Assembly: ConnectionPoint.js

Syntax

JavaScript Copy Code

```
function getNearestBorderPoint (point)
```

Parameters

point
A Point instance specifying location in the diagram.

Return Value

AnchorPointDetails. An AnchorPointDetails specifying the anchor point properties.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.getNodeRect Method

Returns the bounding rectangle of the node associated with this connection point.

Namespace: MindFusion.Diagramming
Assembly: ConnectionPoint.js

Syntax

JavaScript Copy Code

```
function getNodeRect ()
```

Return Value

The bounding rectangle of the node.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.linkChanges Method

Checks whether the link would change if attached to the specified node at the specified point.

Namespace: MindFusion.Diagramming
Assembly: ConnectionPoint.js

Syntax

JavaScript Copy Code

```
function linkChanges (item, point)
```

Parameters

item
A DiagramItem under the mouse cursor.

point
A point where the link will be connected.

Return Value

Boolean. true if the link would connect to a different entity if dropped at the specified location; otherwise, false.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.nodesIntersect Method

Checks whether the node associated with the current connection point and the node associated with the specified connection point intersect.

Namespace: MindFusion.Diagramming
Assembly: ConnectionPoint.js

Syntax

JavaScript Copy Code

```
function nodesIntersect (connectionPoint)
```

Parameters

connectionPoint
A ConnectionPoint instance.

Return Value

Boolean. true if the node associated with the current connection point and the node associated with the specified connection point intersect; otherwise, false.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.removeLinkFromNode Method

Removes the link associated with this connection point from the associated node.

Namespace: MindFusion.Diagramming
Assembly: ConnectionPoint.js

Syntax

JavaScript Copy Code

```
function removeLinkFromNode ()
```

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint.saveEndRelative Method

Updates the coordinates of the connection point represented by this link, relative to the bounding rectangle of the associated node.

Namespace: MindFusion.Diagramming
Assembly: ConnectionPoint.js

Syntax

JavaScript Copy Code

```
function saveEndRelative ([ctrRelative])
```

Parameters

ctrRelative
Optional.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionPoint Properties

ConnectionPoint.endPoint Property

Calculates the coordinates of this connection point expressed in document coordinates.

Namespace: MindFusion.Diagramming
Assembly: ConnectionPoint.js

Syntax

JavaScript Copy Code

```
get endPoint() {}
```

Property Value

Point

A Point that represents the coordinate.

See Also

ConnectionPoint Members
ConnectionPoint Class
MindFusion.Diagramming Namespace

ConnectionStyle Enumeration

Specifies whether links should connect to a node or its rows.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
ConnectionStyle = {}
```

Members

	Member name	Description
	Node	Links should connect to the table node when drawn interactively.
	Rows	Links should connect to one of the table's rows when drawn interactively.

Remarks

Members of this enumeration can be assigned to the connectionStyle property of TableNode or TreeViewNode.

See Also

MindFusion.Diagramming Namespace

ContainerNode Class

ContainerNode instances are diagram nodes that can contain other nodes.

Syntax

JavaScript Copy Code

```
// class
ContainerNode.prototype = {}
```

Remarks

Child node can be added to or removed from containers interactively when the allowAddChildren and allowRemoveChildren properties are enabled. Use the add method to add a node to container programmatically. Use the remove method to remove a node from the container.

A container node can be folded and unfolded, either interactively or programmatically, as specified through the foldable and folded properties. When a container is folded, it occupies a minimal area and its child nodes are hidden.

ContainerNode Members

ContainerNode instances are diagram nodes that can contain other nodes.

The following tables list the members exposed by the ContainerNode type.

Public Constructors

	Name	Description
	ContainerNode	Initializes a new instance of the ContainerNode class with default values supplied from the specified Diagram.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	allowAddChildren	Gets or sets whether users are allowed to add child nodes to the container.
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	allowRemoveChildren	Gets or sets whether users are allowed to remove child nodes from the container.
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	autoDeleteChildren	Gets or sets whether whether deleting this container should also remove its child items from the diagram.
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	captionBackBrush	Gets or sets an object specifying how to fill the caption bar.
	captionFont	Gets or sets the font used to render the node's caption text. (Inherited from CaptionedNode.)
	captionHeight	Gets or sets the height of the node's caption bar.
	children	Gets the child nodes of this container.
	clipChildren	Gets or sets whether child items should be clipped by container boundaries.
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)

	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	contentPath	Creates a path corresponding to the content area rectangle, excluding caption bar.
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	dividerStroke	Gets or sets the color used to stroke the divider line between node's caption bar and content area. (Inherited from CaptionedNode.)
	dividerStrokeDashArray	Gets or sets an array of values specifying the dash pattern of the node's divider line. (Inherited from CaptionedNode.)
	dividerStrokeDashOffset	Gets or sets the the distance between the line start and the beginning of the dash pattern. (Inherited from CaptionedNode.)
	dividerStrokeDashStyle	Gets or sets the line dash pattern applied when stroking node's divider line. (Inherited from CaptionedNode.)
	dividerStrokeThickness	Gets or sets the width of the divider line between node's caption bar and content area. (Inherited from CaptionedNode.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	effectiveDividerStrokeThickness	Gets the effective line thickness that should be applied when stroking this node's divider line. (Inherited from CaptionedNode.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	enableStyledText	Gets or sets a value indicating whether styled caption text rendering is enabled.
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	foldable	Gets or sets a value indicating whether users are allowed to fold the container.
	folded	Gets or sets a value indicating whether the container is folded.
	foldedSize	Gets or sets the size of the container in folded state.
	foldIconSize	Gets or sets a value indicating the size of the fold/unfold icon.
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)

	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	shape	Gets or sets the shape of the node's outline.
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)

	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	unfoldedSize	Gets the size of the container in unfolded state.
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	add	Adds a node to this container.
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	arrange	Arranges the container's children with the given layout.
	arrangeAnimated	Arranges the container's children with the given layout, and animates items moving to their new positions.
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	clone	DiagramNode.clone override.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	containsPoint	Checks if the **ContainerNode** contains the specified point.
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	containsRecursively	Determines whether the specified node is contained within this container, either directly or inside child containers.
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)

	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	fromJson	DiagramNode.fromJson override.
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getOutline	Gets an array of points that define the outline of this node shape.
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)

	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	hitTest	Returns the diagram item that contains the specified point.
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	loadFromXml	DiagramNode.LoadFromXml override. Loads the node's content from an XML element.
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	onRemove	DiagramItem.onRemove override.
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	remove	Removes a node from this container.
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	resizeToFitChildren	Resizes the container making it big enough to contain its child nodes.
	resizeToFitText	Makes the container node caption big enough to display its text without clipping.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	restoreState	DiagramNode.restoreState override.
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveState	DiagramNode.saveState override.
	saveToXml	Saves the node's content into an XML element.
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)

	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	toJson	DiagramNode.toJson override.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	visitNodes	Visits the diagram nodes in reverse Z order.
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)

	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
	LoadFromXml	DiagramItem.LoadFromXml override. (Inherited from DiagramNode.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramNode.)
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)

	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode Constructor

Initializes a new instance of the ContainerNode class with default values supplied from the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
function ContainerNode ([parent])
```

Parameters

parent
Optional.
Diagram. The Diagram from which to obtain default values for the node properties.

See Also

ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode Methods

ContainerNode.add Method

Adds a node to this container.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript — Copy Code

```
function add (node)
```

Parameters

node
DiagramNode. The node that should be added to the container.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace
remove Method
children Property

ContainerNode.arrange Method

Arranges the container's children with the given layout.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript — Copy Code

```
function arrange (layout)
```

Parameters

layout
Object. The Layout algorithm to apply.

Remarks

Available layout algorithms are SpringLayout, TreeLayout, BorderedTreeLayout, LayeredLayout, TreeMapLayout, FractalLayout, FlowchartLayout, TopologicalLayout, OrthogonalLayout, RadialTreeLayout, GridLayout.

LayeredLayout Class
SpringLayout Class

ContainerNode.arrangeAnimated Method

Arranges the container's children with the given layout, and animates items moving to their new positions.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
function arrangeAnimated (layout, [duration, [animationType, [easingType]]])
```

Parameters

layout
Object. The Layout algorithm to apply.

duration
Optional.
Number. An integer, specifying the duration of the animation in milliseconds.

animationType
Optional.
A member of the AnimationType enumeration, specifying the animation type to use.

easingType
Optional.
A member of the EasingType enumeration, specifying the type of easing function to apply to the animation.

Remarks

Available layout algorithms are SpringLayout, TreeLayout, BorderedTreeLayout, LayeredLayout, TreeMapLayout, FractalLayout, FlowchartLayout, TopologicalLayout, OrthogonalLayout, RadialTreeLayout, GridLayout.

ContainerNode.containsPoint Method

Checks if the ContainerNode contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
function containsPoint (point)
```

Parameters

point
The Point to check.

Return Value

true if the point is within the bounds of this node; otherwise, **false**.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.containsRecursively Method

Determines whether the specified node is contained within this container, either directly or inside child containers.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
function containsRecursively (node)
```

Parameters

node

Return Value

Boolean. **true** if the specified node is inside the container, or **false** otherwise.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.fromJson Method

DiagramNode.fromJson override.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
function fromJson ()
```

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.getOutline Method

Gets an array of points that define the outline of this node shape.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
function getOutline ()
```

Return Value

An array containing the outline points.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.hitTest Method

Returns the diagram item that contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
function hitTest (point, [threshold, onlyNodes, onlyInteractive])
```

Parameters

point
Point. A Point value specifying the logical coordinates of a diagram point.

threshold
Optional.
Number. Specifies the size of the area around the item outlines where the point is still considered inside the item.

onlyNodes
Boolean. true to exclude child links from the search.

onlyInteractive
Boolean. true to exclude locked items from the search.

Return Value

DiagramItem. The item that contains the specified point.

ContainerNode.loadFromXml Method

DiagramNode.LoadFromXml override. Loads the node's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

ContainerNode.remove Method

Removes a node from this container.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
function remove (node)
```

Parameters

node
DiagramNode. The node that should be removed from the container.

add Method
children Property

ContainerNode.resizeToFitChildren Method

Resizes the container making it big enough to contain its child nodes.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
function resizeToFitChildren (allowShrink, margin)
```

Parameters

allowShrink
true to allow setting smaller size than current size of the container, or **false** otherwise.

margin
Specifies the margin space to leave between container's borders and child nodes.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace
children Property

ContainerNode.resizeToFitText Method

Makes the container node caption big enough to display its text without clipping.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
function resizeToFitText (fit, [fixPosition, [foldBtnWidth]])
```

Parameters

fit
FitSize. A member of the FitSize enumeration.

fixPosition
Optional.
Boolean. Fix the position of the container to the original location. The default is false.

foldBtnWidth
Optional.
Number. The width of the folder button, if it's not provided, the value from foldIconSize is used.

Return Value

Boolean. **true** if the caption is resized successfully, or **false** otherwise.

Saves the node's content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

ContainerNode Properties

ContainerNode.allowAddChildren Property

Gets or sets whether users are allowed to add child nodes to the container.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
get allowAddChildren() {}
set allowAddChildren(value) {}
```

Property Value

Boolean

true if child nodes can be added interactively, or **false** otherwise.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.allowRemoveChildren Property

Gets or sets whether users are allowed to remove child nodes from the container.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
get allowRemoveChildren() {}
set allowRemoveChildren(value) {}
```

Property Value

Boolean

true if child nodes can be removed interactively, or **false** otherwise.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.autoDeleteChildren Property

Gets or sets whether whether deleting this container should also remove its child items from the diagram.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
get autoDeleteChildren() {}
set autoDeleteChildren(value) {}
```

Property Value

Boolean

true to automatically delete child items, or **false** otherwise. The default value is **false**.

ContainerNode.contentPath Property

Creates a path corresponding to the content area rectangle, excluding caption bar.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
get contentPath() {}
```

Property Value

Path

A Path instance.

See Also

ContainerNode Members
ContainerNode Class
MindFusion.Diagramming Namespace

ContainerNode.enableStyledText Property

Gets or sets a value indicating whether styled caption text rendering is enabled.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
get enableStyledText() {}
set enableStyledText(value) {}
```

Property Value

Boolean

true to parse the node's caption text in order to find formatting tags, or **false** otherwise.

foldedSize Property

ContainerNode.foldedSize Property

Gets or sets the size of the container in folded state.

Namespace: MindFusion.Diagramming
Assembly: ContainerNode.js

Syntax

JavaScript Copy Code

```
get foldedSize() {}
set foldedSize(value) {}
```

Property Value

Size

A Size instance specifying the folded size of a container.

Remarks

If this property is not set, the width of the folded container is set to its minimumSize.width, and the height to captionHeight.

See Also

ContainerNode Members
ContainerNode Class

MindFusion.Diagramming Namespace

ContainerPage Members

Represents a page in a PagedContainerNode.

The following tables list the members exposed by the ContainerPage type.

Public Constructors

	Name	Description
	ContainerPage	Initializes a new instance of the ContainerPage class.

Public Properties

	Name	Description
	links	Gets the links on this page.
	nodes	Gets the nodes on this page.

	title	Gets or sets the title of this page.

Public Methods

	Name	Description
	fromJson	Deserializes the page from a JSON object.
	loadFromXml	Loads the page's content from an XML element.
	saveToXml	Saves the page's content into an XML element.
	toJson	Serializes the page to a JSON object.

See Also

ContainerPage Class
MindFusion.Diagramming Namespace

ContainerPage Constructor

Initializes a new instance of the ContainerPage class.

Namespace: MindFusion.Diagramming
Assembly: ContainerPage.js

Syntax

JavaScript Copy Code

```
function ContainerPage ([prototype])
```

Parameters

prototype
Optional.
ContainerPage. A prototype to copy.

See Also

ContainerPage Class
MindFusion.Diagramming Namespace

ContainerPage Methods

ContainerPage.fromJson Method

Deserializes the page from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: ContainerPage.js

Syntax

JavaScript Copy Code

```
function fromJson (json, context)
```

Parameters

json

context

See Also

ContainerPage Members
ContainerPage Class
MindFusion.Diagramming Namespace

ContainerPage.loadFromXml Method

Loads the page's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: ContainerPage.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process.

See Also

ContainerPage Members
ContainerPage Class
MindFusion.Diagramming Namespace

ContainerPage.saveToXml Method

Saves the page's content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: ContainerPage.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process.

See Also

ContainerPage Members
ContainerPage Class
MindFusion.Diagramming Namespace

ContainerPage.toJson Method

Serializes the page to a JSON object.

Namespace: MindFusion.Diagramming
Assembly: ContainerPage.js

Syntax

JavaScript Copy Code

```
function toJson (context)
```

Parameters

context

Return Value

See Also

ContainerPage Members
ContainerPage Class
MindFusion.Diagramming Namespace

ContainerPage Properties

ContainerPage.links Property

Gets the links on this page.

Namespace: MindFusion.Diagramming
Assembly: ContainerPage.js

Syntax

JavaScript Copy Code

```
get links() {}
set links(value) {}
```

Property Value

Array

An array of DiagramLink objects.

Remarks

Unlike nodes, the control does not add links to this collection automatically, as ownership could be ambiguous (when considering nested containers, cross-container links, etc). This list lets you associate links with a page yourself when you want it hidden along with the page. The container automatically hides links between direct child nodes of non-current page.

See Also

ContainerPage Members
ContainerPage Class
MindFusion.Diagramming Namespace

ContainerPage.nodes Property

Gets the nodes on this page.

Namespace: MindFusion.Diagramming
Assembly: ContainerPage.js

Syntax

JavaScript Copy Code

```
get nodes() {}
set nodes(value) {}
```

Property Value

Array

An array of DiagramNode objects.

Remarks

PagedContainerNode automatically adds child nodes to this list when users drag them into currentPage.

See Also

ContainerPage Members
ContainerPage Class
MindFusion.Diagramming Namespace

ContainerPage.title Property

Gets or sets the title of this page.

Namespace: MindFusion.Diagramming
Assembly: ContainerPage.js

Syntax

JavaScript Copy Code

```
get title() {}
set title(value) {}
```

Property Value

String

A string containing title text.

Remarks

PagedContainerNode set its text to the title of currentPage.

MindFusion.Diagramming Namespace

ControlNode Class

ControlNode instances are diagram nodes that render HTML content.

Syntax

JavaScript Copy Code

```
// class
ControlNode.prototype = {}
```

Remarks

ControlNode objects display custom HTML content, specified via their template property. A node's DOM structure is created inside the Content div element, which is then rendered on top of the diagram canvas. Note that this prevents

ControlNodes drawing in diagram' usual Z order, and they will always appear on top of other diagram items.

By default the diagram intercepts mouse events of all hosted html elements to enable moving nodes or drawing links. You can specify that interactive elements, such as buttons or text boxes, should receive input instead by setting their **data-interactive** attribute to **true**.

You can register event handlers for elements in the template by assigning function names to **data-event** attributes in the form data-event-'eventName'='handlerName'. Alternatively, you can attach event listeners using DOM API once nodeDomCreated is raised to signify that **content** is available. E.g. access child elements by calling args.getNode().getContent().querySelector(...) and attach handlers via elements' **addEventListener** method.

ControlNodes create DOM elements from their template only in the main diagram view, and render images instead when shown in Overview or NodeListView. Note that in this case image elements in the template will render only if specified in base64 format. The Utils.toDataUrl method helps you convert an image URL to base64 data URL.

ControlNode Members

ControlNode instances are diagram nodes that render HTML content.

The following tables list the members exposed by the **ControlNode** type.

Public Constructors

	Name	Description
	ControlNode	Initializes a new instance of the **ControlNode** class with default values supplied from the specified Diagram.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)

	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)

	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	template	Gets or sets HTML string representing the DOM content rendered by this node.
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	visible	DiagramItem.visible override. Gets or sets whether this node is visible.
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	clone	DiagramNode.clone override.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	createImage	Creates the background svg image.
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	fromJson	DiagramNode.fromJson override.
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)

	getContent	Gets the content element of this node.
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	init	Returns a Builder object used to configure this ControlNode instance.
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	loadFromXml	DiagramNode.loadFromXml override. Loads the node's content from an XML element.
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	onUpdateBounds	DiagramNode.onUpdateBounds override.

	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	removeCanvasElements	DiagramNode.removeCanvasElements override.
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveToXml	Saves the node's content into an XML element.
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	toJson	DiagramNode.toJson override.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
S	With	Returns a Builder object used to configure and create new **ControlNode** instances.
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)

CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)
CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
LoadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
LoadFromXml	DiagramItem.LoadFromXml override. (Inherited from DiagramNode.)
LoadObsolete	For internal use. (Inherited from DiagramItem.)
OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
Repaint	Overloaded. (Inherited from DiagramItem.)
RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)

	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramNode.)
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

ControlNode Class
MindFusion.Diagramming Namespace

ControlNode Constructor

Initializes a new instance of the ControlNode class with default values supplied from the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: ControlNode.js

Syntax

JavaScript Copy Code

```
function ControlNode ([diagramView])
```

Parameters

diagramView
Optional.
DiagramView. The DiagramView from which to obtain default values for the node properties.

See Also

ControlNode Class
MindFusion.Diagramming Namespace

ControlNode Methods

ControlNode.clone Method

DiagramNode.clone override.

Namespace: MindFusion.Diagramming
Assembly: ControlNode.js

Syntax

JavaScript Copy Code

```
function clone ()
```

ControlNode Members
ControlNode Class
MindFusion.Diagramming Namespace

ControlNode.createImage Method

Creates the background svg image.

Namespace: MindFusion.Diagramming
Assembly: ControlNode.js

Syntax

JavaScript Copy Code

```
function createImage ()
```

See Also

ControlNode Members
ControlNode Class
MindFusion.Diagramming Namespace

ControlNode.fromJson Method

DiagramNode.fromJson override.

Namespace: MindFusion.Diagramming
Assembly: ControlNode.js

Syntax

```
JavaScript                                                    Copy Code
function fromJson ()
```

See Also

ControlNode Members
ControlNode Class
MindFusion.Diagramming Namespace

ControlNode.getContent Method

Gets the content element of this node.

Namespace: MindFusion.Diagramming
Assembly: ControlNode.js

Syntax

```
JavaScript                                                    Copy Code
function getContent ()
```

Return Value

The **div** element hosting HTML content generated from template.

Remarks

The diagram raises nodeDomCreated event once DOM elements have been created from template.

ControlNode.init Method

Returns a Builder object used to configure this ControlNode instance.

Namespace: MindFusion.Diagramming
Assembly: ControlNode.js

Syntax

```
JavaScript                                                    Copy Code
function init ()
```

Return Value

A Builder instance.

MindFusion.Diagramming Namespace

ControlNode.loadFromXml Method

DiagramNode.loadFromXml override. Loads the node's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: ControlNode.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

ControlNode.saveToXml Method

Saves the node's content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: ControlNode.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

ControlNode.toJson Method

DiagramNode.toJson override.

Namespace: MindFusion.Diagramming
Assembly: ControlNode.js

Syntax

JavaScript Copy Code

```
function toJson ()
```

See Also

ControlNode Members
ControlNode Class
MindFusion.Diagramming Namespace

ControlNode.With Method

Returns a Builder object used to configure and create new ControlNode instances.

Namespace: MindFusion.Diagramming
Assembly: ControlNode.js

Syntax

JavaScript Copy Code

```
function With (diagram)
```

Parameters

diagram

Return Value

A Builder instance.

ControlNode Members
ControlNode Class
MindFusion.Diagramming Namespace

ControlNode Properties

ControlNode.template Property

Gets or sets HTML string representing the DOM content rendered by this node.

Namespace: MindFusion.Diagramming
Assembly: ControlNode.js

Syntax

JavaScript Copy Code

```
get template() {}
set template(value) {}
```

Property Value

String

A string containing HTML markup.

Remarks

The diagram raises nodeDomCreated event once DOM elements have been created from this template.

ControlNode Members
ControlNode Class
MindFusion.Diagramming Namespace

ControlNode.visible Property

DiagramItem.visible override. Gets or sets whether this node is visible.

Namespace: MindFusion.Diagramming
Assembly: ControlNode.js

Syntax

JavaScript Copy Code

```
get visible() {}
set visible(value) {}
```

Property Value

Boolean

true if this node should be displayed, or **false** otherwise.

MindFusion.Diagramming Namespace

CreateLinkController Members

A controller used to draw new links in the diagram.

The following tables list the members exposed by the CreateLinkController type.

Public Constructors

	Name	Description
	CreateLinkController	Initializes a new instance of the CreateLinkController class.

Public Methods

	Name	Description
	cancel	Called when the user stops drawing or modifying a diagram element, rejecting the operation. (Inherited from SinglePointerController.)
	commit	SinglePointerController.commit override.
	drawInteraction	SinglePointerController.drawInteraction override.
	move	SinglePointerController.move override.
	start	SinglePointerController.start override.
	validate	SinglePointerController.validate override.

CreateLinkController Class
MindFusion.Diagramming Namespace

CreateLinkController Constructor

Initializes a new instance of the CreateLinkController class.

Namespace: MindFusion.Diagramming
Assembly: CreateLinkController.js

Syntax

JavaScript Copy Code

```
function CreateLinkController (diagram, link)
```

Parameters

diagram
Diagram. The parent diagram of the new link.

link
DiagramLink. The link that will be drawn by this controller.

See Also

CreateLinkController Class
MindFusion.Diagramming Namespace

CreateLinkController Methods

CreateLinkController.commit Method

SinglePointerController.commit override.

Namespace: MindFusion.Diagramming
Assembly: CreateLinkController.js

Syntax

JavaScript Copy Code

```
function commit (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

CreateLinkController Members
CreateLinkController Class
MindFusion.Diagramming Namespace

CreateLinkController.drawInteraction Method

SinglePointerController.drawInteraction override.

Namespace: MindFusion.Diagramming
Assembly: CreateLinkController.js

Syntax

JavaScript Copy Code

```
function drawInteraction (context)
```

Parameters

context
DrawingContext2D. The drawing context for diagram's underlying canvas.

See Also

CreateLinkController Members
CreateLinkController Class
MindFusion.Diagramming Namespace

CreateLinkController.move Method

SinglePointerController.move override.

Namespace: MindFusion.Diagramming
Assembly: CreateLinkController.js

Syntax

JavaScript Copy Code

```
function move (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

CreateLinkController Members
CreateLinkController Class
MindFusion.Diagramming Namespace

CreateLinkController.start Method

SinglePointerController.start override.

Namespace: MindFusion.Diagramming
Assembly: CreateLinkController.js

Syntax

JavaScript Copy Code

```
function start (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

CreateLinkController Members
CreateLinkController Class
MindFusion.Diagramming Namespace

CreateLinkController.validate Method

SinglePointerController.validate override.

Namespace: MindFusion.Diagramming
Assembly: CreateLinkController.js

Syntax

JavaScript Copy Code

```
function validate (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

Return Value

Boolean. true to accept the operation, or false otherwise.

See Also

CreateLinkController Members
CreateLinkController Class

CreateNodeController Members

A controller used to draw new nodes in the diagram.

The following tables list the members exposed by the CreateNodeController type.

Public Constructors

	Name	Description
	CreateNodeController	Initializes a new instance of the CreateNodeController class.

Public Methods

	Name	Description
	cancel	Called when the user stops drawing or modifying a diagram element, rejecting the operation. (Inherited from SinglePointerController.)
	commit	SinglePointerController.commit override.
	drawInteraction	SinglePointerController.drawInteraction override.
	move	SinglePointerController.move override.
	start	SinglePointerController.start override.
	validate	SinglePointerController.validate override.

See Also

CreateNodeController Class
MindFusion.Diagramming Namespace

CreateNodeController Constructor

Initializes a new instance of the CreateNodeController class.

Namespace: MindFusion.Diagramming
Assembly: CreateNodeController.js

Syntax

JavaScript Copy Code

```
function CreateNodeController (diagram, node)
```

Parameters

diagram
Diagram. The parent diagram of the new node.

node
DiagramNode. The node that will be drawn by this controller.

See Also

CreateNodeController Class
MindFusion.Diagramming Namespace

CreateNodeController Methods

CreateNodeController.commit Method

SinglePointerController.commit override.

Namespace: MindFusion.Diagramming
Assembly: CreateNodeController.js

Syntax

JavaScript Copy Code

```
function commit (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

CreateNodeController Members
CreateNodeController Class

CreateNodeController.drawInteraction Method

SinglePointerController.drawInteraction override.

Namespace: MindFusion.Diagramming
Assembly: CreateNodeController.js

Syntax

JavaScript Copy Code

```
function drawInteraction (context)
```

Parameters

context
DrawingContext2D. The drawing context for diagram's underlying canvas.

See Also

CreateNodeController Members
CreateNodeController Class
MindFusion.Diagramming Namespace

CreateNodeController.move Method

SinglePointerController.move override.

Namespace: MindFusion.Diagramming
Assembly: CreateNodeController.js

Syntax

JavaScript Copy Code

```
function move (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

CreateNodeController Members

CreateNodeController.start Method

SinglePointerController.start override.

Namespace: MindFusion.Diagramming
Assembly: CreateNodeController.js

Syntax

JavaScript Copy Code

```
function start (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

CreateNodeController Members
CreateNodeController Class
MindFusion.Diagramming Namespace

CreateNodeController.validate Method

SinglePointerController.validate override.

Namespace: MindFusion.Diagramming
Assembly: CreateNodeController.js

Syntax

JavaScript — Copy Code

```
function validate (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

Return Value

Boolean. true to accept the operation, or false otherwise.

See Also

CreateNodeController Members
CreateNodeController Class
MindFusion.Diagramming Namespace

CreateSelectionController Class

A controller used to draw selection rectangle in the diagram.

Syntax

JavaScript — Copy Code

```
// class
CreateSelectionController.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.SinglePointerController
MindFusion.Diagramming.CreateSelectionController

See Also

CreateSelectionController Members
MindFusion.Diagramming Namespace

CreateSelectionController Members

A controller used to draw selection rectangle in the diagram.

The following tables list the members exposed by the CreateSelectionController type.

Public Constructors

	Name	Description
	CreateSelectionController	Initializes a new instance of the CreateSelectionController class.

Public Methods

	Name	Description
	cancel	Called when the user stops drawing or modifying a diagram element, rejecting the operation. (Inherited from SinglePointerController.)
	commit	SinglePointerController.commit override.
	drawInteraction	SinglePointerController.drawInteraction override.
	move	SinglePointerController.move override.

	start	SinglePointerController.start override.
	validate	Called to validate the operation at current pointer position. (Inherited from SinglePointerController.)

See Also

CreateSelectionController Class
MindFusion.Diagramming Namespace

CreateSelectionController Constructor

Initializes a new instance of the CreateSelectionController class.

Namespace: MindFusion.Diagramming
Assembly: CreateSelectionController.js

Syntax

JavaScript Copy Code

```
function CreateSelectionController (selection)
```

Parameters

selection
Selection. The selection that will be drawn by this controller.

See Also

CreateSelectionController Class
MindFusion.Diagramming Namespace

CreateSelectionController Methods

CreateSelectionController.commit Method

SinglePointerController.commit override.

Namespace: MindFusion.Diagramming
Assembly: CreateSelectionController.js

Syntax

JavaScript Copy Code

```
function commit (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

CreateSelectionController Members
CreateSelectionController Class
MindFusion.Diagramming Namespace

CreateSelectionController.drawInteraction Method

SinglePointerController.drawInteraction override.

Namespace: MindFusion.Diagramming
Assembly: CreateSelectionController.js

Syntax

```
JavaScript                                                    Copy Code
function drawInteraction (context)
```

Parameters

context
DrawingContext2D. The drawing context for diagram's underlying canvas.

See Also

CreateSelectionController Members
CreateSelectionController Class
MindFusion.Diagramming Namespace

CreateSelectionController.move Method

SinglePointerController.move override.

Namespace: MindFusion.Diagramming
Assembly: CreateSelectionController.js

Syntax

```
JavaScript                                                    Copy Code
function move (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

CreateSelectionController Members
CreateSelectionController Class
MindFusion.Diagramming Namespace

CreateSelectionController.start Method

SinglePointerController.start override.

Namespace: MindFusion.Diagramming
Assembly: CreateSelectionController.js

Syntax

```
JavaScript                                                    Copy Code
function start (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

CreateSelectionController Members
CreateSelectionController Class
MindFusion.Diagramming Namespace

DelKeyAction Enumeration

Specifies the type of action performed when the user presses the DEL key.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
DelKeyAction = {}
```

Members

	Member name	Description
	None	Indicates that nothing happens.
	DeleteActiveItem	Indicates that only the activeItem is deleted.
	DeleteSelectedItems	Indicates that all selected items are deleted.

Remarks

Members of this enumeration can be assigned to the delKeyAction property of DiagramView.

See Also

MindFusion.Diagramming Namespace

Diagram Class

The **Diagram** class represents a flow diagram.

Syntax

JavaScript — Copy Code

```
// class
Diagram.prototype = {}
```

Remarks

A diagram can contain connected nodes and links. Nodes are instances of DiagramNode-derived classes. Nodes are stored in the nodes collection. Links in MindFusion.Diagramming for JavaScript are instances of the DiagramLink class and are stored in the links collection.

Managing items

Items can be created by using the **new** operator and added to the diagram by means of the addItem method. Items can be deleted by calling the removeItem method. There are shortcut methods provided by the diagram's Factory object that can be used to create an item and add it to the diagram with just one method call, for example createShapeNode and createDiagramLink.

Controlling Users' Actions

Users actions can be validated by handling various events, fired while items are being created, modified or deleted. The allowInplaceEdit property controls whether users are allowed to edit text by double clicking on items.

Inheritance Hierarchy

MindFusion.Diagramming.DiagramBase

See Also

Diagram Members

The Diagram class represents a flow diagram.

The following tables list the members exposed by the **Diagram** type.

Public Constructors

	Name	Description
	Diagram	Initializes a new instance of the Diagram class.

Public Properties

	Name	Description
	activeItem	Gets the active diagram item.
	activeItemHandlesStyle	Gets or sets the visual style of adjustment handles of the active item.
	adjustmentHandlesSize	Gets or sets the size of adjustment handles that appear around selected items.
	alignToGrid	Gets or sets a value indicating whether the diagram items should be aligned to a grid.
	allowLinksRepeat	Gets or sets a value indicating whether more than one links can connect the same origin and destination diagram nodes.
	allowMultipleResize	Gets or sets a value indicating whether multiple selected nodes can be resized simultaneously.
	allowSelfLoops	Gets or sets a value indicating whether users are allowed to draw reflexive links.
	allowSplitLinks	Gets or sets a value indicating whether link segments can be added and removed interactively.
	allowUnanchoredLinks	Gets or sets a value indicating whether users can link nodes that do not have designated anchor points.
	allowUnconnectedLinks	Gets or sets a value indicating whether users are allowed to draw links that are not connected to any node.
	autoArrangeAvoidContainers	Gets or sets a value indicating whether auto-arranged link labels should avoid containers.
	autoArrangeAvoidSegments	Gets or sets a value indicating whether auto-arranged link labels should avoid link segments.
	autoCloseDistance	Gets or sets the maximum distance between first and last points of a FreeFormNode for which the node's outline is closed automatically.
	autoDeleteLinks	Gets or sets whether links are deleted automatically when their origin or destination is deleted.
	autoResize	Gets or sets a value indicating whether the document area should be resized automatically so it fits the diagram contents.
	backBrush	Gets or sets an object specifying how to fill the diagram background.
	backgroundImageAlign	Gets or sets a value indicating how to align the background image.
	backgroundImageContent	Gets or sets a Base64-encoded image to display as diagram background.
	backgroundImageUrl	Gets or sets URL of the image to paint as diagram's background.

	crossingRadius	Gets or sets the radius length of decorations displayed at link intersection points.
	customLinkType	Gets or sets the type of DiagramLink objects to create when users starts drawing.
	customNodeType	Gets or sets the type of DiagramNode objects to create when users starts drawing.
	defaultShape	Gets or sets the default shape assigned to new ShapeNode objects.
	dirty	Gets or sets a value indicating whether the diagram has changed since loading it.
	disabledHandlesStyle	Gets or sets the visual style of disabled adjustment handles.
	dynamicLinks	Gets or sets initial value of the dynamic property of new links.
	enableSpatialIndex	Gets or sets whether to index item positions for faster hit-testing and viewport clipping queries.
	expandButtonAction	Gets or sets how the control responds to users clickingthe +/- button displayed by expandable nodes.
	expandOnIncoming	Gets or sets a value indicating the link direction in which tree branches are expanded.
	factory	Gets a Factory object that lets you programmatically add new items to the diagram.
	font	Gets or sets the default font of text displayed by diagram items.
	freeFormAttractDistance	Gets or sets the radius around dragged free-form adjustment handle in which other points of **FreeFormNode** are modified too.
	freeFormTargets	Gets or sets an array of Shape objects used to replace **FreeFormNode** instances with ShapeNode ones when behavior is set to LinkFreeShapes or **DrawFreeShapes**.
	gridColor	Gets or sets the color of grid points.
	gridOffsetX	Gets or sets the horizontal offset of the first point of the alignment grid.
	gridOffsetY	Gets or sets the vertical offset of the first point of the alignment grid.
	gridPointSize	Gets or sets the size of shapes used to represent grid points.
	gridSizeX	Gets or sets the horizontal distance between adjacent grid points.
	gridSizeY	Gets or sets the vertical distance between adjacent grid points.
	gridStyle	Gets or sets the visual style of the alignment grid.
	items	Returns an array of all items in this diagram.
	laneGrid	Gets the lane grid.
	linkBaseShape	Gets or sets the shape displayed at the base of new links.
	linkBaseShapeSize	Gets or sets the default size of arrowheads at base of new links.
	linkBrush	Gets or sets the default fill of link arrowheads.
	linkCrossings	Gets or sets a value indicating how to render the intersection points of links.
	linkHeadShape	Gets or sets the shape displayed as head of new links.
	linkHeadShapeSize	Gets or sets the default size of arrowheads.
	linkHitDistance	Gets or sets a value specifying how far from a link a click is still considered a hit.
	linkPen	Gets or sets the default stroke of links.

	linkRouter	Gets or sets the object used to find paths for auto-routed links when diagram nodes are added or their positions change.
	links	Returns an array of all links in this diagram.
	linkSegments	Gets or sets the default number of link segments.
	linkShape	Gets or sets the initial shape assigned to new links.
	linkTextStyle	Gets or sets the default text placement and orientation of new links.
	mergeThreshold	Gets or sets the maximum distance between adjacent control points of a link at which the respective segments can be merged.
	nodeEffects	Gets the global effects applied to nodes in this diagram.
	nodes	Returns an array of all nodes in this diagram.
	nodesExpandable	Gets or sets a value indicating whether newly created nodes are expandable.
	roundedLinks	Gets or sets a value indicating whether the joints between segments of Polyline and **Cascading** links should be rounded.
	roundedLinksRadius	Gets or sets the radius of joint arcs of rounded links' segments.
	routeLinks	Gets or sets initial value of the autoRoute property of new links.
	routeMargin	Gets or sets the minimal distance between nodes and auto-routed links.
	selectedItemHandlesStyle	Gets or sets the visual style of adjustment handles of selected items.
	selection	Gets a Selection instance that represents the selection of items in this diagram.
	shadowOffsetX	Gets or sets the horizontal offset of items' shadows.
	shadowOffsetY	Gets or sets the vertical offset of items' shadows.
	shadowsStyle	Gets or sets the style of shadows.
	shapeBrush	Gets or sets the default fill of **ShapeNode** objects.
	shapeLibraryLocation	Gets or sets the location of a shape library file containing custom shape definitions. It can be set to a full URL of the file, or a relative file path.
	shapePen	Gets or sets the default stroke of **ShapeNode** objects.
	showAnchors	Gets or sets a value indicating when to display anchor point marks.
	showDisabledHandles	Gets or sets a value indicating whether adjustment handles are painted when they are disabled.
	showGrid	Gets or sets a value indicating whether the alignment grid is visible.
	showLaneGrid	Gets or sets a value indicating whether the lane grid is visible.
	style	Gets or sets the style associated with this diagram.
	tag	Gets or sets custom data associated with this diagram.
	theme	Gets or sets the theme associated with this diagram.
	undoEnabled	Gets or sets a value indicating whether saving action records for later undo is enabled.
	validityChecks	Gets or sets a value indicating whether validity checks are performed each time an item is added to the diagram.
	version	Gets a string identifying current version of the library.
	XmlOptions	An XmlOptions object providing properties for customizing the XML serialization process. (Inherited from DiagramBase.)

Public Methods

	Name	Description
	addItem	Adds an item to the **Diagram**.
	alignPointToGrid	Returns a point of the alignment grid nearest to the one passed as an argument.
	arrange	Arranges the **diagram** with the given layout.
	arrangeAnimated	Arranges the diagram using the given layout, and animates items moving to their new positions.
	arrangeLinkLabels	Rearranges link labels whose autoArrange property is enabled.
	cancelCompositeOperation	Stops recording undo/redo commands into a CompositeCommand and discards the records created so far.
	clearAll	Removes all items from the diagram.
	commitCompositeOperation	Stops recording undo/redo commands into a **CompositeCommand** and saves the composite in the history queue.
	executeCommand	Executes the specified command on this diagram.
	fromJson	Deserializes the diagram from a JSON string.
	fromXmlDocument	Loads diagram contents from specified XML Document.
	getContentBounds	Returns the smallest rectangle that bounds all diagram items.
	getItemAt	Finds and returns the topmost DiagramItem found at the specified location.
	getItemsAt	Finds and returns an array of the **diagram items** found at the specified location.
	getLinkAt	Finds and returns the topmost **DiagramLink** found at the specified location.
	getLinksAt	Finds and returns an array of the diagram **DiagramLink**s found at the specified location.
	getNearestNode	Returns the node nearest to the specified point.
	getNodeAt	Finds and returns the topmost **DiagramNode** found at the specified location.
	getNodesAt	Finds and returns an array of the **DiagramNode**s found at the specified location.
	isItemInteractive	Checks if the specified item can be modified interactively.
	isItemVisible	Checks if the specified item is currently visible.
	loadFromString	Loads diagram contents from specified XML or JSON string.
	loadFromXml	Loads the diagram from an XML file.
	raiseClicked	Raises an event which notifies that a Diagram item has been clicked.
	raiseCreated	Raises an event which notifies that a Diagram item has been created.
	raiseDeleted	Raises an event which notifies that a Diagram item has been deleted.
	raiseDeselected	Raises an event which notifies that a Diagram item has been deselected.
	raiseDoubleClicked	Raises an event which notifies that a Diagram item has been double-clicked.
	raiseModified	Raises an event which notifies that a Diagram item has been modified.

	RaiseNodeModifying	Raises the NodeModifying event. (Inherited from DiagramBase.)
	raisePasted	Raises an event which notifies that a Diagram item has been pasted from clipboard.
	raiseSelected	Raises an event which notifies that a Diagram item has been selected.
	raiseSelecting	Raises an event which notifies that a Diagram item will be selected.
	raiseSelectionChanged	Raises an event which notifies that the selection has changed.
	redo	Executes again an action saved in the command history.
S	registerClass	Registers a diagram item class.
S	registerComponent	Registers a component class.
S	registerItemClass	Registers a diagram item class for XML serialization support.
	removeItem	Removes the specified **item** from the **Diagram**.
	resizeToFitItem	Resize the document extents so that the specified item is contained within.
	resizeToFitItems	Resizes the document scrollable area so that it fits all diagram items.
	routeAllLinks	Routes all links in the diagram in such a way they do not cross nodes.
	saveToString	Encodes the diagram contents into an XML or JSON string.
	saveToXml	Saves the diagram to an XML file.
	startCompositeOperation	Starts recording undo/redo commands into a **CompositeCommand**.
	toJson	Serializes the diagram into a JSON string.
	toXmlDocument	Saves the diagram into an XML Document.
	TrackMouseHover	Specifies whether the diagram view should track mouse hover events. (Inherited from DiagramBase.)
	undo	Undoes an action saved in the command history.

Protected Methods

	Name	Description
	OnActionRecorded	Raises the ActionRecorded event. (Inherited from DiagramBase.)
	OnActionRecording	Raises the ActionRecording event. (Inherited from DiagramBase.)
	OnActionRedone	Raises the ActionRedone event. (Inherited from DiagramBase.)
	OnActionUndone	Raises the ActionUndone event. (Inherited from DiagramBase.)
	OnBeginLoad	Raises the BeginLoad event. (Inherited from DiagramBase.)
	OnBoundsChanged	Raises the BoundsChanged event. (Inherited from DiagramBase.)
	OnCellClicked	Raises the CellClicked event. (Inherited from DiagramBase.)
	OnCellDoubleClicked	Raises the CellDoubleClicked event. (Inherited from DiagramBase.)
	OnCellTextEdited	Raises the CellTextEdited event. (Inherited from DiagramBase.)
	OnCellTextEditing	Raises the CellTextEditing event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnClicked	Raises the Clicked event. (Inherited from DiagramBase.)
	OnContainerChildAdded	Raises the ContainerChildAdded event. (Inherited from DiagramBase.)

	OnContainerChildRemoved	Raises the ContainerChildRemoved event. (Inherited from DiagramBase.)
	OnContainerFolded	Raises the ContainerFolded event. (Inherited from DiagramBase.)
	OnContainerPageChanged	Raises the ContainerPageChanged event. (Inherited from DiagramBase.)
	OnContainerUnfolded	Raises the ContainerUnfolded event. (Inherited from DiagramBase.)
	OnContentVisibilityChanged	Raises the ContentVisibilityChanged event. (Inherited from DiagramBase.)
	OnDefaultShapeChanged	Raises the DefaultShapeChanged event. (Inherited from DiagramBase.)
	OnDeserializeTag	Raises the DeserializeTag event. (Inherited from DiagramBase.)
	OnDestinationAnchorChanged	Raises the DestinationAnchorChanged event. (Inherited from DiagramBase.)
	OnDirtyChanged	Raises the DirtyChanged event. (Inherited from DiagramBase.)
	OnDoubleClicked	Raises the DoubleClicked event. (Inherited from DiagramBase.)
	OnDrawAdjustmentHandles	Raises the DrawAdjustmentHandles event. (Inherited from DiagramBase.)
	OnDrawAnchorPoint	Raises the DrawAnchorPoint event. (Inherited from DiagramBase.)
	OnDrawBackground	Raises the DrawBackground event. (Inherited from DiagramBase.)
	OnDrawBranchIndicator	Raises the DrawBranchIndicator event. (Inherited from DiagramBase.)
	OnDrawCell	Raises the DrawCell event. (Inherited from DiagramBase.)
	OnDrawForeground	Raises the DrawForeground event. (Inherited from DiagramBase.)
	OnDrawLink	Raises the DrawLink event. (Inherited from DiagramBase.)
	OnDrawNode	Raises the DrawNode event. (Inherited from DiagramBase.)
	OnEndLoad	Raises the EndLoad event. (Inherited from DiagramBase.)
	OnExpandButtonClicked	Raises the ExpandButtonClicked event. (Inherited from DiagramBase.)
	OnGroupDestroyed	Raises the GroupDestroyed event. (Inherited from DiagramBase.)
	OnHitTestAdjustmentHandles	Raises the HitTestAdjustmentHandles event. (Inherited from DiagramBase.)
	OnInitializeLasso	Raises the InitializeLasso event. (Inherited from DiagramBase.)
	OnInitializeLink	Raises the InitializeLink event. (Inherited from DiagramBase.)
	OnInitializeNode	Raises the InitializeNode event. (Inherited from DiagramBase.)
	OnItemAdded	Raises the ItemAdded event. (Inherited from DiagramBase.)
	OnItemRemoved	Raises the ItemRemoved event. (Inherited from DiagramBase.)
	OnJsonDeserializeTag	Raises the JsonDeserializeTag event. (Inherited from DiagramBase.)
	OnJsonSerializeTag	Raises the JsonSerializeTag event. (Inherited from DiagramBase.)
	OnLayerVisibilityChanged	Raises the LayerVisibilityChanged event. (Inherited from DiagramBase.)
	OnLinkActivated	Raises the LinkActivated event. (Inherited from DiagramBase.)
	OnLinkClicked	Raises the LinkClicked event. (Inherited from DiagramBase.)
	OnLinkCreateCancelled	Raises the LinkCreateCancelled event. (Inherited from DiagramBase.)
	OnLinkCreated	Raises the LinkCreated event. (Inherited from DiagramBase.)
	OnLinkCreating	Raises the LinkCreating event. (Inherited from DiagramBase.)
	OnLinkDeactivated	Raises the LinkDeactivated event. (Inherited from DiagramBase.)

	OnLinkDeleted	Raises the LinkDeleted event. (Inherited from DiagramBase.)
	OnLinkDeleting	Raises the LinkDeleting event. (Inherited from DiagramBase.)
	OnLinkDeselected	Raises the LinkDeselected event. (Inherited from DiagramBase.)
	OnLinkDoubleClicked	Raises the LinkDoubleClicked event. (Inherited from DiagramBase.)
	OnLinkHovered	Raises the LinkHovered event. (Inherited from DiagramBase.)
	OnLinkModified	Raises the LinkModified event. (Inherited from DiagramBase.)
	OnLinkModifyCancelled	Raises the LinkModifyCancelled event. (Inherited from DiagramBase.)
	OnLinkModifying	Raises the LinkModifying event. (Inherited from DiagramBase.)
	OnLinkPasted	Raises the LinkPasted event. (Inherited from DiagramBase.)
	OnLinkRouted	Raises the LinkRouted event. (Inherited from DiagramBase.)
	OnLinkSelected	Raises the LinkSelected event. (Inherited from DiagramBase.)
	OnLinkSelecting	Raises the LinkSelecting event. (Inherited from DiagramBase.)
	OnLinkSplit	Raises the LinkSplit event. (Inherited from DiagramBase.)
	OnLinkStartModifying	Raises the LinkStartModifying event. (Inherited from DiagramBase.)
	OnLinkTextEdited	Raises the LinkTextEdited event. (Inherited from DiagramBase.)
	OnLinkTextEditing	Raises the LinkTextEditing event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnMeasureUnitChanged	Raises the MeasureUnitChanged event. (Inherited from DiagramBase.)
	OnNodeActivated	Raises the NodeActivated event. (Inherited from DiagramBase.)
	OnNodeClicked	Raises the NodeClicked event. (Inherited from DiagramBase.)
	OnNodeCreateCancelled	Raises the NodeCreateCancelled event. (Inherited from DiagramBase.)
	OnNodeCreated	Raises the NodeCreated event. (Inherited from DiagramBase.)
	OnNodeCreating	Raises the NodeCreating event. (Inherited from DiagramBase.)
	OnNodeDeactivated	Raises the NodeDeactivated event. (Inherited from DiagramBase.)
	OnNodeDeleted	Raises the NodeDeleted event. (Inherited from DiagramBase.)
	OnNodeDeleting	Raises the NodeDeleting event. (Inherited from DiagramBase.)
	OnNodeDeselected	Raises the NodeDeselected event. (Inherited from DiagramBase.)
	OnNodeDoubleClicked	Raises the NodeDoubleClicked event. (Inherited from DiagramBase.)
	OnNodeHovered	Raises the NodeHovered event. (Inherited from DiagramBase.)
	OnNodeModified	Raises the NodeModified event. (Inherited from DiagramBase.)
	OnNodeModifyCancelled	Raises the NodeModifyCancelled event. (Inherited from DiagramBase.)
	OnNodeModifying	Raises the NodeModifying event. (Inherited from DiagramBase.)
	OnNodePasted	Raises the NodePasted event. (Inherited from DiagramBase.)
	OnNodeSelected	Raises the NodeSelected event. (Inherited from DiagramBase.)
	OnNodeSelecting	Raises the NodeSelecting event. (Inherited from DiagramBase.)
	OnNodeStartModifying	Raises the NodeStartModifying event. (Inherited from DiagramBase.)
	OnNodeTextEdited	Raises the NodeTextEdited event. (Inherited from DiagramBase.)

	OnNodeTextEditing	Raises the NodeTextEditing event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnOriginAnchorChanged	Raises the OriginAnchorChanged event. (Inherited from DiagramBase.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from DiagramBase.)
	OnQueryAlignTarget	Raises the QueryAlignTarget event. (Inherited from DiagramBase.)
	OnRepaint	Raises the Repaint event. (Inherited from DiagramBase.)
	OnRequestClipboard	Raises the RequestClipboard event. (Inherited from DiagramBase.)
	OnRequestDrawInteractions	Raises the RequestDrawInteractions event. (Inherited from DiagramBase.)
	OnRequestTimer	Raises the RequestTimer event. (Inherited from DiagramBase.)
	OnSelectionChanged	Raises the SelectionChanged event. (Inherited from DiagramBase.)
	OnSelectionModified	Raises the SelectionModified event. (Inherited from DiagramBase.)
	OnSelectionModifying	Raises the SelectionModifying event. (Inherited from DiagramBase.)
	OnSerializeTag	Raises the SerializeTag event. (Inherited from DiagramBase.)
	OnSetSelfLoopShape	Raises the SetSelfLoopShape event. (Inherited from DiagramBase.)
	OnShapeModified	Raises the ShapeModified event. (Inherited from DiagramBase.)
	OnShapeNotDefined	Raises the ShapeNotDefined event. (Inherited from DiagramBase.)
	OnTableColumnResized	Raises the TableColumnResized event. (Inherited from DiagramBase.)
	OnTableColumnResizing	Raises the TableColumnResizing event. (Inherited from DiagramBase.)
	OnTableRowResized	Raises the TableRowResized event. (Inherited from DiagramBase.)
	OnTableRowResizing	Raises the TableRowResizing event. (Inherited from DiagramBase.)
	OnTableSectionCollapsed	Raises the TableSectionCollapsed event. (Inherited from DiagramBase.)
	OnTableSectionExpanded	Raises the TableSectionExpanded event. (Inherited from DiagramBase.)
	OnTreeCollapsed	Raises the TreeCollapsed event. (Inherited from DiagramBase.)
	OnTreeExpanded	Raises the TreeExpanded event. (Inherited from DiagramBase.)
	OnTreeItemTextEditing	Raises the TreeItemTextEditing event. (Inherited from DiagramBase.)
	OnValidateAnchorPoint	Raises the ValidateAnchorPoint event. (Inherited from DiagramBase.)
	OnValidateLinkCrossing	Raises the ValidateLinkCrossing event. (Inherited from DiagramBase.)
	OnViewRemoved	Raises the ViewRemoved event. (Inherited from DiagramBase.)

Public Events

	Name	Description
	ActionRecorded	Raised when an action is recorded in the undo buffer. (Inherited from DiagramBase.)
	ActionRecording	A validation event raised before an action is recorded in the undo buffer. (Inherited from DiagramBase.)
	ActionRedone	Raised when an action is redone. (Inherited from DiagramBase.)
	ActionUndone	Raised when an action is undone. (Inherited from DiagramBase.)
	ActiveLayerChanged	Raised when the diagram's active layer has changed. (Inherited from DiagramBase.)

	BeginLoad	Raised when the component starts loading diagram data from a file or memory stream. (Inherited from DiagramBase.)
	BoundsChanged	Raised when the Bounds property value has changed. (Inherited from DiagramBase.)
	CellClicked	Raised when the user clicks a table's cell. (Inherited from DiagramBase.)
	CellDoubleClicked	Raised when the user double-clicks a table's cell. (Inherited from DiagramBase.)
	CellTextEdited	Raised when the user edits the text of a table's cell. (Inherited from DiagramBase.)
	CellTextEditing	A validation event that lets you approve or reject changes made to the text of a table's cell. (Inherited from DiagramBase.)
	Clicked	Raised when the user clicks the diagram at a point where no items are located. (Inherited from DiagramBase.)
	ContainerChildAdded	Raised when a node is added to a ContainerNode, either programmatically or by the user. (Inherited from DiagramBase.)
	ContainerChildRemoved	Raised when a node is removed from a **ContainerNode**, either programmatically or by the user. (Inherited from DiagramBase.)
	ContainerFolded	Raised when the user folds a container by clicking the arrow-up button in the container's caption bar. (Inherited from DiagramBase.)
	ContainerPageChanged	Raised when the user changes current page of a PagedContainerNode. (Inherited from DiagramBase.)
	ContainerUnfolded	Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar. (Inherited from DiagramBase.)
	ContentVisibilityChanged	Raised when the visibility of container's content changes. (Inherited from DiagramBase.)
	DefaultShapeChanged	Raised when the DefaultShape property value has changed. (Inherited from DiagramBase.)
	DeserializeTag	Raised when the Tag of a diagram item must be deserialized from XML format. (Inherited from DiagramBase.)
	DestinationAnchorChanged	Raised when the DestinationAnchor property value of a link has changed. (Inherited from DiagramBase.)
	DirtyChanged	Raised when the **Dirty** property value has changed. (Inherited from DiagramBase.)
	DoubleClicked	Raised when the user double-clicks the diagram at a point where no items are located. (Inherited from DiagramBase.)
	DrawAdjustmentHandles	Raised when item's adjustment handles must be custom-drawn. (Inherited from DiagramBase.)
	DrawAnchorPoint	Raised when an anchor point must be custom-drawn. (Inherited from DiagramBase.)
	DrawBackground	Raised to let you custom draw the diagram background. (Inherited from DiagramBase.)
	DrawBranchIndicator	Raised when a branch indicator must be custom-drawn. (Inherited from DiagramBase.)
	DrawCell	Raised when a table's cell must be custom drawn. (Inherited from DiagramBase.)
	DrawForeground	Raised to let you custom draw the diagram foreground. (Inherited from DiagramBase.)
	DrawLink	Raised when a diagram link must be custom drawn. (Inherited from DiagramBase.)

	DrawNode	Raised when a diagram node must be custom drawn. (Inherited from DiagramBase.)
	EndLoad	Raised when the component ends loading diagram data from a file or memory stream. (Inherited from DiagramBase.)
	ExpandButtonClicked	Raised when the user clicks the [±] button of an Expandable node. (Inherited from DiagramBase.)
	GroupDestroyed	Raised when a Group object is destroyed. (Inherited from DiagramBase.)
	HitTestAdjustmentHandles	Raised when custom hit testing of item's adjustment handles must be performed. (Inherited from DiagramBase.)
	InitializeLasso	Raised when the user starts drawing a selection lasso, before it is rendered on screen. (Inherited from DiagramBase.)
	InitializeLink	Raised when the user starts drawing a new link, just after the DiagramLink instance is created. (Inherited from DiagramBase.)
	InitializeNode	Raised when the user starts drawing a new node, just after the DiagramNode instance is created. (Inherited from DiagramBase.)
	ItemAdded	Raised when an item is added to the diagram, either programmatically or interactively. (Inherited from DiagramBase.)
	ItemRemoved	Raised when an item is removed from the diagram, either programmatically or interactively. (Inherited from DiagramBase.)
	JsonDeserializeTag	Raised when the **Tag** of a diagram item must be deserialized from JSON. (Inherited from DiagramBase.)
	JsonSerializeTag	Raised when the **Tag** of a diagram item must be serialized to JSON. (Inherited from DiagramBase.)
	LayerVisibilityChanged	Raised when the visibility of a Layer changes. (Inherited from DiagramBase.)
	LinkActivated	Raised when a link becomes the ActiveItem. (Inherited from DiagramBase.)
	LinkClicked	Raised when the user clicks a link. (Inherited from DiagramBase.)
	LinkCreateCancelled	Raised when the user cancels link creation. (Inherited from DiagramBase.)
	LinkCreated	Raised when the user draws a new link. (Inherited from DiagramBase.)
	LinkCreating	A validation event raised while the user is drawing a new link. (Inherited from DiagramBase.)
	LinkDeactivated	Raised when a link is no longer the **ActiveItem**. (Inherited from DiagramBase.)
	LinkDeleted	Raised when a link is deleted, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkDeleting	Raised when the user tries to delete a link, this event lets you cancel the operation. (Inherited from DiagramBase.)
	LinkDeselected	Raised when a link is deselected, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkDoubleClicked	Raised when the user double-clicks a link. (Inherited from DiagramBase.)
	LinkHovered	Raised when the mouse pointer hovers over a link. (Inherited from DiagramBase.)
	LinkModified	Raised when the user moves any control point of a link. (Inherited from DiagramBase.)
	LinkModifyCancelled	Raised when the user cancels move or resize operation being done on a link. (Inherited from DiagramBase.)
	LinkModifying	A validation event raised while the user is modifying a link. (Inherited from DiagramBase.)

	LinkPasted	Raised when a link has been pasted from the clipboard. (Inherited from DiagramBase.)
	LinkRouted	Raised when a link is routed by the auto-routing algorithm. (Inherited from DiagramBase.)
	LinkSelected	Raised when a link is selected, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkSelecting	Raised when the user tries to select a link, this event lets you cancel the operation. (Inherited from DiagramBase.)
	LinkSplit	Raised when the user splits a link interactively. (Inherited from DiagramBase.)
	LinkStartModifying	A validation event raised when the user starts modifying a link. (Inherited from DiagramBase.)
	LinkTextEdited	Raised when the user edits the text of a link. (Inherited from DiagramBase.)
	LinkTextEditing	A validation event that lets you approve or reject changes made to the text of a link. (Inherited from DiagramBase.)
	MeasureUnitChanged	Raised when the MeasureUnit property value has changed. (Inherited from DiagramBase.)
	NodeActivated	Raised when a node becomes the **ActiveItem**. (Inherited from DiagramBase.)
	NodeClicked	Raised when the user clicks a node. (Inherited from DiagramBase.)
	NodeCreateCancelled	Raised when the user cancels node creation. (Inherited from DiagramBase.)
	NodeCreated	Raised when the user draws a new node. (Inherited from DiagramBase.)
	NodeCreating	A validation event raised while the user is drawing a new node. (Inherited from DiagramBase.)
	NodeDeactivated	Raised when a node is no longer the **ActiveItem**. (Inherited from DiagramBase.)
	NodeDeleted	Raised when a node is deleted, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeDeleting	Raised when the user tries to delete a node, this event lets you cancel the operation. (Inherited from DiagramBase.)
	NodeDeselected	Raised when a node is deselected, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeDoubleClicked	Raised when the user double-clicks a node. (Inherited from DiagramBase.)
	NodeHovered	Raised when the mouse pointer hovers over a node. (Inherited from DiagramBase.)
	NodeModified	Raised when the user moves or resizes a node. (Inherited from DiagramBase.)
	NodeModifyCancelled	Raised when the user cancels move or resize operation being done on a node. (Inherited from DiagramBase.)
	NodeModifying	A validation event raised while the user is moving or resizing a node. (Inherited from DiagramBase.)
	NodePasted	Raised when a node has been pasted from the clipboard. (Inherited from DiagramBase.)
	NodeSelected	Raised when a node is selected, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeSelecting	Raised when the user tries to select a node, this event lets you cancel the operation. (Inherited from DiagramBase.)

	NodeStartModifying	A validation event raised when the user starts modifying a node. (Inherited from DiagramBase.)
	NodeTextEdited	Raised when the user edits the text of a node. (Inherited from DiagramBase.)
	NodeTextEditing	A validation event that lets you approve or reject changes made to the text of a node. (Inherited from DiagramBase.)
	OriginAnchorChanged	Raised when the OriginAnchor property value of a link has changed. (Inherited from DiagramBase.)
	PropertyChanged	INotifyPropertyChanged.PropertyChanged implementation. (Inherited from DiagramBase.)
	QueryAlignTarget	Raised to validate a node as target for alignment guides when AutoAlignNodes is enabled. (Inherited from DiagramBase.)
	Repaint	Raised when the diagram views should be repainted. (Inherited from DiagramBase.)
	RequestCacheReset	Raised when an object within the diagram requests a reset of the cached bitmap. (Inherited from DiagramBase.)
	RequestClipboard	Raised when an object within the diagram requests an operation with the clipboard. (Inherited from DiagramBase.)
	RequestDrawInteractions	For internal use. (Inherited from DiagramBase.)
	RequestTimer	Raised when an object within the diagram needs to start or stop a timer. (Inherited from DiagramBase.)
	SelectionChanged	Raised when an item is added to or removed from the selection (Inherited from DiagramBase.)
	SelectionModified	Raised when the user moves multiple selected items. (Inherited from DiagramBase.)
	SelectionModifying	Raised while the user is moving multiple selected items, this event lets you cancel the modification. (Inherited from DiagramBase.)
	SerializeTag	Raised when the **Tag** of a diagram item must be serialized into an XML document. (Inherited from DiagramBase.)
	SetSelfLoopShape	Raised when a link becomes a self-loop, giving you a chance to override the default look shape. (Inherited from DiagramBase.)
	ShapeModified	Raised when the user modifies the shape of a ShapeNode by moving one of the control points corresponding to shape formula parameters. (Inherited from DiagramBase.)
	ShapeNotDefined	Raised when the diagram being loaded contains nodes with an undefined shape. (Inherited from DiagramBase.)
	TableColumnResized	Raised when the user finishes resizing a column in a table. (Inherited from DiagramBase.)
	TableColumnResizing	Raised when the user resizes a column in a table interactively. (Inherited from DiagramBase.)
	TableRowResized	Raised when the user finishes resizing a row in a table. (Inherited from DiagramBase.)
	TableRowResizing	Raised when the user resizes a row in a table interactively. (Inherited from DiagramBase.)
	TableSectionCollapsed	Raised when the user collapses the rows of a table's section by clicking the [-] button in the section's header row. (Inherited from DiagramBase.)
	TableSectionExpanded	Raised when the user expands the rows of a table's section by clicking the [+] button in the section's header row. (Inherited from DiagramBase.)
	TreeCollapsed	Raised when a user collapses a tree branch by clicking the [-] button of an **Expandable** node. (Inherited from DiagramBase.)

	TreeExpanded	Raised when a user expands a tree branch by clicking the [+] button of an **Expandable** node. (Inherited from DiagramBase.)
	TreeItemTextEditing	A validation event that lets you approve or reject changes made to the text of a TreeViewNode's item. (Inherited from DiagramBase.)
	ValidateAnchorPoint	A validation event that lets you approve or reject connecting a link to an anchor point. (Inherited from DiagramBase.)
	ValidateLinkCrossing	A validation event that lets you approve or reject displaying a decoration at the intersection point of links. (Inherited from DiagramBase.)
	ViewRemoved	Raised when a DiagramView is detached from this diagram. (Inherited from DiagramBase.)

MindFusion.Diagramming Namespace

Diagram Constructor

Initializes a new instance of the Diagram class.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function Diagram ()
```

See Also

Diagram Class
MindFusion.Diagramming Namespace

Diagram Methods

Diagram.addItem Method

Adds an item to the Diagram.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function addItem (item)
```

Parameters

item
The DiagramItem to add.

Remarks

This method is called internally by methods of the Factory class. You should call it explicitly only if instantiating items using the **new** operator.

Example

JavaScript Copy Code

```
var node1 = new ShapeNode(diagram);
node1.bounds = new Drawing.Rect(20, 20, 30, 30);
diagram.addItem(node1);

var node2 = diagram.factory.createShapeNode(60, 20, 30, 30);
```

Diagram.alignPointToGrid Method

Returns a point of the alignment grid nearest to the one passed as an argument.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function alignPointToGrid (point)
```

Parameters

point
Point. A point specified in diagram coordinates.

Return Value

Point. A point from the alignment grid.

Remarks

The control aligns items to the alignment grid only during user interaction. This method lets you align coordinates of programmatically created or modified items.

MindFusion.Diagramming Namespace
showGrid Property
alignToGrid Property

Diagram.arrange Method

Arranges the diagram with the given layout.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function arrange (layout)
```

Parameters

layout

Object. The Layout algorithm to apply.

Remarks

Available layout algorithms are SpringLayout, TreeLayout, BorderedTreeLayout, LayeredLayout, TreeMapLayout, FractalLayout, FlowchartLayout, TopologicalLayout, OrthogonalLayout, RadialTreeLayout, GridLayout.

See Also

Diagram Members
Diagram Class

Diagram.arrangeAnimated Method

Arranges the diagram using the given layout, and animates items moving to their new positions.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function arrangeAnimated (layout, [duration, [animationType, [easingType]]])
```

Parameters

layout
Object. The Layout algorithm to apply.

duration
Optional.
Number. An integer, specifying the duration of the animation in milliseconds.

animationType
Optional.
A member of the AnimationType enumeration, specifying the animation type to use.

easingType
Optional.
A member of the EasingType enumeration, specifying the type of easing function to apply to the animation.

Remarks

Available layout algorithms are SpringLayout, TreeLayout, BorderedTreeLayout, LayeredLayout, TreeMapLayout, FractalLayout, FlowchartLayout, TopologicalLayout, OrthogonalLayout, RadialTreeLayout, GridLayout.

Diagram.cancelCompositeOperation Method

Stops recording undo/redo commands into a CompositeCommand and discards the records created so far.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function cancelCompositeOperation ()
```

Remarks

You must call either commitCompositeOperation or this method when the diagram modifications are done after a startCompositeOperation call.

items Property

Diagram.commitCompositeOperation Method

Stops recording undo/redo commands into a CompositeCommand and saves the composite in the history queue.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function commitCompositeOperation ()
```

Remarks

You must call either cancelCompositeOperation or this method when the diagram modifications are done after a startCompositeOperation call.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
undoEnabled Property

Diagram.executeCommand Method

Executes the specified command on this diagram.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function executeCommand (command)
```

Parameters

command
The Command to execute.

Remarks

If undo/redo is enabled, the command is saved in the undo history or added to the active composite command.

AddItemCommand and RemoveItemCommand objects are created automatically by the control when adding or removing items, both programmatically or interactively. Calling this method explicitly could be necessary in order to save item's state for later undo using a ChangeItemCommand, or to run a custom operation represented by a class derived from Command.

Example

The following example shows the pattern that should be used to save the state of an item for later undo.

JavaScript Copy Code

```
var ChangeItemCommand = MindFusion.Diagramming.ChangeItemCommand;
var DiagramNode = MindFusion.Diagramming.DiagramNode;

var diagram = DiagramView.find("diagram").diagram;
var node = diagram.activeItem;
if (node instanceof DiagramNode)
{
    var change = new ChangeItemCommand(diagram, node);
    node.text = "new text";
    node.brush = "red";
    diagram.executeCommand(change);
}
```

Diagram.fromJson Method

Deserializes the diagram from a JSON string.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function fromJson (json)
```

Parameters

json
A string created by the toJson method.

See Also

Diagram Members
Diagram Class

Diagram.fromXmlDocument Method

Loads diagram contents from specified XML Document.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function fromXmlDocument (document)
```

Parameters

document
Document. A DOM Document object containing XML-serialized diagram contents.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
toXmlDocument Method

Diagram.getContentBounds Method

Returns the smallest rectangle that bounds all diagram items.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function getContentBounds ([onlyVisible, [repaintBounds]])
```

Parameters

onlyVisible
Optional.
Boolean. Specifies whether only visible items should be considered.

repaintBounds
Optional.
Boolean. Specifies whether to consider the items' repaint bounds.

Return Value

Rect. A Rect instance specifying the smallest rectangle that bounds all diagram items.

See Also

Diagram Members
Diagram Class

Diagram.getItemAt Method

Finds and returns the topmost DiagramItem found at the specified location.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function getItemAt (point, [onlyInteractive])
```

Parameters

point
A Point instance identifying a diagram location.

onlyInteractive
Optional.
true to return only items that can be interacted with; otherwise, **false**.

Return Value

The topmost DiagramItem found at the given location or **null** if no **DiagramItem** has been found.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.getItemsAt Method

Finds and returns an array of the diagram items found at the specified location.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function getItemsAt (point)
```

Parameters

point
Point. instance identifying a location in the diagram.

Return Value

Array of the DiagramItems found at the given location or **null** if no items have been found. The items are arranged according to their Z-index.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.getLinkAt Method

Finds and returns the topmost DiagramLink found at the specified location.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
function getLinkAt (point)
```

Parameters

point
A Point instance identifying a diagram location.

Return Value

The topmost DiagramLink found at the given location or **null** if no **DiagramLink** has been found.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.getLinksAt Method

Finds and returns an array of the diagram DiagramLinks found at the specified location.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
function getLinksAt (point)
```

Parameters

point
Point. instance identifying a diagram location.

Return Value

Array of the DiagramLinks found at the given location or **null** if no **DiagramLink**s have been found. The links are arranged according to their Z-index.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.getNearestNode Method

Returns the node nearest to the specified point.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
function getNearestNode (point, maxDistance, ignored)
```

Parameters

point
Point. A point in the diagram.

maxDistance
Number. The maximum distance from the point at which to look for nodes.

ignored
DiagramNode. A node that should be ignored.

Return Value

The DiagramNode nearest to the specified point.

Remarks

The last argument is useful when calling this method from nodeCreated and nodeModified handlers and the affected node should not be included in the search.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.getNodeAt Method

Finds and returns the topmost DiagramNode found at the specified location.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function getNodeAt (point, [onlyInteractive])
```

Parameters

point
A Point instance identifying a diagram location.

onlyInteractive
Optional.
true to return only items that can be interacted with; otherwise, **false**.

Return Value

The topmost DiagramNode found at the given location or **null** if no **DiagramNode** has been found.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.getNodesAt Method

Finds and returns an array of the DiagramNodes found at the specified location.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function getNodesAt (point)
```

Parameters

point
Point. instance identifying a diagram location.

Return Value

Array of the DiagramNodes found at the given location or null if no **DiagramNode**s have been found. The nodes are arranged according to their Z-index.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.isItemInteractive Method

Checks if the specified item can be modified interactively.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function isItemInteractive (item)
```

Parameters

item
DiagramItem. The DiagramItem to check.

Return Value

Boolean. **true**, if the item is currently visible and unlocked and it is not associated with a hidden or locked layer, or **false** otherwise.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.isItemVisible Method

Checks if the specified item is currently visible.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function isItemVisible (item)
```

Parameters

item
DiagramItem. The DiagramItem to check.

Return Value

Boolean. **true** if the item's visible property is set to **true** and the item is not associated with a hidden layer, or **false** otherwise.

See Also

Diagram.loadFromString Method

Loads diagram contents from specified XML or JSON string.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function loadFromString (str)
```

Parameters

str
String. A string containing the serialized diagram contents.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
saveToString Method

Diagram.loadFromXml Method

Loads the diagram from an XML file.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function loadFromXml (fileUrl, [onLoad, [onError]])
```

Parameters

fileUrl
String. The URL of an XML file where the data should be read from.

onLoad
Optional.
function. A callback that should be invoked if the file is loaded successfully.

onError
Optional.
function. A callback that should be invoked if the file could not be downloaded.

Diagram.raiseClicked Method

Raises an event which notifies that a Diagram item has been clicked.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function raiseClicked (item, mousePosition, mouseButton)
```

Parameters

item
DiagramItem. The Diagram item.

mousePosition
Point. The position of the mouse.

mouseButton
MouseButton. The mouse button, with which the item has been clicked.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.raiseCreated Method

Raises an event which notifies that a Diagram item has been created.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function raiseCreated (item)
```

Parameters

item
DiagramNode | DiagramLink. The diagram item that has been created.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.raiseDeleted Method

Raises an event which notifies that a Diagram item has been deleted.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function raiseDeleted (item)
```

Parameters

item
DiagramItem. The DiagramItem that has been deleted.

See Also

Diagram Members
Diagram Class

Diagram.raiseDeselected Method

Raises an event which notifies that a Diagram item has been deselected.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
function raiseDeselected (item)
```

Parameters

item
DiagramItem. The Diagram item.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.raiseDoubleClicked Method

Raises an event which notifies that a Diagram item has been double-clicked.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
function raiseDoubleClicked (item, mousePosition, mouseButton)
```

Parameters

item
DiagramItem. The Diagram item.

mousePosition
Point. The position of the mouse.

mouseButton
MouseButton. The mouse button, with which the item has been clicked.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.raiseModified Method

Raises an event which notifies that a Diagram item has been modified.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
function raiseModified (item, mousePosition, adjustmentHandle)
```

Parameters

item
DiagramItem. The DiagramItem that has been modified.

mousePosition
Point. The current mouse pointer position.

adjustmentHandle
Number. Identifies the handle used to modify the item.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.raisePasted Method

Raises an event which notifies that a Diagram item has been pasted from clipboard.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function raisePasted (item)
```

Parameters

item
DiagramItem. The DiagramItem that has been pasted.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.raiseSelected Method

Raises an event which notifies that a Diagram item has been selected.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function raiseSelected (item)
```

Parameters

item
DiagramItem. The Diagram item.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.raiseSelecting Method

Raises an event which notifies that a Diagram item will be selected.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function raiseSelecting (item)
```

Parameters

item
DiagramItem. The Diagram item.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.raiseSelectionChanged Method

Raises an event which notifies that the selection has changed.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function raiseSelectionChanged (oldItems, newItems)
```

Parameters

oldItems
Array. The selected items before the change.

newItems
Array. The selected items after the change.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.redo Method

Executes again an action saved in the command history.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function redo ()
```

Remarks

Calling this method has no effect before undo has been called at least once. Any command that has been undone can later be redone by **redo**. The method processes the commands in the same order they were initially executed, which is opposite to the

order in which they are undone.

actionRedone Event

Diagram.registerClass Method

Registers a diagram item class.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function registerClass (itemClass, className, [classId, [classVersion, [baseType]]])
```

Parameters

itemClass
Object. An object identifying the item class.

className
String. A class identifier to use when saving and loading items of the specified type to/from JSON.

classId
Optional.
String. A class identifier to use when saving and loading items of the specified type to/from XML.

classVersion
Optional.
Number. A revision number of the item's class serialization format.

baseType
Optional.
Object. The base class of the item class.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.registerComponent Method

Registers a component class.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function registerComponent (componentClass, className)
```

Parameters

componentClass
Object. The component class.

className
String. The name that refers to the component class in CompositeNode templates.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.registerItemClass Method

Registers a diagram item class for XML serialization support.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function registerItemClass (itemClass, classId, classVersion)
```

Parameters

itemClass
Object. An object identifying the item class.

classId
String. A class identifier to use when saving and loading items of the specified type.

classVersion
Number. A revision number of the item's class serialization format.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.removeItem Method

Removes the specified item from the Diagram.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function removeItem (item)
```

Parameters

item
The DiagramItem to be removed.

Remarks

The Diagram object calls this method automatically when users delete items. Classes that inherit **Diagram** can override it to implement some additional processing, but in any case they must call the base method.

Diagram.resizeToFitItems Method

Resizes the document scrollable area so that it fits all diagram items.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
function resizeToFitItems ([margin, [onlyVisible, [repaintBounds]]])
```

Parameters

margin
Optional.

onlyVisible
Optional.
Boolean. Specifies whether only visible items should be considered.

repaintBounds
Optional.
Boolean. Specifies whether to consider the items' repaint bounds.

See Also

Diagram Members

Diagram.saveToString Method

Encodes the diagram contents into an XML or JSON string.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function saveToString (format)
```

Parameters

format
A member of the SaveToStringFormat enumeration.

Return Value

String. A string containing the diagram's serialized representation.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.saveToXml Method

Saves the diagram to an XML file.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function saveToXml (url)
```

Parameters

url
String. A URL specifying where the diagram's XML should be posted to.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.startCompositeOperation Method

Starts recording undo/redo commands into a CompositeCommand.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
function startCompositeOperation ()
```

Remarks

After the diagram modifications are done, call commitCompositeOperation or cancelCompositeOperation.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
undoEnabled Property

Diagram.toJson Method

Serializes the diagram into a JSON string.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
function toJson ()
```

Return Value

String. A string containing the diagram's JSON representation.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
fromJson Method

Diagram.toXmlDocument Method

Saves the diagram into an XML Document.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
function toXmlDocument ()
```

Return Value

Document. A DOM Document object containing XML-serialized diagram contents.

See Also

Diagram.undo Method

Undoes an action saved in the command history.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function undo ()
```

Remarks

The control supports unlimited undo/redo depth. This method moves the "current command" pointer one position back, and calling it again will undo the previous command. The commands can later be redone by calling redo.

Diagram Properties

Diagram.activeItem Property

Gets the active diagram item.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get activeItem() {}
```

Property Value

DiagramItem

The active item, or **null** if no item is active.

Remarks

activeItem is set to the last selected item, and has a distinct appearance from other items as set in activeItemHandlesStyle. Some possible uses for it are as target position when aligning multiple selected items, or as a source of property values when copying styles.

See Also

Diagram Members

Diagram.activeItemHandlesStyle Property

Gets or sets the visual style of adjustment handles of the active item.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
get activeItemHandlesStyle() {}
set activeItemHandlesStyle(value) {}
```

Property Value

HandlesVisualStyle

A HandlesVisualStyle instance describing handles' appearance.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

selectedItemHandlesStyle Property
disabledHandlesStyle Property

Diagram.adjustmentHandlesSize Property

Gets or sets the size of adjustment handles that appear around selected items.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
get adjustmentHandlesSize() {}
set adjustmentHandlesSize(value) {}
```

Property Value

Number

A number specifying the size of selection handles. The default value is 2.

See Also

Diagram Members

Diagram.alignToGrid Property

Gets or sets a value indicating whether the diagram items should be aligned to a grid.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
get alignToGrid() {}
set alignToGrid(value) {}
```

Property Value

Boolean

true if the diagram items should be aligned to a grid, or **false** otherwise.

Remarks

When the property is set to true, the sides of every newly created diagram item are aligned to the nearest grid points.

See Also

Diagram Members

Diagram.allowLinksRepeat Property

Gets or sets a value indicating whether more than one links can connect the same origin and destination diagram nodes.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get allowLinksRepeat() {}
set allowLinksRepeat(value) {}
```

Property Value

Boolean

true to let links connect to the same nodes, or **false** otherwise. The default is **true**.

Remarks

Specifies whether more than one link can connect the same origin and destination diagram nodes. If set to **false**, two diagram nodes can be connected with at most one link in a single direction.

See Also

Diagram.allowSelfLoops Property

Gets or sets a value indicating whether users are allowed to draw reflexive links.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get allowSelfLoops() {}
set allowSelfLoops(value) {}
```

Property Value

Boolean

true to allow reflexive links, or **false** otherwise.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
linkCreating Event
allowUnconnectedLinks Property
allowLinksRepeat Property

Diagram.allowSplitLinks Property

Gets or sets a value indicating whether link segments can be added and removed interactively.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get allowSplitLinks() {}
set allowSplitLinks(value) {}
```

Property Value

Boolean

true if interactive adding/removing of link segments is allowed, or **false** otherwise.

Remarks

You can insert new link segments interactively by clicking and dragging a point of a selected link's segment. For polyline-style links this creates one additional segment by splitting the existing one into two parts. For cascading links, there are two segments inserted, keeping intact the alternating pattern of horizontal and vertical segments, each orthogonal to its neighbors.

Segments can be merged by moving their joining point until the angle between reaches certain threshold value. In case of cascading and Bezier links, segments can be merged by placing adjacent control points close to each other, as set in mergeThreshold.

This property also lets users change the orientation of cascading links' end segments, by dragging second or next-to-last control point diagonally.

See Also

Diagram.allowUnanchoredLinks Property

Gets or sets a value indicating whether users can link nodes that do not have designated anchor points.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get allowUnanchoredLinks() {}
set allowUnanchoredLinks(value) {}
```

Property Value

Boolean

true to let links connect to nodes without anchor points, or **false** otherwise. The default is **true**.

Remarks

allowUnanchoredLinks applies to nodes whose anchorPattern is not set or does not contain incoming or outgoing anchor points available. If the property is enabled, users can connect links to any point of such nodes. If disabled, users cannot connect links to such nodes.

See Also

MindFusion.Diagramming Namespace
AnchorPoint Class
AnchorPattern Class

Diagram.allowUnconnectedLinks Property

Gets or sets a value indicating whether users are allowed to draw links that are not connected to any node.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get allowUnconnectedLinks() {}
set allowUnconnectedLinks(value) {}
```

Property Value

Boolean

true to let users draw unconnected links, or **false** otherwise.

Remarks

If this property is set to **true**, users will be able to draw links from or to any point of the document. To draw links that do not start from a node, you must also set behavior to DrawLinks.

Depending on which end of a link is unconnected, its origin or destination nodes will be set to a DummyNode instance.

Diagram.autoArrangeAvoidContainers Property

Gets or sets a value indicating whether auto-arranged link labels should avoid containers.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get autoArrangeAvoidContainers() {}
set autoArrangeAvoidContainers(value) {}
```

Property Value

Boolean

true to avoid containers, or **false** otherwise. The default value is **true**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.autoArrangeAvoidSegments Property

Gets or sets a value indicating whether auto-arranged link labels should avoid link segments.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get autoArrangeAvoidSegments() {}
set autoArrangeAvoidSegments(value) {}
```

Property Value

Boolean

true to avoid link segments, or **false** otherwise. The default value is **true**.

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.autoCloseDistance Property

Gets or sets the maximum distance between first and last points of a FreeFormNode for which the node's outline is closed automatically.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get autoCloseDistance() {}
set autoCloseDistance(value) {}
```

Property Value

Number

A number specifying auto-close distance.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.autoDeleteLinks Property

Gets or sets whether links are deleted automatically when their origin or destination is deleted.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get autoDeleteLinks() {}
set autoDeleteLinks(value) {}
```

Property Value

Boolean

true to delete links along with the nodes they connect, or **false** otherwise. The default value is **true**.

Remarks

If this property is set to **false**, deleting a node will leave its links in the diagram as unconnected links.

Diagram.autoResize Property

Gets or sets a value indicating whether the document area should be resized automatically so it fits the diagram contents.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get autoResize() {}
set autoResize(value) {}
```

Property Value

AutoResize

A member of the AutoResize enumeration indicating the auto resize method. The default is **RightAndDown**.

Remarks

If automatic resizing is enabled, the size of the document scrollable area is updated each time an item is created, deleted or moved by the end-user. To resize the diagram after programmatic changes, call the resizeToFitItems method.

Diagram.backgroundImageContent Property

Gets or sets a Base64-encoded image to display as diagram background.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get backgroundImageContent() {}
set backgroundImageContent(value) {}
```

Property Value

String

A Base64-encoded representation of an image.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
backgroundImageAlign Property

Diagram.backgroundImageUrl Property

Gets or sets URL of the image to paint as diagram's background.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get backgroundImageUrl() {}
set backgroundImageUrl(value) {}
```

Property Value

String

A string containing image URL.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

backgroundImageAlign Property

Diagram.crossingRadius Property

Gets or sets the radius length of decorations displayed at link intersection points.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get crossingRadius() {}
set crossingRadius(value) {}
```

Property Value

Number

A number specifying the radius of the arcs drawn at link intersection points. The default value is 1.5.

Remarks

If linkCrossings is set to Cut, link segments are cut at intersection points and this property defines the length of the break left between adjacent cut points. If **linkCrossings** is set to **Arcs**, this property defines the radius of the arcs drawn over intersection points.

roundedLinksRadius Property

Diagram.customLinkType Property

Gets or sets the type of DiagramLink objects to create when users starts drawing.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get customLinkType() {}
set customLinkType(value) {}
```

Property Value

Object

An object identifying a constructor function or a class.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.customNodeType Property

Gets or sets the type of DiagramNode objects to create when users starts drawing.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get customNodeType() {}
set customNodeType(value) {}
```

Property Value

Object

An object identifying a constructor function or a class.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.defaultShape Property

Gets or sets the default shape assigned to new ShapeNode objects.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get defaultShape() {}
set defaultShape(value) {}
```

Property Value

Shape | *String*

A Shape object or identifier.

Remarks

The shape property of newly created ShapeNode objects is initialized with the value of this property. It defines a series of lines, arcs and curves composed in a complex shape. There are predefined shapes exposed as static members of the Shapes class. You can also define your own shapes as shown below.

Example

JavaScript Copy Code

```
var shape = new MindFusion.Diagramming.Shape({
   id: "DoubleEllipse",
   outline: "M100,50 A50,50,0,1,1,0,50 A50,50,0,1,1,100,50",
   decoration: "M98,50 A48,48,0,1,1,2,50 A48,48,0,1,1,98,50",
   fillMode: "nonzero"});

diagram.defaultShape = shape;
```

Diagram.dirty Property

Gets or sets a value indicating whether the diagram has changed since loading it.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get dirty() {}
set dirty(value) {}
```

Property Value

Boolean

true if the diagram has changed, or **false** otherwise.

See Also

Diagram Members
Diagram Class

Diagram.disabledHandlesStyle Property

Gets or sets the visual style of disabled adjustment handles.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get disabledHandlesStyle() {}
set disabledHandlesStyle(value) {}
```

Property Value

HandlesVisualStyle

A HandlesVisualStyle instance describing handles' appearance.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
enabledHandles Property
activeItemHandlesStyle Property
selectedItemHandlesStyle Property

Diagram.dynamicLinks Property

Gets or sets initial value of the dynamic property of new links.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get dynamicLinks() {}
set dynamicLinks(value) {}
```

Property Value

Boolean

true if dynamic links are enabled, or **false** otherwise. The default value is **false**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.enableSpatialIndex Property

Gets or sets whether to index item positions for faster hit-testing and viewport clipping queries.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get enableSpatialIndex() {}
set enableSpatialIndex(value) {}
```

Property Value

Boolean

true to enable spatial indexing, or **false** otherwise. The default value is **false**.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.expandButtonAction Property

Gets or sets how the control responds to users clickingthe +/- button displayed by expandable nodes.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get expandButtonAction() {}
set expandButtonAction(value) {}
```

Property Value

ExpandButtonAction

A member of the ExpandButtonAction enumeration.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.expandOnIncoming Property

Gets or sets a value indicating the link direction in which tree branches are expanded.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get expandOnIncoming() {}
set expandOnIncoming(value) {}
```

Property Value

Boolean

true if trees are expanded in the direction of incoming links, or **false** otherwise.

See Also

Diagram Members

Diagram.factory Property

Gets a Factory object that lets you programmatically add new items to the diagram.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get factory() {}
```

Property Value

Factory

An instance of the Factory class.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.font Property

Gets or sets the default font of text displayed by diagram items.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get font() {}
set font(value) {}
```

Property Value

Font

A font used to render the text of diagram items.

See Also

Diagram Members

MindFusion.Diagramming Namespace

Diagram.freeFormAttractDistance Property

Gets or sets the radius around dragged free-form adjustment handle in which other points of FreeFormNode are modified too.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get freeFormAttractDistance() {}
set freeFormAttractDistance(value) {}
```

Property Value

Number

A number specifying point attraction radius.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.freeFormTargets Property

Gets or sets an array of Shape objects used to replace FreeFormNode instances with ShapeNode ones when behavior is set to LinkFreeShapes or **DrawFreeShapes**.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get freeFormTargets() {}
set freeFormTargets(value) {}
```

Property Value

Array

An array of shape identifiers or Shape instances.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.gridColor Property

Gets or sets the color of grid points.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get gridColor() {}
set gridColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.gridOffsetX Property

Gets or sets the horizontal offset of the first point of the alignment grid.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get gridOffsetX() {}
set gridOffsetX(value) {}
```

Property Value

Number

The horizontal offset of the first point of the alignment grid.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.gridOffsetY Property

Gets or sets the vertical offset of the first point of the alignment grid.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get gridOffsetY() {}
set gridOffsetY(value) {}
```

Property Value

Number

The vertical offset of the first point of the alignment grid.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.gridPointSize Property

Gets or sets the size of shapes used to represent grid points.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get gridPointSize() {}
set gridPointSize(value) {}
```

Property Value

Number

The size of shapes used to represent grid points.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.gridSizeX Property

Gets or sets the horizontal distance between adjacent grid points.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get gridSizeX() {}
set gridSizeX(value) {}
```

Property Value

Number

The horizontal distance between adjacent grid points.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.gridSizeY Property

Gets or sets the vertical distance between adjacent grid points.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get gridSizeY() {}
set gridSizeY(value) {}
```

Property Value

Number

The vertical distance between adjacent grid points.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.gridStyle Property

Gets or sets the visual style of the alignment grid.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get gridStyle() {}
set gridStyle(value) {}
```

Property Value

GridStyle

A member of the GridStyle enumeration.

See Also

Diagram.items Property

Returns an array of all items in this diagram.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get items() {}
```

Property Value

Array

Array of DiagramItem objects.

Remarks

This collection gives you access to all items contained in this diagram. You cannot add or remove items directly through it, but must use the addItem and removeItem methods instead.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

MindFusion.Diagramming Namespace

Diagram.linkBaseShape Property

Gets or sets the shape displayed at the base of new links.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get linkBaseShape() {}
set linkBaseShape(value) {}
```

Property Value

Shape | *String*

A Shape instance or identifier that represents an arrowhead shape.

Remarks

This property specifies the default shape displayed as arrowhead at the links' origin points.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
ArrowHeads Class
baseShape Property

Diagram.linkBaseShapeSize Property

Gets or sets the default size of arrowheads at base of new links.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get linkBaseShapeSize() {}
set linkBaseShapeSize(value) {}
```

Property Value

Number

A number specifying arrowhead size. The default value is 5.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.linkBrush Property

Gets or sets the default fill of link arrowheads.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get linkBrush() {}
set linkBrush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

Remarks

The property provides a default value for links' brush, used to fill the interior of arrowheads.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.linkCrossings Property

Gets or sets a value indicating how to render the intersection points of links.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get linkCrossings() {}
set linkCrossings(value) {}
```

Property Value

LinkCrossings

A member of the LinkCrossings enumeration. The default value is **Straight**.

Remarks

Intersection points where links cross each other's paths can be rendered as arcs or cuts, depending on the value of this property. The diagram z-order defines which links jump over the others or which links are cut by the others. If **linkCrossings** is set to Arcs, links with higher zIndex jump over those with lower **zIndex**. If set to **Cut**, segments of links at lower z-position are cut by links at higher z-position. Radius of arcs and cuts can be set via the crossingRadius property.

Performance Note

Calculating coordinates for crossing point decorations is CPU intensive operation and is triggered each time link's control points change. If populating large diagrams from data, best enable this property only after creating all links.

validateLinkCrossing Event

Diagram.linkHeadShape Property

Gets or sets the shape displayed as head of new links.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get linkHeadShape() {}
set linkHeadShape(value) {}
```

Property Value

Shape | String

A Shape instance or identifier that represents an arrowhead shape. The default is Arrow.

Remarks

This property specifies the default shape displayed as arrowhead at the links' end points.

MindFusion.Diagramming Namespace

Diagram.linkHitDistance Property

Gets or sets a value specifying how far from a link a click is still considered a hit.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get linkHitDistance() {}
set linkHitDistance(value) {}
```

Property Value

Number

A value specifying link hit distance.

See Also

Diagram Members

Diagram.linkPen Property

Gets or sets the default stroke of links.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get linkPen() {}
set linkPen(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

Remarks

This property specifies the default value for the pen property of new links.

See Also

Diagram Members
Diagram Class

Diagram.linkRouter Property

Gets or sets the object used to find paths for auto-routed links when diagram nodes are added or their positions change.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get linkRouter() {}
set linkRouter(value) {}
```

Property Value

Router

An instance of Router-derived class.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
linkRouted Event

Diagram.links Property

Returns an array of all links in this diagram.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get links() {}
set links(value) {}
```

Property Value

Array

Array of DiagramLink objects.

Remarks

You cannot add or remove links directly through this array, but must use the addItem and removeItem methods instead.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.linkSegments Property

Gets or sets the default number of link segments.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get linkSegments() {}
set linkSegments(value) {}
```

Property Value

Number

The default number of link segments.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.linkShape Property

Gets or sets the initial shape assigned to new links.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get linkShape() {}
set linkShape(value) {}
```

Property Value

LinkShape

A member of the LinkShape enumeration. The default is **Polyline**.

Remarks

The specified value is assigned to the shape property of new links.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
roundedLinks Property

Diagram.linkTextStyle Property

Gets or sets the default text placement and orientation of new links.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
get linkTextStyle() {}
set linkTextStyle(value) {}
```

Property Value

LinkTextStyle

A member of the LinkTextStyle enumeration. The default value is **Center**.

Remarks

The value of this property is used to initialize the textStyle property of new links.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.mergeThreshold Property

Gets or sets the maximum distance between adjacent control points of a link at which the respective segments can be merged.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
get mergeThreshold() {}
set mergeThreshold(value) {}
```

Property Value

Number

A number specifying the maximum distance. The default is 0.

Remarks

A user may add or remove links' segments interactively when the allowSplitLinks property is enabled. They can drag a link's control point over the next one in order to merge two adjacent segments. Usually the two points must be placed exactly at the same coordinates in order to merge the respective segments of the link. Assign a larger value to this property if you wish to make it easier for users to merge segments by just moving link's control point close to each other.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.nodeEffects Property

Gets the global effects applied to nodes in this diagram.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get nodeEffects() {}
```

Property Value

Array

An array of NodeEffect objects.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.nodes Property

Returns an array of all nodes in this diagram.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get nodes() {}
```

Property Value

Array

Array of DiagramNode objects.

Remarks

You cannot add or remove nodes directly through this array, but must use the addItem and removeItem methods instead.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.nodesExpandable Property

Gets or sets a value indicating whether newly created nodes are expandable.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get nodesExpandable() {}
set nodesExpandable(value) {}
```

Property Value

Boolean

A boolean value assigned to the expandable property of new nodes.

See Also

Diagram.roundedLinks Property

Gets or sets a value indicating whether the joints between segments of Polyline and **Cascading** links should be rounded.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get roundedLinks() {}
set roundedLinks(value) {}
```

Property Value

Boolean

true to draw rounded segment joints, or **false** otherwise. The default value is **false**.

Remarks

The value of this property is considered when drawing links whose shape is set to Polyline or **Cascading**. If the property is enabled, the joins between segments of all such links are drawn as arcs, whose radius equals the value of roundedLinksRadius.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
linkCrossings Property

Diagram.roundedLinksRadius Property

Gets or sets the radius of joint arcs of rounded links' segments.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get roundedLinksRadius() {}
set roundedLinksRadius(value) {}
```

Property Value

Number

A number specifying the radius length. The default value is 2.

Remarks

The value of this property is used when roundedLinks is enabled. It specifies the radius of the arcs drawn as joins between link segments.

See Also

Diagram Members

linkCrossings Property
linkRouted Event

Diagram.routeMargin Property

Gets or sets the minimal distance between nodes and auto-routed links.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
get routeMargin() {}
set routeMargin(value) {}
```

Property Value

Number

A value specifying distance in the current measureUnit. The default value is 8.

See Also

Diagram.selectedItemHandlesStyle Property

Gets or sets the visual style of adjustment handles of selected items.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
get selectedItemHandlesStyle() {}
set selectedItemHandlesStyle(value) {}
```

Property Value

HandlesVisualStyle

A HandlesVisualStyle instance describing handles' appearance.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace
selection Property
activeItemHandlesStyle Property
disabledHandlesStyle Property

Diagram.selection Property

Gets a Selection instance that represents the selection of items in this diagram.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get selection() {}
```

Property Value

Selection

An instance of the Selection class representing the current selection.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

allowMultipleSelection Property

Diagram.shadowOffsetX Property

Gets or sets the horizontal offset of items' shadows.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get shadowOffsetX() {}
set shadowOffsetX(value) {}
```

Property Value

Number

A number specifying shadows' horizontal offset.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.shadowOffsetY Property

Gets or sets the vertical offset of items' shadows.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
get shadowOffsetY() {}
set shadowOffsetY(value) {}
```

Property Value

Number

A number specifying shadows' vertical offset.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.shadowsStyle Property

Gets or sets the style of shadows.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
get shadowsStyle() {}
set shadowsStyle(value) {}
```

Property Value

ShadowsStyle

A member of the ShadowsStyle enumeration.

Remarks

This property specifies how the shadows of diagram items are drawn. If its value is None, there are no shadows painted. **OneLevel** makes all shadows paint on the lowest z-level, not covering any items. Thus the diagram items will seem to appear on the same z-level. **ZOrder** makes the shadow paint immediately under their items, possibly covering other items. This style gives more 3D-like outlook to the diagram.

Diagram.shapeBrush Property

Gets or sets the default fill of ShapeNode objects.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript — Copy Code

```
get shapeBrush() {}
set shapeBrush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

Remarks

This property provides a default value for the brush used to fill ShapeNode objects.

See Also

Diagram Class
MindFusion.Diagramming Namespace

Diagram.shapeLibraryLocation Property

Gets or sets the location of a shape library file containing custom shape definitions. It can be set to a full URL of the file, or a relative file path.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get shapeLibraryLocation() {}
set shapeLibraryLocation(value) {}
```

Property Value

String

The location of a shape library file containing custom shape definitions.

See Also

Diagram.shapePen Property

Gets or sets the default stroke of ShapeNode objects.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get shapePen() {}
set shapePen(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

Remarks

This property provides a default value for the pen used to stroke ShapeNode border lines.

Diagram.showAnchors Property

Gets or sets a value indicating when to display anchor point marks.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get showAnchors() {}
set showAnchors(value) {}
```

Property Value

ShowAnchors

A member of the ShowAnchors enumeration.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.showDisabledHandles Property

Gets or sets a value indicating whether adjustment handles are painted when they are disabled.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get showDisabledHandles() {}
set showDisabledHandles(value) {}
```

Property Value

Boolean

true to display disabled handles, or **false** otherwise. The default value is **true**.

See Also

Diagram Members

Diagram.showGrid Property

Gets or sets a value indicating whether the alignment grid is visible.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get showGrid() {}
set showGrid(value) {}
```

Property Value

Boolean

true if the alignment grid is visible, or **false** otherwise.

Remarks

If it is visible, the grid is painted as either a matrix of points or crossing horizontal and vertical lines. That depends on the value of gridStyle.

Diagram.style Property

Gets or sets the style associated with this diagram.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get style() {}
set style(value) {}
```

Property Value

Style

An instance of the Style class.

Diagram.undoEnabled Property

Gets or sets a value indicating whether saving action records for later undo is enabled.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get undoEnabled() {}
set undoEnabled(value) {}
```

Property Value

Boolean

true if undo is enabled, or **false** otherwise.

See Also

Diagram Members
Diagram Class
MindFusion.Diagramming Namespace

Diagram.validityChecks Property

Gets or sets a value indicating whether validity checks are performed each time an item is added to the diagram.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get validityChecks() {}
set validityChecks(value) {}
```

Property Value

Boolean

true to check validity when adding items, or **false** otherwise. The default is **true**.

Remarks

If enabled, validity checks are performed each time an item is added to the diagram. That involves enumerating the items collection and can slow up the process considerably for large diagrams. You can disable this property in order to skip the validity checks, however be sure that you don't add an item twice to the diagram and that links are created only between items in the same diagram.

Diagram.version Property

Gets a string identifying current version of the library.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
get version() {}
set version(value) {}
```

Property Value

String

A string in "major.minor.revision" format.

Diagram Events

DiagramBase.ActionRecorded Event

Raised when an action is recorded in the undo buffer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<UndoEventArgs> ActionRecorded
```

Visual Basic Copy Code

```
Public Event ActionRecorded As EventHandler(Of UndoEventArgs)
```

Event Data

ActionRecorded event handlers receive an argument of type UndoEventArgs. The following **UndoEventArgs** members provide information relevant to the event:

Member name	Description
Command	Refers to the Command instance that identifies the recorded action.

Remarks

This event is raised only for top-level commands. For example, it isn't raised for the constituent actions of a CompositeCmd.

ActionUndone Event

DiagramBase.ActionRecording Event

A validation event raised before an action is recorded in the undo buffer.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<UndoValidationEventArgs> ActionRecording
```

Visual Basic Copy Code

```
Public Event ActionRecording As EventHandler(Of UndoValidationEventArgs)
```

Event Data

ActionRecording event handlers receive an argument of type UndoValidationEventArgs. The following **UndoValidationEventArgs** members provide information relevant to the event:

Member name	Description
Command	Refers to the Command instance that identifies the action being recorded.
Cancel	Set this property to **true** to prevent the action from being recorded in the undo buffer.

Remarks

Do not filter commands that create or delete items and groups. Otherwise, redoing or undoing recorded commands related to the items whose create/delete command is filtered will cause various exceptions. We recommend to filter commands that modify an item, change its selection state, scroll a table, and so on.

Syntax

C# Copy Code

```
public event EventHandler<UndoEventArgs> ActionRedone
```

Visual Basic Copy Code

```
Public Event ActionRedone As EventHandler(Of UndoEventArgs)
```

Event Data

ActionRedone event handlers receive an argument of type UndoEventArgs. The following **UndoEventArgs** members provide information relevant to the event:

Member name	Description
Command	Refers to the Command instance that identifies the recorded action.

Remarks

This event is raised during calls to Redo. It is raised both for top-level commands and for the constituent actions of composite commands.

DiagramBase.CellClicked Event

Raised when the user clicks a table's cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<CellEventArgs> CellClicked
```

Visual Basic Copy Code

```
Public Event CellClicked As EventHandler(Of CellEventArgs)
```

Event Data

CellClicked event handlers receive an argument of type CellEventArgs. The following **CellEventArgs** members provide information relevant to the event:

Member name	Description
Table	The TableNode that contains the clicked cell.
Cell	The Cell that has been clicked.
MouseButton	The mouse button that has been pressed by the user.
MousePosition	A **PointF** specifying the mouse cursor position.
Column	Index of the column containing the clicked cell.
Row	Index of the row containing the clicked cell.

Remarks

The control also raises NodeClicked event for the **TableNode** after **CellClicked**, unless you set the PreventNodeEvent argument to **true**.

DiagramBase.CellDoubleClicked Event

Raised when the user double-clicks a table's cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<CellEventArgs> CellDoubleClicked
```

Visual Basic Copy Code

```
Public Event CellDoubleClicked As EventHandler(Of CellEventArgs)
```

Event Data

CellDoubleClicked event handlers receive an argument of type CellEventArgs. The following **CellEventArgs** members provide information relevant to the event:

Member name	Description

Table	The TableNode that contains the clicked cell.
Cell	The Cell that has been double-clicked.
MouseButton	The mouse button that has been pressed by the user.
MousePosition	A **PointF** specifying the mouse cursor position.
Column	Index of the column containing the clicked cell.
Row	Index of the row containing the clicked cell.

Remarks

The control also raises NodeDoubleClicked event for the **TableNode** after **CellDoubleClicked**, unless you set the PreventNodeEvent argument to **true**.

DiagramBase.CellTextEdited Event

Raised when the user edits the text of a table's cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<EditCellTextEventArgs> CellTextEdited
```

Visual Basic Copy Code

```
Public Event CellTextEdited As EventHandler(Of EditCellTextEventArgs)
```

Event Data

CellTextEdited event handlers receive an argument of type EditCellTextEventArgs. The following **EditCellTextEventArgs** members provide information relevant to the event:

Member name	Description
Table	The TableNode that contains the edited cell.
Cell	The Cell whose text has been edited.
NewText	The cell's new text.
OldText	The cell's old text.
Column	Index of the column containing the edited cell.
Row	Index of the row containing the edited cell.

DiagramBase.CellTextEditing Event

A validation event that lets you approve or reject changes made to the text of a table's cell.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<CellValidationEventArgs> CellTextEditing
```

Visual Basic Copy Code

```
Public Event CellTextEditing As EventHandler(Of CellValidationEventArgs)
```

Event Data

CellTextEditing event handlers receive an argument of type CellValidationEventArgs. The following **CellValidationEventArgs** members provide information relevant to the event:

Member name	Description
Table	The TableNode containing the cell that the user is trying to edit.
Cell	The Cell that the user is trying to edit.
Column	Index of the column containing the cell.
Row	Index of the row containing the cell.
Cancel	Set this property to **true** to prevent the user from editing the cell's text.

DiagramBase.Clicked Event

Raised when the user clicks the diagram at a point where no items are located.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<DiagramEventArgs> Clicked
```

Visual Basic Copy Code

```
Public Event Clicked As EventHandler(Of DiagramEventArgs)
```

Event Data

Clicked event handlers receive an argument of type DiagramEventArgs. The following **DiagramEventArgs** members provide information relevant to the event:

Member name	Description
MouseButton	The mouse button that has been pressed by the user.
MousePosition	A **PointF** specifying the mouse cursor position.

Remarks

This event is raised only if the user clicks an unoccupied point of the diagram. If the user clicks a diagram item, one of the following events is raised: NodeClicked, CellClicked or LinkClicked.

DiagramBase.DeserializeTag Event

Raised when the Tag of a diagram item must be deserialized from XML format.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<SerializeTagEventArgs> DeserializeTag
```

Visual Basic Copy Code

```
Public Event DeserializeTag As EventHandler(Of SerializeTagEventArgs)
```

Event Data

DeserializeTag event handlers receive an argument of type SerializeTagEventArgs. The following **SerializeTagEventArgs** members provide information relevant to the event:

Member name	Description
Object	The object whose Tag is being deserialized. This object can be either a diagram item, group, cell or anchor point.
Tag	Set this property to the object that has been deserialized.
Representation	An **XmlElement** instance that contains the XML representation of a Tag value.
Context	An XmlPersistContext object providing information about the document being deserialized, along with methods that help you deserialize data from XML.
Handled	Set this flag to **true** if you perform custom tag deserialization.

Remarks

Only tags of simple value types can be saved and loaded automatically to/from the XML document. You must provide your own serialization for complex types by implementing this event and SerializeTag.

Example

The following example demonstrates how to deserialize a complex tag value using the **DeserializeTag** event.

C# Copy Code

```
private void Read(string fileName)
{
    diagram.DeserializeTag += new SerializeTagEventHandler(DeserializeTag);
    diagram.LoadFromXml(fileName);
}

private void DeserializeTag(object sender, SerializeTagEventArgs e)
{
    e.Handled = true;
    string type, val;
```

```
    XmlText textNode = e.Representation.LastChild as XmlText;
    string stringRep = textNode.Value;
    int pos = stringRep.IndexOf(";");

    if (pos == -1)
        return;

    type = stringRep.Substring(0, pos);
    val = stringRep.Substring(pos + 1);

    Type t = Type.GetType(type);

    object tag = null;
    if (t == typeof(string))
        tag = val;
    else if (t == typeof(int))
        tag = XmlConvert.ToInt32(val);

    e.Tag = tag;
}
```

Visual Basic Copy Code

```
Private Sub Read(ByVal fileName As String)

    AddHandler diagram.DeserializeTag, New SerializeTagEventHandler(AddressOf DeserializeTag)
    diagram.LoadFromXml(fileName)

End Sub

Private Sub DeserializeTag(ByVal sender As Object, ByVal e As SerializeTagEventArgs)

    e.Handled = True

    Dim type As String
    Dim val As String

    Dim textNode As XmlText = CType(e.Representation.LastChild, XmlText)
    Dim stringRep As String = textNode.Value
    Dim pos As Integer = stringRep.IndexOf(";")

    If pos = -1 Then
        Return
    End If

    type = stringRep.Substring(0, pos)
    val = stringRep.Substring(pos + 1)

    Dim t As Type = System.Type.GetType(type)

    Dim tag As Object = Nothing
    If t Is GetType(String) Then
        tag = val
    ElseIf t Is GetType(Integer) Then
        tag = XmlConvert.ToInt32(val)
    End If

    e.Tag = tag

End Sub
```

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace
SerializeTag Event
Diagram.LoadFromXml Method

DiagramBase.DestinationAnchorChanged Event

Raised when the DestinationAnchor property value of a link has changed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<AnchorPointEventArgs> DestinationAnchorChanged
```

Visual Basic Copy Code

```
Public Event DestinationAnchorChanged As EventHandler(Of AnchorPointEventArgs)
```

Event Data

DestinationAnchorChanged event handlers receive an argument of type AnchorPointEventArgs. The following **AnchorPointEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink whose DestinationAnchor has changed.
OldAnchorIndex	Index of the old anchor point.
NewAnchorIndex	Index of the new anchor point.

Remarks

This event is raised every time the **DestinationAnchor** property of a link changes, either because a user connects the link end to a different anchor point, or because an application sets it programmatically.

MindFusion.Diagramming Namespace
OriginAnchorChanged Event
ActionRedone Event

DiagramBase.DirtyChanged Event

Raised when the **Dirty** property value has changed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler DirtyChanged
```

Visual Basic Copy Code

```
Public Event DirtyChanged As EventHandler
```

Event Data

DirtyChanged event handlers receive an argument of type **EventArgs**.

Remarks

Dirty is set to **true** every time the diagram or the diagram document is modified, but this event is raised only if the flag value changes, either from **false** to **true** or from **true** to **false**. So the event occurs only when a diagram or a diagram document is

modified for the first time, but not when subsequent modifications are done.

ActionRecorded Event

DiagramBase.DoubleClicked Event

Raised when the user double-clicks the diagram at a point where no items are located.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<DiagramEventArgs> DoubleClicked
```

Visual Basic Copy Code

```
Public Event DoubleClicked As EventHandler(Of DiagramEventArgs)
```

Event Data

DoubleClicked event handlers receive an argument of type DiagramEventArgs. The following **DiagramEventArgs** members provide information relevant to the event:

Member name	Description
MouseButton	The mouse button that has been pressed by the user.
MousePosition	A **PointF** specifying the mouse cursor position.

Remarks

This event is raised only if the user double-clicks an unoccupied point of the diagram. If the user double-clicks a diagram item, one of the following events is raised: NodeDoubleClicked, CellDoubleClicked or LinkDoubleClicked.

DiagramBase.DrawAdjustmentHandles Event

Raised when item's adjustment handles must be custom-drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<DrawItemEventArgs> DrawAdjustmentHandles
```

Visual Basic Copy Code

```
Public Event DrawAdjustmentHandles As EventHandler(Of DrawItemEventArgs)
```

Event Data

DrawAdjustmentHandles event handlers receive an argument of type DrawItemEventArgs. The following **DrawItemEventArgs** members provide information relevant to the event:

Member name	Description
Item	The DiagramItem whose adjustment handles should be drawn.
Graphics	An object implementing the IGraphics interface whose methods should be used to draw the item's handles.

Remarks

DrawAdjustmentHandles is raised for selected items whose HandlesStyle is set to Custom.

Example

The following example illustrates how to draw a red frame around a node as a visualization of its adjustment handles.

C# Copy Code

```
void OnDrawAdjustmentHandles(object source, DrawItemEventArgs e)
{
    var pen = new MindFusion.Drawing.Pen(Colors.Red, 0);

    if (e.Item is ShapeNode shapeNode)
    {
        e.Graphics.DrawRectangle(
            pen, shapeNode.Bounds);
    }

    if (e.Item is DiagramLink link)
    {
        e.Graphics.DrawLines(
            pen, link.ControlPoints);
    }
}
```

DiagramBase.DrawAnchorPoint Event

Raised when an anchor point must be custom-drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<DrawAnchorPointEventArgs> DrawAnchorPoint
```

Visual Basic Copy Code

```
Public Event DrawAnchorPoint As EventHandler(Of DrawAnchorPointEventArgs)
```

Event Data

DrawAnchorPoint event handlers receive an argument of type DrawAnchorPointEventArgs. The following **DrawAnchorPointEventArgs** members provide information relevant to the event:

Member name	Description
Node	A DiagramNode containing the anchor point that is being painted.
AnchorIndex	Index of the anchor point within the node's **AnchorPattern**.
AnchorPattern	An AnchorPattern instance that contains the anchor point definition.
Location	A **Point** specifying the location of the anchor point.
Graphics	An object implementing the IGraphics interface whose methods should be used to draw the anchor point mark.

Remarks

DrawAnchorPoint is raised for an AnchorPoint if the point's MarkStyle is set to Custom.

Example

The following example demonstrates how to draw images for anchor points:

C# Copy Code

```
void diagram_DrawAnchorPoint(object sender, DrawAnchorPointEventArgs e)
{
    var imgPos = e.Location;
    imgPos.Y -= 1.8;

    e.Graphics.DrawImage(icon, imgPos);
}
```

DiagramBase.DrawBackground Event

Raised to let you custom draw the diagram background.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<DiagramEventArgs> DrawBackground
```

Visual Basic Copy Code

```
Public Event DrawBackground As EventHandler(Of DiagramEventArgs)
```

Event Data

DrawBackground event handlers receive an argument of type DiagramEventArgs. The following **DiagramEventArgs** members provide information relevant to the event:

Member name	Description
Graphics	Gets an object implementing the IGraphics interface whose methods should be used to draw the custom graphics.
VisibleRect	Specifies what part of the diagram is currently visible.

ClipRect	Gets the current clipping rectangle.

Remarks

This event is raised just after drawing the BackgroundImage and before drawing the alignment grid.

MindFusion.Diagramming Namespace
DrawForeground Event

DiagramBase.DrawBranchIndicator Event

Raised when a branch indicator must be custom-drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<DrawBranchIndicatorEventArgs> DrawBranchIndicator
```

Visual Basic Copy Code

```
Public Event DrawBranchIndicator As EventHandler(Of DrawBranchIndicatorEventArgs)
```

Event Data

Member name	Description
From	A Vector specifying the direction of the incoming link segment.
Graphics	Gets an IGraphics object whose methods should be used to draw the branch indicator.
Merge	**true** to draw a merge indicator, or **false** to draw a branch indicator.
Position	A **PointF** specifying the position of the branch indicator.
To	A Vector specifying the direction of the outgoing link segment.

Remarks

This event is raised when LinkBranchIndicator and/or LinkMergeIndicator properties are set to Custom.

DiagramBase.DrawCell Event

Raised when a table's cell must be custom drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<DrawCellEventArgs> DrawCell
```

Visual Basic Copy Code

```
Public Event DrawCell As EventHandler(Of DrawCellEventArgs)
```

Event Data

DrawCell event handlers receive an argument of type DrawCellEventArgs. The following **DrawCellEventArgs** members provide information relevant to the event:

Member name	Description
Table	The TableNode containing the cell that should be custom drawn.
Cell	The Cell that should be custom drawn.
Column	Index of the column containing the cell.
Row	Index of the row containing the cell.
Bounds	Gets the bounding rectangle of the cell being drawn.
Graphics	An object implementing the IGraphics interface whose methods should be used to draw the cell contents.

Remarks

This event is raised for tables whose CellCustomDraw property is enabled.

ActionRedone Event

DiagramBase.DrawForeground Event

Raised to let you custom draw the diagram foreground.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<DiagramEventArgs> DrawForeground
```

Visual Basic Copy Code

```
Public Event DrawForeground As EventHandler(Of DiagramEventArgs)
```

Event Data

DrawForeground event handlers receive an argument of type DiagramEventArgs. The following **DiagramEventArgs** members provide information relevant to the event:

Member name	Description

Graphics	Gets an object implementing the IGraphics interface whose methods should be used to draw the custom graphics.
VisibleRect	Specifies what part of the diagram is currently visible.
ClipRect	Gets the current clipping rectangle.

Remarks

This event is raised after all diagram elements has been rendered, but before drawing the diagram boundaries with BoundsPen.

DiagramBase.DrawLink Event

Raised when a diagram link must be custom drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<DrawLinkEventArgs> DrawLink
```

Visual Basic Copy Code

```
Public Event DrawLink As EventHandler(Of DrawLinkEventArgs)
```

Event Data

DrawLink event handlers receive an argument of type DrawLinkEventArgs. The following **DrawLinkEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that should be custom drawn.
Points	Gets a collection of the link's control points. When drawing shadows, the points are offset as necessary.
Shadow	**true** if now drawing the link's shadow, otherwise **false**.
Graphics	An object implementing the IGraphics interface whose methods should be used to draw the link.

Remarks

This event is raised for links whose CustomDraw property is enabled.

DrawNode Event

DiagramBase.DrawNode Event

Raised when a diagram node must be custom drawn.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<DrawNodeEventArgs> DrawNode
```

Visual Basic Copy Code

```
Public Event DrawNode As EventHandler(Of DrawNodeEventArgs)
```

Event Data

DrawNode event handlers receive an argument of type DrawNodeEventArgs. The following **DrawNodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that should be custom drawn.
Bounds	The bounding rectangle of the node being drawn.
Shadow	**true** if now drawing the node's shadow, otherwise **false**.
Graphics	An object implementing the IGraphics interface whose methods should be used to draw the node.

Remarks

This event is raised for nodes whose **CustomDraw** property is enabled.

DiagramBase.EndLoad Event

Raised when the component ends loading diagram data from a file or memory stream.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler EndLoad
```

Visual Basic Copy Code

```
Public Event EndLoad As EventHandler
```

Event Data

EndLoad event handlers receive an argument of type **EventArgs**.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.ExpandButtonClicked Event

Raised when the user clicks the [±] button of an Expandable node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> ExpandButtonClicked
```

Visual Basic Copy Code

```
Public Event ExpandButtonClicked As EventHandler(Of NodeEventArgs)
```

Event Data

ExpandButtonClicked event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode whose [±] button has been clicked.

Remarks

This event is raised only if ExpandButtonAction is set to RaiseEvents. Otherwise either the TreeCollapsed or TreeExpanded event is raised, depending on the state of the node.

Example

The following sample code hides or shows all subordinated nodes in a group when the master node's [±] button is clicked:

C# Copy Code

```
void diagram_ExpandButtonClicked(object sender, NodeEventArgs e)
{
    if (e.Node.SubordinateGroup != null)
    {
        foreach (DiagramItem item in e.Node.SubordinateGroup.AttachedNodes)
            item.Visible = e.Node.Expanded;
    }
}
```

Visual Basic Copy Code

```
Sub diagram_ExpandButtonClicked(ByVal sender As Object, ByVal e As NodeEventArgs) Handles
diagram.ExpandButtonClicked

    If Not e.Node.SubordinateGroup Is Nothing Then

        Dim item As DiagramItem
        For Each item In e.Node.SubordinateGroup.AttachedNodes
            item.Visible = e.Node.Expanded
        Next

    End If

End Sub
```

See Also

MindFusion.Diagramming Namespace

DiagramBase.GroupDestroyed Event

Raised when a Group object is destroyed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<GroupEventArgs> GroupDestroyed
```

Visual Basic Copy Code

```
Public Event GroupDestroyed As EventHandler(Of GroupEventArgs)
```

Event Data

GroupDestroyed event handlers receive an argument of type GroupEventArgs. The following **GroupEventArgs** members provide information relevant to the event:

Member name	Description
Group	The Group that has been destroyed.

Remarks

A group can be destroyed in several ways:

- by removing it from the diagram's Groups collection.
- by deleting the group's MainItem.
- in case the main item is a link, if the control point or segment to which subordinated items are attached is removed. That could happen if link's Shape or SegmentCount properties change.

When a group is destroyed, by default the group items are not deleted automatically. You could delete such items from the **GroupDestroyed** handler, or enable AutoDeleteItems to delete them automatically when the group is destroyed.

DiagramBase.HitTestAdjustmentHandles Event

Raised when custom hit testing of item's adjustment handles must be performed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<HitTestEventArgs> HitTestAdjustmentHandles
```

Visual Basic Copy Code

```
Public Event HitTestAdjustmentHandles As EventHandler(Of HitTestEventArgs)
```

Event Data

HitTestAdjustmentHandles event handlers receive an argument of type HitTestEventArgs. The following **HitTestEventArgs** members provide information relevant to the event:

Member name	Description
Item	A DiagramItem whose adjustment handles should be hit tested.
MousePosition	A **Point** specifying the mouse cursor position.
HitResult	Set this property to an AdjustmentHandle instance representing the handle that has been hit.

Remarks

For links, set the result to a LinkAdjustmentHandle initialized with the index of the link's control point that has been hit. For nodes, set the result to a NodeAdjustmentHandle initialized with a NodeHandleType enumeration member.

Example

C# Copy Code

```
void diagram_HitTestAdjustmentHandles(object sender, HitTestEventArgs e)
{
    ShapeNode shapeNode = e.Item as ShapeNode;
    if (shapeNode != null)
    {
        if (shapeNode.Bounds.Contains(e.MousePosition))
        {
            // Always move
            e.HitResult = new NodeAdjustmentHandle(NodeHandleType.Move);
        }
    }
}
```

Visual Basic Copy Code

```
Private Sub diagram_HitTestAdjustmentHandles(ByVal sender As Object, ByVal e As
HitTestEventArgs) Handles diagram.HitTestAdjustmentHandles

    Dim shapeNode As ShapeNode = CType(e.Item, ShapeNode)

    If Not shapeNode Is Nothing Then

        If (shapeNode.Bounds.Contains(e.MousePosition)) Then

            ' Always move
            e.HitResult = New NodeAdjustmentHandle(NodeHandleType.Move)

        End If

    End If

End Sub
```

DrawAdjustmentHandles Event

DiagramBase.InitializeLasso Event

Raised when the user starts drawing a selection lasso, before it is rendered on screen.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<SelectionEventArgs> InitializeLasso
```

Visual Basic Copy Code

```
Public Event InitializeLasso As EventHandler(Of SelectionEventArgs)
```

Remarks

This event is raised immediately after the user starts drawing the lasso tool.

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.InitializeLink Event

Raised when the user starts drawing a new link, just after the DiagramLink instance is created.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> InitializeLink
```

Visual Basic Copy Code

```
Public Event InitializeLink As EventHandler(Of LinkEventArgs)
```

Event Data

InitializeLink event handlers receive an argument of type LinkEventArgs. The following **LinkEventArgs** members provide information relevant to the event:

Member name	Description
Link	The new DiagramLink instance.

Remarks

This event is raised immediately after the user starts drawing a new link. It lets you set the appearance properties of the link if you need their values to be different from the default ones defined in the Diagram object, or if they don't have correspondent properties in the **Diagram** class. The Initialize* events are intended only for initializing the appearance of items. Do not alter the structure of the diagram from their handlers, that is, do not create new items nor delete existing ones; if you do that, the control will be in an undefined state and will likely throw an exception at some point.

DiagramBase.InitializeNode Event

Raised when the user starts drawing a new node, just after the DiagramNode instance is created.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> InitializeNode
```

Visual Basic Copy Code

```
Public Event InitializeNode As EventHandler(Of NodeEventArgs)
```

Event Data

InitializeNode event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The new DiagramNode instance.

Remarks

This event is raised immediately after the user starts drawing a new node. It lets you set the appearance properties of the node if you need their values to be different from the default ones defined in the Diagram object, or if they don't have correspondent properties in the **Diagram** class. The Initialize* events are intended only for initializing the appearance of items. Do not alter the structure of the diagram from their handlers, that is, do not create new items nor delete existing ones; if you do that, the control will be in an undefined state and will likely throw an exception at some point.

DiagramBase.ItemAdded Event

Raised when an item is added to the diagram, either programmatically or interactively.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<ItemEventArgs> ItemAdded
```

Visual Basic Copy Code

```
Public Event ItemAdded As EventHandler(Of ItemEventArgs)
```

Event Data

ItemAdded event handlers receive an argument of type ItemEventArgs. The following **ItemEventArgs** members provide information relevant to the event:

Member name	Description
Item	The DiagramItem that has been added to the diagram.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.ItemRemoved Event

Raised when an item is removed from the diagram, either programmatically or interactively.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<ItemEventArgs> ItemRemoved
```

Visual Basic Copy Code

```
Public Event ItemRemoved As EventHandler(Of ItemEventArgs)
```

Event Data

ItemRemoved event handlers receive an argument of type ItemEventArgs. The following **ItemEventArgs** members provide information relevant to the event:

Member name	Description
Item	The DiagramItem that has been removed from the diagram.

DiagramBase.JsonDeserializeTag Event

Raised when the Tag of a diagram item must be deserialized from JSON.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<JsonSerializeTagEventArgs> JsonDeserializeTag
```

Visual Basic Copy Code

```
Public Event JsonDeserializeTag As EventHandler(Of JsonSerializeTagEventArgs)
```

See Also

DiagramBase Members

DiagramBase.JsonSerializeTag Event

Raised when the Tag of a diagram item must be serialized to JSON.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<JsonSerializeTagEventArgs> JsonSerializeTag
```

Visual Basic Copy Code

```
Public Event JsonSerializeTag As EventHandler(Of JsonSerializeTagEventArgs)
```

Remarks

You can handle this event to serialize non-primitive Id or Tag objects. If not handled, the component uses **System.Text.Json.JsonSerializer** to get JSON representation of current object.

Example

The following code shows how to serialize a simple structure as a JsonObject. **JsonObject** derives from **Dictionary<string, JsonValue>**, where JsonValue is a boxing class containing typecasting operators for primitive types and **JsonObject** itself (so you could nest objects).

C# Copy Code

```
public class MyTag
{
    public string Name { get; set; }
    public double Value { get; set; }
    public bool Flag { get; set; }
}

static public class MyTagExtensions
{
    static public JsonObject WriteJson(this MyTag tag)
    {
        return new JsonObject
        {
            { "Name", tag.Name },
            { "Value", tag.Value},
            { "Flag", tag.Flag }
        };
    }

    static public void ReadJson(this MyTag tag, JsonObject json)
    {
        tag.Name = json["Name"];
        tag.Value = json["Value"];
        tag.Flag = json["Flag"];
    }
}

void OnJsonSerializeTag(object sender, JsonSerializeTagEventArgs e)
{
    if (e.PropertyName == "Tag" && e.Tag is MyTag myTag)
    {
        e.Representation = myTag.WriteJson();
        e.Handled = true;
    }
}

void OnJsonDeserializeTag(object sender, JsonSerializeTagEventArgs e)
{
    if (e.PropertyName == "Tag" && e.Object is DiagramItem item)
    {
        var myTag = new MyTag();
        myTag.ReadJson(e.Representation);
        e.Tag = myTag;
        e.Handled = true;
    }
}
```

DiagramBase.LinkActivated Event

Raised when a link becomes the ActiveItem.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkActivated
```

Visual Basic Copy Code

```
Public Event LinkActivated As EventHandler(Of LinkEventArgs)
```

Event Data

LinkActivated event handlers receive an argument of type LinkEventArgs. The following **LinkEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that has become the ActiveItem.

Remarks

When the event is raised, **ActiveItem** already refers to the activated link. If multiple selection is disabled, the active item is the only item selected by the user; otherwise it is usually the one added last to the selection.

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkClicked
```

Visual Basic Copy Code

```
Public Event LinkClicked As EventHandler(Of LinkEventArgs)
```

Event Data

LinkClicked event handlers receive an argument of type LinkEventArgs. The following **LinkEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that has been clicked.
MouseButton	The mouse button that has been pressed by the user.
MousePosition	A **PointF** specifying the mouse cursor position.

LinkDoubleClicked Event

DiagramBase.LinkCreateCancelled Event

Raised when the user cancels link creation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkCreateCancelled
```

Visual Basic Copy Code

```
Public Event LinkCreateCancelled As EventHandler(Of LinkEventArgs)
```

Event Data

LinkCreateCancelled event handlers receive an argument of type LinkEventArgs. The following **LinkEventArgs** members provide information relevant to the event:

Member name	Description

Link	Gets the link for which the event raised.
MousePosition	Gets or sets the current mouse pointer position.

DiagramBase.LinkCreated Event

Raised when the user draws a new link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkCreated
```

Visual Basic Copy Code

```
Public Event LinkCreated As EventHandler(Of LinkEventArgs)
```

Event Data

LinkCreated event handlers receive an argument of type LinkEventArgs. The following **LinkEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that has been created.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace
InitializeLink Event
LinkCreating Event

DiagramBase.LinkCreating Event

A validation event raised while the user is drawing a new link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkValidationEventArgs> LinkCreating
```

Visual Basic Copy Code

```
Public Event LinkCreating As EventHandler(Of LinkValidationEventArgs)
```

Event Data

LinkCreating event handlers receive an argument of type LinkValidationEventArgs. The following **LinkValidationEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that is being created.
MousePosition	A **PointF** specifying the mouse cursor position.
Destination	The DiagramNode that will be set as the link's Destination if this event is validated.
AnchorIndex	Index of the anchor point to which the link will be connected if this event is validated.
TableRow	Index of the table row to which the link will be connected if this event is validated.
Cancel	Set this property to **true** to prevent the user from creating the link at the current location. That displays the Stop mouse cursor and releasing the button will cancel the operation.
CancelDrag	Call this method to immediately stop the link creation.

Remarks

LinkCreating is raised after each mouse movement while drawing a new link. Setting **Cancel** to **true** will change the mouse cursor to **DisallowCursor** (a Stop icon by default). The event is raised once again when the mouse button is released. Setting **Cancel** to **true** in that case will cancel the link creation.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace
LinkCreated Event

DiagramBase.LinkDeactivated Event

Raised when a link is no longer the ActiveItem.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkDeactivated
```

Visual Basic Copy Code

```
Public Event LinkDeactivated As EventHandler(Of LinkEventArgs)
```

Event Data

LinkDeactivated event handlers receive an argument of type LinkEventArgs. The following **LinkEventArgs** members provide information relevant to the event:

Member name	Description
Link	A DiagramLink that was the ActiveItem.

Remarks

LinkDeactivated is raised when the **ActiveItem** changes and before that it referred to a link.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.LinkDeleted Event

Raised when a link is deleted, either programmatically or by the user.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkDeleted
```

Visual Basic Copy Code

```
Public Event LinkDeleted As EventHandler(Of LinkEventArgs)
```

Event Data

LinkDeleted event handlers receive an argument of type LinkEventArgs. The following **LinkEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that has been deleted.

Remarks

The link is removed from the Items and Links collections before the event is raised. From within an event handler you can still check the values of simple properties such as Text or Tag. Before deleting a node, all links that link to it are deleted too. So there might be several **LinkDeleted** events raised before NodeDeleted is raised.

To prevent users from deleting a link by pressing the DEL key, handle the LinkDeleting event.

MindFusion.Diagramming Namespace
LinkCreated Event

DiagramBase.LinkDeleting Event

Raised when the user tries to delete a link, this event lets you cancel the operation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkValidationEventArgs> LinkDeleting
```

Visual Basic Copy Code

```
Public Event LinkDeleting As EventHandler(Of LinkValidationEventArgs)
```

Event Data

LinkDeleting event handlers receive an argument of type LinkValidationEventArgs. The following **LinkValidationEventArgs** members provide information relevant to the event:

Member name	Description
Link	A DiagramLink that the user is trying to delete by pressing the DEL key.
Cancel	Set this property to **true** to prevent the user from deleting the link.

Remarks

When users delete a node, its connecting links are deleted too. However, in that case **LinkDeleting** validation events are not raised, but just NodeDeleting.

DiagramBase.LinkDeselected Event

Raised when a link is deselected, either programmatically or by the user.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkDeselected
```

Visual Basic Copy Code

```
Public Event LinkDeselected As EventHandler(Of LinkEventArgs)
```

Event Data

LinkDeselected event handlers receive an argument of type LinkEventArgs. The following **LinkEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that has been deselected.

DiagramBase.LinkDoubleClicked Event

Raised when the user double-clicks a link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkDoubleClicked
```

Visual Basic Copy Code

```
Public Event LinkDoubleClicked As EventHandler(Of LinkEventArgs)
```

Event Data

LinkDoubleClicked event handlers receive an argument of type LinkEventArgs. The following **LinkEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that has been double-clicked.
MouseButton	The mouse button that has been pressed by the user.
MousePosition	A **PointF** specifying the mouse cursor position.

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkHovered
```

Visual Basic Copy Code

```
Public Event LinkHovered As EventHandler(Of LinkEventArgs)
```

Event Data

LinkHovered event handlers receive an argument of type LinkEventArgs.

Remarks

This event fires when the mouse pointer rests over a link for **HoverDelay** milliseconds.

DiagramBase.LinkModifying Event

A validation event raised while the user is modifying a link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkValidationEventArgs> LinkModifying
```

Visual Basic Copy Code

```
Public Event LinkModifying As EventHandler(Of LinkValidationEventArgs)
```

Event Data

LinkModifying event handlers receive an argument of type LinkValidationEventArgs. The following **LinkValidationEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that is being modified.
MousePosition	A **PointF** specifying the mouse cursor position.
AdjustmentHandle	Index of the adjustment handle that is being moved.
ChangingOrigin	A value indicating whether the operation changes the origin of the link.
Origin	The DiagramNode that will be set as the link's Origin if this event is validated.
ChangingDestination	A value indicating whether the operation changes the destination of the link.
Destination	The DiagramNode that will be set as the link's Destination if this event is validated.
AnchorIndex	Index of the anchor point to which the link will be connected if this event is validated.
TableRow	Index of the table row to which the link will be connected if this event is validated.
Cancel	Set this property to **true** to prevent the user from ending the modification at the current location. That displays the Stop mouse cursor and releasing the button will cancel the operation.
CancelDrag	Call this method to immediately stop the link modification.

Remarks

This event is raised after each mouse movement while modifying a link. Setting **Cancel** to **true** will change the mouse cursor to **DisallowCursor** (a Stop icon by default). The event is raised once again when the mouse button is released. Setting **Cancel** to **true** in that case will cancel the modification and return the link to its original state.

The **AdjustmentHandle** index corresponds to the link's control point that is being dragged.

LinkModified Event

DiagramBase.LinkPasted Event

Raised when a link has been pasted from the clipboard.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkPasted
```

Visual Basic Copy Code

```
Public Event LinkPasted As EventHandler(Of LinkEventArgs)
```

Event Data

LinkPasted event handlers receive an argument of type LinkEventArgs. The following **LinkEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that has been pasted from the clipboard.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace
DiagramView.PasteFromClipboard Method

DiagramBase.LinkRouted Event

Raised when a link is routed by the auto-routing algorithm.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkRouted
```

Visual Basic Copy Code

```
Public Event LinkRouted As EventHandler(Of LinkEventArgs)
```

Event Data

LinkRouted event handlers receive an argument of type LinkEventArgs. The following **LinkEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that has been routed.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace
DiagramLink.AutoRoute Property

DiagramBase.LinkSelected Event

Raised when a link is selected, either programmatically or by the user.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkSelected
```

Visual Basic Copy Code

```
Public Event LinkSelected As EventHandler(Of LinkEventArgs)
```

Event Data

LinkSelected event handlers receive an argument of type LinkEventArgs. The following **LinkEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that has been selected.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace
LinkDeselected Event

DiagramBase.LinkSelecting Event

Raised when the user tries to select a link, this event lets you cancel the operation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkValidationEventArgs> LinkSelecting
```

Visual Basic Copy Code

```
Public Event LinkSelecting As EventHandler(Of LinkValidationEventArgs)
```

Event Data

LinkSelecting event handlers receive an argument of type LinkValidationEventArgs. The following **LinkValidationEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that the user is trying to select.
MousePosition	A **Point** specifying the mouse cursor position.
SelectionRectangle	The current selection rectangle.

Remarks

LinkSelecting is raised in two distinct cases - when the user clicks a link, or while the user is drawing a selection rectangle. When raised because of a mouse click, the **MousePosition** argument is set to a valid point and the **SelectionRectangle** argument equals to **Empty**. While the user is drawing a selection rectangle, the event is raised for each mouse movement, the **SelectionRectangle** contains the selection coordinates and the **MousePosition** parameter equals to **Empty**.

LinkSelecting is raised while enumerating all items in the z-order collection, so you cannot change the link's ZIndex while handling this event. A selection-related event suitable for changing the z-order of items is SelectionChanged.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.LinkSplit Event

Raised when the user splits a link interactively.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkEventArgs> LinkSplit
```

Visual Basic Copy Code

```
Public Event LinkSplit As EventHandler(Of LinkEventArgs)
```

Event Data

LinkSplit event handlers receive an argument of type LinkEventArgs.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.LinkStartModifying Event

A validation event raised when the user starts modifying a link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkValidationEventArgs> LinkStartModifying
```

Visual Basic Copy Code

```
Public Event LinkStartModifying As EventHandler(Of LinkValidationEventArgs)
```

Event Data

LinkStartModifying event handlers receive an argument of type LinkValidationEventArgs. The following **LinkValidationEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that the user is starting to modify.
MousePosition	A **PointF** specifying the mouse cursor position.
AdjustmentHandle	Index of the adjustment handle that is going to be moved.
Cancel	Set this property to **true** to prevent the user from starting the link modification.

See Also

DiagramBase.LinkTextEdited Event

Raised when the user edits the text of a link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<EditLinkTextEventArgs> LinkTextEdited
```

Visual Basic Copy Code

```
Public Event LinkTextEdited As EventHandler(Of EditLinkTextEventArgs)
```

Event Data

LinkTextEdited event handlers receive an argument of type EditLinkTextEventArgs.

Remarks

The Label event argument identifies the LinkLabel that has been edited. **Label** is a **null** reference if the user has edited link's Text value.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace
LinkTextEditing Event

DiagramBase.LinkTextEditing Event

A validation event that lets you approve or reject changes made to the text of a link.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkValidationEventArgs> LinkTextEditing
```

Visual Basic Copy Code

```
Public Event LinkTextEditing As EventHandler(Of LinkValidationEventArgs)
```

Event Data

LinkTextEditing event handlers receive an argument of type LinkValidationEventArgs.

Remarks

The Label event argument identifies the LinkLabel that is being edited. **Label** is a **null** reference if the user is editing link's Text value.

MindFusion.Diagramming Namespace
NodeTextEditing Event
CellTextEditing Event
LinkTextEdited Event

DiagramBase.MeasureUnitChanged Event

Raised when the MeasureUnit property value has changed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler MeasureUnitChanged
```

Visual Basic Copy Code

```
Public Event MeasureUnitChanged As EventHandler
```

Event Data

MeasureUnitChanged event handlers receive an argument of type **EventArgs**.

See Also

DiagramBase Class
MindFusion.Diagramming Namespace
BoundsChanged Event
ActionRedone Event

DiagramBase.NodeActivated Event

Raised when a node becomes the ActiveItem.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> NodeActivated
```

Visual Basic Copy Code

```
Public Event NodeActivated As EventHandler(Of NodeEventArgs)
```

Event Data

NodeActivated event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that has become the ActiveItem.

Remarks

When this event is raised, **ActiveItem** already refers to the activated node. If multiple selection is disabled, the active item is the only item selected by the user; otherwise usually it is the one added last to the selection.

NodeSelected Event

DiagramBase.NodeClicked Event

Raised when the user clicks a node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> NodeClicked
```

Visual Basic Copy Code

```
Public Event NodeClicked As EventHandler(Of NodeEventArgs)
```

Event Data

NodeClicked event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that has been clicked.
MouseButton	The mouse button that has been pressed by the user.
MousePosition	A **PointF** specifying the mouse cursor position.

See Also

DiagramBase.NodeCreateCancelled Event

Raised when the user cancels node creation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> NodeCreateCancelled
```

Visual Basic Copy Code

```
Public Event NodeCreateCancelled As EventHandler(Of NodeEventArgs)
```

Event Data

NodeCreateCancelled event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
MousePosition	Gets or sets the current mouse pointer position.
Node	Gets the node for which the event was raised.

See Also

DiagramBase Members

DiagramBase.NodeCreated Event

Raised when the user draws a new node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> NodeCreated
```

Visual Basic Copy Code

```
Public Event NodeCreated As EventHandler(Of NodeEventArgs)
```

Event Data

NodeCreated event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that has been created.

See Also

DiagramBase Members

NodeCreating Event
ActionRedone Event

DiagramBase.NodeCreating Event

A validation event raised while the user is drawing a new node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeValidationEventArgs> NodeCreating
```

Visual Basic Copy Code

```
Public Event NodeCreating As EventHandler(Of NodeValidationEventArgs)
```

Event Data

NodeCreating event handlers receive an argument of type NodeValidationEventArgs. The following **NodeValidationEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that is being created.
MousePosition	A **PointF** specifying the mouse cursor position.
Cancel	Set this property to **true** to prevent the user from creating the node at the current location. That displays the Stop mouse cursor and releasing the button will cancel the operation.
CancelDrag	Call this method to immediately stop the node creation.

Remarks

NodeCreating is raised after each mouse movement while drawing a new node. Setting **Cancel** to **true** will change the mouse cursor to **DisallowCursor** (a Stop icon by default). The event is raised once again when the mouse button is released. Setting **Cancel** to **true** in that case will cancel the node creation.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace
NodeCreated Event

DiagramBase.NodeDeactivated Event

Raised when a node is no longer the ActiveItem.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> NodeDeactivated
```

Visual Basic Copy Code

```
Public Event NodeDeactivated As EventHandler(Of NodeEventArgs)
```

Event Data

NodeDeactivated event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that was the ActiveItem.

Remarks

NodeDeactivated is raised when the **ActiveItem** changes and before that it referred to a node.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.NodeDeleted Event

Raised when a node is deleted, either programmatically or by the user.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> NodeDeleted
```

Visual Basic Copy Code

```
Public Event NodeDeleted As EventHandler(Of NodeEventArgs)
```

Event Data

NodeDeleted event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that has been deleted.

Remarks

When the event is raised, the node is already removed from the Items and Nodes collections and all links connected to the node are deleted. From within an event handler you can still check the values of simple properties of the node such as Text or Tag.

To prevent users from deleting a node by pressing the DEL key, handle the NodeCreating event.

DiagramBase.NodeDeleting Event

Raised when the user tries to delete a node, this event lets you cancel the operation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeValidationEventArgs> NodeDeleting
```

Visual Basic Copy Code

```
Public Event NodeDeleting As EventHandler(Of NodeValidationEventArgs)
```

Event Data

NodeDeleting event handlers receive an argument of type NodeValidationEventArgs. The following **NodeValidationEventArgs** members provide information relevant to the event:

Member name	Description
Node	A DiagramNode that the user is trying to delete by pressing the DEL key.
Cancel	Set this property to **true** to prevent the user from deleting the node.

Remarks

When the user deletes a node, the links connected to it are deleted too. However, the LinkDeleting validation event is not raised in that case.

DiagramBase.NodeDeselected Event

Raised when a node is deselected, either programmatically or by the user.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> NodeDeselected
```

Visual Basic Copy Code

```
Public Event NodeDeselected As EventHandler(Of NodeEventArgs)
```

Event Data

NodeDeselected event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that has been deselected.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.NodeDoubleClicked Event

Raised when the user double-clicks a node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> NodeDoubleClicked
```

Visual Basic Copy Code

```
Public Event NodeDoubleClicked As EventHandler(Of NodeEventArgs)
```

Event Data

NodeDoubleClicked event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that has been double-clicked.
MouseButton	The mouse button that has been pressed by the user.
MousePosition	A **Point** specifying the mouse cursor position.

CellDoubleClicked Event

DiagramBase.NodeHovered Event

Raised when the mouse pointer hovers over a node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> NodeHovered
```

Visual Basic Copy Code

```
Public Event NodeHovered As EventHandler(Of NodeEventArgs)
```

Event Data

NodeHovered event handlers receive an argument of type NodeEventArgs.

Remarks

This event fires when the mouse pointer rests over a node for **HoverDelay** milliseconds.

NodePointerLeave Event

DiagramBase.NodeModified Event

Raised when the user moves or resizes a node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> NodeModified
```

Visual Basic Copy Code

```
Public Event NodeModified As EventHandler(Of NodeEventArgs)
```

Event Data

NodeModified event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that has been modified.
MousePosition	A **PointF** specifying the mouse cursor position.
AdjustmentHandle	The adjustment handle that has been moved.

Remarks

NodeModified is not raised if the node position is changed programmatically. The event occurs only when the user has dragged an adjustment handle to a new position.

DiagramBase.NodeModifying Event

A validation event raised while the user is moving or resizing a node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeValidationEventArgs> NodeModifying
```

Visual Basic Copy Code

```
Public Event NodeModifying As EventHandler(Of NodeValidationEventArgs)
```

Event Data

NodeModifying event handlers receive an argument of type NodeValidationEventArgs. The following **NodeValidationEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that is being modified.
MousePosition	A **PointF** specifying the mouse cursor position.
AdjustmentHandle	The adjustment handle that is being moved.
Cancel	Set this property to **true** to prevent the user from ending the modification at the current location. That displays the Stop mouse cursor and releasing the button will cancel the operation.
CancelDrag	Call this method to immediately stop the node modification.

Remarks

This event is raised after each mouse movement while modifying a node. Setting **Cancel** to **true** will change the mouse cursor to **DisallowCursor** (a Stop icon by default). The event is raised once again when the mouse button is released. Setting **Cancel** to **true** in that case will cancel the modification and return the node to its original location.

DiagramBase.NodeSelecting Event

Raised when the user tries to select a node, this event lets you cancel the operation.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeValidationEventArgs> NodeSelecting
```

Visual Basic Copy Code

```
Public Event NodeSelecting As EventHandler(Of NodeValidationEventArgs)
```

Event Data

NodeSelecting event handlers receive an argument of type NodeValidationEventArgs. The following **NodeValidationEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that the user is trying to select.
MousePosition	A **Point** specifying the mouse cursor position.
SelectionRectangle	The current selection rectangle.

Remarks

NodeSelecting is raised in two distinct cases - when the user clicks a node, or while the user is drawing a selection rectangle. When raised because of a mouse click, the **MousePosition** argument is set to a valid point and the **SelectionRectangle** argument equals to **Empty**. While the user is drawing a selection rectangle, the event is raised for each mouse movement, the **SelectionRectangle** contains the selection coordinates and the **MousePosition** parameter equals to **Empty**.

NodeSelecting is raised while enumerating all items in the z-order collection, so you cannot change the node's ZIndex while handling this event. A selection-related event suitable for changing the z-order of items is SelectionChanged.

DiagramBase.NodeStartModifying Event

A validation event raised when the user starts modifying a node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeValidationEventArgs> NodeStartModifying
```

Visual Basic Copy Code

```
Public Event NodeStartModifying As EventHandler(Of NodeValidationEventArgs)
```

Event Data

NodeStartModifying event handlers receive an argument of type NodeValidationEventArgs. The following **NodeValidationEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that the user is starting to modify.
MousePosition	A **PointF** specifying the mouse cursor position.
AdjustmentHandle	The adjustment handle that is going to be moved.
Cancel	Set this property to **true** to prevent the user from starting the node modification.

DiagramBase.NodeTextEdited Event

Raised when the user edits the text of a node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<EditNodeTextEventArgs> NodeTextEdited
```

Visual Basic Copy Code

```
Public Event NodeTextEdited As EventHandler(Of EditNodeTextEventArgs)
```

Event Data

NodeTextEdited event handlers receive an argument of type EditNodeTextEventArgs. The following **EditNodeTextEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode whose text has been edited.
NewText	The node's new text.
OldText	The node's old text.

NodeTextEditing Event

DiagramBase.NodeTextEditing Event

A validation event that lets you approve or reject changes made to the text of a node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeValidationEventArgs> NodeTextEditing
```

Visual Basic Copy Code

```
Public Event NodeTextEditing As EventHandler(Of NodeValidationEventArgs)
```

Event Data

NodeTextEditing event handlers receive an argument of type NodeValidationEventArgs. The following **NodeValidationEventArgs** members provide information relevant to the event:

Member name	Description
Node	The DiagramNode that the user is trying to edit.
Cancel	Set this property to **true** to prevent the user from editing the node's text.

DiagramBase.OriginAnchorChanged Event

Raised when the OriginAnchor property value of a link has changed.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<AnchorPointEventArgs> OriginAnchorChanged
```

Visual Basic Copy Code

```
Public Event OriginAnchorChanged As EventHandler(Of AnchorPointEventArgs)
```

Event Data

OriginAnchorChanged event handlers receive an argument of type AnchorPointEventArgs. The following **AnchorPointEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink whose OriginAnchor has changed.
OldAnchorIndex	Index of the old anchor point.
NewAnchorIndex	Index of the new anchor point.

Remarks

This event is raised every time the **OriginAnchor** property of a link changes, either because a user connects the link end to a different anchor point, or because an application sets it programmatically.

Raised when the diagram views should be repainted.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<RepaintEventArgs> Repaint
```

Visual Basic Copy Code

```
Public Event Repaint As EventHandler(Of RepaintEventArgs)
```

Event Data

Repaint event handlers receive an argument of type RepaintEventArgs. The following **RepaintEventArgs** members provide information relevant to the event:

Member name	Description
InvalidRect	A **Microsoft.Maui.Graphics.Rect** specifying which part of the diagram should be repainted.

Remarks

If **InvalidRect** equals to **Empty**, the whole diagram should be repainted.

Raised when an object within the diagram requests an operation with the clipboard.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<ClipboardEventArgs> RequestClipboard
```

Visual Basic Copy Code

```
Public Event RequestClipboard As EventHandler(Of ClipboardEventArgs)
```

Event Data

RequestClipboard event handlers receive an argument of type ClipboardEventArgs. The following **ClipboardEventArgs** members provide information relevant to the event:

Member name	Description
IsGetOperation	Indicates whether getting or setting the clipboard.
Source	The object, which initiated the operation.

Data	The clipboard data.
DataType	The type of the clipboard data. This is relevant during Clipboard *get* operations.

DiagramBase.SelectionChanged Event

Raised when an item is added to or removed from the selection

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler SelectionChanged
```

Visual Basic Copy Code

```
Public Event SelectionChanged As EventHandler
```

Event Data

SelectionChanged event handlers receive an argument of type **EventArgs**.

Remarks

Use the Nodes and Links properties of the diagram's Selection to find out which items are currently selected.

MindFusion.Diagramming Namespace
SelectionModifying Event

DiagramBase.SelectionModifying Event

Raised while the user is moving multiple selected items, this event lets you cancel the modification.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<SelectionValidationEventArgs> SelectionModifying
```

Visual Basic Copy Code

```
Public Event SelectionModifying As EventHandler(Of SelectionValidationEventArgs)
```

Event Data

SelectionModifying event handlers receive an argument of type SelectionValidationEventArgs. The following **SelectionValidationEventArgs** members provide information relevant to the event:

Member name	Description
Cancel	Set this property to **true** to prevent the user from placing the selected items at the current location. That displays the Stop mouse cursor and releasing the button will cancel the operation.
CancelDrag	Call this method to immediately stop the modification.

Remarks

This event is raised after each mouse movement while modifying a selection of items. Setting Cancel to **true** will change the mouse cursor to **DisallowCursor** (a Stop icon by default). The event is raised once again when the mouse button is released. Setting Cancel to true in that case will cancel the modification and return the items to their original position.

Use the Selection property of the Diagram class to access the selected items.

MindFusion.Diagramming Namespace
SelectionModified Event

DiagramBase.SerializeTag Event

Raised when the Tag of a diagram item must be serialized into an XML document.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<SerializeTagEventArgs> SerializeTag
```

Visual Basic Copy Code

```
Public Event SerializeTag As EventHandler(Of SerializeTagEventArgs)
```

Event Data

SerializeTag event handlers receive an argument of type SerializeTagEventArgs. The following **SerializeTagEventArgs** members provide information relevant to the event:

Member name	Description
Object	The object whose Tag is being serialized. This object can be either a diagram item, group, cell or anchor point.
Tag	The Tag object being serialized.
Representation	An XmlElement instance where the XML representation of the Tag should be saved.
Context	An XmlPersistContext object providing information about the document being serialized, along with methods that help you serialize data to XML.
Handled	Set this flag to **true** if you perform custom tag serialization.

Remarks

Only tags of simple value types can be saved and loaded automatically to/from the XML document. You must provide your own serialization for complex types by implementing this event and DeserializeTag.

Example

C#

Copy Code

```
private void Write(string fileName)
{
    diagram.SerializeTag += new SerializeTagEventHandler(SerializeTag);
    diagram.SaveToXml(fileName);
}

void SerializeTag(object sender, SerializeTagEventArgs e)
{
    e.Handled = true;
    object tag = e.Tag;
    string stringRepresentation = "";

    if (tag != null)
    {
        stringRepresentation = tag.GetType().ToString();
        stringRepresentation += ";";
        stringRepresentation += tag.ToString();
    }

    XmlNode repNode =
        e.Context.XmlDocument.CreateTextNode(stringRepresentation);
    e.Representation.AppendChild(repNode);
}
```

Visual Basic

Copy Code

```
Private Sub Write(ByVal fileName As String)

    AddHandler diagram.SerializeTag, New SerializeTagEventHandler(AddressOf SerializeTag)
    diagram.SaveToXml(fileName)

End Sub

Sub SerializeTag(ByVal sender As Object, ByVal e As SerializeTagEventArgs)

    e.Handled = True

    Dim tag As Object = e.Tag
    Dim stringRepresentation As String = ""

    If Not Tag Is Nothing Then

        stringRepresentation = Tag.GetType().ToString()
        stringRepresentation += ";"
        stringRepresentation += Tag.ToString()

    End If
```

```
    Dim repNode As XmlNode = _
        e.Context.XmlDocument.CreateTextNode(stringRepresentation)
    e.Representation.AppendChild(repNode)

End Sub
```

DeserializeTag Event
Diagram.SaveToXml Method

DiagramBase.SetSelfLoopShape Event

Raised when a link becomes a self-loop, giving you a chance to override the default look shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkShapeEventArgs> SetSelfLoopShape
```

Visual Basic Copy Code

```
Public Event SetSelfLoopShape As EventHandler(Of LinkShapeEventArgs)
```

Event Data

SetSelfLoopShape event handlers receive an argument of type LinkShapeEventArgs. The following **LinkShapeEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that becomes a self-loop.
Handled	Indicates whether the event handler has set a custom loop shape.

DiagramBase.ShapeModified Event

Raised when the user modifies the shape of a ShapeNode by moving one of the control points corresponding to shape formula parameters.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<ControlPointEventArgs> ShapeModified
```

Visual Basic Copy Code

```
Public Event ShapeModified As EventHandler(Of ControlPointEventArgs)
```

Event Data

ShapeModified event handlers receive an argument of type ControlPointEventArgs. The following **ControlPointEventArgs** members provide information relevant to the event:

Member name	Description
ControlPoint	Gets the ShapeControlPoint used to modify the node's shape.
NewValue	Gets the new position of the control point.
Node	Gets the ShapeNode whose Shape has been modified.
OldValue	Gets the original position of the control point.

DiagramBase.ShapeNotDefined Event

Raised when the diagram being loaded contains nodes with an undefined shape.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<ShapeEventArgs> ShapeNotDefined
```

Visual Basic Copy Code

```
Public Event ShapeNotDefined As EventHandler(Of ShapeEventArgs)
```

Event Data

The UnknownId argument contains the shape identifier. Set the Shape argument to assign to the loaded node.

Remarks

You can handle this event by loading a ShapeLibrary file or creating a new Shape instance from code.

DiagramBase.TableSectionCollapsed Event

Raised when the user collapses the rows of a table's section by clicking the [-] button in the section's header row.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<RowEventArgs> TableSectionCollapsed
```

Visual Basic Copy Code

```
Public Event TableSectionCollapsed As EventHandler(Of RowEventArgs)
```

Event Data

TableSectionCollapsed event handlers receive an argument of type RowEventArgs. The following **RowEventArgs** members provide information relevant to the event:

Member name	Description
Table	The TableNode that contains the collapsed rows.
RowIndex	Index of the header row of the collapsed section.

Remarks

A header row is a row whose Header property is enabled. Such rows display a [±] button which can be used to expand or collapse all rows below a header up to the next header. **TableSectionCollapsed** is raised when a user clicks the [-] button, but not when Expanded is set to **false** programmatically.

TableSectionExpanded Event

DiagramBase.TableSectionExpanded Event

Raised when the user expands the rows of a table's section by clicking the [+] button in the section's header row.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<RowEventArgs> TableSectionExpanded
```

Visual Basic Copy Code

```
Public Event TableSectionExpanded As EventHandler(Of RowEventArgs)
```

Event Data

TableSectionExpanded event handlers receive an argument of type RowEventArgs. The following **RowEventArgs** members provide information relevant to the event:

Member name	Description
Table	The TableNode that contains the expanded rows.
RowIndex	Index of the header row of the expanded section.

Remarks

A header row is a row whose Header property is enabled. Such rows display a [±] button which can be used to expand or collapse all rows below a header up to the next header. **TableSectionExpanded** is raised when a user clicks the [+] button, but not when Expanded is set to **true** programmatically.

Example

The code below changes the color of the first cell of a header row when the table section defined via that row is expanded:

C# Copy Code

```
void diagram_TableSectionExpanded(object sender, RowEventArgs e)
{
    e.Table[0, e.RowIndex].Brush = new MindFusion.Drawing.SolidBrush(Color.Blue);
}
```

Visual Basic Copy Code

```
Private Sub Diagram_TableSectionExpanded(ByVal sender As Object, ByVal e As
MindFusion.Diagramming.RowEventArgs)Handles Diagram.TableSectionExpanded
    e.Table(0, e.RowIndex).Brush = New MindFusion.Drawing.SolidBrush(Color.Blue)
End Sub
```

TableSectionCollapsed Event

DiagramBase.TreeCollapsed Event

Raised when a user collapses a tree branch by clicking the [-] button of an Expandable node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> TreeCollapsed
```

Visual Basic Copy Code

```
Public Event TreeCollapsed As EventHandler(Of NodeEventArgs)
```

Event Data

TreeCollapsed event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The root DiagramNode of the collapsed tree branch.

ActionRedone Event

DiagramBase.TreeExpanded Event

Raised when a user expands a tree branch by clicking the [+] button of an Expandable node.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<NodeEventArgs> TreeExpanded
```

Visual Basic Copy Code

```
Public Event TreeExpanded As EventHandler(Of NodeEventArgs)
```

Event Data

TreeExpanded event handlers receive an argument of type NodeEventArgs. The following **NodeEventArgs** members provide information relevant to the event:

Member name	Description
Node	The root DiagramNode of the expanded tree branch.

TreeCollapsed Event

DiagramBase.TreeItemTextEditing Event

A validation event that lets you approve or reject changes made to the text of a TreeViewNode's item.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<TreeItemValidationEventArgs> TreeItemTextEditing
```

Visual Basic Copy Code

```
Public Event TreeItemTextEditing As EventHandler(Of TreeItemValidationEventArgs)
```

Event Data

TreeItemTextEditing event handlers receive an argument of type TreeItemValidationEventArgs.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.ValidateAnchorPoint Event

A validation event that lets you approve or reject connecting a link to an anchor point.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkValidationEventArgs> ValidateAnchorPoint
```

Visual Basic Copy Code

```
Public Event ValidateAnchorPoint As EventHandler(Of LinkValidationEventArgs)
```

Event Data

ValidateAnchorPoint event handlers receive an argument of type LinkValidationEventArgs. The following **LinkValidationEventArgs** members provide information relevant to the event:

Member name	Description
Link	The DiagramLink that will be connected to the anchor point.
MousePosition	A **PointF** specifying the mouse cursor position.
AdjustmentHandle	Index of the adjustment handle that is being moved.
ChangingOrigin	A value indicating whether the operation changes the origin of the link.
ChangingDestination	A value indicating whether the operation changes the destination of the link.
Node	The DiagramNode to which the link will be connected.
AnchorIndex	Index of an anchor point to which the link will be connected if this event is validated.
Cancel	Set this property to **true** to prevent connecting the link to specified point.

Remarks

This event is raised for each point of an AnchorPattern while a link's end point is being moved over a node. If none of the anchor points are validated, the mouse cursor icon changes to **DisallowLinkCursor**, indicating that the link cannot be connected to that node.

When the mouse button is released over a node, the event is raised again for the node's anchor points. From all validated anchor points, the one nearest to the dragged link end point is used to dock the link.

DiagramBase.ValidateLinkCrossing Event

A validation event that lets you approve or reject displaying a decoration at the intersection point of links.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<LinkCrossingEventArgs> ValidateLinkCrossing
```

Visual Basic Copy Code

```
Public Event ValidateLinkCrossing As EventHandler(Of LinkCrossingEventArgs)
```

Remarks

This event is raised for each intersection point of links when LinkCrossings property is enabled.

DiagramBase.ViewRemoved Event

Raised when a DiagramView is detached from this diagram.

Namespace: MindFusion.Diagramming
Assembly: MindFusion.Diagramming

Syntax

C# Copy Code

```
public event EventHandler<CancelEventArgs> ViewRemoved
```

Visual Basic Copy Code

```
Public Event ViewRemoved As EventHandler(Of CancelEventArgs)
```

Event Data

ViewRemoved event handlers receive an argument of type **CancelEventArgs**.

DiagramBase Members

The base class of the Diagram and DiagramDocument classes.

The following tables list the members exposed by the DiagramBase type.

Public Constructors

	Name	Description
	DiagramBase	Initializes a new instance of the DiagramBase class.

Public Methods

	Name	Description
	raiseClicked	Raises an event which notifies that a Diagram item has been clicked.
	raiseCreated	Raises an event which notifies that a Diagram item has been created.
	raiseDeleted	Raises an event which notifies that a Diagram item has been deleted.
	raiseDeselected	Raises an event which notifies that a Diagram item has been deselected.
	raiseDoubleClicked	Raises an event which notifies that a Diagram item has been double-clicked.
	raiseModified	Raises an event which notifies that a Diagram item has been modified.
	raisePasted	Raises an event which notifies that a Diagram item has been pasted from clipboard.
	raiseSelected	Raises an event which notifies that a Diagram item has been selected.
	raiseSelecting	Raises an event which notifies that a Diagram item will be selected.
	raiseSelectingAsync	Raises an event which notifies that a Diagram item will be selected.
	raiseSelectionChanged	Raises an event which notifies that the selection has changed.

Public Events

	Name	Description
	actionRedone	Raised when an action is redone.
	actionUndone	Raised when an action is undone.
	animatedLayoutCompleted	Raised when an animated layout completes.
	cellTextEdited	Raised when the user edits the text of a table cell.
	cellTextEditing	Raised when the user starts to edit the text of a table cell.

	clicked	Raised when the user clicks the diagram at a point where no items are located.
	containerChildAdded	Raised when the user adds a node to a ContainerNode.
	containerChildAdding	A validation event raised to let you prevent users from adding child nodes to a container. Event handlers receive a NodeEventArgs instance that contains data about this event.
	containerChildRemoved	Raised when the user removes a node from a **ContainerNode**.
	containerChildRemoving	Raised when the user removes a node from a **ContainerNode**.
	containerFolded	Raised when the user folds a container by clicking the arrow-up button in the container's caption bar. Event handlers receive a NodeEventArgs instance that contains data about this event.
	containerPageChanged	Raised when the user changes current page of a PagedContainerNode.
	containerUnfolded	Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar. Event handlers receive a NodeEventArgs instance that contains data about this event.
	dataLoaded	Raised when the diagram data is loaded.
	deserializeTag	Raised when the Tag or Id of a diagram item must be deserialized from XML format. Event handlers receive a SerializeTagEventArgs instance that contains data about this event.
	drawAdjustmentHandles	Raised to draw custom adjustment handles.
	drawAnchorPoint	Raised when an anchor point must be custom-drawn.
	expandButtonClicked	Raised if expandButtonAction is set to RaiseEvents and the [+/-]button of an expandable node is clicked.
	headerResized	Raised when the user finished resizing a header.
	headerStartResizing	Raised when the user starts resizing a header.
	hitTestAdjustmentHandles	Raised to hit-test custom adjustment handles.
	hyperlinkClicked	Raised when the user clicks a hyperlink inside a node.
	initializeLink	Raised when the user starts drawing a new link, just after the DiagramLink instance is created.
	initializeNode	Raised when the user starts drawing a new node, just after the DiagramNode instance is created.
	itemAdded	Raised when an item is added to the diagram.
	itemRemoved	Raised when an item is removed from the diagram.
	laneGridCellTextEdited	Raised when the user edits the text of a grid cell.
	linkClicked	Raised when the user clicks a link.
	linkCreated	Raised when the user draws a new link.
	linkCreating	A validation event raised while the user is drawing a new link.
	linkDeleted	Raised when a link is deleted, either programmatically or by the user.
	linkDeleting	Raised when the user tries to delete a link. This event lets you cancel the operation.
	linkDeselected	Raised when a link is deselected, either programmatically or by the user.
	linkDoubleClicked	Raised when the user double-clicks a link.
	linkHovered	Raised when the mouse pointer hovers over a link.
	linkModified	Raised when the user moves any control point of a link.

	linkModifying	A validation event raised while the user is modifying a link.
	linkPasted	Raised when a link has been pasted from the clipboard.
	linkPointerEnter	Raised when the mouse pointer enters the boundaries of a link.
	linkPointerLeave	Raised when the mouse pointer leaves the boundaries of a link.
	linkRouted	Raised when a link is routed by the auto-routing algorithm.
	linkSelected	Raised when a link is selected, either programmatically or by the user.
	linkSelecting	Raised when the user tries to select a link. This event lets you cancel the operation.
	linkSplit	Raised when the user splits a link interactively.
	linkTextEdited	Raised when the user edits the text of a link.
	linkTextEditing	Raised when the user starts to edit the text of a link.
	nodeClicked	Raised when the user clicks a node.
	nodeCreated	Raised when the user draws a new node.
	nodeCreating	A validation event raised while the user is drawing a new node.
	nodeDeleted	Raised when a node is deleted, either programmatically or by the user.
	nodeDeleting	Raised when the user tries to delete a node. This event lets you cancel the operation.
	nodeDeselected	Raised when a node is deselected, either programmatically or by the user.
	nodeDomCreated	Raised when the content of a ControlNode is added to the page DOM.
	nodeDoubleClicked	Raised when the user double-clicks a node.
	nodeHovered	Raised when the mouse pointer hovers over a node.
	nodeModified	Raised when the user moves or resizes a node.
	nodeModifying	A validation event raised while the user is moving or resizing a node.
	nodePasted	Raised when a node has been pasted from the clipboard.
	nodePointerEnter	Raised when the mouse pointer enters the boundaries of a node.
	nodePointerLeave	Raised when the mouse pointer leaves the boundaries of a node.
	nodeSelected	Raised when a node is selected, either programmatically or by the user.
	nodeSelecting	Raised when the user tries to select a node. This event lets you cancel the operation.
	nodeTextEdited	Raised when the user edits the text of a node.
	nodeTextEditing	Raised when the user starts to edit the text of a node.
	queryView	Raised to enumerate diagram views.
	selectionChanged	Raised when the diagram selection has changed.
	selectionModifying	A validation event raised while the user is moving or resizing multiple items.
	serializeTag	Raised when the Tag or Id of a diagram item must be serialized in XML format. Event handlers receive a SerializeTagEventArgs instance that contains data about this event.
	shapeLibraryLoaded	Raised when a ShapeLibrary is loaded from shapeLibraryLocation.
	sizeChanged	Raised when the size of the diagram canvas has changed.

	tableColumnResized	Raised when the user finishes resizing a column in a table.
	tableColumnResizing	Raised when the user resizes a column in a table interactively.
	tableRowResized	Raised when the user finishes resizing a row in a table.
	tableRowResizing	Raised when the user resizes a row in a table interactively.
	tableSectionCollapsed	Raised when a table section is collapsed.
	tableSectionExpanded	Raised when a table section is expanded.
	treeCollapsed	Raised when a user collapses a tree branch by clicking the [-] button of an **expandable** node.
	treeExpanded	Raised when a user expands a tree branch by clicking the [+] button of an **expandable** node.
	treeItemTextEdited	Raised when the user edits the text of a tree view item.
	treeItemTextEditing	Raised when the user starts to edit the text of a tree view item.
	validateAnchorPoint	A validation event that lets you approve or reject connecting a link to an anchor point.
	validateLinkCrossing	A validation event that lets you approve or reject displaying a decoration at the intersection point of links.

DiagramBase Methods

DiagramBase.raiseClicked Method

Raises an event which notifies that a Diagram item has been clicked.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
function raiseClicked (item, mousePosition, mouseButton)
```

Parameters

item
DiagramItem. The Diagram item.

mousePosition
Point. The position of the mouse.

mouseButton
MouseButton. The mouse button, with which the item has been clicked.

DiagramBase.raiseDoubleClicked Method

Raises an event which notifies that a Diagram item has been double-clicked.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
function raiseDoubleClicked (item, mousePosition, mouseButton)
```

Parameters

item
DiagramItem. The Diagram item.

mousePosition
Point. The position of the mouse.

mouseButton
MouseButton. The mouse button, with which the item has been clicked.

DiagramBase.raiseModified Method

Raises an event which notifies that a Diagram item has been modified.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
function raiseModified (item, mousePosition, adjustmentHandle)
```

Parameters

item
DiagramItem. The DiagramItem that has been modified.

mousePosition
Point. The current mouse pointer position.

adjustmentHandle
Number. Identifies the handle used to modify the item.

DiagramBase.raiseSelectionChanged Method

Raises an event which notifies that the selection has changed.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

```
JavaScript                                                    Copy Code
function raiseSelectionChanged (oldItems, newItems)
```

Parameters

oldItems
Array. The selected items before the change.

newItems
Array. The selected items after the change.

DiagramBase Class

DiagramBase Events

DiagramBase.actionRedone Event

Raised when an action is redone.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
diagram.actionRedone.addEventListener(onActionRedone);

function onActionRedone(sender, args)
{
}
```

Event Data

Event handlers receive an UndoEventArgs instance containing data about this event.

Remarks

This event is raised during calls to redo. It is raised both for top-level commands and for the constituent actions of composite commands.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace
actionUndone Event

DiagramBase.actionUndone Event

Raised when an action is undone.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
diagram.actionUndone.addEventListener(onActionUndone);

function onActionUndone(sender, args)
{
}
```

Event Data

Event handlers receive an UndoEventArgs instance containing data about this event.

Remarks

This event is raised during calls to undo. It is raised both for top-level commands and for the constituent actions of composite commands.

See Also

DiagramBase.animatedLayoutCompleted Event

Raised when an animated layout completes.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
diagram.animatedLayoutCompleted.addEventListener(onAnimatedLayoutCompleted);

function onAnimatedLayoutCompleted(sender, args)
{
}
```

Event Data

When layout is applied on a ContainerNode, event handlers receive a NodeEventArgs instance as argument.

Example

This example handles the **animatedLayoutCompleted** event to resize the diagram.

JavaScript Copy Code

```
diagram.animatedLayoutCompleted.addEventListener(
    (sender, args) =>
    {
        sender.resizeToFitItems(10);
    });
diagram.arrangeAnimated(...);
```

linkClicked Event
nodeClicked Event

DiagramBase.containerChildAdded Event

Raised when the user adds a node to a ContainerNode.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

Event Data

Event handlers receive a NodeEventArgs instance that contains data about this event.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.containerChildAdding Event

A validation event raised to let you prevent users from adding child nodes to a container. Event handlers receive a NodeEventArgs instance that contains data about this event.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

Event Data

Event handlers receive a NodeEventArgs instance that contains data about this event.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.containerChildRemoved Event

Raised when the user removes a node from a ContainerNode.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

Event Data

Event handlers receive a NodeEventArgs instance that contains data about this event.

See Also

ContainerNode.foldable Property

DiagramBase.containerPageChanged Event

Raised when the user changes current page of a PagedContainerNode.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.containerUnfolded Event

Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar. Event handlers receive a NodeEventArgs instance that contains data about this event.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

Event Data

Event handlers receive a NodeEventArgs instance that contains data about this event.

See Also

DiagramBase Members
DiagramBase Class

ContainerNode.foldable Property

DiagramBase.dataLoaded Event

Raised when the diagram data is loaded.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
diagram.dataLoaded.addEventListener(onDataLoaded);

function onDataLoaded(sender, args)
{
}
```

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.deserializeTag Event

Raised when the Tag or Id of a diagram item must be deserialized from XML format. Event handlers receive a SerializeTagEventArgs instance that contains data about this event.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

Event Data

Event handlers receive a SerializeTagEventArgs instance that contains data about this event.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.drawAdjustmentHandles Event

Raised to draw custom adjustment handles.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
diagram.drawAdjustmentHandles.addEventListener(onDrawAdjustmentHandles);

function onDrawAdjustmentHandles(sender, args)
{
}
```

Event Data

Event handlers receive a NodeEventArgs or LinkEventArgs instance that contains data about this event.

See Also

DiagramNode.handlesStyle Property

DiagramBase.drawAnchorPoint Event

Raised when an anchor point must be custom-drawn.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
diagram.drawAnchorPoint.addEventListener(onDrawAnchorPoint);

function onDrawAnchorPoint(sender, args)
```

```
{
}
```

Event Data

Event handlers receive a DrawAnchorPointEventArgs instance that contains data about this event.

Remarks

Set the markStyle property of AnchorPoint to Custom to get this event raised.

Example

JavaScript Copy Code

```
function onDrawAnchorPoint(sender, e)
{
    var p = e.location;
    var ctx = e.context;
    ctx.fillStyle = "red";
    ctx.fillRect(p.x - 1, p.y - 1, 2, 2);
}
```

DiagramBase.expandButtonClicked Event

Raised if expandButtonAction is set to RaiseEvents and the [+/-]button of an expandable node is clicked.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
diagram.expandButtonClicked.addEventListener(onExpandButtonClicked);

function onExpandButtonClicked(sender, args)
{
}
```

Event Data

Event handlers receive a NodeEventArgs instance that contains data about this event.

See Also

DiagramBase Members
DiagramBase Class

DiagramBase.hitTestAdjustmentHandles Event

Raised to hit-test custom adjustment handles.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
diagram.hitTestAdjustmentHandles.addEventListener(onHitTestAdjustmentHandles);

function onHitTestAdjustmentHandles(sender, args)
{
}
```

Event Data

Event handlers receive a NodeEventArgs or LinkEventArgs instance that contains data about this event.

See Also

DiagramNode.handlesStyle Property

DiagramBase.hyperlinkClicked Event

Raised when the user clicks a hyperlink inside a node.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
diagram.hyperlinkClicked.addEventListener(onHyperlinkClicked);

function onHyperlinkClicked(sender, args)
{
}
```

Event Data

Event handlers receive a NodeEventArgs instance containing data about this event.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.initializeLink Event

Raised when the user starts drawing a new link, just after the DiagramLink instance is created.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

Event Data

Event handlers receive a LinkEventArgs instance containing data about this event.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.initializeNode Event

Raised when the user starts drawing a new node, just after the DiagramNode instance is created.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
diagram.initializeNode.addEventListener(onInitializeNode);

function onInitializeNode(sender, args)
{
}
```

Event Data

Event handlers receive a NodeEventArgs instance containing data about this event.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.itemAdded Event

Raised when an item is added to the diagram.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript — Copy Code

```
diagram.itemAdded.addEventListener(onItemAdded);

function onItemAdded(sender, args)
{
}
```

Event Data

Event handlers receive an ItemEventArgs instance containing data about this event.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.itemRemoved Event

Raised when an item is removed from the diagram.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript — Copy Code

```
diagram.itemRemoved.addEventListener(onItemRemoved);

function onItemRemoved(sender, args)
{
}
```

Event Data

Event handlers receive an ItemEventArgs instance containing data about this event.

See Also

DiagramBase Members

linkHovered Event
linkDoubleClicked Event

DiagramBase.linkCreated Event

Raised when the user draws a new link.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

Event Data

Event handlers receive a LinkEventArgs instance containing data about this event.

See Also

DiagramBase Members
DiagramBase Class
MindFusion.Diagramming Namespace

DiagramBase.linkCreating Event

A validation event raised while the user is drawing a new link.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

Event Data

Event handlers receive a LinkEventArgs instance containing data about this event.

Example

This example shows how to handle the **linkCreating** event to prevent cycles in the graph.

JavaScript Copy Code

```
// assuming namespaced scripts
var PathFinder = MindFusion.Diagramming.PathFinder;
```

```
diagram.linkCreating.addEventListener(onLinkCreating);

function onLinkCreating(diagram, args)
{
    if (args.destination == null)
    {
        // not pointing to a node yet
        return;
    }

    var pathFinder = new PathFinder(diagram);
    var path = pathFinder.findShortestPath(
        args.destination, args.origin);

    if (path != null)
    {
        // adding this new link would create a cycle
        // [origin]--[dest]--[path internal nodes]--[origin]

        args.cancel = true;
    }
}
```

DiagramBase.linkHovered Event

Raised when the mouse pointer hovers over a link.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

Event Data

Event handlers receive a LinkEventArgs instance containing data about this event.

Remarks

This event fires when the mouse pointer rests over a link for hoverDelay milliseconds.

nodeHovered Event

DiagramBase.nodeCreated Event

Raised when the user draws a new node.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

Event Data

Event handlers receive a NodeEventArgs instance containing data about this event.

Example

This example handles the **nodeCreated** event to set new node's anchorPattern.

JavaScript Copy Code

```
diagram.nodeCreated.addEventListener(
    (sender, args) =>
    {
        if (sender.defaultShape.id == "Rectangle")
            args.node.anchorPattern = pattern1;
        else
            args.node.anchorPattern = pattern2;
    });
```

Event handlers receive a TreeItemEventArgs instance containing data about this event.

Example

This example handles the **treeItemTextEdited** event to remove items without text.

JavaScript Copy Code

```
diagram.treeItemTextEdited.addEventListener(
    (sender, args) =>
    {
        if (!args.newText)
            args.node.removeItem(args.item);
    });
```

DiagramBase.treeItemTextEditing Event

Raised when the user starts to edit the text of a tree view item.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

Event Data

Event handlers receive a TreeItemEventArgs instance containing data about this event.

allowInplaceEdit Property

DiagramBase.validateAnchorPoint Event

A validation event that lets you approve or reject connecting a link to an anchor point.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
diagram.validateAnchorPoint.addEventListener(onValidateAnchorPoint);

function onValidateAnchorPoint(sender, args)
{
}
```

Event Data

Event handlers receive a LinkValidationEventArgs instance containing data about this event.

Remarks

This event is raised for each point of an AnchorPattern while a link's end point is being moved over a node. If none of the anchor points are validated, the mouse cursor icon changes to *NotAllowed*, indicating that the link cannot be connected to that node.

When the mouse button is released over a node, the event is raised again for the node's anchor points. From all validated anchor points, the one nearest to the dragged link end point is used to dock the link.

DiagramBase.validateLinkCrossing Event

A validation event that lets you approve or reject displaying a decoration at the intersection point of links.

Namespace: MindFusion.Diagramming
Assembly: DiagramBase.js

Syntax

JavaScript Copy Code

```
diagram.validateLinkCrossing.addEventListener(onValidateLinkCrossing);
```

```
function onValidateLinkCrossing(sender, args)
{
}
```

Event Data

Event handlers receive a LinkCrossingEventArgs instance containing data about this event.

Remarks

This event is raised for each intersection point of links when linkCrossings property is enabled.

DiagramDocument Class

Represents a collection of diagram pages.

Syntax

JavaScript Copy Code

```
// class
DiagramDocument.prototype = {}
```

Remarks

The **DiagramDocument** class represents a collection of diagram pages or sheets, represented by DiagramPage objects. New pages can be added to the document and existing pages can be removed and reordered by using the addPage and removePage methods respectively. The toJson, saveToXml and saveToString methods of **DiagramDocument** save all pages in a single file, and respectively the fromJson, loadFromXml and loadFromString methods load all pages from the file. **DiagramDocument** can also load files created by the serialization methods of Diagram, and will show them in a single page.

DiagramPage is derived from **Diagram** and only adds a few properties, so any code that processes **Diagram** objects will work with **DiagramPage** objects too. A diagram document forwards each event raised by its pages, giving you a chance to use the same handler for events raised by different pages. If a page should implement distinct user interaction or validation logic, it is also possible to attach handlers to the **Diagram** events inherited by **DiagramPage**.

A single **DiagramPage** could be assigned to the diagram property of DiagramView, and that lets you create your own user interface for presenting a list of pages to the user and selecting a current page. The package also includes a TabbedDiagramView that presents all pages of a document in a tabbed user interface where each tab corresponds to a page. The page displayed in the active tab is exposed by the selectedPage property of **TabbedDiagramView**. The active page can be changed interactively by activating its associated tab. New pages can be added and removed to / from the document through buttons in the tab strip and the pages can be rearranged by dragging their associated tabs with the mouse.

DiagramDocument Members

Represents a collection of diagram pages.

The following tables list the members exposed by the DiagramDocument type.

Public Constructors

	Name	Description

	DiagramDocument	Initializes a new instance of the DiagramDocument class.

Public Properties

	Name	Description
	dirty	Gets or sets a value indicating whether the diagram document has changed since loading it.
	pages	Gets a list of the diagram pages contained in this document.
	XmlOptions	An XmlOptions object providing properties for customizing the XML serialization process. (Inherited from DiagramBase.)

Public Methods

	Name	Description
	addPage	Adds a page to the document.
	fromJson	Deserializes the document from a JSON string.
	fromXmlDocument	Loads document contents from specified XML Document.
	loadFromString	Loads document contents from specified XML or JSON string.
	loadFromXml	Loads the document from an XML file.
	RaiseNodeModifying	Raises the NodeModifying event. (Inherited from DiagramBase.)
	removePage	Removes the specified page from the document.
	saveToString	Encodes the document contents into an XML or JSON string.
	saveToXml	Saves the document to an XML file.
	toJson	Serializes the document into a JSON string.
	toXmlDocument	Saves the document into an XML Document.
	TrackMouseHover	Specifies whether the diagram view should track mouse hover events. (Inherited from DiagramBase.)

Protected Methods

	Name	Description
	OnActionRecorded	Raises the ActionRecorded event. (Inherited from DiagramBase.)
	OnActionRecording	Raises the ActionRecording event. (Inherited from DiagramBase.)
	OnActionRedone	Raises the ActionRedone event. (Inherited from DiagramBase.)
	OnActionUndone	Raises the ActionUndone event. (Inherited from DiagramBase.)
	OnBeginLoad	Raises the BeginLoad event. (Inherited from DiagramBase.)
	OnBoundsChanged	Raises the BoundsChanged event. (Inherited from DiagramBase.)
	OnCellClicked	Raises the CellClicked event. (Inherited from DiagramBase.)
	OnCellDoubleClicked	Raises the CellDoubleClicked event. (Inherited from DiagramBase.)
	OnCellTextEdited	Raises the CellTextEdited event. (Inherited from DiagramBase.)
	OnCellTextEditing	Raises the CellTextEditing event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnClicked	Raises the Clicked event. (Inherited from DiagramBase.)

	OnContainerChildAdded	Raises the ContainerChildAdded event. (Inherited from DiagramBase.)
	OnContainerChildRemoved	Raises the ContainerChildRemoved event. (Inherited from DiagramBase.)
	OnContainerFolded	Raises the ContainerFolded event. (Inherited from DiagramBase.)
	OnContainerPageChanged	Raises the ContainerPageChanged event. (Inherited from DiagramBase.)
	OnContainerUnfolded	Raises the ContainerUnfolded event. (Inherited from DiagramBase.)
	OnContentVisibilityChanged	Raises the ContentVisibilityChanged event. (Inherited from DiagramBase.)
	OnDefaultShapeChanged	Raises the DefaultShapeChanged event. (Inherited from DiagramBase.)
	OnDeserializeTag	Raises the DeserializeTag event. (Inherited from DiagramBase.)
	OnDestinationAnchorChanged	Raises the DestinationAnchorChanged event. (Inherited from DiagramBase.)
	OnDirtyChanged	Raises the DirtyChanged event. (Inherited from DiagramBase.)
	OnDoubleClicked	Raises the DoubleClicked event. (Inherited from DiagramBase.)
	OnDrawAdjustmentHandles	Raises the DrawAdjustmentHandles event. (Inherited from DiagramBase.)
	OnDrawAnchorPoint	Raises the DrawAnchorPoint event. (Inherited from DiagramBase.)
	OnDrawBackground	Raises the DrawBackground event. (Inherited from DiagramBase.)
	OnDrawBranchIndicator	Raises the DrawBranchIndicator event. (Inherited from DiagramBase.)
	OnDrawCell	Raises the DrawCell event. (Inherited from DiagramBase.)
	OnDrawForeground	Raises the DrawForeground event. (Inherited from DiagramBase.)
	OnDrawLink	Raises the DrawLink event. (Inherited from DiagramBase.)
	OnDrawNode	Raises the DrawNode event. (Inherited from DiagramBase.)
	OnEndLoad	Raises the EndLoad event. (Inherited from DiagramBase.)
	OnExpandButtonClicked	Raises the ExpandButtonClicked event. (Inherited from DiagramBase.)
	OnGroupDestroyed	Raises the GroupDestroyed event. (Inherited from DiagramBase.)
	OnHitTestAdjustmentHandles	Raises the HitTestAdjustmentHandles event. (Inherited from DiagramBase.)
	OnInitializeLasso	Raises the InitializeLasso event. (Inherited from DiagramBase.)
	OnInitializeLink	Raises the InitializeLink event. (Inherited from DiagramBase.)
	OnInitializeNode	Raises the InitializeNode event. (Inherited from DiagramBase.)
	OnItemAdded	Raises the ItemAdded event. (Inherited from DiagramBase.)
	OnItemRemoved	Raises the ItemRemoved event. (Inherited from DiagramBase.)
	OnJsonDeserializeTag	Raises the JsonDeserializeTag event. (Inherited from DiagramBase.)
	OnJsonSerializeTag	Raises the JsonSerializeTag event. (Inherited from DiagramBase.)
	OnLayerVisibilityChanged	Raises the LayerVisibilityChanged event. (Inherited from DiagramBase.)
	OnLinkActivated	Raises the LinkActivated event. (Inherited from DiagramBase.)
	OnLinkClicked	Raises the LinkClicked event. (Inherited from DiagramBase.)
	OnLinkCreateCancelled	Raises the LinkCreateCancelled event. (Inherited from DiagramBase.)
	OnLinkCreated	Raises the LinkCreated event. (Inherited from DiagramBase.)
	OnLinkCreating	Raises the LinkCreating event. (Inherited from DiagramBase.)

	OnLinkDeactivated	Raises the LinkDeactivated event. (Inherited from DiagramBase.)
	OnLinkDeleted	Raises the LinkDeleted event. (Inherited from DiagramBase.)
	OnLinkDeleting	Raises the LinkDeleting event. (Inherited from DiagramBase.)
	OnLinkDeselected	Raises the LinkDeselected event. (Inherited from DiagramBase.)
	OnLinkDoubleClicked	Raises the LinkDoubleClicked event. (Inherited from DiagramBase.)
	OnLinkHovered	Raises the LinkHovered event. (Inherited from DiagramBase.)
	OnLinkModified	Raises the LinkModified event. (Inherited from DiagramBase.)
	OnLinkModifyCancelled	Raises the LinkModifyCancelled event. (Inherited from DiagramBase.)
	OnLinkModifying	Raises the LinkModifying event. (Inherited from DiagramBase.)
	OnLinkPasted	Raises the LinkPasted event. (Inherited from DiagramBase.)
	OnLinkRouted	Raises the LinkRouted event. (Inherited from DiagramBase.)
	OnLinkSelected	Raises the LinkSelected event. (Inherited from DiagramBase.)
	OnLinkSelecting	Raises the LinkSelecting event. (Inherited from DiagramBase.)
	OnLinkSplit	Raises the LinkSplit event. (Inherited from DiagramBase.)
	OnLinkStartModifying	Raises the LinkStartModifying event. (Inherited from DiagramBase.)
	OnLinkTextEdited	Raises the LinkTextEdited event. (Inherited from DiagramBase.)
	OnLinkTextEditing	Raises the LinkTextEditing event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnMeasureUnitChanged	Raises the MeasureUnitChanged event. (Inherited from DiagramBase.)
	OnNodeActivated	Raises the NodeActivated event. (Inherited from DiagramBase.)
	OnNodeClicked	Raises the NodeClicked event. (Inherited from DiagramBase.)
	OnNodeCreateCancelled	Raises the NodeCreateCancelled event. (Inherited from DiagramBase.)
	OnNodeCreated	Raises the NodeCreated event. (Inherited from DiagramBase.)
	OnNodeCreating	Raises the NodeCreating event. (Inherited from DiagramBase.)
	OnNodeDeactivated	Raises the NodeDeactivated event. (Inherited from DiagramBase.)
	OnNodeDeleted	Raises the NodeDeleted event. (Inherited from DiagramBase.)
	OnNodeDeleting	Raises the NodeDeleting event. (Inherited from DiagramBase.)
	OnNodeDeselected	Raises the NodeDeselected event. (Inherited from DiagramBase.)
	OnNodeDoubleClicked	Raises the NodeDoubleClicked event. (Inherited from DiagramBase.)
	OnNodeHovered	Raises the NodeHovered event. (Inherited from DiagramBase.)
	OnNodeModified	Raises the NodeModified event. (Inherited from DiagramBase.)
	OnNodeModifyCancelled	Raises the NodeModifyCancelled event. (Inherited from DiagramBase.)
	OnNodeModifying	Raises the NodeModifying event. (Inherited from DiagramBase.)
	OnNodePasted	Raises the NodePasted event. (Inherited from DiagramBase.)
	OnNodeSelected	Raises the NodeSelected event. (Inherited from DiagramBase.)
	OnNodeSelecting	Raises the NodeSelecting event. (Inherited from DiagramBase.)
	OnNodeStartModifying	Raises the NodeStartModifying event. (Inherited from DiagramBase.)

	OnNodeTextEdited	Raises the NodeTextEdited event. (Inherited from DiagramBase.)
	OnNodeTextEditing	Raises the NodeTextEditing event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnOriginAnchorChanged	Raises the OriginAnchorChanged event. (Inherited from DiagramBase.)
	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from DiagramBase.)
	OnQueryAlignTarget	Raises the QueryAlignTarget event. (Inherited from DiagramBase.)
	OnRepaint	Raises the Repaint event. (Inherited from DiagramBase.)
	OnRequestClipboard	Raises the RequestClipboard event. (Inherited from DiagramBase.)
	OnRequestDrawInteractions	Raises the RequestDrawInteractions event. (Inherited from DiagramBase.)
	OnRequestTimer	Raises the RequestTimer event. (Inherited from DiagramBase.)
	OnSelectionChanged	Raises the SelectionChanged event. (Inherited from DiagramBase.)
	OnSelectionModified	Raises the SelectionModified event. (Inherited from DiagramBase.)
	OnSelectionModifying	Raises the SelectionModifying event. (Inherited from DiagramBase.)
	OnSerializeTag	Raises the SerializeTag event. (Inherited from DiagramBase.)
	OnSetSelfLoopShape	Raises the SetSelfLoopShape event. (Inherited from DiagramBase.)
	OnShapeModified	Raises the ShapeModified event. (Inherited from DiagramBase.)
	OnShapeNotDefined	Raises the ShapeNotDefined event. (Inherited from DiagramBase.)
	OnTableColumnResized	Raises the TableColumnResized event. (Inherited from DiagramBase.)
	OnTableColumnResizing	Raises the TableColumnResizing event. (Inherited from DiagramBase.)
	OnTableRowResized	Raises the TableRowResized event. (Inherited from DiagramBase.)
	OnTableRowResizing	Raises the TableRowResizing event. (Inherited from DiagramBase.)
	OnTableSectionCollapsed	Raises the TableSectionCollapsed event. (Inherited from DiagramBase.)
	OnTableSectionExpanded	Raises the TableSectionExpanded event. (Inherited from DiagramBase.)
	OnTreeCollapsed	Raises the TreeCollapsed event. (Inherited from DiagramBase.)
	OnTreeExpanded	Raises the TreeExpanded event. (Inherited from DiagramBase.)
	OnTreeItemTextEditing	Raises the TreeItemTextEditing event. (Inherited from DiagramBase.)
	OnValidateAnchorPoint	Raises the ValidateAnchorPoint event. (Inherited from DiagramBase.)
	OnValidateLinkCrossing	Raises the ValidateLinkCrossing event. (Inherited from DiagramBase.)
	OnViewRemoved	Raises the ViewRemoved event. (Inherited from DiagramBase.)

Public Events

	Name	Description
	ActionRecorded	Raised when an action is recorded in the undo buffer. (Inherited from DiagramBase.)
	ActionRecording	A validation event raised before an action is recorded in the undo buffer. (Inherited from DiagramBase.)
	ActionRedone	Raised when an action is redone. (Inherited from DiagramBase.)
	ActionUndone	Raised when an action is undone. (Inherited from DiagramBase.)

	ActiveLayerChanged	Raised when the diagram's active layer has changed. (Inherited from DiagramBase.)
	BeginLoad	Raised when the component starts loading diagram data from a file or memory stream. (Inherited from DiagramBase.)
	BoundsChanged	Raised when the Bounds property value has changed. (Inherited from DiagramBase.)
	CellClicked	Raised when the user clicks a table's cell. (Inherited from DiagramBase.)
	CellDoubleClicked	Raised when the user double-clicks a table's cell. (Inherited from DiagramBase.)
	CellTextEdited	Raised when the user edits the text of a table's cell. (Inherited from DiagramBase.)
	CellTextEditing	A validation event that lets you approve or reject changes made to the text of a table's cell. (Inherited from DiagramBase.)
	Clicked	Raised when the user clicks the diagram at a point where no items are located. (Inherited from DiagramBase.)
	ContainerChildAdded	Raised when a node is added to a ContainerNode, either programmatically or by the user. (Inherited from DiagramBase.)
	ContainerChildRemoved	Raised when a node is removed from a **ContainerNode**, either programmatically or by the user. (Inherited from DiagramBase.)
	ContainerFolded	Raised when the user folds a container by clicking the arrow-up button in the container's caption bar. (Inherited from DiagramBase.)
	ContainerPageChanged	Raised when the user changes current page of a PagedContainerNode. (Inherited from DiagramBase.)
	ContainerUnfolded	Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar. (Inherited from DiagramBase.)
	ContentVisibilityChanged	Raised when the visibility of container's content changes. (Inherited from DiagramBase.)
	DefaultShapeChanged	Raised when the DefaultShape property value has changed. (Inherited from DiagramBase.)
	DeserializeTag	Raised when the Tag of a diagram item must be deserialized from XML format. (Inherited from DiagramBase.)
	DestinationAnchorChanged	Raised when the DestinationAnchor property value of a link has changed. (Inherited from DiagramBase.)
	DirtyChanged	Raised when the **Dirty** property value has changed. (Inherited from DiagramBase.)
	DoubleClicked	Raised when the user double-clicks the diagram at a point where no items are located. (Inherited from DiagramBase.)
	DrawAdjustmentHandles	Raised when item's adjustment handles must be custom-drawn. (Inherited from DiagramBase.)
	DrawAnchorPoint	Raised when an anchor point must be custom-drawn. (Inherited from DiagramBase.)
	DrawBackground	Raised to let you custom draw the diagram background. (Inherited from DiagramBase.)
	DrawBranchIndicator	Raised when a branch indicator must be custom-drawn. (Inherited from DiagramBase.)
	DrawCell	Raised when a table's cell must be custom drawn. (Inherited from DiagramBase.)
	DrawForeground	Raised to let you custom draw the diagram foreground. (Inherited from DiagramBase.)

	DrawLink	Raised when a diagram link must be custom drawn. (Inherited from DiagramBase.)
	DrawNode	Raised when a diagram node must be custom drawn. (Inherited from DiagramBase.)
	EndLoad	Raised when the component ends loading diagram data from a file or memory stream. (Inherited from DiagramBase.)
	ExpandButtonClicked	Raised when the user clicks the [±] button of an Expandable node. (Inherited from DiagramBase.)
	GroupDestroyed	Raised when a Group object is destroyed. (Inherited from DiagramBase.)
	HitTestAdjustmentHandles	Raised when custom hit testing of item's adjustment handles must be performed. (Inherited from DiagramBase.)
	InitializeLasso	Raised when the user starts drawing a selection lasso, before it is rendered on screen. (Inherited from DiagramBase.)
	InitializeLink	Raised when the user starts drawing a new link, just after the DiagramLink instance is created. (Inherited from DiagramBase.)
	InitializeNode	Raised when the user starts drawing a new node, just after the DiagramNode instance is created. (Inherited from DiagramBase.)
	ItemAdded	Raised when an item is added to the diagram, either programmatically or interactively. (Inherited from DiagramBase.)
	ItemRemoved	Raised when an item is removed from the diagram, either programmatically or interactively. (Inherited from DiagramBase.)
	JsonDeserializeTag	Raised when the **Tag** of a diagram item must be deserialized from JSON. (Inherited from DiagramBase.)
	JsonSerializeTag	Raised when the **Tag** of a diagram item must be serialized to JSON. (Inherited from DiagramBase.)
	LayerVisibilityChanged	Raised when the visibility of a Layer changes. (Inherited from DiagramBase.)
	LinkActivated	Raised when a link becomes the ActiveItem. (Inherited from DiagramBase.)
	LinkClicked	Raised when the user clicks a link. (Inherited from DiagramBase.)
	LinkCreateCancelled	Raised when the user cancels link creation. (Inherited from DiagramBase.)
	LinkCreated	Raised when the user draws a new link. (Inherited from DiagramBase.)
	LinkCreating	A validation event raised while the user is drawing a new link. (Inherited from DiagramBase.)
	LinkDeactivated	Raised when a link is no longer the **ActiveItem**. (Inherited from DiagramBase.)
	LinkDeleted	Raised when a link is deleted, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkDeleting	Raised when the user tries to delete a link, this event lets you cancel the operation. (Inherited from DiagramBase.)
	LinkDeselected	Raised when a link is deselected, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkDoubleClicked	Raised when the user double-clicks a link. (Inherited from DiagramBase.)
	LinkHovered	Raised when the mouse pointer hovers over a link. (Inherited from DiagramBase.)
	LinkModified	Raised when the user moves any control point of a link. (Inherited from DiagramBase.)
	LinkModifyCancelled	Raised when the user cancels move or resize operation being done on a link. (Inherited from DiagramBase.)

	LinkModifying	A validation event raised while the user is modifying a link. (Inherited from DiagramBase.)
	LinkPasted	Raised when a link has been pasted from the clipboard. (Inherited from DiagramBase.)
	LinkRouted	Raised when a link is routed by the auto-routing algorithm. (Inherited from DiagramBase.)
	LinkSelected	Raised when a link is selected, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkSelecting	Raised when the user tries to select a link, this event lets you cancel the operation. (Inherited from DiagramBase.)
	LinkSplit	Raised when the user splits a link interactively. (Inherited from DiagramBase.)
	LinkStartModifying	A validation event raised when the user starts modifying a link. (Inherited from DiagramBase.)
	LinkTextEdited	Raised when the user edits the text of a link. (Inherited from DiagramBase.)
	LinkTextEditing	A validation event that lets you approve or reject changes made to the text of a link. (Inherited from DiagramBase.)
	MeasureUnitChanged	Raised when the MeasureUnit property value has changed. (Inherited from DiagramBase.)
	NodeActivated	Raised when a node becomes the **ActiveItem**. (Inherited from DiagramBase.)
	NodeClicked	Raised when the user clicks a node. (Inherited from DiagramBase.)
	NodeCreateCancelled	Raised when the user cancels node creation. (Inherited from DiagramBase.)
	NodeCreated	Raised when the user draws a new node. (Inherited from DiagramBase.)
	NodeCreating	A validation event raised while the user is drawing a new node. (Inherited from DiagramBase.)
	NodeDeactivated	Raised when a node is no longer the **ActiveItem**. (Inherited from DiagramBase.)
	NodeDeleted	Raised when a node is deleted, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeDeleting	Raised when the user tries to delete a node, this event lets you cancel the operation. (Inherited from DiagramBase.)
	NodeDeselected	Raised when a node is deselected, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeDoubleClicked	Raised when the user double-clicks a node. (Inherited from DiagramBase.)
	NodeHovered	Raised when the mouse pointer hovers over a node. (Inherited from DiagramBase.)
	NodeModified	Raised when the user moves or resizes a node. (Inherited from DiagramBase.)
	NodeModifyCancelled	Raised when the user cancels move or resize operation being done on a node. (Inherited from DiagramBase.)
	NodeModifying	A validation event raised while the user is moving or resizing a node. (Inherited from DiagramBase.)
	NodePasted	Raised when a node has been pasted from the clipboard. (Inherited from DiagramBase.)
	NodeSelected	Raised when a node is selected, either programmatically or by the user. (Inherited from DiagramBase.)

	NodeSelecting	Raised when the user tries to select a node, this event lets you cancel the operation. (Inherited from DiagramBase.)
	NodeStartModifying	A validation event raised when the user starts modifying a node. (Inherited from DiagramBase.)
	NodeTextEdited	Raised when the user edits the text of a node. (Inherited from DiagramBase.)
	NodeTextEditing	A validation event that lets you approve or reject changes made to the text of a node. (Inherited from DiagramBase.)
	OriginAnchorChanged	Raised when the OriginAnchor property value of a link has changed. (Inherited from DiagramBase.)
	PropertyChanged	INotifyPropertyChanged.PropertyChanged implementation. (Inherited from DiagramBase.)
	QueryAlignTarget	Raised to validate a node as target for alignment guides when AutoAlignNodes is enabled. (Inherited from DiagramBase.)
	Repaint	Raised when the diagram views should be repainted. (Inherited from DiagramBase.)
	RequestCacheReset	Raised when an object within the diagram requests a reset of the cached bitmap. (Inherited from DiagramBase.)
	RequestClipboard	Raised when an object within the diagram requests an operation with the clipboard. (Inherited from DiagramBase.)
	RequestDrawInteractions	For internal use. (Inherited from DiagramBase.)
	RequestTimer	Raised when an object within the diagram needs to start or stop a timer. (Inherited from DiagramBase.)
	SelectionChanged	Raised when an item is added to or removed from the selection (Inherited from DiagramBase.)
	SelectionModified	Raised when the user moves multiple selected items. (Inherited from DiagramBase.)
	SelectionModifying	Raised while the user is moving multiple selected items, this event lets you cancel the modification. (Inherited from DiagramBase.)
	SerializeTag	Raised when the **Tag** of a diagram item must be serialized into an XML document. (Inherited from DiagramBase.)
	SetSelfLoopShape	Raised when a link becomes a self-loop, giving you a chance to override the default look shape. (Inherited from DiagramBase.)
	ShapeModified	Raised when the user modifies the shape of a ShapeNode by moving one of the control points corresponding to shape formula parameters. (Inherited from DiagramBase.)
	ShapeNotDefined	Raised when the diagram being loaded contains nodes with an undefined shape. (Inherited from DiagramBase.)
	TableColumnResized	Raised when the user finishes resizing a column in a table. (Inherited from DiagramBase.)
	TableColumnResizing	Raised when the user resizes a column in a table interactively. (Inherited from DiagramBase.)
	TableRowResized	Raised when the user finishes resizing a row in a table. (Inherited from DiagramBase.)
	TableRowResizing	Raised when the user resizes a row in a table interactively. (Inherited from DiagramBase.)
	TableSectionCollapsed	Raised when the user collapses the rows of a table's section by clicking the [-] button in the section's header row. (Inherited from DiagramBase.)
	TableSectionExpanded	Raised when the user expands the rows of a table's section by clicking the [+] button in the section's header row. (Inherited from DiagramBase.)

	TreeCollapsed	Raised when a user collapses a tree branch by clicking the [-] button of an **Expandable** node. (Inherited from DiagramBase.)
	TreeExpanded	Raised when a user expands a tree branch by clicking the [+] button of an **Expandable** node. (Inherited from DiagramBase.)
	TreeItemTextEditing	A validation event that lets you approve or reject changes made to the text of a TreeViewNode's item. (Inherited from DiagramBase.)
	ValidateAnchorPoint	A validation event that lets you approve or reject connecting a link to an anchor point. (Inherited from DiagramBase.)
	ValidateLinkCrossing	A validation event that lets you approve or reject displaying a decoration at the intersection point of links. (Inherited from DiagramBase.)
	ViewRemoved	Raised when a DiagramView is detached from this diagram. (Inherited from DiagramBase.)

DiagramDocument Constructor

Initializes a new instance of the DiagramDocument class.

Namespace: MindFusion.Diagramming
Assembly: DiagramDocument.js

Syntax

JavaScript Copy Code

```
function DiagramDocument ()
```

See Also

DiagramDocument Class
MindFusion.Diagramming Namespace

DiagramDocument Methods

DiagramDocument.addPage Method

Adds a page to the document.

Namespace: MindFusion.Diagramming
Assembly: DiagramDocument.js

Syntax

JavaScript Copy Code

```
function addPage (page)
```

Parameters

page
DiagramPage. The page to add.

See Also

DiagramDocument Members
DiagramDocument Class

DiagramDocument.fromJson Method

Deserializes the document from a JSON string.

Namespace: MindFusion.Diagramming
Assembly: DiagramDocument.js

Syntax

JavaScript Copy Code

```
function fromJson (json)
```

Parameters

json
String. A string created by the toJson method.

See Also

DiagramDocument Members
DiagramDocument Class
MindFusion.Diagramming Namespace

DiagramDocument.fromXmlDocument Method

Loads document contents from specified XML Document.

Namespace: MindFusion.Diagramming
Assembly: DiagramDocument.js

Syntax

JavaScript Copy Code

```
function fromXmlDocument (document)
```

Parameters

document
Document. A DOM Document object containing XML-serialized DiagramDocument contents.

See Also

DiagramDocument Members
DiagramDocument Class
MindFusion.Diagramming Namespace

DiagramDocument.loadFromString Method

Loads document contents from specified XML or JSON string.

Namespace: MindFusion.Diagramming
Assembly: DiagramDocument.js

Syntax

JavaScript Copy Code

```
function loadFromString (str)
```

Parameters

str

String. A string containing the serialized document contents.

See Also

DiagramDocument Members
DiagramDocument Class
MindFusion.Diagramming Namespace

DiagramDocument.loadFromXml Method

Loads the document from an XML file.

Namespace: MindFusion.Diagramming
Assembly: DiagramDocument.js

Syntax

JavaScript Copy Code

```
function loadFromXml (fileUrl, [onLoad, [onError]])
```

Parameters

fileUrl
String. The URL of an XML file where the data should be read from.

onLoad
Optional.
function. A callback that should be invoked if the file is loaded successfully.

onError
Optional.
function. A callback that should be invoked if the file could not be downloaded.

DiagramDocument.removePage Method

Removes the specified page from the document.

Namespace: MindFusion.Diagramming
Assembly: DiagramDocument.js

Syntax

JavaScript Copy Code

```
function removePage (page)
```

Parameters

page
DiagramPage. The page to be removed.

DiagramDocument.saveToString Method

Encodes the document contents into an XML or JSON string.

Namespace: MindFusion.Diagramming
Assembly: DiagramDocument.js

Syntax

JavaScript Copy Code

```
function saveToString (format)
```

Parameters

format
SaveToStringFormat. A member of the SaveToStringFormat enumeration.

Return Value

String. A string containing the document's serialized representation.

See Also

DiagramDocument Members
DiagramDocument Class
MindFusion.Diagramming Namespace

DiagramDocument.saveToXml Method

Saves the document to an XML file.

Namespace: MindFusion.Diagramming
Assembly: DiagramDocument.js

Syntax

JavaScript Copy Code

```
function saveToXml (url)
```

Parameters

url
String. A URL specifying where the document's XML should be posted to.

DiagramDocument Class
MindFusion.Diagramming Namespace

DiagramDocument.toJson Method

Serializes the document into a JSON string.

Namespace: MindFusion.Diagramming
Assembly: DiagramDocument.js

Syntax

JavaScript Copy Code

```
function toJson ()
```

Return Value

String. A string containing the document's JSON representation.

DiagramDocument Properties

DiagramDocument.dirty Property

Gets or sets a value indicating whether the diagram document has changed since loading it.

Namespace: MindFusion.Diagramming
Assembly: DiagramDocument.js

Syntax

JavaScript Copy Code

```
get dirty() {}
set dirty(value) {}
```

Property Value

Boolean

true if the document has changed, or false otherwise.

See Also

DiagramDocument Members
DiagramDocument Class
MindFusion.Diagramming Namespace

DiagramDocument.pages Property

Gets a list of the diagram pages contained in this document.

Namespace: MindFusion.Diagramming
Assembly: DiagramDocument.js

Syntax

JavaScript Copy Code

```
get pages() {}
set pages(value) {}
```

Property Value

Array

Array of DiagramPage objects.

Remarks

Use the addPage and removePage methods to respectively add or remove pages.

Events Class

DiagramEventArgs Members

Contains the arguments passed to handlers of global diagram events such as clicked.

The following tables list the members exposed by the DiagramEventArgs type.

Public Constructors

	Name	Description
	DiagramEventArgs	Initializes a new instance of the DiagramEventArgs class.

Public Properties

	Name	Description
	deltaX	Gets the horizontal scroll amount of a wheel event.
	deltaY	Gets the vertical scroll amount of a wheel event.

	handled	Gets or sets a value indicating whether the event has been handled. (Inherited from EventArgs.)
	mouseButton	Gets which mouse button has been pressed.
	mousePosition	Gets the current mouse pointer position.

DiagramEventArgs Class
MindFusion.Diagramming Namespace

DiagramEventArgs Constructor

Initializes a new instance of the DiagramEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
function DiagramEventArgs ()
```

See Also

DiagramEventArgs Class
MindFusion.Diagramming Namespace

DiagramEventArgs Properties

DiagramEventArgs.deltaX Property

Gets the horizontal scroll amount of a wheel event.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get deltaX() {}
set deltaX(value) {}
```

Property Value

Number

The horizontal scroll amount.

See Also

DiagramEventArgs Members
DiagramEventArgs Class
MindFusion.Diagramming Namespace

DiagramEventArgs.deltaY Property

Gets the vertical scroll amount of a wheel event.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get deltaY() {}
set deltaY(value) {}
```

Property Value

Number

The vertical scroll amount.

See Also

DiagramEventArgs Members
DiagramEventArgs Class
MindFusion.Diagramming Namespace

DiagramEventArgs.mouseButton Property

Gets which mouse button has been pressed.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get mouseButton() {}
```

Property Value

MouseButton

A member of the MouseButton enumeration.

See Also

DiagramEventArgs Members
DiagramEventArgs Class
MindFusion.Diagramming Namespace

DiagramEventArgs.mousePosition Property

Gets the current mouse pointer position.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get mousePosition() {}
```

Property Value

Point

A Point instance containing mouse pointer coordinates.

See Also

DiagramItem Class

Represents an item in the diagram model. All classes representing diagram elements derive from **DiagramItem**.

Syntax

JavaScript Copy Code

```
// class
DiagramItem.prototype = {}
```

Remarks

All items in the diagram document - links and nodes - share common base class called **DiagramItem**. Its main function is to provide interface for the most common methods and properties of every diagram element.

The main textual content of an item is set using the text property. Supplementary labels can be created by calling addLabel.

Appearance can be customized using a shared Style object assigned to the style property. Attributes of the shared style can be overridden by setting item's properties such as brush, stroke, font.

Inheritance Hierarchy

MindFusion.Diagramming.DiagramItem

DiagramItem Members

Represents an item in the diagram model. All classes representing diagram elements derive from DiagramItem.

The following tables list the members exposed by the **DiagramItem** type.

Public Constructors

	Name	Description
	DiagramItem	Initializes a new instance of the **DiagramItem** class.

Public Properties

	Name	Description
	brush	Gets or sets an object specifying how to fill the interior of this item.
	container	Gets the parent ContainerNode containing this node.
	cssClass	Gets or sets the CSS class associated with this item.
	cssElementName	Gets the name of the CSS element associated with this item.
	effectiveBrush	Gets the effective brush that should be used to paint this item.
	effectiveCaptionBackBrush	Gets the effective brush that should be used to paint node's caption bar.
	effectiveFont	Gets the effective font that should be used to render this item's text.
	effectiveFontName	Gets the name of the effective font that should be used to render this item's text.

	effectiveFontSize	Gets the size of the effective font that should be used to render this item's text.
	effectiveFontStyle	Gets the style of the effective font that should be used to render this item's text.
	effectiveOpacity	Gets the effective opacity that should be used to paint this item.
	effectiveShadowColor	Gets the effective color that should be used to render this item's shadow.
	effectiveStroke	Gets the effective color that should be used to stroke this item.
	effectiveStrokeDashArray	Gets the effective line dash array that should be applied when stroking this item.
	effectiveStrokeDashOffset	Gets the effective line dash offset that should be applied when stroking this item.
	effectiveStrokeDashStyle	Gets the effective line dash pattern that should be applied when stroking this item.
	effectiveStrokeThickness	Gets the effective line thickness that should be applied when stroking this item.
	effectiveTextColor	Gets the effective text color that should be used to render this item's text.
	effectiveTextStroke	Gets the effective text color that should be used to render this item's text outline.
	effectiveTextStrokeThickness	Gets the effective width of the text outline of this item.
	font	Gets or sets the font used to render item's text.
	graphicsContent	Gets an array of visual elements used to render this item on the canvas.
	hyperLink	Gets or sets the hyperlink associated with this diagram item.
	id	Gets or sets a custom identifier associated with this item.
	ignoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods.
	layoutTraits	Gets an object containing properties specific to individual layout algorithms.
	lineAlignment	Gets or sets the vertical alignment of item's text.
	locked	Gets or sets whether users are allowed to interact with this item.
	opacity	Gets or sets opacity of this item.
	parent	Gets the Diagram to which this item belongs.
	pen	Gets or sets the color used to stroke item's borders.
	selected	Gets or sets a value indicating whether a diagram item is selected.
	shadowColor	Gets or sets the color used to draw item's shadow.
	shadowOffsetX	Gets or sets the horizontal offset of item's shadow.
	shadowOffsetY	Gets or sets the vertical offset of item's shadow.
	stroke	Gets or sets the color used to stroke item's frame.
	strokeDashArray	Gets or sets an array of values specifying the dash pattern.
	strokeDashOffset	Gets or sets the the distance between the line start and the beginning of the dash pattern.
	strokeDashStyle	Gets or sets the line dash pattern applied when stroking item's frame.
	strokeThickness	Gets or sets the line width applied when stroking item's frame.

	style	Gets or sets the style associated with this item.
	tag	Gets or sets custom data tag associated with this item.
	text	Gets or sets the text label displayed by this item.
	textAlignment	Gets or sets the horizontal alignment of item's text.
	textColor	Gets or sets the color used to fill item's text.
	textComponent	Gets the Text object instance used to render item's text.
	textPadding	Gets or sets the padding distance between item's boundaries and text label.
	textStroke	Gets or sets the color used to stroke item's text.
	textStrokeThickness	Gets or sets the outline width of item's text.
	tooltip	Gets or sets tooltip text that should be displayed when the mouse hovers over this item.
	topLevel	Gets if this is a top-level item in the diagram.
	visible	Gets or sets a value indicating whether this item is visible.
	weight	Gets or sets a weight value used by layout and path-finding algorithms.
	zIndex	Gets the z-order position of this item.

Public Methods

	Name	Description
	addCanvasElements	Derived classes must implement this method by adding their graphics primitives to the canvas.elements collection.
	addLabel	Adds a new label to this item.
	allowDrag	Invoked to validate the drag operation.
	animate	Animates the item.
	clone	Creates a copy of this item.
	containsPoint	Determines whether this item contains the specified point.
	endDrag	Invoked when the user stops dragging this item.
	fromJson	Deserializes this item from a JSON object.
	getRepaintBounds	Gets the repaint region for this item, taking into account factors such as pen width, selection handles and shadow.
	hitTest	Returns the diagram item that contains the specified point.
	invalidate	Invalidates the region of the canvas, that matches the item's repaint bounds.
	loadFromXml	Loads the item content from an XML element.
	onRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or via undo / redo.
	removeCanvasElements	Derived classes must implement this method by removing their graphics primitives from the canvas.elements collection.
	removeLabel	Removes the specified label from this item.
	restoreState	Loads the properties of this diagram item.
	saveLocationState	Saves the state of this **DiagramItem**.

	saveState	Saves the properties of this diagram item.
	saveToXml	Saves the item content into an XML element.
	startDrag	Invoked when the user starts dragging this item.
	toJson	Serializes this item into a JSON object.
	updateCanvasElements	Derived classes must implement this method to update the **item**'s visual elements.
	updateDrag	Invoked while the user drags this item.

See Also

DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem Constructor

Initializes a new instance of the DiagramItem class.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function DiagramItem ([parent])
```

Parameters

parent
Optional.
Diagram. The Diagram from which to obtain default values for the item properties.

See Also

DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem Methods

DiagramItem.addCanvasElements Method

Derived classes must implement this method by adding their graphics primitives to the canvas.elements collection.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function addCanvasElements ()
```

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.addLabel Method

Adds a new label to this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript — Copy Code

```
function addLabel (text)
```

Parameters

text
String. The label's text.

Return Value

A LinkLabel or NodeLabel instance, depending on item's type.

Remarks

An item's main text content is specified via its text property. Call **addLabel** if you need to display additional text labels, such as identifiers or hints to the user.

Position of labels can be specified by calling methods such as setCornerPosition for nodes, or setControlPointPosition for links. You can let users move labels interactively by setting the behavior property of DiagramView to MoveLabels.

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace
ItemLabel Class
removeLabel Method

DiagramItem.allowDrag Method

Invoked to validate the drag operation.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript — Copy Code

```
function allowDrag (ist)
```

Parameters

ist
An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.animate Method

Animates the item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function animate (animation)
```

Parameters

animation
ItemAnimation. An **ItemAnimation** -derived object.

Remarks

Item's animated values are considered transient and do not change actual property values. If you want to assign last value from animation to actual property such as bounds or opacity, set the *keepLastValue* flag in animation parameters as in example below.

Example

JavaScript Copy Code

```
node.animate(
    new PathAnimation(
        [
            new Point(30, 30),
            new Point(50, 30),
            new Point(75, 66),
            new Point(125, 88)
        ],
        {
            keepLastValue: true
        }));
```

Animations

DiagramItem.clone Method

Creates a copy of this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function clone ()
```

Return Value

Object. The copied item.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.containsPoint Method

Determines whether this item contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function containsPoint (point)
```

Parameters

point
The Point to check.

Return Value

Boolean. **true** if this item contains the specified point, or **false** otherwise.

Remarks

This method is used during hit-testing to see if the mouse is inside the item.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.endDrag Method

Invoked when the user stops dragging this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function endDrag (ist)
```

Parameters

ist
InteractionState. An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.fromJson Method

Deserializes this item from a JSON object.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function fromJson (json)
```

Parameters

json
Object. An object, containing the data for this item.

See Also

DiagramItem.getRepaintBounds Method

Gets the repaint region for this item, taking into account factors such as pen width, selection handles and shadow.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function getRepaintBounds ()
```

Return Value

A Rect specifying the region that should be repainted when this item is modified.

Remarks

This method is invoked when an item is modified by the user, or when an appearance property of the item changes. The returned region is invalidated and redrawn at the next paint operation.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace
bounds Property

DiagramItem.hitTest Method

Returns the diagram item that contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function hitTest (point, [threshold, [onlyNodes, [onlyInteractive]]])
```

Parameters

point
Point. A Point value specifying the logical coordinates of a diagram point.

threshold
Optional.
Number. Specifies the size of the area around the item outlines where the point is still considered inside the item.

onlyNodes
Optional.
Boolean. true to exclude child links from the search.

onlyInteractive
Optional.
Boolean. true to exclude locked items from the search.

Return Value

DiagramItem. The item that contains the specified point.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.invalidate Method

Invalidates the region of the canvas, that matches the item's repaint bounds.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function invalidate ([dirty, [force]])
```

Parameters

dirty
Optional.
Boolean. Optional.

force
Optional.
Boolean. Optional.

See Also

DiagramItem Members
DiagramItem Class

DiagramItem.loadFromXml Method

Loads the item content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that contains the item's serialized content.

context
An XmlPersistContext object providing contextual information about the serialization process and some helper serialization methods.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace
saveToXml Method

DiagramItem.onRemove Method

Called when an item is removed from a Diagram, either by the user, programmatically or via undo / redo.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function onRemove ()
```

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.removeCanvasElements Method

Derived classes must implement this method by removing their graphics primitives from the canvas.elements collection.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function removeCanvasElements ()
```

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.removeLabel Method

Removes the specified label from this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function removeLabel (label)
```

Parameters

label
An ItemLabel instance.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace
addLabel Method

DiagramItem.restoreState Method

Loads the properties of this diagram item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function restoreState (state)
```

Parameters

state
Object. An object, containing the properties of this DiagramItem.

Remarks

This method is used by the undo/redo subsystem.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.saveLocationState Method

Saves the state of this DiagramItem.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function saveLocationState ()
```

Return Value

A DiagramItemState instance.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.saveState Method

Saves the properties of this diagram item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function saveState ()
```

Return Value

Object. An object, containing the properties of this DiagramItem.

Remarks

This method is used by the undo/redo subsystem.

See Also

DiagramItem Members
DiagramItem Class

DiagramItem.saveToXml Method

Saves the item content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace
loadFromXml Method

DiagramItem.startDrag Method

Invoked when the user starts dragging this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function startDrag (ist)
```

Parameters

ist
An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.toJson Method

Serializes this item into a JSON object.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function toJson ()
```

Return Value

Object. An object, containing the data for this item.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.updateCanvasElements Method

Derived classes must implement this method to update the item's visual elements.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function updateCanvasElements ()
```

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.updateDrag Method

Invoked while the user drags this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
function updateDrag (ist)
```

Parameters

ist

An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem Properties

DiagramItem.brush Property

Gets or sets an object specifying how to fill the interior of this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get brush() {}
set brush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

Remarks

This property can be set to a color string to specify solid fill:

JavaScript Copy Code

```
node.brush = "white";
```

It also accepts objects that specify the type of brush and additional information:

JavaScript Copy Code

```
node1.brush =
    { type: 'SolidBrush', color: '#e0e9e9' };
node2.brush =
    { type: 'LinearGradientBrush', color1: '#e0e9e9', color2: '#616a7f', angle: 90 };
```

stroke Property
opacity Property

DiagramItem.container Property

Gets the parent ContainerNode containing this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get container() {}
```

Property Value

ContainerNode

The parent ContainerNode of this node.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.cssClass Property

Gets or sets the CSS class associated with this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get cssClass() {}
set cssClass(value) {}
```

Property Value

String

A string containing the CSS class.

Remarks

You could set this value to associate CSS rules with a specific item using class selector.

Example

JavaScript Copy Code

```
// JavaScript
node.text = "Attention";
node.cssClass = "urgent";

// CSS
mfd-shapenode.urgent {
    --brush: #ffcccc;
    --stroke: red;
}
```

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace
style Property

DiagramItem.cssElementName Property

Gets the name of the CSS element associated with this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get cssElementName() {}
set cssElementName(value) {}
```

Property Value

String

A string containing the CSS element name for item's type.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.effectiveBrush Property

Gets the effective brush that should be used to paint this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveBrush() {}
```

Property Value

Object

A color string or an object literal specifying gradient.

Remarks

This property returns the brush set locally for an item via its brush property, or looks up in the styling hierarchy for a brush set in the item's style, the diagram's style or the current theme.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

style Property

DiagramItem.effectiveCaptionBackBrush Property

Gets the effective brush that should be used to paint node's caption bar.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveCaptionBackBrush() {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.effectiveFont Property

Gets the effective font that should be used to render this item's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveFont() {}
```

Property Value

Font

An instance of the Font class.

Remarks

This property returns a font set locally for an item via its font property, or constructs a font from the results of effectiveFontName and effectiveFontSize properties.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace
font Property
style Property

DiagramItem.effectiveFontName Property

Gets the name of the effective font that should be used to render this item's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveFontName() {}
```

Property Value

String

A string specifying the font name.

Remarks

This property looks up in the styling hierarchy for font names set in the item's style, the diagram's style or the current theme.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.effectiveFontSize Property

Gets the size of the effective font that should be used to render this item's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveFontSize() {}
```

Property Value

Number

A number specifying the font size.

Remarks

This property looks up in the styling hierarchy for font sizes set in the item's style, the diagram's style or the current theme.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.effectiveFontStyle Property

Gets the style of the effective font that should be used to render this item's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveFontStyle() {}
```

Property Value

FontStyle

A combination of FontStyle enumeration members.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.effectiveOpacity Property

Gets the effective opacity that should be used to paint this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveOpacity() {}
set effectiveOpacity(value) {}
```

Property Value

Number

A value between 0 and 1 specifying the item's opacity.

Remarks

Returns opacity value or current OpacityAnimation progress.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.effectiveShadowColor Property

Gets the effective color that should be used to render this item's shadow.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveShadowColor() {}
```

Property Value

String

A string specifying the item's shadow color.

Remarks

This property returns the shadow color set locally for an item via shadowColor, or looks up in the styling hierarchy for a shadow color set in the item's style, the diagram's style or the current theme.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.effectiveStroke Property

Gets the effective color that should be used to stroke this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveStroke() {}
```

Property Value

String

A string specifying the item's stroke color.

Remarks

This property returns the stroke color set locally for an item via stroke, or looks up in the styling hierarchy for a stroke color set in the item's style, the diagram's style or the current theme.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.effectiveStrokeDashArray Property

Gets the effective line dash array that should be applied when stroking this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveStrokeDashArray() {}
set effectiveStrokeDashArray(value) {}
```

Property Value

Array

An array of numbers specifying the item's stroke dash array.

Remarks

This property returns the array set locally for an item via strokeDashArray, or looks up in the styling hierarchy for a stroke color set in the item's style, the diagram's style or the current theme.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.effectiveStrokeDashOffset Property

Gets the effective line dash offset that should be applied when stroking this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveStrokeDashOffset() {}
set effectiveStrokeDashOffset(value) {}
```

Property Value

Number

A number specifying the item's stroke dash offset.

Remarks

This property returns the offset set locally for an item via strokeDashOffset, or looks up in the styling hierarchy for a stroke color set in the item's style, the diagram's style or the current theme.

See Also

DiagramItem Members
DiagramItem Class

DiagramItem.effectiveStrokeDashStyle Property

Gets the effective line dash pattern that should be applied when stroking this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveStrokeDashStyle() {}
```

Property Value

DashStyle

A member of the DashStyle enumeration.

DiagramItem.effectiveStrokeThickness Property

Gets the effective line thickness that should be applied when stroking this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveStrokeThickness() {}
```

Property Value

Number

A number specifying the item's stroke thickness.

Remarks

This method returns the stroke thickness set locally for an item via strokeThickness, or looks up in the styling hierarchy for a thickness set in the item's style, the diagram's style or the current theme.

style Property

DiagramItem.effectiveTextColor Property

Gets the effective text color that should be used to render this item's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveTextColor() {}
```

Property Value

String

A string specifying the item's text color.

Remarks

This method returns the text color set locally for an item via textColor, or looks up in the styling hierarchy for a text color set in the item's style, the diagram's style or the current theme.

DiagramItem.effectiveTextStroke Property

Gets the effective text color that should be used to render this item's text outline.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveTextStroke() {}
```

Property Value

String

A string specifying the item's text outline color.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.effectiveTextStrokeThickness Property

Gets the effective width of the text outline of this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get effectiveTextStrokeThickness() {}
```

Property Value

Number

The width of the text outline of this item.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.font Property

Gets or sets the font used to render item's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get font() {}
set font(value) {}
```

Property Value

Font

An instance of the Font class.

textColor Property

DiagramItem.graphicsContent Property

Gets an array of visual elements used to render this item on the canvas.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get graphicsContent() {}
```

Property Value

Array

An array containing objects from MindFusion.Drawing namespace.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.hyperLink Property

Gets or sets the hyperlink associated with this diagram item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get hyperLink() {}
set hyperLink(value) {}
```

Property Value

String

A string containing hyperlink URL.

Remarks

This is just a data property, and clicking an item whose **hyperlink** is set does not automatically open the target page. If that's required, you could call **window.open** fron nodeClicked or linkClicked event handlers.

Another way to associate hyperlinks with items is by embedding <a> elements in text when enableStyledText is set to **true**. The control raises hyperlinkClicked event when users click on such embeded hyperlinks.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.id Property

Gets or sets a custom identifier associated with this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get id() {}
set id(value) {}
```

Property Value

Object

An Object containing custom identifier.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.ignoreLayout Property

Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get ignoreLayout() {}
set ignoreLayout(value) {}
```

Property Value

Boolean

true to ignore this item when arranging the diagram, or **false** otherwise.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.layoutTraits Property

Gets an object containing properties specific to individual layout algorithms.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get layoutTraits() {}
```

Property Value

Object

An object containing layout properties.

Remarks

At this time this property is used only by TreeLayout in JavaScript version of the library:

- **TreeLayout** looks for a **treeLayoutAssistant** value set to a member of the AssistantType enumeration.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.lineAlignment Property

Gets or sets the vertical alignment of item's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get lineAlignment() {}
set lineAlignment(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.locked Property

Gets or sets whether users are allowed to interact with this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get locked() {}
set locked(value) {}
```

Property Value

Boolean

true to prevent interaction, or **false** otherwise. Default value is **false**.

Remarks

A locked item cannot be selected, moved or resized interactively. Additionally, its text cannot be edited in-place.

Locked nodes still can be moved or resized programmatically through their bounds property. Positions of locked links' control points can be changed programmatically too - through their controlPoints collections.

Locked items positions can be changed also by the automatic layout algorithms. To prevent automatic layout methods from changing positions of individual items, set the ignoreLayout property of DiagramItem to **true**.

DiagramItem.opacity Property

Gets or sets opacity of this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript — Copy Code

```
get opacity() {}
set opacity(value) {}
```

Property Value

Number

A value between 0 and 1 specifying the item's opacity.

Remarks

This value is applied as a factor multiplying the alpha channel of all colors in the item's graphics.

stroke Property

DiagramItem.parent Property

Gets the Diagram to which this item belongs.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript — Copy Code

```
get parent() {}
```

Property Value

Diagram

An instance of the Diagram class.

Remarks

Call diagram's addItem method to add items to it.

DiagramItem.pen Property

Gets or sets the color used to stroke item's borders.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get pen() {}
set pen(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

Remarks

This is synonim for the stroke property, and will be removed in future versions of the library.

DiagramItem.selected Property

Gets or sets a value indicating whether a diagram item is selected.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get selected() {}
set selected(value) {}
```

Property Value

Boolean

true if the item is selected, or **false** otherwise.

Remarks

Use the property to check which items are selected by the user, or to programmatically select items if needed.

DiagramItem.shadowOffsetX Property

Gets or sets the horizontal offset of item's shadow.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get shadowOffsetX() {}
set shadowOffsetX(value) {}
```

Property Value

Number

A number specifying the shadow's horizontal offset.

See Also

DiagramItem Members

DiagramItem.stroke Property

Gets or sets the color used to stroke item's frame.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get stroke() {}
set stroke(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

opacity Property

DiagramItem.strokeDashArray Property

Gets or sets an array of values specifying the dash pattern.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get strokeDashArray() {}
set strokeDashArray(value) {}
```

Property Value

Array

An array of numbers specifying the dash pattern.

Remarks

This value is used when strokeDashStyle is set to Custom.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.strokeDashOffset Property

Gets or sets the the distance between the line start and the beginning of the dash pattern.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get strokeDashOffset() {}
set strokeDashOffset(value) {}
```

Property Value

Number

The dash offset.

Remarks

This value is used when strokeDashStyle is set to Custom.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.strokeDashStyle Property

Gets or sets the line dash pattern applied when stroking item's frame.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get strokeDashStyle() {}
set strokeDashStyle(value) {}
```

Property Value

DashStyle

A member of the DashStyle enumeration.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.strokeThickness Property

Gets or sets the line width applied when stroking item's frame.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get strokeThickness() {}
set strokeThickness(value) {}
```

Property Value

Number

A number specifying the stroke thickness.

Remarks

Setting this value to zero makes stroke one-pixel wide regardless of diagram's measureUnit.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.style Property

Gets or sets the style associated with this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get style() {}
set style(value) {}
```

Property Value

Style

An instance of the Style class.

Remarks

Individual properties of DiagramItem have higher priority than ones set through a Style object. If neither are set, values are inherited from Diagram's style or from current theme.

Note

As of version 4.9 of the library, items can also by styled via CSS, where a custom CSS property name inside a declaration matches respective Style property, but is hyphenated, and type selectors match item type name with added mfd- prefix. For example:

```
mfd-shapenode {
   --brush: lightblue;
   --stroke: blue;
   --stroke-thickness: 2px;
   --font-name: 'Verdana';
   --font-size: 12px;
}
```

You can also associate CSS rules with individual items by setting cssClass property and specifying it in class selectors.

MindFusion.Diagramming Namespace

DiagramItem.tag Property

Gets or sets custom data tag associated with this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get tag() {}
set tag(value) {}
```

Property Value

Object

An Object containing custom data.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.text Property

Gets or sets the text label displayed by this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript — Copy Code

```
get text() {}
set text(value) {}
```

Property Value

String

A string containing the item's text. The default value is empty string "".

Remarks

This property defines item's main text content. You can add more text labels by calling the addLabel method, and customize their position and appearance via the various members of returned ItemLabel object.

Users can double-click an item to edit its text interactively when the allowInplaceEdit property is enabled. You can trigger the edit operation from a different event handler by calling beginEdit.

DiagramItem.textComponent Property

Gets the Text object instance used to render item's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get textComponent() {}
set textComponent(value) {}
```

Property Value

Text

The Text component.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.textPadding Property

Gets or sets the padding distance between item's boundaries and text label.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get textPadding() {}
set textPadding(value) {}
```

Property Value

Thickness

An instance of the Thickness class.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace
text Property

DiagramItem.textStroke Property

Gets or sets the color used to stroke item's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get textStroke() {}
set textStroke(value) {}
```

Property Value

String

A string value identifying the text stroke color.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.textStrokeThickness Property

Gets or sets the outline width of item's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get textStrokeThickness() {}
set textStrokeThickness(value) {}
```

Property Value

Number

A number specifying the thickness of text outline.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.tooltip Property

Gets or sets tooltip text that should be displayed when the mouse hovers over this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get tooltip() {}
set tooltip(value) {}
```

Property Value

String

A string containing the tooltip text.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.topLevel Property

Gets if this is a top-level item in the diagram.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get topLevel() {}
```

Property Value

Boolean

true if this is a top-level item in the diagram, or **false** if inside a container.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.visible Property

Gets or sets a value indicating whether this item is visible.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get visible() {}
set visible(value) {}
```

Property Value

Boolean

true if this item should be displayed, or **false** otherwise.

Remarks

Invisible items are not drawn at all. You might use the property to hide or show items temporarily, or to construct more complex groups of attached items in which intermediate helper items are invisible.

Invisible nodes are ignored by automatic layout classes. The position of such nodes won't change when the arrange method of Diagram is called. Visible items can be ignored too by enabling their ignoreLayout property.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.weight Property

Gets or sets a weight value used by layout and path-finding algorithms.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get weight() {}
set weight(value) {}
```

Property Value

Number

A number specifying the weight of this item. The default value is 1.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramItem.zIndex Property

Gets the z-order position of this item.

Namespace: MindFusion.Diagramming
Assembly: DiagramItem.js

Syntax

JavaScript Copy Code

```
get zIndex() {}
set zIndex(value) {}
```

Property Value

Number

A number specifying the position of this item within diagram's z-order.

Remarks

Use the method to arrange items in depth. Items with lower **zIndex** appear behind items with higher **zIndex**.

See Also

DiagramItem Members
DiagramItem Class
MindFusion.Diagramming Namespace

DiagramLink Class

Represents a link between two diagram nodes.

Syntax

JavaScript — Copy Code

```
// class
DiagramLink.prototype = {}
```

Remarks

Links between nodes in MvcDiagram are represented by instances of the **DiagramLink** class. Links connect at most two nodes, which can be accessed via the origin and destination properties. If connected to node anchor points, the point indices can be accessed using the originAnchor and destinationAnchor properties.

Links are built of smaller parts called segments, which can be straight lines, cascading orthogonal lines or Bezier curves. The type of segments is set through the shape property. The number of link's segments and their locations are specified by the segmentCount and controlPoints properties. If changing the coordinates of individual points in **controlPoints**, you should also call the updateFromPoints method to update link's internal state.

Typically, only the start and end segments of a link are updated when the nodes it connects are moved. Number, orientation and/or position of link segments can change dynamically in various ways depending on the values of autoRoute and dynamic properties.

Links can display distinct arrowhead shapes at their ends. These shapes are configured using the headShape and baseShape properties. The sizes of the base and arrowhead images are specified with the headShapeSize and baseShapeSize properties. Arrowhead shapes can also be displayed at the midpoint of each segment to help distinguish between different links. The type and size of these shapes are controlled by the intermediateShape and intermediateShapeSize properties. The outlines of the arrowhead shapes are rendered using the headStroke color.

The color of link segments is specified by the stroke property, while the fill color of the base and head shapes is controlled by the baseBrush and headBrush properties.

Links can have associated text, displayed according to the text, textColor, and textStyle properties. The addLabel method allows multiple labels to be displayed per link. Labels can automatically avoid overlapping nodes or other labels when their autoArrange property is enabled.

Inheritance Hierarchy

MindFusion.Diagramming.DiagramItem
  MindFusion.Diagramming.DiagramLink

See Also

DiagramLink Members
MindFusion.Diagramming Namespace

DiagramLink Members

Represents a link between two diagram nodes.

The following tables list the members exposed by the DiagramLink type.

Public Constructors

	Name	Description
	DiagramLink	Initializes a new instance of the DiagramLink class between the specified nodes using the specified diagram link as a prototype.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	autoRoute	Gets or sets whether this link should be automatically routed to avoid crossing nodes.

	baseBrush	Gets or sets an object that specifies how to fill link's baseShape.
	baseShape	Gets or sets the arrowhead shape displayed at the link' start point.
	baseShapeSize	Gets or sets the size of the arrowhead displayed at the link's start point.
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	controlPoints	Gets or sets the control points of this link.
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	destination	Gets or sets the destination node of this link.
	destinationAnchor	Gets or sets the anchor point to which the link connects at its destination.
	destinationIndex	Gets or sets the index of link's destination row when destination is a TableNode.
	dynamic	Gets or sets whether link's end segments are automatically adjustedin order to keep pointing to the centers of the nodes it connects.
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	endPoint	Gets or sets the last control point of this link.
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	headBrush	Gets or sets an object that specifies how to fill link's headShape.
	headShape	Gets or sets the arrowhead shape displayed at the link' end point.
	headShapeSize	Gets or sets the size of the arrowhead displayed at the link's end point.
	headStroke	Gets or sets the brush used to stroke the outline of link's arrowheads.
	headStrokeDashStyle	Gets or sets the dash pattern of arrowhead outlines.
	headStrokeThickness	Gets or sets the thickness of arrowhead outlines.
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	intermediateBrush	Gets or sets an object that specifies how to fill intermediateShape arrowheads.
	intermediateShape	Gets or sets the arrowhead shape displayed at the middle of each segment of the link.
	intermediateShapeSize	Gets or sets the size of the arrowhead displayed at the middle of each segment of the link.
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)

	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	origin	Gets or sets the origin node of this link.
	originAnchor	Gets or sets the anchor point to which the link connects at its origin.
	originIndex	Gets or sets the index of link's origin row when origin is a **TableNode**.
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	segmentCount	Gets or sets the number of segments that form the link's geometry.
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	shape	Gets or sets the type of link segments and how they are oriented relatively to each other.
	startPoint	Gets or sets the first control point of this link.
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	text	Gets or sets the text displayed by this link.
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	textAlignment	Gets or sets the alignment of link's text.
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	textStyle	Gets or sets the placement and orientation of link's text.
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	True if this is a top-level item in the diagram, or false if it is inside a container. (Inherited from DiagramItem.)

	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	addLabel	Adds a new label to this link.
	allowDrag	DiagramItem.allowDrag override.
	Animate	Animates the item. (Inherited from DiagramItem.)
	clone	DiagramItem.clone override.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	containsPoint	DiagramItem.containsPoint override.
	ContainsPoint	Overloaded. Determines whether this item contains the specified point. (Inherited from DiagramItem.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	Draws the item on the specified IGraphics surface. (Inherited from DiagramItem.)
	DrawHandles	Renders the adjustment handles of this item. (Inherited from DiagramItem.)
	DrawInRect	(Inherited from DiagramItem.)
	DrawShadow	Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramItem.)
	endDrag	DiagramItem.endDrag override.
	fromJson	DiagramItem.fromJson override.
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	getLength	Gets the length of the links
	GetOutlinePoly	Gets a polygon approximating the outline of this object. (Inherited from DiagramItem.)

GetRepaintRect	Gets the repaint region for this item, taking into account factors such as pen, selection handles and shadow. (Inherited from DiagramItem.)
GetRotatedBounds	Gets the bounding rectangle of this item when it is rotated. (Inherited from DiagramItem.)
GetToolTip	Gets the tooltip that should be displayed for this item at the specified point. (Inherited from DiagramItem.)
HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
HitTestHandle	Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramItem.)
HitTestManipulators	Finds the **Manipulator** object located at the specified point. (Inherited from DiagramItem.)
intersects	Checks whether the link contour intersects with the outline of the specified node.
LabelFromPoint	Returns the ItemLabel located at specified point. (Inherited from DiagramItem.)
loadFromXml	DiagramItem.LoadFromXml override. Loads the link's content from an XML element.
NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
pointAlongLength	Returns a point lying on a polyline that is positioned at a relative position along the polyline's length.
putEndPointsAtNodeBorders	Places the link's end points on the outline of its origin and destination nodes.
Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
removeLabel	Removes the specified label from this link.
RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
restoreLocationState	DiagramItem.restoreLocationState override.
restoreState	DiagramItem.restoreState override.
route	Routes this link, regardless of whether the link's **autoRoute** property is enabled.
SaveItemProperties	For internal use. (Inherited from DiagramItem.)
saveLocationState	**DiagramItem.saveLocationState** override.
saveState	DiagramItem.saveState override.
saveToXml	Saves the item's content into an XML element.
setDestination	Sets the destination node of this link.
splitSegment	Splits the link segment with the specified index at the specified point.
startDrag	DiagramItem.startDrag override.
toJson	DiagramItem.toJson override.
updateCanvasElements	Updates the elements on the HTML Canvas.
updateDrag	DiagramItem.updateDrag override.

	updateFromPoints	Updates the link's internal state after the link's control points have been changed.
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	Invoked during interactive creation of items to test whether the operation can be completed in the current context. (Inherited from DiagramItem.)
	AllowModify	Invoked during interactive modification of items to test whether the operation can be completed in the current context. (Inherited from DiagramItem.)
	CancelModify	Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramItem.)
	CompleteCreate	Invoked when the item creation has been completed. (Inherited from DiagramItem.)
	CompleteModify	Invoked when the item modification has been completed. (Inherited from DiagramItem.)
	CreateProperties	Creates an item property set corresponding to the type of this diagram item. (Inherited from DiagramItem.)
	CreateState	Creates an item state corresponding to the type of this diagram item. (Inherited from DiagramItem.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the item is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramItem.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	LoadFromJson	Loads the item from a JSON object. (Inherited from DiagramItem.)
	LoadFromXml	Loads the item content from an XML element. (Inherited from DiagramItem.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	Called when the item is added to a Diagram, either by the user, programmatically or via undo / redo. (Inherited from DiagramItem.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)

	OnMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	OnRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or via undo / redo. (Inherited from DiagramItem.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnZoomChanged	Called when the diagram's **ZoomFactor** changes. (Inherited from DiagramItem.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	Restores the properties of this diagram item. (Inherited from DiagramItem.)
	RestoreState	Restores the state of this diagram item. (Inherited from DiagramItem.)
	SaveProperties	Saves the properties of this diagram item. (Inherited from DiagramItem.)
	SaveState	Saves the state of this diagram item. (Inherited from DiagramItem.)
	SaveToJson	Saves the item as a JSON object. (Inherited from DiagramItem.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramItem.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpanded	Sets whether the item is in expanded or collapsed state. (Inherited from DiagramItem.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	StartCreate	Invoked once when the user starts creating a new item interactively. (Inherited from DiagramItem.)
	StartModify	Invoked when the user starts modifying this item interactively. (Inherited from DiagramItem.)
	UpdateCreate	Invoked during interactive creation of this item. (Inherited from DiagramItem.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateModify	Invoked during interactive modification of this item. (Inherited from DiagramItem.)

DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink Constructor

Initializes a new instance of the DiagramLink class between the specified nodes using the specified diagram link as a prototype.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
function DiagramLink ([parent, [origin, [destination]]])
```

Parameters

parent
Optional.
Diagram. The Diagram from which to obtain default values for the link properties.

origin
Optional.
DiagramNode | Point. The origin node of the new link.

destination
Optional.
DiagramNode | Point. The destination node of the new link.

See Also

DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink Methods

DiagramLink.addLabel Method

Adds a new label to this link.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
function addLabel (text)
```

Parameters

text
String. The label's text.

Return Value

A LinkLabel instance.

Remarks

A link's main text content is specified via its text property. Call **addLabel** if you need to display additional text labels, such as identifiers or hints to the user.

Position of labels can be specified by calling methods such as setControlPointPosition. You can let users move labels interactively by setting the behavior property of DiagramView to MoveLabels.

removeLabel Method

DiagramLink.allowDrag Method

DiagramItem.allowDrag override.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
function allowDrag (ist)
```

Parameters

ist
An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.clone Method

DiagramItem.clone override.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
function clone ()
```

DiagramLink.containsPoint Method

DiagramItem.containsPoint override.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
function containsPoint (point)
```

Parameters

point
The Point to check.

Return Value

Boolean. **true** if the link contains the point, or **false** otherwise.

See Also

DiagramLink Members
DiagramLink Class

DiagramLink.endDrag Method

DiagramItem.endDrag override.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
function endDrag (ist)
```

Parameters

ist
An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

DiagramLink.getLength Method

Gets the length of the links

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
function getLength ([segments])
```

Parameters

segments
Optional.
Array. A list of points specifying the polyline segments.

Return Value

Number. The sum of the lengths of the line's segments.

Remarks

If the link's Shape is set to Bezier, an approximate length is calculated.

See Also

DiagramLink Members

DiagramLink.intersects Method

Checks whether the link contour intersects with the outline of the specified node.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
function intersects (rect)
```

Parameters

rect
Rect. The bounding rectangle of the specified node.

Return Value

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.loadFromXml Method

DiagramItem.LoadFromXml override. Loads the link's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.pointAlongLength Method

Returns a point lying on a polyline that is positioned at a relative position along the polyline's length.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript — Copy Code

```
function pointAlongLength (lengthFactor, [segments])
```

Parameters

lengthFactor
Number. A value from 0 to 1 specifying a portion of link's length.

segments
Optional.
Array. A list of points specifying the polyline segments.

Return Value

Point. A Point instance.

DiagramLink.putEndPointsAtNodeBorders Method

Places the link's end points on the outline of its origin and destination nodes.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript — Copy Code

```
function putEndPointsAtNodeBorders (action, routing)
```

Parameters

action

routing

See Also

DiagramLink.saveToXml Method

Saves the item's content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

DiagramLink.updateDrag Method

DiagramItem.updateDrag override.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
function updateDrag (ist)
```

Parameters

ist
An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.updateFromPoints Method

Updates the link's internal state after the link's control points have been changed.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
function updateFromPoints ()
```

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink Properties

DiagramLink.autoRoute Property

Gets or sets whether this link should be automatically routed to avoid crossing nodes.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get autoRoute() {}
set autoRoute(value) {}
```

Property Value

Boolean

true to automatically route this link, or **false** otherwise.

Remarks

If **autoRoute** is enabled, a link automatically finds the shortest possible path between its origin and destination that doesn't intersect obstacle nodes. The number and orientation of the link's segments are updated when the nodes it links are moved around. The positions of end points of a routed link are not changed, unless the link is also set to dynamic.

> **Performance Note**
>
> Auto-routing is CPU intensive operation and is triggered each time a node is moved or resized. If populating large diagrams from data, best enable this property only after creating all nodes. Alternatively, call route or routeAllLinks method explicitly when appropriate for your application.

See Also

DiagramLink Class
MindFusion.Diagramming Namespace
dynamic Property

DiagramLink.baseBrush Property

Gets or sets an object that specifies how to fill link's baseShape.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get baseBrush() {}
set baseBrush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

Remarks

If this property is not set, the arrowhead is filled using the link's brush.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.baseShape Property

Gets or sets the arrowhead shape displayed at the link' start point.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get baseShape() {}
set baseShape(value) {}
```

Property Value

Shape | *String*

A Shape instance that represents an arrowhead shape.

Remarks

This property specifies the shape that is displayed at the beginning of a link, that is, the point where it connects to its origin node. This shape is rotated simultaneously with the first segment of the link so that it follows the overall link direction.

The ArrowHeads class exposes predefined arrowhead shapes as static methods, each one returning Shape.fromId result for respective **shape identifier**.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace
headShape Property
intermediateShape Property

DiagramLink.baseShapeSize Property

Gets or sets the size of the arrowhead displayed at the link's start point.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get baseShapeSize() {}
set baseShapeSize(value) {}
```

Property Value

Number

A number that represents the size of the arrowhead shape.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.controlPoints Property

Gets or sets the control points of this link.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get controlPoints() {}
set controlPoints(value) {}
```

Property Value

Array

An array of Point objects containing coordinates of link segments.

Remarks

This property lets you change coordinates of link points. The number of points per segment depends on link's shape. Links made of Bézier-splines have four control points for each segment. Links with other shape types have two control points per segment. Adjacent segments share a common control point. After setting new positions of control points, you must call the updateFromPoints method.

See Also

DiagramLink.destination Property

Gets or sets the destination node of this link.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get destination() {}
set destination(value) {}
```

Property Value

DiagramNode

A reference to the destination DiagramNode.

Remarks

When handling validation events, this property keeps pointing to the original destination node. Use the destination property of LinkEventArgs to determine which node the link will connect to if operation is approved.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace
origin Property
destinationIndex Property

DiagramLink.destinationAnchor Property

Gets or sets the anchor point to which the link connects at its destination.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get destinationAnchor() {}
set destinationAnchor(value) {}
```

Property Value

Number

An integer value specifying the index of the destination anchor point.

Remarks

This property is valid when destination node's anchorPattern is set.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.destinationIndex Property

Gets or sets the index of link's destination row when destination is a TableNode.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get destinationIndex() {}
set destinationIndex(value) {}
```

Property Value

Number

An integer value specifying the index of destination row.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.dynamic Property

Gets or sets whether link's end segments are automatically adjustedin order to keep pointing to the centers of the nodes it connects.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get dynamic() {}
set dynamic(value) {}
```

Property Value

Boolean

true if the link automatically adjusts its end points, or false otherwise.

Remarks

If this property is enabled, moving link's adjacent nodes or next-to-last link control points will also update the position of link end points along the node border.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace
autoRoute Property

DiagramLink.endPoint Property

Gets or sets the last control point of this link.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get endPoint() {}
set endPoint(value) {}
```

Property Value

Point

A Point instance containing the control point coordinates.

Remarks

This is a shortcut for accessing last element of controlPoints.

See Also

DiagramLink.headBrush Property

Gets or sets an object that specifies how to fill link's headShape.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get headBrush() {}
set headBrush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

Remarks

If this property is not set, the arrowhead is filled using the link's brush.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.headShape Property

Gets or sets the arrowhead shape displayed at the link' end point.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get headShape() {}
set headShape(value) {}
```

Property Value

Shape | *String*

A Shape instance that represents an arrowhead shape.

Remarks

This property specifies the shape that is displayed at the end of a link, that is, the point where it connects to its destination node. This shape is rotated simultaneously with the last segment of the link so that it follows the overall link direction.

The ArrowHeads class exposes predefined arrowhead shapes as static methods, each one returning Shape.fromId result for respective **shape identifier**.

DiagramLink.headStroke Property

Gets or sets the brush used to stroke the outline of link's arrowheads.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get headStroke() {}
set headStroke(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace
headShape Property
baseShape Property

DiagramLink.headStrokeDashStyle Property

Gets or sets the dash pattern of arrowhead outlines.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get headStrokeDashStyle() {}
set headStrokeDashStyle(value) {}
```

Property Value

DashStyle

A member of the DashStyle enumeration.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.headStrokeThickness Property

Gets or sets the thickness of arrowhead outlines.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get headStrokeThickness() {}
set headStrokeThickness(value) {}
```

Property Value

Number

A number specifying the line thickness.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.intermediateBrush Property

Gets or sets an object that specifies how to fill intermediateShape arrowheads.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get intermediateBrush() {}
set intermediateBrush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

Remarks

If this property is not set, intermediate arrowheads are filled using the link's brush.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace
intermediateShapeSize Property

DiagramLink.intermediateShape Property

Gets or sets the arrowhead shape displayed at the middle of each segment of the link.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get intermediateShape() {}
set intermediateShape(value) {}
```

Property Value

Shape | *String*

A Shape instance that represents an arrowhead shape.

Remarks

The property specifies what shape to display at the middle of each segment of a link. This could help users more easily follow the path of long links.

The ArrowHeads class exposes predefined arrowhead shapes as static methods, each one returning Shape.fromId result for respective shape identifier.

See Also

DiagramLink Members

baseShape Property

DiagramLink.intermediateShapeSize Property

Gets or sets the size of the arrowhead displayed at the middle of each segment of the link.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get intermediateShapeSize() {}
set intermediateShapeSize(value) {}
```

Property Value

Number

A number that represents the size of the arrowhead shape.

See Also

DiagramLink.origin Property

Gets or sets the origin node of this link.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get origin() {}
set origin(value) {}
```

Property Value

DiagramNode

A reference to the origin DiagramNode.

Remarks

When handling validation events, this property keeps pointing to the original origin node. Use the origin property of LinkEventArgs to determine which node the link will connect to if operation is approved.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace
destination Property
originIndex Property

DiagramLink.originAnchor Property

Gets or sets the anchor point to which the link connects at its origin.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get originAnchor() {}
set originAnchor(value) {}
```

Property Value

Number

An integer value specifying the index of the origin anchor point.

Remarks

This property is valid when origin node's anchorPattern is set.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.originIndex Property

Gets or sets the index of link's origin row when origin is a TableNode.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get originIndex() {}
set originIndex(value) {}
```

Property Value

Number

An integer value specifying the index of origin row.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.segmentCount Property

Gets or sets the number of segments that form the link's geometry.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get segmentCount() {}
set segmentCount(value) {}
```

Property Value

Number

An integer value specifying the number of segments of this link.

Remarks

Link segments are either straight lines or Bezier curves, depending on the value of the link's shape property. The segment coordinates are defined by the elements of controlPoints, which contains four points per Bezier segment or two points per straight line segment, where each pair of adjacent segments share a common point. Changing the **segmentCount** property value will resize the **controlPoints** array so that it contains appropriate number of points.

See Also

DiagramLink Members
DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.shape Property

Gets or sets the type of link segments and how they are oriented relatively to each other.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get shape() {}
set shape(value) {}
```

Property Value

LinkShape

A member of the LinkShape enumeration.

Remarks

This property specifies whether the segments of a link are straight lines or curves. In case of straight lines, they can be set all horizontal and vertical, each segment orthogonal to its neighbor, by using the Cascading shape.

controlPoints Property

DiagramLink.startPoint Property

Gets or sets the first control point of this link.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get startPoint() {}
set startPoint(value) {}
```

Property Value

Point

A Point instance containing the control point coordinates.

Remarks

This is a shortcut for accessing first element of controlPoints.

DiagramLink.text Property

Gets or sets the text displayed by this link.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get text() {}
set text(value) {}
```

Property Value

String

A string containing the link's text. The default value is empty string "".

Remarks

Gets or sets the text that should be drawn over a link. Use this to provide to end-users a short description of the relation's purpose. The text appearance can be customized through the textColor and textStyle properties.

Version 1.6 of the control adds the capability to display multiple labels per link via the LinkLabel class. Labels can automatically avoid overlapping nodes or other labels when their autoArrange property is set.

DiagramLink Class
MindFusion.Diagramming Namespace

DiagramLink.textAlignment Property

Gets or sets the alignment of link's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get textAlignment() {}
set textAlignment(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration. The default value is **Center**.

Remarks

Currently this property is considered only when textStyle is set to OverLongestSegment.

DiagramLink.textStyle Property

Gets or sets the placement and orientation of link's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramLink.js

Syntax

JavaScript Copy Code

```
get textStyle() {}
set textStyle(value) {}
```

Property Value

LinkTextStyle

A member of the LinkTextStyle enumeration.

DiagramNode Class

Represents a diagram node.

Syntax

JavaScript Copy Code

```
// class
DiagramNode.prototype = {}
```

Remarks

DiagramNode objects can represent graph vertices, nodes in organizational or flow diagrams, entities in ER diagrams, and so on. **DiagramNode** is an abstract class. You cannot instantiate it directly, but instead use objects from specific classes such as ShapeNode, TableNode, ContainerNode, CompositeNode. You can also define your own node type by deriving from **DiagramNode** or its descendants.

Use the bounds property to get or change the location and size of a node. Constraints upon how users are allowed to modify a node are set through the constraints and enabledHandles properties. The former specifies constraints on move direction and node size. The latter enables or disables specific manipulation handles of a node.

The main textual content of a node is set using its text property and can be customized by setting font and textAlignment. Supplementary labels can be created by calling addLabel.

Relations between nodes are indicated by connecting the nodes with DiagramLink instances. Links are considered directed graph edges, so each node has two collections referring to links: incomingLinks and outgoingLinks. anchorPattern lets you specify the points of a node to which incoming or outgoing links can be connected. The allowIncomingLinks property lets you specify whether incoming links can be drawn to a node. The allowOutgoingLinks property lets you do that for outgoing links.

A user is allowed to expand or collapse the tree starting from a node if expandable is set to **true**. The expanded property gets or sets whether the subtree starting from a node is expanded or not.

Nodes can be attached to other items, and be used as simple labels, image-holders or other kinds of UI elements. The attachTo method overloads provide various options for that.

Nodes can be rotated, either interactively using the rotation handle above a node, or programmatically by setting the rotationAngle property.

DiagramNode Members

Represents a diagram node.

The following tables list the members exposed by the DiagramNode type.

Public Constructors

	Name	Description
	DiagramNode	Initializes a new instance of the **DiagramNode** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description

	allowIncomingLinks	Gets or sets whether users are allowed to draw incoming links to this node.
	allowOutgoingLinks	Gets or sets whether users are allowed to draw outgoing links from this node.
	anchorPattern	Gets or sets the anchor points to which links attach when connected to this node.
	attachedNodes	Returns the nodes attached to this node.
	bounds	Gets or sets a rectangle that defines the position of this node.
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	center	Gets the center of this node's bounding rectangle.
	constraints	Gets or sets constraints applied to the location and size of this node.
	cornerRadius	Gets or sets the corner radius of nodes whose shape is set to a rounded rectangle.
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	effectiveEffects	Gets the effects applied to this node.
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	effects	Gets the effects applied to this node.
	enabledHandles	Gets or sets a value indicating which adjustment handles are enabled for this node.
	expandable	Gets or sets whether users are allowed to expand or collapse the subtree rooted at this node.
	expanded	Gets or sets whether the subtree rooted at this node is expanded.
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	handlesStyle	Gets or sets a value specifying appearance and behavior of node's adjustment handles.
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	incomingLinks	Gets the incoming links to this node.
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)

	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	masterNode	Returns the node to which this node is attached.
	obstacle	Gets or sets whether this node is considered an obstacle by link routing algorithms.
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	outgoingLinks	Gets the outgoing links from this node.
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	rotationAngle	Gets or sets the angle at which this node is rotated.
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	showDeleteButton	Gets or sets whether this node displays a delete button.
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	True if this is a top-level item in the diagram, or false if it is inside a container. (Inherited from DiagramItem.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	acceptLinks	Determines whether the node can be connected with links of the specified type.
	allowDrag	DiagramItem.allowDrag override.
	Animate	Animates the item. (Inherited from DiagramItem.)
	attach	Attaches the specified subordinate node to this node, so that when this node is moved, the subordinate follows it.
	attachTo	Attaches this node to the specified master node so that when the master is moved, the attached node follows it.
	clone	DiagramItem.clone override.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	containsPoint	DiagramItem.containsPoint override.
	ContainsPoint	Overloaded. Determines whether this item contains the specified point. (Inherited from DiagramItem.)
	createConnectionPoint	Creates a connection point between this node and the specified link at the specified point.
	detach	Detaches this node from its current master node.
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	Draws the item on the specified IGraphics surface. (Inherited from DiagramItem.)
	DrawHandles	Renders the adjustment handles of this item. (Inherited from DiagramItem.)
	DrawInRect	(Inherited from DiagramItem.)
	DrawShadow	Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramItem.)
	endDrag	**DiagramItem.endDrag** override.
	fromJson	DiagramItem.fromJson override.
	getAllLinks	Returns all links connected to this node.
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)

	getIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline.
	getOutline	Gets the bounding rectangle of this node.
	GetOutlinePoly	Gets a polygon approximating the outline of this object. (Inherited from DiagramItem.)
	GetRepaintRect	Gets the repaint region for this item, taking into account factors such as pen, selection handles and shadow. (Inherited from DiagramItem.)
	getRotatedBounds	Gets the bounding **rectangle** of this item when it is rotated.
	GetRotatedBounds	Gets the bounding rectangle of this item when it is rotated. (Inherited from DiagramItem.)
	GetToolTip	Gets the tooltip that should be displayed for this item at the specified point. (Inherited from DiagramItem.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramItem.)
	HitTestManipulators	Finds the **Manipulator** object located at the specified point. (Inherited from DiagramItem.)
	LabelFromPoint	Returns the ItemLabel located at specified point. (Inherited from DiagramItem.)
	loadFromXml	DiagramItem.loadFromXml override. Loads the node's content from an XML element.
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	raiseClicked	Raises an event which notifies that a **node** has been clicked.
	raiseDoubleClicked	Raises an event which notifies that a node has been double-clicked.
	removeCanvasElements	DiagramItem.removeCanvasElements override.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	restoreLocationState	DiagramItem.restoreLocationState override.
	restoreState	DiagramItem.restoreState override.
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveLocationState	**DiagramItem.saveLocationState** override.
	saveState	DiagramItem.saveState override.
	saveToXml	Saves the item content into an XML element.
	setBounds	Sets the rectangle that defines the position of the diagram node.
	toJson	DiagramItem.toJson override.
	updateDrag	**DiagramItem.updateDrag** override.
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)

	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	Invoked during interactive creation of items to test whether the operation can be completed in the current context. (Inherited from DiagramItem.)
	AllowModify	Invoked during interactive modification of items to test whether the operation can be completed in the current context. (Inherited from DiagramItem.)
	CancelModify	Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramItem.)
	CompleteCreate	Invoked when the item creation has been completed. (Inherited from DiagramItem.)
	CompleteModify	Invoked when the item modification has been completed. (Inherited from DiagramItem.)
	CreateProperties	Creates an item property set corresponding to the type of this diagram item. (Inherited from DiagramItem.)
	CreateState	Creates an item state corresponding to the type of this diagram item. (Inherited from DiagramItem.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the item is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramItem.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	LoadFromJson	Loads the item from a JSON object. (Inherited from DiagramItem.)
	LoadFromXml	Loads the item content from an XML element. (Inherited from DiagramItem.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	Called when the item is added to a Diagram, either by the user, programmatically or via undo / redo. (Inherited from DiagramItem.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	OnRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or via undo / redo. (Inherited from DiagramItem.)

	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnZoomChanged	Called when the diagram's **ZoomFactor** changes. (Inherited from DiagramItem.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	Restores the properties of this diagram item. (Inherited from DiagramItem.)
	RestoreState	Restores the state of this diagram item. (Inherited from DiagramItem.)
	SaveProperties	Saves the properties of this diagram item. (Inherited from DiagramItem.)
	SaveState	Saves the state of this diagram item. (Inherited from DiagramItem.)
	SaveToJson	Saves the item as a JSON object. (Inherited from DiagramItem.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramItem.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpanded	Sets whether the item is in expanded or collapsed state. (Inherited from DiagramItem.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	StartCreate	Invoked once when the user starts creating a new item interactively. (Inherited from DiagramItem.)
	StartModify	Invoked when the user starts modifying this item interactively. (Inherited from DiagramItem.)
	UpdateCreate	Invoked during interactive creation of this item. (Inherited from DiagramItem.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateModify	Invoked during interactive modification of this item. (Inherited from DiagramItem.)

DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode Constructor

Initializes a new instance of the DiagramNode class.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
function DiagramNode ([parent])
```

Parameters

parent
Optional.
Diagram. A Diagram instance whose default node attributes are copied to this node.

See Also

DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode Methods

DiagramNode.acceptLinks Method

Determines whether the node can be connected with links of the specified type.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
function acceptLinks (outgoing)
```

Parameters

outgoing
Boolean. **true** to check for outgoing links, or **false** otherwise.

Return Value

Boolean. **true** if the node accepts connections of the specified type, or **false** otherwise.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.allowDrag Method

DiagramItem.allowDrag override.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
function allowDrag (ist)
```

Parameters

ist
InteractionState. An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.attach Method

Attaches the specified subordinate node to this node, so that when this node is moved, the subordinate follows it.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript — Copy Code

```
function attach (subordinate)
```

Parameters

subordinate
A DiagramNode instance specifying the node that should be attached.

Remarks

Layout algorithms can treat a group of attached nodes either as a single node to be placed in the arranged graph, or as distinct nodes whose final positions are set independently from the initial group layout. This is controlled via the keepGroupLayout property.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
detach Method
attachTo Method
attachedNodes Property

DiagramNode.attachTo Method

Attaches this node to the specified master node so that when the master is moved, the attached node follows it.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript — Copy Code

```
function attachTo (node)
```

Parameters

node
A DiagramNode instance specifying the master node.

Remarks

Layout algorithms can treat a group of attached nodes either as a single node to be placed in the arranged graph, or as distinct nodes whose final positions are set independently from the initial group layout. This is controlled via the keepGroupLayout property.

DiagramNode.containsPoint Method

DiagramItem.containsPoint override.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
function containsPoint (point)
```

Parameters

point
Point. The point to check.

Return Value

Boolean. true it this node contains the specified point; otherwise, false.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.createConnectionPoint Method

Creates a connection point between this node and the specified link at the specified point.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
function createConnectionPoint (link, point, incoming)
```

Parameters

link
A DiagramLink that should be connected to this node.

point
The Point at which the link should be connected.

incoming

Boolean. **true** if link is an incoming link, or **false** otherwise.

Return Value

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.detach Method

Detaches this node from its current master node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
function detach ()
```

Remarks

This method does nothing if the node hasn't been previously attached to another node via the attach or attachTo methods.

DiagramNode.getAllLinks Method

Returns all links connected to this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
function getAllLinks ()
```

Return Value

Array. An array of DiagramLink objects.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.getIntersection Method

Calculates the intersection point between the segment defined by the specified point pair and the node's outline.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
function getIntersection (point1, point2)
```

Parameters

point1

The first Point of the segment.

point2

The second **Point** of the segment.

Return Value

A **Point** object representing the intersection point.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.getOutline Method

Gets the bounding rectangle of this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript — Copy Code

```
function getOutline ()
```

Return Value

A rectangle.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.getRotatedBounds Method

Gets the bounding rectangle of this item when it is rotated.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript — Copy Code

```
function getRotatedBounds ()
```

Return Value

A Rect that bounds the rotated shape of this node.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
rotationAngle Property

DiagramNode.loadFromXml Method

DiagramItem.loadFromXml override. Loads the node's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript — Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

DiagramNode.raiseClicked Method

Raises an event which notifies that a node has been clicked.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
function raiseClicked (mousePosition, mouseButton)
```

Parameters

mousePosition
Point. The position of the mouse.

mouseButton
A value identifying the clicked mouse button.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.raiseDoubleClicked Method

Raises an event which notifies that a node has been double-clicked.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
function raiseDoubleClicked (mousePosition, mouseButton)
```

Parameters

mousePosition
Point. The position of the mouse.

mouseButton
MouseButton. A value identifying the clicked mouse button.

DiagramNode.saveToXml Method

Saves the item content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement

Element. An XML DOM element that will contain the item's data.

context

XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.setBounds Method

Sets the rectangle that defines the position of the diagram node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
function setBounds (bounds, [updateDependencies])
```

Parameters

bounds
The node's bounding rectangle.

updateDependencies
Optional. **true** if links and attachments must be updated too, or **false** otherwise.

Remarks

Use this method to set the size and/or location of a node. If updateDependencies is set, moving the node will also update the control-point coordinates of all links connected to it.

DiagramNode Properties

DiagramNode.allowIncomingLinks Property

Gets or sets whether users are allowed to draw incoming links to this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get allowIncomingLinks() {}
set allowIncomingLinks(value) {}
```

Property Value

Boolean

true if users are allowed to draw incoming links, or **false** otherwise.

Remarks

Links to a node can always be created programmatically regardless of the value of this property.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.allowOutgoingLinks Property

Gets or sets whether users are allowed to draw outgoing links from this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get allowOutgoingLinks() {}
set allowOutgoingLinks(value) {}
```

Property Value

Boolean

true if users are allowed to draw outgoing links, or **false** otherwise.

Remarks

Links from a node can always be created programmatically regardless of the value of this property.

See Also

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.anchorPattern Property

Gets or sets the anchor points to which links attach when connected to this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript — Copy Code

```
get anchorPattern() {}
set anchorPattern(value) {}
```

Property Value

AnchorPattern

An AnchorPattern object that defines a set of anchor points.

Remarks

This property specifies a set of points to which links can be attached. Each anchor point can accept either incoming links, outgoing links or both. If a node does not have any anchor points defined, links can be connected to any part of the node.

Shape.anchorPattern Property

DiagramNode.attachedNodes Property

Returns the nodes attached to this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript — Copy Code

```
get attachedNodes() {}
```

Property Value

Array

An array of nodes attached to this node via the attach or attachTo methods.

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
detach Method

DiagramNode.bounds Property

Gets or sets a rectangle that defines the position of this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript — Copy Code

```
get bounds() {}
set bounds(value) {}
```

Property Value

Rect

The node's bounding rectangle.

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
Diagram.enableSpatialIndex Property

DiagramNode.center Property

Gets the center of this node's bounding rectangle.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get center() {}
```

Property Value

Point

A Point representing the center point of this node.

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.constraints Property

Gets or sets constraints applied to the location and size of this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get constraints() {}
set constraints(value) {}
```

Property Value

NodeConstraints

An instance of the NodeConstraints class.

Remarks

These constraints are considered when a user modifies the node interactively. They are ignored if node placement is changed programmatically by using methods and properties.

DiagramNode Members
DiagramNode Class

DiagramNode.cornerRadius Property

Gets or sets the corner radius of nodes whose shape is set to a rounded rectangle.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get cornerRadius() {}
set cornerRadius(value) {}
```

Property Value

Number

A number specifying the corner radius.

ShapeNode.shape Property
TableNode.shape Property
ContainerNode.shape Property

DiagramNode.effectiveEffects Property

Gets the effects applied to this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get effectiveEffects() {}
```

Property Value

Array

An array of NodeEffect objects.

Remarks

Returns the local effects array if it's not empty, or otherwise the effects defined in item's style or diagram's theme.

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.effects Property

Gets the effects applied to this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get effects() {}
set effects(value) {}
```

Property Value

Array

An array of NodeEffect objects.

Remarks

The local node effects are applied after the diagram-wide node effects defined in nodeEffects. Setting **null** marker as first element in this list allows ignoring the global diagram effects.

Node Effects

DiagramNode.enabledHandles Property

Gets or sets a value indicating which adjustment handles are enabled for this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get enabledHandles() {}
set enabledHandles(value) {}
```

Property Value

AdjustmentHandles

A combination of the AdjustmentHandles enumeration members. The default is **AdjustmentHandles.All**.

Remarks

Disabling some selection handles allows restricting the types of modifications that users can perform on a node. Each manipulation handle can be enabled or disabled by setting or clearing the respective flag in the combination.

For example, to make a node resizable only horizontally, set this property to a combination of the Move, ResizeMiddleLeft and ResizeMiddleRight flags. That will disable all manipulation handles, except the left and right ones, which allow horizontal resizing, and the central one allowing movement of the node.

constraints Property

DiagramNode.expandable Property

Gets or sets whether users are allowed to expand or collapse the subtree rooted at this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get expandable() {}
set expandable(value) {}
```

Property Value

Boolean

true if users are allowed to expand/collapse the subtree, or **false** otherwise.

Remarks

This property is useful mostly when nodes form a tree-like hierarchical structure.

expanded Property
treeCollapsed Event
treeExpanded Event
expandButtonAction Property

DiagramNode.expanded Property

Gets or sets whether the subtree rooted at this node is expanded.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get expanded() {}
set expanded(value) {}
```

Property Value

Boolean

true if the subtree is expanded, or **false** otherwise.

Remarks

By default, the control considers nodes that can be reached by following outgoing links to be the child nodes in a tree, and respectively outgoing links determine the direction in which tree branches collapse or expand. This direction can be reversed by setting the expandOnIncoming property to **true**.

DiagramNode.handlesStyle Property

Gets or sets a value specifying appearance and behavior of node's adjustment handles.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get handlesStyle() {}
set handlesStyle(value) {}
```

Property Value

HandlesStyle

A member of the HandlesStyle enumeration. The default value is **SquareHandles**.

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace
enabledHandles Property

DiagramNode.incomingLinks Property

Gets the incoming links to this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get incomingLinks() {}
```

Property Value

Array

An array of DiagramLink objects.

Remarks

Set link's destination property to programmatically create incoming link to a node, or set respective argument of createDiagramLink method.

DiagramNode Members
DiagramNode Class
MindFusion.Diagramming Namespace

DiagramNode.masterNode Property

Returns the node to which this node is attached.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get masterNode() {}
```

Property Value

DiagramNode

A DiagramNode reference specifying the node to whichthis node has been previously attached via the attach or attachTo method.

See Also

DiagramNode.obstacle Property

Gets or sets whether this node is considered an obstacle by link routing algorithms.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get obstacle() {}
set obstacle(value) {}
```

Property Value

Boolean

true to route links around this node, or **false** to lets links cross the node. The default value is **true**.

DiagramNode.outgoingLinks Property

Gets the outgoing links from this node.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get outgoingLinks() {}
```

Property Value

Array

An array of DiagramLink objects.

Remarks

Set link's origin property to programmatically create outgoing link from a node, or set respective argument of createDiagramLink method.

DiagramNode.rotationAngle Property

Gets or sets the angle at which this node is rotated.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get rotationAngle() {}
set rotationAngle(value) {}
```

Property Value

Number

A number specifying the rotation angle. The default is 0.

MindFusion.Diagramming Namespace

DiagramNode.showDeleteButton Property

Gets or sets whether this node displays a delete button.

Namespace: MindFusion.Diagramming
Assembly: DiagramNode.js

Syntax

JavaScript Copy Code

```
get showDeleteButton() {}
set showDeleteButton(value) {}
```

Property Value

Boolean

true to display delete button for the node, or **false** otherwise.

DiagramPage Class

Represents a single page in a DiagramDocument object.

Syntax

JavaScript Copy Code

```
// class
DiagramPage.prototype = {}
```

Remarks

DiagramPage is derived from Diagram and only adds a few properties, so any code that processes **Diagram** objects will work with **DiagramPage** objects too. A DiagramDocument forwards each event raised by its pages, giving you a chance to use the same handler for events raised by different pages. If a page should implement distinct user interaction or validation logic, it is also possible to attach handlers to the **Diagram** events inherited by **DiagramPage**.

DiagramPage Members

Represents a single page in a DiagramDocument object.

The following tables list the members exposed by the DiagramPage type.

Public Constructors

	Name	Description
	DiagramPage	Initializes a new instance of the DiagramPage class.

Public Fields

	Name	Description
	Dummy	A shared DummyNode instance. (Inherited from Diagram.)

Public Properties

	Name	Description
	ActiveItem	Gets or sets the active diagram element. (Inherited from Diagram.)
	ActiveItemHandlesStyle	Gets the visual style of adjustment handles of the active item. (Inherited from Diagram.)
	ActiveLayer	Gets or sets the zero-based index of the active layer. (Inherited from Diagram.)
	AdjustmentHandlesSize	Gets or sets the size of the handles, which appear around selected objects. (Inherited from Diagram.)
	AlignmentGuidePen	Gets or sets the pen used to draw alignment guides. (Inherited from Diagram.)
	AlignToGrid	Gets or sets a value indicating whether the diagram items is aligned to a grid. (Inherited from Diagram.)
	AllowLinksRepeat	Gets or sets a value indicating whether more than one link can connect the same origin and destination diagram nodes. (Inherited from Diagram.)
	AllowMultipleResize	Gets or sets whether multiple selected nodes can be resized simultaneously. (Inherited from Diagram.)
	AllowSelfLoops	Gets or sets a value indicating whether self-loops are allowed. (Inherited from Diagram.)
	AllowSplitLinks	Gets or sets a value indicating whether link segments can be added and removed interactively. (Inherited from Diagram.)
	AllowUnanchoredLinks	Gets or sets a value indicating whether links can be connected to nodes to which there aren't anchor points assigned. (Inherited from Diagram.)
	AllowUnconnectedLinks	Gets or sets a value indicating whether users are allowed to draw links that are not connected to any node. (Inherited from Diagram.)
	AutoAlignDistance	Gets or sets the maximal horizontal or vertical distance at which a node aligns to the borders of other nodes. (Inherited from Diagram.)
	AutoAlignNodes	Gets or sets whether nodes should automatically align to the borders of other nodes during user interaction. (Inherited from Diagram.)

	AutoArrangeAvoidContainers	Gets or sets a value indicating whether auto-arranged link labels should avoid containers. (Inherited from Diagram.)
	AutoArrangeAvoidSegments	Gets or sets a value indicating whether auto-arranged link labels should avoid link segments. (Inherited from Diagram.)
	AutoCloseDistance	Gets or sets the maximum distance between first and last points of a FreeFormNode for which the node's outline is closed automatically. (Inherited from Diagram.)
	AutoDeleteLinks	Gets or sets whether links are deleted automatically when their Origin or Destination is deleted. (Inherited from Diagram.)
	AutoHighlightRows	Gets or sets whether a table row should be highlighted when the user clicks on it. (Inherited from Diagram.)
	AutoResize	Gets or sets a value indicating whether the document area must be resized automatically so it fits the diagram contents. (Inherited from Diagram.)
	AutoSnapDistance	Specifies the maximum distance at which links auto-snap to nodes. (Inherited from Diagram.)
	AutoSnapLinks	Gets or sets the default value for the AutoSnapToNode property of new links. (Inherited from Diagram.)
	BackBrush	Gets or sets the brush used for painting the diagram background. (Inherited from Diagram.)
	BackgroundImage	Gets or sets the image displayed as background of this diagram. (Inherited from Diagram.)
	BackgroundImageAlign	Gets or sets a value indicating how the background image is positioned, relatively to the scrollable document area. (Inherited from Diagram.)
	BackgroundImageUrl	URL of the image painted as diagram's background. (Inherited from Diagram.)
	BarcodeNodeStyle	Gets the theme-level style for barcode nodes. (Inherited from Diagram.)
	Bounds	Gets or sets a value representing the size of the diagram's scrollable area. (Inherited from Diagram.)
	BoundsPen	The pen with which the document bounds should be drawn. (Inherited from Diagram.)
	BranchIndicatorColor	Gets or sets the color of link branch indicators. (Inherited from Diagram.)
	BranchIndicatorSize	Gets or sets the size of link branch indicators. (Inherited from Diagram.)
	CellCustomDraw	Gets or sets the default type of custom painting done on the cells of tables. (Inherited from Diagram.)
	CellFrameStyle	Gets or sets the default cell border style of new tables. (Inherited from Diagram.)
	CompositeNodeStyle	Gets the theme-level style for composite nodes. (Inherited from Diagram.)
	ContainerCaption	Gets or sets the default value for the Caption property of containers. (Inherited from Diagram.)
	ContainerCaptionHeight	Gets or sets the default value for the CaptionHeight property of containers. (Inherited from Diagram.)
	ContainerHighlightPen	Gets or sets the default value for the HighlightPen property of containers. (Inherited from Diagram.)
	ContainerMargin	Gets or sets the default value for the Margin property of containers. (Inherited from Diagram.)
	ContainerMinimumSize	Gets or sets the default value for the MinimumSize property of containers. (Inherited from Diagram.)

	ContainerNodeStyle	Gets the theme-level style for container nodes. (Inherited from Diagram.)
	ContainersFoldable	Gets or sets the default value for the Foldable property of containers. (Inherited from Diagram.)
	CrossingRadius	Gets or sets the radius length of decorations displayed at link intersection points. (Inherited from Diagram.)
	DefaultShape	Gets or sets the default shape of shape nodes. (Inherited from Diagram.)
	DiagramLinkStyle	Gets the theme-level style for diagram links. (Inherited from Diagram.)
	DiagramStyle	Gets the theme-level style for the diagram. (Inherited from Diagram.)
	Dirty	Gets or sets a value indicating whether the diagram has changed since the last save. (Inherited from Diagram.)
	DisabledHandlesStyle	Gets the visual style of disabled adjustment handles. (Inherited from Diagram.)
	DynamicLinks	Gets or sets the default value for the Dynamic property of new links. (Inherited from Diagram.)
	EffectiveBackBrush	Gets the currently effective background brush of the diagram. (Inherited from Diagram.)
	EffectsProvider	Gets or sets an object used to generate visual effects for shape nodes such as embossment and shadow dispersion. (Inherited from Diagram.)
	EnableEmbossEffects	Gets or sets a value indicating whether emboss effect for shape nodes is enabled. (Inherited from Diagram.)
	EnableLanes	Gets or sets whether lanes are enabled. (Inherited from Diagram.)
	EnableShadowEffects	Gets or sets a value indicating whether the shadow dispersion effect for nodes is enabled. (Inherited from Diagram.)
	EnableSpatialIndex	Gets or sets whether to index item positions for faster hit-testing and viewport clipping queries. (Inherited from Diagram.)
	EnableStyledText	Gets or sets the default value for the EnableStyledText property of new nodes. (Inherited from Diagram.)
	ExpandButtonAction	Gets or sets a value indicating what should happen when a user clicks the [±] button that is displayed near expandable nodes. (Inherited from Diagram.)
	ExpandButtonPosition	Gets or sets where expand/collapse buttons are located relatively to their nodes. (Inherited from Diagram.)
	ExpandOnIncoming	Gets or sets a value, indicating in which direction object hierarchies are expanded. (Inherited from Diagram.)
	ExteriorBrush	Gets or sets the brush used for painting the area outside **Bounds**. (Inherited from Diagram.)
	Factory	Gets a Factory instance that lets you add programmatically new items to the diagram. (Inherited from Diagram.)
	FocusedComponent	Gets or sets the component within this diagram which currently has the input focus. (Inherited from Diagram.)
	FoldedContainerSize	Gets or sets the size of folded containers. (Inherited from Diagram.)
	Font	Gets or sets the default font for new diagram items. (Inherited from Diagram.)
	FreeFormAttractDistance	Gets or sets the radius around dragged free-form adjustment handle in which other points of FreeFormNode are modified too. (Inherited from Diagram.)
	FreeFormTargets	An array of Shape objects used to replace FreeFormNode instances with ShapeNode ones when Behavior is set to LinkFreeShapes or DrawFreeShapes. (Inherited from Diagram.)

	GridColor	Gets or sets the color of the grid points. (Inherited from Diagram.)
	GridOffsetX	Gets or sets the horizontal offset of the first point of the alignment grid. (Inherited from Diagram.)
	GridOffsetY	Gets or sets the vertical offset of the first point of the alignment grid. (Inherited from Diagram.)
	GridPatternHatch	Gets or sets a hatch style used to draw dense alignment grid at low zoom levels. (Inherited from Diagram.)
	GridPatternThreshold	Gets or sets the distance between grid points (in pixels) that triggers drawing using **GridPatternHatch**. (Inherited from Diagram.)
	GridSizeX	Gets or sets the horizontal distance between adjacent grid points. (Inherited from Diagram.)
	GridSizeY	Gets or sets the vertical distance between adjacent grid points. (Inherited from Diagram.)
	GridStyle	Gets or sets the visual style of the alignment grid. (Inherited from Diagram.)
	Groups	Gets a collection of all groups in the diagram. (Inherited from Diagram.)
	HitTestPriority	Gets or sets a value indicating the order in which items are hit-tested. (Inherited from Diagram.)
	iconUrl	Gets or sets URL of the image to paint as the page's icon.
	Interaction	Gets an InteractionState instance representing the current action being carried out by the user. (Inherited from Diagram.)
	IsProEdition	Gets a value indicating whether the currently loaded MvcDiagram is a professional version of the control. (Inherited from Diagram.)
	Items	Gets a collection of all items in this diagram. (Inherited from Diagram.)
	LaneGrid	Gets the Grid instance that represents the lane grid. (Inherited from Diagram.)
	Layers	Gets a list of the layers in the current diagram. (Inherited from Diagram.)
	LinkBaseShape	Gets or sets the shape displayed at the base of new links. (Inherited from Diagram.)
	LinkBaseShapeSize	Gets or sets the default size of the base of new links. (Inherited from Diagram.)
	LinkBranchIndicator	Gets or sets a value indicating what shapes to display as markers at points where overlapping Cascading links diverge. (Inherited from Diagram.)
	LinkBrush	Gets or sets the default value for the Brush property of links. (Inherited from Diagram.)
	LinkCascadeOrientation	Gets or sets the initial orientation of the first segment of new cascading links. (Inherited from Diagram.)
	LinkCrossings	Gets or sets how to render the intersection points where links cross their paths. (Inherited from Diagram.)
	LinkCustomDraw	Gets or sets the default type of custom painting done on links. (Inherited from Diagram.)
	LinkEndsMovable	Gets or sets a value indicating whether link ends can be moved by users after the link is created. (Inherited from Diagram.)
	LinkHandlesStyle	Gets or sets the default value for the HandlesStyle property of new links. (Inherited from Diagram.)
	LinkHeadShape	Gets or sets the shape displayed as head of new links. (Inherited from Diagram.)

	LinkHeadShapeSize	Gets or sets the default size of arrowheads. (Inherited from Diagram.)
	LinkHitDistance	Gets or sets a value specifying how far from a link a click is still considered a hit. (Inherited from Diagram.)
	LinkIntermediateShape	Gets or sets the default shape to be displayed in the middle of each segment of links. (Inherited from Diagram.)
	LinkIntermediateShapeSize	Gets or sets the default size of the shapes at middles of link segments. (Inherited from Diagram.)
	LinkMergeIndicator	Gets or sets a value indicating what shapes to display as markers at points where overlapping **Cascading** links merge. (Inherited from Diagram.)
	LinkPen	Gets or sets the default value for the Pen and HeadPen properties of links. (Inherited from Diagram.)
	LinkRouter	Gets or sets the component used to find paths for auto-routed links when diagram nodes are added or their positions change. (Inherited from Diagram.)
	Links	Gets a collection of all DiagramLink objects in the diagram. (Inherited from Diagram.)
	LinkSegments	Gets or sets the default number of link segments. (Inherited from Diagram.)
	LinkShape	Gets or sets the default value of the Shape property of new links. (Inherited from Diagram.)
	LinksRetainForm	Gets or sets whether links should maintain their forms if the nodes linked with those links are moved around. (Inherited from Diagram.)
	LinkText	Gets or sets the default text of links. (Inherited from Diagram.)
	LinkTextStyle	Gets or sets default placement and orientation for links' text. (Inherited from Diagram.)
	MeasureTextRenderingHint	Gets or sets the TextRenderingHint to use when measuring texts. This should be effectively set to the value of DiagramView.TextRenderingHint. (Inherited from Diagram.)
	MeasureUnit	Gets or sets the unit of measure used for logical coordinates in this diagram. (Inherited from Diagram.)
	MergeIndicatorColor	Gets or sets the color of link merge indicators. (Inherited from Diagram.)
	MergeIndicatorSize	Gets or sets the size of link merge indicators. (Inherited from Diagram.)
	MergeThreshold	Gets or sets the maximum distance between adjacent control points of a link at which the respective segments can be merged. (Inherited from Diagram.)
	MinimumNodeSize	Gets or sets the minimum node size that the user is allowed to set. (Inherited from Diagram.)
	ModificationEffect	Gets or sets the visual effect to apply during interactive modification of items. (Inherited from Diagram.)
	NodeEffects	Gets a collection with all effects applied to the nodes of this diagram. (Inherited from Diagram.)
	Nodes	Gets a collection of all DiagramNode objects in the diagram. (Inherited from Diagram.)
	NodesExpandable	Gets or sets a value indicating whether newly created nodes can be expanded. (Inherited from Diagram.)
	NowLoading	Gets a value indicating whether the diagram data is now being loaded from a file. (Inherited from Diagram.)
	PolygonalTextLayout	Gets or sets a value indicating whether to enable the formatting of text inside non-rectangular shape node outlines. (Inherited from Diagram.)

	RecursiveExpand	Gets or sets value indicating how a tree is expanded. (Inherited from Diagram.)
	RenderOptions	Gets the current rendering options for this diagram. (Inherited from Diagram.)
	RestrictItemsToBounds	Gets or sets a value indicating whether users are allowed to place items outside the scrollable area of the diagram. (Inherited from Diagram.)
	RoundedLinks	Gets or sets a value indicating whether the joins between segments of **Polyline** and **Cascading** links should be rounded. (Inherited from Diagram.)
	RoundedLinksRadius	Gets or sets the radius of arc joins of rounded links' segments. (Inherited from Diagram.)
	RoundRectFactor	Gets or sets the relative size of arcs displayed at the corners of rounded rectangles. (Inherited from Diagram.)
	RouteLinks	Gets or sets a value indicating whether links should avoid nodes by going the shortest path from their origin to their destination without crossing any other nodes. (Inherited from Diagram.)
	RoutingOptions	Gets an object, which allows customizing various parameters of the link routing algorithm. (Inherited from Diagram.)
	RowHighlightBrush	Gets or sets the Brush used to fill highlighted table rows. (Inherited from Diagram.)
	ScriptHelper	Gets a ScriptHelper object which can be used in html scripts to instantiate various objects and to call static methods. (Inherited from Diagram.)
	SelectAfterCreate	Gets or sets a value indicating whether newly created objects are automatically selected. (Inherited from Diagram.)
	SelectedItemHandlesStyle	Gets the visual style of adjustment handles of selected items. (Inherited from Diagram.)
	Selection	Gets a Selection instance that represents the selection of items in this diagram. (Inherited from Diagram.)
	SelectionOnTop	Gets or sets a value indicating whether selected items should be painted on top of other items. (Inherited from Diagram.)
	SerializationBinder	Gets or sets a SerializationBinder object used to control class loading. (Inherited from Diagram.)
	ShadowBrush	Gets or sets the default brush used to paint the shadows cast by diagram items. (Inherited from Diagram.)
	ShadowOffsetX	Gets or sets the horizontal offset of item shadows. (Inherited from Diagram.)
	ShadowOffsetY	Gets or sets the vertical offset of item shadows. (Inherited from Diagram.)
	ShadowsStyle	Gets or sets the style for rendering shadows. (Inherited from Diagram.)
	ShapeBrush	Gets or sets the default value for the **Brush** property of shape nodes. (Inherited from Diagram.)
	ShapeCustomDraw	Gets or sets the default type of custom painting done for shape nodes. (Inherited from Diagram.)
	ShapeHandlesStyle	Gets or sets the default value for the **HandlesStyle** property of new shape nodes. (Inherited from Diagram.)
	ShapeNodeStyle	Gets the theme-level style for shape nodes. (Inherited from Diagram.)
	ShapeOrientation	Gets or sets the default value for the ShapeOrientation property of shape nodes. (Inherited from Diagram.)
	ShapePen	Gets or sets the default value for the **Pen** property of shape nodes. (Inherited from Diagram.)

	ShapeText	Gets or sets the default text of shape nodes. (Inherited from Diagram.)
	ShowAnchors	Gets or sets a value indicating whether and when node anchor points should be displayed. (Inherited from Diagram.)
	ShowDisabledHandles	Gets or sets a value indicating whether manipulation handles are painted when they are disabled. (Inherited from Diagram.)
	ShowGrid	Gets or sets a value indicating whether the alignment grid is visible. (Inherited from Diagram.)
	ShowHandlesOnDrag	Gets or sets a value indicating whether to display selection handles of objects under the mouse while another object is being modified. (Inherited from Diagram.)
	SnapToAnchor	Gets or sets when link end points should be aligned to the nearest anchor points. (Inherited from Diagram.)
	SortGroupsByZ	Gets or sets a value indicating whether grouped items should be drawn sorted by their z-order while the whole group is being moved. (Inherited from Diagram.)
	Style	Gets or sets the style associated with the diagram. (Inherited from Diagram.)
	SvgNodeStyle	Gets the theme-level style for SVG nodes. (Inherited from Diagram.)
	TableBrush	Gets or sets the default value for the **Brush** property of tables. (Inherited from Diagram.)
	TableCaption	Gets or sets the default text for tables' captions. (Inherited from Diagram.)
	TableCaptionHeight	Gets or sets the default height of table captions. (Inherited from Diagram.)
	TableColumnCount	Gets or sets the default number of table columns. (Inherited from Diagram.)
	TableColumnWidth	Gets or sets the default width of tables' columns. (Inherited from Diagram.)
	TableConnectionStyle	Gets or sets a value indicating whether drawing a link between tables should connect the rows of those tables, or the tables as whole entities. (Inherited from Diagram.)
	TableCustomDraw	Gets or sets the default type of custom painting done on tables. (Inherited from Diagram.)
	TableHandlesStyle	Gets or sets the default value for the **HandlesStyle** property of new tables. (Inherited from Diagram.)
	TableNodeStyle	Gets the theme-level style for table nodes. (Inherited from Diagram.)
	TablePen	Gets or sets the default value for the **Pen** property of tables. (Inherited from Diagram.)
	TableRowCount	Gets or sets the default number of table rows. (Inherited from Diagram.)
	TableRowHeight	Gets or sets the default height of tables' rows. (Inherited from Diagram.)
	TableShape	Gets or sets the default value of the Shape property of new tables. (Inherited from Diagram.)
	TablesScrollable	Gets or sets the default value for the Scrollable property of new tables. (Inherited from Diagram.)
	Tag	Gets or sets custom data associated with this diagram. (Inherited from Diagram.)
	TextColor	Gets or sets the default color of text displayed inside diagram items. (Inherited from Diagram.)

	TextFormat	Gets or sets the default alignment and formatting style for text displayed inside nodes and table cells. (Inherited from Diagram.)
	Theme	Gets or sets the theme associated with the diagram. (Inherited from Diagram.)
	title	Gets or sets the page title.
	titleColor	Gets or sets the color of the title when the title is displayed.
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram. (Inherited from Diagram.)
	TouchHitDistance	Specifies distance from adjustment handles at which they are still considered as hit when processing touch input. (Inherited from Diagram.)
	TouchThreshold	Gets or sets the threshold value for easier touch interaction through adjustment handles. (Inherited from Diagram.)
	TreeViewNodeStyle	Gets the theme-level style for tree view nodes. (Inherited from Diagram.)
	UndoManager	Gets a reference to the diagram's UndoManager instance. (Inherited from Diagram.)
	ValidityChecks	Gets or sets a value indicating whether validity checks are performed each time an item is added to the diagram. (Inherited from Diagram.)
	VisioNodeStyle	Gets the theme-level style for Visio nodes. (Inherited from Diagram.)
	XmlOptions	An XmlOptions object providing properties for customizing the XML serialization process. (Inherited from DiagramBase.)

Public Methods

	Name	Description
	AlignPointToGrid	Returns a point of the alignment grid nearest to the one passed as an argument. (Inherited from Diagram.)
	AllowNodeBounds	Determines whether node can be placed at specified coordinates. (Inherited from Diagram.)
	Arrange	Arranges the diagram using the specified graph layout algorithm. (Inherited from Diagram.)
	ArrangeAnimated	Arranges the diagram using the specified graph layout algorithm, and animates items moving to their new positions. (Inherited from Diagram.)
	ArrangeAsync	Arranges the diagram asynchronously using the specified graph layout algorithm. (Inherited from Diagram.)
	ArrangeLinkLabels	Rearranges link labels whose AutoArrange property is enabled. (Inherited from Diagram.)
	ChangeUnit	Sets new **MeasureUnit** value and scales the coordinates of diagram items so that their absolute size remains unchanged. (Inherited from Diagram.)
	ClearAll	Removes all items from the diagram. (Inherited from Diagram.)
	Clone	Creates a copy of this diagram. (Inherited from Diagram.)
	CopySelection	Overloaded. Creates a copy of specified diagram elements. (Inherited from Diagram.)
	CopyTo	Copies this diagram's properties and items to specified target diagram. (Inherited from Diagram.)
	CreateImage	Overloaded. Creates a bitmap containing an image of the diagram. (Inherited from Diagram.)
	CreateMeasureGraphics	Creates an IGraphics object that can be used to obtain various string size measurements. (Inherited from Diagram.)

	CreateThemeFromDefaults	Creates a Theme object representing the default properties of the diagram. (Inherited from Diagram.)
	Draw	Renders the diagram on the specified **IGraphics** object. (Inherited from Diagram.)
	DrawAlignmentGuides	Draws the current alignment guides. (Inherited from Diagram.)
	DrawInteraction	Draws the items that the user is currently modifying. (Inherited from Diagram.)
	DrawInteractions	For internal use. (Inherited from Diagram.)
	DrawLayer	Renders all diagram items to the specified graphics. (Inherited from Diagram.)
S	DrawStyledText	Draws a formatted text string, the same way text is drawn in shape nodes whose **EnableStyledText** property is set to **true**. This method lets you display styled text in custom-drawn nodes or links. (Inherited from Diagram.)
	EffectiveTouchHitDistance	Returns **TouchHitDistance** or a default value. (Inherited from Diagram.)
	EnumByReverseZ	Hit-tests diagram items in reverse Z order. (Inherited from Diagram.)
	EnumTopLevelByReverseZ	Hit-tests diagram top-level items in reverse Z order. (Inherited from Diagram.)
	ExecuteCommand	Executes the specified command on this diagram. (Inherited from Diagram.)
	FindGroup	Finds the group that has the specified tag value. (Inherited from Diagram.)
	FindLink	Finds the link that has the specified tag value. (Inherited from Diagram.)
	FindLinkById	Finds the link that has the specified id value. (Inherited from Diagram.)
	FindNode	Finds the node that has the specified tag value. (Inherited from Diagram.)
	FindNodeById	Finds the node that has the specified id value. (Inherited from Diagram.)
	GetContentBounds	Returns the smallest rectangle that bounds all diagram objects. (Inherited from Diagram.)
	GetItemAt	Overloaded. (Inherited from Diagram.)
	GetLinkAt	Overloaded. Finds and returns the link that lies at the specified location. (Inherited from Diagram.)
	GetLinksAt	Returns the links that contain the specified point. (Inherited from Diagram.)
	GetNearestNode	Returns the node nearest to the specified point. (Inherited from Diagram.)
	GetNodeAt	Overloaded. Gets the node that lies at the specified location. (Inherited from Diagram.)
	GetNodesAt	Returns the nodes that contain the specified point. (Inherited from Diagram.)
	GetNodesInViewport	Returns all nodes visible in the current viewport. (Inherited from Diagram.)
	HandleKeyDown	Propagates keyboard input to interested manipulators and components. (Inherited from Diagram.)
	HandleKeyPress	Propagates keyboard input to interested manipulators. (Inherited from Diagram.)
	HandleKeyUp	Propagates keyboard input to interested components. (Inherited from Diagram.)

	HandleMouseMove	Propagates mouse input to interested manipulators. (Inherited from Diagram.)
	HitTestComponents	Tests whether the specified point is within a component of a diagram item and returns this component. (Inherited from Diagram.)
	HitTestLabels	Returns the item label located at specified position. (Inherited from Diagram.)
	HitTestManipulators	Tests whether the specified point is within the manipulator of a diagram object and triggers the manipulator. (Inherited from Diagram.)
	Invalidate	Overloaded. Invalidates the diagram or a region of the diagram, causing it to be repainted. (Inherited from Diagram.)
	InvalidateZOrder	Forces a new sort of the Z order list before next redraw. (Inherited from Diagram.)
S	IsClassRegistered	Checks if a class is registered for serialization support. (Inherited from Diagram.)
S	IsClientClassRegistered	Checks if a class is registered for JSON serialization support. (Inherited from Diagram.)
	IsItemInteractive	Checks if the specified item can be modified interactively. (Inherited from Diagram.)
	IsItemLocked	Checks if the specified item is locked. (Inherited from Diagram.)
	IsItemVisible	Checks if the specified item is currently visible. (Inherited from Diagram.)
	LoadFromJson	Loads the diagram from a JSON-formatted string. (Inherited from Diagram.)
	LoadFromJsonAsync	Loads the diagram from a JSON-formatted string. (Inherited from Diagram.)
	LoadFromJsonFile	Loads the diagram from a JSON file. (Inherited from Diagram.)
	LoadFromJsonFileAsync	Loads the diagram from a JSON file. (Inherited from Diagram.)
	LoadFromJsonObject	Loads the diagram from a JSON object. (Inherited from Diagram.)
	LoadFromString	Decodes diagram contents from a string that was created with SaveToString. (Inherited from Diagram.)
	LoadFromXml	Overloaded. Loads the contents of an XML diagram document into the control. (Inherited from Diagram.)
	LoadFromXmlAsync	Overloaded. (Inherited from Diagram.)
	LoadSelectionFromJson	(Inherited from Diagram.)
	MeasureString	Overloaded. Measures a text taking into consideration the current affine transform of the diagram. (Inherited from Diagram.)
	Navigate	Selects the nearest item in the specified direction. (Inherited from Diagram.)
	NewInstance	Custom Diagram classes must override this method to return an instance of their type. (Inherited from Diagram.)
	PasteSelection	Adds the specified items and groups to the specified diagram document. (Inherited from Diagram.)
	RaiseCellTextEdited	Raises the CellTextEdited event . (Inherited from Diagram.)
	RaiseCellTextEditing	Raises the CellTextEditing event to validate entering in-place editing mode. (Inherited from Diagram.)
	RaiseClicked	Overloaded. Raises the Clicked event of the diagram or one of the *Clicked events related to diagram items. (Inherited from Diagram.)

	RaiseCreated	Raises the appropriate *Created event according to the type of the specified item. (Inherited from Diagram.)
	RaiseDeleting	Raises the appropriate *Deleting event according to the type of the specified item. (Inherited from Diagram.)
	RaiseDoubleClicked	Overloaded. Raises the DoubleClicked event of the diagram or one of the *DoubleClicked events related to diagram items. (Inherited from Diagram.)
	RaiseLinkTextEdited	Raises the LinkTextEdited event. (Inherited from Diagram.)
	RaiseLinkTextEditing	Raises the LinkTextEditing event to validate entering inplace edit mode. (Inherited from Diagram.)
	RaiseModified	Raises the NodeModified event. (Inherited from Diagram.)
	RaiseMouseHover	Raises the appropriate Pointed event. (Inherited from Diagram.)
	RaiseNodeModifying	Raises the NodeModifying event. (Inherited from DiagramBase.)
	RaiseNodeTextEdited	Raises the NodeTextEdited event. (Inherited from Diagram.)
	RaiseNodeTextEditing	Raises the NodeTextEditing event to validate entering inplace edit mode. (Inherited from Diagram.)
	RaisePasted	Raises the appropriate Pasted event. (Inherited from Diagram.)
	RaiseSelecting	Raises the appropriate Selecting event. (Inherited from Diagram.)
	RaiseTreeItemTextEditing	Raises the TreeItemTextEditing event to validate entering inplace edit mode. (Inherited from Diagram.)
	RaiseViewRemoved	Raises the ViewRemoved event. (Inherited from Diagram.)
	RegisterClass	Overloaded. (Inherited from Diagram.)
	RegisterDefaultStyle	Registers a default style for the objects of the specified type. (Inherited from Diagram.)
	RegisterItemClass	Overloaded. (Inherited from Diagram.)
	ResetAlignmentGuides	For internal use. (Inherited from Diagram.)
	ResizeToFitItem	Resizes the document extents so that the specified item is contained within. (Inherited from Diagram.)
	ResizeToFitItems	Overloaded. Resizes the document scrollable area so it fits all diagram items. (Inherited from Diagram.)
	ResumeLinkRouter	Called when the control ends a batch update operation that might affect many links. (Inherited from Diagram.)
	RouteAllLinks	Overloaded. (Inherited from Diagram.)
	SaveSelectionToJson	Saves the diagram selection to a JSON object. (Inherited from Diagram.)
	SaveToJson	Saves the diagram to a JSON-formatted string. (Inherited from Diagram.)
	SaveToJsonAsync	Saves the diagram to a JSON-formatted string. (Inherited from Diagram.)
	SaveToJsonFile	Saves the diagram into a JSON file. (Inherited from Diagram.)
	SaveToJsonFileAsync	Saves the diagram into a JSON file. (Inherited from Diagram.)
	SaveToJsonObject	Saves the diagram to a JSON object. (Inherited from Diagram.)
	SaveToString	Encodes the diagram contents into an ASCII string using the specified format and optionally clearing the **Dirty** flag. (Inherited from Diagram.)
	SaveToXml	Overloaded. Saves the diagram to an XML document. (Inherited from Diagram.)
	SaveToXmlAsync	Overloaded. (Inherited from Diagram.)

	SetShadowOffset	Sets the default offset at which items shadows are drawn. (Inherited from Diagram.)
	SuspendLinkRouter	Called when the control starts a batch update operation that might affect many links. The diagram collects links specified through Route and RouteAllLinks calls and defers finding their paths to when **ResumeLinkRouter** is called. (Inherited from Diagram.)
	TrackMouseHover	Specifies whether the diagram view should track mouse hover events. (Inherited from DiagramBase.)
	UpdateMeasureTextScale	Gets or sets the scale to use when measuring texts. This should be effectively set to the value of DiagramView.Zoom / 100. (Inherited from Diagram.)
	UpdateRuntimeIndices	For internal use. (Inherited from Diagram.)
	UpdateZOrder	Immediately sorts the Z-order list if Z-order has been invalidated. Otherwise it will be sorted next time the diagram draws its contents. (Inherited from Diagram.)

Protected Methods

	Name	Description
	AddItem	Invoked by the AddItemCmd and RemoveItemCmd classes to effectively add the specified item to the diagram. (Inherited from Diagram.)
	CreateAddItemCmd	Creates an **AddItemCmd** instance that implements undo/redo of adding an item to the diagram. (Inherited from Diagram.)
	CreateModifyItemCmd	Creates a ModifyItemCmd instance that implements undo/redo of item move and resize operations. (Inherited from Diagram.)
	CreateRemoveItemCmd	Creates a **RemoveItemCmd** instance that implements undo/redo of removing an item from the diagram. (Inherited from Diagram.)
	DeleteGroup	Removes the specified group from the group collection. (Inherited from Diagram.)
	Dispose	Clean up any resources being used. (Inherited from Diagram.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from Diagram.)
	OnActionRecorded	Raises the ActionRecorded event. (Inherited from DiagramBase.)
	OnActionRecording	Raises the ActionRecording event. (Inherited from DiagramBase.)
	OnActionRedone	Raises the ActionRedone event. (Inherited from DiagramBase.)
	OnActionUndone	Raises the ActionUndone event. (Inherited from DiagramBase.)
	OnBeginLoad	Raises the BeginLoad event. (Inherited from DiagramBase.)
	OnBoundsChanged	Raises the BoundsChanged event. (Inherited from DiagramBase.)
	OnCellClicked	Raises the CellClicked event. (Inherited from DiagramBase.)
	OnCellDoubleClicked	Raises the CellDoubleClicked event. (Inherited from DiagramBase.)
	OnCellTextEdited	Raises the **CellTextEdited** event. (Inherited from DiagramBase.)
	OnCellTextEditing	Raises the **CellTextEditing** event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnClicked	Raises the **Clicked** event. (Inherited from DiagramBase.)
	OnContainerChildAdded	Raises the ContainerChildAdded event. (Inherited from DiagramBase.)
	OnContainerChildRemoved	Raises the ContainerChildRemoved event. (Inherited from DiagramBase.)
	OnContainerFolded	Raises the ContainerFolded event. (Inherited from DiagramBase.)

	OnContainerPageChanged	Raises the ContainerPageChanged event. (Inherited from DiagramBase.)
	OnContainerUnfolded	Raises the ContainerUnfolded event. (Inherited from DiagramBase.)
	OnContentVisibilityChanged	Raises the ContentVisibilityChanged event. (Inherited from DiagramBase.)
	OnDefaultShapeChanged	Raises the DefaultShapeChanged event. (Inherited from DiagramBase.)
	OnDeserializeTag	Raises the DeserializeTag event. (Inherited from DiagramBase.)
	OnDestinationAnchorChanged	Raises the DestinationAnchorChanged event. (Inherited from DiagramBase.)
	OnDirtyChanged	Raises the DirtyChanged event. (Inherited from DiagramBase.)
	OnDoubleClicked	Raises the **DoubleClicked** event. (Inherited from DiagramBase.)
	OnDrawAdjustmentHandles	Raises the DrawAdjustmentHandles event. (Inherited from DiagramBase.)
	OnDrawAnchorPoint	Raises the DrawAnchorPoint event. (Inherited from DiagramBase.)
	OnDrawBackground	Raises the DrawBackground event. (Inherited from DiagramBase.)
	OnDrawBranchIndicator	Raises the DrawBranchIndicator event. (Inherited from DiagramBase.)
	OnDrawCell	Raises the DrawCell event. (Inherited from DiagramBase.)
	OnDrawForeground	Raises the DrawForeground event. (Inherited from DiagramBase.)
	OnDrawLink	Raises the DrawLink event. (Inherited from DiagramBase.)
	OnDrawNode	Raises the DrawNode event. (Inherited from DiagramBase.)
	OnEndLoad	Raises the EndLoad event. (Inherited from DiagramBase.)
	OnExpandButtonClicked	Raises the ExpandButtonClicked event. (Inherited from DiagramBase.)
	OnGroupDestroyed	Raises the GroupDestroyed event. (Inherited from DiagramBase.)
	OnHitTestAdjustmentHandles	Raises the HitTestAdjustmentHandles event. (Inherited from DiagramBase.)
	OnInitializeLasso	Raises the InitializeLasso event. (Inherited from DiagramBase.)
	OnInitializeLink	Raises the InitializeLink event. (Inherited from DiagramBase.)
	OnInitializeNode	Raises the InitializeNode event. (Inherited from DiagramBase.)
	OnItemAdded	Raises the ItemAdded event. (Inherited from DiagramBase.)
	OnItemRemoved	Raises the ItemRemoved event. (Inherited from DiagramBase.)
	OnJsonDeserializeTag	Raises the JsonDeserializeTag event. (Inherited from DiagramBase.)
	OnJsonSerializeTag	Raises the JsonSerializeTag event. (Inherited from DiagramBase.)
	OnLayerVisibilityChanged	Raises the LayerVisibilityChanged event. (Inherited from DiagramBase.)
	OnLinkActivated	Raises the LinkActivated event. (Inherited from DiagramBase.)
	OnLinkClicked	Raises the LinkClicked event. (Inherited from DiagramBase.)
	OnLinkCreateCancelled	Raises the LinkCreateCancelled event. (Inherited from DiagramBase.)
	OnLinkCreated	Raises the LinkCreated event. (Inherited from DiagramBase.)
	OnLinkCreating	Raises the LinkCreating event. (Inherited from DiagramBase.)
	OnLinkDeactivated	Raises the LinkDeactivated event. (Inherited from DiagramBase.)
	OnLinkDeleted	Raises the LinkDeleted event. (Inherited from DiagramBase.)
	OnLinkDeleting	Raises the LinkDeleting event. (Inherited from DiagramBase.)

	OnLinkDeselected	Raises the LinkDeselected event. (Inherited from DiagramBase.)
	OnLinkDoubleClicked	Raises the LinkDoubleClicked event. (Inherited from DiagramBase.)
	OnLinkHovered	Raises the LinkHovered event. (Inherited from DiagramBase.)
	OnLinkModified	Raises the LinkModified event. (Inherited from DiagramBase.)
	OnLinkModifyCancelled	Raises the LinkModifyCancelled event. (Inherited from DiagramBase.)
	OnLinkModifying	Raises the LinkModifying event. (Inherited from DiagramBase.)
	OnLinkPasted	Raises the LinkPasted event. (Inherited from DiagramBase.)
	OnLinkRouted	Raises the LinkRouted event. (Inherited from DiagramBase.)
	OnLinkSelected	Raises the LinkSelected event. (Inherited from DiagramBase.)
	OnLinkSelecting	Raises the LinkSelecting event. (Inherited from DiagramBase.)
	OnLinkSplit	Raises the LinkSplit event. (Inherited from DiagramBase.)
	OnLinkStartModifying	Raises the LinkStartModifying event. (Inherited from DiagramBase.)
	OnLinkTextEdited	Raises the **LinkTextEdited** event. (Inherited from DiagramBase.)
	OnLinkTextEditing	Raises the **LinkTextEditing** event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnMeasureUnitChanged	Raises the MeasureUnitChanged event. (Inherited from DiagramBase.)
	OnNodeActivated	Raises the NodeActivated event. (Inherited from DiagramBase.)
	OnNodeClicked	Raises the NodeClicked event. (Inherited from DiagramBase.)
	OnNodeCreateCancelled	Raises the NodeCreateCancelled event. (Inherited from DiagramBase.)
	OnNodeCreated	Raises the NodeCreated event. (Inherited from DiagramBase.)
	OnNodeCreating	Raises the NodeCreating event. (Inherited from DiagramBase.)
	OnNodeDeactivated	Raises the NodeDeactivated event. (Inherited from DiagramBase.)
	OnNodeDeleted	Raises the NodeDeleted event. (Inherited from DiagramBase.)
	OnNodeDeleting	Raises the NodeDeleting event. (Inherited from DiagramBase.)
	OnNodeDeselected	Raises the NodeDeselected event. (Inherited from DiagramBase.)
	OnNodeDoubleClicked	Raises the NodeDoubleClicked event. (Inherited from DiagramBase.)
	OnNodeHovered	Raises the NodeHovered event. (Inherited from DiagramBase.)
	OnNodeModified	Raises the **NodeModified** event. (Inherited from DiagramBase.)
	OnNodeModifyCancelled	Raises the NodeModifyCancelled event. (Inherited from DiagramBase.)
	OnNodeModifying	Raises the NodeModifying event. (Inherited from DiagramBase.)
	OnNodePasted	Raises the NodePasted event. (Inherited from DiagramBase.)
	OnNodeSelected	Raises the NodeSelected event. (Inherited from DiagramBase.)
	OnNodeSelecting	Raises the NodeSelecting event. (Inherited from DiagramBase.)
	OnNodeStartModifying	Raises the NodeStartModifying event. (Inherited from DiagramBase.)
	OnNodeTextEdited	Raises the **NodeTextEdited** event. (Inherited from DiagramBase.)
	OnNodeTextEditing	Raises the NodeTextEditing event to validate entering inplace edit mode. (Inherited from DiagramBase.)
	OnOriginAnchorChanged	Raises the OriginAnchorChanged event. (Inherited from DiagramBase.)

	OnPropertyChanged	Raises the PropertyChanged event. (Inherited from DiagramBase.)
	OnQueryAlignTarget	Raises the QueryAlignTarget event. (Inherited from DiagramBase.)
	OnRepaint	Raises the Repaint event. (Inherited from DiagramBase.)
	OnRequestClipboard	Raises the RequestClipboard event. (Inherited from DiagramBase.)
	OnRequestDrawInteractions	Raises the RequestDrawInteractions event. (Inherited from DiagramBase.)
	OnRequestTimer	Raises the RequestTimer event. (Inherited from DiagramBase.)
	OnSelectionChanged	Raises the SelectionChanged event. (Inherited from DiagramBase.)
	OnSelectionModified	Raises the SelectionModified event. (Inherited from DiagramBase.)
	OnSelectionModifying	Raises the SelectionModifying event. (Inherited from DiagramBase.)
	OnSerializeTag	Raises the SerializeTag event. (Inherited from DiagramBase.)
	OnSetSelfLoopShape	Raises the SetSelfLoopShape event. (Inherited from DiagramBase.)
	OnShapeModified	Raises the ShapeModified event. (Inherited from DiagramBase.)
	OnShapeNotDefined	Raises the ShapeNotDefined event. (Inherited from DiagramBase.)
	OnTableColumnResized	Raises the TableColumnResized event. (Inherited from DiagramBase.)
	OnTableColumnResizing	Raises the TableColumnResizing event. (Inherited from DiagramBase.)
	OnTableRowResized	Raises the TableRowResized event. (Inherited from DiagramBase.)
	OnTableRowResizing	Raises the TableRowResizing event. (Inherited from DiagramBase.)
	OnTableSectionCollapsed	Raises the TableSectionCollapsed event. (Inherited from DiagramBase.)
	OnTableSectionExpanded	Raises the TableSectionExpanded event. (Inherited from DiagramBase.)
	OnTreeCollapsed	Raises the TreeCollapsed event. (Inherited from DiagramBase.)
	OnTreeExpanded	Raises the TreeExpanded event. (Inherited from DiagramBase.)
	OnTreeItemTextEditing	Raises the **TreeItemTextEditing** event. (Inherited from DiagramBase.)
	OnValidateAnchorPoint	Raises the ValidateAnchorPoint event. (Inherited from DiagramBase.)
	OnValidateLinkCrossing	Raises the ValidateLinkCrossing event. (Inherited from DiagramBase.)
	OnViewRemoved	Raises the **ViewRemoved** event. (Inherited from DiagramBase.)
	RemoveItem	Invoked by the **AddItemCmd** and **RemoveItemCmd** classes to effectively remove the specified item from the diagram. (Inherited from Diagram.)

Public Events

	Name	Description
	ActionRecorded	Raised when an action is recorded in the undo buffer. (Inherited from DiagramBase.)
	ActionRecording	A validation event raised before an action is recorded in the undo buffer. (Inherited from DiagramBase.)
	ActionRedone	Raised when an action is redone. (Inherited from DiagramBase.)
	ActionUndone	Raised when an action is undone. (Inherited from DiagramBase.)
	ActiveLayerChanged	Raised when the diagram's active layer has changed. (Inherited from DiagramBase.)
	BeginLoad	Raised when the component starts loading diagram data from a file or memory stream. (Inherited from DiagramBase.)

	BoundsChanged	Raised when the **Bounds** property value has changed. (Inherited from DiagramBase.)
	CellClicked	Raised when the user clicks a table's cell. (Inherited from DiagramBase.)
	CellDoubleClicked	Raised when the user double-clicks a table's cell. (Inherited from DiagramBase.)
	CellTextEdited	Raised when the user edits the text of a table's cell. (Inherited from DiagramBase.)
	CellTextEditing	A validation event that lets you approve or reject changes made to the text of a table's cell. (Inherited from DiagramBase.)
	Clicked	Raised when the user clicks the diagram at a point where no items are located. (Inherited from DiagramBase.)
	ContainerChildAdded	Raised when a node is added to a ContainerNode, either programmatically or by the user. (Inherited from DiagramBase.)
	ContainerChildRemoved	Raised when a node is removed from a **ContainerNode**, either programmatically or by the user. (Inherited from DiagramBase.)
	ContainerFolded	Raised when the user folds a container by clicking the arrow-up button in the container's caption bar. (Inherited from DiagramBase.)
	ContainerPageChanged	Raised when the user changes current page of a PagedContainerNode. (Inherited from DiagramBase.)
	ContainerUnfolded	Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar. (Inherited from DiagramBase.)
	ContentVisibilityChanged	Raised when the visibility of container's content changes. (Inherited from DiagramBase.)
	DefaultShapeChanged	Raised when the **DefaultShape** property value has changed. (Inherited from DiagramBase.)
	DeserializeTag	Raised when the Tag of a diagram item must be deserialized from XML format. (Inherited from DiagramBase.)
	DestinationAnchorChanged	Raised when the DestinationAnchor property value of a link has changed. (Inherited from DiagramBase.)
	DirtyChanged	Raised when the **Dirty** property value has changed. (Inherited from DiagramBase.)
	DoubleClicked	Raised when the user double-clicks the diagram at a point where no items are located. (Inherited from DiagramBase.)
	DrawAdjustmentHandles	Raised when item's adjustment handles must be custom-drawn. (Inherited from DiagramBase.)
	DrawAnchorPoint	Raised when an anchor point must be custom-drawn. (Inherited from DiagramBase.)
	DrawBackground	Raised to let you custom draw the diagram background. (Inherited from DiagramBase.)
	DrawBranchIndicator	Raised when a branch indicator must be custom-drawn. (Inherited from DiagramBase.)
	DrawCell	Raised when a table's cell must be custom drawn. (Inherited from DiagramBase.)
	DrawForeground	Raised to let you custom draw the diagram foreground. (Inherited from DiagramBase.)
	DrawLink	Raised when a diagram link must be custom drawn. (Inherited from DiagramBase.)
	DrawNode	Raised when a diagram node must be custom drawn. (Inherited from DiagramBase.)

	EndLoad	Raised when the component ends loading diagram data from a file or memory stream. (Inherited from DiagramBase.)
	ExpandButtonClicked	Raised when the user clicks the [±] button of an Expandable node. (Inherited from DiagramBase.)
	GroupDestroyed	Raised when a Group object is destroyed. (Inherited from DiagramBase.)
	HitTestAdjustmentHandles	Raised when custom hit testing of item's adjustment handles must be performed. (Inherited from DiagramBase.)
	InitializeLasso	Raised when the user starts drawing a selection lasso, before it is rendered on screen. (Inherited from DiagramBase.)
	InitializeLink	Raised when the user starts drawing a new link, just after the **DiagramLink** instance is created. (Inherited from DiagramBase.)
	InitializeNode	Raised when the user starts drawing a new node, just after the **DiagramNode** instance is created. (Inherited from DiagramBase.)
	ItemAdded	Raised when an item is added to the diagram, either programmatically or interactively. (Inherited from DiagramBase.)
	ItemRemoved	Raised when an item is removed from the diagram, either programmatically or interactively. (Inherited from DiagramBase.)
	JsonDeserializeTag	Raised when the **Tag** of a diagram item must be deserialized from JSON. (Inherited from DiagramBase.)
	JsonSerializeTag	Raised when the **Tag** of a diagram item must be serialized to JSON. (Inherited from DiagramBase.)
	LayerVisibilityChanged	Raised when the visibility of a Layer changes. (Inherited from DiagramBase.)
	LinkActivated	Raised when a link becomes the **ActiveItem**. (Inherited from DiagramBase.)
	LinkClicked	Raised when the user clicks a link. (Inherited from DiagramBase.)
	LinkCreateCancelled	Raised when the user cancels link creation. (Inherited from DiagramBase.)
	LinkCreated	Raised when the user draws a new link. (Inherited from DiagramBase.)
	LinkCreating	A validation event raised while the user is drawing a new link. (Inherited from DiagramBase.)
	LinkDeactivated	Raised when a link is no longer the **ActiveItem**. (Inherited from DiagramBase.)
	LinkDeleted	Raised when a link is deleted, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkDeleting	Raised when the user tries to delete a link, this event lets you cancel the operation. (Inherited from DiagramBase.)
	LinkDeselected	Raised when a link is deselected, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkDoubleClicked	Raised when the user double-clicks a link. (Inherited from DiagramBase.)
	LinkHovered	Raised when the mouse pointer hovers over a link. (Inherited from DiagramBase.)
	LinkModified	Raised when the user moves any control point of a link. (Inherited from DiagramBase.)
	LinkModifyCancelled	Raised when the user cancels move or resize operation being done on a link. (Inherited from DiagramBase.)
	LinkModifying	A validation event raised while the user is modifying a link. (Inherited from DiagramBase.)

	LinkPasted	Raised when a link has been pasted from the clipboard. (Inherited from DiagramBase.)
	LinkRouted	Raised when a link is routed by the auto-routing algorithm. (Inherited from DiagramBase.)
	LinkSelected	Raised when a link is selected, either programmatically or by the user. (Inherited from DiagramBase.)
	LinkSelecting	Raised when the user tries to select a link, this event lets you cancel the operation. (Inherited from DiagramBase.)
	LinkSplit	Raised when the user splits a link interactively. (Inherited from DiagramBase.)
	LinkStartModifying	A validation event raised when the user starts modifying a link. (Inherited from DiagramBase.)
	LinkTextEdited	Raised when the user edits the text of a link. (Inherited from DiagramBase.)
	LinkTextEditing	A validation event that lets you approve or reject changes made to the text of a link. (Inherited from DiagramBase.)
	MeasureUnitChanged	Raised when the **MeasureUnit** property value has changed. (Inherited from DiagramBase.)
	NodeActivated	Raised when a node becomes the **ActiveItem**. (Inherited from DiagramBase.)
	NodeClicked	Raised when the user clicks a node. (Inherited from DiagramBase.)
	NodeCreateCancelled	Raised when the user cancels node creation. (Inherited from DiagramBase.)
	NodeCreated	Raised when the user draws a new node. (Inherited from DiagramBase.)
	NodeCreating	A validation event raised while the user is drawing a new node. (Inherited from DiagramBase.)
	NodeDeactivated	Raised when a node is no longer the **ActiveItem**. (Inherited from DiagramBase.)
	NodeDeleted	Raised when a node is deleted, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeDeleting	Raised when the user tries to delete a node, this event lets you cancel the operation. (Inherited from DiagramBase.)
	NodeDeselected	Raised when a node is deselected, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeDoubleClicked	Raised when the user double-clicks a node. (Inherited from DiagramBase.)
	NodeHovered	Raised when the mouse pointer hovers over a node. (Inherited from DiagramBase.)
	NodeModified	Raised when the user moves or resizes a node. (Inherited from DiagramBase.)
	NodeModifyCancelled	Raised when the user cancels move or resize operation being done on a node. (Inherited from DiagramBase.)
	NodeModifying	A validation event raised while the user is moving or resizing a node. (Inherited from DiagramBase.)
	NodePasted	Raised when a node has been pasted from the clipboard. (Inherited from DiagramBase.)
	NodeSelected	Raised when a node is selected, either programmatically or by the user. (Inherited from DiagramBase.)
	NodeSelecting	Raised when the user tries to select a node, this event lets you cancel the operation. (Inherited from DiagramBase.)

	NodeStartModifying	A validation event raised when the user starts modifying a node. (Inherited from DiagramBase.)
	NodeTextEdited	Raised when the user edits the text of a node. (Inherited from DiagramBase.)
	NodeTextEditing	A validation event that lets you approve or reject changes made to the text of a node. (Inherited from DiagramBase.)
	OriginAnchorChanged	Raised when the OriginAnchor property value of a link has changed. (Inherited from DiagramBase.)
	PropertyChanged	INotifyPropertyChanged.PropertyChanged implementation. (Inherited from DiagramBase.)
	QueryAlignTarget	Raised to validate a node as target for alignment guides when **AutoAlignNodes** is enabled. (Inherited from DiagramBase.)
	Repaint	Raised when the diagram views should be repainted. (Inherited from DiagramBase.)
	RequestCacheReset	Raised when an object within the diagram requests a reset of the cached bitmap. (Inherited from DiagramBase.)
	RequestClipboard	Raised when an object within the diagram requests an operation with the clipboard. (Inherited from DiagramBase.)
	RequestDrawInteractions	For internal use. (Inherited from DiagramBase.)
	RequestTimer	Raised when an object within the diagram needs to start or stop a timer. (Inherited from DiagramBase.)
	SelectionChanged	Raised when an item is added to or removed from the selection (Inherited from DiagramBase.)
	SelectionModified	Raised when the user moves multiple selected items. (Inherited from DiagramBase.)
	SelectionModifying	Raised while the user is moving multiple selected items, this event lets you cancel the modification. (Inherited from DiagramBase.)
	SerializeTag	Raised when the **Tag** of a diagram item must be serialized into an XML document. (Inherited from DiagramBase.)
	SetSelfLoopShape	Raised when a link becomes a self-loop, giving you a chance to override the default look shape. (Inherited from DiagramBase.)
	ShapeModified	Raised when the user modifies the shape of a ShapeNode by moving one of the control points corresponding to shape formula parameters. (Inherited from DiagramBase.)
	ShapeNotDefined	Raised when the diagram being loaded contains nodes with an undefined shape. (Inherited from DiagramBase.)
	TableColumnResized	Raised when the user finishes resizing a column in a table. (Inherited from DiagramBase.)
	TableColumnResizing	Raised when the user resizes a column in a table interactively. (Inherited from DiagramBase.)
	TableRowResized	Raised when the user finishes resizing a row in a table. (Inherited from DiagramBase.)
	TableRowResizing	Raised when the user resizes a row in a table interactively. (Inherited from DiagramBase.)
	TableSectionCollapsed	Raised when the user collapses the rows of a table's section by clicking the [-] button in the section's header row. (Inherited from DiagramBase.)
	TableSectionExpanded	Raised when the user expands the rows of a table's section by clicking the [+] button in the section's header row. (Inherited from DiagramBase.)
	TreeCollapsed	Raised when a user collapses a tree branch by clicking the [-] button of an **Expandable** node. (Inherited from DiagramBase.)

	TreeExpanded	Raised when a user expands a tree branch by clicking the [+] button of an **Expandable** node. (Inherited from DiagramBase.)
	TreeItemTextEditing	A validation event that lets you approve or reject changes made to the text of a TreeViewNode's item. (Inherited from DiagramBase.)
	ValidateAnchorPoint	A validation event that lets you approve or reject connecting a link to an anchor point. (Inherited from DiagramBase.)
	ValidateLinkCrossing	A validation event that lets you approve or reject displaying a decoration at the intersection point of links. (Inherited from DiagramBase.)
	ViewRemoved	Raised when a DiagramView is detached from this diagram. (Inherited from DiagramBase.)

DiagramPage Class
MindFusion.Diagramming Namespace

DiagramPage Constructor

Initializes a new instance of the DiagramPage class.

Namespace: MindFusion.Diagramming
Assembly: DiagramPage.js

Syntax

JavaScript Copy Code

```
function DiagramPage ([title])
```

Parameters

title
Optional.
String. The page title.

See Also

DiagramPage Class
MindFusion.Diagramming Namespace

DiagramPage Properties

DiagramPage.iconUrl Property

Gets or sets URL of the image to paint as the page's icon.

Namespace: MindFusion.Diagramming
Assembly: DiagramPage.js

Syntax

JavaScript Copy Code

```
get iconUrl() {}
set iconUrl(value) {}
```

Property Value

String

A string containing image URL.

DiagramPage.title Property

Gets or sets the page title.

Namespace: MindFusion.Diagramming
Assembly: DiagramPage.js

Syntax

JavaScript Copy Code

```
get title() {}
set title(value) {}
```

Property Value

String

A string specifying the page title.

DiagramPage Class
MindFusion.Diagramming Namespace

DiagramPage.titleColor Property

Gets or sets the color of the title when the title is displayed.

Namespace: MindFusion.Diagramming
Assembly: DiagramPage.js

Syntax

JavaScript Copy Code

```
get titleColor() {}
set titleColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

DiagramPage Events

DiagramView Class

Represents a control that displays the content of a Diagram object.

Syntax

JavaScript — Copy Code

```
// class
DiagramView.prototype = {}
```

Inheritance Hierarchy

MindFusion.Controls.CanvasControl
  MindFusion.Diagramming.DiagramView

DiagramView Members

Represents a control that displays the content of a Diagram object.

The following tables list the members exposed by the DiagramView type.

Public Constructors

	Name	Description
	DiagramView	Initializes a new instance of the DiagramView class.

Public Properties

	Name	Description
	allowInplaceEdit	Gets or sets whether users are allowed to edit the text of diagram items.
	autoScroll	Gets or sets a value indicating whether automatic scrolling is enabled.
	autoScrollAmount	Gets or sets the amount by which to auto-scroll the view when the mouse leaves the view boundaries while drawing.
	behavior	Gets or sets a value indicating how the control responds to user actions.
	defaultControlTemplate	Gets or sets HTML string representing the DOM content rendered by default by newly created ControlNode objects.
	delKeyAction	Gets or sets what action to perform when users hit the Del key.
	diagram	Gets or sets the diagram displayed by this view.
	dragIndicatorOpacity	Gets or sets the opacity of ghost image displayed during drag-and-drop from NodeListView.
	enableMultiTouch	Gets or sets a value indicating whether the control handles DOM Pointer events to implement multi-touch interactions, such as zooming, node rotation or simultaneous drawing of multiple diagram items.
	handleTouchHitDistance	Gets or sets maximum distance between touch position and adjustment handle at which the handle can still be grabbed to modify its item.
	horizontalDropAlignment	Gets or sets the horizontal placement of nodes created by drag-and-drop operations, relatively to mouse cursor.
	hoverDelay	Gets or sets the time in milliseconds that mouse pointer should remain stationary before reporting hover events.
	inplaceEditAcceptOnEnter	Gets or sets a value indicating whether pressing the ENTER keyshould exit inplace-edit mode and accept changes made to text.

	inplaceEditCancelOnEsc	Gets or sets a value indicating whether pressing the ESC keyshould exit inplace-edit mode and reject changes made to text.
	leftButtonActions	Gets or sets a combination of flags that specify what actions can be performed via the left mouse button.
	licenseLocation	Gets or sets URL of the control's license file.
	magnifierEnabled	Gets or sets a value indicating whether the magnifier tool is currently enabled.
	magnifierFactor	Gets or sets the zoom factor of the magnifier tool.
	magnifierFrameColor	Gets or sets the color of the magnifier tool's frame.
	magnifierFrameThickness	Gets or sets the thickness of the magnifier frame.
	magnifierHeight	Gets or sets the height of the magnifier tool.
	magnifierSecondaryFrameColor	Gets or sets the color of the magnifier tool's secondary frame.
	magnifierShading	Gets or sets whether to enhance the effect of a magnifier lense by using a gradient shading.
	magnifierShape	Gets or sets a reference to the geometric shape definition of the magnifier tool.
	magnifierWidth	Gets or sets the width of the magnifier tool.
	middleButtonActions	Gets or sets a combination of flags that specify what actions can be performed via the middle mouse button.
	modificationStart	Gets or sets how users can start modifying diagram items.
	modifierKeyActions	Gets an object that allows changing the function of keyboard modifier keys such as Ctrl and Alt.
	mouseWheelAction	Gets or sets what action to perform when users rotate the mouse wheel.
	multiTouchDraw	Gets or sets a value indicating whether the control allows drawing multiple items simultaneously.
	multiTouchModify	Gets or sets a value indicating whether multi-touch modifications are enabled.
	multiTouchZoom	Gets or sets a value indicating whether multi-touch zoom is enabled.
	rightButtonActions	Gets or sets a combination of flags that specify what actions can be performed via the right mouse button.
	scrollX	Gets or sets the diagram's horizontal scroll position.
	scrollY	Gets or sets the diagram's vertical scroll position.
	scrollZoneSize	Gets or sets the size of the auto scroll zone near the edges of the control.
	tooltipDelay	Gets or sets the delay before a tooltip is shown.
	verticalDropAlignment	Gets or sets the vertical placement of nodes created by drag-and-drop operations, relatively to mouse cursor.
	viewport	Returns the visible portion of the diagram area.
	virtualScroll	Gets or sets a value indicating whether virtual scroll mode is enabled.
	zoomFactor	Gets or sets the zoom factor.

Public Methods

	Name	Description
	animate	Animates the view state.

	beginEdit	Begins in-place editing of the specified object.
	bringIntoView	Scrolls the view to make the specified item visible.
	bringRectIntoView	Scrolls the view to make the specified rectangular area visible.
	cancelDrag	Cancels all current drag operations.
	clearTooltip	Forces the removal of any created tooltips from the diagram canvas.
	copyToClipboard	Copies the current selection of items to the clipboard.
S	create	Creates and initializes a new **DiagramView** from the specified element. This method is static and can be called without creating an instance of the class.
	cutToClipboard	Cuts the currently selected items to the clipboard.
	dispose	Control.dispose override.
	endEdit	Exits the in-place editing mode and either accepts or rejects the changes made to the item's text.
S	find	Returns the specified **DiagramView** object. This member is static and can be invoked without creating an instance of the class.
	fromJson	Loads the diagram from a JSON string.
	initialize	Control.initialize override.
	loadFromXml	Loads the diagram from an XML file.
	pasteFromClipboard	Pastes diagram items from the clipboard.
	print	Exports the diagram as a list of images to a new HTML document and opens the browser's print dialog.
	printPreview	Exports the diagram as a list of images to a new HTML document.
	record	Starts recording mouse and keyboard events for subsequent replay.
	replay	Replays a sequence of recorded mouse and keyboard events created by record and stopRecording methods.
	saveToXml	Saves the diagram to an XML file.
	scrollTo	Scrolls the diagram to the specified point.
	setScroll	IZoomTarget implementation
	setZoomFactorPivot	Sets the zoom factor, preserving the on-screen position of the specified diagram point.
	stopRecording	Stops recording mouse and keyboard events.
	toJson	Saves the diagram to a JSON string.
	zoomToFit	Zooms the view to fit the **Diagram** contents in component's area.
	zoomToRect	Zooms and scrolls the view to fit the specified **Diagram** region in component's area.

Public Events

	Name	Description
	createEditControl	Raised to let you create a custom inplace editor control.
	diagramChanged	Raised when the **diagram** property changes.
	enterInplaceEditMode	Raised when entering inplace-edit mode.

	leaveInplaceEditMode	Raised when leaving inplace-edit mode.
	mouseWheel	Raised when the user rotates the mouse wheel while the cursor is positioned over the diagram surface.
	zoomChanged	Raised when the zoom factor property changes.

See Also

DiagramView Class
MindFusion.Diagramming Namespace

DiagramView Constructor

Initializes a new instance of the DiagramView class.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function DiagramView (element, [diagram])
```

Parameters

element
HTMLCanvasElement. The Canvas DOM Element this DiagramView is associated with.

diagram
Optional.
Diagram. The Diagram instance this control is associated with.

See Also

DiagramView Class
MindFusion.Diagramming Namespace

DiagramView Methods

DiagramView.animate Method

Animates the view state.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function animate (animation)
```

Parameters

animation
ViewAnimation. A **ViewAnimation** -derived object.

Example

This example centers specified node in the viewport by running a ScrollAnimation:

JavaScript Copy Code

```
var endNode = diagram.nodes.find(
    n => n.id == "end");

if (endNode != null)
{
    var viewSize = diagramView.viewport.getSize();
    var newScroll = new Point(
        endNode.center.x - viewSize.width / 2,
        endNode.center.y - viewSize.height / 2);

    var currentScroll = new Point(
        diagramView.scrollX, diagramView.scrollY);

    diagramView.animate(
        new ScrollAnimation(
        {
            fromValue: currentScroll,
            toValue: newScroll,
            animationType: Animations.AnimationType.Power,
            easingType: Animations.EasingType.EaseInOut
        }));
}
```

DiagramView.beginEdit Method

Begins in-place editing of the specified object.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function beginEdit (item, [point, [editTarget]])
```

Parameters

item
InplaceEditable. The DiagramItem whose text should be edited.

point
Optional.
Point. A Point specifying where the in-place edit box should appear.

editTarget
Optional.
Cell | LinkLabel. The element to use as a target for the inplace edit.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.bringIntoView Method

Scrolls the view to make the specified item visible.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function bringIntoView (item)
```

Parameters

item
DiagramItem. The item to bring into view.

Remarks

Scrolls the diagram view to ensure that the specified item is visible. No scrolling is done if the item is already inside the viewport.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace
scrollTo Method
bringRectIntoView Method
scrollX Property
scrollY Property
zoomToRect Method

DiagramView.bringRectIntoView Method

Scrolls the view to make the specified rectangular area visible.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function bringRectIntoView (rect)
```

Parameters

rect
Rect. A Rect specifying the diagram region to show in the viewport.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.cancelDrag Method

Cancels all current drag operations.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function cancelDrag ()
```

Remarks

This method is useful in situations when the current draw operations must be cancelled, for example when starting external drag-and-drop from **pointerMove** DOM event handlers, or in response to Esc keypress. Multiple operations could be running

simultaneously when enableMultiTouch is set to **true**, and this method cancels them all. Individual operations can be cancelled by calling cancelDrag method of event arguments when handling validation events, such as nodeCreating.

DiagramView.clearTooltip Method

Forces the removal of any created tooltips from the diagram canvas.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function clearTooltip ()
```

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.copyToClipboard Method

Copies the current selection of items to the clipboard.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function copyToClipboard ([systemClipboard])
```

Parameters

systemClipboard
Optional.
Boolean. **true** to copy to the system clipboard, or **false** otherwise. The default value is **false**.

Remarks

The diagram control maintains its own local clipboard and items are copied to it by default. If you specify a **true** argument and running under browsers that allow access to the system clipboard, the items are copied to the system clipboard; in all other cases they are copied to the local clipboard.

pasteFromClipboard Method

DiagramView.create Method

Creates and initializes a new DiagramView from the specified element. This method is static and can be called without creating an instance of the class.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
function create (element, [diagram])
```

Parameters

element
HTMLCanvasElement. The DOM <canvas> element that the DiagramView should be attached to.

diagram
Optional.
Diagram. The Diagram instance that should be rendered by the new view.

Return Value

DiagramView. The newly created **DiagramView** object.

DiagramView.cutToClipboard Method

Cuts the currently selected items to the clipboard.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
function cutToClipboard ([systemClipboard])
```

Parameters

systemClipboard
Optional.
Boolean. **true** to copy to the system clipboard, or **false** otherwise. The default value is **false**.

Remarks

The diagram control maintains its own local clipboard and items are copied to it by default. If you specify a **true** argument and running under browsers that allow access to the system clipboard, the items are copied to the system clipboard; in all other cases they are copied to the local clipboard.

DiagramView.endEdit Method

Exits the in-place editing mode and either accepts or rejects the changes made to the item's text.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function endEdit ([accept])
```

Parameters

accept
Optional.
Boolean. **true** to accept changes made to text, or **false** to reject them.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.find Method

Returns the specified DiagramView object. This member is static and can be invoked without creating an instance of the class.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function find (id)
```

Parameters

id
String. The id of the DiagramView's element.

Return Value

DiagramView. A **DiagramView** object with the specified id, if found, or **null** otherwise.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace
create Method

DiagramView.fromJson Method

Loads the diagram from a JSON string.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
function fromJson ()
```

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.initialize Method

Control.initialize override.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
function initialize ()
```

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.loadFromXml Method

Loads the diagram from an XML file.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
function loadFromXml (fileUrl, [onLoad, [onError]])
```

Parameters

fileUrl
String. The URL of an XML file where the data should be read from.

onLoad
Optional.
function. A callback that should be invoked if the file is loaded successfully.

onError
Optional.
function. A callback that should be invoked if the file could not be downloaded.

See Also

DiagramView.pasteFromClipboard Method

Pastes diagram items from the clipboard.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function pasteFromClipboard (offsetX, offsetY, [systemClipboard, [unconnectedLinks]])
```

Parameters

offsetX
Number. Horizontal offset of pasted items from their original positions.

offsetY
Number. Vertical offset of pasted items from their original positions.

systemClipboard
Optional.
Boolean. **true** to paste from the system clipboard, or **false** otherwise. The default value is **false**.

unconnectedLinks
Optional.
Boolean. **true** to allow pasting links whose origin or destination node has not been copied, or **false** otherwise. The default value is **false**.

Remarks

The diagram control maintains its own local clipboard and items are copied to it by default. If you specify **true** for the *systemClipboard* argument and running under browsers that allow access to the system clipboard, the items are copied to the system clipboard; in all other cases they are copied to the local clipboard.

Due to **Navigator.clipboard** API being asynchronous, pasted items are not available immediately after calling this method with *systemClipboard* enabled. You will be able to access them only after nodePasted and linkPasted events are raised.

DiagramView.print Method

Exports the diagram as a list of images to a new HTML document and opens the browser's print dialog.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function print ([options])
```

Parameters

options
Optional.
Object. An object, containing customization properties, including printArea (defaults to diagram.getContentBounds()) and pageSize (defaults to diagramView.viewport).

See Also

printPreview Method

DiagramView.printPreview Method

Exports the diagram as a list of images to a new HTML document.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function printPreview ([options])
```

Parameters

options
Optional.
Object. An object, containing customization properties, including printArea (defaults to diagram.getContentBounds()) and pageSize (defaults to diagramView.viewport).

Example

JavaScript Copy Code

```
document.getElementById("printPreview").addEventListener("click", () => {
    var diagramView = DiagramView.find("diagram");

    // preferred image size is A4 with subtracted margins
    var A4 = new Size(210, 297);
    A4.width -= 25.4;
    A4.height -= 25.4;

    diagramView.printPreview(
        {
            printArea: diagramView.diagram.bounds,
            pageSize: A4
        });
});
```

DiagramView.record Method

Starts recording mouse and keyboard events for subsequent replay.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function record ()
```

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace
replay Method
stopRecording Method

DiagramView.replay Method

Replays a sequence of recorded mouse and keyboard events created by record and stopRecording methods.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function replay (recording, timer, [savedState, [timerInterval]])
```

Parameters

recording
Array. An array of event records returned by stopRecording.

timer
Boolean. **true** to replay records using a timer, preserving their original relative timing, or **false** to replay them immediately.

savedState
Optional.
String. A diagram JSON string that should be loaded before replaying recorded events.

timerInterval
Optional.
Number. A number of milliseconds to use as a constant interval instead of relative timing.

stopRecording Method

DiagramView.saveToXml Method

Saves the diagram to an XML file.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function saveToXml (url)
```

Parameters

url
String. A URL specifying where the diagram's XML should be posted to.

See Also

DiagramView Members

MindFusion.Diagramming Namespace

DiagramView.scrollTo Method

Scrolls the diagram to the specified point.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
function scrollTo (x, y)
```

Parameters

x
Number. A number specifying the new horizontal scroll position in the current unit of measure.

y
Number. A number specifying the new vertical scroll position in the current unit of measure.

DiagramView.setZoomFactorPivot Method

Sets the zoom factor, preserving the on-screen position of the specified diagram point.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
function setZoomFactorPivot (zoomFactor, pivotPoint)
```

Parameters

zoomFactor
Number. The new zoom factor.

pivotPoint
Point. A Point instance specifying the zoom center.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.stopRecording Method

Stops recording mouse and keyboard events.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function stopRecording ()
```

Return Value

Array. An array of event records representing user's input.

See Also

DiagramView Members
DiagramView Class

record Method
replay Method

DiagramView.toJson Method

Saves the diagram to a JSON string.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function toJson ()
```

Return Value

String. A string containing the diagram's JSON representation.

DiagramView.zoomToFit Method

Zooms the view to fit the Diagram contents in component's area.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function zoomToFit ()
```

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.zoomToRect Method

Zooms and scrolls the view to fit the specified Diagram region in component's area.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
function zoomToRect (rect)
```

Parameters

rect
Rect. A Rect instance specifying desired viewport position and size.

bringRectIntoView Method
bringIntoView Method

DiagramView Properties

DiagramView.allowInplaceEdit Property

Gets or sets whether users are allowed to edit the text of diagram items.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get allowInplaceEdit() {}
set allowInplaceEdit(value) {}
```

Property Value

Boolean

true to allow in-place editing, or **false** otherwise. The default value is **false**.

Remarks

Specifies whether users are allowed to edit text of diagram nodes in-place. If enabled, a text-entry field appears at node's position when the node is double-clicked. In-place editing mode can be exited by clicking anywhere outside the text field.

To enter or exit in-place editing mode programmatically, call the beginEdit and endEdit methods of DiagramView.

inplaceEditAcceptOnEnter Property

inplaceEditCancelOnEsc Property
nodeTextEdited Event
linkTextEdited Event
enterInplaceEditMode Event

DiagramView.autoScroll Property

Gets or sets a value indicating whether automatic scrolling is enabled.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get autoScroll() {}
set autoScroll(value) {}
```

Property Value

Boolean

true to enable auto scrolling, or **false** otherwise. The default value is **true**.

Remarks

If enabled, the control will scroll its content automatically when the user drags the mouse near the viewport edges. This works only if the diagram view is placed inside a DIV whose **overflow** attribute is set to **scroll** or **auto**.

DiagramView.autoScrollAmount Property

Gets or sets the amount by which to auto-scroll the view when the mouse leaves the view boundaries while drawing.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get autoScrollAmount() {}
set autoScrollAmount(value) {}
```

Property Value

Number

A number specifying the amount by which to auto-scroll.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.behavior Property

Gets or sets a value indicating how the control responds to user actions.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get behavior() {}
set behavior(value) {}
```

Property Value

Behavior

A member of the Behavior enumeration. The default value is **LinkShapes**.

Remarks

The property specifies how the control responds to user actions with the mouse. The default value, LinkShapes, facilitates drawing of flowchart diagrams. **LinkTables** makes JsDiagram create table nodes and links while the user draws with the mouse, allowing creation of entity-relationship or class-hierarchy diagrams.

Modes such as **Modify**, **PanAndModify**, **MoveNodes**, **SelectOnly** allow users to interact with existing items, but not draw new ones on the canvas. Note that NodeListView can be used to create new nodes regardless of DiagramView's current behavior mode.

There are several more values that can be assigned to the property, that make the control draw specific types of items, for example only shape nodes, only free-form nodes, only links, and so on. These are useful when implementing the ability to select specific drawing tools in applications.

DiagramView.defaultControlTemplate Property

Gets or sets HTML string representing the DOM content rendered by default by newly created ControlNode objects.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get defaultControlTemplate() {}
set defaultControlTemplate(value) {}
```

Property Value

String

An HTML string.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.delKeyAction Property

Gets or sets what action to perform when users hit the Del key.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get delKeyAction() {}
set delKeyAction(value) {}
```

Property Value

DelKeyAction

A member of the DelKeyAction enumeration. The default value is **DeleteSelectedItems**.

Remarks

Depending on this property value, the control can delete all selected items, delete only the active item, or ignore the Del key press.

DiagramView.diagram Property

Gets or sets the diagram displayed by this view.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get diagram() {}
set diagram(value) {}
```

Property Value

Diagram

The Diagram instance displayed by this view.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.dragIndicatorOpacity Property

Gets or sets the opacity of ghost image displayed during drag-and-drop from NodeListView.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get dragIndicatorOpacity() {}
set dragIndicatorOpacity(value) {}
```

Property Value

Number

A number specifying opacity. The default value is 0.4.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.enableMultiTouch Property

Gets or sets a value indicating whether the control handles DOM Pointer events to implement multi-touch interactions, such as zooming, node rotation or simultaneous drawing of multiple diagram items.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get enableMultiTouch() {}
set enableMultiTouch(value) {}
```

Property Value

Boolean

true to enable multi-touch, or **false** otherwise. The default value is **true**.

Remarks

Set this property to **false** if you need to handle touch events yourself or through a third-party gesture library. If disabled, the control will revert to its mouse event handling code from previous versions. It will also no longer be able to capture the mouse input during drag operations (to detect mouse pointer leaving the view), which is handled through DOM Pointers API.

MindFusion.Diagramming Namespace
multiTouchModify Property
multiTouchZoom Property
multiTouchDraw Property

DiagramView.handleTouchHitDistance Property

Gets or sets maximum distance between touch position and adjustment handle at which the handle can still be grabbed to modify its item.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get handleTouchHitDistance() {}
set handleTouchHitDistance(value) {}
```

Property Value

Number

A number specifying the allowed hit distance, in diagram's current unit. The default value is 5.

Remarks

This value is considered only when handling touch events.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.horizontalDropAlignment Property

Gets or sets the horizontal placement of nodes created by drag-and-drop operations, relatively to mouse cursor.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get horizontalDropAlignment() {}
set horizontalDropAlignment(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration. The default value is **Near**.

Remarks

This property lets you center the new node or align specified edge to the mouse pointer position when drag-and-drop ends.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.hoverDelay Property

Gets or sets the time in milliseconds that mouse pointer should remain stationary before reporting hover events.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get hoverDelay() {}
set hoverDelay(value) {}
```

Property Value

Number

The hover delay in milliseconds. The default value is 1500.

MindFusion.Diagramming Namespace
nodeHovered Event
linkHovered Event

DiagramView.inplaceEditAcceptOnEnter Property

Gets or sets a value indicating whether pressing the ENTER keyshould exit inplace-edit mode and accept changes made to text.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get inplaceEditAcceptOnEnter() {}
set inplaceEditAcceptOnEnter(value) {}
```

Property Value

Boolean

true to end inplace editing and accept changes when ENTER is pressed, or **false** otherwise. The default value is **false**.

Remarks

If the value of this property is **false**, pressing the ENTER key inserts a new line in the text while in inplace-edit mode.

allowInplaceEdit Property
inplaceEditCancelOnEsc Property

DiagramView.inplaceEditCancelOnEsc Property

Gets or sets a value indicating whether pressing the ESC keyshould exit inplace-edit mode and reject changes made to text.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get inplaceEditCancelOnEsc() {}
set inplaceEditCancelOnEsc(value) {}
```

Property Value

Boolean

true to end inplace editing and cancel changes when ESC is pressed, or **false** otherwise. The default value is **true**.

Remarks

If the value of this property is **false**, pressing the ESC key has no effect while in inplace-edit mode.

DiagramView.leftButtonActions Property

Gets or sets a combination of flags that specify what actions can be performed via the left mouse button.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get leftButtonActions() {}
set leftButtonActions(value) {}
```

Property Value

MouseButtonActions

A combination of MouseButtonActions members.

See Also

DiagramView Members

DiagramView.licenseLocation Property

Gets or sets URL of the control's license file.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get licenseLocation() {}
set licenseLocation(value) {}
```

Property Value

String

A URL string that specifies the location of the license key.

MindFusion.Diagramming Namespace

DiagramView.magnifierEnabled Property

Gets or sets a value indicating whether the magnifier tool is currently enabled.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get magnifierEnabled() {}
set magnifierEnabled(value) {}
```

Property Value

Boolean

true if the magnifier is enabled, or **false** otherwise. The default value is **false**.

Remarks

The magnifier tool can be alternatively enabled on-demand through a modifier key specified by modifierKeyActions, or a mouse button specified in leftButtonActions, middleButtonActions, rightButtonActions.

DiagramView.magnifierFactor Property

Gets or sets the zoom factor of the magnifier tool.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get magnifierFactor() {}
set magnifierFactor(value) {}
```

Property Value

Number

The zoom factor of the magnifier tool as percentage.

See Also

DiagramView Members

DiagramView.magnifierFrameColor Property

Gets or sets the color of the magnifier tool's frame.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get magnifierFrameColor() {}
set magnifierFrameColor(value) {}
```

Property Value

String

The color of the magnifier tool's frame.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.magnifierFrameThickness Property

Gets or sets the thickness of the magnifier frame.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get magnifierFrameThickness() {}
set magnifierFrameThickness(value) {}
```

Property Value

Number

A number specifying the thickness of the magnifier frame.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.magnifierHeight Property

Gets or sets the height of the magnifier tool.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get magnifierHeight() {}
set magnifierHeight(value) {}
```

Property Value

Number

A number specifying the height of the magnifier tool.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.magnifierSecondaryFrameColor Property

Gets or sets the color of the magnifier tool's secondary frame.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get magnifierSecondaryFrameColor() {}
set magnifierSecondaryFrameColor(value) {}
```

Property Value

String

The color of the magnifier tool's secondary frame.

See Also

DiagramView Members

DiagramView.magnifierShading Property

Gets or sets whether to enhance the effect of a magnifier lense by using a gradient shading.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
get magnifierShading() {}
set magnifierShading(value) {}
```

Property Value

Boolean

true to enable shading, or **false** otherwise.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.magnifierShape Property

Gets or sets a reference to the geometric shape definition of the magnifier tool.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
get magnifierShape() {}
set magnifierShape(value) {}
```

Property Value

Shape | String

The Shape or shape identifier of the magnifier tool.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.magnifierWidth Property

Gets or sets the width of the magnifier tool.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
get magnifierWidth() {}
set magnifierWidth(value) {}
```

Property Value

Number

A number specifying the width of the magnifier tool.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.middleButtonActions Property

Gets or sets a combination of flags that specify what actions can be performed via the middle mouse button.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get middleButtonActions() {}
set middleButtonActions(value) {}
```

Property Value

MouseButtonActions

A combination of MouseButtonActions members.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.modificationStart Property

Gets or sets how users can start modifying diagram items.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get modificationStart() {}
set modificationStart(value) {}
```

Property Value

ModificationStart

A member of the ModificationStart enumeration.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.modifierKeyActions Property

Gets an object that allows changing the function of keyboard modifier keys such as Ctrl and Alt.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
get modifierKeyActions() {}
```

Property Value

ModifierKeyActions

An instance of the ModifierKeyActions class.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.mouseWheelAction Property

Gets or sets what action to perform when users rotate the mouse wheel.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
get mouseWheelAction() {}
set mouseWheelAction(value) {}
```

Property Value

MouseWheelAction

A member of the MouseWheelAction enumeration. The default value is **Scroll**.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace
mouseWheel Event

DiagramView.multiTouchDraw Property

Gets or sets a value indicating whether the control allows drawing multiple items simultaneously.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
get multiTouchDraw() {}
set multiTouchDraw(value) {}
```

Property Value

Boolean

true to allow drawing multiple items simultaneously, or **false** otherwise. The default value is **true**.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

multiTouchModify Property
multiTouchZoom Property
enableMultiTouch Property

DiagramView.multiTouchModify Property

Gets or sets a value indicating whether multi-touch modifications are enabled.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get multiTouchModify() {}
set multiTouchModify(value) {}
```

Property Value

Boolean

true to enable multi-touch node modification, or **false** otherwise. The default value is **true**.

Remarks

If this property is enabled, two touches on same node will scale and rotate it. Otherwise each touch is handled independently according to current behavior value, e.g. by drawing a new diagram link.

Multi-touch rotation is applied only if the Rotate handle bit in enabledHandles is set.

MindFusion.Diagramming Namespace
multiTouchZoom Property
multiTouchDraw Property
enableMultiTouch Property

DiagramView.multiTouchZoom Property

Gets or sets a value indicating whether multi-touch zoom is enabled.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get multiTouchZoom() {}
set multiTouchZoom(value) {}
```

Property Value

Boolean

true to enable multi-touch zoom, or **false** otherwise. The default value is **true**.

Remarks

If this property is disabled, each touch is handled independently according to current behavior value, e.g. by drawing a new diagram item or moving an existing one.

multiTouchModify Property
enableMultiTouch Property

DiagramView.rightButtonActions Property

Gets or sets a combination of flags that specify what actions can be performed via the right mouse button.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get rightButtonActions() {}
set rightButtonActions(value) {}
```

Property Value

MouseButtonActions

A combination of MouseButtonActions members.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.scrollX Property

Gets or sets the diagram's horizontal scroll position.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get scrollX() {}
set scrollX(value) {}
```

Property Value

Number

A number specifying the horizontal scroll position in the current unit of measure.

See Also

DiagramView Members
DiagramView Class

scrollY Property
autoScroll Property
scrollTo Method
bringIntoView Method

DiagramView.scrollY Property

Gets or sets the diagram's vertical scroll position.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get scrollY() {}
set scrollY(value) {}
```

Property Value

Number

A number specifying the vertical scroll position in the current unit of measure.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace
scrollX Property
autoScroll Property
scrollTo Method
bringIntoView Method

DiagramView.scrollZoneSize Property

Gets or sets the size of the auto scroll zone near the edges of the control.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get scrollZoneSize() {}
set scrollZoneSize(value) {}
```

Property Value

Number

A number specifying the size of the auto scroll zone. The default value is 8.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace
autoScroll Property

DiagramView.tooltipDelay Property

Gets or sets the delay before a tooltip is shown.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get tooltipDelay() {}
set tooltipDelay(value) {}
```

Property Value

Number

The tooltip delay in milliseconds.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.verticalDropAlignment Property

Gets or sets the vertical placement of nodes created by drag-and-drop operations, relatively to mouse cursor.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get verticalDropAlignment() {}
set verticalDropAlignment(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration. The default value is **Near**.

Remarks

This property lets you center the new node or align specified edge to the mouse pointer position when drag-and-drop ends.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace
horizontalDropAlignment Property

DiagramView.viewport Property

Returns the visible portion of the diagram area.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
get viewport() {}
```

Property Value

Rect

A Rect instance specifying the viewport coordinates.

Remarks

When the view's canvas element is placed inside a scrollable div element, this method returns what part of the diagram is currently visible within the div. The result is specified in the current measure unit.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace

DiagramView.virtualScroll Property

Gets or sets a value indicating whether virtual scroll mode is enabled.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
get virtualScroll() {}
set virtualScroll(value) {}
```

Property Value

Boolean

true if virtual scroll is enabled, or **false** otherwise. The default value is **true**.

Remarks

If this mode is enabled, the canvas stays as big as its containing div, and its content is drawn with a translation bound to the div's scrollbar positions. This allow displaying large diagrams in browsers and on mobile devices where the size of HTML canvas elements is limited.

Virtual scroll mode requires browser support for grid layout. If you need to use it in older browsers, set CompatConfig.gridLayout = false to use absolute positioning instead.

See Also

DiagramView Members
DiagramView Class
MindFusion.Diagramming Namespace
CompatConfig.gridLayout Field

DiagramView.zoomFactor Property

Gets or sets the zoom factor.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript — Copy Code

```
get zoomFactor() {}
set zoomFactor(value) {}
```

Property Value

Number

The current zoom factor as percentage.

DiagramView Events

DiagramView.createEditControl Event

Raised to let you create a custom inplace editor control.

Namespace: MindFusion.Diagramming
Assembly: DiagramView.js

Syntax

JavaScript Copy Code

```
diagramView.createEditControl.addEventListener(onCreateEditControl);

function onCreateEditControl(sender, args)
{
}
```

Event Data

Event handlers receive an InplaceEditEventArgs instance as argument.

See Also

DirectionConstraint Enumeration

Defines values that specify in what direction to constrain node movement.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
DirectionConstraint = {}
```

Members

	Member name	Description
	None	No restrictions.
	Horizontal	Users are allowed to move the node horizontally.
	Vertical	Users are allowed to move the node vertically.

DrawAnchorPointEventArgs Members

Contains the arguments passed to the drawAnchorPoint event handlers.

The following tables list the members exposed by the DrawAnchorPointEventArgs type.

Public Constructors

	Name	Description
	DrawAnchorPointEventArgs	Initializes a new instance of the **DrawAnchorPointEventArgs** class.

Public Properties

	Name	Description
	AdjustmentHandle	Gets or sets the adjustment handle being moved by the user. (Inherited from NodeEventArgs.)
	anchorIndex	Gets the zero-based index of the anchor point related to the event.
	anchorPattern	Gets the anchor pattern containing the anchor point being drawn.

	Label	Gets or sets a NodeLabel related to this event. (Inherited from NodeEventArgs.)
	location	Gets the location of the anchor point being drawn.
	MouseButton	Gets which mouse button has been pressed. (Inherited from NodeEventArgs.)
	MousePosition	Gets or sets the current mouse pointer position. (Inherited from NodeEventArgs.)
	Node	Gets the node for which the event was raised. (Inherited from NodeEventArgs.)

DrawAnchorPointEventArgs Properties

DrawAnchorPointEventArgs.anchorIndex Property

Gets the zero-based index of the anchor point related to the event.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get anchorIndex() {}
set anchorIndex(value) {}
```

Property Value

Number

The anchor point index.

See Also

DrawAnchorPointEventArgs Members
DrawAnchorPointEventArgs Class

DrawAnchorPointEventArgs.anchorPattern Property

Gets the anchor pattern containing the anchor point being drawn.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get anchorPattern() {}
set anchorPattern(value) {}
```

Property Value

AnchorPattern

The anchor pattern.

See Also

```
function DrawShapesBehavior (parent)
```

Parameters

parent
The Diagram this behavior will be associated with.

DrawShapesBehavior Methods

DrawShapesBehavior.createNode Method

DrawNodesBehavior.CreateNode override.

Namespace: MindFusion.Diagramming
Assembly: DrawShapesBehavior.js

Syntax

JavaScript Copy Code

```
function createNode ()
```

Return Value

An instance of the DiagramNode class.

DummyNode Members

DummyNode represents virtual nodes set as targets of disconnected links.

The following tables list the members exposed by the **DummyNode** type.

Public Constructors

	Name	Description
	DummyNode	Initializes a new instance of the DummyNode class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)

	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)

	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)

	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)

	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
	LoadFromXml	DiagramItem.LoadFromXml override. (Inherited from DiagramNode.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)

	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramNode.)
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)

	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

DummyNode Class
MindFusion.Diagramming Namespace

DummyNode Constructor

Initializes a new instance of the DummyNode class.

Namespace: MindFusion.Diagramming
Assembly: DummyNode.js

Syntax

JavaScript Copy Code

```
function DummyNode ([parent])
```

Parameters

parent
Optional.
Diagram. A Diagram instance whose default node attributes are copied to this node.

See Also

DummyNode Class
MindFusion.Diagramming Namespace

EffectPhase Enumeration

Specifies the rendering phase during which an effect application is requested.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
EffectPhase = {}
```

Members

	Member name	Description
	BeforeFill	Indicates that the NodeEffect.apply method is invoked before the target node is filled.
	AfterFill	Indicates that the NodeEffect.apply method is invoked after the target node is filled.
	AfterOutline	Indicates that the NodeEffect.apply method is invoked after the target node is stroked.

MindFusion.Diagramming Namespace

Events Class

Obsolete. Defines all events raised by the Diagram component.

Syntax

JavaScript Copy Code

```
// class
Events.prototype = {}
```

Remarks

Obsolete

Events are now raised by event emitters exposed as properties of the Diagram class. Adding event listeners through this class is supported for compatibility with old code.

To register an event handler function, call the addEventListener method of **Diagram**. Event handlers receive the diagram as first argument, and an instance of EventArgs subclass as second argument.

Example

The following code handles nodeCreated event, raised when the user draws a new node.

JavaScript Copy Code

```
diagram.addEventListener(Events.nodeCreated, onNodeCreated);

function onNodeCreated(sender, args)
{
    var node = args.node;
    node.handlesStyle = HandlesStyle.HatchHandles3;
}
```

Inheritance Hierarchy

Events Members

Obsolete. Defines all events raised by the Diagram component.

The following tables list the members exposed by the Events type.

Public Properties

	Name	Description
	actionRedone	Raised when an action is redone.
	actionUndone	Raised when an action is undone.
	animatedLayoutCompleted	Raised when an animated layout completes.
	cellTextEdited	Raised when the user edits the text of a table cell.

	cellTextEditing	Raised when the user starts to edit the text of a table cell.
	clicked	Raised when the user clicks the diagram at a point where no items are located.
	containerChildAdded	Raised when the user adds a node to a ContainerNode.
	containerChildAdding	A validation event raised to let you prevent users from adding child nodes to a container.
	containerChildRemoved	Raised when the user removes a node from a **ContainerNode**.
	containerChildRemoving	A validation event raised to let you prevent users from removing child nodes from a container.
	containerFolded	Raised when the user folds a container by clicking the arrow-up button in the container's caption bar.
	containerPageChanged	Raised when the user changes current page of a PagedContainerNode.
	containerUnfolded	Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar.
	controlLoaded	Raised when the control is loaded. For internal use by MindFusion ASP.NET WebForms / MVC controls.
	controlUnloaded	Raised when the control is unloaded.
	controlUnloading	Raised before the control is unloaded.
	createEditControl	Raised to let you create a custom inplace editor control.
	dataLoaded	Raised when the diagram data is loaded.
	deserializeTag	Raised when the Tag or Id of a diagram item must be deserialized from XML format.
	diagramChanged	Raised when the diagram property of a diagram view changes.
	documentChanged	Raised when a page is added or removed from a DiagramDocument instance.
	drawAdjustmentHandles	Raised to draw custom adjustment handles.
	drawAnchorPoint	Raised when an anchor point must be custom-drawn.
	enterInplaceEditMode	Raised when entering inplace-edit mode.
	expandButtonClicked	Raised if ExpandButtonAction is set to RaiseEvents and the [+/-]button of an Expandable node is clicked.
	headerResized	Raised when the user finished resizing a header.
	headerStartResizing	Raised when the user starts resizing a header.
	hitTestAdjustmentHandles	Raised to hit-test custom adjustment handles.
	hyperlinkClicked	Raised when the user clicks a hyperlink inside a node.
	initializeLink	Raised when the user starts drawing a new link, just after the DiagramLink instance is created.
	initializeNode	Raised when the user starts drawing a new node, just after the DiagramNode instance is created.
	itemAdded	Raised when an item is added to the diagram.
	itemRemoved	Raised when an item is removed from the diagram.
	laneGridCellTextEdited	Raised when the user edits the text of a grid cell.
	leaveInplaceEditMode	Raised when leaving inplace-edit mode.
	linkClicked	Raised when the user clicks a link.

	linkCreated	Raised when the user draws a new link.
	linkCreating	A validation event raised while the user is drawing a new link.
	linkDeleted	Raised when a link is deleted, either programmatically or by the user.
	linkDeleting	Raised when the user tries to delete a link. This event lets you cancel the operation.
	linkDeselected	Raised when a link is deselected, either programmatically or by the user.
	linkDoubleClicked	Raised when the user double-clicks a link.
	linkHovered	Raised when the mouse pointer hovers over a link.
	linkModified	Raised when the user moves any control point of a link.
	linkModifying	A validation event raised while the user is modifying a link.
	linkPasted	Raised when a link has been pasted from the clipboard.
	linkPointerEnter	Raised when the mouse pointer enters the boundaries of a link.
	linkPointerLeave	Raised when the mouse pointer leaves the boundaries of a link.
	linkRouted	Raised when a link is routed by the auto-routing algorithm. Event handlers receive a LinkEventArgs instance that contains data about this event.
	linkSelected	Raised when a link is selected, either programmatically or by the user.
	linkSelecting	Raised when the user tries to select a link. This event lets you cancel the operation.
	linkSplit	Raised when the user splits a link segment interactively.
	linkTextEdited	Raised when the user edits the text of a link.
	linkTextEditing	Raised when the user starts to edit the text of a link.
	mouseWheel	Raised when the user rotates the mouse wheel while the cursor is positioned over the diagram surface.
	nodeClicked	Raised when the user clicks a node.
	nodeCreated	Raised when the user draws a new node.
	nodeCreating	A validation event raised while the user is drawing a new node.
	nodeDeleted	Raised when a node is deleted, either programmatically or by the user.
	nodeDeleting	Raised when the user tries to delete a node. This event lets you cancel the operation.
	nodeDeselected	Raised when a node is deselected, either programmatically or by the user.
	nodeDomCreated	Raised when the content of a ControlNode is added to the page DOM.
	nodeDoubleClicked	Raised when the user double-clicks a node.
	nodeHovered	Raised when the mouse pointer hovers over a node.
	nodeModified	Raised when the user moves or resizes a node.
	nodeModifying	A validation event raised while the user is moving or resizing a node.
	nodePasted	Raised when a node has been pasted from the clipboard.
	nodePointerEnter	Raised when the mouse pointer enters the boundaries of a node.
	nodePointerLeave	Raised when the mouse pointer leaves the boundaries of a node.
	nodeSelected	Raised when a node is selected, either programmatically or by the user.

	nodeSelecting	Raised when the user tries to select a node. This event lets you cancel the operation.
	nodeTextEdited	Raised when the user edits the text of a node.
	nodeTextEditing	Raised when the user starts to edit the text of a node.
	queryView	Raised to enumerate diagram views.
	repaint	Raised when the diagram has been repainted.
	selectionChanged	Raised when the diagram selection has changed.
	selectionModifying	A validation event raised while the user is moving or resizing multiple items.
	serializeTag	Raised when the tag or id of a diagram item must be serialized in XML format.
	shapeLibraryLoaded	Raised when a ShapeLibrary is loaded from shapeLibraryLocation.
	sizeChanged	Raised when the size of the diagram canvas has changed.
	tableColumnResized	Raised when the user finishes resizing a column in a table.
	tableColumnResizing	Raised when the user resizes a column in a table interactively.
	tableRowResized	Raised when the user finishes resizing a row in a table.
	tableRowResizing	Raised when the user resizes a row in a table interactively.
	tableSectionCollapsed	Raised when a table section is collapsed.
	tableSectionExpanded	Raised when a table section is expanded.
	treeCollapsed	Raised when a user collapses a tree branch by clicking the [-] button of an expandable node.
	treeExpanded	Raised when a user expands a tree branch by clicking the [+] button of an **expandable** node.
	treeItemTextEdited	Raised when the user edits the text of a tree view item.
	treeItemTextEditing	Raised when the user starts to edit the text of a tree view item.
	validateAnchorPoint	A validation event that lets you approve or reject connecting a link to an anchor point.
	validateLinkCrossing	A validation event that lets you approve or reject displaying a decoration at the intersection point of links.

Events Properties

Events.actionRedone Property

Raised when an action is redone.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get actionRedone() {}
set actionRedone(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.actionUndone Property

Raised when an action is undone.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get actionUndone() {}
set actionUndone(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.animatedLayoutCompleted Property

Raised when an animated layout completes.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get animatedLayoutCompleted() {}
set animatedLayoutCompleted(value) {}
```

Property Value

String

A string containing the event name.

Remarks

When layout is applied on a ContainerNode, event handlers receive a NodeEventArgs instance as argument.

Example

This example handles the **animatedLayoutCompleted** event to resize the diagram.

JavaScript Copy Code

```
diagram.addEventListener(Events.animatedLayoutCompleted, (sender, args) => {
    sender.resizeToFitItems(10);
});
diagram.arrangeAnimated(...);
```

Events.cellTextEdited Property

Raised when the user edits the text of a table cell.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get cellTextEdited() {}
set cellTextEdited(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a CellEventArgs instance as argument.

Events.cellTextEditing Property

Raised when the user starts to edit the text of a table cell.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get cellTextEditing() {}
set cellTextEditing(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a CellEventArgs instance as argument.

Events.clicked Property

Raised when the user clicks the diagram at a point where no items are located.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get clicked() {}
set clicked(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a DiagramEventArgs instance as argument.

Events.containerChildAdded Property

Raised when the user adds a node to a ContainerNode.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get containerChildAdded() {}
set containerChildAdded(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.containerChildAdding Property

A validation event raised to let you prevent users from adding child nodes to a container.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get containerChildAdding() {}
set containerChildAdding(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.containerChildRemoved Property

Raised when the user removes a node from a ContainerNode.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get containerChildRemoved() {}
set containerChildRemoved(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.containerChildRemoving Property

A validation event raised to let you prevent users from removing child nodes from a container.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get containerChildRemoving() {}
set containerChildRemoving(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.containerFolded Property

Raised when the user folds a container by clicking the arrow-up button in the container's caption bar.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get containerFolded() {}
set containerFolded(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.containerPageChanged Property

Raised when the user changes current page of a PagedContainerNode.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get containerPageChanged() {}
set containerPageChanged(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events.containerUnfolded Property

Raised when the user unfolds a container by clicking the arrow-down button in the container's caption bar.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript — Copy Code

```
get containerUnfolded() {}
set containerUnfolded(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.controlLoaded Property

Raised when the control is loaded. For internal use by MindFusion ASP.NET WebForms / MVC controls.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript — Copy Code

```
get controlLoaded() {}
set controlLoaded(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Unlike most events listed here, the event listener must be added to DiagramView instead of Diagram, and respectively the *sender* argument of handler function is set to the view.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace
addEventListener Method

Events.controlUnloaded Property

Raised when the control is unloaded.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get controlUnloaded() {}
set controlUnloaded(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.controlUnloading Property

Raised before the control is unloaded.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get controlUnloading() {}
set controlUnloading(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.createEditControl Property

Raised to let you create a custom inplace editor control.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get createEditControl() {}
set createEditControl(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive an InplaceEditEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.dataLoaded Property

Raised when the diagram data is loaded.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get dataLoaded() {}
set dataLoaded(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.deserializeTag Property

Raised when the Tag or Id of a diagram item must be deserialized from XML format.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get deserializeTag() {}
set deserializeTag(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a SerializeTagEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.diagramChanged Property

Raised when the diagram property of a diagram view changes.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get diagramChanged() {}
set diagramChanged(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.documentChanged Property

Raised when a page is added or removed from a DiagramDocument instance.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get documentChanged() {}
set documentChanged(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.drawAdjustmentHandles Property

Raised to draw custom adjustment handles.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get drawAdjustmentHandles() {}
set drawAdjustmentHandles(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive either NodeEventArgs or LinkEventArgs instance as argument, depending on the item type.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.drawAnchorPoint Property

Raised when an anchor point must be custom-drawn.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get drawAnchorPoint() {}
set drawAnchorPoint(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Set the markStyle property of AnchorPoint to Custom to get this event raised. Handlers receive a DrawAnchorPointEventArgs instance as argument.

Example

JavaScript Copy Code

```
diagram.addEventListener(
    Events.drawAnchorPoint, onDrawAnchorPoint);

function onDrawAnchorPoint(sender, e)
{
    var p = e.location;
    var ctx = e.context;
    ctx.fillStyle = "red";
    ctx.fillRect(p.x - 1, p.y - 1, 2, 2);
}
```

See Also

Events Members

Events.enterInplaceEditMode Property

Raised when entering inplace-edit mode.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get enterInplaceEditMode() {}
set enterInplaceEditMode(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive an InplaceEditEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.expandButtonClicked Property

Raised if ExpandButtonAction is set to RaiseEvents and the [+/-]button of an Expandable node is clicked.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get expandButtonClicked() {}
set expandButtonClicked(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.headerResized Property

Raised when the user finished resizing a header.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get headerResized() {}
set headerResized(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a HeaderResizeEventArgs instance as argument.

See Also

Events.headerStartResizing Property

Raised when the user starts resizing a header.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript — Copy Code

```
get headerStartResizing() {}
set headerStartResizing(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a HeaderResizeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.hitTestAdjustmentHandles Property

Raised to hit-test custom adjustment handles.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript — Copy Code

```
get hitTestAdjustmentHandles() {}
set hitTestAdjustmentHandles(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive either NodeEventArgs or LinkEventArgs instance as argument, depending on the item type.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.hyperlinkClicked Property

Raised when the user clicks a hyperlink inside a node.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get hyperlinkClicked() {}
set hyperlinkClicked(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.initializeLink Property

Raised when the user starts drawing a new link, just after the DiagramLink instance is created.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get initializeLink() {}
set initializeLink(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.initializeNode Property

Raised when the user starts drawing a new node, just after the DiagramNode instance is created.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get initializeNode() {}
set initializeNode(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.itemAdded Property

Raised when an item is added to the diagram.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get itemAdded() {}
set itemAdded(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive an ItemEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.itemRemoved Property

Raised when an item is removed from the diagram.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get itemRemoved() {}
set itemRemoved(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive an ItemEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.laneGridCellTextEdited Property

Raised when the user edits the text of a grid cell.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get laneGridCellTextEdited() {}
set laneGridCellTextEdited(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a CellEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.leaveInplaceEditMode Property

Raised when leaving inplace-edit mode.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get leaveInplaceEditMode() {}
set leaveInplaceEditMode(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive an InplaceEditEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.linkClicked Property

Raised when the user clicks a link.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkClicked() {}
set linkClicked(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace
linkHovered Event
linkDoubleClicked Event

Events.linkCreated Property

Raised when the user draws a new link.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkCreated() {}
set linkCreated(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.linkCreating Property

A validation event raised while the user is drawing a new link.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkCreating() {}
set linkCreating(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

Example

This example shows how to handle the **linkCreating** event to prevent cycles in the graph.

JavaScript Copy Code

```
// assuming namespaced scripts
var Events = MindFusion.Diagramming.Events;
var PathFinder = MindFusion.Diagramming.PathFinder;

diagram.addEventListener(
    Events.linkCreating, onLinkCreating);

function onLinkCreating(diagram, args)
{
    if (args.destination == null)
    {
        // not pointing to a node yet
        return;
    }

    var pathFinder = new PathFinder(diagram);
    var path = pathFinder.findShortestPath(
        args.destination, args.origin);

    if (path != null)
    {
        // adding this new link would create a cycle
        // [origin]--[dest]--[path internal nodes]--[origin]

        args.cancel = true;
    }
}
```

Events.linkDeleted Property

Raised when a link is deleted, either programmatically or by the user.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkDeleted() {}
set linkDeleted(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.linkDeleting Property

Raised when the user tries to delete a link. This event lets you cancel the operation.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkDeleting() {}
set linkDeleting(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.linkDeselected Property

Raised when a link is deselected, either programmatically or by the user.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkDeselected() {}
set linkDeselected(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.linkDoubleClicked Property

Raised when the user double-clicks a link.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkDoubleClicked() {}
set linkDoubleClicked(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members

MindFusion.Diagramming Namespace

Events.linkHovered Property

Raised when the mouse pointer hovers over a link.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkHovered() {}
set linkHovered(value) {}
```

Property Value

String

A string containing the event name.

Remarks

This event fires when the mouse pointer rests over a link for hoverDelay milliseconds. Event handlers receive a LinkEventArgs instance as argument.

Events.linkModified Property

Raised when the user moves any control point of a link.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkModified() {}
set linkModified(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members

Events.linkModifying Property

A validation event raised while the user is modifying a link.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkModifying() {}
set linkModifying(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.linkPasted Property

Raised when a link has been pasted from the clipboard.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkPasted() {}
set linkPasted(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members
Events Class

Events.linkPointerEnter Property

Raised when the mouse pointer enters the boundaries of a link.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkPointerEnter() {}
set linkPointerEnter(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance that contains data about this event.

See Also

Events.linkPointerLeave Property

Raised when the mouse pointer leaves the boundaries of a link.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkPointerLeave() {}
set linkPointerLeave(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance that contains data about this event.

Events.linkRouted Property

Raised when a link is routed by the auto-routing algorithm. Event handlers receive a LinkEventArgs instance that contains data about this event.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkRouted() {}
set linkRouted(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members

Events.linkSelecting Property

Raised when the user tries to select a link. This event lets you cancel the operation.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkSelecting() {}
set linkSelecting(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members
Events Class

Events.linkSplit Property

Raised when the user splits a link segment interactively.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkSplit() {}
set linkSplit(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace
allowSplitLinks Property

Events.linkTextEdited Property

Raised when the user edits the text of a link.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkTextEdited() {}
set linkTextEdited(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.linkTextEditing Property

Raised when the user starts to edit the text of a link.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get linkTextEditing() {}
set linkTextEditing(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a LinkEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.mouseWheel Property

Raised when the user rotates the mouse wheel while the cursor is positioned over the diagram surface.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get mouseWheel() {}
set mouseWheel(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a DiagramEventArgs instance as argument. Unlike most events listed here, the event listener must be added to DiagramView instead of Diagram, and respectively the *sender* argument of handler function is set to the view.

Events.nodeClicked Property

Raised when the user clicks a node.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get nodeClicked() {}
set nodeClicked(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class

nodeHovered Event

Events.nodeCreated Property

Raised when the user draws a new node.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get nodeCreated() {}
set nodeCreated(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

Example

This example handles the **nodeCreated** event to set new node's anchorPattern.

JavaScript Copy Code

```
diagram.addEventListener(Events.nodeCreated, (sender, args) => {
    if (sender.defaultShape.id == "Rectangle")
        args.node.anchorPattern = pattern1;
    else
        args.node.anchorPattern = pattern2;
});
```

Raised when the mouse pointer leaves the boundaries of a node.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get nodePointerLeave() {}
set nodePointerLeave(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance that contains data about this event.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace
nodeHovered Event
nodePointerEnter Event

Events.nodeSelected Property

Raised when a node is selected, either programmatically or by the user.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get nodeSelected() {}
set nodeSelected(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.nodeSelecting Property

Raised when the user tries to select a node. This event lets you cancel the operation.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript — Copy Code

```
get nodeSelecting() {}
set nodeSelecting(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.nodeTextEdited Property

Raised when the user edits the text of a node.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript — Copy Code

```
get nodeTextEdited() {}
set nodeTextEdited(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.nodeTextEditing Property

Raised when the user starts to edit the text of a node.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get nodeTextEditing() {}
set nodeTextEditing(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.queryView Property

Raised to enumerate diagram views.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get queryView() {}
set queryView(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.repaint Property

Raised when the diagram has been repainted.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get repaint() {}
set repaint(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive an EventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.selectionChanged Property

Raised when the diagram selection has changed.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get selectionChanged() {}
set selectionChanged(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a SelectionChangedEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.selectionModifying Property

A validation event raised while the user is moving or resizing multiple items.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get selectionModifying() {}
set selectionModifying(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a SelectionEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.serializeTag Property

Raised when the tag or id of a diagram item must be serialized in XML format.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get serializeTag() {}
set serializeTag(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a SerializeTagEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.shapeLibraryLoaded Property

Raised when a ShapeLibrary is loaded from shapeLibraryLocation.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get shapeLibraryLoaded() {}
set shapeLibraryLoaded(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.sizeChanged Property

Raised when the size of the diagram canvas has changed.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get sizeChanged() {}
set sizeChanged(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive an EventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.tableColumnResized Property

Raised when the user finishes resizing a column in a table.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get tableColumnResized() {}
set tableColumnResized(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a CellEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace
allowResizeColumns Property

Events.tableColumnResizing Property

Raised when the user resizes a column in a table interactively.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get tableColumnResizing() {}
set tableColumnResizing(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a CellEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace
allowResizeColumns Property

Events.tableRowResized Property

Raised when the user finishes resizing a row in a table.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get tableRowResized() {}
set tableRowResized(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a CellEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace
allowResizeRows Property

Events.tableRowResizing Property

Raised when the user resizes a row in a table interactively.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get tableRowResizing() {}
set tableRowResizing(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a CellEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace
allowResizeRows Property

Events.tableSectionCollapsed Property

Raised when a table section is collapsed.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get tableSectionCollapsed() {}
set tableSectionCollapsed(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.tableSectionExpanded Property

Raised when a table section is expanded.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get tableSectionExpanded() {}
set tableSectionExpanded(value) {}
```

Property Value

String

A string containing the event name.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.treeCollapsed Property

Raised when a user collapses a tree branch by clicking the [-] button of an expandable node.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get treeCollapsed() {}
set treeCollapsed(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.treeExpanded Property

Raised when a user expands a tree branch by clicking the [+] button of an expandable node.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get treeExpanded() {}
set treeExpanded(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a NodeEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.treeItemTextEdited Property

Raised when the user edits the text of a tree view item.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get treeItemTextEdited() {}
set treeItemTextEdited(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a TreeItemEventArgs instance as argument.

Example

This example handles the **treeItemTextEdited** event to remove items without text.

JavaScript Copy Code

```
diagram.addEventListener(Events.treeItemTextEdited, (sender, args) => {
    if (!args.newText)
        args.node.removeItem(args.item);
});
```

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.treeItemTextEditing Property

Raised when the user starts to edit the text of a tree view item.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get treeItemTextEditing() {}
set treeItemTextEditing(value) {}
```

Property Value

String

A string containing the event name.

Remarks

Event handlers receive a TreeItemEventArgs instance as argument.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.validateAnchorPoint Property

A validation event that lets you approve or reject connecting a link to an anchor point.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get validateAnchorPoint() {}
set validateAnchorPoint(value) {}
```

Property Value

String

A string containing the event name.

Remarks

validateAnchorPoint event handlers receive an argument of type LinkValidationEventArgs.

This event is raised for each point of an AnchorPattern while a link's end point is being moved over a node. If none of the anchor points are validated, the mouse cursor icon changes to *NotAllowed*, indicating that the link cannot be connected to that node.

When the mouse button is released over a node, the event is raised again for the node's anchor points. From all validated anchor points, the one nearest to the dragged link end point is used to dock the link.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

Events.validateLinkCrossing Property

A validation event that lets you approve or reject displaying a decoration at the intersection point of links.

Namespace: MindFusion.Diagramming
Assembly: Events.js

Syntax

JavaScript Copy Code

```
get validateLinkCrossing() {}
set validateLinkCrossing(value) {}
```

Property Value

String

A string containing the event name.

Remarks

validateLinkCrossing event handlers receive an argument of type LinkCrossingEventArgs.

This event is raised for each intersection point of links when linkCrossings property is enabled.

See Also

Events Members
Events Class
MindFusion.Diagramming Namespace

ExpandButtonAction Enumeration

Specifies what action is triggered by the +/- buttons that are displayed near expandable nodes.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
ExpandButtonAction = {}
```

Members

	Member name	Description
	ExpandTreeBranch	Expands or collapses the children of a node in a tree-like diagram and raises the treeExpanded or treeCollapsed event.
	RaiseEvents	Raises the expandButtonClicked event.

Remarks

Members of this enumeration can be assigned to the expandButtonAction property of Diagram.

Factory Members
MindFusion.Diagramming Namespace

Factory Members

Provides shortcut methods for creating and adding instances of the standard item types.

The following tables list the members exposed by the Factory type.

Public Constructors

	Name	Description
	Factory	Initializes a new instance of the Factory class over the specified Diagram.

Public Methods

	Name	Description
	createContainerNode	Creates a new ContainerNode instance and adds it to the nodes collection of the underlying diagram.
	createControlNode	Creates a new ControlNode instance and adds it to the nodes collection of the underlying diagram.
	createDiagramLink	Overloaded.
	createPagedContainerNode	Creates a new PagedContainerNode instance and adds it to the nodes collection of the underlying diagram.
	createShapeNode	Creates a new ShapeNode instance and adds it to the nodes collection of the underlying diagram.
	createSvgNode	Creates a new SvgNode instance and adds it to the nodes collection of the underlying diagram.
	createTableNode	Creates a new TableNode instance and adds it to the nodes collection of the underlying diagram.
	createTreeViewNode	Creates a new TreeViewNode instance and adds it to the nodes collection of the underlying diagram.

	createVideoNode	Creates a new VideoNode instance and adds it to the nodes collection of the underlying diagram.

See Also

Factory Class
MindFusion.Diagramming Namespace

Factory Constructor

Initializes a new instance of the Factory class over the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: Factory.js

Syntax

JavaScript Copy Code

```
function Factory (diagram)
```

Parameters

diagram
Diagram. The Diagram object for which to create the new factory.

See Also

Factory Class
MindFusion.Diagramming Namespace

Factory Methods

Factory.createContainerNode Method

Creates a new ContainerNode instance and adds it to the nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: Factory.js

Syntax

JavaScript Copy Code

```
function createContainerNode ([bounds, [x, [y, [width, [height]]]]])
```

Parameters

bounds
Optional. A Rect instance specifying the bounding rectangle of the new node.

x
Optional.
Number. The x-coordinate of the upper-left corner of the new node.

y
Optional.
Number. The y-coordinate of the upper-left corner of the new node.

width
Optional.
Number. The width of the new node.

height
Optional.
Number. The height of the new node.

Return Value

The newly created ContainerNode instance.

See Also

Factory Members
Factory Class
MindFusion.Diagramming Namespace

Factory.createControlNode Method

Creates a new ControlNode instance and adds it to the nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: Factory.js

Syntax

JavaScript Copy Code

```
function createControlNode ([bounds, [x, [y, [width, [height]]]]])
```

Parameters

bounds
Optional.
Rect. Specifies the bounding rectangle of the new node.

x
Optional.
Number. The x-coordinate of the upper-left corner of the new node.

y
Optional.
Number. The y-coordinate of the upper-left corner of the new node.

width
Optional.
Number. The width of the new node.

height
Optional.
Number. The height of the new node.

Return Value

ControlNode. The newly created ControlNode instance.

Factory.createDiagramLink Method

Overload List

Name	Description
Factory.createDiagramLink (DiagramNode, DiagramNode)	Creates a new DiagramLink instance between the specified nodes and adds it to the links collection of the underlying diagram.
Factory.createDiagramLink (DiagramNode, Number | TreeViewItem, DiagramNode, Number | TreeviewItem)	Creates a new **DiagramLink** instance between the specified nodes and adds it to the links collection of the underlying diagram.

See Also

Factory Members
Factory Class

Factory.createDiagramLink Method (DiagramNode, DiagramNode)

Creates a new DiagramLink instance between the specified nodes and adds it to the links collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: Factory.js

Syntax

JavaScript Copy Code

```
function createDiagramLink ([origin, [destination]])
```

Parameters

origin
Optional. The origin node.

destination
Optional. The destination **node**.

Return Value

The newly created DiagramLink instance.

Remarks

The method creates a link connecting the nodes specified by origin and destination.

See Also

createDiagramLink Method Overload List
Factory Members
Factory Class
MindFusion.Diagramming Namespace

Factory.createDiagramLink Method (DiagramNode, Number | TreeViewItem, DiagramNode, Number | TreeviewItem)

Creates a new DiagramLink instance between the specified nodes and adds it to the links collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: Factory.js

Syntax

JavaScript Copy Code

```
function createDiagramLink (
    origin, [originRow], destination, [destRow])
```

Parameters

origin
Optional.
DiagramNode. The origin node.

originRow
Optional.
Number | TreeViewItem. The zero-based index of the origin table row or the origin tree item of the new link.

destination
Optional.
DiagramNode. The destination node.

destRow
Optional.
Number | **TreeviewItem**. The zero-based index of the destination table row or the destination tree item of the new link.

Return Value

The newly created DiagramLink instance.

Remarks

If the *origin* or *destination* argument refers to a TableNode, it can be optionally followed by a row index specifying the origin or destination row. If the *origin* or *destination* argument refers to a TreeViewNode, it can be optionally followed by a TreeViewItem argument specifying the origin or destination item. If index / item arguments are omitted, the link connects to the specified node as a target instead of specific element inside.

Example

The following script demonstrates various Factory method calls.

JavaScript Copy Code

```
function buildDiagram(diagram)
{
    var node = diagram.factory.createShapeNode(10, 50, 40, 30);

    var table = diagram.factory.createTableNode(80, 10, 40, 60);
    table.text = "table";
    table.rowCount = 10;

    var treeView = diagram.factory.createTreeViewNode(150, 90, 40, 60);
    treeView.addItem(new TreeViewItem());
    treeView.addItem(new TreeViewItem());

    diagram.factory.createDiagramLink(node, table, 2);
    diagram.factory.createDiagramLink(table, 4, node);

    diagram.factory.createDiagramLink(treeView, treeView.rootItems[1], node);

    diagram.factory.createDiagramLink(table, 6, treeView, treeView.rootItems[0]);
}
```

See Also

createDiagramLink Method Overload List
Factory Members
Factory Class
MindFusion.Diagramming Namespace

Factory.createPagedContainerNode Method

Creates a new PagedContainerNode instance and adds it to the nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: Factory.js

Syntax

JavaScript Copy Code

```
function createPagedContainerNode ([bounds, [x, [y, [width, [height, [pageTitles]]]]]])
```

Parameters

bounds
Optional.
Rect. Specifies the bounding rectangle of the new node.

x
Optional.
Number. The x-coordinate of the upper-left corner of the new node.

y
Optional.
Number. The y-coordinate of the upper-left corner of the new node.

width
Optional.

Number. The width of the new node.

height
Optional.
Number. The height of the new node.

pageTitles
Optional.
Array. An array of title strings for the initial pages.

Return Value

PagedContainerNode. The newly created PagedContainerNode instance.

See Also

Factory Members
Factory Class
MindFusion.Diagramming Namespace

Factory.createShapeNode Method

Creates a new ShapeNode instance and adds it to the nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: Factory.js

Syntax

JavaScript Copy Code

```
function createShapeNode ([bounds, [x, [y, [width, [height]]]]])
```

Parameters

bounds
Optional. A Rect instance specifying the bounding rectangle of the new node.

x
Optional.
Number. The x-coordinate of the upper-left corner of the new node.

y
Optional.
Number. The y-coordinate of the upper-left corner of the new node.

width
Optional.
Number. The width of the new node.

height
Optional.
Number. The height of the new node.

Return Value

The newly created ShapeNode instance.

Remarks

This method accepts either a single Rect object specifying the bounding rectangle of the new node, or a list of four numbers specifying the location and size.

The method creates a shape node with the specified arguments, if any.

Factory Class
MindFusion.Diagramming Namespace

Factory.createSvgNode Method

Creates a new SvgNode instance and adds it to the nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: Factory.js

Syntax

JavaScript Copy Code

```
function createSvgNode ([bounds, [x, [y, [width, [height]]]]])
```

Parameters

bounds
Optional. A Rect instance specifying the bounding rectangle of the new node.

x
Optional.
Number. The x-coordinate of the upper-left corner of the new node.

y
Optional.
Number. The y-coordinate of the upper-left corner of the new node.

width
Optional.
Number. The width of the new node.

height
Optional.
Number. The height of the new node.

Return Value

The newly created SvgNode instance.

Factory.createTableNode Method

Creates a new TableNode instance and adds it to the nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: Factory.js

Syntax

JavaScript Copy Code

```
function createTableNode ([bounds, [x, [y, [width, [height]]]]])
```

Parameters

bounds
Optional. A Rect instance specifying the bounding rectangle of the new node.

x
Optional.
Number. The x-coordinate of the upper-left corner of the new node.

y
Optional.
Number. The y-coordinate of the upper-left corner of the new node.

width
Optional.
Number. The width of the new node.

height
Optional.
Number. The height of the new node.

Return Value

The newly created TableNode instance.

Factory.createTreeViewNode Method

Creates a new TreeViewNode instance and adds it to the nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: Factory.js

Syntax

JavaScript Copy Code

```
function createTreeViewNode ([bounds, [x, [y, [width, [height]]]]])
```

Parameters

bounds
Optional.
Rect. Specifies the bounding rectangle of the new node.

x
Optional.
Number. The x-coordinate of the upper-left corner of the new node.

y
Optional.
Number. The y-coordinate of the upper-left corner of the new node.

width
Optional.
Number. The width of the new node.

height
Optional.
Number. The height of the new node.

Return Value

TreeViewNode. The newly created TreeViewNode instance.

Factory.createVideoNode Method

Creates a new VideoNode instance and adds it to the nodes collection of the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: Factory.js

Syntax

JavaScript Copy Code

```
function createVideoNode ([bounds, [x, [y, [width, [height]]]]])
```

Parameters

bounds
Optional.
A Rect instance specifying the bounding rectangle of the new node.

x
Optional.

Number. The x-coordinate of the upper-left corner of the new node.

y
Optional.
Number. The y-coordinate of the upper-left corner of the new node.

width
Optional.
Number. The width of the new node.

height
Optional.
Number. The height of the new node.

Return Value

The newly created VideoNode instance.

FitSize Enumeration

Specifies how the resizeToFitText method should resize a node.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
FitSize = {}
```

Members

	Member name	Description
	KeepWidth	The original node width should remain intact.
	KeepHeight	The original node height should remain intact.
	KeepRatio	Allow changing both the width and height of a node, but keep the original width/height ratio if possible.

FoldContainerCommand Class
MindFusion.Diagramming Namespace

FreeFormNode Class

A **FreeFormNode** collects all points from users' mouse or touch input and displays them as node's outline.

Syntax

JavaScript Copy Code

```
// class
FreeFormNode.prototype = {}
```

Remarks

To let users draw free-form nodes interactively, set behavior to DrawFreeForms or **LinkFreeForms**. Use the points property of **FreeFormNode** to get or set outline points programmatically. If the closed property is set, the node is drawn as a closed shape and its interior filled, or otherwise the node is drawn as a polyline. If the distance between first and last points drawn by user is shorter than autoCloseDistance, the node's **closed** property is automatically set to **true**. **autoCloseDistance** default value is Number.MAX_VALUE, so free-form nodes are always closed.

Inheritance Hierarchy

MindFusion.Diagramming.DiagramItem
  MindFusion.Diagramming.DiagramNode
    MindFusion.Diagramming.FreeFormNode

FreeFormNode Members
MindFusion.Diagramming Namespace

FreeFormNode Members

A FreeFormNode collects all points from users' mouse or touch input and displays them as node's outline.

The following tables list the members exposed by the **FreeFormNode** type.

Public Constructors

	Name	Description
	FreeFormNode	Initializes a new instance of the **FreeFormNode** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	closed	Gets or sets whether the node's shape is closed.
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)

	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)

	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	points	Gets or sets the node's outline points.
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description

	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	clone	DiagramNode.clone override.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	containsPoint	DiagramItem.containsPoint override.
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	endDrag	DiagramNode.endDrag override.
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	fromJson	DiagramNode.fromJson override.
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)

	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getOutline	DiagramNode.getOutline override. Gets the outline of this node.
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	init	Returns a Builder object used to configure this FreeFormNode instance.
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	loadFromXml	DiagramNode.LoadFromXml override. Loads the node's content from an XML element.
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from

		DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	restoreLocationState	DiagramNode.restoreLocationState override.
	restoreState	DiagramNode.restoreState override.
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveLocationState	DiagramNode.saveLocationState override.
	saveState	DiagramNode.saveState override.
	saveToXml	Saves the node's content into an XML element.
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	startDrag	DiagramNode.startDrag override.
	toJson	DiagramNode.toJson override.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	updateDrag	DiagramNode.updateDrag override.
	updateFromPoints	Updates the node's internal state after its points have changed.
S	With	Returns a Builder object used to configure and create new **FreeFormNode** instances.
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)

	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
	LoadFromXml	DiagramItem.LoadFromXml override. (Inherited from DiagramNode.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)

	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramNode.)
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

FreeFormNode Constructor

Initializes a new instance of the FreeFormNode class.

Namespace: MindFusion.Diagramming
Assembly: FreeFormNode.js

Syntax

JavaScript Copy Code

```
function FreeFormNode ([parent])
```

Parameters

parent
Optional.
A Diagram instance whose default node attributes are copied to this node.

See Also

FreeFormNode Class
MindFusion.Diagramming Namespace

FreeFormNode Methods

FreeFormNode.clone Method

DiagramNode.clone override.

Namespace: MindFusion.Diagramming
Assembly: FreeFormNode.js

Syntax

JavaScript Copy Code

```
function clone ()
```

FreeFormNode.containsPoint Method

DiagramItem.containsPoint override.

Namespace: MindFusion.Diagramming
Assembly: FreeFormNode.js

Syntax

JavaScript Copy Code

```
function containsPoint (point)
```

Parameters

point
Point. The point to check.

Return Value

true it this node contains the specified point; otherwise, **false**.

FreeFormNode.endDrag Method

DiagramNode.endDrag override.

Namespace: MindFusion.Diagramming
Assembly: FreeFormNode.js

Syntax

JavaScript Copy Code

```
function endDrag (ist)
```

Parameters

ist
An InteractionState object that encapsulates the current state of user interaction with the control.

FreeFormNode.getOutline Method

DiagramNode.getOutline override. Gets the outline of this node.

Namespace: MindFusion.Diagramming
Assembly: FreeFormNode.js

Syntax

JavaScript Copy Code

```
function getOutline ()
```

Return Value

Array. An array of points.

FreeFormNode.loadFromXml Method

DiagramNode.LoadFromXml override. Loads the node's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: FreeFormNode.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement

Element. An XML DOM element containing the item's data.

context

XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

FreeFormNode.saveToXml Method

Saves the node's content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: FreeFormNode.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement

Element. An XML DOM element that will contain the item's data.

context

XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

FreeFormNode.With Method

Returns a Builder object used to configure and create new FreeFormNode instances.

Namespace: MindFusion.Diagramming
Assembly: FreeFormNode.js

Syntax

JavaScript Copy Code

```
function With (diagram)
```

Parameters

diagram

Return Value

A Builder instance.

FreeFormNode Properties

FreeFormNode.closed Property

Gets or sets whether the node's shape is closed.

Namespace: MindFusion.Diagramming
Assembly: FreeFormNode.js

Syntax

JavaScript Copy Code

```
get closed() {}
set closed(value) {}
```

Property Value

Boolean

true it this node has a closed shape, or **false** otherwise.

See Also

FreeFormNode Members
FreeFormNode Class
MindFusion.Diagramming Namespace

FreeFormNode.points Property

Gets or sets the node's outline points.

Namespace: MindFusion.Diagramming
Assembly: FreeFormNode.js

Syntax

JavaScript Copy Code

```
get points() {}
set points(value) {}
```

Property Value

Array

An array of Point objects.

GlassEffect Class

Represents a glass-like visual effect.

Syntax

JavaScript Copy Code

```
// class
GlassEffect.prototype = {}
```

Remarks

This effect can be applied to all nodes in a Diagram by adding **GlassEffect** instance to the nodeEffects collection, or to individual nodes by adding it to their effects array.

The following image illustrates the Glass effect applied to an item as well as how the different properties affect the output:

Example

The following example demonstrates how to apply glass effect to the nodes of an existing diagram.

JavaScript Copy Code

```
var GlassEffect = MindFusion.Diagramming.GlassEffect;
diagram.nodeEffects.push(new GlassEffect());
```

Inheritance Hierarchy

MindFusion.Diagramming.NodeEffect
  MindFusion.Diagramming.GlassEffect

See Also

GlassEffect Members
MindFusion.Diagramming Namespace
Node Effects
AeroEffect Class

GlassEffect Members

Represents a glass-like visual effect.

The following tables list the members exposed by the GlassEffect type.

Public Constructors

	Name	Description
	GlassEffect	Initializes a new instance of the GlassEffect class.

Public Properties

	Name	Description
	glowColor	Gets or sets the color of the glow region of the effect.
	reflectionColor	Gets or sets the color of the reflection region of the effect.
	type	Gets or sets the type of the glass effect.
	usePenAsGlow	Gets or sets whether the glow area of the effect should be painted using the stroke color of target node.

Public Methods

	Name	Description
	Clone	**ICloneable.Clone** implementation. (Inherited from NodeEffect.)

Public Events

	Name	Description
	PropertyChanged	INotifyPropertyChanged.PropertyChanged implementation. (Inherited from NodeEffect.)

GlassEffect Properties

GlassEffect.glowColor Property

Gets or sets the color of the glow region of the effect.

Namespace: MindFusion.Diagramming
Assembly: NodeEffects.js

Syntax

JavaScript Copy Code

```
get glowColor() {}
set glowColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value. The default value is "white".

See Also

GlassEffect Members
GlassEffect Class
MindFusion.Diagramming Namespace

GlassEffect.reflectionColor Property

Gets or sets the color of the reflection region of the effect.

Namespace: MindFusion.Diagramming
Assembly: NodeEffects.js

Syntax

JavaScript Copy Code

```
get reflectionColor() {}
set reflectionColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value. The default value is "white".

GlassEffect Members
GlassEffect Class
MindFusion.Diagramming Namespace

GlassEffect.type Property

Gets or sets the type of the glass effect.

Namespace: MindFusion.Diagramming
Assembly: NodeEffects.js

Syntax

JavaScript Copy Code

```
get type() {}
set type(value) {}
```

Property Value

GlassEffectType

A member of the GlassEffectType enumeration. The default is **Type1**.

See Also

GlassEffect Members
GlassEffect Class
MindFusion.Diagramming Namespace

GlassEffect.usePenAsGlow Property

Gets or sets whether the glow area of the effect should be painted using the stroke color of target node.

Namespace: MindFusion.Diagramming
Assembly: NodeEffects.js

Syntax

JavaScript Copy Code

```
get usePenAsGlow() {}
set usePenAsGlow(value) {}
```

Property Value

Boolean

true to ignore glowColor and use node's stroke color for the glow, or **false** otherwise.

See Also

GlassEffect Members
GlassEffect Class
MindFusion.Diagramming Namespace

GlassEffect Events

GlassEffectType Enumeration

Specifies the type of a GlassEffect node effect.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
GlassEffectType = {}
```

Members

	Member name	Description
	Type1	Indicates a glass effect with soft radial glow at the bottom and a sharp reflection at the top.
	Type2	Indicates a glass effect with linear glow at the bottom and sharp reflection at the top.
	Type3	Indicates a glass effect with radial glow at the bottom and smooth reflection and emphasized outline at the top.
	Type4	Indicates a glass effect with sharp reflection at the top and soft glow at the left and right sides.

Remarks

Members of this enumeration can be assigned to the type property of GlassEffect.

GridColumn Class

Represents a column in a GridPanel.

Syntax

JavaScript Copy Code

```
// class
GridColumn.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.GridColumn

See Also

GridColumn Members
MindFusion.Diagramming Namespace

GridColumn Members

Represents a column in a GridPanel.

The following tables list the members exposed by the GridColumn type.

Public Constructors

	Name	Description
	GridColumn	Initializes a new instance of the **GridColumn** class.

Public Properties

	Name	Description
	lengthType	Gets or sets how **GridPanel** determines the width of this column.
	width	Gets or sets fixed width for this column.

GridPanel Members

A layout container that arranges its child components in a grid.

The following tables list the members exposed by the GridPanel type.

Public Constructors

	Name	Description
	GridPanel	Initializes a new instance of the GridPanel class.

Public Properties

	Name	Description
	columns	Gets a list of GridColumn objects specifying column attributes.
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	rows	Gets a list of GridRow objects specifying row attributes.
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

Public Methods

	Name	Description
	getComponents	Gets the child components of this panel. (Inherited from Panel.)

See Also

GridPanel Constructor

Initializes a new instance of the GridPanel class.

Namespace: MindFusion.Diagramming
Assembly: GridPanel.js

Syntax

JavaScript Copy Code

```
function GridPanel ()
```

See Also

GridPanel Class
MindFusion.Diagramming Namespace

GridPanel Properties

GridPanel.columns Property

Gets a list of GridColumn objects specifying column attributes.

Namespace: MindFusion.Diagramming
Assembly: GridPanel.js

Syntax

JavaScript Copy Code

```
get columns() {}
```

Property Value

Array

An array containing the grid columns.

See Also

GridPanel Members
GridPanel Class
MindFusion.Diagramming Namespace

GridPanel.rows Property

Gets a list of GridRow objects specifying row attributes.

Namespace: MindFusion.Diagramming
Assembly: GridPanel.js

Syntax

JavaScript Copy Code

```
get rows() {}
```

Property Value

Array

An array containing the grid rows.

GridRouter Members
MindFusion.Diagramming Namespace

GridRouter Members

Implements a link routing algorithm that uses a grid to represent the free and occupied regions in the diagram.

The following tables list the members exposed by the GridRouter type.

Public Constructors

	Name	Description
	GridRouter	Initializes a new instance of the GridRouter class.

Public Properties

	Name	Description
	avoidOverlaps	Gets or sets a value indicating whether to avoid overlapping links. (Inherited from Router.)
	crossingCost	Gets or sets a value added to the total cost of a route which causes a link to cross another link.
	gridSize	Gets or sets the size of the pieces of the routing grid.
	lengthCost	Gets or sets a value added to the total cost of a route for each piece of the routing grid occupied by the route.
	nodeVicinityCost	Gets or sets a value added to the total cost of a route if the route passes too close to a node.
	nodeVicinitySize	Gets or sets the size of buffer zone around nodes for which routes get a penalty cost if they pass through it.
	turnCost	Gets or sets a value added to the total cost of a route if the route passes too close to a node.

Public Methods

	Name	Description
	route	Called when a single link must be routed. (Inherited from Router.)
	routeInternal	Calculates actual route and returns it as an array of points. (Inherited from Router.)
	routeLinks	Called when more than one link must be routed. (Inherited from Router.)

GridRouter Class
MindFusion.Diagramming Namespace

GridRouter Constructor

Initializes a new instance of the GridRouter class.

Namespace: MindFusion.Diagramming
Assembly: GridRouter.js

Syntax

JavaScript Copy Code

```
function GridRouter ([diagram])
```

Parameters

diagram
Optional.
Diagram. Gets or sets the diagram this router is associated with.

See Also

GridRouter Class
MindFusion.Diagramming Namespace

GridRouter Properties

GridRouter.crossingCost Property

Gets or sets a value added to the total cost of a route which causes a link to cross another link.

Namespace: MindFusion.Diagramming
Assembly: GridRouter.js

Syntax

JavaScript Copy Code

```
get crossingCost() {}
set crossingCost(value) {}
```

Property Value

Number

A number specifying the crossing cost. The default is 4.

Remarks

This is a penalty value added to the total cost of an evaluated link route if it crosses another link. The routing algorithm aims to find paths that have a minimal cost, so assigning a greater value to **crossingCost** leads to fewer link intersections. This value is

considered only when routing multiple links at once, e.g. by routeAllLinks method.

GridRouter Members
GridRouter Class
MindFusion.Diagramming Namespace

GridRouter.gridSize Property

Gets or sets the size of the pieces of the routing grid.

Namespace: MindFusion.Diagramming
Assembly: GridRouter.js

Syntax

JavaScript Copy Code

```
get gridSize() {}
set gridSize(value) {}
```

Property Value

Number

A number specifying the size of the pieces of the routing grid. The default is 4.

See Also

GridRouter Members

GridRouter.lengthCost Property

Gets or sets a value added to the total cost of a route for each piece of the routing grid occupied by the route.

Namespace: MindFusion.Diagramming
Assembly: GridRouter.js

Syntax

JavaScript Copy Code

```
get lengthCost() {}
set lengthCost(value) {}
```

Property Value

Number

A number specifying the length cost. The default is 2.

See Also

GridRouter Members
GridRouter Class

GridRouter.nodeVicinityCost Property

Gets or sets a value added to the total cost of a route if the route passes too close to a node.

Namespace: MindFusion.Diagramming
Assembly: GridRouter.js

Syntax

JavaScript Copy Code

```
get nodeVicinityCost() {}
set nodeVicinityCost(value) {}
```

Property Value

Number

A number specifying the node vicinity cost. The default is 2.

See Also

GridRouter Members
GridRouter Class
MindFusion.Diagramming Namespace

GridRouter.nodeVicinitySize Property

Gets or sets the size of buffer zone around nodes for which routes get a penalty cost if they pass through it.

Namespace: MindFusion.Diagramming
Assembly: GridRouter.js

Syntax

JavaScript Copy Code

```
get nodeVicinitySize() {}
set nodeVicinitySize(value) {}
```

Property Value

Number

A number specifying the size of the buffer area in which passing routes receive a penalty cost. The default is 12.

See Also

GridRouter Members
GridRouter Class
MindFusion.Diagramming Namespace

GridRouter.turnCost Property

Gets or sets a value added to the total cost of a route if the route passes too close to a node.

Namespace: MindFusion.Diagramming
Assembly: GridRouter.js

Syntax

JavaScript Copy Code

```
get turnCost() {}
set turnCost(value) {}
```

Property Value

Number

A number specifying the node vicinity cost. The default is 2.

function GridRow ()
```

See Also

GridRow Class
MindFusion.Diagramming Namespace

GridRow Properties

GridRow.height Property

Gets or sets fixed height for this row.

Namespace: MindFusion.Diagramming
Assembly: GridRow.js

Syntax

JavaScript Copy Code

```
get height() {}
set height(value) {}
```

Property Value

Number

A number specifying the rows's height.

See Also

GridRow Members
GridRow Class
MindFusion.Diagramming Namespace

GridRow.lengthType Property

Gets or sets how GridPanel determines the height of this row.

Namespace: MindFusion.Diagramming
Assembly: GridRow.js

Syntax

JavaScript Copy Code

```
get lengthType() {}
set lengthType(value) {}
```

Property Value

LengthType

A member of the LengthType enumeration.

See Also

GridRow Members
GridRow Class
MindFusion.Diagramming Namespace

GridStyle Enumeration

Defines values that specify the visual style of the alignment grid.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
GridStyle = {}
```

Members

	Member name	Description
	Points	The grid is painted as a matrix of points.
	Lines	The grid is represented as a series of crossing horizontal and vertical lines.
	Crosses	The grid is painted as a matrix of crosses.

Remarks

Members of this enumeration can be assigned to the gridStyle property of Diagram.

See Also

MindFusion.Diagramming Namespace

HandlesStyle Enumeration

Enumerates possible visual styles for frames and handles drawn around selected nodes.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
HandlesStyle = {}
```

Members

	Member name	Description
	Invisible	There is no visible difference between selected and unselected node.
	SquareHandles	If selected, the node is drawn with square modification handles.
	DashFrame	If selected, a node is drawn with a dashed frame. The frame enables resizing the node. The center of the node allows moving it and the edge area enables creating links.
	HatchFrame	If selected, the item is drawn with hatched frame. Modifications can be done as with DashFrame.
	HatchHandles	If selected, a node is drawn with both hatched frame and modification handles. The frame enable moving the node, and the handles enable resizing. Links are created from any point of the interior.
	HatchHandles2	Looks like HatchHandles, but allows moving the node from the interior area. Links are created from the points near the edge.
	HatchHandles3	Behaves like HatchHandles2, but paints the selection frame using a denser brush pattern.
	MoveOnly	If a node is selected, it can be only moved. Best used with ModificationStart set to AutoHandles.

	EasyMove	Any point of the interior of a node enables moving the node, except a small area in the center that allows creating links. Best used with ModificationStart set to AutoHandles.
	SquareHandles2	Square resize handles are drawn around a selected node. There isn't a move handle in the center as with the SquareHandles style, but nodes can be moved by dragging their interior or caption areas. Links can be created by drawing from near the edges of a node.
	Custom	The control raises the drawAdjustmentHandles and hitTestAdjustmentHandles events to let your application perform custom drawing and hit testing of selection handles.
	InvisibleMove	There aren't any selection handles displayed. The selected node can be only moved, but not resized.
	RoundAndSquare	Corner resize handles are round, remaining handles are square.
	RoundAndSquare2	Corner resize handles are round, remaining handles are square. In addition, there is a dashed frame drawn around selected nodes.

Remarks

Members of this enumeration can be assigned to the handlesStyle property of DiagramNode.

MindFusion.Diagramming Namespace

HandlesVisualStyle Class

Defines the pen and brush objects used to draw items' adjustment handles.

Syntax

JavaScript Copy Code

```
// class
HandlesVisualStyle.prototype = {}
```

Remarks

The component uses several different **HandlesVisualStyle** objects depending on the context. They can be accessed through the activeItemHandlesStyle, selectedItemHandlesStyle and disabledHandlesStyle properties of Diagram.

HandlesVisualStyle Members

Defines the pen and brush objects used to draw items' adjustment handles.

The following tables list the members exposed by the HandlesVisualStyle type.

Public Constructors

	Name	Description
	HandlesVisualStyle	Initializes a new instance of the HandlesVisualStyle class.

Public Properties

	Name	Description
	controlPointBrush	Gets or sets the brush used to fill the interior of shape control points.
	dashStroke	Gets or sets the color used to stroke dashed selection frames.
	dashStrokeThickness	Gets or sets the line width applied when stroking dashed selection frames.
	handleBrush	Gets or sets the brush used to fill the interior of selection handles.
	handleStroke	Gets or sets the color used to stroke borders of adjustment handles.
	handleStrokeThickness	Gets or sets the line width applied when stroking borders of adjustment handles.
	hatchBrush	Gets or sets the brush used to draw hatch frames.
	patternBrush	Gets or sets the brush used to draw selection frames for the MoveOnly style.
	rotationHandleBrush	Gets or sets the brush used to fill the interior of the rotation handle.

InteractionState Members

Encapsulates the current state of user interaction with the control.

The following tables list the members exposed by the InteractionState type.

Public Constructors

	Name	Description
	InteractionState	Initializes a new instance of the **InteractionState** class.

Public Methods

	Name	Description
	cancel	Cancels the user interaction. Call this method to cancel interaction, usually in response to the user clicking the right mouse button while dragging.
	commit	Invoked to commit the changes made by the user.
	isAllowed	Checks whether the current interaction can be completed at the specified point.
	start	This method is invoked in the beginning of the interaction, usually when the user presses the left mouse button over a modification handle.

	update	This method is invoked to update the interaction state, usually in response to the user moving the mouse after the modification has started.

InteractionState Constructor

Initializes a new instance of the InteractionState class.

Namespace: MindFusion.Diagramming
Assembly: InteractionState.js

Syntax

JavaScript Copy Code

```
function InteractionState (modifiedItem, action, adjustmentHandle, point)
```

Parameters

modifiedItem
The DiagramItem to be created or modified.

action
One of the Action enumeration values, specifying what kind of action to perform.

adjustmentHandle
The index of the selection handle to be dragged with the mouse, defines what kind of modification to perform.

point
A Point specifying the mouse position where the user starts to draw or modify an item.

See Also

InteractionState Methods

InteractionState.cancel Method

Cancels the user interaction. Call this method to cancel interaction, usually in response to the user clicking the right mouse button while dragging.

Namespace: MindFusion.Diagramming
Assembly: InteractionState.js

Syntax

JavaScript Copy Code

```
function cancel (diagram)
```

Parameters

diagram
The Diagram, at which the action is performed.

Remarks

Call this method to cancel interaction, usually in response to the user clicking the right mouse button while dragging.

See Also

ItemEventArgs Members

Contains the arguments passed to handlers of item-related events.

The following tables list the members exposed by the ItemEventArgs type.

Public Constructors

	Name	Description

	ItemEventArgs	Initializes a new instance of the ItemEventArgs class.

Public Properties

	Name	Description
	adjustmentHandle	Gets the adjustment handle being moved by the user.
	cancel	Gets or sets a value indicating whether to allow the current operation. (Inherited from CancelEventArgs.)
	context	Gets the canvas rendering context.
	handled	Gets or sets a value indicating whether the event has been handled. (Inherited from EventArgs.)
	item	Gets the diagram item for which the event is raised.
	mouseButton	Gets which mouse button has been pressed.
	mousePosition	Gets the current mouse pointer position.
	newText	Gets the text that has just been entered by the user.
	oldText	Gets the text that had been displayed in the node before the user edited it.

Public Methods

	Name	Description
	cancelDrag	Immediately cancels the creation or modification of the node.

ItemEventArgs Properties

ItemEventArgs.adjustmentHandle Property

Gets the adjustment handle being moved by the user.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get adjustmentHandle() {}
set adjustmentHandle(value) {}
```

Property Value

AdjustmentHandles

A member of the AdjustmentHandles enumeration.

See Also

ItemEventArgs Members
ItemEventArgs Class

ItemEventArgs.context Property

Gets the canvas rendering context.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get context() {}
```

Property Value

CanvasRenderingContext2D

A rendering context used to draw on the Canvas element.

ItemEventArgs.item Property

Gets the diagram item for which the event is raised.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript — Copy Code

```
get item() {}
```

Property Value

DiagramItem

An instance of the DiagramItem class.

See Also

ItemEventArgs Members
ItemEventArgs Class
MindFusion.Diagramming Namespace

ItemEventArgs.mouseButton Property

Gets which mouse button has been pressed.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript — Copy Code

```
get mouseButton() {}
```

Property Value

MouseButton

A member of the MouseButton enumeration.

See Also

ItemEventArgs Members

MindFusion.Diagramming Namespace

ItemEventArgs.newText Property

Gets the text that has just been entered by the user.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get newText() {}
```

Property Value

String

A string containing newly entered text.

See Also

ItemEventArgs Members
ItemEventArgs Class
MindFusion.Diagramming Namespace

ItemEventArgs.oldText Property

Gets the text that had been displayed in the node before the user edited it.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get oldText() {}
```

Property Value

String

A string containing item's original text.

See Also

ItemEventArgs Members
ItemEventArgs Class
MindFusion.Diagramming Namespace

ItemLabel Class

Represents a label displayed by a DiagramItem.

Syntax

JavaScript Copy Code

```
// class
ItemLabel.prototype = {}
```

Remarks

This class represents supplementary labels displayed by an item, in addition to its main text property. Call the addLabel method to create a label, and customize it through various members of type-specific LinkLabel and NodeLabel classes.

A label can also display an image assigned to the image or imageLocation property. This lets you draw multiple icons per node, or along a link's geometry.

Inheritance Hierarchy

MindFusion.Diagramming.ItemLabel

See Also

ItemLabel Members
MindFusion.Diagramming Namespace

ItemLabel Members

Represents a label displayed by a DiagramItem.

The following tables list the members exposed by the ItemLabel type.

Public Constructors

	Name	Description
	ItemLabel	Initializes a new instance of the **ItemLabel** class.

Public Properties

	Name	Description
	brush	Gets or sets the brush used to draw the label's background.
	contentPadding	Gets or sets the distance between image and text when both are specified.
	enableStyledText	Gets or sets a value indicating whether styled text rendering is enabled.
	enableWrap	Gets or sets a value indicating whether text wrapping is enabled.
	font	Gets or sets the font used to render label's text.
	horizontalAlign	Gets or sets the label's horizontal alignment.
	horizontalOffset	Gets or sets label's horizontal offset from its pin point.
	image	Gets or sets the image displayed by this label.
	imageAlign	Gets or sets the alignment of label's image relative to text.
	imageContent	Gets or sets a Base64-encoded image to display inside this label.
	imageLocation	Gets or sets URL of the image to display inside this label.
	imageSize	Gets or sets a size that overrides the native image size.
	locked	Gets or sets a value indicating whether users are allowed to edit this label.
	margin	Gets or sets the label's margin.
	maxWidth	Gets or sets the maximum width of this label.
	text	Gets or sets the label's text.

	textColor	Gets or sets the text color.
	verticalAlign	Gets or sets the label's vertical alignment.
	verticalOffset	Gets or sets label's vertical offset from its pin point.

ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel Constructor

Initializes a new instance of the ItemLabel class.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
function ItemLabel (item, text)
```

Parameters

item
DiagramItem. The DiagramItem that displays the label.

text
String. The label's text.

See Also

ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel Properties

ItemLabel.brush Property

Gets or sets the brush used to draw the label's background.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get brush() {}
set brush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.contentPadding Property

Gets or sets the distance between image and text when both are specified.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get contentPadding() {}
set contentPadding(value) {}
```

Property Value

Number

A Number specifying the distance.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.enableStyledText Property

Gets or sets a value indicating whether styled text rendering is enabled.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get enableStyledText() {}
set enableStyledText(value) {}
```

Property Value

Boolean

true to parse the label's text in order to find formatting tags, or **false** otherwise.

Remarks

Styled text recognizes the following format tags:

Tag	Description
text	Indicates italic text.
text	Indicates bold text.
<u>text</u>	Indicates underlined text.
_{text}	Indicates subscript.
^{text}	Indicates superscript.
<color=#RRGGBB>text</color>	Changes the color of the text. The red, green and blue color channels are specified as two-digit hexadecimal numbers.
 	Indicates line break.
<a=url>text	Renders specified text as a hyperlink and raises hyperlinkClicked event when link has been clicked.
<size=N>text</size>	Changes the font size.

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.enableWrap Property

Gets or sets a value indicating whether text wrapping is enabled.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get enableWrap() {}
set enableWrap(value) {}
```

Property Value

Boolean

true to wrap the label's text, or **false** otherwise.

Remarks

In order to wrap text, you must also set the maxWidth property to specify maximum line length.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.font Property

Gets or sets the font used to render label's text.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get font() {}
set font(value) {}
```

Property Value

Font

An instance of the Font class.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.horizontalAlign Property

Gets or sets the label's horizontal alignment.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get horizontalAlign() {}
set horizontalAlign(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.horizontalOffset Property

Gets or sets label's horizontal offset from its pin point.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get horizontalOffset() {}
set horizontalOffset(value) {}
```

Property Value

Number

A number specifying label's horizontal position, specified in diagram's measureUnit.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.image Property

Gets or sets the image displayed by this label.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get image() {}
set image(value) {}
```

Property Value

HTMLImageElement

An image object to render inside the label.

Remarks

If a label displays both image and text, the image position relative to text depends on the imageAlign property.

If the label is only intended to display an icon image and no text, you could also set its locked property to prevent users from entering text.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace
imageSize Property
imageLocation Property

ItemLabel.imageAlign Property

Gets or sets the alignment of label's image relative to text.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get imageAlign() {}
set imageAlign(value) {}
```

Property Value

ImageAlign

A member of the ImageAlign enumeration. The default value is **MiddleLeft**.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace
image Property
imageLocation Property

ItemLabel.imageContent Property

Gets or sets a Base64-encoded image to display inside this label.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get imageContent() {}
set imageContent(value) {}
```

Property Value

String

A Base64-encoded representation of an image.

Remarks

If a label displays both image and text, the image position relative to text depends on the imageAlign property.

If the label is only intended to display an icon image and no text, you could also set its locked property to prevent users from entering text.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.imageLocation Property

Gets or sets URL of the image to display inside this label.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript — Copy Code

```
get imageLocation() {}
set imageLocation(value) {}
```

Property Value

String

A URL string that identifies the image to be loaded.

Remarks

If a label displays both image and text, the image position relative to text depends on the imageAlign property.

If the label is only intended to display an icon image and no text, you could also set its locked property to prevent users from entering text.

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace
image Property

ItemLabel.imageSize Property

Gets or sets a size that overrides the native image size.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript — Copy Code

```
get imageSize() {}
set imageSize(value) {}
```

Property Value

Size

A Size instance.

Remarks

By default, image is rendered using bitmap's intrinsic size. Set this value to increase or reduce the size of the rendered image.

imageLocation Property

ItemLabel.locked Property

Gets or sets a value indicating whether users are allowed to edit this label.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get locked() {}
set locked(value) {}
```

Property Value

Boolean

true to prevent users from editing this label, or **false** otherwise.

See Also

ItemLabel Members
ItemLabel Class

ItemLabel.margin Property

Gets or sets the label's margin.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get margin() {}
set margin(value) {}
```

Property Value

Thickness

A Thickness instance specifying the margin space on all sides of label.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.maxWidth Property

Gets or sets the maximum width of this label.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get maxWidth() {}
set maxWidth(value) {}
```

Property Value

Number

The maximum width.

Remarks

This value is used when enableWrap is set to **true**.

MindFusion.Diagramming Namespace

ItemLabel.text Property

Gets or sets the label's text.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get text() {}
set text(value) {}
```

Property Value

String

A string containing the label's text.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.textColor Property

Gets or sets the text color.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get textColor() {}
set textColor(value) {}
```

Property Value

String

A string value identifying the text color.

See Also

ItemLabel Members
ItemLabel Class

ItemLabel.verticalAlign Property

Gets or sets the label's vertical alignment.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get verticalAlign() {}
set verticalAlign(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemLabel.verticalOffset Property

Gets or sets label's vertical offset from its pin point.

Namespace: MindFusion.Diagramming
Assembly: ItemLabel.js

Syntax

JavaScript Copy Code

```
get verticalOffset() {}
set verticalOffset(value) {}
```

Property Value

Number

A number specifying label's vertical position, specified in diagram's measureUnit.

See Also

ItemLabel Members
ItemLabel Class
MindFusion.Diagramming Namespace

ItemListView Class

A list view control that hosts DiagramItems and supports drag-and-drop to DiagramView.

Syntax

JavaScript Copy Code

```
// class
ItemListView.prototype = {}
```

Remarks

Call the addItem method to add an item to the view.

Drag-and-drop operations create a copy of the dragged item, and set its size to newInstanceSize. The copy is created by calling item's clone method. You can override **clone** to copy property values of custom item subclasses.

Icons in the list are drawn by scaling **newInstanceSize** down to iconSize. E.g. if a list icon is half the size of the diagram item it creates, its graphic elements such as cells, labels, strokes would be rendered at half scale too (as opposed to rendering with same label / stroke sizes but in smaller bounding rectangle). The scaling code assumes measureUnit of the target diagram and the list view have matching values.

Palette Class

ItemListView Members

A list view control that hosts DiagramItems and supports drag-and-drop to DiagramView.

The following tables list the members exposed by the ItemListView type.

Public Constructors

	Name	Description
	ItemListView	Creates an instance of **ItemListView**.

Public Properties

	Name	Description
	autoConnectDistance	Gets or sets the maximum distance to a node when auto connecting links.
	autoConnectLinks	Gets or sets whether links should be automatically connected to the nearest node.
	backColor	Gets or sets the background color of the list view. (Inherited from ListViewBase.)
	columns	Gets or sets the number of columns in control's layout.
	draggedItem	Gets the currently dragged item. (Inherited from ListViewBase.)
	element	Returns a reference to the control's DOM element. (Inherited from Control.)
	enabled	Gets or sets whether mouse events are enabled. (Inherited from Control.)
	iconSize	Gets or sets the size of items displayed in this list view. (Inherited from ListViewBase.)
	items	Gets the items contained in this list view. (Inherited from ListViewBase.)
	labelPosition	Gets or sets a value indicating the position of labels relative to item icons.
	licenseLocation	Gets or sets the location of the license key file. (Inherited from Control.)
	measureUnit	Gets the unit of measure used for logical coordinates. (Inherited from CanvasControl.)
	newInstanceSize	Gets or sets the default size of items created by drag-and-drop from this list view. (Inherited from ListViewBase.)
	orientation	Gets or sets the orientation of the view layout. (Inherited from ListViewBase.)
	padding	Gets or sets the padding space between item's slot bounds and its contents. (Inherited from ListViewBase.)
	shapeLibraryLocation	Gets the location of a shape library file containing custom shape definitions. It can be set to a full URL of the file, or a relative file path. (Inherited from ListViewBase.)
	textColor	Gets or sets the color used to paint item captions. (Inherited from ListViewBase.)

	tooltipDelay	Gets or sets the delay before a tooltip is shown. (Inherited from ListViewBase.)

Public Methods

	Name	Description
	addEventListener	Registers a single event listener on the instance. (Inherited from Disposable.)
S	addHandlers	Adds an event listener to a DOM element. (Inherited from Control.)
	addItem	Adds an item to the list view. (Inherited from ListViewBase.)
	clearAll	Removes all items from the list view. (Inherited from ListViewBase.)
S	clearHandlers	Removes all event listeners from a DOM element. (Inherited from Control.)
	clientToDoc	Transforms a point from client to document coordinates. (Inherited from CanvasControl.)
S	create	Creates and initializes a new **ItemListView** from the specified element. This method is static and can be called without creating an instance of the class.
	docToClient	Transforms a point from document to client coordinates. (Inherited from CanvasControl.)
S	find	Returns the specified **ItemListView** object. This member is static and can be invoked without creating an instance of the class.
S	fromJson	Constructs a JavaScript object from a JSON string. (Inherited from Control.)
	getItemAt	Gets the item at the specified location. (Inherited from ListViewBase.)
	raiseEvent	Raises an event. (Inherited from Disposable.)
	registerForSubmit	Registers an onsubmit handler for the Control's parent html form to flush postback data. (Inherited from Control.)
	removeEventListener	Removes a single event listener attached to the instance. (Inherited from Disposable.)
	removeItem	Removes an item from the list view. (Inherited from ListViewBase.)
	selectItem	Selects the specified item. (Inherited from ListViewBase.)
S	toJson	Converts a JavaScript object to a JSON string. (Inherited from Control.)

Public Events

	Name	Description
	controlLoaded	Raised when the control is loaded. (Inherited from Control.)
	controlUnloaded	Raised when the control is unloaded. (Inherited from Control.)
	controlUnloading	Raised when the control is unloading. (Inherited from Control.)
	linkSelected	Raised when a link is selected, either programmatically or by the user. (Inherited from ListViewBase.)
	nodeSelected	Raised when a node is selected, either programmatically or by the user. (Inherited from ListViewBase.)
	shapeLibraryLoaded	Raised when a ShapeLibrary is loaded from **shapeLibraryLocation**. (Inherited from ListViewBase.)

See Also

ItemListView Class
MindFusion.Diagramming Namespace

ItemListView Constructor

Creates an instance of ItemListView.

Namespace: MindFusion.Diagramming
Assembly: ItemListView.js

Syntax

JavaScript — Copy Code

```
function ItemListView (element)
```

Parameters

element
HTMLCanvasElement. The Canvas DOM Element this ItemListView is associated with.

See Also

ItemListView Class
MindFusion.Diagramming Namespace

ItemListView Methods

ItemListView.create Method

Creates and initializes a new ItemListView from the specified element. This method is static and can be called without creating an instance of the class.

Namespace: MindFusion.Diagramming
Assembly: ItemListView.js

Syntax

JavaScript — Copy Code

```
function create (element)
```

Parameters

element
HTMLCanvasElement. The DOM element that the ItemListView should be attached to.

Return Value

ItemListView. An **ItemListView** object that represents the newly created view.

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming Namespace

ItemListView.find Method

Returns the specified ItemListView object. This member is static and can be invoked without creating an instance of the class.

Namespace: MindFusion.Diagramming
Assembly: ItemListView.js

Syntax

JavaScript Copy Code

```
function find (id)
```

Parameters

id

String. The id of the ItemListView's DOM element.

Return Value

ItemListView. An ItemListView object with the specified id, if found; otherwise, null.

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming Namespace

ItemListView Properties

ItemListView.autoConnectDistance Property

Gets or sets the maximum distance to a node when auto connecting links.

Namespace: MindFusion.Diagramming
Assembly: ItemListView.js

Syntax

JavaScript Copy Code

```
get autoConnectDistance() {}
set autoConnectDistance(value) {}
```

Property Value

Number

A number specifying auto-connect distance.

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming Namespace

ItemListView.autoConnectLinks Property

Gets or sets whether links should be automatically connected to the nearest node.

Namespace: MindFusion.Diagramming
Assembly: ItemListView.js

Syntax

JavaScript Copy Code

```
get autoConnectLinks() {}
set autoConnectLinks(value) {}
```

Property Value

Boolean

true to automatically connect links, or **false** otherwise. The default value is **true**.

Remarks

If this property is enabled and there are nodes within autoConnectDistance when a link is created via drag-and-drop, the link automatically connects to the nodes. Otherwise it is created as unconnected link.

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming Namespace

ItemListView.columns Property

Gets or sets the number of columns in control's layout.

Namespace: MindFusion.Diagramming
Assembly: ItemListView.js

Syntax

JavaScript Copy Code

```
get columns() {}
set columns(value) {}
```

Property Value

Number

An integer value specifying the number of columns. The default value is 1.

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming Namespace

ItemListView.labelPosition Property

Gets or sets a value indicating the position of labels relative to item icons.

Namespace: MindFusion.Diagramming
Assembly: ItemListView.js

Syntax

JavaScript Copy Code

```
get labelPosition() {}
set labelPosition(value) {}
```

Property Value

LabelPosition

A member of the LabelPosition enumeration. The default value is **Auto**.

Remarks

The default Auto value places labels to the right of item icons if using one-column layout, and below icons if showing multiple columns.

See Also

ItemListView Members
ItemListView Class
MindFusion.Diagramming Namespace

ItemListView Events

ListViewBase.linkSelected Event

Raised when a link is selected, either programmatically or by the user.

Namespace: MindFusion.Diagramming
Assembly: ListViewBase.js

Syntax

JavaScript — Copy Code

```
listView.linkSelected.addEventListener(onLinkSelected);
```

See Also

ListViewBase Members
ListViewBase Class
MindFusion.Diagramming Namespace

ListViewBase.nodeSelected Event

Raised when a node is selected, either programmatically or by the user.

Namespace: MindFusion.Diagramming
Assembly: ListViewBase.js

Syntax

JavaScript — Copy Code

```
listView.nodeSelected.addEventListener(onNodeSelected);
```

See Also

ListViewBase Members
ListViewBase Class
MindFusion.Diagramming Namespace

ListViewBase.shapeLibraryLoaded Event

Raised when a ShapeLibrary is loaded from shapeLibraryLocation.

Namespace: MindFusion.Diagramming
Assembly: ListViewBase.js

Syntax

JavaScript — Copy Code

```
listView.shapeLibraryLoaded.addEventListener(onShapeLibraryLoaded);
```

See Also

ListViewBase Members
ListViewBase Class
MindFusion.Diagramming Namespace

LabelPosition Enumeration

Specifies the position of labels in a ListView control.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
LabelPosition = {}
```

Members

	Member name	Description
	Auto	Labels are positioned depending on the column count.
	Right	Labels are on the right side of the icon.
	Left	Labels are on the left side of the icon.
	Bottom	Labels are positioned below the icon.

See Also

MindFusion.Diagramming Namespace

LengthType Enumeration

Indicates how GridPanel determines dimensions of its rows and columns.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
LengthType = {}
```

Members

	Member name	Description
	Auto	The row or column is auto-sized to fit its child components.
	Relative	The size of relative elements is calculated from available space in the GridPanel proportionally to the number of other relative elements.

Remarks

Members of this enumeration can be assigned to the lengthType property of GridRow and GridColumn.

LinkCrossingEventArgs Class

Contains the arguments passed to handlers of the validateLinkCrossing event.

Syntax

JavaScript Copy Code

```
// class
LinkCrossingEventArgs.prototype = {}
```

Inheritance Hierarchy

MindFusion.Controls.CancelEventArgs
MindFusion.Diagramming.LinkCrossingEventArgs

See Also

LinkCrossingEventArgs Members
MindFusion.Diagramming Namespace

LinkCrossingEventArgs Members

Contains the arguments passed to handlers of the validateLinkCrossing event.

The following tables list the members exposed by the LinkCrossingEventArgs type.

Public Constructors

	Name	Description
	LinkCrossingEventArgs	Initializes a new instance of the LinkCrossingEventArgs class.

Public Properties

	Name	Description
	bottomLink	The link at lower Z position.
	bottomSegmentIndex	Index of bottom link's segment that contains the intersection point.
	intersectionPoint	Intersection point that will show crossing decoration if the event is validated.
	topLink	The link at higher Z position.
	topSegmentIndex	Index of top link's segment that contains the intersection point.

MindFusion.Diagramming Namespace

LinkCrossingEventArgs Constructor

Initializes a new instance of the LinkCrossingEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
function LinkCrossingEventArgs (args)
```

Parameters

args

See Also

LinkCrossingEventArgs Class
MindFusion.Diagramming Namespace

LinkCrossingEventArgs Properties

LinkCrossingEventArgs.bottomLink Property

The link at lower Z position.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get bottomLink() {}
set bottomLink(value) {}
```

Property Value

DiagramLink

An instance of the DiagramLink class.

See Also

LinkCrossingEventArgs Members
LinkCrossingEventArgs Class
MindFusion.Diagramming Namespace

LinkCrossingEventArgs.bottomSegmentIndex Property

Index of bottom link's segment that contains the intersection point.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get bottomSegmentIndex() {}
set bottomSegmentIndex(value) {}
```

Property Value

Number

An integer index of link's segment containing intersectionPoint.

See Also

LinkCrossingEventArgs Members
LinkCrossingEventArgs Class
MindFusion.Diagramming Namespace

LinkCrossingEventArgs.intersectionPoint Property

Intersection point that will show crossing decoration if the event is validated.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get intersectionPoint() {}
set intersectionPoint(value) {}
```

Property Value

Point

An instance of the Point class containing intersection coordinates.

See Also

LinkCrossingEventArgs Members
LinkCrossingEventArgs Class
MindFusion.Diagramming Namespace

LinkCrossingEventArgs.topLink Property

The link at higher Z position.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get topLink() {}
set topLink(value) {}
```

Property Value

DiagramLink

An instance of the DiagramLink class.

See Also

LinkCrossingEventArgs Members
LinkCrossingEventArgs Class
MindFusion.Diagramming Namespace

LinkCrossingEventArgs.topSegmentIndex Property

Index of top link's segment that contains the intersection point.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get topSegmentIndex() {}
set topSegmentIndex(value) {}
```

Property Value

Number

An integer index of link's segment containing intersectionPoint.

LinkCrossingEventArgs Members
LinkCrossingEventArgs Class
MindFusion.Diagramming Namespace

LinkCrossings Enumeration

Defines values that indicate how to render link intersection points.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
LinkCrossings = {}
```

Members

	Member name	Description
	Straight	No special indication for link intersection points.
	Arcs	An arc is drawn at the intersection point of two links. It connects the segments of the link at higher Z position and goes over the link at lower Z.
	Cut	The intersection segments of links at lower Z position are cut by links at higher Z position.

Remarks

Members of this enumeration can be assigned to the linkCrossings property of Diagram.

Events Class

LinkEventArgs Members

Contains the arguments passed to handlers of link-related events.

The following tables list the members exposed by the LinkEventArgs type.

Public Constructors

	Name	Description
	LinkEventArgs	Initializes a new instance of the **LinkEventArgs** class.

Public Properties

	Name	Description
	destination	Gets the candidate destination node; reported to validation events.
	Index	Gets an integer index related to the event. (Inherited from ItemEventArgs.)
	Item	Gets the item for which the event is raised. (Inherited from ItemEventArgs.)
	label	Gets the link label for which the event is raised.
	link	Gets the link for which the event is raised.
	origin	Gets the candidate origin node; reported to validation events.

LinkEventArgs Class
MindFusion.Diagramming Namespace

LinkEventArgs Constructor

Initializes a new instance of the LinkEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
function LinkEventArgs (args)
```

Parameters

args

See Also

LinkEventArgs Class
MindFusion.Diagramming Namespace

LinkEventArgs Properties

LinkEventArgs.destination Property

Gets the candidate destination node; reported to validation events.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get destination() {}
set destination(value) {}
```

Property Value

DiagramNode

A DiagramNode instance.

Remarks

When handling linkCreating and linkModifying validation events, origin and **destination** values of LinkEventArgs are generally different from link's current origin and destination. If you do not cancel the operation, the former are assigned to the latter once the user stops drawing the link.

MindFusion.Diagramming Namespace

LinkEventArgs.label Property

Gets the link label for which the event is raised.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get label() {}
```

Property Value

LinkLabel

A LinkLabel instance.

See Also

LinkEventArgs Members
LinkEventArgs Class
MindFusion.Diagramming Namespace

LinkEventArgs.link Property

Gets the link for which the event is raised.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get link() {}
```

Property Value

DiagramLink

A DiagramLink instance.

See Also

LinkEventArgs Members
LinkEventArgs Class
MindFusion.Diagramming Namespace

LinkEventArgs.origin Property

Gets the candidate origin node; reported to validation events.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript — Copy Code

```
get origin() {}
set origin(value) {}
```

Property Value

DiagramNode

A DiagramNode instance.

Remarks

When handling linkCreating and linkModifying validation events, **origin** and destination values of LinkEventArgs are generally different from link's current origin and destination. If you do not cancel the operation, the former are assigned to the latter once the user stops drawing the link.

linkModifying Event

LinkLabel Class

Represents a label displayed by a DiagramLink. New labels can be added to a link by calling its addLabel method.

Syntax

JavaScript — Copy Code

```
// class
LinkLabel.prototype = {}
```

Remarks

The position of a label is determined by where it is pinned along the link's geometry, and offset from the pin point, as set using setControlPointPosition, setSegmentPosition and setLinkLengthPosition methods. In addition, the horizontalAlign and verticalAlign properties specify whether the label is centered on its pin point or aligned to it.

Set the autoArrange property to let the diagram set label's position automatically, avoiding overlaps with nodes and other link labels.

You can let users arrange labels manually by setting the behavior property of DiagramView to MoveLabels.

Inheritance Hierarchy

MindFusion.Diagramming.ItemLabel
  MindFusion.Diagramming.LinkLabel

LinkLabel Members

Represents a label displayed by a DiagramLink. New labels can be added to a link by calling its addLabel method.

The following tables list the members exposed by the LinkLabel type.

Public Constructors

	Name	Description
	LinkLabel	Initializes a new instance of the LinkLabel class.

Public Properties

	Name	Description
	autoArrange	Gets or sets whether to automatically arrange the label to avoid overlapping nodes.
	brush	Gets or sets the brush used to draw the label's background.
	Brush	Gets or sets the brush used to draw the label's background. (Inherited from ItemLabel.)
	ContentPadding	Gets or sets the distance between image and text when both are specified. (Inherited from ItemLabel.)
	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled. (Inherited from ItemLabel.)
	EnableWrap	Gets or sets a value indicating whether the label's text can be wrapped. (Inherited from ItemLabel.)
	font	Gets or sets the font used to render label's text.
	Font	Gets or sets the label's font. (Inherited from ItemLabel.)
	horizontalAlign	Gets or sets the label's horizontal alignment.
	HorizontalAlign	Gets or sets the label's horizontal alignment. (Inherited from ItemLabel.)
	HorizontalOffset	Gets or sets the label's horizontal offset from its pin point. (Inherited from ItemLabel.)
	Image	Gets or sets the image displayed by this label. (Inherited from ItemLabel.)
	ImageAlign	Gets or sets the alignment of label's image relative to text. (Inherited from ItemLabel.)
	ImageSize	Gets or sets a size that overrides the native image size. (Inherited from ItemLabel.)
	ImageUrl	Gets or sets URL of the image to display inside this label. (Inherited from ItemLabel.)
	Index	Gets or sets the index of an edge or point this label is relative to. (Inherited from ItemLabel.)
	Item	Gets or sets the DiagramItem that displays this label. (Inherited from ItemLabel.)
	Locked	Gets or sets a value indicating whether users are allowed to edit this label. (Inherited from ItemLabel.)
	margin	Gets or sets the label's margin.
	Margin	Gets or sets the label's margin. (Inherited from ItemLabel.)
	MaxWidth	Gets or sets the maximum width of the label. (Inherited from ItemLabel.)
	text	Gets or sets the label's text.
	Text	Gets or sets the label's text. (Inherited from ItemLabel.)
	TextBrush	Gets or sets the brush used to draw the label's text. (Inherited from ItemLabel.)

	textColor	Gets or sets the text color.
	verticalAlign	Gets or sets the label's vertical alignment.
	VerticalAlign	Gets or sets the label's vertical alignment. (Inherited from ItemLabel.)
	VerticalOffset	Gets or sets the label's vertical offset from its pin point. (Inherited from ItemLabel.)

Public Methods

	Name	Description
	Cancel	Called when drag operation is canceled. (Inherited from ItemLabel.)
	Draw	Draws the label on the specified IGraphics surface. (Inherited from ItemLabel.)
	GetEditRect	InplaceEditable.GetEditRect implementation. (Inherited from ItemLabel.)
	GetTextToEdit	InplaceEditable.GetTextToEdit implementation. (Inherited from ItemLabel.)
	LoadFromXml	Loads the label from the specified XML element. (Inherited from ItemLabel.)
	OnMouseDown	Called when the left mouse button is pressed while the pointer is over this label. (Inherited from ItemLabel.)
	OnMouseMove	Called when the mouse is moved while this label tracks the mouse events. (Inherited from ItemLabel.)
	OnMouseUp	Called when the left mouse button is released while this label tracks the mouse events. (Inherited from ItemLabel.)
	SaveToXml	Saves the label into the specified XML element. (Inherited from ItemLabel.)
	setControlPointPosition	Positions this label relatively to the specified control point.
	SetEditedText	InplaceEditable.SetEditedText implementation. (Inherited from ItemLabel.)
	setLinkLengthPosition	Positions this label relatively to the link length.
	SetMouseCursor	Indicates what cursor to display for interactive labels. (Inherited from ItemLabel.)
	setSegmentPosition	Positions this label relatively to the specified link segment.
	UpdateValue	Called while drag operation is in progress. (Inherited from ItemLabel.)

Protected Methods

	Name	Description
	LoadFromJson	Loads the label from a JsonObject. (Inherited from ItemLabel.)
	SaveToJson	Saves the label into a **JsonObject**. (Inherited from ItemLabel.)

LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel Constructor

Initializes a new instance of the LinkLabel class.

Namespace: MindFusion.Diagramming
Assembly: LinkLabel.js

Syntax

JavaScript Copy Code

```
function LinkLabel (link, text)
```

Parameters

link
DiagramLink. The DiagramLink that displays the label.

text
String. The label's text.

See Also

LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel Methods

LinkLabel.setControlPointPosition Method

Positions this label relatively to the specified control point.

Namespace: MindFusion.Diagramming
Assembly: LinkLabel.js

Syntax

JavaScript Copy Code

```
function setControlPointPosition (controlPoint, dx, dy)
```

Parameters

controlPoint
Number. The control point index.

dx
Number. Horizontal offset from the control point.

dy
Number. Vertical offset from the control point.

Remarks

This method sets the specified control point as label's pin point and assigns specified offsets to horizontalOffset and verticalOffset properties.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.setLinkLengthPosition Method

Positions this label relatively to the link length.

Namespace: MindFusion.Diagramming
Assembly: LinkLabel.js

Syntax

JavaScript Copy Code

```
function setLinkLengthPosition (lengthFactor)
```

Parameters

lengthFactor
Number. A value between 0 and 1 specifying the position of the label relatively to the link's length.

Remarks

This method sets the point at specified distance along link's geometry as pin point and assigns specified offsets to horizontalOffset and verticalOffset properties.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.setSegmentPosition Method

Positions this label relatively to the specified link segment.

Namespace: MindFusion.Diagramming
Assembly: LinkLabel.js

Syntax

JavaScript Copy Code

```
function setSegmentPosition (segment, dx, dy)
```

Parameters

segment
Number. The segment index.

dx
Number. Horizontal offset from the segment center.

dy
Number. Vertical offset from the segment center.

Remarks

This method sets the middle of specified segment as label's pin point and assigns specified offsets to horizontalOffset and verticalOffset properties.

LinkLabel Properties

LinkLabel.autoArrange Property

Gets or sets whether to automatically arrange the label to avoid overlapping nodes.

Namespace: MindFusion.Diagramming
Assembly: LinkLabel.js

Syntax

JavaScript Copy Code

```
get autoArrange() {}
set autoArrange(value) {}
```

Property Value

Boolean

true if the label should be auto-arranged, or **false** otherwise.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.brush Property

Gets or sets the brush used to draw the label's background.

Namespace: MindFusion.Diagramming
Assembly: LinkLabel.js

Syntax

JavaScript Copy Code

```
get brush() {}
set brush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.font Property

Gets or sets the font used to render label's text.

Namespace: MindFusion.Diagramming
Assembly: LinkLabel.js

Syntax

JavaScript Copy Code

```
get font() {}
set font(value) {}
```

Property Value

Font

An instance of the Font class.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.horizontalAlign Property

Gets or sets the label's horizontal alignment.

Namespace: MindFusion.Diagramming
Assembly: LinkLabel.js

Syntax

JavaScript Copy Code

```
get horizontalAlign() {}
set horizontalAlign(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.margin Property

Gets or sets the label's margin.

Namespace: MindFusion.Diagramming
Assembly: LinkLabel.js

Syntax

JavaScript Copy Code

```
get margin() {}
set margin(value) {}
```

Property Value

Thickness

A Thickness instance specifying the margin space on all sides of label.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.text Property

Gets or sets the label's text.

Namespace: MindFusion.Diagramming
Assembly: LinkLabel.js

Syntax

JavaScript Copy Code

```
get text() {}
set text(value) {}
```

Property Value

String

A string containing the label's text.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.textColor Property

Gets or sets the text color.

Namespace: MindFusion.Diagramming
Assembly: LinkLabel.js

Syntax

JavaScript Copy Code

```
get textColor() {}
set textColor(value) {}
```

Property Value

String

A string value identifying the text color.

See Also

LinkLabel Members
LinkLabel Class
MindFusion.Diagramming Namespace

LinkLabel.verticalAlign Property

Gets or sets the label's vertical alignment.

Namespace: MindFusion.Diagramming
Assembly: LinkLabel.js

Syntax

JavaScript Copy Code

```
get verticalAlign() {}
set verticalAlign(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration.

LinkNodesBehavior Class

The base class for behavior types that allow drawing both nodes and links.

Syntax

JavaScript Copy Code

```
// class
LinkNodesBehavior.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.BehaviorBase
MindFusion.Diagramming.LinkNodesBehavior

See Also

LinkNodesBehavior Members
MindFusion.Diagramming Namespace

LinkNodesBehavior Members

The base class for behavior types that allow drawing both nodes and links.

The following tables list the members exposed by the LinkNodesBehavior type.

Public Constructors

	Name	Description
	LinkNodesBehavior	Overloaded.

Public Properties

	Name	Description
	diagram	Gets the target diagram of this behavior object. (Inherited from BehaviorBase.)

Public Methods

	Name	Description
	createController	BehaviorBase.createController override.

LinkNodesBehavior Constructor (Diagram)

Initializes a new instance of the LinkNodesBehavior class.

Namespace: MindFusion.Diagramming
Assembly: LinkNodesBehavior.js

Syntax

JavaScript Copy Code

```
function LinkNodesBehavior (parent)
```

Parameters

parent
The Diagram this behavior will be associated with.

See Also

LinkNodesBehavior Constructor Overload List
LinkNodesBehavior Class
MindFusion.Diagramming Namespace

LinkNodesBehavior Constructor (DiagramView)

Initializes a new instance of the LinkNodesBehavior class.

Namespace: MindFusion.Diagramming
Assembly: LinkNodesBehavior.js

Syntax

JavaScript Copy Code

```
function LinkNodesBehavior (parent)
```

Parameters

parent
DiagramView. The DiagramView this behavior will be associated with.

See Also

LinkNodesBehavior Constructor Overload List
LinkNodesBehavior Class

LinkNodesBehavior Methods

LinkNodesBehavior.createController Method

BehaviorBase.createController override.

Namespace: MindFusion.Diagramming
Assembly: LinkNodesBehavior.js

Syntax

JavaScript Copy Code

```
function createController (state)
```

Parameters

state
Object. An object representing current context and input event.

Return Value

SinglePointerController. An instance of SinglePointerController -derived class.

LinkShape Enumeration

Specifies available styles for the segments of links.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
LinkShape = {}
```

Members

	Member name	Description
	Bezier	The segments of a link are Bézier curves.
	Polyline	The segments of a link are straight lines.
	Cascading	The segments of a link are alternating horizontal and vertical lines, orthogonal to each other.
	Spline	The segments of a link are curves forming an interpolating spline that passes through all control points.

Remarks

Members of this enumeration can be assigned to the shape property of DiagramLink.

See Also

MindFusion.Diagramming Namespace

LinkShapesBehavior Class

This class is used when view's behavior is set to Behavior.LinkShapes.

Syntax

JavaScript Copy Code

```
// class
LinkShapesBehavior.prototype = {}
```

Inheritance Hierarchy

See Also

LinkShapesBehavior Members
MindFusion.Diagramming Namespace

LinkShapesBehavior Members

This class is used when view's behavior is set to Behavior.LinkShapes.

The following tables list the members exposed by the LinkShapesBehavior type.

Public Constructors

	Name	Description
	LinkShapesBehavior	Initializes a new instance of the **LinkShapesBehavior** class.

Public Methods

	Name	Description
	createNode	LinkNodesBehavior.CreateNode override.

See Also

LinkShapesBehavior Class
MindFusion.Diagramming Namespace

LinkShapesBehavior Constructor

Initializes a new instance of the LinkShapesBehavior class.

Namespace: MindFusion.Diagramming
Assembly: LinkShapesBehavior.js

Syntax

JavaScript Copy Code

```
function LinkShapesBehavior (parent)
```

Parameters

parent
The Diagram this behavior will be associated with.

See Also

LinkShapesBehavior Class
MindFusion.Diagramming Namespace

LinkShapesBehavior Methods

LinkShapesBehavior.createNode Method

LinkNodesBehavior.CreateNode override.

Namespace: MindFusion.Diagramming
Assembly: LinkShapesBehavior.js

Syntax

JavaScript — Copy Code

```
function createNode ()
```

Return Value

An instance of the DiagramNode class.

See Also

LinkShapesBehavior Members
LinkShapesBehavior Class
MindFusion.Diagramming Namespace

LinkTextStyle Enumeration

Specifies the position and alignment of links' labels.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
LinkTextStyle = {}
```

Members

	Member name	Description
	Center	The text is displayed horizontally above the middle link segment or control point, depending on whetherthere are an odd or even number of segments.
	Rotate	The text is displayed rotated at the same angle as the segment where the text is placed.A long enough segment from the middle link segments is chosen for that purpose.
	OverLongestSegment	The text follows the longest link segment and is displayed centered at the segment's middle point.
	Follow	The label text starts from the first point of the link and follows the path defined by the link segments. This style is useful for displaying long text.
	MiddleSegment	The text is displayed horizontally above the middle link segment. If there are an even number of segments, the label is drawn over the longer from the two segments adjacent to the middle control point.
	MiddleSegmentRotated	The text is displayed rotated at the same angle as the segment where the text is placed. A long enough segmentfrom the middle link segments is chosen for that purpose.

Remarks

Members of this enumeration can be assigned to the textStyle property of DiagramLink.

LinkValidationEventArgs Members

Contains the arguments passed to handlers of link validation events.

The following tables list the members exposed by the LinkValidationEventArgs type.

Public Constructors

	Name	Description
	LinkValidationEventArgs	Initializes a new instance of the LinkValidationEventArgs class.

Public Properties

	Name	Description
	AdjustmentHandle	Gets or sets the adjustment handle being moved by the user. (Inherited from LinkEventArgs.)
	anchorIndex	Gets the zero-based index of the anchor point related to the event.
	Label	Gets or sets a LinkLabel related to this event. (Inherited from LinkEventArgs.)
	Link	Gets the link for which the event raised. (Inherited from LinkEventArgs.)
	MouseButton	Gets which mouse button has been pressed. (Inherited from LinkEventArgs.)
	MousePosition	Gets or sets the current mouse pointer position. (Inherited from LinkEventArgs.)
	node	Gets the node related to the event.
	tableRow	Gets the zero-based index of the table row related to the event.

ListViewBase Members
MindFusion.Diagramming Namespace

ListViewBase Members

The base class of ItemListView and NodeListView controls.

The following tables list the members exposed by the ListViewBase type.

Public Properties

	Name	Description
	backColor	Gets or sets the background color of the list view.
	draggedItem	Gets the currently dragged item.
	element	Returns a reference to the control's DOM element. (Inherited from Control.)
	enabled	Gets or sets whether mouse events are enabled. (Inherited from Control.)
	iconSize	Gets or sets the size of items displayed in this list view.
	items	Gets the items contained in this list view.
	licenseLocation	Gets or sets the location of the license key file. (Inherited from Control.)
	measureUnit	Gets the unit of measure used for logical coordinates. (Inherited from CanvasControl.)
	newInstanceSize	Gets or sets the default size of items created by drag-and-drop from this list view.
	orientation	Gets or sets the orientation of the view layout.
	padding	Gets or sets the padding space between item's slot bounds and its contents.
	shapeLibraryLocation	Gets the location of a shape library file containing custom shape definitions. It can be set to a full URL of the file, or a relative file path.
	textColor	Gets or sets the color used to paint item captions.
	tooltipDelay	Gets or sets the delay before a tooltip is shown.

Public Methods

	Name	Description
	addEventListener	Registers a single event listener on the instance. (Inherited from Disposable.)
S	addHandlers	Adds an event listener to a DOM element. (Inherited from Control.)
	addItem	Adds an item to the list view.
	clearAll	Removes all items from the list view.
S	clearHandlers	Removes all event listeners from a DOM element. (Inherited from Control.)
	clientToDoc	Transforms a point from client to document coordinates. (Inherited from CanvasControl.)
	docToClient	Transforms a point from document to client coordinates. (Inherited from CanvasControl.)
S	fromJson	Constructs a JavaScript object from a JSON string. (Inherited from Control.)
	getItemAt	Gets the item at the specified location.
	raiseEvent	Raises an event. (Inherited from Disposable.)

	registerForSubmit	Registers an onsubmit handler for the Control's parent html form to flush postback data. (Inherited from Control.)
	removeEventListener	Removes a single event listener attached to the instance. (Inherited from Disposable.)
	removeItem	Removes an item from the list view.
	selectItem	Selects the specified item.
	toJson	Converts a JavaScript object to a JSON string. (Inherited from Control.)

Public Events

	Name	Description
	controlLoaded	Raised when the control is loaded. (Inherited from Control.)
	controlUnloaded	Raised when the control is unloaded. (Inherited from Control.)
	controlUnloading	Raised when the control is unloading. (Inherited from Control.)
	linkSelected	Raised when a link is selected, either programmatically or by the user.
	nodeSelected	Raised when a node is selected, either programmatically or by the user.
	shapeLibraryLoaded	Raised when a ShapeLibrary is loaded from **shapeLibraryLocation**.

ListViewBase Methods

ListViewBase.addItem Method

Adds an item to the list view.

Namespace: MindFusion.Diagramming
Assembly: ListViewBase.js

Syntax

JavaScript Copy Code

```
function addItem (item, [caption, [locked, [inactive]]])
```

Parameters

item
DiagramItem. The item to add.

caption
Optional.
String. The caption to display for the item.

locked
Optional.
Boolean. Indicates whether the item can be dragged.

inactive
Optional.
Boolean. Indicates whether the item can be selected.

ListViewBase.iconSize Property

Gets or sets the size of items displayed in this list view.

Namespace: MindFusion.Diagramming
Assembly: ListViewBase.js

Syntax

JavaScript — Copy Code

```
get iconSize() {}
set iconSize(value) {}
```

Property Value

Size

An instance of the Size class specifying item size.

See Also

ListViewBase Members
ListViewBase Class
MindFusion.Diagramming Namespace
newInstanceSize Property
measureUnit Property

ListViewBase.items Property

Gets the items contained in this list view.

Namespace: MindFusion.Diagramming
Assembly: ListViewBase.js

Syntax

JavaScript — Copy Code

```
get items() {}
set items(value) {}
```

Property Value

Array

An array of DiagramItem objects to show in the list view.

Remarks

You must call addItem to add items to the list view, instead of modifying this array directly.

addItem Method
removeItem Method
clearAll Method

ListViewBase.newInstanceSize Property

Gets or sets the default size of items created by drag-and-drop from this list view.

Namespace: MindFusion.Diagramming
Assembly: ListViewBase.js

Syntax

JavaScript Copy Code

```
get newInstanceSize() {}
set newInstanceSize(value) {}
```

Property Value

Size

An instance of the Size class specifying item size.

See Also

ListViewBase Members
ListViewBase Class
MindFusion.Diagramming Namespace
iconSize Property
measureUnit Property

ListViewBase.orientation Property

Gets or sets the orientation of the view layout.

Namespace: MindFusion.Diagramming
Assembly: ListViewBase.js

Syntax

JavaScript Copy Code

```
get orientation() {}
set orientation(value) {}
```

Property Value

Orientation

A member of the Orientation enumeration.

See Also

ListViewBase Members
ListViewBase Class
MindFusion.Diagramming Namespace

ListViewBase.padding Property

Gets or sets the padding space between item's slot bounds and its contents.

Namespace: MindFusion.Diagramming
Assembly: ListViewBase.js

Syntax

JavaScript — Copy Code

```
get padding() {}
set padding(value) {}
```

Property Value

Number

A number that specifies the padding space size.

See Also

ListViewBase Members
ListViewBase Class
MindFusion.Diagramming Namespace

ListViewBase.shapeLibraryLocation Property

Gets the location of a shape library file containing custom shape definitions. It can be set to a full URL of the file, or a relative file path.

Namespace: MindFusion.Diagramming
Assembly: ListViewBase.js

Syntax

JavaScript — Copy Code

```
get shapeLibraryLocation() {}
set shapeLibraryLocation(value) {}
```

Property Value

String

URL of a shape library file containing custom shape definitions.

See Also

ListViewBase Members
ListViewBase Class
MindFusion.Diagramming Namespace

ListViewBase.textColor Property

Gets or sets the color used to paint item captions.

Namespace: MindFusion.Diagramming
Assembly: ListViewBase.js

Syntax

JavaScript — Copy Code

```
get textColor() {}
set textColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

ListViewBase Members
ListViewBase Class

ListViewBase.tooltipDelay Property

Gets or sets the delay before a tooltip is shown.

Namespace: MindFusion.Diagramming
Assembly: ListViewBase.js

Syntax

JavaScript Copy Code

```
get tooltipDelay() {}
set tooltipDelay(value) {}
```

Property Value

Number

The tooltip delay in milliseconds.

MagnifyBehavior Members

This class is used when view's behavior is set to Behavior.Magnify.

The following tables list the members exposed by the MagnifyBehavior type.

Public Constructors

	Name	Description
	MagnifyBehavior	Overloaded.

Public Properties

	Name	Description
	diagram	Gets the target diagram of this behavior object. (Inherited from BehaviorBase.)

Public Methods

	Name	Description
	createController	Creates a controller appropriate for current context and pointer position. (Inherited from BehaviorBase.)
	onMouseDown	BehaviorBase.onMouseDown override.
	onMouseMove	BehaviorBase.onMouseMove override.
	onMouseUp	BehaviorBase.onMouseUp override.

MagnifyBehavior Methods

MagnifyBehavior.onMouseDown Method

BehaviorBase.onMouseDown override.

Namespace: MindFusion.Diagramming
Assembly: MagnifyBehavior.js

Syntax

JavaScript Copy Code

```
function onMouseDown (e)
```

Parameters

e
A **MouseButtonEventArgs** that contains the event data.

Return Value

Boolean. true if interaction starts.

See Also

MagnifyBehavior Members
MagnifyBehavior Class

Manipulator Members

Manipulator is an abstract base class which defines the behavior of miscellaneous UI widgets attached to nodes.

The following tables list the members exposed by the Manipulator type.

Public Constructors

	Name	Description
	Manipulator	Initializes a new instance of the Manipulator class.

Public Properties

	Name	Description
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

See Also

Manipulator Class
MindFusion.Diagramming Namespace

Manipulator Constructor

Initializes a new instance of the Manipulator class.

Namespace: MindFusion.Diagramming
Assembly: Manipulator.js

Syntax

JavaScript Copy Code

```
function Manipulator ([node])
```

Parameters

node

Optional.
DiagramNode. The DiagramNode containing this manipulator.

See Also

Manipulator Class
MindFusion.Diagramming Namespace

MarkStyle Enumeration

Specifies the visual style of anchor point marks.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
MarkStyle = {}
```

Members

	Member name	Description
	None	No visual indication for the anchor point.
	Cross	Anchor point marked with a cross.
	X	Anchor point marked with an 'X'.
	Circle	Anchor point marked with a circle.
	Rectangle	Anchor point marked with a rectangle.
	Custom	Raises drawAnchorPoint event, which lets you draw custom graphics using the Canvas API.

Remarks

Members of this enumeration can be assigned to the markStyle property of AnchorPoint.

See Also

MindFusion.Diagramming Namespace

ModificationStart Enumeration

Specifies how the user can start modifying an item.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
ModificationStart = {}
```

Members

	Member name	Description
	SelectedOnly	Only selected objects can be modified.
	AutoHandles	Adjustment handles appear automatically around the object under the mouse; it can be modified without selecting it first.

Remarks

Members of this enumeration can be assigned to the modificationStart property of DiagramView.

See Also

MindFusion.Diagramming Namespace

ModifierKeyAction Enumeration

Defines the actions that can be assigned to a modifier key such as CTRL or ALT.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
ModifierKeyAction = {}
```

Members

	Member name	Description
	None	Specifies that a modifier key does not have any specific function assigned to it.
	Pan	Pan the view if the mouse is dragged while the modifier key is pressed down.
	Select	Start drawing a selection rectangle if the mouse is dragged while a modifier key is pressed down. Toggle the selection if an item is clicked while the key is down.
	OverrideBehavior	While the modifier key is pressed down, dragging the mouse starts creating a new item or drawing a selection rectangle instead of modifying a selected item. Otherwise, dragging the mouse could start modification of the selected item.
	Magnify	Magnifies the diagram objects under the mouse while the modifier key is pressed down.
	Zoom	Start drawing a zoom-lasso if the mouse is dragged while respective modifier key is pressed down.

Remarks

Members of this enumeration can be assigned to the properties of view's modifierKeyActions.

See Also

MindFusion.Diagramming Namespace

ModifierKeyActions Class

Maps keyboard modifier keys to special actions in MindFusion.Diagramming such as panning and drawing selection rectangle.

Syntax

JavaScript — Copy Code

```
// class
ModifierKeyActions.prototype = {}
```

Remarks

The modifierKeyActions property of DiagramView returns an object from this class, letting you specify the modifier key functions for each view instance.

Assign member of the ModifierKeyAction enumeration to the alt, control and shift properties to specify what function is assigned to the ALT, CTRL and SHIFT keys.

Inheritance Hierarchy

MindFusion.Diagramming.ModifierKeyActions

See Also

ModifierKeyActions Members
MindFusion.Diagramming Namespace

ModifierKeyActions Members

Maps keyboard modifier keys to special actions in MindFusion.Diagramming such as panning and drawing selection rectangle.

The following tables list the members exposed by the ModifierKeyActions type.

Public Constructors

	Name	Description
	ModifierKeyActions	Initializes a new instance of the ModifierKeyActions class.

Public Properties

	Name	Description
	alt	Gets or sets the action triggered by the ALT key.
	control	Gets or sets the action triggered by the CTRL key.
	shift	Gets or sets the action triggered by the SHIFT key.

See Also

ModifierKeyActions Class
MindFusion.Diagramming Namespace

ModifierKeyActions Constructor

Initializes a new instance of the ModifierKeyActions class.

Namespace: MindFusion.Diagramming
Assembly: ModifierKeyActions.js

Syntax

JavaScript Copy Code

```
function ModifierKeyActions ()
```

See Also

ModifierKeyActions Class
MindFusion.Diagramming Namespace

ModifierKeyActions Properties

ModifierKeyActions.alt Property

Gets or sets the action triggered by the ALT key.

Namespace: MindFusion.Diagramming
Assembly: ModifierKeyActions.js

Syntax

JavaScript Copy Code

```
get alt() {}
set alt(value) {}
```

Property Value

ModifierKeyAction

A member of the ModifierKeyAction enumeration.

Remarks

The value of this property specifies what happens when a user holds down the ALT key and drags the mouse. The default value Pan makes the control enter pan mode, letting the user scroll the diagram contents by dragging it with the mouse. You can change the function of ALT by assigning a different value to this property.

See Also

ModifierKeyActions Members
ModifierKeyActions Class
MindFusion.Diagramming Namespace

ModifierKeyActions.control Property

Gets or sets the action triggered by the CTRL key.

Namespace: MindFusion.Diagramming
Assembly: ModifierKeyActions.js

Syntax

JavaScript Copy Code

```
get control() {}
set control(value) {}
```

Property Value

ModifierKeyAction

A member of the ModifierKeyAction enumeration.

Remarks

The value of this property specifies what happens when a user holds down the CTRL key and drags the mouse. The default value Select makes the control enter selection mode, letting the user draw a lasso rectangle around diagram items in order to select them. You can change the function of CTRL by assigning a different value to this property.

See Also

ModifierKeyActions Members
ModifierKeyActions Class
MindFusion.Diagramming Namespace

ModifierKeyActions.shift Property

Gets or sets the action triggered by the SHIFT key.

Namespace: MindFusion.Diagramming
Assembly: ModifierKeyActions.js

Syntax

JavaScript Copy Code

```
get shift() {}
set shift(value) {}
```

Property Value

ModifierKeyAction

A member of the ModifierKeyAction enumeration.

Remarks

The value of this property specifies what happens when a user holds down the SHIFT key and drags the mouse. The default value OverrideBehavior makes the control ignore item's selection handles, thus not allowing modifying a selected item but starts the creation of a new item. You can change the function of SHIFT by assigning a different value to this property.

ModifyBehavior Constructor (Diagram)

Initializes a new instance of the ModifyBehavior class.

Namespace: MindFusion.Diagramming
Assembly: ModifyBehavior.js

Syntax

JavaScript Copy Code

```
function ModifyBehavior (parent)
```

Parameters

parent
The Diagram this behavior will be associated with.

See Also

ModifyBehavior Constructor Overload List
ModifyBehavior Class
MindFusion.Diagramming Namespace

ModifyBehavior Constructor (DiagramView)

Initializes a new instance of the ModifyBehavior class.

Namespace: MindFusion.Diagramming
Assembly: ModifyBehavior.js

Syntax

JavaScript Copy Code

```
function ModifyBehavior (parent)
```

Parameters

parent
DiagramView. The DiagramView this behavior will be associated with.

See Also

ModifyBehavior Constructor Overload List
ModifyBehavior Class

ModifyBehavior Methods

ModifyBehavior.createController Method

BehaviorBase.createController override.

Namespace: MindFusion.Diagramming
Assembly: ModifyBehavior.js

Syntax

JavaScript Copy Code

```
function createController (state)
```

Parameters

state
Object. An object representing current context and input event.

Return Value

SinglePointerController. An instance of SinglePointerController -derived class.

See Also

ModifyBehavior Members
ModifyBehavior Class
MindFusion.Diagramming Namespace

ModifyLinkController Class

A controller used to modify existing links in the diagram.

Syntax

JavaScript Copy Code

```
// class
ModifyLinkController.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.SinglePointerController
MindFusion.Diagramming.ModifyLinkController

See Also

ModifyLinkController Members
MindFusion.Diagramming Namespace

ModifyLinkController Members

A controller used to modify existing links in the diagram.

The following tables list the members exposed by the ModifyLinkController type.

Public Constructors

	Name	Description

	ModifyLinkController	Initializes a new instance of the ModifyLinkController class.

Public Methods

	Name	Description
	cancel	Called when the user stops drawing or modifying a diagram element, rejecting the operation. (Inherited from SinglePointerController.)
	commit	SinglePointerController.commit override.
	drawInteraction	Called to draw current state of user interaction. (Inherited from SinglePointerController.)
	move	SinglePointerController.move override.
	start	SinglePointerController.start override.
	validate	SinglePointerController.validate override.

ModifyLinkController Constructor

Initializes a new instance of the ModifyLinkController class.

Namespace: MindFusion.Diagramming
Assembly: ModifyLinkController.js

Syntax

JavaScript Copy Code

```
function ModifyLinkController (link, adjustmentHandle)
```

Parameters

link
DiagramLink. The link that will be modified by this controller.

adjustmentHandle
Object. An object representing the adjustment handle used to modify the link.

See Also

ModifyLinkController Class
MindFusion.Diagramming Namespace

ModifyLinkController Methods

ModifyLinkController.commit Method

SinglePointerController.commit override.

Namespace: MindFusion.Diagramming
Assembly: ModifyLinkController.js

Syntax

JavaScript Copy Code

```
function commit (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

ModifyLinkController Members
ModifyLinkController Class
MindFusion.Diagramming Namespace

ModifyLinkController.move Method

SinglePointerController.move override.

Namespace: MindFusion.Diagramming
Assembly: ModifyLinkController.js

Syntax

MouseButtonActions Enumeration

Specifies what actions can be associated with the middle and right mouse buttons.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
MouseButtonActions = {}
```

Members

	Member name	Description
	None	Do not associate any action with the button.
	Pan	Pans the view if the mouse is dragged while the button is pressed down.
	Cancel	Cancels the current drawing operation.
	Select	Starts a multiple selection operation.
	Draw	Draw new items or modify existing items.
	Magnify	Magnifies the items under the mouse while the button is pressed down.
	Zoom	Draw a zoom-lasso if the mouse is dragged with specified button pressed down.

Remarks

Members of this enumeration can be assigned to the middleButtonActions and rightButtonActions properties of DiagramView.

MouseInputDispatcher Constructor Overload List
MouseInputDispatcher Class
MindFusion.Diagramming Namespace

MouseInputDispatcher Constructor (DiagramView)

Initializes a new instance of the MouseInputDispatcher class.

Namespace: MindFusion.Diagramming
Assembly: MouseInputDispatcher.js

Syntax

JavaScript — Copy Code

```
function MouseInputDispatcher (diagramView)
```

Parameters

diagramView
DiagramView. The DiagramView instance that should receive mouse input.

See Also

MouseInputDispatcher Constructor Overload List
MouseInputDispatcher Class
MindFusion.Diagramming Namespace

MouseInputDispatcher Methods

MouseInputDispatcher.onMouseDown Method

Called when the user presses down a mouse button.

Namespace: MindFusion.Diagramming
Assembly: MouseInputDispatcher.js

Syntax

JavaScript — Copy Code

```
function onMouseDown (position, button)
```

Parameters

position
Point. A point specified in diagram coordinates.

button
Number. 0 for left button, 1 for middle button, 2 for right button.

See Also

MouseInputDispatcher Members
MouseInputDispatcher Class
MindFusion.Diagramming Namespace

MouseInputDispatcher.onMouseMove Method

Called when the user moves the mouse.

MouseWheelAction Enumeration

Specifies the type of action performed when the user rotates the mouse wheel.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
MouseWheelAction = {}
```

Members

	Member name	Description
	None	The control does not handle wheel rotation internally, but raises mouseWheel event to allow custom handling.
	Scroll	Indicates that the mouse wheel should scroll the view.
	Zoom	Indicates that the mouse wheel should zoom the view.

Remarks

Members of this enumeration can be assigned to the mouseWheelAction property of DiagramView.

MoveNodesBehavior Class

This class is used when view's behavior is set to Behavior.MoveNodes.

Syntax

JavaScript — Copy Code

```
// class
MoveNodesBehavior.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.BehaviorBase
  MindFusion.Diagramming.MoveNodesBehavior

See Also

MoveNodesBehavior Members
MindFusion.Diagramming Namespace

MoveNodesBehavior Members

This class is used when view's behavior is set to Behavior.MoveNodes.

The following tables list the members exposed by the MoveNodesBehavior type.

Public Constructors

	Name	Description
	MoveNodesBehavior	Initializes a new instance of the MoveNodesBehavior class.

Public Properties

	Name	Description
	diagram	Gets the target diagram of this behavior object. (Inherited from BehaviorBase.)

Public Methods

	Name	Description
	createController	BehaviorBase.createController override.

See Also

MoveNodesBehavior Class
MindFusion.Diagramming Namespace

MoveNodesBehavior Constructor

Initializes a new instance of the MoveNodesBehavior class.

Namespace: MindFusion.Diagramming
Assembly: MoveNodesBehavior.js

Syntax

JavaScript — Copy Code

```
function MoveNodesBehavior (parent)
```

Parameters

parent
DiagramView. The DiagramView this behavior will be associated with.

See Also

MoveNodesBehavior Class
MindFusion.Diagramming Namespace

MoveNodesBehavior Methods

MoveNodesBehavior.createController Method

BehaviorBase.createController override.

Namespace: MindFusion.Diagramming
Assembly: MoveNodesBehavior.js

Syntax

JavaScript Copy Code

```
function createController (state)
```

Parameters

state
Object. An object representing current context and input event.

Return Value

MindFusion.Diagramming.SinglePointerController. An instance of SinglePointerController -derived class.

See Also

MoveNodesBehavior Members
MoveNodesBehavior Class
MindFusion.Diagramming Namespace

NodeConstraints Class

Defines specific constraints that can be applied to the size and location of nodes.

Syntax

JavaScript Copy Code

```
// class
NodeConstraints.prototype = {}
```

Remarks

Instances of this class can be assigned to the constraints property of nodes.

Inheritance Hierarchy

MindFusion.Diagramming.NodeConstraints

See Also

NodeConstraints Members
MindFusion.Diagramming Namespace

NodeConstraints Members

Defines specific constraints that can be applied to the size and location of nodes.

The following tables list the members exposed by the NodeConstraints type.

Public Constructors

	Name	Description
	NodeConstraints	Initializes a new instance of the **NodeConstraints** class.

Public Properties

	Name	Description
	keepRatio	Gets or sets a value indicating whether the initial width/height ratio of a node should be preserved.
	maxHeight	Gets or sets the maximal node height allowed.
	maxWidth	Gets or sets the maximal node width allowed.
	minHeight	Gets or sets the minimal node height allowed.
	minWidth	Gets or sets the minimal node width allowed.
	moveDirection	Gets or sets constraints on movement direction.

See Also

NodeConstraints Class
MindFusion.Diagramming Namespace

NodeConstraints Constructor

Initializes a new instance of the NodeConstraints class.

Namespace: MindFusion.Diagramming
Assembly: NodeConstraints.js

Syntax

JavaScript Copy Code

```
function NodeConstraints ()
```

See Also

NodeConstraints Class
MindFusion.Diagramming Namespace

NodeConstraints Properties

NodeConstraints.keepRatio Property

Gets or sets a value indicating whether the initial width/height ratio of a node should be preserved.

Namespace: MindFusion.Diagramming
Assembly: NodeConstraints.js

Syntax

JavaScript Copy Code

```
get keepRatio() {}
set keepRatio(value) {}
```

Property Value

Boolean

true to preserve the initial width/height ratio of a node, or **false** othwerise. The default is **false**.

Remarks

If you enable this property from a custom node class' constructor or an initialization-event handler, the node will keep an aspect ratio of 1:1. Thus you could let users draw perfect square or circle shapes by setting **keepRatio** to **true** from the initializeNode handler.

See Also

NodeConstraints Members
NodeConstraints Class
MindFusion.Diagramming Namespace

NodeConstraints.maxHeight Property

Gets or sets the maximal node height allowed.

Namespace: MindFusion.Diagramming
Assembly: NodeConstraints.js

Syntax

JavaScript Copy Code

```
get maxHeight() {}
set maxHeight(value) {}
```

Property Value

Number

A number specifying the maximal node height.

Remarks

0 = no height constraints; any other value specifies the maximal node height allowed.

See Also

NodeConstraints Members
NodeConstraints Class
MindFusion.Diagramming Namespace

NodeConstraints.maxWidth Property

Gets or sets the maximal node width allowed.

Namespace: MindFusion.Diagramming
Assembly: NodeConstraints.js

Syntax

JavaScript Copy Code

```
get maxWidth() {}
set maxWidth(value) {}
```

Property Value

Number

A number specifying the maximal node width.

Remarks

0 = no width constraints; any other value specifies the maximal node width allowed.

See Also

NodeConstraints Members
NodeConstraints Class
MindFusion.Diagramming Namespace

NodeConstraints.minHeight Property

Gets or sets the minimal node height allowed.

Namespace: MindFusion.Diagramming
Assembly: NodeConstraints.js

Syntax

JavaScript Copy Code

```
get minHeight() {}
set minHeight(value) {}
```

Property Value

Number

A number specifying the minimal node height.

Remarks

0 = no height constraints; any other value specifies the minimal node height allowed.

See Also

NodeConstraints Members
NodeConstraints Class
MindFusion.Diagramming Namespace

NodeConstraints.minWidth Property

Gets or sets the minimal node width allowed.

Namespace: MindFusion.Diagramming
Assembly: NodeConstraints.js

Syntax

JavaScript Copy Code

```
get minWidth() {}
set minWidth(value) {}
```

Property Value

Number

A number specifying the minimal node width.

Remarks

0 = no width constraints; any other value specifies the minimal node width allowed.

See Also

NodeConstraints Members
NodeConstraints Class

NodeConstraints.moveDirection Property

Gets or sets constraints on movement direction.

Namespace: MindFusion.Diagramming
Assembly: NodeConstraints.js

Syntax

JavaScript — Copy Code

```
get moveDirection() {}
set moveDirection(value) {}
```

Property Value

DirectionConstraint

A member of the DirectionConstraint enumeration. The default value is **None**.

NodeEffect Class

Represents the base class of all visual effects that can be applied to the nodes in a Diagram.

Syntax

JavaScript — Copy Code

```
// class
NodeEffect.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.NodeEffect

See Also

NodeEffect Members
MindFusion.Diagramming Namespace

NodeEffect Members

Represents the base class of all visual effects that can be applied to the nodes in a Diagram.

The following tables list the members exposed by the NodeEffect type.

See Also

NodeEffect Class
MindFusion.Diagramming Namespace

NodeEventArgs Class

Contains the arguments passed to handlers of node-related events.

Syntax

JavaScript — Copy Code

```
// class
NodeEventArgs.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.ItemEventArgs
  MindFusion.Diagramming.NodeEventArgs

See Also

NodeEventArgs Members
MindFusion.Diagramming Namespace
Events Class

NodeEventArgs Members

Contains the arguments passed to handlers of node-related events.

The following tables list the members exposed by the NodeEventArgs type.

Public Constructors

	Name	Description
	NodeEventArgs	Initializes a new instance of the **NodeEventArgs** class.

Public Properties

	Name	Description
	container	Gets the container a node has been added to or removed from.
	hyperlink	Gets the hyperlink that was clicked inside a node.
	Index	Gets an integer index related to the event. (Inherited from ItemEventArgs.)
	Item	Gets the item for which the event is raised. (Inherited from ItemEventArgs.)
	label	Gets the node label for which the event is raised.
	node	Gets the node for which the event is raised.

See Also

NodeEventArgs Class
MindFusion.Diagramming Namespace

NodeEventArgs Constructor

Initializes a new instance of the NodeEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript — Copy Code

```
function NodeEventArgs (args)
```

Parameters

args

See Also

NodeEventArgs Class
MindFusion.Diagramming Namespace

NodeEventArgs Properties

NodeEventArgs.container Property

Gets the container a node has been added to or removed from.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get container() {}
```

Property Value

ContainerNode

A ContainerNode instance.

See Also

NodeEventArgs Members
NodeEventArgs Class
MindFusion.Diagramming Namespace

NodeEventArgs.hyperlink Property

Gets the hyperlink that was clicked inside a node.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get hyperlink() {}
```

Property Value

String

A string containing clicked hyperlink.

Remarks

This value is valid when handling hyperlinkClicked event.

See Also

NodeEventArgs Members
NodeEventArgs Class
MindFusion.Diagramming Namespace

NodeEventArgs.label Property

Gets the node label for which the event is raised.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript — Copy Code

```
get label() {}
set label(value) {}
```

Property Value

NodeLabel

A NodeLabel instance.

See Also

NodeEventArgs Members
NodeEventArgs Class
MindFusion.Diagramming Namespace

NodeEventArgs.node Property

Gets the node for which the event is raised.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript — Copy Code

```
get node() {}
```

Property Value

DiagramNode

An instance of the DiagramNode class.

See Also

NodeEventArgs Members
NodeEventArgs Class
MindFusion.Diagramming Namespace

NodeLabel Class

Represents a supplementary label displayed by a DiagramNode. New labels can be added to a node by calling its addLabel method.

Syntax

JavaScript — Copy Code

```
// class
NodeLabel.prototype = {}
```

Remarks

The position of a label is determined by where it is pinned relative to node's bounding box, and offset from the pin point, as set using setCornerPosition, setEdgePosition and setCenterPosition methods. In addition, the horizontalAlign and verticalAlign properties specify whether the label is centered on its pin point or aligned to it.

You can let users arrange labels manually by setting the behavior property of DiagramView to MoveLabels.

Inheritance Hierarchy

MindFusion.Diagramming.ItemLabel
MindFusion.Diagramming.NodeLabel

See Also

NodeLabel Members
MindFusion.Diagramming Namespace

NodeLabel Members

Represents a supplementary label displayed by a DiagramNode. New labels can be added to a node by calling its addLabel method.

The following tables list the members exposed by the NodeLabel type.

Public Constructors

	Name	Description
	NodeLabel	Initializes a new instance of the **NodeLabel** class.

Public Properties

	Name	Description
	Brush	Gets or sets the brush used to draw the label's background. (Inherited from ItemLabel.)
	ContentPadding	Gets or sets the distance between image and text when both are specified. (Inherited from ItemLabel.)
	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled. (Inherited from ItemLabel.)
	EnableWrap	Gets or sets a value indicating whether the label's text can be wrapped. (Inherited from ItemLabel.)
	Font	Gets or sets the label's font. (Inherited from ItemLabel.)
	HorizontalAlign	Gets or sets the label's horizontal alignment. (Inherited from ItemLabel.)
	HorizontalOffset	Gets or sets the label's horizontal offset from its pin point. (Inherited from ItemLabel.)
	Image	Gets or sets the image displayed by this label. (Inherited from ItemLabel.)
	ImageAlign	Gets or sets the alignment of label's image relative to text. (Inherited from ItemLabel.)
	ImageSize	Gets or sets a size that overrides the native image size. (Inherited from ItemLabel.)
	ImageUrl	Gets or sets URL of the image to display inside this label. (Inherited from ItemLabel.)
	Index	Gets or sets the index of an edge or point this label is relative to. (Inherited from ItemLabel.)
	Item	Gets or sets the DiagramItem that displays this label. (Inherited from ItemLabel.)
	Locked	Gets or sets a value indicating whether users are allowed to edit this label. (Inherited from ItemLabel.)
	Margin	Gets or sets the label's margin. (Inherited from ItemLabel.)
	MaxWidth	Gets or sets the maximum width of the label. (Inherited from ItemLabel.)
	Text	Gets or sets the label's text. (Inherited from ItemLabel.)

	TextBrush	Gets or sets the brush used to draw the label's text. (Inherited from ItemLabel.)
	VerticalAlign	Gets or sets the label's vertical alignment. (Inherited from ItemLabel.)
	VerticalOffset	Gets or sets the label's vertical offset from its pin point. (Inherited from ItemLabel.)

Public Methods

	Name	Description
	Cancel	Called when drag operation is canceled. (Inherited from ItemLabel.)
	Draw	Draws the label on the specified IGraphics surface. (Inherited from ItemLabel.)
	GetEditRect	InplaceEditable.GetEditRect implementation. (Inherited from ItemLabel.)
	GetTextToEdit	InplaceEditable.GetTextToEdit implementation. (Inherited from ItemLabel.)
	LoadFromXml	Loads the label from the specified XML element. (Inherited from ItemLabel.)
	OnMouseDown	Called when the left mouse button is pressed while the pointer is over this label. (Inherited from ItemLabel.)
	OnMouseMove	Called when the mouse is moved while this label tracks the mouse events. (Inherited from ItemLabel.)
	OnMouseUp	Called when the left mouse button is released while this label tracks the mouse events. (Inherited from ItemLabel.)
	SaveToXml	Saves the label into the specified XML element. (Inherited from ItemLabel.)
	setCenterPosition	Positions this label relatively to the node center.
	setCornerPosition	Positions this label relatively to the specified corner point.
	setEdgePosition	Positions this label relatively to the specified node edge.
	SetEditedText	InplaceEditable.SetEditedText implementation. (Inherited from ItemLabel.)
	SetMouseCursor	Indicates what cursor to display for interactive labels. (Inherited from ItemLabel.)
	UpdateValue	Called while drag operation is in progress. (Inherited from ItemLabel.)

Protected Methods

	Name	Description
	LoadFromJson	Loads the label from a JsonObject. (Inherited from ItemLabel.)
	SaveToJson	Saves the label into a **JsonObject**. (Inherited from ItemLabel.)

See Also

NodeLabel Class
MindFusion.Diagramming Namespace

NodeLabel Constructor

Initializes a new instance of the NodeLabel class.

Namespace: MindFusion.Diagramming
Assembly: NodeLabel.js

Syntax

JavaScript Copy Code

```
function NodeLabel (node, text)
```

Parameters

node
DiagramNode. The DiagramNode that displays the label.

text
String. The label's text.

See Also

NodeLabel Class
MindFusion.Diagramming Namespace

NodeLabel Methods

NodeLabel.setCenterPosition Method

Positions this label relatively to the node center.

Namespace: MindFusion.Diagramming
Assembly: NodeLabel.js

Syntax

JavaScript Copy Code

```
function setCenterPosition (dx, dy)
```

Parameters

dx
Number. Horizontal offset from the center point.

dy
Number. Vertical offset from the center point.

Remarks

This method sets the node's center as label's pin point and assigns specified offsets to horizontalOffset and verticalOffset properties.

See Also

NodeLabel Members
NodeLabel Class
MindFusion.Diagramming Namespace

NodeLabel.setCornerPosition Method

Positions this label relatively to the specified corner point.

Namespace: MindFusion.Diagramming
Assembly: NodeLabel.js

Syntax

JavaScript Copy Code

```
function setCornerPosition (cornerPoint, dx, dy)
```

Parameters

cornerPoint
Number. The corner point index.

dx
Number. Horizontal offset from the corner point.

dy
Number. Vertical offset from the corner point.

Remarks

This method sets node's corner as label's pin point and assigns specified offsets to horizontalOffset and verticalOffset properties. The *cornerPoint* index starts counting from top-left corner in clockwise direction:

- 0 desigates top-left corner;
- 1 desigates top-right corner;
- 2 desigates bottom-right corner;
- 3 desigates bottom-left corner;

See Also

NodeLabel Members
NodeLabel Class
MindFusion.Diagramming Namespace

NodeLabel.setEdgePosition Method

Positions this label relatively to the specified node edge.

Namespace: MindFusion.Diagramming
Assembly: NodeLabel.js

Syntax

JavaScript Copy Code

```
function setEdgePosition (edge, dx, dy)
```

Parameters

edge
Number. The edge index.

dx
Number. Horizontal offset from the edge center.

dy
Number. Vertical offset from the edge center.

Remarks

This method sets the middle point of node's edge as label's pin point and assigns specified offsets to horizontalOffset and verticalOffset properties. The *edge* index starts counting from top side in clockwise direction:

- 0 desigates center of top edge;
- 1 desigates center of right edge;
- 2 desigates center of bottom edge;
- 3 desigates center of left edge;

NodeLabel Class
MindFusion.Diagramming Namespace

NodeListView Class

A list view control that hosts DiagramNodes and supports drag-and-drop to DiagramView.

Syntax

JavaScript Copy Code

```
// class
NodeListView.prototype = {}
```

Remarks

Obsolete

This component has been superseded by ItemListView, which can also display DiagramLink objects and supports multi-column layouts.

Call the addNode method to add a node to the view.

Drag-and-drop operations create a clone of the dragged node by calling its clone method. You can override clone to copy property values of custom node subclasses.

Inheritance Hierarchy

MindFusion.Controls.CanvasControl

MindFusion.Diagramming Namespace
Palette Class

NodeListView Members

A list view control that hosts DiagramNodes and supports drag-and-drop to DiagramView.

The following tables list the members exposed by the NodeListView type.

Public Constructors

	Name	Description
	NodeListView	Creates an instance of NodeListView

Public Properties

	Name	Description
	backColor	Gets or sets the background color of the control.
	defaultNodeSize	Gets or sets the default size of nodes created after dragging from this list view.
	draggedItem	Gets the currently dragged item. (Inherited from ListViewBase.)
	draggedNode	Gets the currently dragged node from this list view.
	element	Returns a reference to the control's DOM element. (Inherited from Control.)
	enabled	Gets or sets whether mouse events are enabled. (Inherited from Control.)
	iconSize	Gets or sets the size of nodes displayed in this list view.
	items	Gets the items contained in this list view. (Inherited from ListViewBase.)
	licenseLocation	Gets or sets the location of the license key file. (Inherited from Control.)
	measureUnit	Gets the unit of measure used for logical coordinates. (Inherited from CanvasControl.)

	newInstanceSize	Gets or sets the default size of items created by drag-and-drop from this list view. (Inherited from ListViewBase.)
	nodes	Gets the nodes contained in this NodeListView.
	orientation	Gets or sets the orientation of the view layout.
	padding	Gets or sets the padding space between the NodeListView control and its contents.
	shapeLibraryLocation	Gets the location of a shape library file containing custom shape definitions.It can be set to a full URL of the file, or a relative file path.
	textColor	Gets or sets the color used to paint text in the NodeListView control.
	tooltipDelay	Gets or sets the delay before a tooltip is shown.

Public Methods

	Name	Description
	addEventListener	Registers a single event listener on the instance. (Inherited from Disposable.)
S	addHandlers	Adds an event listener to a DOM element. (Inherited from Control.)
	addItem	Adds an item to the list view. (Inherited from ListViewBase.)
	addNode	Adds a node to the NodeListView.
	clearAll	Removes all items from the **NodeListView**.
S	clearHandlers	Removes all event listeners from a DOM element. (Inherited from Control.)
	clientToDoc	Transforms a point from client to document coordinates. (Inherited from CanvasControl.)
S	create	Creates and initializes a new **NodeListView** from the specified element. This method is static and can be called without creating an instance of the class.
	docToClient	Transforms a point from document to client coordinates. (Inherited from CanvasControl.)
S	find	Returns the specified **NodeListView** object. This member is static and can be invoked without creating an instance of the class.
S	fromJson	Constructs a JavaScript object from a JSON string. (Inherited from Control.)
	getItemAt	Gets the item at the specified location. (Inherited from ListViewBase.)
	getNodeAt	Gets the item at the specified location.
	raiseEvent	Raises an event. (Inherited from Disposable.)
	registerForSubmit	Registers an onsubmit handler for the Control's parent html form to flush postback data. (Inherited from Control.)
	removeEventListener	Removes a single event listener attached to the instance. (Inherited from Disposable.)
	removeItem	Removes an item from the list view. (Inherited from ListViewBase.)
	removeNode	Removes a node from the list view.
	selectItem	Selects the specified item.
	selectItem	Selects the specified item. (Inherited from ListViewBase.)
S	toJson	Converts a JavaScript object to a JSON string. (Inherited from Control.)

Public Events

	Name	Description
	controlLoaded	Raised when the control is loaded. (Inherited from Control.)
	controlUnloaded	Raised when the control is unloaded. (Inherited from Control.)
	controlUnloading	Raised when the control is unloading. (Inherited from Control.)
	linkSelected	Raised when a link is selected, either programmatically or by the user. (Inherited from ListViewBase.)
	nodeSelected	Raised when a node is selected, either programmatically or by the user.
	shapeLibraryLoaded	Raised when a ShapeLibrary is loaded from **shapeLibraryLocation**.

MindFusion.Diagramming Namespace

NodeListView Constructor

Creates an instance of NodeListView

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript Copy Code

```
function NodeListView (element)
```

Parameters

element
HTMLCanvasElement. The Canvas DOM Element this NodeListView is associated with.

See Also

NodeListView Class
MindFusion.Diagramming Namespace

NodeListView Methods

NodeListView.addNode Method

Adds a node to the NodeListView.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript Copy Code

```
function addNode (node, [caption])
```

Parameters

node
DiagramNode. The node to add.

caption

Optional.
String. The caption to display for the node.

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace
addNode Method
removeNode Method

NodeListView.create Method

Creates and initializes a new NodeListView from the specified element. This method is static and can be called without creating an instance of the class.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript Copy Code

```
function create (element)
```

Parameters

element
HTMLCanvasElement. The DOM element that the NodeListView should be attached to.

Return Value

A NodeListView object that represents the newly created list view.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace

NodeListView.find Method

Returns the specified NodeListView object. This member is static and can be invoked without creating an instance of the class.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript — Copy Code

```
function find (id)
```

Parameters

id
String. The id of the NodeListView's element.

Return Value

A NodeListView object that contains the list view requested by id, if found, or **null** otherwise.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace

NodeListView.getNodeAt Method

Gets the item at the specified location.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript — Copy Code

```
function getNodeAt (point)
```

Parameters

point
Point. The location where to look.

Return Value

DiagramNode. The item found.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace

NodeListView.removeNode Method

Removes a node from the list view.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript — Copy Code

```
function removeNode (node)
```

Parameters

node
DiagramNode. The node to remove.

See Also

NodeListView Members

MindFusion.Diagramming Namespace
addNode Method
clearAll Method

NodeListView.selectItem Method

Selects the specified item.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript Copy Code

```
function selectItem (item)
```

Parameters

item
DiagramNode. The item to select.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace

NodeListView Properties

NodeListView.backColor Property

Gets or sets the background color of the control.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript Copy Code

```
get backColor() {}
set backColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace

NodeListView.defaultNodeSize Property

Gets or sets the default size of nodes created after dragging from this list view.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

```
JavaScript                                                    Copy Code

get defaultNodeSize() {}
set defaultNodeSize(value) {}
```

Property Value

Size

An instance of the Size class specifying node size.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace

NodeListView.draggedNode Property

Gets the currently dragged node from this list view.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

```
JavaScript                                                    Copy Code

get draggedNode() {}
```

Property Value

DiagramNode

The dragged diagram node.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace

NodeListView.iconSize Property

Gets or sets the size of nodes displayed in this list view.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

```
JavaScript                                                    Copy Code

get iconSize() {}
```

Property Value

Size

An instance of the Size class specifying node size.

See Also

NodeListView.nodes Property

Gets the nodes contained in this NodeListView.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript Copy Code

```
get nodes() {}
```

Property Value

Array

An array of DiagramNode objects to show in the list view.

Remarks

You must call addNode to add nodes to the list view, instead of modifying this array directly.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace

NodeListView.orientation Property

Gets or sets the orientation of the view layout.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript Copy Code

```
get orientation() {}
set orientation(value) {}
```

Property Value

Orientation

A member of the Orientation enumeration.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace

NodeListView.padding Property

Gets or sets the padding space between the NodeListView control and its contents.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript Copy Code

```
get padding() {}
set padding(value) {}
```

Property Value

Number

A number that specifies the padding space size.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace

NodeListView.shapeLibraryLocation Property

Gets the location of a shape library file containing custom shape definitions.It can be set to a full URL of the file, or a relative file path.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript Copy Code

```
get shapeLibraryLocation() {}
set shapeLibraryLocation(value) {}
```

Property Value

String

URL of a shape library file containing custom shape definitions.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace

NodeListView.textColor Property

Gets or sets the color used to paint text in the NodeListView control.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript Copy Code

```
get textColor() {}
set textColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

NodeListView Members
NodeListView Class
MindFusion.Diagramming Namespace

NodeListView.tooltipDelay Property

Gets or sets the delay before a tooltip is shown.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript — Copy Code

```
get tooltipDelay() {}
set tooltipDelay(value) {}
```

Property Value

Number

The tooltip delay in milliseconds.

MindFusion.Diagramming Namespace

NodeListView.shapeLibraryLoaded Event

Raised when a ShapeLibrary is loaded from shapeLibraryLocation.

Namespace: MindFusion.Diagramming
Assembly: NodeListView.js

Syntax

JavaScript — Copy Code

```
nodeList.shapeLibraryLoaded.addEventListener(onShapeLibraryLoaded);
```

See Also

NodeListView Members
NodeListView Class

Orientation Enumeration

Specifies the orientation of user interface elements.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
Orientation = {}
```

Members

	Member name	Description
	Auto	Select orientation automatically.
	Horizontal	Specifies horizontal orientation.
	Vertical	Specifies vertical orientation.

Overview Class

The **Overview** control provides a scaled-down view of Diagram contents and allows scrolling and zooming a DiagramView.

Syntax

JavaScript — Copy Code

```
// class
Overview.prototype = {}
```

Remarks

To specify which DiagramView instance is controlled by the overview, set the diagramView property. Set the scaleMode property to specify if overview should zoom-to-fit the whole diagram or display it at a fixed scale.

Overview Members

The Overview control provides a scaled-down view of Diagram contents and allows scrolling and zooming a DiagramView.

The following tables list the members exposed by the **Overview** type.

Public Constructors

	Name	Description

	Overview	Initializes a new instance of the Overview class.

Public Properties

	Name	Description
	allowZoom	Gets or sets a value indicating whether users are allowed to zoom the diagramby resizing the overview's viewport tracker rectangle.
	autoScrollAmount	Gets or sets the amount by which to auto-scroll the view when the mouse leaves the view boundaries while drawing.
	backColor	Gets or sets the background color of the overview control.
	diagramView	Gets or sets the **DiagramView** shown by this **Overview**.
	dimColor	Gets or sets a color used to blend with the part of the diagram that is not visible in target DiagramView.
	element	Returns a reference to the control's DOM element. (Inherited from Control.)
	enabled	Gets or sets whether mouse events are enabled. (Inherited from Control.)
	licenseLocation	Gets or sets the location of the license key file. (Inherited from Control.)
	measureUnit	Gets the unit of measure used for logical coordinates. (Inherited from CanvasControl.)
	scaleFactor	Gets or sets a fixed scale factor to apply when FitAll is disabled.
	scaleMode	Gets or sets a value indicating whether to fit the whole diagram inside the overview control.
	scrollX	Gets the overview's horizontal scroll position.
	scrollY	Gets the overview's vertical scroll position.
	viewport	Returns the visible portion of the diagram area.

Public Methods

	Name	Description
	addEventListener	Registers a single event listener on the instance. (Inherited from Disposable.)
S	addHandlers	Adds an event listener to a DOM element. (Inherited from Control.)
S	clearHandlers	Removes all event listeners from a DOM element. (Inherited from Control.)
	clientToDoc	Transforms a point from client to document coordinates. (Inherited from CanvasControl.)
S	create	Creates and initializes a new **Overview** from the specified element. This method is static and can be called without creating an instance of the class.
	docToClient	Transforms a point from document to client coordinates. (Inherited from CanvasControl.)
S	find	Returns the specified **Overview** object. This member is static and can be invoked without creating an instance of the class.
S	fromJson	Constructs a JavaScript object from a JSON string. (Inherited from Control.)
	raiseEvent	Raises an event. (Inherited from Disposable.)
	registerForSubmit	Registers an onsubmit handler for the Control's parent html form to flush postback data. (Inherited from Control.)

	removeEventListener	Removes a single event listener attached to the instance. (Inherited from Disposable.)
	toJson	Converts a JavaScript object to a JSON string. (Inherited from Control.)

Public Events

	Name	Description
	controlLoaded	Raised when the control is loaded. (Inherited from Control.)
	controlUnloaded	Raised when the control is unloaded. (Inherited from Control.)
	controlUnloading	Raised when the control is unloading. (Inherited from Control.)

Overview Constructor

Initializes a new instance of the Overview class.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
function Overview (element)
```

Parameters

element
HTMLCanvasElement. The Canvas DOM Element this Overview is associated with.

See Also

Overview Class
MindFusion.Diagramming Namespace

Overview Methods

Overview.create Method

Creates and initializes a new Overview from the specified element. This method is static and can be called without creating an instance of the class.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
function create (element)
```

Parameters

element
HTMLCanvasElement. The DOM element that the overview should be attached to.

Return Value

An Overview object that represents the newly created overview.

See Also

Overview Members
Overview Class
MindFusion.Diagramming Namespace

Overview.find Method

Returns the specified Overview object. This member is static and can be invoked without creating an instance of the class.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
function find (id)
```

Parameters

id
String. The id of the Overview's element.

Return Value

An **Overview** object with the specified id, if found, or **null** otherwise.

Overview Properties

Overview.allowZoom Property

Gets or sets a value indicating whether users are allowed to zoom the diagramby resizing the overview's viewport tracker rectangle.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
get allowZoom() {}
set allowZoom(value) {}
```

Property Value

Boolean

true to let users zoom by resizing the tracker rectangle, or **false** otherwise.

Overview.autoScrollAmount Property

Gets or sets the amount by which to auto-scroll the view when the mouse leaves the view boundaries while drawing.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
get autoScrollAmount() {}
set autoScrollAmount(value) {}
```

Property Value

Number

A number specifying the amount by which to auto-scroll.

Overview.backColor Property

Gets or sets the background color of the overview control.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
get backColor() {}
set backColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

Overview.diagramView Property

Gets or sets the DiagramView shown by this Overview.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
get diagramView() {}
set diagramView(value) {}
```

Property Value

DiagramView

The DiagramView shown by the overview.

Overview.dimColor Property

Gets or sets a color used to blend with the part of the diagram that is not visible in target DiagramView.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
get dimColor() {}
set dimColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

Overview.scaleFactor Property

Gets or sets a fixed scale factor to apply when FitAll is disabled.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
get scaleFactor() {}
set scaleFactor(value) {}
```

Property Value

Number

A number specifying the scale as percentage.

See Also

Overview.scaleMode Property

Gets or sets a value indicating whether to fit the whole diagram inside the overview control.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
get scaleMode() {}
set scaleMode(value) {}
```

Property Value

ScaleMode

A member of the ScaleMode enumeration. The default value is **FitAll**.

Overview.scrollX Property

Gets the overview's horizontal scroll position.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
get scrollX() {}
set scrollX(value) {}
```

Property Value

Number

A number specifying the horizontal scroll position in current unit of measure.

See Also

Overview.scrollY Property

Gets the overview's vertical scroll position.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
get scrollY() {}
set scrollY(value) {}
```

Property Value

Number

A number specifying the vertical scroll position in current unit of measure.

Overview.viewport Property

Returns the visible portion of the diagram area.

Namespace: MindFusion.Diagramming
Assembly: Overview.js

Syntax

JavaScript Copy Code

```
get viewport() {}
set viewport(value) {}
```

Property Value

Rect

A Rect instance containing the viewport coordinates.

PagedContainerNode Class

A container that can arrange its children in pages.

Syntax

JavaScript Copy Code

```
// class
PagedContainerNode.prototype = {}
```

Remarks

PagedContainerNode is a ContainerNode subclass that organizes its child nodes into a collection of pages, represented by ContainerPage objects. This allows for the creation of more orgainzed diagrams where nodes can be grouped into logical views within a single container. Only the nodes belonging to the currently active page, specified by currentPage property, are rendered and participate in user interactions.

Navigation between pages is handled by scroll arrows in the caption bar, allowing users to cycle through the pages sequentially. For faster access, users can also double-click the container's caption to open an in-place combo box listing available page titles, enabling direct navigation to any page. The node's text automatically displays the title of newly activated **ContainerPage**.

PagedContainerNode Members

A container that can arrange its children in pages.

The following tables list the members exposed by the PagedContainerNode type.

Public Constructors

	Name	Description
	PagedContainerNode	Initializes a new instance of the PagedContainerNode class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowAddChildren	Gets or sets a value indicating whether child nodes can be added interactively to this container. (Inherited from ContainerNode.)
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AllowRemoveChildren	Gets or sets a value indicating whether child nodes can be removed interactively from this container. (Inherited from ContainerNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	AutoDeleteChildren	Gets or sets whether deleting this container should also remove its child items from the diagram. (Inherited from ContainerNode.)
	AutoGrow	Gets or sets a value indicating whether the container should grow in size when nodes are added to it. (Inherited from ContainerNode.)
	AutoShrink	Gets or sets a value indicating whether the container should shrink in size when nodes are removed from it. (Inherited from ContainerNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Caption	Gets or sets the text displayed as caption of the table. (Inherited from ContainerNode.)
	CaptionBackBrush	Gets or sets the brush used to paint the caption bar of this container. (Inherited from ContainerNode.)
	CaptionBrush	Gets or sets the brush used to paint the container caption. (Inherited from ContainerNode.)

	CaptionFormat	Gets or sets the caption alignment and format. (Inherited from ContainerNode.)
	CaptionHeight	Gets or sets the height of the container's caption bar. (Inherited from ContainerNode.)
	Children	Gets the child nodes of this container. (Inherited from ContainerNode.)
	ClipChildren	Gets or sets a value indicating whether child items should be clipped by container boundaries. (Inherited from ContainerNode.)
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent **ContainerNode** containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	currentPage	Gets or sets the current page.
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveCaptionBackBrush	Gets the effective caption back brush of the container. (Inherited from ContainerNode.)
	EffectiveCaptionBrush	Gets the effective caption brush of the container. (Inherited from ContainerNode.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled. (Inherited from ContainerNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Foldable	Gets or sets a value indicating whether the user is allowed to fold this container. (Inherited from ContainerNode.)
	Folded	Gets or sets a value indicating whether this container is folded. (Inherited from ContainerNode.)
	FoldedSize	Gets or sets the size of the container when folded. (Inherited from ContainerNode.)
	FoldIconSize	Gets or sets the size of the fold/unfold icon. (Inherited from ContainerNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HighlightPen	Gets or sets the pen used to draw the container frame lines when an item is dragged over the container. (Inherited from ContainerNode.)

	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	Margin	Gets or sets how much space should be left between contained nodes and the container borders. (Inherited from ContainerNode.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	MinimumSize	Gets or sets the minimum size of the container. (Inherited from ContainerNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	pages	Gets the pages of this container.
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Scrollable	Gets or sets a value indicating whether users are allowed to scroll the contents of this container. (Inherited from ContainerNode.)
	ScrollX	Gets or sets the container's horizontal scroll position. (Inherited from ContainerNode.)
	ScrollY	Gets or sets the container's vertical scroll position. (Inherited from ContainerNode.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)

	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Shape	Gets or sets the shape of the container's outline. (Inherited from ContainerNode.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	UnfoldedSize	Returns the original size of a folded container. (Inherited from ContainerNode.)
	Visible	Gets or sets a value indicating whether the container is visible. (Inherited from ContainerNode.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	Add	Adds a node to this container. (Inherited from ContainerNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	addPage	Adds a page to the container.

	Animate	Animates the item. (Inherited from DiagramItem.)
	Arrange	Arranges the container's children with the given layout. (Inherited from ContainerNode.)
	ArrangeAnimated	Arranges the container's children using the given layout, and animates items moving to their new positions. (Inherited from ContainerNode.)
	ArrangeAsync	Arranges the container's children with the given layout asynchronously. (Inherited from ContainerNode.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	clone	DiagramNode.clone override.
	Clone	DiagramItem.Clone override. Creates a copy of this item. (Inherited from ContainerNode.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	ContainsRecursively	Determines whether this container contains the specified node, either directly or recursively through other containers. (Inherited from ContainerNode.)
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramNode.Draw override. Draws the container on the specified IGraphics surface. (Inherited from ContainerNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	drawChildren	ContainerNode.drawChildren override.
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	DiagramNode.DrawLocal override. Draws the container on the specified IGraphics surface. (Inherited from ContainerNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified **IGraphics** surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	fromJson	DiagramNode.fromJson override.
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)

	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
S	GetContainer	Retrieves the container node (if any) the specified node belongs to. (Inherited from ContainerNode.)
	getEditRect	DiagramNode.getEditRect override.
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectiveCaptionBackBrush	Returns a Brush object representing the currently effective caption background of the container. (Inherited from ContainerNode.)
	GetEffectiveCaptionBrush	Returns a Brush object representing the currently effective caption brush of the container. (Inherited from ContainerNode.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramNode.GetRepaintRect override. (Inherited from ContainerNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	DiagramItem.HitTest override. (Inherited from ContainerNode.)
	HitTestHandle	DiagramNode.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from ContainerNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	insertPage	Inserts a page at the specified index.
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	loadFromXml	DiagramNode.loadFromXml override.
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	movePage	Moves a page to a new position in the page list.
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)

	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from ContainerNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from ContainerNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from ContainerNode.)
	OnLoad	DiagramItem.OnLoad override. (Inherited from ContainerNode.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	Remove	Removes a node from this container. (Inherited from ContainerNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	removePage	Removes a page from the container.
	Resize	Resizes the node. (Inherited from DiagramNode.)
	ResizeToFitChildren	Resizes the container making it big enough to contain its child nodes. (Inherited from ContainerNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveToXml	DiagramNode.saveToXml override.
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	toJson	DiagramNode.toJson override.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	UpdateBounds	Overloaded. (Inherited from ContainerNode.)
	VisitNodes	Visits the diagram nodes in reverse Z order. (Inherited from ContainerNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from ContainerNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object. (Inherited from ContainerNode.)
	LoadFromXml	Loads the item content from an XML element. (Inherited from ContainerNode.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from ContainerNode.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramNode.OnRemove override. (Inherited from ContainerNode.)

	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramNode.RestoreProperties override. (Inherited from ContainerNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramNode.SaveProperties override. (Inherited from ContainerNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from ContainerNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from ContainerNode.)
	ScaleElements	DiagramNode.ScaleElements override. (Inherited from ContainerNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)

	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

PagedContainerNode Class
MindFusion.Diagramming Namespace

PagedContainerNode Constructor

Initializes a new instance of the PagedContainerNode class.

Namespace: MindFusion.Diagramming
Assembly: PagedContainerNode.js

Syntax

JavaScript Copy Code

```
function PagedContainerNode ([parent, [pageTitles]])
```

Parameters

parent
Optional.
Diagram. The Diagram from which to obtain default values for the node properties.

pageTitles
Optional.
An array of title strings for the initial pages.

PagedContainerNode Methods

PagedContainerNode.addPage Method

Adds a page to the container.

Namespace: MindFusion.Diagramming
Assembly: PagedContainerNode.js

Syntax

JavaScript Copy Code

```
function addPage (page)
```

Parameters

page
ContainerPage. The page to add.

Remarks

Container's current pages are accessible via pages property.

See Also

PagedContainerNode.clone Method

DiagramNode.clone override.

Namespace: MindFusion.Diagramming
Assembly: PagedContainerNode.js

Syntax

PagedContainerNode.insertPage Method

Inserts a page at the specified index.

Namespace: MindFusion.Diagramming
Assembly: PagedContainerNode.js

Syntax

JavaScript — Copy Code

```
function insertPage (index, page)
```

Parameters

index
Number. The zero-based index at which the page should be inserted.

page
ContainerPage. The page to insert.

PagedContainerNode Properties

PagedContainerNode.currentPage Property

Gets or sets the current page.

Namespace: MindFusion.Diagramming
Assembly: PagedContainerNode.js

Syntax

JavaScript Copy Code

```
get currentPage() {}
set currentPage(value) {}
```

Property Value

ContainerPage

A ContainerPage reference.

Remarks

PagedContainerNode displays only child items associated with this page. Users can change the current page by clicking on arrow icons in the caption bar.

PanBehavior Class
MindFusion.Diagramming Namespace

PanBehavior Constructor (Diagram)

Initializes a new instance of the PanBehavior class.

Namespace: MindFusion.Diagramming
Assembly: PanBehavior.js

Syntax

JavaScript Copy Code

```
function PanBehavior (parent)
```

Parameters

parent
The Diagram this behavior will be associated with.

See Also

PanBehavior Constructor Overload List
PanBehavior Class
MindFusion.Diagramming Namespace

PanBehavior Constructor (DiagramView)

Initializes a new instance of the PanBehavior class.

Namespace: MindFusion.Diagramming
Assembly: PanBehavior.js

Syntax

JavaScript Copy Code

```
function PanBehavior (parent)
```

Parameters

parent
DiagramView. The DiagramView this behavior will be associated with.

See Also

PanBehavior Constructor Overload List
PanBehavior Class
MindFusion.Diagramming Namespace

PanBehavior Methods

PanBehavior.createController Method

BehaviorBase.createController override.

Namespace: MindFusion.Diagramming
Assembly: PanBehavior.js

Syntax

JavaScript Copy Code

```
function createController (state)
```

Parameters

state
Object. An object representing current context and input event.

Return Value

SinglePointerController. An instance of SinglePointerController -derived class.

See Also

PanBehavior Members
PanBehavior Class
MindFusion.Diagramming Namespace

PanController Class

A controller used to pan the DiagramView.

Syntax

JavaScript Copy Code

```
// class
PanController.prototype = {}
```

PanController Members

A controller used to pan the DiagramView.

The following tables list the members exposed by the PanController type.

Public Constructors

	Name	Description
	PanController	Overloaded.

Public Methods

	Name	Description
	cancel	Called when the user stops drawing or modifying a diagram element, rejecting the operation. (Inherited from SinglePointerController.)
	commit	Called when the user stops drawing or modifying a diagram element, accepting the operation. (Inherited from SinglePointerController.)
	drawInteraction	Called to draw current state of user interaction. (Inherited from SinglePointerController.)
	move	SinglePointerController.move override.
	start	SinglePointerController.start override.
	validate	Called to validate the operation at current pointer position. (Inherited from SinglePointerController.)

Composite Nodes

Panel Members

Represents layout containers in CompositeNode visual tree.

The following tables list the members exposed by the Panel type.

Public Constructors

	Name	Description
	Panel	Initializes a new instance of the Panel class.

Public Properties

	Name	Description
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)

	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

Public Methods

	Name	Description
	getComponents	Gets the child components of this panel.

See Also

Panel Class
MindFusion.Diagramming Namespace

Panel Constructor

Initializes a new instance of the Panel class.

Namespace: MindFusion.Diagramming
Assembly: Panel.js

Syntax

JavaScript Copy Code

function Panel ()
```

See Also

Panel Class
MindFusion.Diagramming Namespace

Panel Methods

Panel.getComponents Method

Gets the child components of this panel.

Namespace: MindFusion.Diagramming
Assembly: Panel.js

Syntax

JavaScript Copy Code

```
function getComponents ()
```

Return Value

Array. An array containing the child components of this panel.

See Also

Panel Members
Panel Class
MindFusion.Diagramming Namespace

Path Class

Represents a sequence of connected DiagramNode and DiagramLink elements.

Syntax

JavaScript Copy Code

```
// class
Path.prototype = {}
```

Remarks

Path instances are returned by methods of the PathFinder class.

Inheritance Hierarchy

MindFusion.Diagramming.Path

See Also

Path Members
MindFusion.Diagramming Namespace

Path Members

Represents a sequence of connected DiagramNode and DiagramLink elements.

The following tables list the members exposed by the Path type.

Public Constructors

	Name	Description
	Path	Initializes a new instance of the **Path** class.

Public Fields

	Name	Description
	items	An array of all DiagramItem elements participating in the path.
	links	An array of all **DiagramLink** elements participating in the path.
	nodes	An array of all **DiagramNode** elements participating in the path.

Public Methods

	Name	Description
	getLength	Gets the length of the **Path** expressed as the number of **links** participating in it.
	getWeight	Calculates the weight of this **Path** by accumulating the Weight of all participating diagram elements.

See Also

Path Class
MindFusion.Diagramming Namespace

Path Fields

Path.items Field

An array of all DiagramItem elements participating in the path.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript Copy Code

```
var items
```

Remarks

The collection contains consecutive DiagramNode and DiagramLink objects.

See Also

Path Members
Path Class
MindFusion.Diagramming Namespace

Path.links Field

An array of all DiagramLink elements participating in the path.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript Copy Code

```
var links
```

Remarks

Use nodes to get all DiagramNode elements in the Path.

See Also

Path Members
Path Class
MindFusion.Diagramming Namespace

Path.nodes Field

An array of all DiagramNode elements participating in the path.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript Copy Code

```
var nodes
```

Remarks

Use links to get all DiagramLink elements in the Path.

See Also

Path Constructor

Initializes a new instance of the Path class.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript Copy Code

```
function Path ()
```

See Also

Path Class
MindFusion.Diagramming Namespace

Path Methods

Path.getLength Method

Gets the length of the Path expressed as the number of links participating in it.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript Copy Code

```
function getLength ()
```

Return Value

Number. An integer value that represents the number of edges (links) in the path.

See Also

Path Members
Path Class
MindFusion.Diagramming Namespace

Path.getWeight Method

Calculates the weight of this Path by accumulating the Weight of all participating diagram elements.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript Copy Code

```
function getWeight ([incNodes, [incLinks]])
```

Parameters

incNodes
Optional.

A boolean value specifying whether the Weight of DiagramNode elements should be considered.

incLinks
Optional.
A boolean value specifying whether the Weight of DiagramLink elements should be considered.

Return Value

A number that represents the total weight of the elements in this Path according to the *incNodes* and *incLinks* parameters.

See Also

Path Members
Path Class
MindFusion.Diagramming Namespace

PathFinder Class

Provides methods that help you find paths and cycles in a graph.

Syntax

JavaScript Copy Code

```
// class
PathFinder.prototype = {}
```

Remarks

The direction of links is taken into account when looking for paths or cycles.

A path-finder object caches graph information between method calls in order to achieve better performance when path and cycle -finding methods are called on the same diagram more than once. If the diagram structure changes, you must create a new PathFinder instance in order to use the new structure of diagram's graph.

Inheritance Hierarchy

MindFusion.Diagramming.PathFinder

See Also

PathFinder Members
MindFusion.Diagramming Namespace

PathFinder Members

Provides methods that help you find paths and cycles in a graph.

The following tables list the members exposed by the PathFinder type.

Public Constructors

	Name	Description
	PathFinder	Initializes a new instance of the PathFinder class.

Public Methods

	Name	Description
	findAllCycles	Finds all cycles in the underlying diagram.
	findAllPaths	Finds and returns all paths that exist between two DiagramNode objects.
	findCycle	Detects whether the specified **DiagramNode** participates in a cycle.
	findLongestPath	Finds the longest path between the specified **DiagramNode** objects.

	findShortestPath	Finds the shortest path between two **DiagramNode** elements, optionally considering the Weight of nodes and / or links.
	findShortestRoute	Calculates a route that passes through all nodes of the diagram, using only existing links. This implementation of the Traveling Salesperson Problem uses the nearest-neighbor heuristic.
	generateShortestRoute	Calculates a route that passes through all nodes of the diagram. This implementation of the Traveling Salesperson Problem uses the nearest-neighbor heuristic.

PathFinder Class
MindFusion.Diagramming Namespace

PathFinder Constructor

Initializes a new instance of the PathFinder class.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript Copy Code

```
function PathFinder (diagram)
```

Parameters

diagram
An instance of the Diagram class in which to look for paths or cycles.

See Also

PathFinder Class
MindFusion.Diagramming Namespace

PathFinder Methods

PathFinder.findAllCycles Method

Finds all cycles in the underlying diagram.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript Copy Code

```
function findAllCycles ()
```

Return Value

An array of Path objects; if no cycles are detected, the array is empty.

See Also

PathFinder Members
PathFinder Class
MindFusion.Diagramming Namespace
findCycle Method

PathFinder.findAllPaths Method

Finds and returns all paths that exist between two DiagramNode objects.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript — Copy Code

```
function findAllPaths (from, to, [maxPaths])
```

Parameters

from
The first DiagramNode in the Path.

to
The last **DiagramNode** in the **Path**.

maxPaths
Optional.
Number. The maximum number of paths to find.

Return Value

An array of **Path** objects; if no paths are found, the array is empty.

Remarks

The returned Path instances include the *from* and *to* nodes.

See Also

PathFinder Members
PathFinder Class
MindFusion.Diagramming Namespace

PathFinder.findCycle Method

Detects whether the specified DiagramNode participates in a cycle.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript — Copy Code

```
function findCycle (participant)
```

Parameters

participant
A DiagramNode element which should participate in the found cycle.

Return Value

A Path instance that represents the found cycle; **null** if no cycle is detected.

See Also

PathFinder Members
PathFinder Class
MindFusion.Diagramming Namespace
findAllCycles Method

PathFinder.findLongestPath Method

Finds the longest path between the specified DiagramNode objects.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript — Copy Code

```
function findLongestPath ([from, [to]])
```

Parameters

from
Optional.
The first DiagramNode element in the Path.

to
Optional.
The last **DiagramNode** element in the **Path**.

Return Value

A **Path** instance that represents the longest path found; **null** if there is no **Path** connecting *from* and *to*.

See Also

PathFinder Members
PathFinder Class
MindFusion.Diagramming Namespace
findAllPaths Method

PathFinder.findShortestPath Method

Finds the shortest path between two DiagramNode elements, optionally considering the Weight of nodes and / or links.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript — Copy Code

```
function findShortestPath (from, to, [useNodeWeights, [useLinkWeights]])
```

Parameters

from
The first DiagramNode in the Path.

to
The last **DiagramNode** in the **Path**.

useNodeWeights
Optional.
If **true**, the **Path** with minimal total weight is found, summing the Weight of nodes in the **Path**.

useLinkWeights
Optional.
If **true**, the **Path** with minimal total weight is found, summing the Weight of links in the **Path**.

Return Value

A **Path** instance that represents the shortest **Path** found or **null** if there is no **Path** connecting *from* and *to*.

See Also

PathFinder Members
PathFinder Class
MindFusion.Diagramming Namespace
findAllPaths Method

PathFinder.findShortestRoute Method

Calculates a route that passes through all nodes of the diagram, using only existing links. This implementation of the Traveling Salesperson Problem uses the nearest-neighbor heuristic.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript Copy Code

```
function findShortestRoute ()
```

Return Value

A Path object with its nodes, links and items fields populated, representing the approximate shortest route found by the heuristic.

Remarks

This method expects to be called on a connected graph and builds a path consisting of existing diagram links. The weight of the links is taken from their weight property.

See Also

PathFinder Members
PathFinder Class
MindFusion.Diagramming Namespace
generateShortestRoute Method

PathFinder.generateShortestRoute Method

Calculates a route that passes through all nodes of the diagram. This implementation of the Traveling Salesperson Problem uses the nearest-neighbor heuristic.

Namespace: MindFusion.Diagramming
Assembly: PathFinder.js

Syntax

JavaScript Copy Code

```
function generateShortestRoute ([weight])
```

Parameters

weight
Optional.
function. A function that takes two DiagramNode arguments and returns a number that represents the distance between them. If not provided, the geometric distance between the nodes' centers is used.

Return Value

A Path object with its nodes and items fields populated, representing approximate shortest route found by the heuristic.

Remarks

This method does not consider current links in the diagram. Instead, it uses geometrical distance between nodes or the result of *weight* function to suggest the sequence of nodes you should connect to generate approximate shortest path passing between them.

See Also

PathFinder Members
PathFinder Class
MindFusion.Diagramming Namespace
findShortestRoute Method

PatternRouter Class

Routes links by applying patterns of segment and turn sequences and accepting them when resulting paths do not cross nodes.

Syntax

JavaScript Copy Code

```
// class
PatternRouter.prototype = {}
```

Remarks

You can add custom patterns to the patterns property, or replace the standard patterns altogether. Patterns are defined using RoutePattern and RouteStep objects.

Example

The following code defines a Z-like link route that will be accepted if it does not cross obstacle nodes, nor passes by them within minimumDistance.

JavaScript Copy Code

```
var rightZigzag = new RoutePattern();
rightZigzag.steps.push(
    new RouteStep(RouteStepKind.AdvanceRelative, 0.5));
rightZigzag.steps.push(
    new RouteStep(RouteStepKind.TurnRight));
rightZigzag.steps.push(
    new RouteStep(RouteStepKind.AdvanceRelative, 1));
rightZigzag.steps.push(
    new RouteStep(RouteStepKind.TurnLeft));
rightZigzag.steps.push(
    new RouteStep(RouteStepKind.AdvanceRelative, 0.5));
router.patterns.push(rightZigzag);

// this can be defined in shorter form using a pattern string
// var rightZigzag = new RoutePattern(
//     "ADR0.5 TRR ADR1 TRL ADR0.5");
```

Inheritance Hierarchy

PatternRouter Members
MindFusion.Diagramming Namespace

PatternRouter Members

Routes links by applying patterns of segment and turn sequences and accepting them when resulting paths do not cross nodes.

The following tables list the members exposed by the PatternRouter type.

Public Constructors

	Name	Description
	PatternRouter	Initializes a new instance of the PatternRouter class.

Public Properties

	Name	Description

	avoidOverlaps	Gets or sets a value indicating whether to avoid overlapping links. (Inherited from Router.)
	minimumDistance	Gets or sets the minimum allowed distance from obstacles for a route to be accepted.
	patterns	Gets or sets a list of RoutePattern objects representing the routing patterns.
	preferredDistance	Gets or sets the preferred distance from link's bend points to the link's nodes.

Public Methods

	Name	Description
	route	Called when a single link must be routed. (Inherited from Router.)
	routeInternal	Overrides Router.routeInternal.
	routeLinks	Called when more than one link must be routed. (Inherited from Router.)

See Also

PatternRouter Class
MindFusion.Diagramming Namespace

PatternRouter Constructor

Initializes a new instance of the PatternRouter class.

Namespace: MindFusion.Diagramming
Assembly: PatternRouter.js

Syntax

JavaScript Copy Code

```
function PatternRouter ([diagram])
```

Parameters

diagram
Optional.
Diagram. The diagram this router is associated with.

See Also

PatternRouter Class
MindFusion.Diagramming Namespace

PatternRouter Methods

PatternRouter.routeInternal Method

Overrides Router.routeInternal.

Namespace: MindFusion.Diagramming
Assembly: PatternRouter.js

Syntax

JavaScript Copy Code

```
function routeInternal (link)
```

Parameters

link
DiagramLink. The link to route.

Return Value

Array. An array of points representing the link's new shape, or null if routing fails.

MindFusion.Diagramming Namespace

PatternRouter Properties

PatternRouter.minimumDistance Property

Gets or sets the minimum allowed distance from obstacles for a route to be accepted.

Namespace: MindFusion.Diagramming
Assembly: PatternRouter.js

Syntax

JavaScript Copy Code

```
get minimumDistance() {}
set minimumDistance(value) {}
```

Property Value

Number

A number specifying minimum distance. The default value is 4.

See Also

PatternRouter Members
PatternRouter Class
MindFusion.Diagramming Namespace

PatternRouter.patterns Property

Gets or sets a list of RoutePattern objects representing the routing patterns.

Namespace: MindFusion.Diagramming
Assembly: PatternRouter.js

Syntax

JavaScript Copy Code

```
get patterns() {}
set patterns(value) {}
```

Property Value

Array

An array of RoutePattern objects defining link route templates.

See Also

PatternRouter Members
PatternRouter Class

PatternRouter.preferredDistance Property

Gets or sets the preferred distance from link's bend points to the link's nodes.

Namespace: MindFusion.Diagramming
Assembly: PatternRouter.js

Syntax

JavaScript Copy Code

```
get preferredDistance() {}
set preferredDistance(value) {}
```

Property Value

Number

A number specifying specifying preferred distance. The default value is 10.

Remarks

The value of this property can be used in route templates using an AdvancePreferred RouteStep.

RelativeToLink Enumeration

Specifies how the link labels are positioned.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
RelativeToLink = {}
```

Members

	Member name	Description
	Segment	The link labels are positioned relative to a specified segment.
	ControlPoint	The link labels are positioned relative to a specified control point.
	LinkLength	The link labels are positioned relative to the link.

Remarks

Members of this enumeration can be passed as arguments to LinkLabel positioning methods.

See Also

MindFusion.Diagramming Namespace

RelativeToNode Enumeration

Specifies how the node labels are positioned.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
RelativeToNode = {}
```

Members

	Member name	Description
	Edge	The node labels are positioned relative to a specified edge.
	Corner	The node labels are positioned relative to a specified corner point.
	Center	The node labels are positioned relative to the node center.

Router Constructor

Initializes a new instance of the Router class.

Namespace: MindFusion.Diagramming
Assembly: Router.js

Syntax

JavaScript Copy Code

```
function Router ([diagram])
```

Parameters

diagram
Optional.
Diagram. The diagram this router is associated with.

See Also

Router Class
MindFusion.Diagramming Namespace

Router Methods

Router.route Method

Called when a single link must be routed.

Namespace: MindFusion.Diagramming
Assembly: Router.js

Syntax

JavaScript Copy Code

```
function route (link)
```

Parameters

link
DiagramLink. The link to route.

See Also

Router Members
Router Class
MindFusion.Diagramming Namespace

Router.routeInternal Method

Calculates actual route and returns it as an array of points.

Namespace: MindFusion.Diagramming
Assembly: Router.js

Syntax

JavaScript Copy Code

```
function routeInternal (link)
```

Parameters

link
DiagramLink. The link to route.

Return Value

Array.<Point>. An array of points representing the link's new shape, or null if routing fails.

See Also

Router Members
Router Class
MindFusion.Diagramming Namespace

Router.routeLinks Method

Called when more than one link must be routed.

Namespace: MindFusion.Diagramming
Assembly: Router.js

Syntax

JavaScript — Copy Code

```
function routeLinks (links)
```

Parameters

links
Array.<DiagramLink>. A list of links to route.

See Also

Router Members
Router Class
MindFusion.Diagramming Namespace

Router Properties

Router.avoidOverlaps Property

Gets or sets a value indicating whether to avoid overlapping links.

Namespace: MindFusion.Diagramming
Assembly: Router.js

Syntax

JavaScript — Copy Code

```
get avoidOverlaps() {}
set avoidOverlaps(value) {}
```

Property Value

boolean

true to avoid link-link overlaps, otherwise false.

RouteStep Constructor

Initializes a new instance of the RouteStep class.

Namespace: MindFusion.Diagramming
Assembly: PatternRouter.js

Syntax

JavaScript Copy Code

```
function RouteStep (kind, [amount])
```

Parameters

kind
RouteStepKind. A member of the **RouteStepKind** enumeration.

amount
Optional.
Number. The distance to add when step kind is Advance*.

See Also

RouteStep Class
MindFusion.Diagramming Namespace

RouteStepKind Enumeration

Represents parts of a route template.

Namespace: MindFusion.Diagramming
Assembly: PatternRouter.js

Syntax

JavaScript Copy Code

```
// enum
RouteStepKind = {}
```

Members

	Member name	Description
	AdvanceRelative	Advance by the specified relative distance from origin to destination node.Equivalent to "ADR" command in pattern strings.
	AdvanceAbsolute	Advance by the specified absolute distance.Corresponds to "ADA" command in pattern strings.
	AdvancePreferred	Advance by PreferredDistance.Corresponds to "ADP" command in pattern strings.
	AdvanceDest	Advance by the specified relative remaining distance to destination node.Corresponds to "ADD" command in pattern strings.
	AdvanceRemaining	Advance by the specified relative remaining distance to link's end point.Corresponds to "ADM" command in pattern strings.
	AlignToOrigin	Advance to align with nearest side of origin node.Corresponds to "ALO" command in pattern strings.
	AlignToDestination	Advance to align with nearest side of destination node.Corresponds to "ALD" command in pattern strings.
	AlignToStart	Advance to align with link's start point.Corresponds to "ALS" command in pattern strings.
	AlignToEnd	Advance to align with link's end point.Corresponds to "ALE" command in pattern strings.
	AlignToFarBorder	Advance to align with furthest border of both nodes.Corresponds to "AFB" command in pattern strings.
	TurnLeft	Turn 90 degrees to the left.Corresponds to "TRL" command in pattern strings.
	TurnRight	Turn 90 degrees to the right.Corresponds to "TRR" command in pattern strings.

Ruler Members

The Ruler control provides horizontal and vertical scales that help users measure and align diagram items.

The following tables list the members exposed by the **Ruler** type.

Public Constructors

	Name	Description
	Ruler	Initializes a new instance of the Ruler class.

Public Properties

	Name	Description
	backColor	Gets or sets the background color of the control.
	diagramView	Gets or sets the DiagramView shown by this Ruler.
	element	Returns a reference to the control's DOM element. (Inherited from Control.)
	enabled	Gets or sets whether mouse events are enabled. (Inherited from Control.)
	enableGuides	Gets or sets a value indicating whether the alignment guides are enabled.
	foreColor	Gets or sets the foreground color of the control.
	guideColor	Gets or sets the color of the alignment guide lines.
	horizontalScaleVisible	Gets or sets a value indicating whether the horizontal ruler scale is visible.
	licenseLocation	Gets or sets the location of the license key file. (Inherited from Control.)
	negatedX	Gets or sets whether the horizontal scale should show negated values, simulating that the coordinate system's X axis grows to the left.
	negatedY	Gets or sets whether the vertical scale should show negated values, simulating that the coordinate system's Y axis grows to the top.
	pointerColor	Gets or sets the color of the mouse pointer's projections.
	projectionColor	Gets or sets the color used to paint the projection of the active node.
	projectRotatedBounds	Gets or sets whether projections of nodes on ruler's scales reflect their rotated boundaries.
	textColor	Gets or sets the color used to paint text in the ruler.
	unit	Gets the measure units displayed in the ruler scales.
	verticalScaleVisible	Gets or sets a value indicating whether the vertical ruler scale is visible.

Public Methods

	Name	Description
	addEventListener	Registers a single event listener on the instance. (Inherited from Disposable.)
S	addHandlers	Adds an event listener to a DOM element. (Inherited from Control.)
S	clearHandlers	Removes all event listeners from a DOM element. (Inherited from Control.)
S	create	Creates and initializes a new Ruler from the specified element. This method is static and can be called without creating an instance of the class.

	find	Returns the specified Ruler object. This member is static and can be invoked without creating an instance of the class.
	fromJson	Constructs a JavaScript object from a JSON string. (Inherited from Control.)
	raiseEvent	Raises an event. (Inherited from Disposable.)
	registerForSubmit	Registers an onsubmit handler for the Ruler's parent html form to flush postback data.
	removeEventListener	Removes a single event listener attached to the instance. (Inherited from Disposable.)
	toJson	Converts a JavaScript object to a JSON string. (Inherited from Control.)

Public Events

	Name	Description
	controlLoaded	Raised when the control is loaded. (Inherited from Control.)
	controlUnloaded	Raised when the control is unloaded. (Inherited from Control.)
	controlUnloading	Raised when the control is unloading. (Inherited from Control.)

Ruler Class
MindFusion.Diagramming Namespace

Ruler Constructor

Initializes a new instance of the Ruler class.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
function Ruler (element)
```

Parameters

element
HTMLDivElement. The Canvas DOM Element this Ruler is associated with.

See Also

Ruler Class
MindFusion.Diagramming Namespace

Ruler Methods

Ruler.create Method

Creates and initializes a new Ruler from the specified element. This method is static and can be called without creating an instance of the class.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
function create (element)
```

Parameters

element
HTMLDivElement. The DOM element that the ruler should be attached to.

Return Value

A Ruler object that represents the newly created ruler.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.find Method

Returns the specified Ruler object. This member is static and can be invoked without creating an instance of the class.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
function find (id)
```

Parameters

id
String. The id of the Ruler's element.

Return Value

A Ruler object with the specified id, if found, or **null** otherwise.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.registerForSubmit Method

Registers an onsubmit handler for the Ruler's parent html form to flush postback data.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
function registerForSubmit (id)
```

Parameters

id
String. The id of the hidden field to flush the data to.

See Also

Ruler Properties

Ruler.backColor Property

Gets or sets the background color of the control.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get backColor() {}
set backColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.diagramView Property

Gets or sets the DiagramView shown by this Ruler.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get diagramView() {}
set diagramView(value) {}
```

Property Value

DiagramView

The DiagramView attached to this ruler.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.enableGuides Property

Gets or sets a value indicating whether the alignment guides are enabled.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get enableGuides() {}
set enableGuides(value) {}
```

Property Value

Boolean

true to allow aligning diagram items using ruler guides, or **false** otherwise. The default is **true**.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.foreColor Property

Gets or sets the foreground color of the control.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get foreColor() {}
set foreColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.guideColor Property

Gets or sets the color of the alignment guide lines.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get guideColor() {}
set guideColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Ruler.horizontalScaleVisible Property

Gets or sets a value indicating whether the horizontal ruler scale is visible.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get horizontalScaleVisible() {}
set horizontalScaleVisible(value) {}
```

Property Value

Boolean

true to display the horizontal scale, or **false** otherwise. The default is **true**.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.negatedX Property

Gets or sets whether the horizontal scale should show negated values, simulating that the coordinate system's X axis grows to the left.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get negatedX() {}
set negatedX(value) {}
```

Property Value

Boolean

true if the horizontal scale should show negated values, or **false** otherwise. The default value is **false**.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.negatedY Property

Gets or sets whether the vertical scale should show negated values, simulating that the coordinate system's Y axis grows to the top.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get negatedY() {}
set negatedY(value) {}
```

Property Value

Boolean

true if the vertical scale should show negated values, or **false** otherwise. The default value is **false**.

Ruler.pointerColor Property

Gets or sets the color of the mouse pointer's projections.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get pointerColor() {}
set pointerColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.projectionColor Property

Gets or sets the color used to paint the projection of the active node.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get projectionColor() {}
set projectionColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.projectRotatedBounds Property

Gets or sets whether projections of nodes on ruler's scales reflect their rotated boundaries.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get projectRotatedBounds() {}
set projectRotatedBounds(value) {}
```

Property Value

Boolean

true if node's projection should match the boundaries of rotated node shape, or **false** to ignore rotation and project only the coordinates of node's Bounds. The default value is **true**.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.textColor Property

Gets or sets the color used to paint text in the ruler.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get textColor() {}
set textColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.unit Property

Gets the measure units displayed in the ruler scales.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get unit() {}
set unit(value) {}
```

Property Value

GraphicsUnit

A member of the GraphicsUnit enumeration.

See Also

Ruler Members
Ruler Class
MindFusion.Diagramming Namespace

Ruler.verticalScaleVisible Property

Gets or sets a value indicating whether the vertical ruler scale is visible.

Namespace: MindFusion.Diagramming
Assembly: Ruler.js

Syntax

JavaScript Copy Code

```
get verticalScaleVisible() {}
set verticalScaleVisible(value) {}
```

Property Value

Boolean

true to display the vertical scale, or **false** otherwise. The default is **true**.

MindFusion.Diagramming Namespace

ScaleMode Enumeration

Defines Overview scaling modes.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
ScaleMode = {}
```

Members

	Member name	Description
	FitAll	Scale the Overview dynamically to fit the entire diagram.
	CombinedScales	Combine diagram's ZoomFactor with overview's ScaleFactor.
	FixedScale	Use fixed scale specified via ScaleFactor, ignoring diagram's zoom level.

Remarks

Members of this enumeration can be assigned to the scaleMode property of **Overview**.

Selection Class

Represents a set of items selected in the Diagram document.

Syntax

JavaScript Copy Code

```
// class
Selection.prototype = {}
```

Remarks

Several diagram items could be selected simultaneously. If more than one item is selected, the compound set of selected items is handled by an instance of the **Selection** class, returned by diagram's selection property. Items in the selection can be of any element type. The items property returns an array of all items, while more specific types are returned by links and nodes properties.

Inheritance Hierarchy

MindFusion.Diagramming.DiagramItem

Selection Members

Represents a set of items selected in the Diagram document.

The following tables list the members exposed by the Selection type.

Public Constructors

	Name	Description
	Selection	Initializes a new instance of the **Selection** class.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	allowMultipleSelection	Gets or sets a value indicating whether more than one items can be selected simultaneously.
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	items	Returns an array of all items in this selection.
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	links	Returns an array of all links in this selection.

	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	nodes	Returns an array of all nodes in this selection.
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	True if this is a top-level item in the diagram, or false if it is inside a container. (Inherited from DiagramItem.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	addItem	Adds an item to the **Selection**.
	allowDrag	DiagramItem.allowDrag override.
	Animate	Animates the item. (Inherited from DiagramItem.)
	clear	Removes all items from the **selection**.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	ContainsPoint	Overloaded. Determines whether this item contains the specified point. (Inherited from DiagramItem.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	Draws the item on the specified IGraphics surface. (Inherited from DiagramItem.)
	DrawHandles	Renders the adjustment handles of this item. (Inherited from DiagramItem.)
	DrawInRect	(Inherited from DiagramItem.)
	DrawShadow	Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramItem.)
	endDrag	DiagramItem.endDrag override.
	getBounds	Gets a rectangle that defines the position of the selection frame.
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetOutlinePoly	Gets a polygon approximating the outline of this object. (Inherited from DiagramItem.)
	GetRepaintRect	Gets the repaint region for this item, taking into account factors such as pen, selection handles and shadow. (Inherited from DiagramItem.)
	GetRotatedBounds	Gets the bounding rectangle of this item when it is rotated. (Inherited from DiagramItem.)
	GetToolTip	Gets the tooltip that should be displayed for this item at the specified point. (Inherited from DiagramItem.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramItem.)
	HitTestManipulators	Finds the **Manipulator** object located at the specified point. (Inherited from DiagramItem.)
	LabelFromPoint	Returns the ItemLabel located at specified point. (Inherited from DiagramItem.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)

	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	onRemove	DiagramItem.onRemove override.
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	removeItem	Removes an item from the **Diagram**.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveLocationState	DiagramItem.saveLocationState override.
	startDrag	DiagramItem.startDrag override.
	updateDrag	DiagramItem.updateDrag override.
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	Invoked during interactive creation of items to test whether the operation can be completed in the current context. (Inherited from DiagramItem.)
	AllowModify	Invoked during interactive modification of items to test whether the operation can be completed in the current context. (Inherited from DiagramItem.)
	CancelModify	Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramItem.)
	CompleteCreate	Invoked when the item creation has been completed. (Inherited from DiagramItem.)
	CompleteModify	Invoked when the item modification has been completed. (Inherited from DiagramItem.)
	CreateProperties	Creates an item property set corresponding to the type of this diagram item. (Inherited from DiagramItem.)
	CreateState	Creates an item state corresponding to the type of this diagram item. (Inherited from DiagramItem.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the item is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramItem.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)

	LoadFromJson	Loads the item from a JSON object. (Inherited from DiagramItem.)
	LoadFromXml	Loads the item content from an XML element. (Inherited from DiagramItem.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	Called when the item is added to a Diagram, either by the user, programmatically or via undo / redo. (Inherited from DiagramItem.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	Called when the diagram's MeasureUnit changes. (Inherited from DiagramItem.)
	OnRemove	Called when an item is removed from a **Diagram**, either by the user, programmatically or via undo / redo. (Inherited from DiagramItem.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnZoomChanged	Called when the diagram's **ZoomFactor** changes. (Inherited from DiagramItem.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	Restores the properties of this diagram item. (Inherited from DiagramItem.)
	RestoreState	Restores the state of this diagram item. (Inherited from DiagramItem.)
	SaveProperties	Saves the properties of this diagram item. (Inherited from DiagramItem.)
	SaveState	Saves the state of this diagram item. (Inherited from DiagramItem.)
	SaveToJson	Saves the item as a JSON object. (Inherited from DiagramItem.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramItem.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpanded	Sets whether the item is in expanded or collapsed state. (Inherited from DiagramItem.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	StartCreate	Invoked once when the user starts creating a new item interactively. (Inherited from DiagramItem.)
	StartModify	Invoked when the user starts modifying this item interactively. (Inherited from DiagramItem.)
	UpdateCreate	Invoked during interactive creation of this item. (Inherited from DiagramItem.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from

		DiagramItem.)
	UpdateModify	Invoked during interactive modification of this item. (Inherited from DiagramItem.)

Selection Fields

Selection Constructor

Initializes a new instance of the Selection class.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript Copy Code

```
function Selection (parent)
```

Parameters

parent
The diagram where the items are selected.

See Also

Selection Class
MindFusion.Diagramming Namespace

Selection Methods

Selection.addItem Method

Adds an item to the Selection.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript Copy Code

```
function addItem (item)
```

Parameters

item
The item to add.

Remarks

This method adds a new item to the selection. It also deactivates the activeItem, if any, and makes the newly added item the active one.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.allowDrag Method

DiagramItem.allowDrag override.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript — Copy Code

```
function allowDrag (ist)
```

Parameters

ist
InteractionState. An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.clear Method

Removes all items from the selection.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript — Copy Code

```
function clear ()
```

Remarks

Call clear to deselect all items. The items are not deleted. The method also sets the diagram's activeItem to Null.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.endDrag Method

DiagramItem.endDrag override.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript — Copy Code

```
function endDrag (ist)
```

Parameters

ist
InteractionState. An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.getBounds Method

Gets a rectangle that defines the position of the selection frame.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript Copy Code

```
function getBounds ()
```

Return Value

Rect. The frame's bounding rectangle.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.onRemove Method

DiagramItem.onRemove override.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript Copy Code

```
function onRemove ()
```

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.removeItem Method

Removes an item from the Diagram.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript Copy Code

```
function removeItem (item)
```

Parameters

item
The item to add.

Remarks

Call this method to deselect an item. Note that the item is not deleted, but just removed from the selection.

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.saveLocationState Method

DiagramItem.saveLocationState override.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript Copy Code

```
function saveLocationState ()
```

Return Value

Object. An object containing selection state.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.startDrag Method

DiagramItem.startDrag override.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript Copy Code

```
function startDrag ([ist])
```

Parameters

ist
Optional. An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.updateDrag Method

DiagramItem.updateDrag override.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript Copy Code

```
function updateDrag (ist)
```

Parameters

ist

An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection Properties

Selection.allowMultipleSelection Property

Gets or sets a value indicating whether more than one items can be selected simultaneously.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript Copy Code

```
get allowMultipleSelection() {}
set allowMultipleSelection(value) {}
```

Property Value

Boolean

true to let the user select multiple items, or **false** otherwise. The default value is **true**.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.items Property

Returns an array of all items in this selection.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript Copy Code

```
get items() {}
```

Property Value

Array

Array of DiagramItem objects.

Remarks

Do not modify this array directly, but call Selection methods such as addItem and removeItem, which also update item's state variables and redraw the diagram.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.links Property

Returns an array of all links in this selection.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript Copy Code

```
get links() {}
```

Property Value

DiagramLink

Array of DiagramLink objects.

Remarks

Do not modify this array directly, but call Selection methods such as addItem and removeItem, which also update item's state variables and redraw the diagram.

See Also

Selection Members
Selection Class
MindFusion.Diagramming Namespace

Selection.nodes Property

Returns an array of all nodes in this selection.

Namespace: MindFusion.Diagramming
Assembly: Selection.js

Syntax

JavaScript Copy Code

```
get nodes() {}
```

Property Value

DiagramNode

Array of DiagramNode objects.

Remarks

Do not modify this array directly, but call Selection methods such as addItem and removeItem, which also update item's state variables and redraw the diagram.

function SelectionChangedEventArgs (args)
```

Parameters

args

See Also

SelectionChangedEventArgs Class
MindFusion.Diagramming Namespace

SelectionChangedEventArgs Properties

SelectionChangedEventArgs.newItems Property

Gets the selected items after the change.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get newItems() {}
set newItems(value) {}
```

Property Value

Array

An array of items.

See Also

SelectionChangedEventArgs Members

Events Class

SelectionEventArgs Members

Contains the arguments passed to handlers of selection-related events.

The following tables list the members exposed by the SelectionEventArgs type.

Public Constructors

	Name	Description
	SelectionEventArgs	Initializes a new instance of the SelectionEventArgs class.

Public Properties

	Name	Description
	adjustmentHandle	Gets the adjustment handle being moved by the user.
	cancel	Gets or sets a value indicating whether to allow the current operation. (Inherited from CancelEventArgs.)
	handled	Gets or sets a value indicating whether the event has been handled. (Inherited from EventArgs.)
	mousePosition	Gets the current mouse pointer position.

Public Methods

	Name	Description
	cancelDrag	Immediately cancels the current selection modification.

SelectionEventArgs Properties

SelectionEventArgs.adjustmentHandle Property

Gets the adjustment handle being moved by the user.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get adjustmentHandle() {}
```

Property Value

AdjustmentHandles

A member of the AdjustmentHandles enumeration.

See Also

SelectionEventArgs Members

MindFusion.Diagramming Namespace

SelectionEventArgs.mousePosition Property

Gets the current mouse pointer position.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript — Copy Code

```
get mousePosition() {}
```

Property Value

Point

A Point instance containing mouse pointer coordinates.

SelectOnlyBehavior Members

Allows only selection of existing items. Modifying them or drawing new ones is disabled.

The following tables list the members exposed by the SelectOnlyBehavior type.

Public Constructors

	Name	Description
	SelectOnlyBehavior	Overloaded.

Public Properties

	Name	Description
	diagram	Gets the target diagram of this behavior object. (Inherited from BehaviorBase.)

Public Methods

	Name	Description
	createController	BehaviorBase.createController override.

See Also

SelectOnlyBehavior Class

SelectOnlyBehavior Constructor

Overload List

Name	Description
SelectOnlyBehavior (Diagram)	Initializes a new instance of the SelectOnlyBehavior class.
SelectOnlyBehavior (DiagramView)	Initializes a new instance of the SelectOnlyBehavior class.

See Also

SelectOnlyBehavior Class
MindFusion.Diagramming Namespace

SelectOnlyBehavior Constructor (Diagram)

Initializes a new instance of the SelectOnlyBehavior class.

Namespace: MindFusion.Diagramming
Assembly: SelectOnlyBehavior.js

Syntax

JavaScript Copy Code

```
function SelectOnlyBehavior (parent)
```

Parameters

parent
The Diagram this behavior will be associated with.

See Also

SelectOnlyBehavior Constructor Overload List
SelectOnlyBehavior Class
MindFusion.Diagramming Namespace

SelectOnlyBehavior Constructor (DiagramView)

Initializes a new instance of the SelectOnlyBehavior class.

Namespace: MindFusion.Diagramming
Assembly: SelectOnlyBehavior.js

Syntax

JavaScript Copy Code

```
function SelectOnlyBehavior (parent)
```

Parameters

parent
DiagramView. The DiagramView this behavior will be associated with.

See Also

SelectOnlyBehavior Constructor Overload List
SelectOnlyBehavior Class
MindFusion.Diagramming Namespace

SelectOnlyBehavior Methods

SelectOnlyBehavior.createController Method

BehaviorBase.createController override.

Namespace: MindFusion.Diagramming
Assembly: SelectOnlyBehavior.js

Syntax

JavaScript Copy Code

```
function createController (state)
```

Parameters

state
Object. An object representing current context and input event.

Return Value

SinglePointerController. An instance of SinglePointerController -derived class.

See Also

SelectOnlyBehavior Members
SelectOnlyBehavior Class
MindFusion.Diagramming Namespace

SerializeTagEventArgs Class

Contains the arguments passed to the serializeTag and deserializeTag event handlers.

Syntax

JavaScript Copy Code

```
// class
SerializeTagEventArgs.prototype = {}
```

Inheritance Hierarchy

MindFusion.Controls.EventArgs
MindFusion.Diagramming.SerializeTagEventArgs

MindFusion.Diagramming Namespace

SerializeTagEventArgs Members

Contains the arguments passed to the serializeTag and deserializeTag event handlers.

The following tables list the members exposed by the SerializeTagEventArgs type.

Public Constructors

	Name	Description
	SerializeTagEventArgs	Initializes a new instance of the SerializeTagEventArgs class.

Public Properties

	Name	Description
	context	Gets an XmlPersistContext object providing helper read and write methods for various value types.
	element	Gets the XML element where the tag value should be serialized to or deserialized from.
	jsonObject	Gets or sets the object representing the tag.
	object	Gets the object whose property is being serialized or deserialized.
	propertyName	Gets the name of the property being serialized.
	tag	Gets or sets the tag value being serialized or deserialized.

MindFusion.Diagramming Namespace

SerializeTagEventArgs Constructor

Initializes a new instance of the SerializeTagEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
function SerializeTagEventArgs ()
```

See Also

SerializeTagEventArgs Class
MindFusion.Diagramming Namespace

SerializeTagEventArgs Properties

SerializeTagEventArgs.context Property

Gets an XmlPersistContext object providing helper read and write methods for various value types.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

```
JavaScript
get context() {}
```

Property Value

XmlPersistContext

An instance of the XmlPersistContext class.

See Also

SerializeTagEventArgs Members
SerializeTagEventArgs Class
MindFusion.Diagramming Namespace

SerializeTagEventArgs.element Property

Gets the XML element where the tag value should be serialized to or deserialized from.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

```
JavaScript
get element() {}
```

Property Value

Element

The XML element.

See Also

SerializeTagEventArgs Members
SerializeTagEventArgs Class
MindFusion.Diagramming Namespace

SerializeTagEventArgs.jsonObject Property

Gets or sets the object representing the tag.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

```
JavaScript
get jsonObject() {}
set jsonObject(value) {}
```

Property Value

Object

The object represeting the tag.

Remarks

Used in JSON serialization.

See Also

SerializeTagEventArgs Members
SerializeTagEventArgs Class
MindFusion.Diagramming Namespace

SerializeTagEventArgs.object Property

Gets the object whose property is being serialized or deserialized.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get object() {}
```

Property Value

Object

An object whose custom data is being serialized.

See Also

SerializeTagEventArgs Members
SerializeTagEventArgs Class
MindFusion.Diagramming Namespace

SerializeTagEventArgs.propertyName Property

Gets the name of the property being serialized.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get propertyName() {}
```

Property Value

String

A string containing property name.

See Also

SerializeTagEventArgs Members
SerializeTagEventArgs Class
MindFusion.Diagramming Namespace

SerializeTagEventArgs.tag Property

Gets or sets the tag value being serialized or deserialized.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get tag() {}
set tag(value) {}
```

Property Value

Object

An object containing custom data.

See Also

SerializeTagEventArgs Members
SerializeTagEventArgs Class
MindFusion.Diagramming Namespace

ShadowsStyle Enumeration

Enumerates possible shadows-drawing styles.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
ShadowsStyle = {}
```

Members

	Member name	Description
	None	No shadows are drawn.
	OneLevel	All shadows are drawn at the lowest z-level, and appear to be on one level.
	ZOrder	Every shadows is drawn just below its object, possibly covering other objects.

Remarks

Members of this enumeration can be assigned to the shadowsStyle property of Diagram.

See Also

MindFusion.Diagramming Namespace

Shape Class

An instance of this class represents a shape defined through a series of arc, line and Bezier segments. The segments can be a part of the shape outline, in which case they define the part of the shape is filled, used for hit-testing and for aligning links to the node edges. Segments can also be added as decoration elements, in which case they only affect the appearance of a ShapeNode.

Syntax

JavaScript Copy Code

```
// class
Shape.prototype = {}
```

Remarks

The **Shape** class can also be used as a component in composite nodes. When its **isOutline** attribute is set, the shape will control CompositeNode's geometry, defining hit test and clip area, and link alignment points along node's border. If **isOutline** is disabled, the shape will serve mostly as a decorative element. The code below shows a sample fragment specifying shape component in template:

JavaScript Copy Code

```
{
    component: "Shape",
    id: "Cloud",
    autoProperty: true,
    name: "OutlineShape",
```

```
    pen: "gray",
    brush: "Transparent",
    isOutline: true
},
```

Example

Custom shapes can be defined using SVG Path syntax. The following code creates custom shape geoometry and assigns it to a ShapeNode:

JavaScript Copy Code

```
var shape = new MindFusion.Diagramming.Shape({
   id: "DoubleEllipse",
   outline: "M100,50 A50,50,0,1,1,0,50 A50,50,0,1,1,100,50",
   decoration: "M98,50 A48,48,0,1,1,2,50 A48,48,0,1,1,98,50",
   fillMode: "nonzero"});

Shape Members

An instance of this class represents a shape defined through a series of arc, line and Bezier segments. The segments can be a part of the shape outline, in which case they define the part of the shape is filled, used for hit-testing and for aligning links to the node edges. Segments can also be added as decoration elements, in which case they only affect the appearance of a ShapeNode.

The following tables list the members exposed by the Shape type.

Public Constructors

	Name	Description
	Shape	Initializes a new instance of the Shape class.

Public Properties

	Name	Description
	anchorPattern	Gets or sets the default anchor pattern for nodes that use this shape.
	brush	Gets or sets the brush used to paint the interior of this shape.
	pen	Gets or sets the pen used to stroke the frame of this shape.
	strokeThickness	Gets or sets the thickness of the shape's frame.

Public Methods

	Name	Description
S	component	Creates a shape component.
S	fromId	Returns a reference to the **Shape** with the specified string identifier.
	getId	Gets the id of this **Shape**.
	isElliptic	Gets a value indicating whether this shape is elliptic.

	loadFromXml	Loads the shape content from an XML element.

Shape Class
MindFusion.Diagramming Namespace

Shape Constructor

Initializes a new instance of the Shape class.

Namespace: MindFusion.Diagramming
Assembly: Shape.js

Syntax

JavaScript Copy Code

```
function Shape ([params])
```

Parameters

params.outline
Optional.
String. A string defining the shape's outline.

params.decoration
Optional.
String. A string defining the shape's decoration.

params.shapeDecorations
Optional.
Array. An array containing shapeDecoration objects defining additional shape decoration.

params.id
Optional.
String. The string identifier of the shape.

params.fillMode
Optional.
String. A string specifying the fill mode;

params.outlinePen
Optional.
String. A string specifying the stroke of the shape's outline.

params.outlineBrush
Optional.
String. A string specifying the fill of the shape's outline.

params.decorationPen
Optional.
String. A string specifying the stroke of the shape's decoration.

params.decorationBrush
Optional.
String. A string specifying the fill of the shape's decoration.

Shape Methods

Shape.component Method

Creates a shape component.

Namespace: MindFusion.Diagramming
Assembly: Shape.js

Syntax

JavaScript — Copy Code

```
function component (id, [isOutline, [node]])
```

Parameters

id
String. The identifier of the shape.

isOutline
Optional.
Boolean. A value indicating whether this shape defines the outline of its host node.

node
Optional.
CompositeNode. The host node of this component.

Return Value

Shape. A reference to a Shape component with the specified identifier.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace

Shape.fromId Method

Returns a reference to the Shape with the specified string identifier.

Namespace: MindFusion.Diagramming
Assembly: Shape.js

Syntax

JavaScript — Copy Code

```
function fromId (id)
```

Parameters

id
The identifier of the Shape of interest.

Return Value

A reference to the **Shape** with the specified identifier or **null** if there is no such shape.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace

Shape.getId Method

Gets the id of this Shape.

Namespace: MindFusion.Diagramming
Assembly: Shape.js

Syntax

JavaScript — Copy Code

```
function getId ()
```

Return Value

The string identifier.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace

Shape.isElliptic Method

Gets a value indicating whether this shape is elliptic.

Namespace: MindFusion.Diagramming
Assembly: Shape.js

Syntax

JavaScript Copy Code

```
function isElliptic ()
```

Return Value

Boolean. True if the shape is elliptic, or false otherwise.

See Also

Shape Members
Shape Class
MindFusion.Diagramming Namespace

Shape.loadFromXml Method

Loads the shape content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: Shape.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement

Element. An XML DOM element that contains the the shape's data.

context

XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

Shape Properties

Shape.anchorPattern Property

Gets or sets the default anchor pattern for nodes that use this shape.

Namespace: MindFusion.Diagramming
Assembly: Shape.js

Syntax

JavaScript — Copy Code

```
get anchorPattern() {}
set anchorPattern(value) {}
```

Property Value

AnchorPattern

An AnchorPattern instance. The default value is **null**.

Remarks

If the anchorPattern of a ShapeNode is set, it overrides the one associated with the Shape definition.

Shape.brush Property

Gets or sets the brush used to paint the interior of this shape.

Namespace: MindFusion.Diagramming
Assembly: Shape.js

Syntax

JavaScript — Copy Code

```
get brush() {}
set brush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

Remarks

Used to paint Shape components of CompositeNode.

Shape.pen Property

Gets or sets the pen used to stroke the frame of this shape.

Namespace: MindFusion.Diagramming
Assembly: Shape.js

Syntax

JavaScript Copy Code

```
get pen() {}
set pen(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

Remarks

Used to paint Shape components of CompositeNode.

Shape.strokeThickness Property

Gets or sets the thickness of the shape's frame.

Namespace: MindFusion.Diagramming
Assembly: Shape.js

Syntax

JavaScript Copy Code

```
get strokeThickness() {}
set strokeThickness(value) {}
```

Property Value

Number

A number specifying stroke thickness.

Remarks

Used to paint Shape components of CompositeNode.

ShapeDecoration Constructor

Initializes a new instance of the ShapeDecoration class.

Namespace: MindFusion.Diagramming
Assembly: Shape.js

Syntax

JavaScript Copy Code

```
function ShapeDecoration ([elements, [fillColor, [strokeColor, [strokeThickness,
[strokeDashStyle]]]]])
```

Parameters

elements
Optional.
Array. An array of ShapeElement objects.

fillColor
Optional.
String. Optional fill color.

strokeColor
Optional.
String. Optional stroke color.

strokeThickness
Optional.
Number. Optional stroke thickness.

strokeDashStyle
Optional.
DashStyle. Optional dash style.

ShapeElement Constructor

Initializes a new instance of the ShapeElement class.

Namespace: MindFusion.Diagramming
Assembly: Shape.js

Syntax

JavaScript Copy Code

```
function ShapeElement ([func, [args, [strokeColor, [strokeThickness, [strokeDashStyle]]]]])
```

Parameters

func
Optional.
String. One of the moveTo, lineTo, arc, bezierCurveTo, roundRect functions.

args
Optional.
Array. Coordinates to pass to the drawing function.

strokeColor
Optional.
String. Optional color to apply to the element.

strokeThickness
Optional.
Number. Optional thickness to apply to the element.

strokeDashStyle
Optional.
DashStyle. Optional dash style to apply to the element.

ShapeLibrary Class

The **ShapeLibrary** class represents a collection of shape definitions stored together.

Syntax

JavaScript Copy Code

```
// class
ShapeLibrary.prototype = {}
```

Remarks

Shape libraries can be created using the ShapeDesigner tool that comes with MindFusion.Diagramming. Use the loadFromXml method to load a shape library from a file. The loaded shapes can be accessed through the Shapes property.

Loads the library from the specified XML document.

Namespace: MindFusion.Diagramming
Assembly: ShapeLibrary.js

Syntax

JavaScript Copy Code

```
function loadFromXml (fileUrl, [onLoad, [onError]])
```

Parameters

fileUrl
String. The URL of an XML file where the data should be read from.

onLoad
Optional.
function. A callback that should be invoked if the file is loaded successfully.

onError
Optional.
function. A callback that should be invoked if the file could not be downloaded.

ShapeNode Class

ShapeNode instances are diagram nodes that represent geometric shapes.

Syntax

JavaScript Copy Code

```
// class
ShapeNode.prototype = {}
```

Remarks

ShapeNode instance might represent nodes in graphs, tree, process diagrams, and so on. Node's geometry is specified via its shape property. The default shape of new nodes is specified by diagram's defaultShape property. Shapes can be rotated, either interactively using the rotation handle above the node, or programmatically using the rotationAngle property. Shape nodes can display images and text.

Assign an image to be painted inside a node by setting image, imageLocation or imageContent properties. Image position and alignment are set via the imagePadding and imageAlign properties.

Text inside a shape node is represented by the text property. Its appearance can be customized using textColor and font properties. To get even richer text formatting, set enableStyledText to **true** and embed HTML-like formatting tags in the raw text. To make a node big enough to display its text without clipping, call resizeToFitText.

ShapeNode Members

ShapeNode instances are diagram nodes that represent geometric shapes.

The following tables list the members exposed by the **ShapeNode** type.

Public Constructors

	Name	Description

	ShapeNode	Initializes a new instance of the **ShapeNode** class with default values supplied form the specified Diagram.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	allowFlip	Gets or sets whether the node's shape flips when users drag an edge over its opposite edge.
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	anchorPattern	DiagramNode.anchorPattern override.
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	clipText	Gets or sets a value indicating whether to clip the text assigned to this node to fit into the shape's geometry.
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	cssElementName	Gets the name of the CSS element associated with this item.
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	enableStyledText	Gets or sets a value indicating whether styled text rendering is enabled.
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)

	flipX	Gets or sets a value indicating whether the node's shape is fliped horizontally.
	flipY	Gets or sets a value indicating whether the node's shape is fliped vertically.
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	image	Gets or sets the image displayed by this node.
	imageAlign	Gets or sets the alignment of node's image.
	imageContent	Gets or sets a Base64-encoded image to display inside this node.
	imageLocation	Gets or sets URL of the image to display inside this node.
	imagePadding	Gets or sets the padding distance between node borders and image.
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	polygonalTextLayout	Gets or sets a value indicating whether text is wrapped to fit the node's shape.
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	rotateImage	Gets or sets a value indicating whether image gets rotated along with the node.

	rotateText	Gets or sets a value indicating whether text gets rotated along with the node.
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	shape	Gets or sets the geometric shape displayed by this node.
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	transparent	Gets or sets a value indicating whether the node's geometry is visible.
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description

	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	clone	DiagramNode.clone override.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	containsPoint	Checks if the **ShapeNode** contains the specified point.
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	fromJson	DiagramNode.fromJson override.
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)

	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getOutline	Gets an array of points that define the outline of this node shape.
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	loadFromXml	DiagramNode.LoadFromXml override. Loads the node's content from an XML element.
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)

	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	resizeToFitText	Makes the shape node big enough to display its text without clipping.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	restoreLocationState	DiagramItem.restoreLocationState override.
	restoreState	DiagramNode.restoreState override.
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveLocationState	DiagramItem.saveLocationState override.
	saveState	DiagramNode.saveState override.
	saveToXml	Saves the node's content into an XML element.
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	toJson	DiagramNode.toJson override.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	updateDrag	DiagramItem.updateDrag override.
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)

	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
	LoadFromXml	DiagramItem.LoadFromXml override. (Inherited from DiagramNode.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)

	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramNode.)
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

ShapeNode Constructor

Initializes a new instance of the ShapeNode class with default values supplied form the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
function ShapeNode ([parent])
```

Parameters

parent
Optional. The Diagram from which to obtain default values for the node properties.

Remarks

If parent is not specified, this constructor initializes the ShapeNode properties with the values specified in the respective default-value properties of the Diagram object.

If parent is specified, the constructor copies the ShapeNode property values from the specified prototype node.

MindFusion.Diagramming Namespace

ShapeNode.containsPoint Method

Checks if the ShapeNode contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
function containsPoint (point)
```

Parameters

point
The Point to check.

Return Value

true if the **Point** is within the bounds of this node; otherwise, false.

Remarks

This method is used during hit-testing to see if the mouse is inside the item.

ShapeNode.getOutline Method

Gets an array of points that define the outline of this node shape.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
function getOutline ()
```

Return Value

Array. An array with the points.

ShapeNode.loadFromXml Method

DiagramNode.LoadFromXml override. Loads the node's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the item's data.

context

XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.resizeToFitText Method

Makes the shape node big enough to display its text without clipping.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
function resizeToFitText (fit)
```

Parameters

fit

One of the FitSize enumeration values.

Return Value

true if the node is resized successfully; otherwise, **false**.

ShapeNode.saveToXml Method

Saves the node's content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement

Element. An XML DOM element that will contain the item's data.

context

XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

ShapeNode.updateDrag Method

DiagramItem.updateDrag override.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
function updateDrag (ist)
```

Parameters

ist

InteractionState. An InteractionState object that encapsulates the current state of user interaction with the control.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode Properties

ShapeNode.allowFlip Property

Gets or sets whether the node's shape flips when users drag an edge over its opposite edge.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript — Copy Code

```
get allowFlip() {}
set allowFlip(value) {}
```

Property Value

Boolean

true to flip the shape, or **false** otherwise.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.anchorPattern Property

DiagramNode.anchorPattern override.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript — Copy Code

```
get anchorPattern() {}
set anchorPattern(value) {}
```

Property Value

AnchorPattern

An AnchorPattern object that defines a set of anchor points.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.clipText Property

Gets or sets a value indicating whether to clip the text assigned to this node to fit into the shape's geometry.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript — Copy Code

```
get clipText() {}
set clipText(value) {}
```

Property Value

Boolean

true to clip the node's text, or **false** otherwise. The default value is **false**.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace
text Property
rotateText Property

ShapeNode.cssElementName Property

Gets the name of the CSS element associated with this item.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get cssElementName() {}
set cssElementName(value) {}
```

Property Value

String

A string containing the CSS element name.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.enableStyledText Property

Gets or sets a value indicating whether styled text rendering is enabled.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get enableStyledText() {}
set enableStyledText(value) {}
```

Property Value

Boolean

true to parse the node's text in order to find formatting tags, or **false** otherwise.

Remarks

Styled text allows applying various attributes to the characters it contains. Attributes are specified using HTML-like formatting tags embedded in the raw text. At this time the component supports the following formatting tags:

- <b> specifies bold text
- <i> specifies italic text
- <u> specifies underlined text
- <color=value> specifies text color
- <sub>specifies subscript
- <sup>specifies superscript
-
 indicates line break

- <a=url> renders specified text as a hyperlink and raises hyperlinkClicked event when link has been clicked
- <size=value>specifies font size

ShapeNode.flipX Property

Gets or sets a value indicating whether the node's shape is fliped horizontally.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get flipX() {}
set flipX(value) {}
```

Property Value

Boolean

true if the shape is flipped horizontally, or **false** otherwise.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.flipY Property

Gets or sets a value indicating whether the node's shape is fliped vertically.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get flipY() {}
set flipY(value) {}
```

Property Value

Boolean

true if the shape is flipped vertically, or **false** otherwise.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.image Property

Gets or sets the image displayed by this node.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get image() {}
set image(value) {}
```

Property Value

HTMLImageElement

An image object to render as node's content.

Remarks

This property lets you display an image inside the node. Set the imageAlign property to specify how the image is aligned inside shape's area. By default, the image is displayed in the center of the bounding rectangle of the node.

If a node should display multiple images, you could add and arrange them using NodeLabel objects.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.imageAlign Property

Gets or sets the alignment of node's image.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get imageAlign() {}
set imageAlign(value) {}
```

Property Value

ImageAlign

A member of the ImageAlign enumeration.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.imageContent Property

Gets or sets a Base64-encoded image to display inside this node.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get imageContent() {}
set imageContent(value) {}
```

Property Value

String

A Base64-encoded representation of an image.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.imageLocation Property

Gets or sets URL of the image to display inside this node.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get imageLocation() {}
set imageLocation(value) {}
```

Property Value

String

A URL string that identifies the image to be loaded.

Remarks

This property lets you display an image inside the node. Set the imageAlign property to specify how the image is aligned inside shape's area. By default, the image is displayed in the center of the bounding rectangle of the node.

If a node should display multiple images, you could add and arrange them using NodeLabel objects.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.imagePadding Property

Gets or sets the padding distance between node borders and image.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get imagePadding() {}
set imagePadding(value) {}
```

Property Value

Thickness

A Thickness instance specifying image padding.

See Also

ShapeNode Members
ShapeNode Class
MindFusion.Diagramming Namespace

ShapeNode.polygonalTextLayout Property

Gets or sets a value indicating whether text is wrapped to fit the node's shape.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get polygonalTextLayout() {}
set polygonalTextLayout(value) {}
```

Property Value

Boolean

true to wrap the text according to node's geometry, or **false** otherwise.

Remarks

The formatting algorithm is designed to lay out text inside polygonal outlines. A polygonal approximation is created for outlines that contain curved segments, so text can also be laid out relatively to Bézier or spline segments.

ShapeNode.rotateImage Property

Gets or sets a value indicating whether image gets rotated along with the node.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get rotateImage() {}
set rotateImage(value) {}
```

Property Value

Boolean

true to rotate the image, or **false** otherwise.

See Also

ShapeNode Members
ShapeNode Class

ShapeNode.rotateText Property

Gets or sets a value indicating whether text gets rotated along with the node.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get rotateText() {}
set rotateText(value) {}
```

Property Value

Boolean

true to rotate the text, or **false** to keep it horizontal.

See Also

ShapeNode Members
ShapeNode Class

clipText Property

ShapeNode.shape Property

Gets or sets the geometric shape displayed by this node.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get shape() {}
set shape(value) {}
```

Property Value

Shape | *String*

The Shape of this node.

See Also

ShapeNode Members

ShapeNode.transparent Property

Gets or sets a value indicating whether the node's geometry is visible.

Namespace: MindFusion.Diagramming
Assembly: ShapeNode.js

Syntax

JavaScript Copy Code

```
get transparent() {}
set transparent(value) {}
```

Property Value

Boolean

true if node's geometry is hidden, or **false** otherwise.

Remarks

If a node is transparent, only its image and text are drawn. Shape, filling and frames are not painted.

Shapes Members

Provides alternative methods of access to the predefined shapes.

The following tables list the members exposed by the Shapes type.

Public Methods

	Name	Description
	Actor	Gets the Actor predefined shape.
	Alternative	Gets the Alternative predefined shape.
	Arrow	Gets the Arrow predefined shape.
	Arrow1	Gets the Arrow1 predefined shape.
	Arrow2	Gets the Arrow2 predefined shape.
	Arrow3	Gets the Arrow3 predefined shape.
	Arrow4	Gets the Arrow4 predefined shape.
	Arrow5	Gets the Arrow5 predefined shape.
	Arrow6	Gets the Arrow6 predefined shape.
	Arrow7	Gets the Arrow7 predefined shape.
	Arrow8	Gets the Arrow8 predefined shape.
	Arrow9	Gets the Arrow9 predefined shape.
	BackSlash	Gets the BackSlash predefined shape.
	BeginLoop	Gets the BeginLoop predefined shape.
	BowArrow	Gets the BowArrow predefined shape.

	BpmnComplex	Gets the BpmnComplex predefined shape.
	BpmnDataBasedXor	Gets the BpmnDataBasedXor predefined shape.
	BpmnEndCancel	Gets the BpmnEndCancel predefined shape.
	BpmnEndCompensation	Gets the BpmnEndCompensation predefined shape.
	BpmnEndError	Gets the BpmnEndError predefined shape.
	BpmnEndLink	Gets the BpmnEndLink predefined shape.
	BpmnEndMessage	Gets the BpmnEndMessage predefined shape.
	BpmnEndMultiple	Gets the BpmnEndMultiple predefined shape.
	BpmnEndTerminate	Gets the BpmnEndTerminate predefined shape.
	BpmnEventBasedXor	Gets the BpmnEventBasedXor predefined shape.
	BpmnInclusive	Gets the BpmnInclusive predefined shape.
	BpmnIntermediateCancel	Gets the BpmnIntermediateCancel predefined shape.
	BpmnIntermediateCompensation	Gets the BpmnIntermediateCompensation predefined shape.
	BpmnIntermediateError	Gets the BpmnIntermediateError predefined shape.
	BpmnIntermediateLink	Gets the BpmnIntermediateLink predefined shape.
	BpmnIntermediateMessage	Gets the BpmnIntermediateMessage predefined shape.
	BpmnIntermediateMultiple	Gets the BpmnIntermediateMultiple predefined shape.
	BpmnIntermediateRule	Gets the BpmnIntermediateRule predefined shape.
	BpmnIntermediateTimer	Gets the BpmnIntermediateTimer predefined shape.
	BpmnParallelFork	Gets the BpmnParallelFork predefined shape.
	BpmnStartLink	Gets the BpmnStartLink predefined shape.
	BpmnStartMessage	Gets the BpmnStartMessage predefined shape.
	BpmnStartMultiple	Gets the BpmnStartMultiple predefined shape.
	BpmnStartRule	Gets the BpmnStartRule predefined shape.
	BpmnStartTimer	Gets the BpmnStartTimer predefined shape.
	Circle	Gets the Circle predefined shape.
	Cloud	Gets the Cloud predefined shape.
	Collate	Gets the Collate predefined shape.
	ConeDown	Gets the ConeDown predefined shape.
	ConeUp	Gets the ConeUp predefined shape.
	ConnectedIssues	Gets the ConnectedIssues predefined shape.
	CreateRequest	Gets the CreateRequest predefined shape.
	Cross	Gets the Cross predefined shape.
	Cube	Gets the Cube predefined shape.
	Cylinder	Gets the Cylinder predefined shape.
	Database	Gets the Database predefined shape.
	DataTransmition	Gets the DataTransmition predefined shape.

	DDelay	Gets the DDelay predefined shape.
	Decagon	Gets the Decagon predefined shape.
	Decision	Gets the Decision predefined shape.
	Decision2	Gets the Decision2 predefined shape.
	DefaultFlow	Gets the DefaultFlow predefined shape.
	Delay	Gets the Delay predefined shape.
	DInDelay	Gets the DInDelay predefined shape.
	DirectAccessStorage	Gets the DirectAccessStorage predefined shape.
	DiskStorage	Gets the DiskStorage predefined shape.
	Display	Gets the Display predefined shape.
	DividedEvent	Gets the DividedEvent predefined shape.
	DividedProcess	Gets the DividedProcess predefined shape.
	Document	Gets the Document predefined shape.
	Donut	Gets the Donut predefined shape.
	DoubleArrow	Gets the DoubleArrow predefined shape.
	DOutDelay	Gets the DOutDelay predefined shape.
	Ellipse	Gets the Ellipse predefined shape.
	EndLoop	Gets the EndLoop predefined shape.
	ExternalOrganization	Gets the ExternalOrganization predefined shape.
	ExternalProcess	Gets the ExternalProcess predefined shape.
	File	Gets the File predefined shape.
	FramedRectangle	Gets the FramedRectangle predefined shape.
	Gate	Gets the Gate predefined shape.
	Heart	Gets the Heart predefined shape.
	Heptagon	Gets the Heptagon predefined shape.
	Hourglass	Gets the Hourglass predefined shape.
	Input	Gets the Input predefined shape.
	InternalStorage	Gets the InternalStorage predefined shape.
	Interrupt	Gets the Interrupt predefined shape.
	Interrupt2	Gets the Interrupt2 predefined shape.
	IsoProcess	Gets the IsoProcess predefined shape.
	Junction	Gets the Junction predefined shape.
	Lightning	Gets the Lightning predefined shape.
	LinedDocument	Gets the LinedDocument predefined shape.
	ManualOperation	Gets the ManualOperation predefined shape.
	Merge	Gets the Merge predefined shape.
	MessageFromUser	Gets the MessageFromUser predefined shape.

	MessageToUser	Gets the MessageToUser predefined shape.
	Microform	Gets the Microform predefined shape.
	MicroformProcessing	Gets the MicroformProcessing predefined shape.
	MicroformRecording	Gets the MicroformRecording predefined shape.
	MultiDocument	Gets the MultiDocument predefined shape.
	MultiProc	Gets the MultiProc predefined shape.
	Octagon	Gets the Octagon predefined shape.
	OfflineStorage	Gets the OfflineStorage predefined shape.
	OffpageConnection	Gets the OffpageConnection predefined shape.
	OffpageReference	Gets the OffpageReference predefined shape.
	Or	Gets the Or predefined shape.
	Pentagon	Gets the Pentagon predefined shape.
	PentagonArrow	Gets the PentagonArrow predefined shape.
	Plaque	Gets the Plaque predefined shape.
	PointerArrow	Gets the PointerArrow predefined shape.
	PrimitiveFromCall	Gets the PrimitiveFromCall predefined shape.
	PrimitiveToCall	Gets the PrimitiveToCall predefined shape.
	Procedure	Gets the Procedure predefined shape.
	Process	Gets the Process predefined shape.
	Prysm	Gets the Prysm predefined shape.
	PunchedCard	Gets the PunchedCard predefined shape.
	PyramidDown	Gets the PyramidDown predefined shape.
	PyramidUp	Gets the PyramidUp predefined shape.
	Quill	Gets the Quill predefined shape.
	Rectangle	Gets the Rectangle predefined shape.
	Reversed	Gets the Reversed predefined shape.
	RevTriangle	Gets the RevTriangle predefined shape.
	RevWithCirc	Gets the RevWithCirc predefined shape.
	RevWithLine	Gets the RevWithLine predefined shape.
	Rhombus	Gets the Rhombus predefined shape.
	RightTriangle	Gets the RightTriangle predefined shape.
	RoundRect	Gets the RoundRect predefined shape.
	RSave	Gets the RSave predefined shape.
	Save	Gets the Save predefined shape.
	Slash	Gets the Slash predefined shape.
	Sort	Gets the Sort predefined shape.
	Sphere	Gets the Sphere predefined shape.

	Star	Gets the Star predefined shape.
	Star16Pointed	Gets the Star16Pointed predefined shape.
	Star24Pointed	Gets the Star24Pointed predefined shape.
	Star32Pointed	Gets the Star32Pointed predefined shape.
	Star4Pointed	Gets the Star4Pointed predefined shape.
	Star5Pointed	Gets the Star5Pointed predefined shape.
	Star6Pointed	Gets the Star6Pointed predefined shape.
	Star7Pointed	Gets the Star7Pointed predefined shape.
	Start	Gets the Start predefined shape.
	Tape	Gets the Tape predefined shape.
	Terminator	Gets the Terminator predefined shape.
	Tetragon	Gets the Tetragon predefined shape.
	TransmittalTape	Gets the TransmittalTape predefined shape.
	Trapezoid	Gets the Trapezoid predefined shape.
	Triangle	Gets the Triangle predefined shape.

Shapes.Arrow Method

Gets the Arrow predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Arrow ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Arrow1 Method

Gets the Arrow1 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Arrow1 ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class

Shapes.Arrow5 Method

Gets the Arrow5 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Arrow5 ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Arrow6 Method

Gets the Arrow6 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Arrow6 ()
```

Return Value

An instance of the Shape class representing the predefined shape.

Shapes Class
MindFusion.Diagramming Namespace

Shapes.Arrow7 Method

Gets the Arrow7 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Arrow7 ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Arrow8 Method

Gets the Arrow8 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Arrow8 ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Arrow9 Method

Gets the Arrow9 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Arrow9 ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BackSlash Method

Gets the BackSlash predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BackSlash ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BeginLoop Method

Gets the BeginLoop predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BeginLoop ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BowArrow Method

Gets the BowArrow predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BowArrow ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnComplex Method

Gets the BpmnComplex predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnComplex ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnDataBasedXor Method

Gets the BpmnDataBasedXor predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnDataBasedXor ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndCancel Method

Gets the BpmnEndCancel predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnEndCancel ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndCompensation Method

Gets the BpmnEndCompensation predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnEndCompensation ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndError Method

Gets the BpmnEndError predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnEndError ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndLink Method

Gets the BpmnEndLink predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnEndLink ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndMessage Method

Gets the BpmnEndMessage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnEndMessage ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndMultiple Method

Gets the BpmnEndMultiple predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnEndMultiple ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEndTerminate Method

Gets the BpmnEndTerminate predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnEndTerminate ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnEventBasedXor Method

Gets the BpmnEventBasedXor predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnEventBasedXor ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnInclusive Method

Gets the BpmnInclusive predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnInclusive ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateCancel Method

Gets the BpmnIntermediateCancel predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnIntermediateCancel ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateCompensation Method

Gets the BpmnIntermediateCompensation predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnIntermediateCompensation ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateError Method

Gets the BpmnIntermediateError predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function BpmnIntermediateError ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateLink Method

Gets the BpmnIntermediateLink predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function BpmnIntermediateLink ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateMessage Method

Gets the BpmnIntermediateMessage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function BpmnIntermediateMessage ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateMultiple Method

Gets the BpmnIntermediateMultiple predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function BpmnIntermediateMultiple ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateRule Method

Gets the BpmnIntermediateRule predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function BpmnIntermediateRule ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnIntermediateTimer Method

Gets the BpmnIntermediateTimer predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function BpmnIntermediateTimer ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnParallelFork Method

Gets the BpmnParallelFork predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnParallelFork ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnStartLink Method

Gets the BpmnStartLink predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnStartLink ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnStartMessage Method

Gets the BpmnStartMessage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnStartMessage ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnStartMultiple Method

Gets the BpmnStartMultiple predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnStartMultiple ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnStartRule Method

Gets the BpmnStartRule predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnStartRule ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.BpmnStartTimer Method

Gets the BpmnStartTimer predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function BpmnStartTimer ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Circle Method

Gets the Circle predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Circle ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Cloud Method

Gets the Cloud predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Cloud ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Collate Method

Gets the Collate predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Collate ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.ConeDown Method

Gets the ConeDown predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function ConeDown ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.ConeUp Method

Gets the ConeUp predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function ConeUp ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.ConnectedIssues Method

Gets the ConnectedIssues predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function ConnectedIssues ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.CreateRequest Method

Gets the CreateRequest predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function CreateRequest ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Cross Method

Gets the Cross predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Cross ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Cube Method

Gets the Cube predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Cube ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Cylinder Method

Gets the Cylinder predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Cylinder ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Database Method

Gets the Database predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Database ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DataTransmition Method

Gets the DataTransmition predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function DataTransmition ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DDelay Method

Gets the DDelay predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function DDelay ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Decagon Method

Gets the Decagon predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Decagon ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Decision Method

Gets the Decision predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Decision ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Decision2 Method

Gets the Decision2 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Decision2 ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DefaultFlow Method

Gets the DefaultFlow predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function DefaultFlow ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Delay Method

Gets the Delay predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Delay ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DInDelay Method

Gets the DInDelay predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function DInDelay ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DirectAccessStorage Method

Gets the DirectAccessStorage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function DirectAccessStorage ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DiskStorage Method

Gets the DiskStorage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function DiskStorage ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Display Method

Gets the Display predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Display ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DividedEvent Method

Gets the DividedEvent predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function DividedEvent ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DividedProcess Method

Gets the DividedProcess predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function DividedProcess ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Document Method

Gets the Document predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Document ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Donut Method

Gets the Donut predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Donut ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DoubleArrow Method

Gets the DoubleArrow predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function DoubleArrow ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.DOutDelay Method

Gets the DOutDelay predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function DOutDelay ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Ellipse Method

Gets the Ellipse predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Ellipse ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.EndLoop Method

Gets the EndLoop predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function EndLoop ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.ExternalOrganization Method

Gets the ExternalOrganization predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function ExternalOrganization ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.ExternalProcess Method

Gets the ExternalProcess predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function ExternalProcess ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.File Method

Gets the File predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function File ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.FramedRectangle Method

Gets the FramedRectangle predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function FramedRectangle ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Gate Method

Gets the Gate predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Gate ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Heart Method

Gets the Heart predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Heart ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Heptagon Method

Gets the Heptagon predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Heptagon ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Hourglass Method

Gets the Hourglass predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Hourglass ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Input Method

Gets the Input predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Input ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.InternalStorage Method

Gets the InternalStorage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function InternalStorage ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Interrupt Method

Gets the Interrupt predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Interrupt ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Interrupt2 Method

Gets the Interrupt2 predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Interrupt2 ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.IsoProcess Method

Gets the IsoProcess predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function IsoProcess ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Junction Method

Gets the Junction predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Junction ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Lightning Method

Gets the Lightning predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Lightning ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.LinedDocument Method

Gets the LinedDocument predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function LinedDocument ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.ManualOperation Method

Gets the ManualOperation predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function ManualOperation ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Merge Method

Gets the Merge predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Merge ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.MessageFromUser Method

Gets the MessageFromUser predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function MessageFromUser ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.MessageToUser Method

Gets the MessageToUser predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function MessageToUser ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Microform Method

Gets the Microform predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Microform ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.MicroformProcessing Method

Gets the MicroformProcessing predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function MicroformProcessing ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.MicroformRecording Method

Gets the MicroformRecording predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function MicroformRecording ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.MultiDocument Method

Gets the MultiDocument predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function MultiDocument ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.MultiProc Method

Gets the MultiProc predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function MultiProc ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Octagon Method

Gets the Octagon predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Octagon ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.OfflineStorage Method

Gets the OfflineStorage predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function OfflineStorage ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.OffpageConnection Method

Gets the OffpageConnection predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function OffpageConnection ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.OffpageReference Method

Gets the OffpageReference predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function OffpageReference ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Or Method

Gets the Or predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Or ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Pentagon Method

Gets the Pentagon predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Pentagon ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.PentagonArrow Method

Gets the PentagonArrow predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function PentagonArrow ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Plaque Method

Gets the Plaque predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Plaque ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.PointerArrow Method

Gets the PointerArrow predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function PointerArrow ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.PrimitiveFromCall Method

Gets the PrimitiveFromCall predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function PrimitiveFromCall ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.PrimitiveToCall Method

Gets the PrimitiveToCall predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function PrimitiveToCall ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Procedure Method

Gets the Procedure predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Procedure ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Process Method

Gets the Process predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Process ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Prysm Method

Gets the Prysm predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Prysm ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.PunchedCard Method

Gets the PunchedCard predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function PunchedCard ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.PyramidDown Method

Gets the PyramidDown predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function PyramidDown ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.PyramidUp Method

Gets the PyramidUp predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function PyramidUp ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Quill Method

Gets the Quill predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Quill ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Rectangle Method

Gets the Rectangle predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Rectangle ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Reversed Method

Gets the Reversed predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Reversed ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.RevTriangle Method

Gets the RevTriangle predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function RevTriangle ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.RevWithCirc Method

Gets the RevWithCirc predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function RevWithCirc ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.RevWithLine Method

Gets the RevWithLine predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function RevWithLine ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Rhombus Method

Gets the Rhombus predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Rhombus ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.RightTriangle Method

Gets the RightTriangle predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function RightTriangle ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.RoundRect Method

Gets the RoundRect predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function RoundRect ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.RSave Method

Gets the RSave predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function RSave ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Save Method

Gets the Save predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Save ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Slash Method

Gets the Slash predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Slash ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Sort Method

Gets the Sort predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Sort ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Sphere Method

Gets the Sphere predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Sphere ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Star Method

Gets the Star predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Star ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Star16Pointed Method

Gets the Star16Pointed predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Star16Pointed ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Star24Pointed Method

Gets the Star24Pointed predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Star24Pointed ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Star32Pointed Method

Gets the Star32Pointed predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Star32Pointed ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Star4Pointed Method

Gets the Star4Pointed predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Star4Pointed ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Star5Pointed Method

Gets the Star5Pointed predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Star5Pointed ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Star6Pointed Method

Gets the Star6Pointed predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Star6Pointed ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Star7Pointed Method

Gets the Star7Pointed predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Star7Pointed ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Start Method

Gets the Start predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Start ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Tape Method

Gets the Tape predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Tape ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Terminator Method

Gets the Terminator predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Terminator ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Tetragon Method

Gets the Tetragon predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function Tetragon ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.TransmittalTape Method

Gets the TransmittalTape predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript — Copy Code

```
function TransmittalTape ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Trapezoid Method

Gets the Trapezoid predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Trapezoid ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

Shapes.Triangle Method

Gets the Triangle predefined shape.

Namespace: MindFusion.Diagramming
Assembly: Shapes.js

Syntax

JavaScript Copy Code

```
function Triangle ()
```

Return Value

An instance of the Shape class representing the predefined shape.

See Also

Shapes Members
Shapes Class
MindFusion.Diagramming Namespace

ShowAnchors Enumeration

Specifies when anchor points should be displayed.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
ShowAnchors = {}
```

Members

	Member name	Description
	Always	Anchor point marks are always painted.
	Never	Anchor point marks are never painted.

	Auto	Anchor point marks are shown for the node under the mouse cursor.
	Selected	Anchor point marks are painted for the selected node.

Remarks

Members of this enumeration can be assigned to the showAnchors property of Diagram.

MindFusion.Diagramming Namespace
Composite Nodes

SimplePanel Members

A layout container that arranges its child components on top of each other.

The following tables list the members exposed by the SimplePanel type.

Public Constructors

	Name	Description
	SimplePanel	Initializes a new instance of the SimplePanel class.

Public Properties

	Name	Description
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)

	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

Public Methods

	Name	Description
	getComponents	Gets the child components of this panel. (Inherited from Panel.)

See Also

SimplePanel Class

SimplePanel Constructor

Initializes a new instance of the SimplePanel class.

Namespace: MindFusion.Diagramming
Assembly: SimplePanel.js

Syntax

JavaScript Copy Code

```
function SimplePanel ()
```

See Also

SimplePanel Class
MindFusion.Diagramming Namespace

SimpleShape Enumeration

Defines the possible values for shape property of tables and containers.

Namespace: MindFusion.Diagramming
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
SimpleShape = {}
```

Members

	Member name	Description
	Rectangle	Sets node's shape to rectangle.
	RoundedRectangle	Sets node's shape to rounded rectangle.

MindFusion.Diagramming Namespace

SinglePointerController Class

Processes mouse or single-touch events targeting a diagram element.

Syntax

JavaScript — Copy Code

```
// class
SinglePointerController.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.SinglePointerController
- MindFusion.Diagramming.CreateLinkController
- MindFusion.Diagramming.CreateNodeController
- MindFusion.Diagramming.CreateSelectionController
- MindFusion.Diagramming.ModifyLinkController
- MindFusion.Diagramming.ModifyNodeController
- MindFusion.Diagramming.ModifySelectionController
- MindFusion.Diagramming.PanController

SinglePointerController Members
MindFusion.Diagramming Namespace

SinglePointerController Members

Processes mouse or single-touch events targeting a diagram element.

The following tables list the members exposed by the SinglePointerController type.

Public Constructors

	Name	Description
	SinglePointerController	Initializes a new instance of the SinglePointerController class.

Public Methods

	Name	Description
	cancel	Called when the user stops drawing or modifying a diagram element, rejecting the operation.
	commit	Called when the user stops drawing or modifying a diagram element, accepting the operation.
	drawInteraction	Called to draw current state of user interaction.
	move	Called continuously while the user draws with the mouse or touch.
	start	Called when the user starts drawing or modifying a diagram element.
	validate	Called to validate the operation at current pointer position.

See Also

SinglePointerController Class
MindFusion.Diagramming Namespace

SinglePointerController Constructor

Initializes a new instance of the SinglePointerController class.

Namespace: MindFusion.Diagramming
Assembly: SinglePointerController.js

Syntax

JavaScript Copy Code

```
function SinglePointerController (modifiedItem, adjustmentHandle)
```

Parameters

modifiedItem
DiagramItem. The item that will be modified by this controller.

adjustmentHandle
Object. An object representing the adjustment handle used to modify the item.

See Also

SinglePointerController Class
MindFusion.Diagramming Namespace

SinglePointerController Methods

SinglePointerController.cancel Method

Called when the user stops drawing or modifying a diagram element, rejecting the operation.

Namespace: MindFusion.Diagramming
Assembly: SinglePointerController.js

Syntax

JavaScript Copy Code

```
function cancel (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

SinglePointerController Members
SinglePointerController Class
MindFusion.Diagramming Namespace

SinglePointerController.commit Method

Called when the user stops drawing or modifying a diagram element, accepting the operation.

Namespace: MindFusion.Diagramming
Assembly: SinglePointerController.js

Syntax

JavaScript Copy Code

```
function commit (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

SinglePointerController Members
SinglePointerController Class
MindFusion.Diagramming Namespace

SinglePointerController.drawInteraction Method

Called to draw current state of user interaction.

Namespace: MindFusion.Diagramming
Assembly: SinglePointerController.js

Syntax

JavaScript — Copy Code

```
function drawInteraction (context)
```

Parameters

context
DrawingContext2D. The drawing context for diagram's underlying canvas.

See Also

SinglePointerController Members
SinglePointerController Class
MindFusion.Diagramming Namespace

SinglePointerController.move Method

Called continuously while the user draws with the mouse or touch.

Namespace: MindFusion.Diagramming
Assembly: SinglePointerController.js

Syntax

JavaScript — Copy Code

```
function move (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

SinglePointerController Members
SinglePointerController Class
MindFusion.Diagramming Namespace

SinglePointerController.start Method

Called when the user starts drawing or modifying a diagram element.

Namespace: MindFusion.Diagramming
Assembly: SinglePointerController.js

Syntax

JavaScript — Copy Code

```
function start (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

See Also

SinglePointerController Members
SinglePointerController Class
MindFusion.Diagramming Namespace

SinglePointerController.validate Method

Called to validate the operation at current pointer position.

Namespace: MindFusion.Diagramming
Assembly: SinglePointerController.js

Syntax

JavaScript Copy Code

```
function validate (position)
```

Parameters

position
Point. A point specified in diagram coordinates.

Return Value

Boolean. true to accept the operation, or false otherwise.

Composite Nodes

StackPanel Members

A layout container that arranges its child components stacked horizontally or vertically.

The following tables list the members exposed by the StackPanel type.

Public Constructors

	Name	Description
	StackPanel	Initializes a new instance of the **StackPanel** class.

Public Properties

	Name	Description
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	orientation	Gets or sets the stack orientation.
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

Public Methods

	Name	Description
	getComponents	Gets the child components of this panel. (Inherited from Panel.)
	getOrientation	Gets the stack orientation.
	setOrientation	Sets the stack orientation.

StackPanel Class
MindFusion.Diagramming Namespace

StackPanel Constructor

Initializes a new instance of the StackPanel class.

Namespace: MindFusion.Diagramming
Assembly: StackPanel.js

Syntax

JavaScript Copy Code

```
function StackPanel ()
```

See Also

StackPanel Class
MindFusion.Diagramming Namespace

StackPanel Methods

StackPanel.getOrientation Method

Gets the stack orientation.

Namespace: MindFusion.Diagramming
Assembly: StackPanel.js

Syntax

JavaScript — Copy Code

```
function getOrientation ()
```

Return Value

A member of the Orientation enumeration.

See Also

StackPanel Members
StackPanel Class
MindFusion.Diagramming Namespace

StackPanel.setOrientation Method

Sets the stack orientation.

Namespace: MindFusion.Diagramming
Assembly: StackPanel.js

Syntax

JavaScript — Copy Code

```
function setOrientation (value)
```

Parameters

value
A member of the Orientation enumeration.

See Also

StackPanel Members
StackPanel Class
MindFusion.Diagramming Namespace

StackPanel Properties

StackPanel.orientation Property

Gets or sets the stack orientation.

Namespace: MindFusion.Diagramming
Assembly: StackPanel.js

Syntax

JavaScript — Copy Code

```
get orientation() {}
set orientation(value) {}
```

Property Value

Orientation

A member of the Orientation enumeration.

See Also

StackPanel Members
StackPanel Class
MindFusion.Diagramming Namespace

Style Class

Represents a set of appearance properties whose values can be inherited from parent objects if not set locally for an item.

Syntax

JavaScript Copy Code

```
// class
Style.prototype = {}
```

Remarks

An instance of this class can be used to set items' appearance properties as a single unit via their style property. In order for style attributes to be used, the respective local appearance properties of a DiagramItem objects must have undefined or **null** values. If an item's **style** does not define a value for some attribute, it is looked up in the styling hierarchy, first in the diagram's style, next in the current theme, and finally in the set of default styles defined for each item class.

Inheritance Hierarchy

MindFusion.Diagramming.Style

Style Members
MindFusion.Diagramming Namespace

Style Members

Represents a set of appearance properties whose values can be inherited from parent objects if not set locally for an item.

The following tables list the members exposed by the Style type.

Public Constructors

	Name	Description
	Style	Initializes a new instance of the Style class.

Public Properties

	Name	Description
	backBrush	Gets or sets the brush used to paint diagram background.
	brush	Gets or sets the brush used to fill the interior of diagram items.
	captionBackBrush	Gets or sets the brush used to fill nodes' caption bars.
	fontName	Gets or sets the font name used to draw text of diagram items.
	fontSize	Gets or sets the font size used to draw text of diagram items.
	fontStyle	Gets or sets the font style used to draw text of diagram items.
	nodeEffects	Gets or sets a list of effects applied to diagram nodes.
	selectedBrush	Gets or sets the brush used to paint the background of selected items.

	selectedStroke	Gets or sets the color used to stroke outlines of selected items.
	shadowColor	Gets or sets the color used to draw shadows of diagram items.
	stroke	Gets or sets the color used to stroke outlines of diagram items.
	strokeDashStyle	Gets or sets the line dash pattern applied when stroking outlines of diagram items.
	strokeThickness	Gets or sets the line width applied when stroking outlines of diagram items.
	textColor	Gets or sets the color used to draw text of diagram items.

Style Class
MindFusion.Diagramming Namespace

Style Constructor

Initializes a new instance of the Style class.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
function Style ([prototype])
```

Parameters

prototype
Optional.

See Also

Style Class
MindFusion.Diagramming Namespace

Style Properties

Style.backBrush Property

Gets or sets the brush used to paint diagram background.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get backBrush() {}
set backBrush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.brush Property

Gets or sets the brush used to fill the interior of diagram items.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get brush() {}
set brush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.captionBackBrush Property

Gets or sets the brush used to fill nodes' caption bars.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get captionBackBrush() {}
set captionBackBrush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

Remarks

This value is applied to TableNode and ContainerNode objects.

See Also

Style Members

Style.fontName Property

Gets or sets the font name used to draw text of diagram items.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get fontName() {}
set fontName(value) {}
```

Property Value

String

A string containing font name.

See Also

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.fontSize Property

Gets or sets the font size used to draw text of diagram items.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get fontSize() {}
set fontSize(value) {}
```

Property Value

Number

A number specifying font size.

See Also

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.fontStyle Property

Gets or sets the font style used to draw text of diagram items.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get fontStyle() {}
set fontStyle(value) {}
```

Property Value

FontStyle

A combination of FontStyle enumeration members.

See Also

Style.nodeEffects Property

Gets or sets a list of effects applied to diagram nodes.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get nodeEffects() {}
set nodeEffects(value) {}
```

Property Value

Array

An array of NodeEffect objects.

MindFusion.Diagramming Namespace

Style.selectedBrush Property

Gets or sets the brush used to paint the background of selected items.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get selectedBrush() {}
set selectedBrush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.selectedStroke Property

Gets or sets the color used to stroke outlines of selected items.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get selectedStroke() {}
set selectedStroke(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.shadowColor Property

Gets or sets the color used to draw shadows of diagram items.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get shadowColor() {}
set shadowColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

Style.stroke Property

Gets or sets the color used to stroke outlines of diagram items.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get stroke() {}
set stroke(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.strokeDashStyle Property

Gets or sets the line dash pattern applied when stroking outlines of diagram items.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get strokeDashStyle() {}
set strokeDashStyle(value) {}
```

Property Value

DashStyle

A member of the DashStyle enumeration.

See Also

Style Members
Style Class
MindFusion.Diagramming Namespace

Style.strokeThickness Property

Gets or sets the line width applied when stroking outlines of diagram items.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get strokeThickness() {}
set strokeThickness(value) {}
```

Property Value

Number

A number specifying stroke thickness.

Style.textColor Property

Gets or sets the color used to draw text of diagram items.

Namespace: MindFusion.Diagramming
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get textColor() {}
set textColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

SvgContent Class

SvgContent represents the markup code of an SVG drawing.

Syntax

JavaScript Copy Code

```
// class
SvgContent.prototype = {}
```

Remarks

SvgContent objects are assigned to the content property of SvgNode.

Inheritance Hierarchy

MindFusion.Diagramming.SvgContent

See Also

SvgContent Members
MindFusion.Diagramming Namespace

SvgContent Members

SvgContent represents the markup code of an SVG drawing.

The following tables list the members exposed by the **SvgContent** type.

Public Methods

	Name	Description
	parse	Loads SVG code from the specified file.
	parseSvg	Loads SVG code from the specified string.

See Also

SvgContent Class
MindFusion.Diagramming Namespace

SvgContent Methods

SvgContent.parse Method

Loads SVG code from the specified file.

Namespace: MindFusion.Diagramming
Assembly: SvgNode.js

Syntax

JavaScript Copy Code

```
function parse (value)
```

Parameters

value
String. A string specifying the SVG file location.

Remarks

The MIME type of .svg files on server should be set to image/svg+xml.

See Also

SvgContent Members
SvgContent Class
MindFusion.Diagramming Namespace

SvgContent.parseSvg Method

Loads SVG code from the specified string.

Namespace: MindFusion.Diagramming
Assembly: SvgNode.js

Syntax

JavaScript Copy Code

```
function parseSvg (value)
```

Parameters

value
String. A string containing the SVG markup code.

SvgExporter Class

Creates SVG (Scalable Vector Graphics) drawings from the content of Diagram objects.

Syntax

JavaScript Copy Code

```
// class
SvgExporter.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.SvgExporter

See Also

SvgExporter Members
MindFusion.Diagramming Namespace

SvgExporter Members

Creates SVG (Scalable Vector Graphics) drawings from the content of Diagram objects.

The following tables list the members exposed by the SvgExporter type.

Public Constructors

	Name	Description
	SvgExporter	Initializes a new instance of the **SvgExporter** class.

Public Methods

	Name	Description
	exportElement	Overloaded.
	exportString	Creates an SVG document representing the specified diagram.

SvgExporter Class
MindFusion.Diagramming Namespace

SvgExporter Methods

SvgExporter.exportElement Method

Overload List

Name	Description
SvgExporter.exportElement (Diagram)	Creates an SVG element representing the specified diagram.
SvgExporter.exportElement (Diagram, Document)	Creates an SVG element representing the specified diagram.

See Also

SvgExporter Members
SvgExporter Class
MindFusion.Diagramming Namespace

SvgExporter.exportElement Method (Diagram)

Creates an SVG element representing the specified diagram.

Namespace: MindFusion.Diagramming
Assembly: SvgExporter.js

Syntax

JavaScript Copy Code

```
function exportElement (diagram)
```

Parameters

diagram
A reference to the diagram to be exported.

See Also

exportElement Method Overload List
SvgExporter Members
SvgExporter Class
MindFusion.Diagramming Namespace

SvgExporter.exportElement Method (Diagram, Document)

Creates an SVG element representing the specified diagram.

Namespace: MindFusion.Diagramming
Assembly: SvgExporter.js

Syntax

JavaScript Copy Code

```
function exportElement (diagram, [parentDoc])
```

Parameters

diagram
Diagram. A reference to the diagram to be exported.

parentDoc
Optional.
Document. The document to export to.

Return Value

Object. A DOM SVG element.

See Also

exportElement Method Overload List
SvgExporter Members
SvgExporter Class
MindFusion.Diagramming Namespace

SvgExporter.exportString Method

Creates an SVG document representing the specified diagram.

Namespace: MindFusion.Diagramming
Assembly: SvgExporter.js

Syntax

JavaScript Copy Code

```
function exportString (diagram)
```

Parameters

diagram
Diagram. A reference to the diagram to be exported.

Return Value

Object. A string containing the SVG document's content.

See Also

SvgExporter Members
SvgExporter Class
MindFusion.Diagramming Namespace

SvgNode Class

SvgNode instances are diagram nodes that can render SVG drawings.

Syntax

JavaScript Copy Code

```
// class
SvgNode.prototype = {}
```

Remarks

An **SvgNode** instance represents nodes that can display SVG drawings in addition to the rendering provided by the base ShapeNode class. The SVG drawing of a node is specified through its content property. The SVG graphics are loaded and associated with the node through an SvgContent object, which should be initialized and then assigned to **content**. Note that the MIME type of .svg files on server should be set to image/svg+xml.

Example

The following code illustrates how to load SVG graphics from a server file and associate it with a new **SvgNode**:

JavaScript Copy Code

```
var node = diagram.factory.createSvgNode(bounds);
node.transparent = true; // hide ShapeNode geometry

var svg = new SvgContent();
svg.parse("image.svg");
node.content = svg;
```

Inheritance Hierarchy

MindFusion.Diagramming.DiagramItem
  MindFusion.Diagramming.DiagramNode
    MindFusion.Diagramming.ShapeNode
      MindFusion.Diagramming.SvgNode

See Also

SvgNode Members
MindFusion.Diagramming Namespace

SvgNode Members

SvgNode instances are diagram nodes that can render SVG drawings.

The following tables list the members exposed by the **SvgNode** type.

Public Constructors

	Name	Description
	SvgNode	Initializes a new instance of the SvgNode class with default values supplied from the specified Diagram.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowFlip	Gets or sets a value indicating whether the node's shape flips when an edge is dragged over its opposite edge. (Inherited from ShapeNode.)
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	content	Gets or sets an SvgContent instance representing the SVG drawing rendered in this node.
	contentAlign	Gets or sets the alignment of the **SvgContent** displayed in this node.
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	CustomDraw	Gets or sets the type of custom drawing performed on this shape node. (Inherited from ShapeNode.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	EnableStyledText	Gets or sets a value indicating whether styled text rendering is enabled. (Inherited from ShapeNode.)

	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	FlipX	Gets or sets a value indicating whether the node's shape is flipped horizontally. (Inherited from ShapeNode.)
	FlipY	Gets or sets a value indicating whether the node's shape is flipped vertically. (Inherited from ShapeNode.)
	Font	Gets or sets the font used to render the node's text. (Inherited from ShapeNode.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	Image	Gets or sets the image that is displayed in this shape node. (Inherited from ShapeNode.)
	ImageAlign	Gets or sets the alignment of the image displayed in this shape node. (Inherited from ShapeNode.)
	ImagePadding	Gets or sets the padding distance between node's borders and **Image**. (Inherited from ShapeNode.)
	ImageUrl	Gets or sets a URL used to load an image into this node. (Inherited from ShapeNode.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)

	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	PlainText	Gets the plain text of this shape node. (Inherited from ShapeNode.)
	PolygonalTextLayout	Gets or sets a value indicating whether the node's Text is formatted inside non-rectangular outline. (Inherited from ShapeNode.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotateImage	Gets or sets a value indicating whether the **Image** should be rotated when the shape node is rotated. (Inherited from ShapeNode.)
	RotateText	Gets or sets a value indicating whether the **Text** should be rotated when the shape node is rotated. (Inherited from ShapeNode.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Shape	Gets or sets a reference to the node's geometric shape definition. (Inherited from ShapeNode.)
	ShapeOrientation	Gets or sets the angle specifying the orientation with which a shape template is applied to the node bounds. (Inherited from ShapeNode.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed inside the shape node. (Inherited from ShapeNode.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of the text that is displayed inside shape nodes. (Inherited from ShapeNode.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from ShapeNode.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Transparent	Gets or sets a value indicating whether this shape node is transparent. (Inherited from ShapeNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)

	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	clone	ShapeNode.clone override.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from ShapeNode.)
	CreateConnectionPoint	DiagramNode.CreateConnectionPoint override. (Inherited from ShapeNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramNode.DrawHandles override. Renders the adjustment handles of this item. (Inherited from ShapeNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Draws the node on the specified IGraphics surface. (Inherited from ShapeNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified **IGraphics** surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Draws the shadow of this node on the specified **IGraphics** surface. (Inherited from ShapeNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	fromJson	ShapeNode.fromJson override.

	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from ShapeNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetOutlinePoly	Node.GetOutlinePoly override. (Inherited from ShapeNode.)
	GetRepaintRect	DiagramNode.GetRepaintRect override. (Inherited from ShapeNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramNode.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from ShapeNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	init	Returns a Builder object used to configure this SvgNode instance.
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	loadFromXml	DiagramNode.LoadFromXml override. Loads the node's content from an XML element.
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)

	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	DiagramItem.OnLoad override. (Inherited from ShapeNode.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	ResizeToFitImage	Makes the shape node as big as the image it displays. (Inherited from ShapeNode.)
	ResizeToFitText	Makes the shape node big enough to display its text without clipping. (Inherited from ShapeNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveToXml	Saves the node's content into an XML element.
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	toJson	ShapeNode.toJson override.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	With	Returns a Builder object used to configure and create new **SvgNode** instances.
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)

	AllowModify	DiagramNode.AllowModify override. Invoked during interactive modification of items to test whether the operation can be completed in the current context. (Inherited from ShapeNode.)
	CancelModify	DiagramNode.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from ShapeNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramNode.CompleteModify override. Invoked when the item modification has been completed. (Inherited from ShapeNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from ShapeNode.)
	CreateState	DiagramNode.CreateState override; creates a ShapeNodeState instance. (Inherited from ShapeNode.)
	Dispose	Disposes any disposable resources managed by this shape. (Inherited from ShapeNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetImageRect	Overloaded. Gets the destination rectangle of the node's image. (Inherited from ShapeNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a GraphicsPath object for this node as though it is contained in the specified rectangle. (Inherited from ShapeNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object. (Inherited from ShapeNode.)
	LoadFromXml	Loads the item content from an XML element. (Inherited from ShapeNode.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	Called when the item is added to a **Diagram**, either by users, programmatically or via undo / redo. (Inherited from ShapeNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	Called when the Diagram's MeasureUnit changes. (Inherited from ShapeNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)

	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	DiagramNode.OnRotationAngleChanged override. (Inherited from ShapeNode.)
	OnStyleChanged	DiagramItem.OnStyleChanged override. (Inherited from ShapeNode.)
	OnTextChanged	DiagramItem.OnTextChanged override. (Inherited from ShapeNode.)
	OnTextFormatChanged	DiagramItem.OnTextFormatChanged override. (Inherited from ShapeNode.)
	OnUpdateBounds	DiagramNode.OnUpdateBounds override. (Inherited from ShapeNode.)
	OnZoomChanged	Called when the Diagram's **ZoomFactor** changes. (Inherited from ShapeNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramNode.RestoreProperties override. (Inherited from ShapeNode.)
	RestoreState	DiagramNode.RestoreState override. Restores the state of this diagram item. (Inherited from ShapeNode.)
	SaveProperties	DiagramNode.SaveProperties override. (Inherited from ShapeNode.)
	SaveState	DiagramNode.SaveState override. Saves the state of this diagram item. (Inherited from ShapeNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from ShapeNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from ShapeNode.)
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramNode.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from ShapeNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)

	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	**DiagramNode.UpdateModify** override. Invoked during interactive modification of this item. (Inherited from ShapeNode.)

SvgNode Constructor

Initializes a new instance of the SvgNode class with default values supplied from the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: SvgNode.js

Syntax

JavaScript Copy Code

```
function SvgNode ([parent])
```

Parameters

parent
Optional.
Diagram. The Diagram from which to obtain default values for the node properties.

SvgNode.loadFromXml Method

DiagramNode.LoadFromXml override. Loads the node's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: SvgNode.js

Syntax

JavaScript — Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

SvgNode.saveToXml Method

Saves the node's content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: SvgNode.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

SvgNode Members
SvgNode Class
MindFusion.Diagramming Namespace

SvgNode.With Method

Returns a Builder object used to configure and create new SvgNode instances.

Namespace: MindFusion.Diagramming
Assembly: SvgNode.js

Syntax

JavaScript Copy Code

```
function With (diagram)
```

Parameters

diagram

Return Value

A Builder instance.

SvgNode Properties

SvgNode.content Property

Gets or sets an SvgContent instance representing the SVG drawing rendered in this node.

Namespace: MindFusion.Diagramming
Assembly: SvgNode.js

Syntax

JavaScript Copy Code

```
get content() {}
set content(value) {}
```

Property Value

SvgContent

An instance of the SvgContent class.

See Also

SvgNode Members
SvgNode Class
MindFusion.Diagramming Namespace
contentAlign Property

SvgNode.contentAlign Property

Gets or sets the alignment of the SvgContent displayed in this node.

Namespace: MindFusion.Diagramming
Assembly: SvgNode.js

Syntax

JavaScript Copy Code

```
get contentAlign() {}
set contentAlign(value) {}
```

Property Value

ImageAlign

A member of the ImageAlign enumeration.

TableColumn Class

Represents a column of a TableNode.

Syntax

JavaScript Copy Code

```
// class
TableColumn.prototype = {}
```

Remarks

Call the getColumn method of TableNode to get the **TableColumn** instance at specified position. In order to add or remove columns, set table's columnCount property, or call methods such as addColumn, insertColumn, deleteColumn, redimTable.

TableColumn Properties

TableColumn.columnStyle Property

Gets or sets the column style.

Namespace: MindFusion.Diagramming
Assembly: TableColumn.js

Syntax

JavaScript Copy Code

```
get columnStyle() {}
set columnStyle(value) {}
```

Property Value

ColumnStyle

A member of the ColumnStyle enumeration.

TableColumn.width Property

Gets or sets the width of this column.

Namespace: MindFusion.Diagramming
Assembly: TableColumn.js

Syntax

JavaScript Copy Code

```
get width() {}
set width(value) {}
```

Property Value

Number

A number specifying the width.

TableConnectionPoint Members

A class that represents a connection between an edge and a node in a graph.

The following tables list the members exposed by the TableConnectionPoint type.

Public Properties

	Name	Description
	endPoint	Calculates the coordinates of this connection point expressed in document coordinates.
	RelativePosition	Gets or sets the position of this connection point, relative to the associated node's bounding rectangle, expressed as percentage. (Inherited from ConnectionPoint.)
	Row	Gets the index of a constituent item within the associated node where the link represented by this connection point is connected, or -1, if the link is connected to the node itself. (Inherited from ConnectionPoint.)

Protected Properties

	Name	Description
	Incoming	Gets a flag indicating whether this connection point is at the origin or the destination of the associated link. (Inherited from ConnectionPoint.)
	Link	Gets the link associated with this connection point. (Inherited from ConnectionPoint.)
	Node	Gets the node associated with this connection point. (Inherited from ConnectionPoint.)

Public Methods

	Name	Description
	addLinkToNode	Adds the link associated with this connection point to the associated node.
	AddLinkToNode	Adds the link associated with this connection point to the associated node. (Inherited from ConnectionPoint.)
	CalculateIntersections	Determines whether the end of a link should be aligned to the point where the node contour is intersected by the line connecting the centers of the connected nodes. (Inherited from ConnectionPoint.)
	CanMoveLink	Checks whether the specified point, expressed in document coordinates, is a valid location for this connection point. (Inherited from ConnectionPoint.)
	GetAnchorPos	Overloaded. (Inherited from ConnectionPoint.)

	GetEndPoint	Calculates the coordinates of the this connection point expressed in document coordinates. (Inherited from ConnectionPoint.)
	getInitialPoint	Returns a point (usually the center of the bounding rectangle) contained within the associated node.
	GetInitialPoint	Returns a point (usually the center of the bounding rectangle) contained within the associated node. (Inherited from ConnectionPoint.)
	getIntersection	Calculates the intersection point between the specified line segment and the contour of the node associated with this connection point.
	GetIntersection	Calculates the intersection point between the specified line segment and the contour of the node associated with this connection point. (Inherited from ConnectionPoint.)
	getNearestBorderPoint	Returns the nearest point lying on the node border.
	GetNodeRect	Returns the bounding rectangle of the node associated with this connection point. (Inherited from ConnectionPoint.)
	linkChanges	Checks whether the link would change if attached to the specified node at the specified point.
	LinkChanges	Checks whether the relationship represented by the associated link would change if the link is attached to the specified node at the specified point. (Inherited from ConnectionPoint.)
	NearestAnchorPoint	Returns the anchor point closest to the specified point from the node's associated anchor pattern. (Inherited from ConnectionPoint.)
	NodesIntersect	Checks whether the node associated with the current connection point and the node associated with the specified connection point intersect. (Inherited from ConnectionPoint.)
	removeLinkFromNode	Removes the link associated with this connection point from the associated node.
	RemoveLinkFromNode	Removes the link associated with this connection point from the associated node. (Inherited from ConnectionPoint.)
	SameNode	Checks whether the current connection point and the specified connection point are associated with the same node. (Inherited from ConnectionPoint.)
	saveEndRelative	Updates the coordinates of the connection point represented by this link, relative to the bounding rectangle of the associated node.
	SaveEndRelative	Updates the coordinates of the connection point represented by this link, relative to the bounding rectangle of the associated node. (Inherited from ConnectionPoint.)

Protected Methods

	Name	Description
	GetNearestBorderPoint	Returns the nearest point lying on the node border. (Inherited from ConnectionPoint.)
	UpdateFromPoint	Updates the connection state according to the specified point, without changing the related node. (Inherited from ConnectionPoint.)

TableConnectionPoint Methods

TableConnectionPoint.addLinkToNode Method

Adds the link associated with this connection point to the associated node.

Namespace: MindFusion.Diagramming
Assembly: TableConnectionPoint.js

Syntax

JavaScript Copy Code

```
function addLinkToNode ()
```

See Also

TableConnectionPoint Members
TableConnectionPoint Class
MindFusion.Diagramming Namespace

TableConnectionPoint.getInitialPoint Method

Returns a point (usually the center of the bounding rectangle) contained within the associated node.

Namespace: MindFusion.Diagramming
Assembly: TableConnectionPoint.js

Syntax

JavaScript Copy Code

```
function getInitialPoint ()
```

Return Value

Point. A Point contained within the node.

See Also

TableConnectionPoint Members
TableConnectionPoint Class
MindFusion.Diagramming Namespace

TableConnectionPoint.getIntersection Method

Calculates the intersection point between the specified line segment and the contour of the node associated with this connection point.

Namespace: MindFusion.Diagramming
Assembly: TableConnectionPoint.js

Syntax

JavaScript Copy Code

```
function getIntersection (point1, point2)
```

Parameters

point1
Point. The first point of the segment.

point2
Point. The second point of the segment.

Return Value

Point. A Point object representing the intersection point.

TableConnectionPoint Members
TableConnectionPoint Class
MindFusion.Diagramming Namespace

TableConnectionPoint.getNearestBorderPoint Method

Returns the nearest point lying on the node border.

Namespace: MindFusion.Diagramming
Assembly: TableConnectionPoint.js

Syntax

JavaScript Copy Code

```
function getNearestBorderPoint (point)
```

Parameters

point
Point. A Point instance specifying location in the diagram.

Return Value

AnchorPointDetails. An AnchorPointDetails specifying the anchor point properties.

See Also

TableConnectionPoint Members
TableConnectionPoint Class
MindFusion.Diagramming Namespace

TableConnectionPoint.linkChanges Method

Checks whether the link would change if attached to the specified node at the specified point.

Namespace: MindFusion.Diagramming
Assembly: TableConnectionPoint.js

Syntax

JavaScript Copy Code

```
function linkChanges (item, point)
```

Parameters

item
DiagramItem. A DiagramItem under the mouse cursor.

point
Point. A point where the link will be connected.

Return Value

Boolean. true if the link would connect to a different entity if dropped at the specified location; otherwise, false.

TableConnectionPoint Class
MindFusion.Diagramming Namespace

TableConnectionPoint.removeLinkFromNode Method

Removes the link associated with this connection point from the associated node.

Namespace: MindFusion.Diagramming
Assembly: TableConnectionPoint.js

Syntax

JavaScript Copy Code

```
function removeLinkFromNode ()
```

See Also

TableConnectionPoint Members
TableConnectionPoint Class
MindFusion.Diagramming Namespace

TableConnectionPoint.saveEndRelative Method

Updates the coordinates of the connection point represented by this link, relative to the bounding rectangle of the associated node.

Namespace: MindFusion.Diagramming
Assembly: TableConnectionPoint.js

Syntax

JavaScript Copy Code

```
function saveEndRelative ()
```

See Also

TableConnectionPoint Members
TableConnectionPoint Class

TableConnectionPoint Properties

TableConnectionPoint.endPoint Property

Calculates the coordinates of this connection point expressed in document coordinates.

Namespace: MindFusion.Diagramming
Assembly: TableConnectionPoint.js

Syntax

JavaScript Copy Code

```
get endPoint() {}
set endPoint(value) {}
```

Property Value

Point

A Point that represents the coordinate.

See Also

TableConnectionPoint Members
TableConnectionPoint Class
MindFusion.Diagramming Namespace

TableNode Class

TableNode instances are diagram nodes that can be used to display tabular or list data.

Syntax

JavaScript Copy Code

```
// class
TableNode.prototype = {}
```

Remarks

Tables consist of Cell instances distributed across rows and columns. The number of rows and columns can be set by calling the redimTable method. Cells can be made to span several rows and columns by setting their rowSpan and columnSpan properties to values larger than one.

Rows can be assigned to distinct sections of the table. Each section can be collapsed or expanded, hiding or showing all rows in the section except the header one. To define a section, set a header row. A section consists of all rows after a header row and spans to the next header. Each header row displays a [±] button that allows expanding or collapsing the section interactively. The button appears on the left of the first cell of a header row. Clicking that button raises the tableSectionCollapsed and tableSectionExpanded events. Sections can be collapsed or expanded programmatically by setting the expanded property of their header rows.

The structure of a table can be dynamically changed by adding and deleting rows and columns. This can be done with the addColumn and addRow methods as well as with the insertColumn, insertRow and **redimTable** methods. deleteRow and deleteColumn methods delete existing rows and columns.

Table cells can display text as specified via their text, textColor and textAlignment properties. Cells can also contain images, as set via the image and imageAlign properties.

Table nodes can show a caption in their title bar, whose text is set via the text property inherited from DiagramItem. The height of the caption bar is set via the captionHeight property.

TableNode Members

TableNode instances are diagram nodes that can be used to display tabular or list data.

The following tables list the members exposed by the **TableNode** type.

Public Constructors

	Name	Description
	TableNode	Initializes a new instance of the TableNode class with default values supplied from the specified Diagram.

Public Fields

	Name	Description
	useScrollBars	Set this flag to show full scrollbars for scrollable tables instead of up/down buttons in captions.

Protected Fields

	Name	Description

	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	allowResizeColumns	Gets or sets a value indicating whether users are allowed to resize table columns.
	allowResizeRows	Gets or sets a value indicating whether users are allowed to resize table rows.
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	captionBackBrush	Gets or sets an object specifying how to fill the caption bar.
	captionFont	Gets or sets the font used to render the node's caption text.
	captionHeight	Gets or sets the height of the node's caption area.
	cellFrameStyle	Gets or sets the style of cells' frame lines.
	cellStyle	Gets or sets the style used to draw table's cells.
	cellTextColor	Gets or sets the color used to fill cells text.
	columnCount	Gets or sets the number of columns in the table.
	connectionStyle	Gets or sets whether drawing a link from/to this node should connectan individual table row, or the whole table as an integral entity.
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	currentScrollRow	Gets or sets the table's current scroll position.
	dividerStroke	Gets or sets the color used to stroke the divider line between node's caption bar and content area. (Inherited from CaptionedNode.)
	dividerStrokeDashArray	Gets or sets an array of values specifying the dash pattern of the node's divider line. (Inherited from CaptionedNode.)
	dividerStrokeDashOffset	Gets or sets the the distance between the line start and the beginning of the dash pattern. (Inherited from CaptionedNode.)
	dividerStrokeDashStyle	Gets or sets the line dash pattern applied when stroking node's divider line. (Inherited from CaptionedNode.)
	dividerStrokeThickness	Gets or sets the width of the divider line between node's caption bar and content area. (Inherited from CaptionedNode.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)

	effectiveDividerStrokeThickness	Gets the effective line thickness that should be applied when stroking this node's divider line. (Inherited from CaptionedNode.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	enableStyledText	Gets or sets a value indicating whether styled text rendering is enabled.
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)

	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	rowAnchorPattern	Gets or sets the default anchor pattern for the rows of a table.
	rowCount	Gets or sets the number of rows in the table.
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	scrollable	Gets or sets whether the user is allowed to scroll the table rows.
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	shape	Gets or sets the shape of the node's outline.
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	addColumn	Adds a new column to the table.
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	addRow	Adds a new row to the table.
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	cellFromPoint	Returns the cell that contains the specified point.
	clone	DiagramNode.clone override.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	containsPoint	Checks if the **TableNode** contains the specified point.
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	createConnectionPoint	Creates a connection point between this node and the specified link at the specified point.
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	deleteColumn	Deletes the specified column.
	deleteRow	Deletes the specified row.
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)

	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	fromJson	DiagramNode.fromJson override.
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
	getCell	Returns a reference to the cell located at the specified column and row of this table.
	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getColumn	Returns a reference to the column at the specified position within the table's list of columns.
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getOutline	Gets an array of points that define the outline of this node shape.
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	getParentRow	Returns the number of the first header row before thespecified row. If the specified row is a header rowitself, returns 'row'. If there is no header rowbefore this one, the return value is -1.
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	getRow	Returns a reference to the row at the specified position within the table's list of rows.
	getRowRect	Returns the bounding rectangle of the specified row.
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	insertColumn	Inserts a new column at the specified position.

	insertRow	Inserts a new row at the specified position.
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	isRowCollapsed	Checks whether the specified row is collapsed.Collapsed are all rows whose header row is collapsed.
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	loadFromXml	DiagramNode.loadFromXml override. Loads the node's content from an XML element.
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	redimTable	Changes the number of columns and rows in this table.
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	resizeToFitText	Resizes the columns and rows so that cells are large enough to fit their text.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	restoreState	DiagramNode.restoreState override.
	rowFromPoint	Returns the index of the table's row that contains the specified point.
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveState	DiagramNode.saveState override.
	saveToXml	Saves the node's content into an XML element.
	scrollDown	Scrolls the table's rows down.
	scrollUp	Scrolls the table's rows up.
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)

	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	toJson	DiagramNode.toJson override.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)
	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
	LoadFromXml	DiagramItem.LoadFromXml override. (Inherited from DiagramNode.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)

	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)
	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramNode.)
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)

	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

TableNode Fields

TableNode.useScrollBars Field

Set this flag to show full scrollbars for scrollable tables instead of up/down buttons in captions.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
var useScrollBars
```

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode Constructor

Initializes a new instance of the TableNode class with default values supplied from the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function TableNode ([parent])
```

Parameters

parent
Optional.
Diagram. The Diagram from which to obtain default values for the node properties.

See Also

TableNode Class
MindFusion.Diagramming Namespace

TableNode Methods

TableNode.addColumn Method

Adds a new column to the table.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function addColumn ()
```

Return Value

Object. The newly created column object.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
deleteColumn Method
addRow Method
redimTable Method

TableNode.addRow Method

Adds a new row to the table.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function addRow ()
```

Return Value

Object. The newly created row object.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
deleteRow Method
addColumn Method
redimTable Method

TableNode.cellFromPoint Method

Returns the cell that contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript — Copy Code

```
function cellFromPoint (point)
```

Parameters

point
A Point instance.

Return Value

A JavaScript object containing following fields:
{
cell: Cell reference,
cellRect: Rect,
column: Number,
row: Number
};

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.clone Method

DiagramNode.clone override.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript — Copy Code

```
function clone ()
```

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.containsPoint Method

Checks if the TableNode contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript — Copy Code

```
function containsPoint (point)
```

Parameters

point
The Point to check.

Return Value

true if the point is within the bounds of this node, or **false** otherwise.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.createConnectionPoint Method

Creates a connection point between this node and the specified link at the specified point.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function createConnectionPoint (link, point, incoming)
```

Parameters

link
DiagramLink. A DiagramLink that should be connected to this node.

point
Point. The point at which the link should be connected.

incoming
Boolean. true if link is an incoming link, otherwise, false.

Return Value

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.deleteColumn Method

Deletes the specified column.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function deleteColumn (col)
```

Parameters

col
Number. An integer value specifying which column to delete.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.deleteRow Method

Deletes the specified row.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript — Copy Code

```
function deleteRow (row)
```

Parameters

row
Number. An integer value specifying which row to delete.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.fromJson Method

DiagramNode.fromJson override.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript — Copy Code

```
function fromJson ()
```

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.getCell Method

Returns a reference to the cell located at the specified column and row of this table.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript — Copy Code

```
function getCell (col, row)
```

Parameters

col
Number. An integer value specifying the index of a table's column.

row
Number. An integer value specifying the index of a table's row.

Return Value

A Cell instance representing the specified cell.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.getColumn Method

Returns a reference to the column at the specified position within the table's list of columns.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function getColumn (col)
```

Parameters

col
Number. An integer value specifying the index of a table's column.

Return Value

A TableColumn instance.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
columnCount Property

TableNode.getOutline Method

Gets an array of points that define the outline of this node shape.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function getOutline ()
```

Return Value

Array. An array with the points.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.getParentRow Method

Returns the number of the first header row before thespecified row. If the specified row is a header rowitself, returns 'row'. If there is no header rowbefore this one, the return value is -1.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript — Copy Code

```
function getParentRow ()
```

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.getRow Method

Returns a reference to the row at the specified position within the table's list of rows.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript — Copy Code

```
function getRow (row)
```

Parameters

row
Number. An integer value specifying the index of a table's row.

Return Value

A TableRow instance.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
rowCount Property

TableNode.getRowRect Method

Returns the bounding rectangle of the specified row.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript — Copy Code

```
function getRowRect (row)
```

Parameters

row
Number. An integer value specifying the index of a table's row.

Return Value

Rect. A Rect object representing the row's bounding rectangle.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.insertColumn Method

Inserts a new column at the specified position.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function insertColumn (col)
```

Parameters

col
Number. An integer value specifying the position within the table's list of columns where the new column should be inserted.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
columnCount Property

TableNode.insertRow Method

Inserts a new row at the specified position.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function insertRow (row)
```

Parameters

row
Number. An integer value specifying the position within the table's list of rows where the new row should be inserted.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
rowCount Property

TableNode.isRowCollapsed Method

Checks whether the specified row is collapsed.Collapsed are all rows whose header row is collapsed.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function isRowCollapsed ()
```

See Also

TableNode Members
TableNode Class

TableNode.loadFromXml Method

DiagramNode.loadFromXml override. Loads the node's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.redimTable Method

Changes the number of columns and rows in this table.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function redimTable (columns, rows)
```

Parameters

columns
Number. An integer value specifying the new number of columns.

rows
Number. An integer value specifying the new number of rows.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.resizeToFitText Method

Resizes the columns and rows so that cells are large enough to fit their text.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function resizeToFitText (ignoreCaption, keepCellWidth)
```

Parameters

ignoreCaption
true to ignore caption text and consider only cells for table size, or **false** otherwise.

keepCellWidth
true to preserve column widths and resize only row heights, or **false** otherwise.

See Also

TableNode Members
TableNode Class

DiagramNode.restoreState override.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function restoreState ()
```

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.rowFromPoint Method

Returns the index of the table's row that contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function rowFromPoint (point)
```

Parameters

point
Point. A Point instance.

Return Value

Number. An integer value specifying the row's index.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.saveState Method

DiagramNode.saveState override.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript — Copy Code

```
function saveState ()
```

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.saveToXml Method

Saves the node's content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript — Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.scrollDown Method

Scrolls the table's rows down.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript — Copy Code

```
function scrollDown ()
```

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
currentScrollRow Property

TableNode.scrollUp Method

Scrolls the table's rows up.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function scrollUp ()
```

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
currentScrollRow Property

TableNode.toJson Method

DiagramNode.toJson override.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
function toJson ()
```

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode Properties

TableNode.allowResizeColumns Property

Gets or sets a value indicating whether users are allowed to resize table columns.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get allowResizeColumns() {}
set allowResizeColumns(value) {}
```

Property Value

Boolean

true if users are allowed to resize table columns, or **false** otherwise.

Remarks

A column can be resized by dragging its right border. If the columnStyle field of a column is set to AutoWidth, it is automatically reset to **FixedWidth** when the column is resized. Rightmost columns always fill all remaining space in their tables and cannot be

resized.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
tableColumnResized Event
tableColumnResizing Event

TableNode.allowResizeRows Property

Gets or sets a value indicating whether users are allowed to resize table rows.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get allowResizeRows() {}
set allowResizeRows(value) {}
```

Property Value

Boolean

true if users are allowed to resize table rows, or **false** otherwise.

Remarks

A row can be resized by dragging its bottom border.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
tableRowResized Event
tableRowResizing Event

TableNode.captionBackBrush Property

Gets or sets an object specifying how to fill the caption bar.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get captionBackBrush() {}
set captionBackBrush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.captionFont Property

Gets or sets the font used to render the node's caption text.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get captionFont() {}
set captionFont(value) {}
```

Property Value

Font

A Font object specifying the font of the caption bar.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.captionHeight Property

Gets or sets the height of the node's caption area.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get captionHeight() {}
set captionHeight(value) {}
```

Property Value

Number

A number specifying the height of the caption bar. The default value is 6.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.cellFrameStyle Property

Gets or sets the style of cells' frame lines.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get cellFrameStyle() {}
set cellFrameStyle(value) {}
```

Property Value

CellFrameStyle

A member of the CellFrameStyle enumeration.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.cellStyle Property

Gets or sets the style used to draw table's cells.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get cellStyle() {}
set cellStyle(value) {}
```

Property Value

Style

An instance of the Style class.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.cellTextColor Property

Gets or sets the color used to fill cells text.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get cellTextColor() {}
set cellTextColor(value) {}
```

Property Value

String

A string value identifying the text fill color.

Remarks

If this property is not set, cells derive their text color from table's textColor property, which also applies to the table's caption. You can also set textColor property of individual cells.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.columnCount Property

Gets or sets the number of columns in the table.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get columnCount() {}
set columnCount(value) {}
```

Property Value

Number

The number of columns in the table.

Remarks

If you increase the number of columns the content of the initialcolumns will remain intact. If you decrease the number, the lastcolumns are removed and the other remain unchanged.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.connectionStyle Property

Gets or sets whether drawing a link from/to this node should connectan individual table row, or the whole table as an integral entity.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get connectionStyle() {}
set connectionStyle(value) {}
```

Property Value

ConnectionStyle

A member of the ConnectionStyle enumeration.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.currentScrollRow Property

Gets or sets the table's current scroll position.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get currentScrollRow() {}
set currentScrollRow(value) {}
```

Property Value

Number

The index of the first row that should be visible in the table.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.enableStyledText Property

Gets or sets a value indicating whether styled text rendering is enabled.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get enableStyledText() {}
set enableStyledText(value) {}
```

Property Value

Boolean

true to parse the node's text in order to find formatting tags, or **false** otherwise.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.rowAnchorPattern Property

Gets or sets the default anchor pattern for the rows of a table.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

JavaScript Copy Code

```
get rowAnchorPattern() {}
set rowAnchorPattern(value) {}
```

Property Value

AnchorPattern

An AnchorPattern object that defines a set of anchor points.

Remarks

You can specify individual row's anchor points by setting the anchorPattern property of TableRow.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.rowCount Property

Gets or sets the number of rows in the table.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

```
JavaScript
get rowCount() {}
set rowCount(value) {}
```

Property Value

Number

The number of rows in the table.

Remarks

If you increase the number of rows the content of the initialrows will remain intact. If you decrease the number, the lastrows are removed and the other remain unchanged.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.scrollable Property

Gets or sets whether the user is allowed to scroll the table rows.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

```
JavaScript
get scrollable() {}
set scrollable(value) {}
```

Property Value

Boolean

true to allow scrolling, or **false** otherwise.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace

TableNode.shape Property

Gets or sets the shape of the node's outline.

Namespace: MindFusion.Diagramming
Assembly: TableNode.js

Syntax

```
JavaScript
get shape() {}
set shape(value) {}
```

Property Value

SimpleShape

A member of the SimpleShape enumeration.

See Also

TableNode Members
TableNode Class
MindFusion.Diagramming Namespace
cornerRadius Property

TableRow Class

Represents a row of a TableNode.

Syntax

JavaScript Copy Code

```
// class
TableRow.prototype = {}
```

Remarks

Call the getRow method of TableNode to get the **TableRow** instance at specified position. In order to add or remove rows, set table's rowCount property, or call methods such as addRow, insertRow, deleteRow, redimTable.

Inheritance Hierarchy

MindFusion.Diagramming.TableRow

See Also

TableRow Members
MindFusion.Diagramming Namespace
TableColumn Class

TableRow Members

Represents a row of a TableNode.

The following tables list the members exposed by the TableRow type.

Public Constructors

	Name	Description
	TableRow	Initializes a new instance of the TableRow class.

Public Properties

	Name	Description
	anchorPattern	Gets or sets the anchor points to which links attach when connected to this row.
	expanded	Gets or sets a value indicating whether the table section starting from this header row is collapsed or expanded.
	header	Gets or sets a value indicating whether this row is a section header.
	height	Gets or sets the height of this row.

See Also

TableRow Class
MindFusion.Diagramming Namespace

TableRow Constructor

Initializes a new instance of the TableRow class.

Namespace: MindFusion.Diagramming
Assembly: TableRow.js

Syntax

JavaScript — Copy Code

```
function TableRow ()
```

See Also

TableRow Class
MindFusion.Diagramming Namespace

TableRow Properties

TableRow.anchorPattern Property

Gets or sets the anchor points to which links attach when connected to this row.

Namespace: MindFusion.Diagramming
Assembly: TableRow.js

Syntax

JavaScript — Copy Code

```
get anchorPattern() {}
set anchorPattern(value) {}
```

Property Value

AnchorPattern

An AnchorPattern object that defines a set of anchor points.

Remarks

If this property is not set, links attach to points defined by table's rowAnchorPattern property.

See Also

TableRow Members
TableRow Class
MindFusion.Diagramming Namespace

TableRow.expanded Property

Gets or sets a value indicating whether the table section starting from this header row is collapsed or expanded.

Namespace: MindFusion.Diagramming
Assembly: TableRow.js

Syntax

JavaScript — Copy Code

```
get expanded() {}
set expanded(value) {}
```

Property Value

Boolean

true if the table section that starts from this row is expanded; or **false** otherwise. The default is **true**.

Remarks

This property can be set only if the row is a header. Links connected to the rows of a collapsed table section appear to be connected to the section header row.

See Also

TableRow Members
TableRow Class
MindFusion.Diagramming Namespace

TableRow.header Property

Gets or sets a value indicating whether this row is a section header.

Namespace: MindFusion.Diagramming
Assembly: TableRow.js

Syntax

JavaScript Copy Code

```
get header() {}
set header(value) {}
```

Property Value

Boolean

true if this is the header row of a table section, otherwise **false**. The default is **false**.

Remarks

Each header row defines a section of the table that includes all non-header rows after the header. Such sections can be expanded or collapsed, that is, the rows included in them can be shown or hidden. This can be done interactively by pressing the [±] button displayed in header rows, or programmatically by setting the expanded property. The tableSectionCollapsed and tableSectionExpanded events are raised when a user clicks the [±] button.

TableRow Members
TableRow Class
MindFusion.Diagramming Namespace

TableRow.height Property

Gets or sets the height of this row.

Namespace: MindFusion.Diagramming
Assembly: TableRow.js

Syntax

JavaScript Copy Code

```
get height() {}
set height(value) {}
```

Property Value

Number

A number specifying the width.

See Also

Theme Class

Represents a set of Style objects whose properties are used to render items of a specific type in the current diagram.

Syntax

JavaScript Copy Code

```
// class
Theme.prototype = {}
```

Remarks

Theme objects can be assigned to the theme property of Diagram.

Inheritance Hierarchy

MindFusion.Diagramming.Theme

See Also

Theme Members
MindFusion.Diagramming Namespace

Theme Members

Represents a set of Style objects whose properties are used to render items of a specific type in the current diagram.

The following tables list the members exposed by the Theme type.

Public Constructors

	Name	Description
	Theme	Initializes a new instance of the Theme class.

Public Properties

	Name	Description
	styles	A dictionary object that maps item type identifiers to **Style** objects.

Public Methods

	Name	Description
	fromId	Gets a built-in theme by its string identificator.
	getBlack	Gets the built-in Black theme.
	getBlue	Gets the built-in Blue theme.
	getBusiness	Gets the built-in Business theme.
	getEarth	Gets the built-in Earth theme.
	getGray	Gets the built-in Gray theme.
	getGreen	Gets the built-in Green theme.
	getLight	Gets the built-in Light theme.

	getPastel	Gets the built-in Pastel theme.
	getPeach	Gets the built-in Peach theme.
	getStandard	Gets the built-in Standard theme.

See Also

Theme Class
MindFusion.Diagramming Namespace

Theme Constructor

Initializes a new instance of the Theme class.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript Copy Code

```
function Theme ()
```

See Also

Theme Class
MindFusion.Diagramming Namespace

Theme Methods

Theme.fromId Method

Gets a built-in theme by its string identificator.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript Copy Code

```
function fromId (id)
```

Parameters

id
String. The theme identificator.

Return Value

Theme. An instance of the Theme class.

See Also

Theme Members
Theme Class
MindFusion.Diagramming Namespace

Theme.getBlack Method

Gets the built-in Black theme.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript Copy Code

```
function getBlack ()
```

Return Value

Theme. An instance of the Theme class.

See Also

Theme Members
Theme Class
MindFusion.Diagramming Namespace

Theme.getBlue Method

Gets the built-in Blue theme.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript Copy Code

```
function getBlue ()
```

Return Value

An instance of the Theme class.

See Also

Theme Members
Theme Class
MindFusion.Diagramming Namespace

Theme.getBusiness Method

Gets the built-in Business theme.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript Copy Code

```
function getBusiness ()
```

Return Value

An instance of the Theme class.

See Also

Theme Members
Theme Class
MindFusion.Diagramming Namespace

Theme.getEarth Method

Gets the built-in Earth theme.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript Copy Code

```
function getEarth ()
```

Return Value

An instance of the Theme class.

See Also

Theme Members
Theme Class
MindFusion.Diagramming Namespace

Theme.getGray Method

Gets the built-in Gray theme.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript Copy Code

```
function getGray ()
```

Return Value

An instance of the Theme class.

See Also

Theme Members
Theme Class
MindFusion.Diagramming Namespace

Theme.getGreen Method

Gets the built-in Green theme.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript Copy Code

```
function getGreen ()
```

Return Value

An instance of the Theme class.

See Also

Theme Members
Theme Class
MindFusion.Diagramming Namespace

Theme.getLight Method

Gets the built-in Light theme.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript — Copy Code

```
function getLight ()
```

Return Value

An instance of the Theme class.

See Also

Theme Members
Theme Class
MindFusion.Diagramming Namespace

Theme.getPastel Method

Gets the built-in Pastel theme.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript — Copy Code

```
function getPastel ()
```

Return Value

An instance of the Theme class.

See Also

Theme Members
Theme Class
MindFusion.Diagramming Namespace

Theme.getPeach Method

Gets the built-in Peach theme.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript — Copy Code

```
function getPeach ()
```

Return Value

An instance of the Theme class.

See Also

Theme Members
Theme Class
MindFusion.Diagramming Namespace

Theme.getStandard Method

Gets the built-in Standard theme.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript — Copy Code

```
function getStandard ()
```

Return Value

An instance of the Theme class.

See Also

Theme Members
Theme Class
MindFusion.Diagramming Namespace

Theme Properties

Theme.styles Property

A dictionary object that maps item type identifiers to Style objects.

Namespace: MindFusion.Diagramming
Assembly: Theme.js

Syntax

JavaScript — Copy Code

```
get styles() {}
set styles(value) {}
```

Property Value

Map

Maps item types to Style objects.

Example

The following code sets default white background of ShapeNode objects when the theme is applied.

JavaScript — Copy Code

```
var shapeNodeStyle = new Style();
shapeNodeStyle.brush = "white";
theme.styles.set("std:ShapeNode", shapeNodeStyle);
```

MindFusion.Diagramming Namespace
Events Class

TreeItemEventArgs Members

Contains the arguments passed to handlers of tree view items -related events.

The following tables list the members exposed by the TreeItemEventArgs type.

Public Constructors

	Name	Description
	TreeItemEventArgs	Initializes a new instance of the TreeItemEventArgs class.

Public Properties

	Name	Description
	cancel	Gets or sets a value indicating whether to allow the current operation. (Inherited from CancelEventArgs.)
	context	Gets the canvas rendering context.
	handled	Gets or sets a value indicating whether the event has been handled. (Inherited from EventArgs.)
	item	Gets the item related to the event.
	mouseButton	Gets which mouse button has been pressed.
	newText	Gets the text that has just been entered by the user.
	node	Gets the node related to the event.
	oldText	Gets the text that had been displayed in the node before the user edited it.

MindFusion.Diagramming Namespace

TreeItemEventArgs Constructor

Initializes a new instance of the TreeItemEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
function TreeItemEventArgs ()
```

See Also

TreeItemEventArgs Class
MindFusion.Diagramming Namespace

TreeItemEventArgs Properties

TreeItemEventArgs.context Property

Gets the canvas rendering context.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get context() {}
set context(value) {}
```

Property Value

CanvasRenderingContext2D

A rendering context used to draw on the Canvas element.

See Also

TreeItemEventArgs Members
TreeItemEventArgs Class
MindFusion.Diagramming Namespace

TreeItemEventArgs.item Property

Gets the item related to the event.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get item() {}
set item(value) {}
```

Property Value

TreeViewItem

A TreeViewItem instance.

See Also

TreeItemEventArgs Members
TreeItemEventArgs Class
MindFusion.Diagramming Namespace

TreeItemEventArgs.mouseButton Property

Gets which mouse button has been pressed.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get mouseButton() {}
set mouseButton(value) {}
```

Property Value

Number

An integer mouse button id.

See Also

TreeItemEventArgs Members
TreeItemEventArgs Class
MindFusion.Diagramming Namespace

TreeItemEventArgs.newText Property

Gets the text that has just been entered by the user.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get newText() {}
set newText(value) {}
```

Property Value

String

A string containing newly entered text.

See Also

TreeItemEventArgs Members
TreeItemEventArgs Class
MindFusion.Diagramming Namespace

TreeItemEventArgs.node Property

Gets the node related to the event.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get node() {}
set node(value) {}
```

Property Value

TreeViewNode

A TreeViewNode instance.

See Also

TreeItemEventArgs Members
TreeItemEventArgs Class
MindFusion.Diagramming Namespace

TreeItemEventArgs.oldText Property

Gets the text that had been displayed in the node before the user edited it.

Namespace: MindFusion.Diagramming
Assembly: EventArgs.js

Syntax

JavaScript Copy Code

```
get oldText() {}
set oldText(value) {}
```

Property Value

String

A string containing item's original text.

TreeViewConnectionPoint Class

A class that represents a connection between an edge and a node in a graph.

Syntax

JavaScript Copy Code

```
// class
TreeViewConnectionPoint.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.ConnectionPoint
MindFusion.Diagramming.TreeViewConnectionPoint

See Also

TreeViewConnectionPoint Members
MindFusion.Diagramming Namespace

TreeViewConnectionPoint Members

A class that represents a connection between an edge and a node in a graph.

The following tables list the members exposed by the TreeViewConnectionPoint type.

Public Properties

	Name	Description
	endPoint	Calculates the coordinates of this connection point expressed in document coordinates.
	RelativePosition	Gets or sets the position of this connection point, relative to the associated node's bounding rectangle, expressed as percentage. (Inherited from

		ConnectionPoint.)
	Row	Gets the index of a constituent item within the associated node where the link represented by this connection point is connected, or -1, if the link is connected to the node itself. (Inherited from ConnectionPoint.)

Protected Properties

	Name	Description
	Incoming	Gets a flag indicating whether this connection point is at the origin or the destination of the associated link. (Inherited from ConnectionPoint.)
	Link	Gets the link associated with this connection point. (Inherited from ConnectionPoint.)
	Node	Gets the node associated with this connection point. (Inherited from ConnectionPoint.)

Public Methods

	Name	Description
	addLinkToNode	Adds the link associated with this connection point to the associated node.
	AddLinkToNode	Adds the link associated with this connection point to the associated node. (Inherited from ConnectionPoint.)
	CalculateIntersections	Determines whether the end of a link should be aligned to the point where the node contour is intersected by the line connecting the centers of the connected nodes. (Inherited from ConnectionPoint.)
	CanMoveLink	Checks whether the specified point, expressed in document coordinates, is a valid location for this connection point. (Inherited from ConnectionPoint.)
	GetAnchorPos	Overloaded. (Inherited from ConnectionPoint.)
	GetEndPoint	Calculates the coordinates of the this connection point expressed in document coordinates. (Inherited from ConnectionPoint.)
	getInitialPoint	Returns a point (usually the center of the bounding rectangle) contained within the associated node.
	GetInitialPoint	Returns a point (usually the center of the bounding rectangle) contained within the associated node. (Inherited from ConnectionPoint.)
	getIntersection	Calculates the intersection point between the specified line segment and the contour of the node associated with this connection point.
	GetIntersection	Calculates the intersection point between the specified line segment and the contour of the node associated with this connection point. (Inherited from ConnectionPoint.)
	getNearestBorderPoint	Returns the nearest point lying on the node border.
	GetNodeRect	Returns the bounding rectangle of the node associated with this connection point. (Inherited from ConnectionPoint.)
	linkChanges	Checks whether the link would change if attached to the specified node at the specified point.
	LinkChanges	Checks whether the relationship represented by the associated link would change if the link is attached to the specified node at the specified point. (Inherited from ConnectionPoint.)
	NearestAnchorPoint	Returns the anchor point closest to the specified point from the node's associated anchor pattern. (Inherited from ConnectionPoint.)
	NodesIntersect	Checks whether the node associated with the current connection point and the node associated with the specified connection point intersect. (Inherited from ConnectionPoint.)

	removeLinkFromNode	Removes the link associated with this connection point from the associated node.
	RemoveLinkFromNode	Removes the link associated with this connection point from the associated node. (Inherited from ConnectionPoint.)
	SameNode	Checks whether the current connection point and the specified connection point are associated with the same node. (Inherited from ConnectionPoint.)
	saveEndRelative	Updates the coordinates of the connection point represented by this link, relative to the bounding rectangle of the associated node.
	SaveEndRelative	Updates the coordinates of the connection point represented by this link, relative to the bounding rectangle of the associated node. (Inherited from ConnectionPoint.)

Protected Methods

	Name	Description
	GetNearestBorderPoint	Returns the nearest point lying on the node border. (Inherited from ConnectionPoint.)
	UpdateFromPoint	Updates the connection state according to the specified point, without changing the related node. (Inherited from ConnectionPoint.)

TreeViewConnectionPoint Methods

TreeViewConnectionPoint.addLinkToNode Method

Adds the link associated with this connection point to the associated node.

Namespace: MindFusion.Diagramming
Assembly: TreeViewConnectionPoint.js

Syntax

JavaScript Copy Code

```
function addLinkToNode ()
```

See Also

TreeViewConnectionPoint Members
TreeViewConnectionPoint Class
MindFusion.Diagramming Namespace

TreeViewConnectionPoint.getInitialPoint Method

Returns a point (usually the center of the bounding rectangle) contained within the associated node.

Namespace: MindFusion.Diagramming
Assembly: TreeViewConnectionPoint.js

Syntax

JavaScript Copy Code

```
function getInitialPoint ()
```

Return Value

Point. A Point contained within the node.

See Also

TreeViewConnectionPoint Members
TreeViewConnectionPoint Class
MindFusion.Diagramming Namespace

TreeViewConnectionPoint.getIntersection Method

Calculates the intersection point between the specified line segment and the contour of the node associated with this connection point.

Namespace: MindFusion.Diagramming
Assembly: TreeViewConnectionPoint.js

Syntax

JavaScript Copy Code

```
function getIntersection (point1, point2)
```

Parameters

point1
Point. The first point of the segment.

point2
Point. The second point of the segment.

Return Value

Point. A Point object representing the intersection point.

See Also

TreeViewConnectionPoint Members
TreeViewConnectionPoint Class
MindFusion.Diagramming Namespace

TreeViewConnectionPoint.getNearestBorderPoint Method

Returns the nearest point lying on the node border.

Namespace: MindFusion.Diagramming
Assembly: TreeViewConnectionPoint.js

Syntax

JavaScript Copy Code

```
function getNearestBorderPoint (point)
```

Parameters

point
Point. A Point instance specifying location in the diagram.

Return Value

AnchorPointDetails. An AnchorPointDetails specifying the anchor point properties.

See Also

TreeViewConnectionPoint Members
TreeViewConnectionPoint Class
MindFusion.Diagramming Namespace

TreeViewConnectionPoint.linkChanges Method

Checks whether the link would change if attached to the specified node at the specified point.

Namespace: MindFusion.Diagramming
Assembly: TreeViewConnectionPoint.js

Syntax

JavaScript Copy Code

```
function linkChanges (item, point)
```

Parameters

item
DiagramItem. A DiagramItem under the mouse cursor.

point
Point. A point where the link will be connected.

Return Value

Boolean. true if the link would connect to a different entity if dropped at the specified location; otherwise, false.

TreeViewConnectionPoint Members
TreeViewConnectionPoint Class
MindFusion.Diagramming Namespace

TreeViewConnectionPoint.removeLinkFromNode Method

Removes the link associated with this connection point from the associated node.

Namespace: MindFusion.Diagramming
Assembly: TreeViewConnectionPoint.js

Syntax

JavaScript Copy Code

```
function removeLinkFromNode ()
```

See Also

TreeViewConnectionPoint Members
TreeViewConnectionPoint Class
MindFusion.Diagramming Namespace

TreeViewConnectionPoint.saveEndRelative Method

Updates the coordinates of the connection point represented by this link, relative to the bounding rectangle of the associated node.

Namespace: MindFusion.Diagramming
Assembly: TreeViewConnectionPoint.js

Syntax

JavaScript Copy Code

```
function saveEndRelative ()
```

See Also

TreeViewConnectionPoint Members
TreeViewConnectionPoint Class

TreeViewConnectionPoint Properties

TreeViewConnectionPoint.endPoint Property

Calculates the coordinates of this connection point expressed in document coordinates.

Namespace: MindFusion.Diagramming
Assembly: TreeViewConnectionPoint.js

Syntax

JavaScript Copy Code

```
get endPoint() {}
set endPoint(value) {}
```

Property Value

Point

A Point that represents the coordinate.

See Also

TreeViewConnectionPoint Members
TreeViewConnectionPoint Class

TreeViewItem Class

Represents a constituent item of the hierarchy displayed inside a TreeViewNode.

Syntax

JavaScript Copy Code

```
// class
TreeViewItem.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.TreeViewItem

See Also

TreeViewItem Members
MindFusion.Diagramming Namespace

TreeViewItem Members

Represents a constituent item of the hierarchy displayed inside a TreeViewNode.

The following tables list the members exposed by the TreeViewItem type.

Public Constructors

	Name	Description
	TreeViewItem	Initializes a new instance of the TreeViewItem class.

Public Properties

	Name	Description
	brush	Gets or sets the brush used to paint item's background.
	children	Gets a list of this item's children.
	expanded	Gets or sets a value indicating whether this item is expanded to show its children.
	font	Gets or sets the font used to render item's text.
	height	Gets or sets the height of this item.
	image	Gets or sets the image displayed by this item.
	imageContent	Gets or sets a Base64-encoded image to display inside this item.
	imageLocation	Gets or sets URL of the image to display inside this item.
	imagePadding	Gets or sets the padding distance between item's borders and image.
	parent	Gets the parent item of this item.
	tag	Gets or sets custom data tag associated with this item.
	text	Gets or sets the text label displayed by this item.
	textColor	Gets or sets the item's text color.
	tooltip	Gets or sets the tooltip text that should be displayed when the mouse hovers over this item.

Public Methods

	Name	Description
	loadFromXml	Loads the item's content from an XML element.
	saveToXml	Saves the item's content into an XML element.

TreeViewItem Constructor

Initializes a new instance of the TreeViewItem class.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
function TreeViewItem ()
```

See Also

TreeViewItem Methods

TreeViewItem.loadFromXml Method

Loads the item's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.saveToXml Method

Saves the item's content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem Properties

TreeViewItem.brush Property

Gets or sets the brush used to paint item's background.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get brush() {}
set brush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.children Property

Gets a list of this item's children.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get children() {}
```

Property Value

Array

An array of TreeViewItem objects.

Remarks

Do not add items to this array directly, but call the addItem method of TreeViewNode.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.expanded Property

Gets or sets a value indicating whether this item is expanded to show its children.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get expanded() {}
set expanded(value) {}
```

Property Value

Boolean

true if the item is expanded, or **false** otherwise.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.font Property

Gets or sets the font used to render item's text.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get font() {}
set font(value) {}
```

Property Value

Font

An instance of the Font class.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.height Property

Gets or sets the height of this item.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get height() {}
set height(value) {}
```

Property Value

Number

A number specifying item's height.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.image Property

Gets or sets the image displayed by this item.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get image() {}
set image(value) {}
```

Property Value

HTMLImageElement

An image object to render as item's content.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.imageContent Property

Gets or sets a Base64-encoded image to display inside this item.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get imageContent() {}
set imageContent(value) {}
```

Property Value

String

A Base64-encoded representation of an image.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.imageLocation Property

Gets or sets URL of the image to display inside this item.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get imageLocation() {}
set imageLocation(value) {}
```

Property Value

String

A URL string that identifies the image to be loaded.

See Also

TreeViewItem.imagePadding Property

Gets or sets the padding distance between item's borders and image.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get imagePadding() {}
set imagePadding(value) {}
```

Property Value

Thickness

A Thickness instance specifying image padding.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.parent Property

Gets the parent item of this item.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get parent() {}
set parent(value) {}
```

Property Value

TreeViewItem

The parent item.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.tag Property

Gets or sets custom data tag associated with this item.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get tag() {}
set tag(value) {}
```

Property Value

Object

An Object containing custom data.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.text Property

Gets or sets the text label displayed by this item.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get text() {}
set text(value) {}
```

Property Value

String

A string containing the item's text. The default value is empty string "".

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.textColor Property

Gets or sets the item's text color.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript Copy Code

```
get textColor() {}
set textColor(value) {}
```

Property Value

String

A string value identifying the text color.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewItem.tooltip Property

Gets or sets the tooltip text that should be displayed when the mouse hovers over this item.

Namespace: MindFusion.Diagramming
Assembly: TreeViewItem.js

Syntax

JavaScript — Copy Code

```
get tooltip() {}
set tooltip(value) {}
```

Property Value

String

A string containing the tooltip text.

See Also

TreeViewItem Members
TreeViewItem Class
MindFusion.Diagramming Namespace

TreeViewNode Class

TreeViewNode instances are diagram nodes that can draw hierarchical data.

Syntax

JavaScript — Copy Code

```
// class
TreeViewNode.prototype = {}
```

Remarks

The root items displayed in the node can be accessed through the rootItems property. Items can be added and removed individually by using the addItem and removeItem methods, or in bulk by calling the fromObject method, which loads the tree view items from an array of objects.

Inheritance Hierarchy

MindFusion.Diagramming.DiagramItem
  MindFusion.Diagramming.DiagramNode
    MindFusion.Diagramming.CaptionedNode
      MindFusion.Diagramming.TreeViewNode

See Also

TreeViewNode Members
MindFusion.Diagramming Namespace

TreeViewNode Members

TreeViewNode instances are diagram nodes that can draw hierarchical data.

The following tables list the members exposed by the **TreeViewNode** type.

Public Constructors

	Name	Description
	TreeViewNode	Initializes a new instance of the TreeViewNode class with default values supplied from the specified Diagram.

Protected Fields

	Name	Description
	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	captionBackBrush	Gets or sets an object specifying how to fill the caption bar.
	captionFont	Gets or sets the font used to render the node's caption text.
	captionHeight	Gets or sets the height of the node's caption area.
	connectionStyle	Gets or sets whether drawing a link from/to this node should connectan individual TreeViewItem, or the whole node as an integral entity.
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	dividerStroke	Gets or sets the color used to stroke the divider line between node's caption bar and content area. (Inherited from CaptionedNode.)
	dividerStrokeDashArray	Gets or sets an array of values specifying the dash pattern of the node's divider line. (Inherited from CaptionedNode.)
	dividerStrokeDashOffset	Gets or sets the the distance between the line start and the beginning of the dash pattern. (Inherited from CaptionedNode.)
	dividerStrokeDashStyle	Gets or sets the line dash pattern applied when stroking node's divider line. (Inherited from CaptionedNode.)
	dividerStrokeThickness	Gets or sets the width of the divider line between node's caption bar and content area. (Inherited from CaptionedNode.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	effectiveDividerStrokeThickness	Gets the effective line thickness that should be applied when stroking this node's divider line. (Inherited from CaptionedNode.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)

	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	enableStyledText	Gets or sets a value indicating whether styled text rendering is enabled.
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	flatItems	Gets a list of all items in this node.
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)
	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	rootItems	Gets a list of root items displayed in this node.

	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	scrollable	Gets or sets whether the node's items can be scrolled vertically.
	scrollPosition	Gets or sets the node's current scroll position.
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	shape	Gets or sets the shape of the node's outline.
	showLines	Gets or sets whether to display lines connecting child items to parent items.
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)
	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description

	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	addItem	Adds a new child item to the specified parent item or to the root items list, if a parent is not specified.
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	clone	DiagramNode.clone override.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	containsPoint	Checks if the TreeViewNode contains the specified point.
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	createConnectionPoint	Creates a connection point between this node and the specified link at the specified point.
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)
	DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
	Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	fromJson	DiagramNode.fromJson override.
	fromObject	Loads the tree view items from a data object.
	GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
	GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
	GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)

	GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
	GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
	GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
	GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
	GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
	GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
	GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
	getItemRect	Returns the bounding rectangle of the specified item.
	GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
	getOutline	Gets an array of points that define the outline of this node shape.
	GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
	GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
	GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
	GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
	GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
	HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
	HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
	HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
	Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
	itemFromPoint	Returns the item that contains the specified point.
	LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
	loadFromXml	DiagramNode.LoadFromXml override. Loads the node's content from an XML element.
	Move	Moves the node to the specified location. (Inherited from DiagramNode.)
	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)

	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	removeItem	Removes the specified item from the node.
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	resizeToFitText	Resizes the tree view so that it is large enough to fit the text of its items.
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	restoreState	DiagramItem.restoreState override. (Inherited from CaptionedNode.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveState	DiagramItem.saveState override. (Inherited from CaptionedNode.)
	saveToXml	Saves the node's content into an XML element.
	scrollDown	Scrolls the node down.
	scrollUp	Scrolls the table's rows up.
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	toJson	DiagramNode.toJson override.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)

	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
	LoadFromXml	DiagramItem.LoadFromXml override. (Inherited from DiagramNode.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)

	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramNode.)
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

See Also

TreeViewNode Constructor

Initializes a new instance of the TreeViewNode class with default values supplied from the specified Diagram.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function TreeViewNode ([parent])
```

Parameters

parent
Optional.
Diagram. The Diagram from which to obtain default values for the node properties.

See Also

TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode Methods

TreeViewNode.addItem Method

Adds a new child item to the specified parent item or to the root items list, if a parent is not specified.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function addItem (item, [parentItem])
```

Parameters

item
TreeViewItem. The item to add.

parentItem
Optional.
TreeViewItem. The parent item.

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.clone Method

DiagramNode.clone override.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function clone ()
```

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.containsPoint Method

Checks if the TreeViewNode contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function containsPoint (point)
```

Parameters

point
Point. The Point to check.

Return Value

Boolean. true if the point is within the bounds of this node; otherwise, false.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.createConnectionPoint Method

Creates a connection point between this node and the specified link at the specified point.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function createConnectionPoint (link, point, incoming)
```

Parameters

link
DiagramLink. A DiagramLink that should be connected to this node.

point
Point. The point at which the link should be connected.

incoming
Boolean. true if link is an incoming link, otherwise, false.

Return Value

TreeViewConnectionPoint. The connection point.

See Also

TreeViewNode.fromJson Method

DiagramNode.fromJson override.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function fromJson ()
```

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.fromObject Method

Loads the tree view items from a data object.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function fromObject (data)
```

Parameters

data
Object. The object containing the tree view data.

Example

JavaScript Copy Code

```
node.fromObject(
[{
    text: "Order",
    imageLocation: "icon_calculator.png"
},
{
    text: "Date",
    imageLocation: "icon_time.png"
},
{
    text: "Products",
    imageLocation: "icon_delivery.png",
    children: [{ text: "Name" }, { text: "TotalPrice", brush: "lightblue" }]
}]
);
```

TreeViewNode.getItemRect Method

Returns the bounding rectangle of the specified item.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function getItemRect (item)
```

Parameters

item
TreeViewItem. The item.

Return Value

Rect. A Rect object representing the item's bounding rectangle.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.getOutline Method

Gets an array of points that define the outline of this node shape.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function getOutline ()
```

Return Value

Array. An array with the points.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.itemFromPoint Method

Returns the item that contains the specified point.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function itemFromPoint (point)
```

Parameters

point
Point. A Point instance.

Return Value

TreeViewItem. The item containing the point, or null.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.loadFromXml Method

DiagramNode.LoadFromXml override. Loads the node's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.removeItem Method

Removes the specified item from the node.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function removeItem (item)
```

Parameters

item
TreeViewItem. The item to remove.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.resizeToFitText Method

Resizes the tree view so that it is large enough to fit the text of its items.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function resizeToFitText ()
```

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.saveToXml Method

Saves the node's content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

TreeViewNode.scrollDown Method

Scrolls the node down.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function scrollDown ()
```

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.scrollUp Method

Scrolls the table's rows up.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function scrollUp ()
```

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.toJson Method

DiagramNode.toJson override.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
function toJson ()
```

See Also

TreeViewNode Members
TreeViewNode Class

TreeViewNode Properties

TreeViewNode.captionBackBrush Property

Gets or sets an object specifying how to fill the caption bar.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
get captionBackBrush() {}
set captionBackBrush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.captionFont Property

Gets or sets the font used to render the node's caption text.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
get captionFont() {}
set captionFont(value) {}
```

Property Value

Font

An object specifying the font of the caption bar.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.captionHeight Property

Gets or sets the height of the node's caption area.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
get captionHeight() {}
set captionHeight(value) {}
```

Property Value

Number

A number specifying the height of the caption bar. The default value is 6.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.connectionStyle Property

Gets or sets whether drawing a link from/to this node should connectan individual TreeViewItem, or the whole node as an integral entity.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
get connectionStyle() {}
set connectionStyle(value) {}
```

Property Value

ConnectionStyle

A member of the ConnectionStyle enumeration.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.enableStyledText Property

Gets or sets a value indicating whether styled text rendering is enabled.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
get enableStyledText() {}
set enableStyledText(value) {}
```

Property Value

Boolean

true to parse the node's text in order to find formatting tags, or **false** otherwise.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.flatItems Property

Gets a list of all items in this node.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
get flatItems() {}
set flatItems(value) {}
```

Property Value

Array

An array containing all TreeViewItem objects in the node.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.rootItems Property

Gets a list of root items displayed in this node.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
get rootItems() {}
set rootItems(value) {}
```

Property Value

Array

An array of root TreeViewItem objects.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.scrollable Property

Gets or sets whether the node's items can be scrolled vertically.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
get scrollable() {}
set scrollable(value) {}
```

Property Value

Boolean

true to allow scrolling, or **false** otherwise.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.scrollPosition Property

Gets or sets the node's current scroll position.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
get scrollPosition() {}
set scrollPosition(value) {}
```

Property Value

Number

A number specifying the scroll position.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.shape Property

Gets or sets the shape of the node's outline.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
get shape() {}
set shape(value) {}
```

Property Value

SimpleShape

A member of the SimpleShape enumeration.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

TreeViewNode.showLines Property

Gets or sets whether to display lines connecting child items to parent items.

Namespace: MindFusion.Diagramming
Assembly: TreeViewNode.js

Syntax

JavaScript Copy Code

```
get showLines() {}
set showLines(value) {}
```

Property Value

Boolean

true to display connecting lines, or **false** otherwise.

See Also

TreeViewNode Members
TreeViewNode Class
MindFusion.Diagramming Namespace

UndoEventArgs Class

Contains the arguments passed to the actionUndone and actionRedone event handlers.

Syntax

JavaScript Copy Code

```
// class
UndoEventArgs.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.EventArgs
MindFusion.Diagramming.UndoEventArgs

See Also

UndoEventArgs Members
MindFusion.Diagramming Namespace

UndoEventArgs Members

Contains the arguments passed to the actionUndone and actionRedone event handlers.

The following tables list the members exposed by the UndoEventArgs type.

Public Constructors

	Name	Description
	UndoEventArgs	Initializes a new instance of the UndoEventArgs class.

Public Properties

	Name	Description
	command	Gets the command related to the event.

See Also

UndoEventArgs Class
MindFusion.Diagramming Namespace

UndoEventArgs Constructor

Initializes a new instance of the UndoEventArgs class.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

JavaScript Copy Code

```
function UndoEventArgs (args)
```

Parameters

args

See Also

UndoEventArgs Class
MindFusion.Diagramming Namespace

UndoEventArgs Properties

UndoEventArgs.command Property

Gets the command related to the event.

Namespace: MindFusion.Diagramming
Assembly: Diagram.js

Syntax

```
JavaScript                                                    Copy Code
get command() {}
set command(value) {}
```

Property Value

Command

A Command instance.

See Also

UndoEventArgs Members
UndoEventArgs Class
MindFusion.Diagramming Namespace

VideoNode Class

A **VideoNode** instance renders video stream assigned to the videoLocation property.

Syntax

```
JavaScript                                                    Copy Code
// class
VideoNode.prototype = {}
```

Remarks

VideoNode objects display video streams, along with UI elements to play, pause, seek and change volume. Set node's videoLocation method to specify its video URL. Auto-playing is not supported at this time, and the video can be started only by users clicking the play button.

VideoNode is built around Video component, which can also be used in CompositeNode templates.

Inheritance Hierarchy

MindFusion.Diagramming.DiagramItem
  MindFusion.Diagramming.DiagramNode
    MindFusion.Diagramming.VideoNode

VideoNode Members

A VideoNode instance renders video stream assigned to the videoLocation property.

The following tables list the members exposed by the **VideoNode** type.

Public Constructors

	Name	Description
	VideoNode	Initializes a new instance of the **VideoNode** class.

Protected Fields

	Name	Description

	disposed	For internal use. (Inherited from DiagramItem.)

Public Properties

	Name	Description
	AllowIncomingLinks	Gets or sets a value indicating whether users are allowed to draw incoming links to this node. (Inherited from DiagramNode.)
	AllowOutgoingLinks	Gets or sets a value indicating whether users are allowed to draw outgoing links from this node. (Inherited from DiagramNode.)
	AnchorPattern	Gets or sets the anchor points to which links are attached when connected to the node. (Inherited from DiagramNode.)
	Bounds	Gets or sets the rectangle that defines the position of the diagram node. (Inherited from DiagramNode.)
	Brush	Gets or sets the brush used to fill the interior of this item. (Inherited from DiagramItem.)
	Constraints	Allows applying constraints to the location and size of the node. (Inherited from DiagramNode.)
	Container	Gets the parent ContainerNode containing this node. (Inherited from DiagramNode.)
	CssClass	Gets or sets the CSS class associated with this item. (Inherited from DiagramItem.)
	EffectiveBrush	Gets the effective brush of the item. (Inherited from DiagramItem.)
	EffectiveFont	Gets the currently effective font of the item. (Inherited from DiagramItem.)
	EffectivePen	Gets the effective pen of the item. (Inherited from DiagramItem.)
	EffectiveShadowBrush	Gets the effective shadow brush of the item. (Inherited from DiagramItem.)
	EffectiveTextBrush	Gets the effective text brush of the item. (Inherited from DiagramItem.)
	Effects	Gets a collection with all effects applied to this node. (Inherited from DiagramNode.)
	EnabledHandles	Gets or sets the kinds of modifications that end-users are permitted to perform on the node. (Inherited from DiagramNode.)
	Expandable	Gets or sets a value indicating whether users are allowed to expand or collapse the subtree that starts from this node. (Inherited from DiagramNode.)
	Expanded	Gets or sets a value indicating whether the subtree starting from this node is expanded. (Inherited from DiagramNode.)
	Font	Gets or sets the font used to render the item's text. (Inherited from DiagramItem.)
	HandlesStyle	Gets or sets a value indicating how the node adjustment handles behave and what do they look like. (Inherited from DiagramNode.)
	HyperLink	Gets or sets the hyperlink associated with this diagram item. (Inherited from DiagramItem.)
	Id	Gets or sets user-defined identifier associated with this item. (Inherited from DiagramItem.)
	IgnoreLayout	Gets or sets a value indicating whether the position of this item should not be changed by automatic layout methods. (Inherited from DiagramItem.)
	IncomingLinks	Gets a collection of links that point to the node. (Inherited from DiagramNode.)

	Labels	Returns the list of supplementary labels displayed by this node. (Inherited from DiagramNode.)
	LayerIndex	Gets or sets the zero-based index of the layer this item is associated with, or -1, if the item is not associated with a layer. (Inherited from DiagramItem.)
	LayoutTraits	Contains layout properties of the node, used by some layout algorithms and by **DiagramView3D**. (Inherited from DiagramItem.)
	Locked	Gets or sets a value indicating whether users are allowed to edit the diagram item. (Inherited from DiagramItem.)
	MasterGroup	Gets a reference to the group to which this node is attached. (Inherited from DiagramNode.)
	MasterItem	Returns the node's **Container** or main item of **MasterGroup**. (Inherited from DiagramNode.)
	Obstacle	Gets or sets a value indicating whether this node is considered an obstacle by the link-routing algorithm. (Inherited from DiagramNode.)
	Opacity	Gets or sets the opacity of this item. (Inherited from DiagramItem.)
	OutgoingLinks	Gets a collection of links that start from this node. (Inherited from DiagramNode.)
	Parent	Gets the diagram that contains this item. (Inherited from DiagramItem.)
	Pen	Gets or sets the pen used to paint the frame of the item. (Inherited from DiagramItem.)
	Printable	Gets or sets a value indicating whether to print the item. (Inherited from DiagramItem.)
	RotationAngle	Gets or sets the rotation angle of this node. (Inherited from DiagramNode.)
	RuntimeIndex	For internal use. (Inherited from DiagramItem.)
	Selected	Gets or sets a value indicating whether a diagram item is selected. (Inherited from DiagramItem.)
	ShadowBrush	Gets or sets the brush used to paint the item's shadow. (Inherited from DiagramItem.)
	ShadowOffsetX	Gets or sets the horizontal offset of the shadow of this item. (Inherited from DiagramItem.)
	ShadowOffsetY	Gets or sets the vertical offset of the shadow of this item. (Inherited from DiagramItem.)
	Style	Gets or sets the style associated with the item. (Inherited from DiagramItem.)
	SubordinateGroup	Gets a reference to the group of items that are attached to this one. (Inherited from DiagramItem.)
	Tag	Gets or sets user-defined data associated with this item. (Inherited from DiagramItem.)
	Text	Gets or sets the text displayed by this item. (Inherited from DiagramItem.)
	TextBrush	Gets or sets the brush used to paint texts inside the item. (Inherited from DiagramItem.)
	TextFormat	Gets or sets the alignment of text displayed inside this item. (Inherited from DiagramItem.)
	TextPadding	Gets or sets the spacing between the item boundaries and its text. (Inherited from DiagramItem.)
	ToolTip	Gets or sets a short text message displayed when the mouse pointer rests over the diagram element. (Inherited from DiagramItem.)

	TopLevel	DiagramItem.TopLevel override. (Inherited from DiagramNode.)
	videoLocation	Gets or sets the URL of the video stream displayed in this VideoNode.
	Visible	Gets or sets a value indicating whether this item is visible. (Inherited from DiagramItem.)
	Weight	Gets or sets a weight value used in layout and path-finding algorithms. (Inherited from DiagramItem.)
	ZIndex	Gets or sets the z-order position of this item. (Inherited from DiagramItem.)

Protected Properties

	Name	Description
	HasItems	Determines whether the node supports connections to its constituent elements. (Inherited from DiagramNode.)
	MeasureUnit	Returns the diagram measure unit. (Inherited from DiagramItem.)

Public Methods

	Name	Description
	AcceptLinks	Determines whether the node can be connected with links of the specified type. (Inherited from DiagramNode.)
	AddLabel	Overloaded. Adds a new label to this node. (Inherited from DiagramNode.)
	Animate	Animates the item. (Inherited from DiagramItem.)
	AttachManipulator	Adds the specified manipulator to this node. (Inherited from DiagramNode.)
	AttachTo	Overloaded. Attaches this node to another diagram item. (Inherited from DiagramNode.)
	clone	DiagramNode.clone override.
	Clone	Creates a copy of this item. (Inherited from DiagramItem.)
	Collapse	Hides all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
	ContainsPoint	Overloaded. (Inherited from DiagramNode.)
	CreateConnectionPoint	Creates a connection point between this node and the specified link at the specified point. (Inherited from DiagramNode.)
	Detach	Detaches this node from its master item. (Inherited from DiagramNode.)
	DetachManipulator	Removes the specified manipulator from this node. (Inherited from DiagramNode.)
	Dispose	Overloaded. (Inherited from DiagramItem.)
	DoModify	For internal use. (Inherited from DiagramItem.)
	Draw	DiagramItem.Draw override. Draws the item on the specified IGraphics surface. (Inherited from DiagramNode.)
	DrawAnchors	Draws the anchor points of this node. (Inherited from DiagramNode.)
	DrawHandles	DiagramItem.DrawHandles override. Renders the adjustment handles of this item. (Inherited from DiagramNode.)
	DrawInRect	(Inherited from DiagramNode.)
	DrawLocal	Override in a derived class to provide implementation specific drawing for the node. (Inherited from DiagramNode.)

DrawShadow	DiagramItem.DrawShadow override. Draws the shadow of this item on the specified IGraphics surface. (Inherited from DiagramNode.)
DrawShadowLocal	Override in a derived class to provide implementation specific drawing for the shadow of the node. (Inherited from DiagramNode.)
Expand	Shows all nodes and links in the subtree starting from this node. (Inherited from DiagramNode.)
fromJson	DiagramNode.fromJson override.
GetAllIncomingLinks	Overloaded. (Inherited from DiagramNode.)
GetAllLinks	Gets all links connected to this node. (Inherited from DiagramNode.)
GetBounds	Gets the bounding rectangle of this item. (Inherited from DiagramItem.)
GetCenter	Gets the center of this node's bounding rectangle. (Inherited from DiagramNode.)
GetClosestAnchorPoint	Returns the index of the anchor point that lies at the shortest distance from the specified point. (Inherited from DiagramNode.)
GetEffectiveBrush	Creates a Brush object representing the currently effective brush of the item. (Inherited from DiagramItem.)
GetEffectivePen	Returns a Pen object representing the currently effective pen of the item. (Inherited from DiagramItem.)
GetEffectiveShadowBrush	Returns a Brush object representing the currently effective shadow brush of the item. (Inherited from DiagramItem.)
GetEffectiveTextBrush	Returns a Brush object representing the currently effective text brush of the item. (Inherited from DiagramItem.)
GetIntersection	Calculates the intersection point between the segment defined by the specified point pair and the node's outline. (Inherited from DiagramNode.)
GetNearestBorderPoint	Returns a point that lies on the outline of this node, at the shortest distance from the specified point. (Inherited from DiagramNode.)
GetOutlinePoly	DiagramItem.GetOutlinePoly override. (Inherited from DiagramNode.)
GetRepaintRect	DiagramItem.GetRepaintRect override. (Inherited from DiagramNode.)
GetRotatedBounds	Overloaded. Gets the bounding rectangle of this node or the bounding rectangle of another rectangle rotated at a specified angle around a specified point. (Inherited from DiagramNode.)
GetRotationAngle	Gets the rotation angle of this node. (Inherited from DiagramNode.)
GetToolTip	DiagramItem.GetToolTip override. (Inherited from DiagramNode.)
HitTest	Returns the diagram item that contains the specified point. (Inherited from DiagramItem.)
HitTestHandle	DiagramItem.HitTestHandle override. Determines whether a selection handle of this item is located at the specified point. (Inherited from DiagramNode.)
HitTestManipulators	DiagramItem.HitTestManipulators override. (Inherited from DiagramNode.)
Intersects	Determines whether the node intersects another one, taking into account the outlines of node shapes. (Inherited from DiagramNode.)
LabelFromPoint	Returns the label whose layout rectangle contains the specified point. (Inherited from DiagramNode.)
loadFromXml	DiagramNode.loadFromXml override. Loads the node's content from an XML element.
Move	Moves the node to the specified location. (Inherited from DiagramNode.)

	NotInteractive	Gets whether the user is prevented from manipulating this item. (Inherited from DiagramItem.)
	NowModifying	Gets a flag indicating whether this object is being currently modified interactively by the user. (Inherited from DiagramItem.)
	OnDragOut	Invoked when a diagram item is being dragged out of this node. (Inherited from DiagramNode.)
	OnDragOver	Invoked when a diagram item is being dragged over this node. (Inherited from DiagramNode.)
	OnDropOver	Invoked when a diagram item is dropped over this node. (Inherited from DiagramNode.)
	OnLoad	Called after successful deserialization. (Inherited from DiagramItem.)
	Query	Returns the items that can be reached from this item by following the path specified in the given query expression. (Inherited from DiagramItem.)
	ReassignAnchorPoints	Reassigns links to anchor points so that they are evenly distributed. (Inherited from DiagramNode.)
	ReassignUnanchoredLinks	Reassigns unanchored links (Inherited from DiagramNode.)
	RemoveLabel	Removes the specified label from this node. (Inherited from DiagramNode.)
	Resize	Resizes the node. (Inherited from DiagramNode.)
	RestoreItemProperties	For internal use. (Inherited from DiagramItem.)
	SaveItemProperties	For internal use. (Inherited from DiagramItem.)
	saveToXml	Saves the node's content into an XML element.
	SetBounds	Sets the location and size of this node. (Inherited from DiagramNode.)
	SetExpandedFlag	Sets the 'expanded' flag, repainting the node. (Inherited from DiagramNode.)
	SetPos	Sets the bounding rectangle of this node without updating connected arrows. (Inherited from DiagramNode.)
	SetRect	This method is used internally by the **Ruler** control to align nodes. (Inherited from DiagramNode.)
	toJson	DiagramNode.toJson override.
	UpdateAnimation	Invoked by running animations to update an item according to current animation progress. (Inherited from DiagramNode.)
	ZBottom	Moves the item to the bottom of the z-order. (Inherited from DiagramItem.)
	ZLevelDown	Moves the item one level down in the z-order. (Inherited from DiagramItem.)
	ZLevelUp	Moves the item one level up in the z-order. (Inherited from DiagramItem.)
	ZTop	Moves the item to the top of the z-order. (Inherited from DiagramItem.)

Protected Methods

	Name	Description
	AddManipulator	Adds the specified manipulator to this object. (Inherited from DiagramItem.)
	AllowCreate	DiagramItem.AllowCreate override. (Inherited from DiagramNode.)
	AllowModify	DiagramItem.AllowModify override. (Inherited from DiagramNode.)

	CancelModify	DiagramItem.CancelModify override. Invoked when the interactive modification of this object has been canceled. (Inherited from DiagramNode.)
	CompleteCreate	DiagramItem.CompleteCreate override. (Inherited from DiagramNode.)
	CompleteModify	DiagramItem.CompleteModify override. (Inherited from DiagramNode.)
	ConstraintsInfringed	Check whether the KeepInsideParent constraint is being infringed. (Inherited from DiagramNode.)
	CreateProperties	DiagramItem.CreateProperties override. (Inherited from DiagramNode.)
	CreateState	DiagramItem.CreateState override. (Inherited from DiagramNode.)
	DrawManipulators	Overloaded. Draws the associated manipulators on a specified graphics. (Inherited from DiagramItem.)
	Finalize	DiagramItem finalizer. (Inherited from DiagramItem.)
	FreeResources	Called when the node is completely disassociated from a Diagram, that is, when it is no longer referenced from an item collection or the undo/redo history. (Inherited from DiagramNode.)
	GetAllOutgoingLinks	Overloaded. (Inherited from DiagramNode.)
	GetLocalBounds	Gets this node's bounding rectangle in local coordinates. (Inherited from DiagramNode.)
	GetRgnInRect	Creates and returns a **Region** object for this node as though it is contained in the specified rectangle. (Inherited from DiagramNode.)
	GetValue	Gets the effective value of the style property with the specified name. (Inherited from DiagramItem.)
	GroupContains	Determines whether this node is a predecessor of the specified node in the group hierarchy. (Inherited from DiagramNode.)
	LoadFromJson	Loads the node from a JSON object. (Inherited from DiagramNode.)
	LoadFromXml	DiagramItem.LoadFromXml override. (Inherited from DiagramNode.)
	LoadObsolete	For internal use. (Inherited from DiagramItem.)
	OnAdd	DiagramItem.OnAdd override. (Inherited from DiagramNode.)
	OnChildModified	Called when a group child node has been modified. (Inherited from DiagramItem.)
	OnClick	Invoked when the user clicks this item. (Inherited from DiagramItem.)
	OnDoubleClick	Invoked when the user double-clicks this item. (Inherited from DiagramItem.)
	OnMeasureUnitChanged	DiagramItem.OnMeasureUnitChanged override. (Inherited from DiagramNode.)
	OnModify	Invoked when the user moves or resizes this node. (Inherited from DiagramNode.)
	OnRemove	DiagramItem.OnRemove override. (Inherited from DiagramNode.)
	OnRotationAngleChanged	Invoked when the rotation angle of this node has been changed, either programmatically or interactively. (Inherited from DiagramNode.)
	OnStyleChanged	Invoked when the associated style or theme have changed. (Inherited from DiagramItem.)
	OnTextChanged	Called when the value of the Text property changes. (Inherited from DiagramItem.)
	OnTextFormatChanged	Called when the value of the TextFormat property changes. (Inherited from DiagramItem.)

	OnUpdateBounds	Overloaded. (Inherited from DiagramNode.)
	OnZoomChanged	DiagramItem.OnZoomChanged override. (Inherited from DiagramNode.)
	RemoveManipulator	Removes the specified manipulator from the object. (Inherited from DiagramItem.)
	Repaint	Overloaded. (Inherited from DiagramItem.)
	RestoreProperties	DiagramItem.RestoreProperties override. (Inherited from DiagramNode.)
	RestoreState	DiagramItem.RestoreState override. (Inherited from DiagramNode.)
	SaveProperties	DiagramItem.SaveProperties override. (Inherited from DiagramNode.)
	SaveState	DiagramItem.SaveState override. (Inherited from DiagramNode.)
	SaveToJson	Saves the node as a JSON object. (Inherited from DiagramNode.)
	SaveToXml	Saves the item content into an XML element. (Inherited from DiagramNode.)
	ScaleElements	Scales the node's elements by specified amount. (Inherited from DiagramNode.)
	SetDiagramDirty	Marks the diagram as changed. (Inherited from DiagramItem.)
	SetExpandable	Internally sets the expandable state of this object to the specified value, adding or removing an Expander manipulator object if necessary. (Inherited from DiagramNode.)
	SetExpanded	DiagramItem.SetExpanded override. (Inherited from DiagramNode.)
	SetIncomingLinks	Sets the incoming links collection of this node. (Inherited from DiagramNode.)
	SetOutgoingLinks	Sets the outgoing links collection of this node. (Inherited from DiagramNode.)
	SetReflexive	Invoked to let a node set the shape of a reflexive link connected to it. (Inherited from DiagramNode.)
	ShouldRender	Determines whether the item should be rendered in the current context. (Inherited from DiagramItem.)
	ShouldRenderAnchors	Determines whether the node should render its anchor points. (Inherited from DiagramNode.)
	StartCreate	DiagramItem.StartCreate override. (Inherited from DiagramNode.)
	StartModify	DiagramItem.StartModify override. Invoked when the user starts modifying this item interactively. (Inherited from DiagramNode.)
	UpdateCreate	DiagramItem.UpdateCreate override. (Inherited from DiagramNode.)
	UpdateGroup	Called to update the positions of subordinate nodes attached to this item when the attachment style is set to ControlledByMaster. (Inherited from DiagramItem.)
	UpdateLinkIntersections	Updates the intersection points of links, connected to this node and its outline, usually in response to change in the node's shape. (Inherited from DiagramNode.)
	UpdateLinkPositions	Updates the end points of the links, connected to this node, usually in response to change in the node's size or shape. (Inherited from DiagramNode.)
	UpdateModify	DiagramItem.UpdateModify override. Invoked during interactive modification of this item. (Inherited from DiagramNode.)

See Also

VideoNode Constructor

Initializes a new instance of the VideoNode class.

Namespace: MindFusion.Diagramming
Assembly: VideoNode.js

Syntax

JavaScript Copy Code

```
function VideoNode ([parent])
```

Parameters

parent
Optional.
A Diagram instance whose default node attributes are copied to this node.

See Also

VideoNode Class
MindFusion.Diagramming Namespace

VideoNode Methods

VideoNode.clone Method

DiagramNode.clone override.

Namespace: MindFusion.Diagramming
Assembly: VideoNode.js

Syntax

JavaScript Copy Code

```
function clone ()
```

VideoNode Members
VideoNode Class
MindFusion.Diagramming Namespace

VideoNode.fromJson Method

DiagramNode.fromJson override.

Namespace: MindFusion.Diagramming
Assembly: VideoNode.js

Syntax

JavaScript Copy Code

```
function fromJson ()
```

See Also

VideoNode Members
VideoNode Class
MindFusion.Diagramming Namespace

VideoNode.loadFromXml Method

DiagramNode.loadFromXml override. Loads the node's content from an XML element.

Namespace: MindFusion.Diagramming
Assembly: VideoNode.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element containing the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

VideoNode Members
VideoNode Class
MindFusion.Diagramming Namespace

VideoNode.saveToXml Method

Saves the node's content into an XML element.

Namespace: MindFusion.Diagramming
Assembly: VideoNode.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

VideoNode Members
VideoNode Class
MindFusion.Diagramming Namespace

VideoNode.toJson Method

DiagramNode.toJson override.

Namespace: MindFusion.Diagramming
Assembly: VideoNode.js

Syntax

JavaScript — Copy Code

```
function toJson ()
```

See Also

VideoNode Members
VideoNode Class
MindFusion.Diagramming Namespace

VideoNode Properties

VideoNode.videoLocation Property

Gets or sets the URL of the video stream displayed in this VideoNode.

Namespace: MindFusion.Diagramming
Assembly: VideoNode.js

Syntax

JavaScript — Copy Code

```
get videoLocation() {}
set videoLocation(value) {}
```

Property Value

String

A string containing video stream URL.

See Also

VideoNode Members
VideoNode Class
MindFusion.Diagramming Namespace

WebComponents Class

Implements registration of web components.

Syntax

JavaScript — Copy Code

```
// class
WebComponents.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.WebComponents

See Also

WebComponents Members
MindFusion.Diagramming Namespace

WebComponents Members

Implements registration of web components.

The following tables list the members exposed by the WebComponents type.

Public Methods

	Name	Description
	register	Registers the controls in the package as web components.

See Also

WebComponents Class
MindFusion.Diagramming Namespace

WebComponents Methods

WebComponents.register Method

Registers the controls in the package as web components.

Namespace: MindFusion.Diagramming
Assembly: WebComponents.js

Syntax

JavaScript Copy Code

```
function register ()
```

Remarks

Call this method to register the control classes from Diagramming package as web components. After registration, the browser instantiates corresponding classes for following tags in HTML code:

HTML	JS Class
<mindfusion-diagramview>	DiagramView
<mindfusion-overview>	Overview
<mindfusion-nodelistview>	NodeListView
<mindfusion-ruler>	Ruler
<mindfusion-zoomcontrol>	ZoomControl

You can get a reference to objects created by the browser by calling the find method of corresponding class with **id** attribute's value as argument.

MindFusion.Diagramming Namespace

XmlPersistContext Members

Contains helper methods for serialization of diagram contents to and from XML documents.

The following tables list the members exposed by the XmlPersistContext type.

Public Constructors

	Name	Description
	XmlPersistContext	Initializes a new instance of the XmlPersistContext class.

Public Methods

	Name	Description
	addChildElement	Adds a new child node with the specified name and value to the specified parent node.
	readBool	Reads a Boolean value with the specified name.
	readBrush	Reads a Brush object with the specified name.
	readFloat	Reads a floating-point number with the specified name.
	readImage	Reads an image object with the specified name.
	readInt	Reads an integer number with the specified name.
	readString	Reads a string value with the specified name.
	writeBool	Writes a Boolean value with the specified name.
	writeBrush	Writes a reference to the specified brush. The brush is registered within the internal hashtable for subsequent serialization.
	writeFloat	Writes a floating-point number with the specified name.
	writeImage	Writes a reference to the specified image. The image is registered within the internal hashtable for subsequent serialization.
	writeInt	Writes an integer number with the specified name.
	writeString	Writes a string value with the specified name.

XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext Constructor

Initializes a new instance of the XmlPersistContext class.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript — Copy Code

```
function XmlPersistContext (diagram)
```

Parameters

diagram
Diagram. The Diagram that will be serialized or deserialized.

See Also

XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext Methods

XmlPersistContext.addChildElement Method

Adds a new child node with the specified name and value to the specified parent node.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript — Copy Code

```
function addChildElement (elementName, parentElement, [innerText])
```

Parameters

elementName
String. A string containing the name of new child element.

parentElement
Element. The parent DOM Element object.

innerText
Optional.
String. Optional value to be added as child text node of the new element.

Return Value

Element. The newly created DOM Element object.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.readBool Method

Reads a Boolean value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript Copy Code

```
function readBool (elementName, parentElement, defaultValue)
```

Parameters

elementName
String. A string specifying the name of the Boolean XML element.

parentElement
Element. The parent DOM Element object.

defaultValue
Boolean. The default value to return if specified child XML element does not exist.

Return Value

Boolean. The value loaded from XML.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.readBrush Method

Reads a Brush object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript Copy Code

```
function readBrush (elementName, parentElement, [defaultValue])
```

Parameters

elementName
String. A string specifying the name of the brush XML element.

parentElement
Element. The parent DOM Element object.

defaultValue
Optional.
Object. The default brush to return if specified child XML element does not exist.

Return Value

Object. The brush object loaded from XML.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.readFloat Method

Reads a floating-point number with the specified name.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript Copy Code

```
function readFloat (elementName, parentElement, [defaultValue])
```

Parameters

elementName
String. A string specifying the name of the number XML element.

parentElement
Element. The parent DOM Element object.

defaultValue
Optional.
Number. The default number to return if specified child XML element does not exist.

Return Value

Number. The number loaded from XML.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.readImage Method

Reads an image object with the specified name.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript Copy Code

```
function readImage (elementName, parentElement)
```

Parameters

elementName
String. A string specifying the name of the image XML element.

parentElement
Element. The parent DOM Element object.

Return Value

String. Base64-encoded image data loaded from XML.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.readInt Method

Reads an integer number with the specified name.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript Copy Code

```
function readInt (elementName, parentElement, [defaultValue])
```

Parameters

elementName
String. A string specifying the name of the number XML element.

parentElement
Element. The parent DOM Element object.

defaultValue
Optional.
Number. The default number to return if specified child XML element does not exist.

Return Value

Number. The number loaded from XML.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.readString Method

Reads a string value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript Copy Code

```
function readString (elementName, parentElement, [defaultValue])
```

Parameters

elementName
String. The name of the string's XML element.

parentElement
Element. The parent DOM Element object.

defaultValue
Optional.
Object. The default string to return if specified child XML element does not exist.

Return Value

String. The string loaded from XML.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.writeBool Method

Writes a Boolean value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript Copy Code

```
function writeBool (boolValue, elementName, parentElement)
```

Parameters

boolValue
Boolean. The Boolean value that should be saved in current XML document.

elementName
String. A string specifying the name of the new element.

parentElement
Element. The parent DOM Element object.

Return Value
Element. The newly created DOM Element object.

See Also
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.writeBrush Method

Writes a reference to the specified brush. The brush is registered within the internal hashtable for subsequent serialization.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript Copy Code

```
function writeBrush (brush, elementName, parentElement)
```

Parameters
brush
Object. The Brush object that should be saved in current XML document.

elementName
String. A string specifying the name of the new element.

parentElement
Element. The parent DOM Element object.

Return Value
Element. The newly created DOM Element object.

See Also
XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.writeFloat Method

Writes a floating-point number with the specified name.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript Copy Code

```
function writeFloat (floatValue, elementName, parentElement)
```

Parameters
floatValue
Number. The number that should be saved in current XML document.

elementName
String. A string specifying the name of the new element.

parentElement
Element. The parent DOM Element object.

Return Value

Element. The newly created DOM Element object.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.writeImage Method

Writes a reference to the specified image. The image is registered within the internal hashtable for subsequent serialization.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript Copy Code

```
function writeImage (image, elementName, parentElement)
```

Parameters

image
String. Base64-encoded image data that should be saved in XML.

elementName
String. A string specifying the name of the new element.

parentElement
Element. The parent DOM Element object.

Return Value

Element. The newly created DOM Element object.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.writeInt Method

Writes an integer number with the specified name.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript Copy Code

```
function writeInt (intValue, elementName, parentElement)
```

Parameters

intValue
Number. The number that should be saved in current XML document.

elementName
String. A string specifying the name of the new element.

parentElement
Element. The parent DOM Element object.

Return Value

Element. The newly created DOM Element object.

See Also

XmlPersistContext Members
XmlPersistContext Class
MindFusion.Diagramming Namespace

XmlPersistContext.writeString Method

Writes a string value with the specified name.

Namespace: MindFusion.Diagramming
Assembly: XmlPersistContext.js

Syntax

JavaScript Copy Code

```
function writeString (stringValue, elementName, parentElement)
```

Parameters

stringValue
String. The string that should be saved in current XML document.

elementName
String. A string specifying the name of the new element.

parentElement
Element. The parent DOM Element object.

Return Value

Element. The newly created DOM Element object.

BounceAnimation Class

Animates vertical position of nodes.

Syntax

JavaScript Copy Code

```
// class
BounceAnimation.prototype = {}
```

Remarks

Call item's animate method to run an animation.

Example

JavaScript Copy Code

```
node.animate(
    new BounceAnimation(
        {
            fromValue: 0,
            toValue: -5,
```

```
            duration: 250,
            repeat: true,
            repeatCount: 4,
            reverse: true,
            animationType: Animations.AnimationType.BackBow
        }));
```

BounceAnimation Members

Animates vertical position of nodes.

The following tables list the members exposed by the BounceAnimation type.

Public Fields

	Name	Description
	AnimationsRunning	Track how many animations are running. (Inherited from Animation.)
	InvokeOnMain	For internal use. (Inherited from Animation.)

Public Properties

	Name	Description
	IsRunning	Indicates whether the animation is currently running. (Inherited from Animation.)
	Item	Gets or sets the diagram item that should get animated. (Inherited from ItemAnimation.)
	Options	Gets or sets the object used to specify various property values for the animation. (Inherited from Animation.)
	Progress	Gets the progress of the current animation iteration. (Inherited from Animation.)

Public Methods

	Name	Description
	Dispose	IDisposable.Dispose implementation. (Inherited from Animation.)
	Start	Starts or resumes the animation. (Inherited from Animation.)
	Stop	Stops the animation. (Inherited from Animation.)

Protected Methods

	Name	Description
	FloatValue	Gets the current value from animation's range. (Inherited from Animation.)
	OnAnimationComplete	Raises the AnimationComplete event. (Inherited from Animation.)
	UpdateAnimation	Advance the animation. (Inherited from Animation.)

Public Events

	Name	Description
	AnimationComplete	Raised when an Animation completes. (Inherited from Animation.)

FillColorAnimation Class

Animates the fill color of nodes or link arrowheads.

Syntax

JavaScript Copy Code

```
// class
FillColorAnimation.prototype = {}
```

Remarks

Call item's animate method to run an animation.

Example

JavaScript Copy Code

```
node.animate(
    new FillColorAnimation(
        {
            fromValue: new Drawing.Color("white"),
            toValue: new Drawing.Color("lightSkyBlue"),
            duration: 250,
```

```
            keepLastValue: true
        }));
```

Palette Class

Represents a tool palette control that displays DiagramItem objects grouped into categories. Items from the palette can be added to a diagram by drag-and-drop.

Syntax

JavaScript Copy Code

```
// class
Palette.prototype = {}
```

Remarks

Content Security Policy

To allow for stricter CSP rules, the library no longer loads CSS scripts automatically. If you use **Palette**, you must explicitly link the *common-ui.css* file from distribution's *themes* folder.

The **Palette** is an **Accordion** subclass that displays ItemListView components as its child panels. Each **ItemListView** displays the items of a palette category.

Call the addCategory method to define a category and create its respective accordion pane. Call addItem to add an item to specified category.

Drag-and-drop operations create a copy of the dragged item, and set its size to newInstanceSize. The copy is created by calling item's clone method. You can override **clone** to copy property values of custom item subclasses.

Icons in the list are drawn by scaling **newInstanceSize** down to iconSize. E.g. if a list icon is half the size of the diagram item it creates, its graphic elements such as cells, labels, strokes would be rendered at half scale too (as opposed to rendering with same label / stroke sizes but in smaller bounding rectangle). The scaling code assumes measureUnit of the target diagram and the palette have matching values.

Configuring the control

Palette comes as s a part of the diagramming-controls npm package or the MindFusion.Diagramming.Controls namespace for UMD users.

For npm users simply import the diagramming-controls package:

JavaScript Copy Code

```
import * as Controls from '@mindfusion/diagramming-controls';
```

For UMD users, add references to files from distrbution's /umd folder using <script> tags. Note that the order of the scripts matters.

HTML Copy Code

```
<!-- for core Diagramming -->
<script src="Scripts/collections.js" type="text/javascript"></script>
```

```
<script src="Scripts/drawing.js" type="text/javascript"></script>
<script src="Scripts/controls.js" type="text/javascript"></script>
<script src="Scripts/graphs.js" type="text/javascript"></script>
<script src="Scripts/animations.js" type="text/javascript"></script>
<script src="Scripts/diagramming.js" type="text/javascript"></script>

<!-- for Palette -->
<script src="Scripts/common.js" type="text/javascript"></script>
<script src="Scripts/common-collections.js" type="text/javascript"></script>
<script src="Scripts/common-ui.js" type="text/javascript"></script>
<script src="Scripts/diagramming-controls.js" type="text/javascript"></script>
```

Creating the control instance and adding it to an HTML page can be done by calling the static create method:

JavaScript Copy Code

```
var palette = MindFusion.Diagramming.Controls.Palette
    .create(document.getElementById("palette"));
```

Default images for the collapse/expand buttons must be located in an ./icons folder. Alternatively, you can style the control with a predefined css theme, in which case the themes included in the distribution must be located in a ./themes folder and referenced in the head of the HTML document, e.g.

HTML / JavaScript Copy Code

```
<link rel="stylesheet" type="text/css" href="themes/common-ui.css" />
<link rel="stylesheet" type="text/css" href="themes/business.css" />
...
palette.theme = "business";
```

Palette Members

Represents a tool palette control that displays DiagramItem objects grouped into categories. Items from the palette can be added to a diagram by drag-and-drop.

The following tables list the members exposed by the Palette type.

Public Constructors

	Name	Description
	Palette	Initializes a new instance of the **Palette** class.

Public Properties

	Name	Description
	columns	Gets or sets the number of columns in palette's layout.
	iconSize	Gets or sets the size of items displayed in the palette.
	labelPosition	Gets or sets a value indicating the position of labels relative to item icons.
	measureUnit	Gets or sets the unit of measure used to specify item sizes.
	newInstanceSize	Gets or sets the default size of items created by drag-and-drop from this palette.

	padding	Gets or sets the padding space between item's slot bounds and its contents.
	textColor	Gets or sets the color used to paint item captions.

Public Methods

	Name	Description
	addCategory	Adds a new category to the palette.
	addItem	Adds an item to the palette.
S	create	Creates and initializes a new **Palette** from the specified element. This method is static and can be called without creating an instance of the class.
S	find	Returns the specified **Palette** object. This member is static and can be invoked without creating an instance of the class.
	removeCategory	Removes a category from the palette.
	removeItem	Removes an item from the palette.

Palette Class
MindFusion.Diagramming.Controls Namespace

Palette Constructor

Initializes a new instance of the Palette class.

Namespace: MindFusion.Diagramming.Controls
Assembly: Palette.js

Syntax

JavaScript — Copy Code

```
function Palette (element)
```

Parameters

element
HTMLDivElement. Th DOM Element this Palette is associated with.

See Also

Palette Class
MindFusion.Diagramming.Controls Namespace

Palette Methods

Palette.addCategory Method

Adds a new category to the palette.

Namespace: MindFusion.Diagramming.Controls
Assembly: Palette.js

Syntax

JavaScript — Copy Code

```
function addCategory (title, [image])
```

Parameters

title
String. The title text of the category.

image
Optional.
String. The URL of an image to be displayed in the category header.

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Controls Namespace
addItem Method
removeCategory Method

Palette.addItem Method

Adds an item to the palette.

Namespace: MindFusion.Diagramming.Controls
Assembly: Palette.js

Syntax

JavaScript Copy Code

```
function addItem (item, category, [caption])
```

Parameters

item
DiagramItem. The item to add.

category
String. The category of the item.

caption
Optional.
String. The caption to display for the item.

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Controls Namespace

removeItem Method

Palette.create Method

Creates and initializes a new Palette from the specified element. This method is static and can be called without creating an instance of the class.

Namespace: MindFusion.Diagramming.Controls
Assembly: Palette.js

Syntax

JavaScript Copy Code

```
function create (element)
```

Parameters

element
HTMLDivElement. The DOM element that the Palette should be attached to.

Return Value

Palette. The newly created **Palette** object.

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Controls Namespace

Palette.find Method

Returns the specified Palette object. This member is static and can be invoked without creating an instance of the class.

Namespace: MindFusion.Diagramming.Controls
Assembly: Palette.js

Syntax

JavaScript Copy Code

```
function find (id)
```

Parameters

id
String. The id of the Palette's element.

Return Value

Palette. A **Palette** object with the specified id, if found, or **null** otherwise.

See Also

Palette Members

Palette.removeCategory Method

Removes a category from the palette.

Namespace: MindFusion.Diagramming.Controls
Assembly: Palette.js

Syntax

JavaScript Copy Code

```
function removeCategory (title)
```

Parameters

title
String. The title of the category to remove.

See Also

Palette Members

addItem Method

Palette Properties

Palette.columns Property

Gets or sets the number of columns in palette's layout.

Namespace: MindFusion.Diagramming.Controls
Assembly: Palette.js

Syntax

JavaScript Copy Code

```
get columns() {}
set columns(value) {}
```

Property Value

Number

An integer value specifying the number of columns. The default value is 1.

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Controls Namespace

Palette.iconSize Property

Gets or sets the size of items displayed in the palette.

Namespace: MindFusion.Diagramming.Controls
Assembly: Palette.js

Syntax

JavaScript Copy Code

```
get iconSize() {}
set iconSize(value) {}
```

Property Value

Size

An instance of the Size class specifying item size.

See Also

Palette Members
Palette Class
MindFusion.Diagramming.Controls Namespace
newInstanceSize Property
measureUnit Property

Palette.labelPosition Property

Gets or sets a value indicating the position of labels relative to item icons.

Namespace: MindFusion.Diagramming.Controls
Assembly: Palette.js

Syntax

JavaScript Copy Code

```
get labelPosition() {}
set labelPosition(value) {}
```

Property Value

LabelPosition

A member of the LabelPosition enumeration. The default value is **Auto**.

Remarks

The default Auto value places labels to the right of item icons if using one-column layout, and below icons if showing multiple columns.

ShapeDesigner Members

Represents an interactive vector-drawing control that can be used to design node shapes.

The following tables list the members exposed by the ShapeDesigner type.

Public Constructors

	Name	Description
	ShapeDesigner	Initializes a new instance of the ShapeDesigner class.

Public Properties

	Name	Description
	alignToGrid	Gets or sets a value indicating whether the diagram items should be aligned to a grid.
	anchorPointsLabel	Gets or sets a string specifying the label of graphic AnchorPoints category in shape designer toolbox.
	gridSizeX	Gets or sets the horizontal distance between adjacent grid points.
	gridSizeY	Gets or sets the vertical distance between adjacent grid points.
	primitivesLabel	Gets or sets a string specifying the label of graphic primitives category in shape designer toolbox.
	selectedElement	Gets or sets the selected element in the shape designer.
	showGrid	Gets or sets a value indicating whether the alignment grid is visible.

	showShapeProperties	Gets or sets a value indicating whether to display the property panel.
	templatesLabel	Gets or sets a string specifying the label of outline templates category in shape designer toolbox.
	theme	Gets or sets the theme of the control.
	themesPath	Gets or sets the path to the control's css themes.

Public Methods

	Name	Description
	copyToClipboard	Copies the currently selected element to the clipboard.
S	create	Creates and initializes a new ShapeDesigner from the specified element. This method is static and can be called without creating an instance of the class.
	exportShape	Creates a new Shape from the current content of the design canvas.
	importShape	Imports a Shape into the designer's drawing canvas.
	pasteFromClipboard	Pastes a previously copied element from the clipboard.
	redo	Executes again the most recently undone user action.
	undo	Undoes the most recent user action.

Public Events

	Name	Description
	shapeChanged	Raised when the shape has changed.

ShapeDesigner Properties

ShapeDesigner.alignToGrid Property

Gets or sets a value indicating whether the diagram items should be aligned to a grid.

Namespace: MindFusion.Diagramming.Controls
Assembly: ShapeDesigner.js

Syntax

JavaScript — Copy Code

```
get alignToGrid() {}
set alignToGrid(value) {}
```

Property Value

Boolean

true if the diagram items should be aligned to a grid, or false otherwise.

See Also

ShapeDesigner Members
ShapeDesigner Class

TabAlignment Enumeration

Specifies the alignment of a tab strip relative to its container control.

Namespace: MindFusion.Diagramming.Controls
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
TabAlignment = {}
```

See Also

MindFusion.Diagramming.Controls Namespace

TabbedDiagramView Class

Represents a view that displays DiagramDocument objects.

Syntax

JavaScript — Copy Code

```
// class
TabbedDiagramView.prototype = {}
```

Remarks

Content Security Policy

To allow for stricter CSP rules, the library no longer loads CSS scripts automatically. If you use **TabbedDiagramView**, you must explicitly link the *common-ui.css* file from distribution's *themes* folder.

Individual diagram pages can be activated through the tabs located at the top or at the bottom of the control. The appearance and behavior of the tab strip can be customized using various properties. The location and visibility of the strip is specified through the tabAlignment property. Its height can be changed via the tabsSize property. showAddButton and showNavigationButtons determine the visibility of the buttons for interactive tab creation and tab navigation respectively. showTabCloseButtons specifies whether the tabs can be closed interactively, by clicking on the small 'x' button displayed in each tab. allowReorder enables interactive tab rearrangement by mouse dragging.

Configuring the control

TabbedDiagramView comes as s a part of the diagramming-controls npm package or the MindFusion.Diagramming.Controls namespace for UMD users.

For npm users simply import the diagramming-controls package:

JavaScript — Copy Code

```
import * as Controls from '@mindfusion/diagramming-controls';
```

For UMD users, add references to files from distrbution's /umd folder using <script> tags. Note that the order of the scripts matters.

HTML — Copy Code

```
<!-- for core Diagramming -->
<script src="Scripts/collections.js" type="text/javascript"></script>
<script src="Scripts/drawing.js" type="text/javascript"></script>
<script src="Scripts/controls.js" type="text/javascript"></script>
<script src="Scripts/graphs.js" type="text/javascript"></script>
<script src="Scripts/animations.js" type="text/javascript"></script>
<script src="Scripts/diagramming.js" type="text/javascript"></script>

<!-- for TabbedDiagramView -->
<script src="Scripts/common.js" type="text/javascript"></script>
<script src="Scripts/common-collections.js" type="text/javascript"></script>
```

```
<script src="Scripts/common-ui.js" type="text/javascript"></script>
<script src="Scripts/diagramming-controls.js" type="text/javascript"></script>
```

Creating the control instance and adding it to an HTML page is the same as for the DiagramView control. You can pass a DiagramDocument instance to the create function, or omit that parameter to let the control create a new document with a single DiagramPage.

JavaScript Copy Code

```
var doc = new MindFusion.Diagramming.DiagramDocument();
var page1 = new MindFusion.Diagramming.DiagramPage("diagram1");
var node = page1.factory.createShapeNode(10, 10, 20, 20);
doc.addPage(page1);
var diagramView = MindFusion.Diagramming.Controls.TabbedDiagramView.create(
    document.getElementById("diagram"), doc);
```

or simply

JavaScript Copy Code

```
var diagramView = MindFusion.Diagramming.Controls.TabbedDiagramView.create(
    document.getElementById("diagram"));
```

You can specify a title, iconUrl and titleColor for diagram pages by setting the corresponding properties.

Default images for the navigation buttons must be located in an ./icons folder. Alternatively, you can style the control with a predefined css theme, in which case the themes included in the distribution must be located in a ./themes folder and referenced in the head of the HTML document, e.g.

HTML / JavaScript Copy Code

```
<link rel="stylesheet" type="text/css" href="themes/common-ui.css" />
<link rel="stylesheet" type="text/css" href="themes/business.css" />
...
diagramView.theme = MindFusion.Diagramming.Theme.fromId("business");
```

Inheritance Hierarchy

MindFusion.Diagramming.DiagramView
MindFusion.Diagramming.Controls.TabbedDiagramView

See Also

TabbedDiagramView Members
MindFusion.Diagramming.Controls Namespace

TabbedDiagramView Members

Represents a view that displays DiagramDocument objects.

The following tables list the members exposed by the TabbedDiagramView type.

Public Constructors

	Name	Description
	TabbedDiagramView	Initializes a new instance of the TabbedDiagramView class.

Public Properties

	Name	Description
	allowRenamePages	Gets or sets a value indicating whether DiagramPage titles can be renamed interactively.
	allowReorder	Gets or sets a value indicating whether tabs can be rearranged interactively.
	document	Gets or sets the diagram document displayed by this view.

	selectedIndex	Gets or sets the index of the currently selected diagram page.
	selectedPage	Gets or sets the currently selected tab page.
	showAddButton	Gets or sets a value indicating whether to display the 'Add Tab' button.
	showNavigationButtons	Gets or sets a value indicating whether to show tab navigation buttons.
	showTabCloseButtons	Gets or sets a value indicating whether to display a close button for each tab.
	tabAlignment	Gets or sets the tab alignment.
	tabsSize	Gets or sets the height of the tab strip.
	theme	Gets or sets the theme of the control.
	themesPath	Gets or sets the path to the control's css themes.

Public Methods

	Name	Description
	create	Creates and initializes a new TabbedDiagramView from the specified element. This method is static and can be called without creating an instance of the class.
	dispose	DiagramView.dispose override.
	fromJson	Loads the diagram from a JSON string.
	initialize	DiagramView.initialize override.
	loadFromXml	Loads the diagram from an XML file.
	saveToXml	Saves the diagram to an XML file.
	setTheme	Sets the current theme of the control and its pages.
	toJson	Saves the diagram to a JSON string.

TabbedDiagramView.loadFromXml Method

Loads the diagram from an XML file.

Namespace: MindFusion.Diagramming.Controls
Assembly: TabbedDiagramView.js

Syntax

JavaScript Copy Code

```
function loadFromXml (fileUrl, [onLoad, [onError]])
```

Parameters

fileUrl
String. The URL of an XML file where the data should be read from.

onLoad
Optional.
function. A callback that should be invoked if the file is loaded successfully.

onError
Optional.
function. A callback that should be invoked if the file could not be downloaded.

TabbedDiagramView.saveToXml Method

Saves the diagram to an XML file.

Namespace: MindFusion.Diagramming.Controls
Assembly: TabbedDiagramView.js

Syntax

JavaScript Copy Code

```
function saveToXml (url)
```

Parameters

url
String. A URL specifying where the diagram's XML should be posted to.

See Also

TabbedDiagramView Members
TabbedDiagramView Class

TabbedDiagramView.setTheme Method

Sets the current theme of the control and its pages.

Namespace: MindFusion.Diagramming.Controls
Assembly: TabbedDiagramView.js

Syntax

JavaScript Copy Code

```
function setTheme (theme, [setToPages])
```

Parameters

theme
Theme. The theme.

setToPages
Optional.
Boolean. true to set pages' themes, otherwise false.

TabbedDiagramView.toJson Method

Saves the diagram to a JSON string.

Namespace: MindFusion.Diagramming.Controls
Assembly: TabbedDiagramView.js

Syntax

JavaScript Copy Code

```
function toJson ()
```

Return Value

String. A string containing the diagram's JSON representation.

TabbedDiagramView Properties

TabbedDiagramView.allowRenamePages Property

Gets or sets a value indicating whether DiagramPage titles can be renamed interactively.

Namespace: MindFusion.Diagramming.Controls
Assembly: TabbedDiagramView.js

Syntax

JavaScript Copy Code

```
get allowRenamePages() {}
set allowRenamePages(value) {}
```

Property Value

Boolean

true if tabs can be renamed interactively, or **false** otherwise. The default value is **false**.

TabbedDiagramView.allowReorder Property

Gets or sets a value indicating whether tabs can be rearranged interactively.

Namespace: MindFusion.Diagramming.Controls
Assembly: TabbedDiagramView.js

Syntax

JavaScript Copy Code

```
get allowReorder() {}
set allowReorder(value) {}
```

Property Value

Boolean

true if tabs can be rearranged interactively, or false otherwise. The default value is false.

Grid Members

Represents a lane grid.

The following tables list the members exposed by the Grid type.

Public Constructors

	Name	Description
	Grid	Initializes a new instance of the **Grid** class. For internal use only.

Public Properties

	Name	Description
	allowInplaceEdit	Gets or sets a value indicating whether grid cells' text can be edited interactively.
	allowResizeHeaders	Gets or sets a value indicating whether users can resize the headers of the grid interactively.
	columnCount	Gets or sets the number of columns in the grid.
	columnHeaderBounds	Returns the bounding rectangle of all column headers.
	columnHeaders	Gets the collection of topmost column headers.
	columnHeadersHeights	Gets or sets an array of numbers specifying the heights of individual column levels.
	headersOnTop	Gets or sets a value indicating whether lane headers appear at the top of the z-order above all diagram items.
	hookHeaders	Gets or sets a value indicating whether headers will be anchored to their corresponding side.
	leftMargin	Gets or sets the offset of the lane grid from left side of diagram's bounds.
	minHeaderSize	Gets or sets the minimum size of a header.
	rowCount	Gets or sets the number of rows in the grid.
	rowHeaderBounds	Returns the bounding rectangle of all row headers.
	rowHeaders	Gets the collection of topmost row headers.
	rowHeadersWidths	Gets or sets an array of numbers specifying the widths of individual row levels.
	style	Gets the default style of the grid.
	topLeftAreaStyle	Gets or sets the style of the area above all row headers and to the left of all column headers.
	topLeftAreaText	Gets or sets the text displayed in the top left area.
	topMargin	Gets or sets the offset of the lane grid from top side of diagram's bounds.
	totalColumnHeight	Gets the total height of all column headers.
	totalRowWidth	Gets the total width of all row headers.

Public Methods

	Name	Description
	addColumnHeader	Adds the specified header to the grid as a new column header.
	addRowHeader	Adds the specified header to the grid as a new row header.
	findColumn	Finds the first column whose header caption matches the specified string.
	findRow	Finds the first row whose header caption matches the specified string.
	get	Gets the cell or the cluster of cells corresponding to the specified row and column.
	getCellBounds	Returns the bounding rectangle of the specified cell.
	getCellColumn	Returns the column index of the specified cell.
	getCellFromPoint	Gets the cell located at the specified point.
	getCellRow	Returns the row index of the specified cell.
	getColumn	Returns the column header with the specified index from the bottommost column header level.
	getColumnDepth	Gets the number of levels of the column headers.
	getColumnIndex	Returns the 0-based index of the specified column. Only works for bottommost headers. If the specified column is a group header, returns -1.
	getHeaderBounds	Returns the bounding rectangle of the specified header.
	getHeaderFromPoint	Gets the Header that is located at the specified point.
	getRow	Returns the row header with the specified index from the bottommost row header level.
	getRowDepth	Gets the number of levels of the row headers.
	getRowIndex	Returns the 0-based index of the specified row. Only works for bottommost headers. If the specified row is a group header, returns -1;
	loadFromXml	Deserializes the lane grid from the specified XML element.
	removeColumnHeader	Removes the specified column header and all of its associated cells from the grid.
	removeRowHeader	Removes the specified row header and all of its associated cells from the grid.
	saveToXml	Serializes the lane grid to the specified XML element.

Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid Constructor

Initializes a new instance of the Grid class. For internal use only.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function Grid ()
```

See Also

Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid Methods

Grid.addColumnHeader Method

Adds the specified header to the grid as a new column header.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript — Copy Code

```
function addColumnHeader (header, [parent, [i]])
```

Parameters

header
Lanes.Header. The Header object to add.

parent
Optional.
Lanes.Header. The parent header to add to, or **null** to add the new header as a root column.

i
Optional.
Number. The index at which the header was added in the collection.

Example

The following example adds a new header at the end of the column collection of an existing lane grid.

JavaScript — Copy Code

```
grid.addColumnHeader(new Header());
```

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.addRowHeader Method

Adds the specified header to the grid as a new row header.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript — Copy Code

```
function addRowHeader (header, [parent, [i]])
```

Parameters

header
Lanes.Header. The Header object to add.

parent
Optional.
Lanes.Header. The parent header to add to, or **null** to add the new header as a root row.

i

Optional.
Number. The index at which the header was added in the collection.

Example

The following example adds a new header at the end of the row collection of an existing lane grid.

JavaScript Copy Code

```
d.addRowHeader(new Header());
```

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.findColumn Method

Finds the first column whose header caption matches the specified string.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function findColumn (title)
```

Parameters

title
String. A string containing the header title to look for.

Return Value

Returns the first column Header that has the specified caption.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.findRow Method

Finds the first row whose header caption matches the specified string.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function findRow (title)
```

Parameters

title
String. A string containing the header title to look for.

Return Value

Returns the first row Header that has the specified caption.

See Also

Grid.get Method

Gets the cell or the cluster of cells corresponding to the specified row and column.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function get (column, row)
```

Parameters

column
Number | Lanes.Header. A Header object or a cell index.

row
Number | Lanes.Header. A **Header** object or a cell index.

Return Value

Lanes.Cell. A Cell object representing the cell or cluster of cells with the specified coordinates.

Remarks

This method accepts either Header objects or numbers as arguments, but not a mix of both. If more than one cell corresponds to specified **Header** object, this method returns an object identifying all corresponding cells. Modifying the style of the returned object will affect all cells in the cluster. Calling the method without arguments, or with **null** arguments, will return an object identifying all cells in the grid.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.getCellBounds Method

Returns the bounding rectangle of the specified cell.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function getCellBounds (cell)
```

Parameters

cell
Lanes.Cell. A Cell object representing a cell or a group of cells in the grid.

Return Value

Rect. A Rect instance representing the rectangle that bounds the specified cell or group of cells.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.getCellColumn Method

Returns the column index of the specified cell.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript — Copy Code

```
function getCellColumn (cell)
```

Parameters

cell
Lanes.Cell. A Cell object representing a single cell in the grid.

Return Value

Number. The index of the column that contains cell; -1 if cell is not found or refers to a group of cells.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.getCellFromPoint Method

Gets the cell located at the specified point.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript — Copy Code

```
function getCellFromPoint (point, cellBounds)
```

Parameters

point
A Point instance specifying a point within the grid.

cellBounds
An object that receives the coordinates of the found cell in its **cellBounds** field.

Return Value

A Cell object identifying the found cell, or **null** if there is no cell located at the specified point.

Example

The following example illustrates how to find the cell at a specific position as well as its bounding rectangle:

JavaScript — Copy Code

```
var boundsResult = {};
var cell = grid.getCellFromPoint(new Point(50, 50), boundsResult);
if (cell)
{
    var cellBounds = boundsResult.cellBounds;
}
```

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.getCellRow Method

Returns the row index of the specified cell.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript — Copy Code

```
function getCellRow (cell)
```

Parameters

cell
Lanes.Cell. A Cell object representing a single cell in the grid.

Return Value

Number. The index of the row that contains cell; -1 if cell is not found or refers to a group of cells.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.getColumn Method

Returns the column header with the specified index from the bottommost column header level.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript — Copy Code

```
function getColumn (index)
```

Parameters

index
Number. A number specifying the column index.

Return Value

A Header object representing the column at the specified index.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.getColumnDepth Method

Gets the number of levels of the column headers.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript — Copy Code

```
function getColumnDepth ()
```

Return Value

Number. A number representing the column depth.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.getColumnIndex Method

Returns the 0-based index of the specified column. Only works for bottommost headers. If the specified column is a group header, returns -1.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function getColumnIndex (column)
```

Parameters

column

Lanes.Header. A Header instance that represents a grid column.

Return Value

Number. The index of column, or -1 if the specified header represents a row or a group of child columns.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.getHeaderBounds Method

Returns the bounding rectangle of the specified header.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function getHeaderBounds (header, includeSubHeaders)
```

Parameters

header

Lanes.Header. The Header object whose coordinates to return.

includeSubHeaders

Boolean. **true** to include the coordinates of the child headers in the returned rectangle, or **false** otherwise.

Return Value

Rect. A Rect that bounds the specified header, and optionally its child headers.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.getHeaderFromPoint Method

Gets the Header that is located at the specified point.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript — Copy Code

```
function getHeaderFromPoint (point, headerBounds, scrollPosition)
```

Parameters

point
A Point instance specifying a point within the grid.

headerBounds
An object that receives the coordinates of the found header in its **headerBounds** field.

scrollPosition
Point. When the headers are hooked this parameter should provide information about the current scroll position in the view.

Return Value

The found Header object, or **null** if there is no header located at the specified point.

Example

The following example illustrates how to find the header at a specific position as well as its bounding rectangle:

JavaScript — Copy Code

```
var boundsResult = {};
var header = grid.getHeaderFromPoint(new Point(20, 10), boundsResult);
if (header)
{
    var headerBounds = boundsResult.headerBounds;
}
```

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.getRow Method

Returns the row header with the specified index from the bottommost row header level.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript — Copy Code

```
function getRow (index)
```

Parameters

index
Number. A number specifying the row index.

Return Value

A Header object representing the row at the specified index.

See Also

Grid Members
Grid Class

Grid.getRowDepth Method

Gets the number of levels of the row headers.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function getRowDepth ()
```

Return Value

Number. A number representing the row depth.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.getRowIndex Method

Returns the 0-based index of the specified row. Only works for bottommost headers. If the specified row is a group header, returns -1;

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function getRowIndex (row)
```

Parameters

row
Lanes.Header. A Header instance that represents a grid row.

Return Value

Number. The index of row, or -1 if the specified header represents a column or a group of child rows.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.loadFromXml Method

Deserializes the lane grid from the specified XML element.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the deserialization process and some helper deserialization methods.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.removeColumnHeader Method

Removes the specified column header and all of its associated cells from the grid.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function removeColumnHeader (header)
```

Parameters

header
Lanes.Header. The Header object to remove.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.removeRowHeader Method

Removes the specified row header and all of its associated cells from the grid.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function removeRowHeader (header)
```

Parameters

header
Lanes.Header. The Header object to remove.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.saveToXml Method

Serializes the lane grid to the specified XML element.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement

Element. An XML DOM element that will contain the item's data.

context

XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

Grid Properties

Grid.allowInplaceEdit Property

Gets or sets a value indicating whether grid cells' text can be edited interactively.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get allowInplaceEdit() {}
set allowInplaceEdit(value) {}
```

Property Value

Boolean

true if grid cells' text can be in-place edited, or **false** otherwise.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.allowResizeHeaders Property

Gets or sets a value indicating whether users can resize the headers of the grid interactively.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get allowResizeHeaders() {}
set allowResizeHeaders(value) {}
```

Property Value

Boolean

true if grid headers can resized interactively, or **false** otherwise.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.columnCount Property

Gets or sets the number of columns in the grid.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get columnCount() {}
set columnCount(value) {}
```

Property Value

Number

The number of columns.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.columnHeaderBounds Property

Returns the bounding rectangle of all column headers.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get columnHeaderBounds() {}
```

Property Value

Rect

A Rect that bounds all column headers.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.columnHeaders Property

Gets the collection of topmost column headers.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get columnHeaders() {}
```

Property Value

Array

An array containing the topmost column headers.

Remarks

The returned array should not be modified directly. To add and remove column headers to the grid, use the addColumnHeader and removeColumnHeader methods respectively.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.columnHeadersHeights Property

Gets or sets an array of numbers specifying the heights of individual column levels.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get columnHeadersHeights() {}
set columnHeadersHeights(value) {}
```

Property Value

Array

An array of numbers representing the heights of the various header levels.

Remarks

If a value is non-positive or does not exist because the array has less arguments than the number of columns, then the height is calculated as the maximum height of the columns in that level.

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.headersOnTop Property

Gets or sets a value indicating whether lane headers appear at the top of the z-order above all diagram items.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get headersOnTop() {}
set headersOnTop(value) {}
```

Property Value

Boolean

true to display headers on top of items, or **false** otherwise.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.hookHeaders Property

Gets or sets a value indicating whether headers will be anchored to their corresponding side.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get hookHeaders() {}
set hookHeaders(value) {}
```

Property Value

Boolean

true to anchor the headers, or **false** otherwise.

Remarks

If enabled, the column header stays anchored to the top side and the row header anchored to the left side of diagram's viewport, regardless of scroll position.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.leftMargin Property

Gets or sets the offset of the lane grid from left side of diagram's bounds.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get leftMargin() {}
set leftMargin(value) {}
```

Property Value

Number

A number representing the left margin.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.minHeaderSize Property

Gets or sets the minimum size of a header.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get minHeaderSize() {}
set minHeaderSize(value) {}
```

Property Value

Number

A number representing the minimum size for headers in the grid.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.rowCount Property

Gets or sets the number of rows in the grid.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get rowCount() {}
set rowCount(value) {}
```

Property Value

Number

The number of rows.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.rowHeaderBounds Property

Returns the bounding rectangle of all row headers.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get rowHeaderBounds() {}
```

Property Value

Rect

A Rect that bounds all row headers.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.rowHeaders Property

Gets the collection of topmost row headers.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get rowHeaders() {}
set rowHeaders(value) {}
```

Property Value

Array

An array containing the topmost row headers.

Remarks

The returned array should not be modified directly. To add and remove row headers to the grid, use the addRowHeader and removeRowHeader methods respectively.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.rowHeadersWidths Property

Gets or sets an array of numbers specifying the widths of individual row levels.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get rowHeadersWidths() {}
set rowHeadersWidths(value) {}
```

Property Value

Array

An array of numbers representing the widths of the various header levels.

Remarks

If a value is non-positive or does not exist because the array has less arguments than the number of rows, then the width is calculated as the maximum width of the rows in that level.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.style Property

Gets the default style of the grid.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get style() {}
```

Property Value

Lanes.Style

A Style object representing the style of all grid elements, which do not have an explicitly assigned style.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.topLeftAreaStyle Property

Gets or sets the style of the area above all row headers and to the left of all column headers.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get topLeftAreaStyle() {}
set topLeftAreaStyle(value) {}
```

Property Value

Lanes.Style

A Style object that specifies the appearance of the top-left area.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.topLeftAreaText Property

Gets or sets the text displayed in the top left area.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get topLeftAreaText() {}
set topLeftAreaText(value) {}
```

Property Value

String

A string containing the text.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.topMargin Property

Gets or sets the offset of the lane grid from top side of diagram's bounds.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get topMargin() {}
set topMargin(value) {}
```

Property Value

Number

A number representing the top margin.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.totalColumnHeight Property

Gets the total height of all column headers.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get totalColumnHeight() {}
```

Property Value

Number

A number representing the height.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Grid.totalRowWidth Property

Gets the total width of all row headers.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Grid.js

Syntax

JavaScript Copy Code

```
get totalRowWidth() {}
```

Property Value

Number

A number representing the width.

See Also

Grid Members
Grid Class
MindFusion.Diagramming.Lanes Namespace

Header Class

Represents a header in a lane grid.

Syntax

JavaScript Copy Code

```
// class
Header.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.Lanes.Header

See Also

Header Members
MindFusion.Diagramming.Lanes Namespace

Header Members

Represents a header in a lane grid.

The following tables list the members exposed by the Header type.

Public Constructors

	Name	Description
	Header	Initializes a new instance of the **Header** class.

Public Properties

	Name	Description
	height	Gets or sets the height of this header.
	isColumnHeader	Gets a value indicating whether this header is a column header.
	isRowHeader	Gets a value indicating whether this header is a row header.
	resizeType	Gets or sets how a row or a column is resized relatively to its parent.
	rotateTitle	Gets or sets a value indicating whether to rotate the header caption at 90 degrees.
	style	Gets or sets the style of this header.
	subHeaders	Gets a collection of the subheaders of this header.
	title	Gets or sets the header caption.

	width	Gets or sets the width of this header.

Public Methods

	Name	Description
	loadFromXml	Loads the lane header from the specified XML element.
	saveToXml	Serializes the lane header to the specified XML element

See Also

Header Class
MindFusion.Diagramming.Lanes Namespace

Header Constructor

Initializes a new instance of the Header class.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Header.js

Syntax

JavaScript Copy Code

```
function Header ()
```

See Also

Header Class
MindFusion.Diagramming.Lanes Namespace

Header Methods

Header.loadFromXml Method

Loads the lane header from the specified XML element.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Header.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

Header Members
Header Class
MindFusion.Diagramming.Lanes Namespace

Header.saveToXml Method

Serializes the lane header to the specified XML element

Namespace: MindFusion.Diagramming.Lanes
Assembly: Header.js

Syntax

JavaScript — Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

Header Members
Header Class
MindFusion.Diagramming.Lanes Namespace

Header Properties

Header.height Property

Gets or sets the height of this header.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Header.js

Syntax

JavaScript — Copy Code

```
get height() {}
set height(value) {}
```

Property Value

Number

A number specifying the header height.

Remarks

If this is a row header, the property specifies the height of the whole row.

See Also

Header Members
Header Class
MindFusion.Diagramming.Lanes Namespace

Header.isColumnHeader Property

Gets a value indicating whether this header is a column header.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Header.js

Syntax

JavaScript Copy Code

```
get isColumnHeader() {}
```

Property Value

Boolean

true if the header is a column header, or **false** otherwise.

Remarks

Both **isColumnHeader** and isRowHeader return **false** if the header is not attached to a lane grid.

See Also

Header Members
Header Class
MindFusion.Diagramming.Lanes Namespace

Header.isRowHeader Property

Gets a value indicating whether this header is a row header.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Header.js

Syntax

JavaScript Copy Code

```
get isRowHeader() {}
```

Property Value

Boolean

true if the header is a row header, or **false** otherwise.

Remarks

Both isColumnHeader and **isRowHeader** return **false** if the header is not attached to a lane grid.

See Also

Header Members
Header Class
MindFusion.Diagramming.Lanes Namespace

Header.resizeType Property

Gets or sets how a row or a column is resized relatively to its parent.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Header.js

Syntax

JavaScript Copy Code

```
get resizeType() {}
set resizeType(value) {}
```

Property Value

ResizeType

A member of the ResizeType enumeration.

See Also

Header Members
Header Class
MindFusion.Diagramming.Lanes Namespace

Header.rotateTitle Property

Gets or sets a value indicating whether to rotate the header caption at 90 degrees.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Header.js

Syntax

JavaScript Copy Code

```
get rotateTitle() {}
set rotateTitle(value) {}
```

Property Value

Boolean

true if the title should be rotated, or **false** otherwise.

See Also

Header Members
Header Class
MindFusion.Diagramming.Lanes Namespace

Header.style Property

Gets or sets the style of this header.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Header.js

Syntax

JavaScript Copy Code

```
get style() {}
set style(value) {}
```

Property Value

Style

A Style object that specifies the appearance of the header.

See Also

Header Members
Header Class
MindFusion.Diagramming.Lanes Namespace

Header.subHeaders Property

Gets a collection of the subheaders of this header.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Header.js

Syntax

JavaScript Copy Code

```
get subHeaders() {}
```

Property Value

Array

An array containing the subheaders.

Remarks

The returned array should not be modified directly. To add and remove subheaders, use the addColumnHeader, addRowHeader, removeColumnHeader and removeRowHeader methods of the Grid respectively.

See Also

Header Members
Header Class
MindFusion.Diagramming.Lanes Namespace

Header.title Property

Gets or sets the header caption.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Header.js

Syntax

JavaScript Copy Code

```
get title() {}
set title(value) {}
```

Property Value

String

A string containing the caption text.

See Also

Header Members
Header Class
MindFusion.Diagramming.Lanes Namespace

Header.width Property

Gets or sets the width of this header.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Header.js

Syntax

JavaScript Copy Code

```
get width() {}
set width(value) {}
```

Property Value

Number

A number specifying the header width.

Remarks

If this is a column header, the property specifies the width of the whole column.

See Also

Header Members
Header Class
MindFusion.Diagramming.Lanes Namespace

ResizeType Enumeration

Specifies how to resize child columns and rows in the lanes grid when their parent column or row is resized.

Namespace: MindFusion.Diagramming.Lanes
Assembly: ResizeType.js

Syntax

JavaScript Copy Code

```
// enum
ResizeType = {}
```

Members

	Member name	Description
	Fixed	The header's size (width or height) is fixed and does not change when its parent header is being resized unless all its siblings have fixed size too.
	Proportional	The header resizes in proportion to its parent header.

See Also

MindFusion.Diagramming.Lanes Namespace

Style Class

Encapsulates the appearance properties of an element in a lane grid.

Syntax

JavaScript Copy Code

```
// class
Style.prototype = {}
```

Inheritance Hierarchy

MindFusion.Diagramming.Lanes.Style

See Also

Style Members
MindFusion.Diagramming.Lanes Namespace

Style Members

Encapsulates the appearance properties of an element in a lane grid.

The following tables list the members exposed by the Style type.

Public Constructors

	Name	Description

	Style	Initializes a new instance of the **Style** class.

Public Properties

	Name	Description
	backgroundBrush	Gets or sets the background brush of this style.
	bottomBorderPen	Gets or sets the color used to stoke the bottom border of elements with this style.
	bottomBorderThickness	Gets or sets the width of the bottom border of elements with this style.
	fontName	Gets or sets the name of the font used to draw texts with this style.
	fontSize	Gets or sets the size of the font used to draw texts with this style.
	leftBorderPen	Gets or sets the color used to stoke the left border of elements with this style.
	leftBorderThickness	Gets or sets the width of the left border of elements with this style.
	lineAlignment	Gets or sets a value indicating how to vertically align texts drawn with this style.
	rightBorderPen	Gets or sets the color used to stoke the right border of elements with this style.
	rightBorderThickness	Gets or sets the width of the right border of elements with this style.
	textAlignment	Gets or sets a value indicating how to horizontally align texts drawn with this style.
	textColor	Gets or sets the color used to draw texts with this style.
	topBorderPen	Gets or sets the color used to stoke the top border of elements with this style.
	topBorderThickness	Gets or sets the width of the top border of elements with this style.

Public Methods

	Name	Description
	loadFromXml	Loads the style from the specified XML element
	saveToXml	Serializes the lane style to the specified XML element

Style Constructor

Initializes a new instance of the Style class.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
function Style ()
```

See Also

Style Methods

Style.loadFromXml Method

Loads the style from the specified XML element

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
function loadFromXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.saveToXml Method

Serializes the lane style to the specified XML element

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
function saveToXml (xmlElement, context)
```

Parameters

xmlElement
Element. An XML DOM element that will contain the item's data.

context
XmlPersistContext. An object providing contextual information about the serialization process and some helper serialization methods.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style Properties

Style.backgroundBrush Property

Gets or sets the background brush of this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get backgroundBrush() {}
set backgroundBrush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.bottomBorderPen Property

Gets or sets the color used to stoke the bottom border of elements with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get bottomBorderPen() {}
set bottomBorderPen(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.bottomBorderThickness Property

Gets or sets the width of the bottom border of elements with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get bottomBorderThickness() {}
set bottomBorderThickness(value) {}
```

Property Value

Number

A number specifying the border width.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.fontName Property

Gets or sets the name of the font used to draw texts with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get fontName() {}
set fontName(value) {}
```

Property Value

String

A string specifying font name.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.fontSize Property

Gets or sets the size of the font used to draw texts with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get fontSize() {}
set fontSize(value) {}
```

Property Value

Number

A number specifying font size in current measure unit.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.leftBorderPen Property

Gets or sets the color used to stoke the left border of elements with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get leftBorderPen() {}
set leftBorderPen(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.leftBorderThickness Property

Gets or sets the width of the left border of elements with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get leftBorderThickness() {}
set leftBorderThickness(value) {}
```

Property Value

Number

A number specifying the border width.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.lineAlignment Property

Gets or sets a value indicating how to vertically align texts drawn with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get lineAlignment() {}
set lineAlignment(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration.

See Also

Style.rightBorderPen Property

Gets or sets the color used to stoke the right border of elements with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get rightBorderPen() {}
set rightBorderPen(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.rightBorderThickness Property

Gets or sets the width of the right border of elements with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get rightBorderThickness() {}
set rightBorderThickness(value) {}
```

Property Value

Number

A number specifying the border width.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.textAlignment Property

Gets or sets a value indicating how to horizontally align texts drawn with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get textAlignment() {}
set textAlignment(value) {}
```

Property Value

Alignment

A member of the Alignment enumeration.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.textColor Property

Gets or sets the color used to draw texts with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get textColor() {}
set textColor(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.topBorderPen Property

Gets or sets the color used to stoke the top border of elements with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript Copy Code

```
get topBorderPen() {}
set topBorderPen(value) {}
```

Property Value

String

A string specifying the color name or hexadecimal value.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

Style.topBorderThickness Property

Gets or sets the width of the top border of elements with this style.

Namespace: MindFusion.Diagramming.Lanes
Assembly: Style.js

Syntax

JavaScript — Copy Code

```
get topBorderThickness() {}
set topBorderThickness(value) {}
```

Property Value

Number

A number specifying the border width.

See Also

Style Members
Style Class
MindFusion.Diagramming.Lanes Namespace

MindFusion.Drawing Namespace

Alignment Enumeration

Specifies the alignment of a graphics element relative to its layout rectangle.

Namespace: MindFusion.Drawing
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
Alignment = {}
```

Members

	Member name	Description
	Near	The element is drawn at the near edge of the layout rectangle (left or top).
	Center	The element is drawn at the center of the layout rectangle.
	Far	The element is drawn at the far edge of the layout rectangle (right or bottom).

Component Members

Represents components in CompositeNode visual tree.

The following tables list the members exposed by the Component type.

Public Constructors

	Name	Description
	Component	Initializes a new instance of the **Component** class.

Public Properties

	Name	Description
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

ComponentBase Methods

ComponentBase Properties

ComponentBase.gridColumn Property

Gets or sets the index of the grid column this component is contained in.

Namespace: MindFusion.Drawing
Assembly: ComponentBase.js

Syntax

JavaScript Copy Code

```
get gridColumn() {}
set gridColumn(value) {}
```

Property Value

Number

The grid column index.

Remarks

This value is used when the component is placed inside a GridPanel.

See Also

ComponentBase Members
ComponentBase Class
MindFusion.Drawing Namespace

ComponentBase.gridRow Property

Gets or sets the index of the grid row this component is contained in.

Namespace: MindFusion.Drawing
Assembly: ComponentBase.js

Syntax

JavaScript Copy Code

```
get gridRow() {}
set gridRow(value) {}
```

Property Value

Number

The grid row index.

Remarks

This value is used when the component is placed inside a GridPanel.

See Also

ComponentBase Members
ComponentBase Class

ComponentBase.horizontalAlignment Property

Gets or sets the component's horizontal alignment.

Namespace: MindFusion.Drawing
Assembly: ComponentBase.js

Syntax

JavaScript Copy Code

```
get horizontalAlignment() {}
set horizontalAlignment(value) {}
```

Property Value

LayoutAlignment

A member of the LayoutAlignment enumeration.

See Also

ComponentBase Members
ComponentBase Class
MindFusion.Drawing Namespace

ComponentBase.verticalAlignment Property

Gets or sets the component's vertical alignment.

Namespace: MindFusion.Drawing
Assembly: ComponentBase.js

Syntax

JavaScript Copy Code

```
get verticalAlignment() {}
set verticalAlignment(value) {}
```

Property Value

LayoutAlignment

A member of the LayoutAlignment enumeration.

See Also

ComponentBase Members
ComponentBase Class
MindFusion.Drawing Namespace

ComponentBase.visibility Property

Gets or sets the visibility of this component.

Namespace: MindFusion.Drawing
Assembly: ComponentBase.js

Syntax

JavaScript — Copy Code

```
get visibility() {}
set visibility(value) {}
```

Property Value

Visibility

A member of the Visibility enumeration.

MindFusion.Drawing Namespace

Container Members

Represents container components in drawing tree.

The following tables list the members exposed by the Container type.

Public Properties

	Name	Description
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

Container Class
MindFusion.Drawing Namespace

DashStyle Enumeration

Specifies the dash pattern of lines.

Namespace: MindFusion.Drawing
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
DashStyle = {}
```

Members

	Member name	Description
	Solid	Draw solid line.
	Dash	Draw dashed line.
	Dot	Draw dotted line.
	DashDot	Draw dash-dot pattern.
	DashDotDot	Draw dash-dot-dot pattern.
	Custom	Custom pattern.

MindFusion.Drawing Namespace

DrawingUtils Class

Contains drawing-related helper functions.

Syntax

JavaScript — Copy Code

```
// class
DrawingUtils.prototype = {}
```

Inheritance Hierarchy

MindFusion.Drawing.DrawingUtils

See Also

DrawingUtils Members
MindFusion.Drawing Namespace

DrawingUtils Members

Contains drawing-related helper functions.

The following tables list the members exposed by the DrawingUtils type.

Public Methods

	Name	Description
	approximateBezier	Approximates a Bezier curve with the given quality and by a series of line segments.
	checkIntersect	Checks if the specified rectangle and circle intersect.
	degrees	Converts the specified value from radians to degrees.
	distToPolyline	Calculates the shortest distance from the specified point to the specified polyline, also returning the index of the segment the point is closest to.
	distToRectPoint	Returns the point that lies on the outline of a rectangle and is nearest to the given point.
	getCenter	Returns the center of the specified rectangle.
	getPointsBounds	Calculates the bounding rect of the specified polyline.
	getSegmentIntersection	Checks whether the segments defined by the specified point pairs intersect and returns the intersection point.
	inflate	Creates and returns an enlarged copy of a Rect instance.
	intersect	Determines whether the specified line segments intersect.
	minDistToRect	Calculates the minimum distance between a given point and a given rectangle.
	pointInCircle	Checks whether the specified circle contains the specified point.
	pointInEllipse	Checks whether the specified ellipse contains the specified point.
	pointInPolygon	Checks whether the specified rectangle contains the specified point.
	radians	Converts the specified value from degrees to radians.
	unionRects	Returns the smallest possible rectangle containing both of the specified rectangles.

DrawingUtils Methods

DrawingUtils.approximateBezier Method

Approximates a Bezier curve with the given quality and by a series of line segments.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function approximateBezier (points, quality, start)
```

Parameters

points
Array. A list of Bezier control points.

quality
Number. Specifies the approximation quality.

start
Number. Specifies the start point index.

Return Value
Array. A list of points that approximate the curve as a series of straight line segments.

See Also
DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.checkIntersect Method

Checks if the specified rectangle and circle intersect.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function checkIntersect (point, rect, rad)
```

Parameters
point
Point. The center of the circle.

rect
Rect. The rectangle.

rad
Number. The radius of the circle.

Return Value
Boolean. true if the rectangle and the circle intersect; otherwise, false.

See Also
DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.degrees Method

Converts the specified value from radians to degrees.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function degrees (radians)
```

Parameters
radians
Number. The radians to convert.

Return Value
Number. The converted angle.

See Also

DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.distToPolyline Method

Calculates the shortest distance from the specified point to the specified polyline, also returning the index of the segment the point is closest to.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function distToPolyline ()
```

See Also

DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.distToRectPoint Method

Returns the point that lies on the outline of a rectangle and is nearest to the given point.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function distToRectPoint (point, rect)
```

Parameters

point
Point. The point to consider.

rect
Rect. The rectangle to consider.

Return Value

Number. The nearest point.

See Also

DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.getCenter Method

Returns the center of the specified rectangle.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function getCenter (rect)
```

Parameters

rect
Rect. The rectangle.

Return Value

Point. The center.

See Also

DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.getPointsBounds Method

Calculates the bounding rect of the specified polyline.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function getPointsBounds (points)
```

Parameters

points
Array. An array of points.

Return Value

Rect. The bounding rect.

See Also

DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.getSegmentIntersection Method

Checks whether the segments defined by the specified point pairs intersect and returns the intersection point.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function getSegmentIntersection (p1, p2, p3, p4)
```

Parameters

p1
Point. The start of the first segment.

p2
Point. The end of the first segment.

p3
Point. The start of the second segment.

p4

Point. The end of the second segment.

Return Value

Boolean. true if the segments intersect, false if not.

See Also

DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.inflate Method

Creates and returns an enlarged copy of a Rect instance.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function inflate (rect, x, y)
```

Parameters

rect
Rect. The Rect instance to inflate.

x
Number. The amount to inflate horizontally.

y
Number. The amount to inflate vertically.

Return Value

Rect. The inflated Rect.

See Also

DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.intersect Method

Determines whether the specified line segments intersect.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function intersect (p1, p2, p3, p4)
```

Parameters

p1
Point. The start of the first line segment.

p2
Point. The end of the first line segment.

p3
Point. The start of the second line segment.

p4
Point. The end of the second line segment.

Return Value

Boolean. true if the segments intersect, false if not.

See Also

DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.minDistToRect Method

Calculates the minimum distance between a given point and a given rectangle.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function minDistToRect (point, rect)
```

Parameters

point
Point. The point.

rect
Rectabgle. The rectangle.

Return Value

Number. The minimum distance.

See Also

DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.pointInCircle Method

Checks whether the specified circle contains the specified point.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function pointInCircle (point, center, radius)
```

Parameters

point
Point. The point to check.

center
Point. The center of the circle.

radius
Number. The radius of the circle.

Return Value

Boolean. true if the circle contains the specified point, false if not.

See Also

DrawingUtils.pointInEllipse Method

Checks whether the specified ellipse contains the specified point.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function pointInEllipse (point, rect)
```

Parameters

point
Point. The point to check.

rect
Rect. The bounds of the ellipse.

Return Value

Boolean. true if the ellipse contains the specified point, false if not.

See Also

DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.pointInPolygon Method

Checks whether the specified rectangle contains the specified point.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript Copy Code

```
function pointInPolygon (point, polygon)
```

Parameters

point
Point. The point to check.

polygon
Array. An array with the points that define the polygon.

Return Value

Boolean. true if the polygon contains the specified point, false if not.

See Also

DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.radians Method

Converts the specified value from degrees to radians.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript — Copy Code

```
function radians (degrees)
```

Parameters

degrees
Number. The degrees to convert.

Return Value

Number. The converted angle.

See Also

DrawingUtils Members
DrawingUtils Class
MindFusion.Drawing Namespace

DrawingUtils.unionRects Method

Returns the smallest possible rectangle containing both of the specified rectangles.

Namespace: MindFusion.Drawing
Assembly: DrawingUtils.js

Syntax

JavaScript — Copy Code

```
function unionRects (rect1, rect2)
```

Parameters

rect1
Rect. The first rectangle.

rect2
Rect. The second rectangle.

Return Value

Rect. A Rect instance that represents the union of the specified arguments.

Ellipse Class

Represents an Ellipse.

Syntax

JavaScript — Copy Code

```
// class
Ellipse.prototype = {}
```

Inheritance Hierarchy

MindFusion.Drawing.ComponentBase
MindFusion.Drawing.Ellipse

See Also

Ellipse Members
MindFusion.Drawing Namespace

Ellipse Members

Represents an Ellipse.

The following tables list the members exposed by the Ellipse type.

Public Constructors

	Name	Description
	Ellipse	Initializes a new instance of the Ellipse class.

Public Properties

	Name	Description
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	height	Gets or sets the height of the ellipse.
	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)
	width	Gets or sets the width of the ellipse.
	x	Gets or sets the x-coordinate of the upper-left corner of the ellipse.
	y	Gets or sets the y-coordinate of the upper-left corner of the ellipse.

Public Methods

	Name	Description
	clone	Creates a **Ellipse** object identical to the current object.

See Also

Ellipse Class
MindFusion.Drawing Namespace

Ellipse Constructor

Initializes a new instance of the Ellipse class.

Namespace: MindFusion.Drawing
Assembly: Ellipse.js

Syntax

JavaScript Copy Code

```
function Ellipse (x, y, width, height)
```

Parameters

x
Number. The X-coordinate of the top left corner of the Ellipse.

y
Number. The Y-coordinate of the top left corner of the Ellipse.

width
Number. The width of the Ellipse.

height
Number. The height of the Ellipse.

See Also

Ellipse Class
MindFusion.Drawing Namespace

Ellipse Methods

Ellipse.clone Method

Creates a Ellipse object identical to the current object.

Namespace: MindFusion.Drawing
Assembly: Ellipse.js

Syntax

JavaScript Copy Code

```
function clone ()
```

Return Value

The newly created Ellipse object.

See Also

Ellipse Members
Ellipse Class
MindFusion.Drawing Namespace

Ellipse Properties

Ellipse.height Property

Gets or sets the height of the ellipse.

Namespace: MindFusion.Drawing
Assembly: Ellipse.js

Syntax

JavaScript Copy Code

```
get height() {}
set height(value) {}
```

Property Value

Number

The height of the ellipse.

See Also

Ellipse Members
Ellipse Class
MindFusion.Drawing Namespace

Ellipse.width Property

Gets or sets the width of the ellipse.

Namespace: MindFusion.Drawing
Assembly: Ellipse.js

Syntax

JavaScript Copy Code

```
get width() {}
set width(value) {}
```

Property Value

Number

The width of the ellipse.

See Also

Ellipse Members
Ellipse Class
MindFusion.Drawing Namespace

Ellipse.x Property

Gets or sets the x-coordinate of the upper-left corner of the ellipse.

Namespace: MindFusion.Drawing
Assembly: Ellipse.js

Syntax

JavaScript Copy Code

```
get x() {}
set x(value) {}
```

Property Value

Number

The x-coordinate of the upper-left corner of the ellipse.

See Also

Ellipse Members
Ellipse Class
MindFusion.Drawing Namespace

Ellipse.y Property

Gets or sets the y-coordinate of the upper-left corner of the ellipse.

Namespace: MindFusion.Drawing
Assembly: Ellipse.js

Syntax

JavaScript — Copy Code

```
get y() {}
set y(value) {}
```

Property Value

Number

The x-coordinate of the upper-left corner of the ellipse.

See Also

Ellipse Members
Ellipse Class
MindFusion.Drawing Namespace

Font Class

Represents a font.

Syntax

JavaScript — Copy Code

```
// class
Font.prototype = {}
```

Inheritance Hierarchy

MindFusion.Drawing.Font

See Also

Font Members
MindFusion.Drawing Namespace

Font Members

Represents a font.

The following tables list the members exposed by the Font type.

Public Constructors

	Name	Description
	Font	Initializes a new instance of the Font class with the specified attributes.

Public Properties

	Name	Description
	bold	Gets whether the font is bold.
	fontStyle	Gets or sets the style of this font.
	italic	Gets whether the font is italic.
	name	Gets or sets the name of this font.
	size	Gets or sets the size of this font.
	underline	Gets whether the font is underlined.

Public Methods

	Name	Description
	apply	Applies the font properties to a CanvasRenderingContext2D drawing object.
S	fromObject	Returns a Font from a JSON object or string describing this font.
	toObject	Returns a JSON object describing this font.

See Also

Font Class
MindFusion.Drawing Namespace

Font Constructor

Initializes a new instance of the Font class with the specified attributes.

Namespace: MindFusion.Drawing
Assembly: Font.js

Syntax

JavaScript — Copy Code

```
function Font (name, [size, [bold, [italic, [underline]]]])
```

Parameters

name
String. The font name.

size
Optional.
Number. The font size.

bold
Optional.
Boolean | FontStyle. true if this font is bold, or false otherwise.

italic
Optional.
Boolean. true if this font is italic, or false otherwise.

underline
Optional.
Boolean. true if this font is underlined, or false otherwise.

See Also

Font Class
MindFusion.Drawing Namespace

Font Methods

Font.apply Method

Applies the font properties to a CanvasRenderingContext2D drawing object.

Namespace: MindFusion.Drawing
Assembly: Font.js

Syntax

JavaScript Copy Code

```
function apply (context)
```

Parameters

context
CanvasRenderingContext2D. The CanvasRenderingContext2D drawing object.

See Also

Font Members
Font Class
MindFusion.Drawing Namespace

Font.fromObject Method

Returns a Font from a JSON object or string describing this font.

Namespace: MindFusion.Drawing
Assembly: Font.js

Syntax

JavaScript Copy Code

```
function fromObject ()
```

Return Value

Font. The font object.

See Also

Font Members
Font Class
MindFusion.Drawing Namespace

Font.toObject Method

Returns a JSON object describing this font.

Namespace: MindFusion.Drawing
Assembly: Font.js

Syntax

JavaScript Copy Code

```
function toObject ()
```

Return Value

Object. The object describing this font.

See Also

Font Members
Font Class
MindFusion.Drawing Namespace

Font Properties

Font.bold Property

Gets whether the font is bold.

Namespace: MindFusion.Drawing
Assembly: Font.js

Syntax

JavaScript — Copy Code

```
get bold() {}
```

Property Value

Boolean

true if Bold flag is set in fontStyle, or **false** otherwise.

See Also

Font Members
Font Class
MindFusion.Drawing Namespace

Font.fontStyle Property

Gets or sets the style of this font.

Namespace: MindFusion.Drawing
Assembly: Font.js

Syntax

JavaScript — Copy Code

```
get fontStyle() {}
set fontStyle(value) {}
```

Property Value

FontStyle

A combination of FontStyle enumeration flags.

See Also

Font Members
Font Class
MindFusion.Drawing Namespace

Font.italic Property

Gets whether the font is italic.

Namespace: MindFusion.Drawing
Assembly: Font.js

Syntax

JavaScript — Copy Code

```
get italic() {}
```

Property Value

Boolean

true if Italic flag is set in fontStyle, or **false** otherwise.

See Also

Font Members
Font Class
MindFusion.Drawing Namespace

Font.name Property

Gets or sets the name of this font.

Namespace: MindFusion.Drawing
Assembly: Font.js

Syntax

JavaScript Copy Code

```
get name() {}
set name(value) {}
```

Property Value

String

A string containing font name.

See Also

Font Members
Font Class
MindFusion.Drawing Namespace

Font.size Property

Gets or sets the size of this font.

Namespace: MindFusion.Drawing
Assembly: Font.js

Syntax

JavaScript Copy Code

```
get size() {}
set size(value) {}
```

Property Value

Number

The font size.

See Also

Font Members
Font Class
MindFusion.Drawing Namespace

Font.underline Property

Gets whether the font is underlined.

Namespace: MindFusion.Drawing
Assembly: Font.js

Syntax

JavaScript Copy Code

```
get underline() {}
```

Property Value

Boolean

true if Underline flag is set in fontStyle, or **false** otherwise.

See Also

Font Members
Font Class
MindFusion.Drawing Namespace

FontStyle Enumeration

Specifies font style attributes.

Namespace: MindFusion.Drawing
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
FontStyle = {}
```

Members

	Member name	Description
	Regular	Normal text.
	Bold	Bold text.
	Italic	Italic text.
	Underline	Underlined text.
	Strikeout	Striked text.

See Also

MindFusion.Drawing Namespace

GraphicsUnit Class

Specifies the unit of measure for length and size properties.

Syntax

JavaScript Copy Code

```
// class
GraphicsUnit.prototype = {}
```

Inheritance Hierarchy

MindFusion.Drawing.GraphicsUnit

See Also

GraphicsUnit Members

Specifies the unit of measure for length and size properties.

The following tables list the members exposed by the GraphicsUnit type.

Public Properties

	Name	Description
	Centimeter	Specifies the centimeter as the unit of measure.
	Display	Specifies the display unit as the unit of measure.
	Document	Specifies the document unit as the unit of measure.
	Inch	Specifies the inch as the unit of measure.
	Millimeter	Specifies the millimeter as the unit of measure.
	Percent	Specifies the world coordinate system unit as the unit of measure.
	Pixel	Specifies the pixel unit as the unit of measure.
	Point	Specifies a printer's point as the unit of measure.
	World	Specifies the world coordinate system unit as the unit of measure.
	WpfPoint	Specifies the WpfPoint unit as the unit of measure.

See Also

GraphicsUnit Class
MindFusion.Drawing Namespace

GraphicsUnit Properties

GraphicsUnit.Centimeter Property

Specifies the centimeter as the unit of measure.

Namespace: MindFusion.Drawing
Assembly: GraphicsUnit.js

Syntax

JavaScript Copy Code

```
get Centimeter() {}
set Centimeter(value) {}
```

Property Value

Number

Defines 2.54 DPI resolution.

See Also

GraphicsUnit Members
GraphicsUnit Class
MindFusion.Drawing Namespace

GraphicsUnit.Display Property

Specifies the display unit as the unit of measure.

Namespace: MindFusion.Drawing
Assembly: GraphicsUnit.js

Syntax

JavaScript Copy Code

```
get Display() {}
set Display(value) {}
```

Property Value

Number

Defines 100 DPI resolution.

See Also

GraphicsUnit Members
GraphicsUnit Class
MindFusion.Drawing Namespace

GraphicsUnit.Document Property

Specifies the document unit as the unit of measure.

Namespace: MindFusion.Drawing
Assembly: GraphicsUnit.js

Syntax

JavaScript Copy Code

```
get Document() {}
set Document(value) {}
```

Property Value

Number

Defines 300 DPI resolution.

See Also

GraphicsUnit Members
GraphicsUnit Class
MindFusion.Drawing Namespace

GraphicsUnit.Inch Property

Specifies the inch as the unit of measure.

Namespace: MindFusion.Drawing
Assembly: GraphicsUnit.js

Syntax

JavaScript Copy Code

```
get Inch() {}
set Inch(value) {}
```

Property Value

Number

Defines 1 DPI resolution.

See Also

GraphicsUnit Members
GraphicsUnit Class
MindFusion.Drawing Namespace

GraphicsUnit.Millimeter Property

Specifies the millimeter as the unit of measure.

Namespace: MindFusion.Drawing
Assembly: GraphicsUnit.js

Syntax

JavaScript Copy Code

```
get Millimeter() {}
set Millimeter(value) {}
```

Property Value

Number

Defines 25.4 DPI resolution.

See Also

GraphicsUnit Members
GraphicsUnit Class
MindFusion.Drawing Namespace

GraphicsUnit.Percent Property

Specifies the world coordinate system unit as the unit of measure.

Namespace: MindFusion.Drawing
Assembly: GraphicsUnit.js

Syntax

JavaScript Copy Code

```
get Percent() {}
set Percent(value) {}
```

Property Value

Number

For internal use.

See Also

GraphicsUnit Members
GraphicsUnit Class
MindFusion.Drawing Namespace

GraphicsUnit.Pixel Property

Specifies the pixel unit as the unit of measure.

Namespace: MindFusion.Drawing
Assembly: GraphicsUnit.js

Syntax

JavaScript Copy Code

```
get Pixel() {}
set Pixel(value) {}
```

Property Value

Number

Defines 96 DPI resolution.

See Also

GraphicsUnit Members
GraphicsUnit Class
MindFusion.Drawing Namespace

GraphicsUnit.Point Property

Specifies a printer's point as the unit of measure.

Namespace: MindFusion.Drawing
Assembly: GraphicsUnit.js

Syntax

JavaScript Copy Code

```
get Point() {}
set Point(value) {}
```

Property Value

Number

Defines 72 DPI resolution.

See Also

GraphicsUnit Members
GraphicsUnit Class
MindFusion.Drawing Namespace

GraphicsUnit.World Property

Specifies the world coordinate system unit as the unit of measure.

Namespace: MindFusion.Drawing
Assembly: GraphicsUnit.js

Syntax

JavaScript Copy Code

```
get World() {}
set World(value) {}
```

Property Value

Number

For internal use.

See Also

GraphicsUnit Members
GraphicsUnit Class
MindFusion.Drawing Namespace

GraphicsUnit.WpfPoint Property

Specifies the WpfPoint unit as the unit of measure.

Namespace: MindFusion.Drawing
Assembly: GraphicsUnit.js

Syntax

JavaScript Copy Code

```
get WpfPoint() {}
set WpfPoint(value) {}
```

Property Value

Number

Defines 96 DPI resolution.

Image Members
MindFusion.Drawing Namespace

Image Members

Represents an image.

The following tables list the members exposed by the Image type.

Public Constructors

	Name	Description
	Image	Initializes a new instance of the **Image** class.

Public Fields

	Name	Description
	bounds	The object's bounds.
	image	The image to be displayed.

Public Properties

	Name	Description
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

See Also

Image Class
MindFusion.Drawing Namespace

Image Fields

Image.bounds Field

The object's bounds.

Namespace: MindFusion.Drawing
Assembly: Image.js

Syntax

JavaScript Copy Code

```
var bounds
```

See Also

Image Members
Image Class
MindFusion.Drawing Namespace

Image.image Field

The image to be displayed.

Namespace: MindFusion.Drawing
Assembly: Image.js

Syntax

JavaScript Copy Code

```
var image
```

See Also

Image Members
Image Class
MindFusion.Drawing Namespace

Image Constructor

Initializes a new instance of the Image class.

Namespace: MindFusion.Drawing
Assembly: Image.js

Syntax

JavaScript — Copy Code

```
function Image (bounds)
```

Parameters

bounds
Rect. The bounds of the image.

See Also

Image Class
MindFusion.Drawing Namespace

ImageAlign Enumeration

Specifies the position and alignment of a picture in a node, or that of the background image.

Namespace: MindFusion.Drawing
Assembly: Enum.js

Syntax

JavaScript — Copy Code

```
// enum
ImageAlign = {}
```

Members

	Member name	Description
	Center	The image is centered in the node or diagram.
	Fit	The image is resized to fit the size of the object or the component's client area.
	Stretch	The image is stretched to fill the object or the component's client area.
	Tile	The image is tiled to cover the node or the diagram.
	TopLeft	The image is aligned to the top left corner of the node or the diagram.
	BottomLeft	The image is aligned to the bottom left corner of the node or the diagram.
	TopRight	The image is aligned to the top right corner of the node or the diagram.
	BottomRight	The image is aligned to the bottom right corner of the node or the diagram.
	TopCenter	The image is centered horizontally and aligned to the top side.

	BottomCenter	The image is centered horizontally and aligned to the bottom side.
	MiddleLeft	The image is centered vertically and aligned to the left-hand side.
	MiddleRight	The image is centered vertically and aligned to the right-hand side.
	FitLeft	The image is resized to fit the size of the object and aligned to left side.
	FitTop	The image is resized to fit the size of the object and aligned to top side.
	FitRight	The image is resized to fit the size of the object and aligned to right side.
	FitBottom	The image is resized to fit the size of the object and aligned to bottom side.

MindFusion.Drawing Namespace

LayoutAlignment Enumeration

Specifies alignment of components.

Namespace: MindFusion.Drawing
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
LayoutAlignment = {}
```

Members

	Member name	Description
	Near	Left or top alignment.
	Center	Center alignment.
	Far	Right ot bottom alignment
	Stretch	Stretch the component.

See Also

MindFusion.Drawing Namespace

LineJoin Enumeration

Specifies how to join consecutive line or curve segments in a figure.

Namespace: MindFusion.Drawing
Assembly: Enum.js

Syntax

JavaScript Copy Code

```
// enum
LineJoin = {}
```

Members

	Member name	Description
	Miter	Produces a sharp corner or a clipped corner, depending on whether the length of the miter exceeds the miter limit.
	Bevel	Produces a diagonal corner.
	Round	Produces a smooth, circular arc between the lines.

Path Class

Represents a path.

Syntax

JavaScript Copy Code

```
// class
Path.prototype = {}
```

Inheritance Hierarchy

MindFusion.Drawing.ComponentBase
  MindFusion.Drawing.Path

See Also

Path Members
MindFusion.Drawing Namespace

Path Members

Represents a path.

The following tables list the members exposed by the Path type.

Public Constructors

	Name	Description
	Path	Initializes a new instance of the **Path** class.

Public Properties

	Name	Description
	brush	Gets or sets the brush used to fill a closed path.
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	pen	Gets or sets the pen used to draw the path.
	text	Gets or sets the text displayed inside this path.

	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)

Public Methods

	Name	Description
	addEllipse	Adds an ellipse figure to the path.
	addRect	Adds a rectangle figure to the path.
	arcTo	Draws an arc.
	bezierTo	Draws a cubic bezier curve.
	clone	Creates a **Path** object identical to the current object.
	close	Closes the path.
	done	Ends the path definition.
	empty	Gets a value indicating whether this **Path** is empty.
	getBounds	Gets the bounding rect of the path.
	init	Begins a path or resets the current path.
	lineTo	Draws a line from the current point to the specified location.
	moveTo	Moves the path to the specified location.
	quadraticCurveTo	Draws a quadratic bezier curve.

Path Class
MindFusion.Drawing Namespace

Path Constructor

Initializes a new instance of the Path class.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript Copy Code

```
function Path ([pathString])
```

Parameters

pathString
Optional.
String. A string representing the path figures.

See Also

Path Class
MindFusion.Drawing Namespace

Path Methods

Path.addEllipse Method

Adds an ellipse figure to the path.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript — Copy Code

```
function addEllipse (x, y, width, height)
```

Parameters

x
Number. The x-coordinate of the center of the ellipse.

y
Number. The y-coordinate of the center of the ellipse.

width
Number. The width of the ellipse.

height
Number. The height of the ellipse.

Path Class
MindFusion.Drawing Namespace

Path.addRect Method

Adds a rectangle figure to the path.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript — Copy Code

```
function addRect (x, y, width, height)
```

Parameters

x
Number. The x-coordinate of the rectangle.

y
Number. The y-coordinate of the rectangle.

width
Number. The width of the rectangle.

height
Number. The height of the rectangle.

MindFusion.Drawing Namespace

Path.arcTo Method

Draws an arc.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript — Copy Code

```
function arcTo (x, y, radius, startAngle, endAngle, anticlockwise)
```

Parameters

x
Number. The x-coordinate of the center of the circle.

y
Number. The y-coordinate of the center of the circle.

radius
Number. The radius of the circle

startAngle
Number. The starting angle in radians.

endAngle
Number. The ending angle in radians.

anticlockwise
Boolean. Specifies whether the drawing should be counterclockwise or clockwise.

MindFusion.Drawing Namespace

Path.bezierTo Method

Draws a cubic bezier curve.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript — Copy Code

```
function bezierTo (x1, y1, x2, y2, x3, y3)
```

Parameters

x1
Number. The x-coordinate of the first bezier control point.

y1
Number. The y-coordinate of the first bezier control point.

x2
Number. The x-coordinate of the second bezier control point.

y2
Number. The y-coordinate of the second bezier control point.

x3
Number. The x-coordinate of the ending point.

y3
Number. The y-coordinate of the ending point.

MindFusion.Drawing Namespace

Path.clone Method

Creates a Path object identical to the current object.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript Copy Code

```
function clone ()
```

Return Value

The newly created Path object.

See Also

Path Members
Path Class
MindFusion.Drawing Namespace

Path.close Method

Closes the path.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript Copy Code

```
function close ()
```

See Also

Path Members
Path Class
MindFusion.Drawing Namespace

Path.done Method

Ends the path definition.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript Copy Code

```
function done ()
```

See Also

Path Members
Path Class
MindFusion.Drawing Namespace

Path.empty Method

Gets a value indicating whether this Path is empty.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript Copy Code

```
function empty ()
```

Return Value

true if the path does not contain any figures; otherwise, **false**.

See Also

Path Members
Path Class
MindFusion.Drawing Namespace

Path.getBounds Method

Gets the bounding rect of the path.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript Copy Code

```
function getBounds ()
```

Return Value

Rect. The bounding rect.

Path.init Method

Begins a path or resets the current path.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript Copy Code

```
function init ()
```

See Also

Path Members
Path Class
MindFusion.Drawing Namespace

Path.lineTo Method

Draws a line from the current point to the specified location.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript — Copy Code

```
function lineTo (x, y)
```

Parameters

x
Number. The x-coordinate of the point.

y
Number. The y-coordinate of the point.

See Also

Path Members
Path Class
MindFusion.Drawing Namespace

Path.moveTo Method

Moves the path to the specified location.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript — Copy Code

```
function moveTo (x, y)
```

Parameters

x
Number. The x-coordinate of the point.

y
Number. The y-coordinate of the point.

See Also

Path.quadraticCurveTo Method

Draws a quadratic bezier curve.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript — Copy Code

```
function quadraticCurveTo (x1, y1, x, y)
```

Parameters

x1
Number. The x-coordinate of the bezier control point.

y1
Number. The y-coordinate of the bezier control point.

x
Number. The x-coordinate of the ending point.

y
Number. The y-coordinate of the ending point.

Path Properties

Path.brush Property

Gets or sets the brush used to fill a closed path.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript Copy Code

```
get brush() {}
set brush(value) {}
```

Property Value

Object

A color string or an object literal specifying gradient.

See Also

Path Members

Path.pen Property

Gets or sets the pen used to draw the path.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript Copy Code

```
get pen() {}
set pen(value) {}
```

Property Value

Object

A color string.

Path Members
Path Class
MindFusion.Drawing Namespace

Path.text Property

Gets or sets the text displayed inside this path.

Namespace: MindFusion.Drawing
Assembly: Path.js

Syntax

JavaScript Copy Code

```
get text() {}
set text(value) {}
```

Property Value

String

A string containing path's text.

Point Members

Represents a point.

The following tables list the members exposed by the Point type.

Public Constructors

	Name	Description
	Point	Initializes a new instance of the **Point** class with the specified X and Y coordinates.

Public Properties

	Name	Description
	x	Gets or sets the x-coordinate of the point.
	y	Gets or sets the y-coordinate of the point.

Public Methods

	Name	Description
	empty	Gets a value indicating whether this **Point** is empty.
	equals	Specifies whether this **Point** contains the same coordinates as the specified point.

MindFusion.Drawing Namespace

Point Constructor

Initializes a new instance of the Point class with the specified X and Y coordinates.

Namespace: MindFusion.Drawing
Assembly: Point.js

Syntax

JavaScript Copy Code

```
function Point (x, y)
```

Parameters

x
The X-coordinate of the Point.

y
The Y-coordinate of the **Point**.

See Also

Point Class
MindFusion.Drawing Namespace

Point Methods

Point.empty Method

Gets a value indicating whether this Point is empty.

Namespace: MindFusion.Drawing
Assembly: Point.js

Syntax

JavaScript Copy Code

```
function empty ()
```

Return Value

true if both x and y are 0; otherwise, **false**.

See Also

Point Members
Point Class
MindFusion.Drawing Namespace

Point.equals Method

Specifies whether this Point contains the same coordinates as the specified point.

Namespace: MindFusion.Drawing
Assembly: Point.js

Syntax

JavaScript Copy Code

```
function equals ([point])
```

Parameters

point
Optional. The Point to test.

Return Value

true if *point* is a Point and has the same coordinates as this **Point**.

See Also

Point Members
Point Class
MindFusion.Drawing Namespace

Point Properties

Point.x Property

Gets or sets the x-coordinate of the point.

Namespace: MindFusion.Drawing
Assembly: Point.js

Syntax

JavaScript Copy Code

```
get x() {}
set x(value) {}
```

Property Value

Number

The x-coordinate of the point.

See Also

Point Members
Point Class
MindFusion.Drawing Namespace

Point.y Property

Gets or sets the y-coordinate of the point.

Namespace: MindFusion.Drawing
Assembly: Point.js

Syntax

```
JavaScript                                                    Copy Code

get y() {}
set y(value) {}
```

Property Value

Number

The y-coordinate of the point.

MindFusion.Drawing Namespace

Rect Members

Represents a rectangle.

The following tables list the members exposed by the Rect type.

Public Constructors

	Name	Description
	Rect	Overloaded.

Public Properties

	Name	Description
	gridColumn	Gets or sets the index of the grid column this component is contained in. (Inherited from ComponentBase.)
	gridRow	Gets or sets the index of the grid row this component is contained in. (Inherited from ComponentBase.)
	height	Gets or sets the height of the rectangle.

	horizontalAlignment	Gets or sets the component's horizontal alignment. (Inherited from ComponentBase.)
	verticalAlignment	Gets or sets the component's vertical alignment. (Inherited from ComponentBase.)
	visibility	Gets or sets the visibility of this component. (Inherited from ComponentBase.)
	width	Gets or sets the width of the rectangle.
	x	Gets or sets the x-coordinate of the upper-left corner of the rectangle.
	y	Gets or sets the y-coordinate of the upper-left corner of the rectangle.

Public Methods

	Name	Description
	bottom	Gets the y-coordinate that is the sum of the y and height values of this **Rect** object.
	bottomLeft	Gets the bottom-left edge of this **Rect** object.
	bottomRight	Gets the bottom-right edge of this **Rect** object.
	center	Gets the center of this **Rect** object.
	clone	Creates a **Rect** object identical to the current object.
	contains	Determines if the rectangular region represented by *rect* is entirely contained within this **Rect** object.
	containsPoint	Determines if the specified point is contained within this **Rect** object.
	equals	Specifies whether this Rect contains the same coordinates as the specified rectangle.
	fromLTRB	Creates a Rect object with the specified edge locations.
	intersect	Returns a **Rect** object representing the intersection of the current rectangle with the specified rectangle.
	intersectsWith	Checks if this **Rect** intersects with the specified rect.
	isEmpty	Gets a value indicating whether this Rect is empty.
	left	Gets the x-coordinate of the left edge of this **Rect** object.
	right	Gets the x-coordinate that is the sum of x and width values of this **Rect**.
	setCenter	Sets the center of this **Rect** object.
	setLocation	Sets the top-left edge of this **Rect** object.
	top	Gets the y-coordinate of the top edge of this **Rect** object.
	topLeft	Gets the top-left edge of this **Rect**.
	topMiddle	Gets the top-middle of this **Rect** object.
	topRight	Gets the top-right edge of this **Rect** object.
	union	Returns a **Rect** object representing the union of the current rectangle with the specified rectangle.
